$r^2+3rs-28s^2$

$a^2+4ab-21b^2$

Answer

$(a+7b)(a-3b)$

$p^2-5pq-36q^2$

$m^2-5mn+30n^2$

Answer

Prime

Factor Trinomials of the Form ax2+bx+cax2+bx+c Using Trial and Error

In the following exercises, factor completely using trial and error.

x^3+5x^2-24x

$3y^3-21y^2+30y$

Answer

$3y(y-5)(y-2)$

$5x^4+10x^3-75x^2$

$5y^2+14y+9$

Answer

$(5y+9)(y+1)$

$8x^2+25x+3$

$10y^2-53y-11$

Answer

$(5y+1)(2y-11)$

$6p^2-19pq+10q^2$

$-81a^2+153a+18$

Answer

$-9(9a-1)(a+2)$

Factor Trinomials of the Form ax2+bx+cax2+bx+c using the 'ac' Method

In the following exercises, factor.

$2x^2+9x+4$

$18a^2-9a+1$

Answer

$(3a-1)(6a-1)$

$15p^2+2p-8$

$15x^2+6x-2$

Answer

$(3x-1)(5x+2)$

$8a^2+32a+24$

$3x^2+3x-36$

Answer

$3(x+4)(x-3)$

$48y^2+12y-36$

$18a^2-57a-21$

Answer

$3(2a-7)(3a+1)$

$3n^4-12n^3-96n^2$

Factor using substitution

In the following exercises, factor using substitution.

x^4-13x^2-30

Answer

$(x^2-15)(x^2+2)$

$(x-3)^2-5(x-3)-36$

Factor Special Products

Factor Perfect Square Trinomials

In the following exercises, factor completely using the perfect square trinomials pattern.

$25x^2+30x+9$

Answer

$(5x+3)^2$

$36a^2 - 84ab + 49b^2$

$40x^2 + 360x + 810$

Answer

$10(2x + 9)^2$

$5k^3 - 70k^2 + 245k$

$75u^4 - 30u^3v + 3u^2v^2$

Answer

$3u^2(5u - v)^2$

Factor Differences of Squares

In the following exercises, factor completely using the difference of squares pattern, if possible.

$81r^2 - 25$

$169m^2 - n^2$

Answer

$(13m + n)(13m - n)$

$25p^2 - 1$

$9 - 121y^2$

Answer

$(3 + 11y)(3 - 11y)$

$20x^2 - 125$

$169n^3 - n$

Answer

$n(13n + 1)(13n - 1)$

$6p^2q^2 - 54p^2$

$24p^2 + 54$

Answer

$6(4p^2 + 9)$

$49x^2 - 81y^2$

$16z^4 - 1$

Answer

$(2z-1)(2z+1)(4z^2+1)$

$48m^4n^2-243n^2$

$a^2+6a+9-9b^2$

Answer

$(a+3-3b)(a+3+3b)$

$x^2-16x+64-y^2$

Factor Sums and Differences of Cubes

In the following exercises, factor completely using the sums and differences of cubes pattern, if possible.

a^3-125

Answer

$(a-5)(a^2+5a+25)$

b^3-216

$2m^3+54$

Answer

$2(m+3)(m^2-3m+9)$

$81m^3+3$

General Strategy for Factoring Polynomials

Recognize and Use the Appropriate Method to Factor a Polynomial Completely

In the following exercises, factor completely.

$24x^3+44x^2$

Answer

$4x^2(6x+11)$

$24a^4-9a^3$

$16n^2-56mn+49m^2$

Answer

$(4n-7m)^2$

$6a^2-25a-9$

$5u^4-45u^2$

Answer

$5u^2(u+3)(u-3)$

n^4-81

$64j^2+225$

Answer

prime

$5x^2+5x-60$

b^3-64

Answer

$(b-4)(b^2+4b+16)$

m^3+125

$2b^2-2bc+5cb-5c^2$

Answer

$(2b+5c)(b-c)$

$48x^5y^2-243xy^2$

$5q^2-15q-90$

Answer

$5(q+3)(q-6)$

$4u^5v+4u^2v^3$

$10m^4-6250$

Answer

$10(m-5)(m+5)(m^2+25)$

$60x^2y-75xy+30y$

$16x^2-24xy+9y^2-64$

Answer

$(4x-3y+8)(4x-3y-8)$

Polynomial Equations

Use the Zero Product Property

In the following exercises, solve.

$(a-3)(a+7)=0$

https://math.libretexts.org/@go/page/46381

$(5b+1)(6b+1)=0$

Answer

$b=-\frac{1}{5},\ b=-\frac{1}{6}$

$6m(12m-5)=0$

$(2x-1)^2=0$

Answer

$x=\frac{1}{2}$

$3m(2m-5)(m+6)=0$

Solve Quadratic Equations by Factoring

In the following exercises, solve.

$x^2+9x+20=0$

Answer

$x=-4,\ x=-5$

$y^2-y-72=0$

$2p^2-11p=40$

Answer

$p=-\frac{5}{2}, p=8$

$q^3+3q^2+2q=0$

$144m^2-25=0$

Answer

$m=\frac{5}{12},\ m=-\frac{5}{12}$

$4n^2=36$

$(x+6)(x-3)=-8$

Answer

$x=2,\ x=-5$

$(3x-2)(x+4)=12$

$16p^3=24p^2+9p$

Answer

$p = 0,\ p = \frac{3}{4}$

$2y^3 + 2y^2 = 12y$

Solve Equations with Polynomial Functions

In the following exercises, solve.

For the function, $f(x) = x^2 + 11x + 20$, ⓐ find when $f(x) = -8$ ⓑ Use this information to find two points that lie on the graph of the function.

Answer

ⓐ $x = -7$ or $\backslash x = -4$
ⓑ $(-7, -8)$ $(-4, -8)$

For the function, $f(x) = 9x^2 - 18x + 5$, ⓐ find when $f(x) = -3$ ⓑ Use this information to find two points that lie on the graph of the function.

In each function, find: ⓐ the zeros of the function ⓑ the *x*-intercepts of the graph of the function ⓒ the *y*-intercept of the graph of the function.

$f(x) = 64x^2 - 49$

Answer

ⓐ $x = \frac{7}{8}$ or $x = -\frac{7}{8}$
ⓑ $(\frac{7}{8}, 0),\ (-\frac{7}{8}, 0)$ ⓒ $(0, -49)$

$f(x) = 6x^2 - 13x - 5$

Solve Applications Modeled by Quadratic Equations

In the following exercises, solve.

The product of two consecutive numbers is 399. Find the numbers.

Answer

The numbers are -21 and -19 or 19 and 21.

The area of a rectangular shaped patio 432 square feet. The length of the patio is 6 feet more than its width. Find the length and width.

A ladder leans against the wall of a building. The length of the ladder is 9 feet longer than the distance of the bottom of the ladder from the building. The distance of the top of the ladder reaches up the side of the building is 7 feet longer than the distance of the bottom of the ladder from the building. Find the lengths of all three sides of the triangle formed by the ladder leaning against the building.

Answer

The lengths are 8, 15, and 17 ft.

Shruti is going to throw a ball from the top of a cliff. When she throws the ball from 80 feet above the ground, the function $h(t) = -16t^2 + 64t + 80$ models the height, *h*, of the ball above the ground as a function of time, *t*. Find: ⓐthe zeros of this

function which tells us when the ball will hit the ground. ⓑ the time(s) the ball will be 80 feet above the ground. ⓒ the height the ball will be at $t = 2$ seconds which is when the ball will be at its highest point.

Chapter Practice Test

In the following exercises, factor completely.

$80a^2 + 120a^3$

Answer

$40a^2(2 + 3a)$

$5m(m - 1) + 3(m - 1)$

$x^2 + 13x + 36$

Answer

$(x + 7)(x + 6)$

$p^2 + pq - 12q^2$

$xy - 8y + 7x - 56$

Answer

$(x - 8)(y + 7)$

$40r^2 + 810$

$9s^2 - 12s + 4$

Answer

$(3s - 2)^2$

$6x^2 - 11x - 10$

$3x^2 - 75y^2$

Answer

$3(x + 5y)(x - 5y)$

$6u^2 + 3u - 18$

$x^3 + 125$

Answer

$(x + 5)(x^2 - 5x + 25)$

$32x^5y^2 - 162xy^2$

$6x^4 - 19x^2 + 15$

Answer

$(3x^2-5)(2x^2-3)$

$3x^3-36x^2+108x$

In the following exercises, solve

$5a^2+26a=24$

Answer

$a=\frac{4}{5},\ a=-6$

The product of two consecutive integers is 156. Find the integers.

The area of a rectangular place mat is 168 square inches. Its length is two inches longer than the width. Find the length and width of the placemat.

Answer

The width is 12 inches and the length is 14 inches.

Jing is going to throw a ball from the balcony of her condo. When she throws the ball from 80 feet above the ground, the function $h(t)=-16t^2+64t+80$ models the height, *h*, of the ball above the ground as a function of time, *t*. Find: ⓐ the zeros of this function which tells us when the ball will hit the ground. ⓑ the time(s) the ball will be 128 feet above the ground. ⓒ the height the ball will be at $t=4$ seconds.

For the function, $f(x)=x^2-7x+5$, ⓐ find when $f(x)=-7$ ⓑ Use this information to find two points that lie on the graph of the function.

Answer

ⓐ $x=3$ or $x=4$ ⓑ $(3,-7)$ $(4,-7)$

For the function $f(x)=25x^2-81$, find: ⓐ the zeros of the function ⓑ the *x*-intercepts of the graph of the function ⓒ the *y*-intercept of the graph of the function.

Glossary

degree of the polynomial equation

The degree of the polynomial equation is the degree of the polynomial.

polynomial equation

A polynomial equation is an equation that contains a polynomial expression.

quadratic equation

Polynomial equations of degree two are called quadratic equations.

zero of the function

A value of xx where the function is 0, is called a zero of the function.

Zero Product Property

The Zero Product Property says that if the product of two quantities is zero, then at least one of the quantities is zero.

15.1: Rational Expressions and Functions

Twelve goals last season. Fifteen home runs. Nine touchdowns. Whatever the statistics, sports analysts know it. Their jobs depend on it. Compiling and analyzing sports data not only help fans appreciate their teams but also help owners and coaches decide which players to recruit, how to best use them in games, how much they should be paid, and which players to trade. Understanding this kind of data requires a knowledge of specific types of expressions and functions. In this chapter, you will work with rational expressions and perform operations on them. And you will use rational expressions and inequalities to solve real-world problems.

Figure 7.0.1: *American football is the most watched spectator sport in the United States. People around the country are constantly tracking statistics for football and other sports. (credit: "keijj44" / Pixabay)*

15.2: Multiply and Divide Rational Expressions

Learning Objectives

By the end of this section, you will be able to:

- Determine the values for which a rational expression is undefined
- Simplify rational expressions
- Multiply rational expressions
- Divide rational expressions
- Multiply and divide rational functions

Before you get started, take this readiness quiz.

1. Simplify: $\frac{90y}{15y^2}$.
   If you missed this problem, review [link].
2. Multiply: $\frac{14}{15} \cdot \frac{6}{35}$.
   If you missed this problem, review [link].
3. Divide: $\frac{12}{10} \div \frac{8}{25}$.
   If you missed this problem, review [link].

We previously reviewed the properties of fractions and their operations. We introduced rational numbers, which are just fractions where the numerators and denominators are integers. In this chapter, we will work with fractions whose numerators and denominators are polynomials. We call this kind of expression a **rational expression**.

RATIONAL EXPRESSION

A rational expression is an expression of the form $\frac{p}{q}$, where p and q are polynomials and $q \neq 0$.

Here are some examples of rational expressions:

$$-\frac{24}{56} \qquad \frac{5x}{12y} \qquad \frac{4x+1}{x^2-9} \qquad \frac{4x^2+3x-1}{2x-8}$$

Notice that the first rational expression listed above, $-\frac{24}{56}$, is just a fraction. Since a constant is a polynomial with degree zero, the ratio of two constants is a rational expression, provided the denominator is not zero.

We will do the same operations with rational expressions that we did with fractions. We will simplify, add, subtract, multiply, divide and use them in applications.

Determine the Values for Which a Rational Expression is Undefined

If the denominator is zero, the rational expression is undefined. The numerator of a rational expression may be 0—but not the denominator.

When we work with a numerical fraction, it is easy to avoid dividing by zero because we can see the number in the denominator. In order to avoid dividing by zero in a rational expression, we must not allow values of the variable that will make the denominator be zero.

So before we begin any operation with a rational expression, we examine it first to find the values that would make the denominator zero. That way, when we solve a rational equation for example, we will know whether the algebraic solutions we find are allowed or not.

DETERMINE THE VALUES FOR WHICH A RATIONAL EXPRESSION IS UNDEFINED.

1. Set the denominator equal to zero.
2. Solve the equation.

EXAMPLE 15.2.1

Determine the value for which each rational expression is undefined:

a. $\frac{8a^2b}{3c}$ b. $\frac{4b-3}{2b+5}$ c. $\frac{x+4}{x^2+5x+6}$.

Solution

The expression will be undefined when the denominator is zero.

a.

$$\frac{8a^2b}{3c}$$

Set the denominator equal to zero and solve for the variable.

$$3c=0$$

$$c=0$$

$\frac{8a^2b}{3c}$ is undefined for $c=0$

b.

$$\frac{4b-3}{2b+5}$$

Set the denominator equal to zero and solve for the variable.

$$2b+5=0$$

$$2b=-5$$

$$b=-\frac{5}{2}$$

$\frac{4b-3}{2b+5}$ is undefined for $b=-\frac{5}{2}$

c.

$$\frac{x+4}{x^2+5x+6}$$

Set the denominator equal to zero and solve for the variable.

$$x^2+5x+6=0$$

$$(x+2)(x+3)=0$$

$$x+2=0 \text{ or } x+3=0$$

$$x=-2 \text{ or } x=-3$$

$\frac{x+4}{x^2+5x+6}$ is undefined for $x=-2$ or $x=-3$

Try It 15.2.2

Determine the value for which each rational expression is undefined.

a. $\frac{3y^2}{8x}$ b. $\frac{8n-5}{3n+1}$ c. $\frac{a+10}{a^2+4a+3}$

Answer

a. $x = 0$

b. $n = -\frac{1}{3}$

c. $a = -1, a = -3$

Try It 15.2.3

Determine the value for which each rational expression is undefined.

a. $\frac{4p}{5q}$ b. $\frac{y-1}{3y+2}$ c. $\frac{m-5}{m^2+m-6}$

Answer

a. $q = 0$

b. $y = -\frac{2}{3}$

c. $m = 2, m = -3$

Simplify Rational Expressions

A fraction is considered simplified if there are no common factors, other than 1, in its numerator and denominator. Similarly, a **simplified rational expression** has no common factors, other than 1, in its numerator and denominator.

SIMPLIFIED RATIONAL EXPRESSION

A rational expression is considered simplified if there are no common factors in its numerator and denominator.

For example,

$\frac{x+2}{x+3}$ is simplified because there are no common factors of $x+2$ and $x+3$.

$\frac{2x}{3x}$ is not simplified because x is a common factor of $2x$ and $3x$.

We use the Equivalent Fractions Property to simplify numerical fractions. We restate it here as we will also use it to simplify rational expressions.

EQUIVALENT FRACTIONS PROPERTY

If a, b, and c are numbers where $b \neq 0, c \neq 0$,

$$\text{then } \frac{a}{b} = \frac{a \cdot c}{b \cdot c} \text{ and } \frac{a \cdot c}{b \cdot c} = \frac{a}{b}$$

Notice that in the Equivalent Fractions Property, the values that would make the denominators zero are specifically disallowed. We see $b \neq 0, c \neq 0$ clearly stated.

To simplify rational expressions, we first write the numerator and denominator in factored form. Then we remove the common factors using the Equivalent Fractions Property.

Be very careful as you remove common factors. Factors are multiplied to make a product. You can remove a factor from a product. You cannot remove a term from a sum.

$\frac{2 \cdot \cancel{3} \cdot \cancel{7}}{\cancel{3} \cdot 5 \cdot \cancel{7}}$ $\frac{2}{5}$

We removed the common factors 3 and 7. They are factors of the product.

$\frac{3x\cancel{(x-9)}}{5\cancel{(x-9)}}$ where $x \neq 9$ $\frac{3x}{5}$

We removed the common factor $(x-9)$. It is a factor of the product.

$\frac{x+5}{x}$ **NO COMMON FACTORS**

While there is an x in both the numerator and denominator, the x in the numerator is a term of a sum!

Removing the x's from $\frac{x+5}{x}$ would be like cancelling the 2's in the fraction $\frac{2+5}{2}$!

How to Simplify a Rational Expression

EXAMPLE 15.2.4

Simplify: $\frac{x^2+5x+6}{x^2+8x+12}$

Solution

Step 1. Factor the numerator and denominator completely.	Factor x^2+5x+6 and $x^2+8x+12$	$\frac{x^2+5x+6}{x^2+8x+12}$ $\frac{(x+2)(x+3)}{(x+2)(x+6)}$
Step 2. Simplify by dividing out common factors.	Remove the common factor $x+2$ from the numerator and the denominator.	$\frac{\cancel{(x+2)}(x+3)}{\cancel{(x+2)}(x+6)}$ $\frac{(x+3)}{(x+6)}$ $x \neq -2 \quad x \neq -6$

Try It 15.2.5

Simplify: $\frac{x^2-x-2}{x^2-3x+2}$.

Answer

$\frac{x+1}{x-1}, x \neq 2, x \neq 1$

Try It 15.2.6

Simplify: $\frac{x^2-3x-10}{x^2+x-2}$.

Answer

$\frac{x-5}{x-1}, x \neq -2, x \neq 1$

We now summarize the steps you should follow to simplify rational expressions.

SIMPLIFY A RATIONAL EXPRESSION.

1. Factor the numerator and denominator completely.
2. Simplify by dividing out common factors.

Usually, we leave the simplified rational expression in factored form. This way, it is easy to check that we have removed *all* the common factors.

We'll use the methods we have learned to factor the polynomials in the numerators and denominators in the following examples.

Every time we write a rational expression, we should make a statement disallowing values that would make a denominator zero. However, to let us focus on the work at hand, we will omit writing it in the examples.

EXAMPLE 15.2.7

Simplify: $\frac{3a^2-12ab+12b^2}{6a^2-24b^2}$.

Solution

$$\frac{3a^2-12ab+12b^2}{6a^2-24b^2}$$

Factor the numerator and denominator, first factoring out the GCF.

$$\frac{3(a^2-4ab+4b^2)}{6(a^2-4b^2)}$$

$$\frac{3(a-2b)(a-2b)}{6(a+2b)(a-2b)}$$

Remove the common factors of $a-2b$ and 3.

$$\frac{\cancel{3}(a-2b)\ \cancel{(a-2b)}}{\cancel{3}\cdot 2(a+2b)\ \cancel{(a-2b)}}$$

$$\frac{a-2b}{2(a+2b)}$$

Try It 15.2.8

Simplify: $\frac{2x^2-12xy+18y^2}{3x^2-27y^2}$.

Answer

$$\frac{2(x-3y)}{3(x+3y)}$$

Try It 15.2.9

Simplify: $\frac{5x^2-30xy+25y^2}{2x^2-50y^2}$.

Answer

$$\frac{5(x-y)}{2(x+5y)}$$

Now we will see how to simplify a rational expression whose numerator and denominator have opposite factors. We previously introduced opposite notation: the opposite of a is $-a$ and $-a = -1 \cdot a$.

The numerical fraction, say $\frac{7}{-7}$ simplifies to -1. We also recognize that the numerator and denominator are opposites.

The fraction $\frac{a}{-a}$, whose numerator and denominator are opposites also simplifies to -1.

Let's look at the expression $b-a$.	$b-a$
Rewrite.	$-a+b$
Factor out -1.	$-1(a-b)$

This tells us that $b-a$ is the opposite of $a-b$.

In general, we could write the opposite of $a-b$ as $b-a$. So the rational expression $\frac{a-b}{b-a}$ simplifies to -1.

OPPOSITES IN A RATIONAL EXPRESSION

The opposite of $a-b$ is $b-a$.

$$\frac{a-b}{b-a} = -1 \quad a \neq b$$

An expression and its opposite divide to -1.

We will use this property to simplify rational expressions that contain opposites in their numerators and denominators. Be careful not to treat $a+b$ and $b+a$ as opposites. Recall that in addition, order doesn't matter so $a+b=b+a$. So if $a \neq -b$, then $\frac{a+b}{b+a} = 1$.

EXAMPLE 15.2.10

Simplify: $\frac{x^2-4x-32}{64-x^2}$

Solution

	$\frac{x^2-4x-32}{64-x^2}$
Factor the numerator and the denominator.	$\frac{(x-8)(x+4)}{(8-x)(8+x)}$
Recognize the factors that are opposites.	$(-1)\frac{(x-8)(x+4)}{(8-x)(8+x)}$
Simplify.	$-\frac{x+4}{x+8}$

Try It 15.2.11

Simplify: $\frac{x^2-4x-5}{25-x^2}$

Answer

$-\frac{x+1}{x+5}$

Try It 15.2.12

Simplify: $\dfrac{x^2+x-2}{1-x^2}$.

Answer

$-\dfrac{x+2}{x+1}$

Multiply Rational Expressions

To multiply rational expressions, we do just what we did with numerical fractions. We multiply the numerators and multiply the denominators. Then, if there are any common factors, we remove them to simplify the result.

MULTIPLICATION OF RATIONAL EXPRESSIONS

If p, q, r, and s are polynomials where $q \neq 0$, $s \neq 0$, then

$$\frac{p}{q} \cdot \frac{r}{s} = \frac{pr}{qs}$$

To multiply rational expressions, multiply the numerators and multiply the denominators.

Remember, throughout this chapter, we will assume that all numerical values that would make the denominator be zero are excluded. We will not write the restrictions for each rational expression, but keep in mind that the denominator can never be zero. So in this next example, $x \neq 0$, $x \neq 3$, and $x \neq 4$.

EXAMPLE 15.2.13: How to Multiply Rational Expressions

Simplify: $\dfrac{2x}{x^2-7x+12} \cdot \dfrac{x^2-9}{6x^2}$.

Solution

Step 1. Factor each numerator and denominator completely.	Factor x^2-9 and $x^2-7x+12$.	$\dfrac{2x}{x^2-7x+12} \cdot \dfrac{x^2-9}{6x^2}$ $\dfrac{2x}{(x-3)(x-4)} \cdot \dfrac{(x-3)(x+3)}{6x^2}$
Step 2. Multiply the numerators and denominators.	Multiply the numerators and denominators. It is helpful to write the monomials first.	$\dfrac{2x(x-3)(x+3)}{6x^2(x-3)(x-4)}$
Step 3. Simplify by dividing out common factors.	Divide out the common factors. Leave the denominator in factored form.	$\dfrac{2 \cdot x \cdot (x-3)(x+3)}{2 \cdot 3 \cdot x \cdot x \cdot (x-3)(x-4)}$ $\dfrac{(x+3)}{3x(x-4)}$

Try It 15.2.14

Simplify: $\dfrac{5x}{x^2+5x+6} \cdot \dfrac{x^2-4}{10x}$.

Answer

$\dfrac{x-2}{2(x+3)}$

Try It 15.2.15

Simplify: $\frac{9x^2}{x^2+11x+30} \cdot \frac{x^2-36}{3x^2}$.

Answer

$\frac{3(x-6)}{x+5}$

MULTIPLY RATIONAL EXPRESSIONS.

1. Factor each numerator and denominator completely.
2. Multiply the numerators and denominators.
3. Simplify by dividing out common factors.

EXAMPLE 15.2.16

Multiply: $\frac{3a^2-8a-3}{a^2-25} \cdot \frac{a^2+10a+25}{3a^2-14a-5}$.

Solution

$$\frac{3a^2-8a-3}{a^2-25} \cdot \frac{a^2+10a+25}{3a^2-14a-5}$$

Factor the numerators and denominators and then multiply.

$$\frac{(3a+1)(a-3)(a+5)(a+5)}{(a-5)(a+5)(3a+1)(a-5)}$$

Simplify by dividing out common factors.

$$\frac{\cancel{(3a+1)}(a-3)\ \cancel{(a+5)}(a+5)}{(a-5)\ \cancel{(a+5)}\ \cancel{(3a+1)}(a-5)}$$

Simplify.

$$\frac{(a-3)(a+5)}{(a-5)(a-5)}$$

Rewrite $(a-5)(a-5)$ using an exponent.

$$\frac{(a-3)(a+5)}{(a-5)^2}$$

Try It 15.2.17

Simplify: $\frac{2x^2+5x-12}{x^2-16} \cdot \frac{x^2-8x+16}{2x^2-13x+15}$.

Answer

$\frac{x-4}{x-5}$

Try It 15.2.18

Simplify: $\frac{4b^2+7b-2}{1-b^2} \cdot \frac{b^2-2b+1}{4b^2+15b-4}$.

Answer

$$-\frac{(b+2)(b-1)}{(1+b)(b+4)}$$

Divide Rational Expressions

Just like we did for numerical fractions, to divide rational expressions, we multiply the first fraction by the reciprocal of the second.

DIVISION OF RATIONAL EXPRESSIONS

If p, q, r, and s are polynomials where $q \neq 0$, $r \neq 0$, $s \neq 0$, then

$$\frac{p}{q} \div \frac{r}{s} = \frac{p}{q} \cdot \frac{s}{r}$$

To divide rational expressions, multiply the first fraction by the reciprocal of the second.

Once we rewrite the division as multiplication of the first expression by the reciprocal of the second, we then factor everything and look for common factors.

EXAMPLE 15.2.19: How to Divide Rational Expressions

Divide: $\frac{p^3+q^3}{2p^2+2pq+2q^2} \div \frac{p^2-q^2}{6}$.

Solution

Step 1. Rewrite the division as the product of the first rational expression and the reciprocal of the second.	"Flip" the second fraction and change the division sign to multiplication.	$\frac{p^3+q^3}{2p^2+2pq+2q^2} \div \frac{p^2-q^2}{6}$ $\frac{p^3+q^3}{2p^2+2pq+2q^2} \cdot \frac{6}{p^2-q^2}$
Step 2. Factor the numerators and denominators completely.	Factor the numerators and denominators.	$\frac{(p+q)(p^2-pq+q^2)}{2(p^2+pq+q^2)} \cdot \frac{2 \cdot 3}{(p-q)(p+q)}$
Step 3. Multiply the numerators and denominators.	Multiply the numerators and multiply the denominators.	$\frac{(p+q)(p^2-pq+q^2)2 \cdot 3}{2(p^2+pq+q^2)(p-q)(p+q)}$
Step 4. Simplify by dividing out common factors.	Divide out the common factors.	$\frac{\cancel{(p+q)}(p^2-pq+q^2)\cancel{2} \cdot 3}{\cancel{2}(p^2+pq+q^2)(p-q)\cancel{(p+q)}}$ $\frac{3(p^2-pq+q^2)}{(p-q)(p^2+pq+q^2)}$

Try It 15.2.20

Simplify: $\frac{x^3-8}{3x^2-6x+12} \div \frac{x^2-4}{6}$.

Answer

$$\frac{2(x^2+2x+4)}{(x+2)(x^2-2x+4)}$$

Try It 15.2.21

Simplify: $\frac{2z^2}{z^2-1} \div \frac{z^3-z^2+z}{z^3+1}$.

Answer

$\frac{2z}{z-1}$

DIVISION OF RATIONAL EXPRESSIONS

1. Rewrite the division as the product of the first rational expression and the reciprocal of the second.
2. Factor the numerators and denominators completely.
3. Multiply the numerators and denominators together.
4. Simplify by dividing out common factors.

Recall from Use the Language of Algebra that a complex fraction is a fraction that contains a fraction in the numerator, the denominator or both. Also, remember a fraction bar means division. A complex fraction is another way of writing division of two fractions.

EXAMPLE 15.2.22

Divide: $\frac{\frac{6x^2-7x+2}{4x-8}}{\frac{2x^2-7x+3}{x^2-5x+6}}$.

Solution

$$\frac{\frac{6x^2-7x+2}{4x-8}}{\frac{2x^2-7x+3}{x^2-5x+6}}$$

Rewrite with a division sign. $\frac{6x^2-7x+2}{4x-8} \div \frac{2x^2-7x+3}{x^2-5x+6}$

Rewrite as product of first times reciprocal of second. $\frac{6x^2-7x+2}{4x-8} \cdot \frac{x^2-5x+6}{2x^2-7x+3}$

Factor the numerators and the denominators, and then multiply. $\frac{(2x-1)(3x-2)(x-2)(x-3)}{4(x-2)(2x-1)(x-3)}$

Simplify by dividing out common factors. $\frac{\cancel{(2x-1)}(3x-2)\ \cancel{(x-2)}\ \cancel{(x-3)}}{4\ \cancel{(x-2)}\ \cancel{(2x-1)}\ \cancel{(x-3)}}$

Simplify. $\frac{3x-2}{4}$

Try It 15.2.23

Simplify: $\dfrac{\dfrac{3x^2+7x+2}{4x+24}}{\dfrac{3x^2-14x-5}{x^2+x-30}}$.

Answer

$\dfrac{x+2}{4}$

Try It 15.2.24

Simplify: $\dfrac{\dfrac{y^2-36}{2y^2+11y-6}}{\dfrac{2y^2-2y-60}{8y-4}}$.

Answer

$\dfrac{2}{y+5}$

If we have more than two rational expressions to work with, we still follow the same procedure. The first step will be to rewrite any division as multiplication by the reciprocal. Then, we factor and multiply.

EXAMPLE 15.2.25

Perform the indicated operations: $\dfrac{3x-6}{4x-4}\cdot\dfrac{x^2+2x-3}{x^2-3x-10}\div\dfrac{2x+12}{8x+16}$.

Solution

	$\frac{3x-6}{4x-4}\cdot\frac{x^2+2x-3}{x^2-3x-10}\div\frac{2x+12}{8x+16}$
Rewrite the division as multiplication by the reciprocal.	$\frac{3x-6}{4x-4}\cdot\frac{x^2+2x-3}{x^2-3x-10}\cdot\frac{8x+16}{2x+12}$
Factor the numerators and the denominators.	$\frac{3(x-2)}{4(x-1)}\cdot\frac{(x+3)(x-1)}{(x+2)(x-5)}\cdot\frac{8(x+2)}{2(x+6)}$
Multiply the fractions. Bringing the constants to the front will help when removing common factors.	
Simplify by dividing out common factors.	$\frac{3\cdot 8(x-2)(x+3)(x-1)(x+2)}{4\cdot 2(x-1)(x+2)(x-5)(x+6)}$
Simplify.	$\frac{3(x-2)(x+3)}{(x-5)(x+6)}$

Try It 15.2.26

Perform the indicated operations: $\dfrac{4m+4}{3m-15}\cdot\dfrac{m^2-3m-10}{m^2-4m-32}\div\dfrac{12m-36}{6m-48}$.

Answer

$\dfrac{2(m+1)(m+2)}{3(m+4)(m-3)}$

Try It 15.2.27

Perform the indicated operations: $\frac{2n^2+10n}{n-1} \div \frac{n^2+10n+24}{n^2+8n-9} \cdot \frac{n+4}{8n^2+12n}$.

Answer

$$\frac{(n+5)(n+9)}{2(n+6)(2n+3)}$$

Multiply and Divide Rational Functions

We started this section stating that a **rational expression** is an expression of the form $\frac{p}{q}$, where p and q are polynomials and $q \neq 0$. Similarly, we define a **rational function** as a function of the form $R(x) = \frac{p(x)}{q(x)}$ where $p(x)$ and $q(x)$ are polynomial functions and $q(x)$ is not zero.

RATIONAL FUNCTION

A rational function is a function of the form

$$R(x) = \frac{p(x)}{q(x)}$$

where $p(x)$ and $q(x)$ are polynomial functions and $q(x)$ is not zero.

The domain of a rational function is all real numbers except for those values that would cause division by zero. We must eliminate any values that make $q(x) = 0$.

DETERMINE THE DOMAIN OF A RATIONAL FUNCTION.

1. Set the denominator equal to zero.
2. Solve the equation.
3. The domain is all real numbers excluding the values found in Step 2.

EXAMPLE 15.2.28

Find the domain of $R(x) = \frac{2x^2-14x}{4x^2-16x-48}$.

Solution

The domain will be all real numbers except those values that make the denominator zero. We will set the denominator equal to zero , solve that equation, and then exclude those values from the domain.

Set the denominator to zero.	$4x^2-16x-48=0$
Factor, first factor out the GCF.	$4(x^2-4x-12)=0$
	$4(x-6)(x+2)=0$
Use the Zero Product Property.	$4 \neq 0 \quad x-6=0 \quad x+2=0$
Solve.	$x=6 \quad x=-2$
	The domain of $R(x)$ is all real numbers where $x \neq 6$ and $x \neq -2$

Try It 15.2.29

Find the domain of $R(x) = \dfrac{2x^2 - 10x}{4x^2 - 16x - 20}$.

Answer

The domain of $R(x)$ is all real numbers where $x \neq 5$ and $x \neq -1$.

Try It 15.2.30

Find the domain of $R(x) = \dfrac{4x^2 - 16x}{8x^2 - 16x - 64}$.

Answer

The domain of $R(x)$ is all real numbers where $x \neq 4$ and $x \neq -2$.

To multiply rational functions, we multiply the resulting rational expressions on the right side of the equation using the same techniques we used to multiply rational expressions.

EXAMPLE 15.2.31

Find $R(x) = f(x) \cdot g(x)$ where $f(x) = \dfrac{2x-6}{x^2-8x+15}$ and $g(x) = \dfrac{x^2-25}{2x+10}$.

Solution

$$R(x) = f(x) \cdot g(x)$$

$$R(x) = \frac{2x-6}{x^2-8x+15} \cdot \frac{x^2-25}{2x+10}$$

Factor each numerator and denominator. $$R(x) = \frac{2(x-3)}{(x-3)(x-5)} \cdot \frac{(x-5)(x+5)}{2(x+5)}$$

Multiply the numerators and denominators. $$R(x) = \frac{2(x-3)(x-5)(x+5)}{2(x-3)(x-5)(x+5)}$$

Remove common factors. $$R(x) = \frac{\cancel{2}\,\cancel{(x-3)}\,\cancel{(x-5)}\,\cancel{(x+5)}}{\cancel{2}\,\cancel{(x-3)}\,\cancel{(x-5)}\,\cancel{(x+5)}}$$

Simplify. $$R(x) = 1$$

Try It 15.2.32

Find $R(x) = f(x) \cdot g(x)$ where $f(x) = \dfrac{3x-21}{x^2-9x+14}$ and $g(x) = \dfrac{2x^2-8}{3x+6}$.

Answer

$R(x) = 2$

Try It 15.2.33

Find $R(x) = f(x) \cdot g(x)$ where $f(x) = \dfrac{x^2 - x}{3x^2 + 27x - 30}$ and $g(x) = \dfrac{x^2 - 100}{x^2 - 10x}$.

Answer

$$R(x) = \frac{1}{3}$$

To divide rational functions, we divide the resulting rational expressions on the right side of the equation using the same techniques we used to divide rational expressions.

EXAMPLE 15.2.34

Find $R(x) = \dfrac{f(x)}{g(x)}$ where $f(x) = \dfrac{3x^2}{x^2 - 4x}$ and $g(x) = \dfrac{9x^2 - 45x}{x^2 - 7x + 10}$.

Solution

$$R(x) = \frac{f(x)}{g(x)}$$

Substitute in the functions $f(x),\ g(x)$.

$$R(x) = \frac{\dfrac{3x^2}{x^2 - 4x}}{\dfrac{9x^2 - 45x}{x^2 - 7x + 10}}$$

Rewrite the division as the product of $f(x)$ and the reciprocal of $g(x)$.

$$R(x) = \frac{3x^2}{x^2 - 4x} \cdot \frac{x^2 - 7x + 10}{9x^2 - 45x}$$

Factor the numerators and denominators and then multiply.

$$R(x) = \frac{3 \cdot x \cdot x \cdot (x-5)(x-2)}{x(x-4) \cdot 3 \cdot 3 \cdot x \cdot (x-5)}$$

Simplify by dividing out common factors.

$$R(x) = \frac{\cancel{3} \cdot \cancel{x} \cdot \cancel{x}\,\cancel{(x-5)}(x-2)}{\cancel{x}(x-4) \cdot \cancel{3} \cdot 3 \cdot \cancel{x}\,\cancel{(x-5)}}$$

$$R(x) = \frac{x-2}{3(x-4)}$$

Try It 15.2.35

Find $R(x) = \dfrac{f(x)}{g(x)}$ where $f(x) = \dfrac{2x^2}{x^2 - 8x}$ and $g(x) = \dfrac{8x^2 + 24x}{x^2 + x - 6}$.

Answer

$$R(x) = \frac{x-2}{4(x-8)}$$

Try It 15.2.36

Find $R(x) = \dfrac{f(x)}{g(x)}$ where $f(x) = \dfrac{15x^2}{3x^2 + 33x}$ and $g(x) = \dfrac{5x - 5}{x^2 + 9x - 22}$.

Answer

$$R(x) = \frac{x(x-2)}{x-1}$$

Key Concepts

- **Determine the values for which a rational expression is undefined.**
  1. Set the denominator equal to zero.
  2. Solve the equation.
- **Equivalent Fractions Property**
  If a, b, and c are numbers where $b \neq 0$, $c \neq 0$, then

  $$\frac{a}{b} = \frac{a \cdot c}{b \cdot c} \text{ and } \frac{a \cdot c}{b \cdot c} = \frac{a}{b}.$$
- **How to simplify a rational expression.**
  1. Factor the numerator and denominator completely.
  2. Simplify by dividing out common factors.
- **Opposites in a Rational Expression**
  The opposite of $a - b$ is $b - a$.

  $$\frac{a-b}{b-a} = -1 \qquad a \neq b$$

  An expression and its opposite divide to -1.
- **Multiplication of Rational Expressions**
  If p, q, r, and s are polynomials where $q \neq 0$, $s \neq 0$, then

  $$\frac{p}{q} \cdot \frac{r}{s} = \frac{pr}{qs}$$
- **How to multiply rational expressions.**
  1. Factor each numerator and denominator completely.
  2. Multiply the numerators and denominators.
  3. Simplify by dividing out common factors.
- **Division of Rational Expressions**
  If p, q, r, and s are polynomials where $q \neq 0$, $r \neq 0$, $s \neq 0$, then

  $$\frac{p}{q} \div \frac{r}{s} = \frac{p}{q} \cdot \frac{s}{r}$$
- **How to divide rational expressions.**
  1. Rewrite the division as the product of the first rational expression and the reciprocal of the second.
  2. Factor the numerators and denominators completely.
  3. Multiply the numerators and denominators together.
  4. Simplify by dividing out common factors.
- **How to determine the domain of a rational function.**
  1. Set the denominator equal to zero.
  2. Solve the equation.
  3. The domain is all real numbers excluding the values found in Step 2.

Glossary

rational expression

A rational expression is an expression of the form $\frac{p}{q}$, where p and q are polynomials and $q \neq 0$.

simplified rational expression

A simplified rational expression has no common factors, other than 1, in its numerator and denominator.

rational function

A rational function is a function of the form $R(x) = \dfrac{p(x)}{q(x)}$ where $p(x)$ and $q(x)$ are polynomial functions and $q(x)$ is not zero.

15.2E: Exercises

Practice Makes Perfect

Determine the Values for Which a Rational Expression is Undefined

In the following exercises, determine the values for which the rational expression is undefined.

1. a. $\frac{2x^2}{z}$ b. $\frac{4p-1}{6p-5}$ c. $\frac{n-3}{n^2+2n-8}$

Answer

a. $z=0$
b. $p=\frac{5}{6}$
c. $n=-4, n=2$

2. a. $\frac{10m}{11n}$ b. $\frac{6y+13}{4y-9}$ c. $\frac{b-8}{b^2-36}$

3. a. $\frac{4x^2y}{3y}$ b. $\frac{3x-2}{2x+1}$ c. $\frac{u-1}{u^2-3u-28}$

Answer

a. $y=0$
b. $x=-\frac{1}{2}$
c. $u=-4, u=7$

4. a. $\frac{5pq^2}{9q}$ b. $\frac{7a-4}{3a+5}$ c. $\frac{1}{x^2-4}$

Simplify Rational Expressions

In the following exercises, simplify each rational expression.

5. $-\frac{44}{55}$

Answer

$-\frac{4}{5}$

6. $\frac{56}{63}$

7. $\frac{8m^3n}{12mn^2}$

Answer

$\frac{2m^2}{3n}$

8. $\frac{36v^3w^2}{27vw^3}$

9. $\dfrac{8n-96}{3n-36}$

Answer

$\dfrac{8}{3}$

10. $\dfrac{12p-240}{5p-100}$

11. $\dfrac{x^2+4x-5}{x^2-2x+1}$

Answer

$\dfrac{x+5}{x-1}$

12. $\dfrac{y^2+3y-4}{y^2-6y+5}$

13. $\dfrac{a^2-4}{a^2+6a-16}$

Answer

$\dfrac{a+2}{a+8}$

14. $\dfrac{y^2-2y-3}{y^2-9}$

15. $\dfrac{p^3+3p^2+4p+12}{p^2+p-6}$

Answer

$\dfrac{p^2+4}{p-2}$

16. $\dfrac{x^3-2x^2-25x+50}{x^2-25}$

17. $\dfrac{8b^2-32b}{2b^2-6b-80}$

Answer

$\dfrac{4b(b-4)}{(b+5)(b-8)}$

18. $\dfrac{-5c^2-10c}{-10c^2+30c+100}$

19. $\frac{3m^2+30mn+75n^2}{4m^2-100n^2}$

Answer

$\frac{3(m+5n)}{4(m-5n)}$

20. $\frac{5r^2+30rs-35s^2}{r^2-49s^2}$

21. $\frac{a-5}{5-a}$

Answer

-1

22. $\frac{5-d}{d-5}$

23. $\frac{20-5y}{y^2-16}$

Answer

$\frac{-5}{y+4}$

24. $\frac{4v-32}{64-v^2}$

25. $\frac{w^3+21}{6w^2-36}$

Answer

$\frac{w^2-6w+3}{6w-6}$

26. $\frac{v^3+125}{v^2-25}$

27. $\frac{z^2-9z+20}{16-z^2}$

Answer

$\frac{-z-5}{4+z}$

28. $\frac{a^2-5z-36}{81-a^2}$

Multiply Rational Expressions

In the following exercises, multiply the rational expressions.

29. $\frac{12}{16} \cdot \frac{4}{10}$

Answer

$\frac{3}{10}$

30. $\frac{3}{25} \cdot \frac{16}{24}$

31. $\frac{5x^2y^4}{12xy^3} \cdot \frac{6x^2}{20y^2}$

Answer

$\frac{x^3}{8y}$

32. $\frac{12a^3b}{b^2} \cdot \frac{2ab^2}{9b^3}$

33. $\frac{5p^2}{p^2-5p-36} \cdot \frac{p^2-16}{10p}$

Answer

$\frac{p(p-4)}{2(p-9)}$

34. $\frac{3q^2}{q^2+q-6} \cdot \frac{q^2-9}{9q}$

35. $\frac{2y^2-10y}{y^2+10y+25} \cdot \frac{y+5}{6y}$

Answer

$\frac{y-5}{3(y+5)}$

36. $\frac{z^2+3z}{z^2-3z-4} \cdot \frac{z-4}{z^2}$

37. $\frac{28-4b}{3b-3} \cdot \frac{b^2+8b-9}{b^2-49}$

Answer

$\frac{-4(b+9)}{3(b+7)}$

38. $\frac{72m-12m^2}{8m+32} \cdot \frac{m^2+10m+24}{m^2-36}$

39. $\frac{c^2-10c+25}{c^2-25} \cdot \frac{c^2+10c+25}{3c^2-14c-5}$

Answer

$\frac{c+5}{3c+1}$

40. $\frac{2d^2+d-3}{d^2-16} \cdot \frac{d^2-8d+16}{2d^2-9d-18}$

41. $\frac{2m^2-3m-2}{2m2+7m+3} \cdot \frac{3m^2-14m+15}{3m^2+17m-20}$

Answer

$\frac{(m-3)(m-2)}{(m+4)(m+3)}$

42. $\frac{2n^2-3n-14}{25-n^2} \cdot \frac{n^2-10n+25}{2n^2-13n+21}$

Divide Rational Expressions

In the following exercises, divide the rational expressions.

43. $\frac{v-5}{11-v} \div \frac{v^2-25}{v-11}$

Answer

$-\frac{1}{v+5}$

44. $\frac{10+w}{w-8} \div \frac{100-w^2}{8-w}$

45. $\frac{3s^2}{s^2-16} \div \frac{s^3-4s^2+16s}{s^3-64}$

Answer

$\frac{3s}{s+4}$

46. $\frac{r^2-9}{15} \div \frac{r^3-27}{5r^2+15r+45}$

47. $\frac{p^3+q^3}{3p^2+3pq+3q^2} \div \frac{p^2-q^2}{12}$

Answer

$\frac{4(p^2-pq+q^2)}{(p-q)(p^2+pq+q^2)}$

48. $\dfrac{v^3-8w^3}{2v^2+4vw+8w^2} \div \dfrac{v^2-4w^2}{4}$

49. $\dfrac{x^2+3x-10}{4x} \div (2x^2+20x+50)$

Answer

$$\frac{x-2}{8x(x+5)}$$

50. $\dfrac{2y^2-10yz-48z^2}{2y-1} \div (4y^2-32yz)$

51. $\dfrac{\dfrac{2a^2-a-21}{5a+20}}{\dfrac{a^2+7a+12}{a^2+8a+16}}$

Answer

$$\frac{2a-7}{5}$$

52. $\dfrac{\dfrac{3b^2+2b-8}{12b+18}}{\dfrac{3b^2+2b-8}{2b^2-7b-15}}$

53. $\dfrac{\dfrac{12c^2-12}{2c^2-3c+1}}{\dfrac{4c+4}{6c^2-13c+5}}$

Answer

$$3(3c-5)$$

54. $\dfrac{\dfrac{4d^2+7d-2}{35d+10}}{\dfrac{d^2-4}{7d^2-12d-4}}$

For the following exercises, perform the indicated operations.

55. $\dfrac{10m^2+80m}{3m-9} \cdot \dfrac{m^2+4m-21}{m^2-9m+20} \div \dfrac{5m^2+10m}{2m-10}$

Answer

$$\frac{4(m+8)(m+7)}{3(m-4)(m+2)}$$

56. $\dfrac{4n^2+32n}{3n+2} \cdot \dfrac{3n^2-n-2}{n^2+n-30} \div \dfrac{108n^2-24n}{n+6}$

57. $\dfrac{12p^2+3p}{p+3} \div \dfrac{p^2+2p-63}{p^2-p-12} \cdot \dfrac{p-7}{9p^3-9p^2}$

Answer

$$\frac{(4p+1)(p-4)}{3p(p+9)(p-1)}$$

58. $\dfrac{6q+3}{9q^2-9q} \div \dfrac{q^2+14q+33}{q^2+4q-5} \cdot \dfrac{4q^2+12q}{12q+6}$

Multiply and Divide Rational Functions

In the following exercises, find the domain of each function.

59. $R(x) = \dfrac{x^3-2x^2-25x+50}{x^2-25}$

Answer

$x \neq 5$ and $x \neq -5$

60. $R(x) = \dfrac{x^3+3x^2-4x-12}{x^2-4}$

61. $R(x) = \dfrac{3x^2+15x}{6x^2+6x-36}$

Answer

$x \neq 2$ and $x \neq -3$

62. $R(x) = \dfrac{8x^2-32x}{2x^2-6x-80}$

For the following exercises, find $R(x) = f(x) \cdot g(x)$ where $f(x)$ and $g(x)$ are given.

63. $f(x) = \dfrac{6x^2-12x}{x^2+7x-18} \quad g(x) = \dfrac{x^2-81}{3x^2-27x}$

Answer

$R(x) = 2$

64. $f(x) = \dfrac{x^2-2x}{x^2+6x-16} \quad g(x) = \dfrac{x^2-64}{x^2-8x}$

65. $f(x) = \dfrac{4x}{x^2-3x-10} \quad g(x) = \dfrac{x^2-25}{8x^2}$

Answer

$$R(x) = \frac{x+5}{2x(x+2)}$$

66. $f(x) = \dfrac{2x^2+8x}{x^2-9x+20} \quad g(x) = \dfrac{x-5}{x^2}$

For the following exercises, find $R(x) = f(x)g(x)$ where $f(x)$ and $g(x)$ are given.

67. $f(x) = \dfrac{27x^2}{3x-21} \quad g(x) = \dfrac{3x^2+18x}{x^2+13x+42}$

Answer

$R(x) = \dfrac{3x(x+7)}{x-7}$

68. $f(x) = \dfrac{24x^2}{2x-8} \quad g(x) = \dfrac{4x^3+28x^2}{x^2+11x+28}$

69. $f(x) = \dfrac{16x^2}{4x+36} \quad g(x) = \dfrac{4x^2-24x}{x^2+4x-45}$

Answer

$R(x) = \dfrac{x(x-5)}{x-6}$

70. $f(x) = \dfrac{24x^2}{2x-4} \quad g(x) = \dfrac{12x^2+36x}{x^2-11x+18}$

Writing Exercises

71. Explain how you find the values of *x* for which the rational expression $\dfrac{x^2-x-20}{x^2-4}$ is undefined.

Answer

Answers will vary.

72. Explain all the steps you take to simplify the rational expression $\dfrac{p^2+4p-21}{9-p^2}$.

73. a. Multiply $\dfrac{7}{4} \cdot \dfrac{9}{10}$ and explain all your steps.
b. Multiply $\dfrac{n}{n-3} \cdot \dfrac{9}{n+3}$ and explain all your steps.
c. Evaluate your answer to part b. when $n = 7$. Did you get the same answer you got in part a.? Why or why not?

Answer

Answers will vary.

74. a. Divide $\dfrac{24}{5} \div 6$ and explain all your steps.
b. Divide $\dfrac{x^2-1}{x} \div (x+1)$ and explain all your steps.
c. Evaluate your answer to part b. when $x = 5$. Did you get the same answer you got in part a.? Why or why not?

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine the values for which a rational expression is undefined.			
simplify rational expressions.			
multiply rational expressions.			
divide rational expressions.			
multiply and divide rational functions.			

b. If most of your checks were:

…confidently. Congratulations! You have achieved your goals in this section! Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific!

…with some help. This must be addressed quickly as topics you do not master become potholes in your road to success. Math is sequential - every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is critical and you must not ignore it. You need to get help immediately or you will quickly be overwhelmed. See your instructor as soon as possible to discuss your situation. Together you can come up with a plan to get you the help you need.

15.3: Add and Subtract Rational Expressions

Summary

By the end of this section, you will be able to:

- Add and subtract rational expressions with a common denominator
- Add and subtract rational expressions whose denominators are opposites
- Find the least common denominator of rational expressions
- Add and subtract rational expressions with unlike denominators
- Add and subtract rational functions

Before you get started, take this readiness quiz.

1. Add: $\frac{7}{10}+\frac{8}{15}$.
   If you missed this problem, review [link].
2. Subtract: $\frac{3x}{4}-\frac{8}{9}$.
   If you missed this problem, review [link].
3. Subtract: $6(2x+1)-4(x-5)$.
   If you missed this problem, review [link].

Add and Subtract Rational Expressions with a Common Denominator

What is the first step you take when you add numerical fractions? You check if they have a common denominator. If they do, you add the numerators and place the sum over the common denominator. If they do not have a common denominator, you find one before you add.

It is the same with rational expressions. To add rational expressions, they must have a common denominator. When the denominators are the same, you add the numerators and place the sum over the common denominator.

RATIONAL EXPRESSION ADDITION AND SUBTRACTION

If p, q, and r are polynomials where $r\neq 0$, then

$$\frac{p}{r}+\frac{q}{r}=\frac{p+q}{r} \quad \text{and} \quad \frac{p}{r}-\frac{q}{r}=\frac{p-q}{r}$$

To add or subtract rational expressions with a common denominator, add or subtract the numerators and place the result over the common denominator.

We always simplify rational expressions. Be sure to factor, if possible, after you subtract the numerators so you can identify any common factors.

Remember, too, we do not allow values that would make the denominator zero. What value of x should be excluded in the next example?

Example 15.3.1

Add: $\frac{11x+28}{x+4}+\frac{x^2}{x+4}$.

Solution

Since the denominator is $x+4$, we must exclude the value $x=-4$.

	$\frac{11x+28}{x+4}+\frac{x^2}{x+4},\ x\neq -4$
The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{11x+28+x^2}{x+4}$
Write the degrees in descending order.	$\frac{x^2+11x+28}{x+4}$
Factor the numerator.	$\frac{(x+4)(x+7)}{x+4}$
Simplify by removing common factors.	$\frac{\cancel{(x+4)}(x+7)}{\cancel{x+4}}$
Simplify.	$x+7$

The expression simplifies to $x+7$ but the original expression had a denominator of $x+4$ so $x\neq -4$.

? Try It 15.3.2

Simplify: $\frac{9x+14}{x+7}+\frac{x^2}{x+7}$.

Answer

$x+2$

? Try It 15.3.3

Simplify: $\frac{x^2+8x}{x+5}+\frac{15}{x+5}$.

Answer

$x+3$

To subtract rational expressions, they must also have a common denominator. When the denominators are the same, you subtract the numerators and place the difference over the common denominator. Be careful of the signs when you subtract a binomial or trinomial.

✓ Example 15.3.4

Subtract: $\frac{5x^2-7x+3}{x^2-3x+18}-\frac{4x^2+x-9}{x^2-3x+18}$.

Solution

	$\frac{5x^2-7x+3}{x^2-3x+18}-\frac{4x^2+x-9}{x^2-3x+18}$
Subtract the numerators and place the difference over the common denominator.	$\frac{5x^2-7x+3-(4x^2+x-9)}{x^2-3x+18}$
Distribute the sign in the numerator.	$\frac{5x^2-7x+3-4x^2-x+9}{x^2-3x-18}$
Combine like terms.	$\frac{x^2-8x+12}{x^2-3x-18}$
Factor the numerator and the denominator.	$\frac{(x-2)(x-6)}{(x+3)(x-6)}$
Simplify by removing common factors.	$\frac{(x-2)\ \cancel{(x-6)}}{(x+3)\ \cancel{(x-6)}}$
	$(x-2)(x+3)$

? Try It 15.3.5

Subtract: $\frac{4x^2-11x+8}{x^2-3x+2}-\frac{3x^2+x-3}{x^2-3x+2}$.

Answer

$\frac{x-11}{x-2}$

? Try It 15.3.6

Subtract: $\frac{6x^2-x+20}{x^2-81}-\frac{5x^2+11x-7}{x^2-81}$.

Answer

$\frac{x-3}{x+9}$

Add and Subtract Rational Expressions Whose Denominators are Opposites

When the denominators of two rational expressions are opposites, it is easy to get a common denominator. We just have to multiply one of the fractions by $\frac{-1}{-1}$.

Let's see how this works.

	$\frac{7}{d}+\frac{5}{-d}$
Multiply the second fraction by $\frac{-1}{-1}$.	$\frac{7}{d}+\frac{(-1)5}{(-1)(-d)}$
The denominators are the same.	$\frac{7}{d}+\frac{-5}{d}$

Simplify.	$\frac{2}{d}$

Be careful with the signs as you work with the opposites when the fractions are being subtracted.

Example 15.3.7

Subtract: $\frac{m^2-6m}{m^2-1}-\frac{3m+2}{1-m^2}$.

Solution

	$\frac{m^2-6m}{m^2-1}-\frac{3m+2}{1-m^2}$
The denominators are opposites, so multiply the second fraction by $\frac{-1}{-1}$.	$\frac{m^2-6m}{m^2-1}-\frac{-1(3m+2)}{-1(1-m^2)}$
Simplify the second fraction.	$\frac{m^2-6m}{m^2-1}-\frac{-3m-2}{m^2-1}$
The denominators are the same. Subtract the numerators.	$\frac{m^2-6m-(-3m-2)}{m^2-1}$
Distribute.	$\frac{m^2-6m+3m+2}{m^2-1}$
Combine like terms.	$\frac{m^2-3m+2}{m^2-1}$
Factor the numerator and denominator.	$\frac{(m-1)(m-2)}{(m-1)(m+1)}$
Simplify by removing common factors.	$\frac{\cancel{(m-1)}(m-2)}{\cancel{(m-1)}(m+1)}$
Simplify.	$\frac{m-2}{m+1}$

Try It 15.3.8

Subtract: $\frac{y^2-5y}{y^2-4}-\frac{6y-6}{4-y^2}$.

Answer

$\frac{y+3}{y+2}$

Try It 15.3.9

Subtract: $\frac{2n^2+8n-1}{n^2-1}-\frac{n^2-7n-1}{1-n^2}$.

Answer

$\frac{3n-2}{n-1}$

Find the Least Common Denominator of Rational Expressions

When we add or subtract rational expressions with unlike denominators, we will need to get common denominators. If we review the procedure we used with numerical fractions, we will know what to do with rational expressions.

Let's look at this example: $\frac{7}{12}+\frac{5}{18}$. Since the denominators are not the same, the first step was to find the least common denominator (LCD).

To find the LCD of the fractions, we factored 12 and 18 into primes, lining up any common primes in columns. Then we "brought down" one prime from each column. Finally, we multiplied the factors to find the LCD.

When we add numerical fractions, once we found the LCD, we rewrote each fraction as an equivalent fraction with the LCD by multiplying the numerator and denominator by the same number. We are now ready to add.

$$\frac{7}{12}+\frac{5}{18}$$
$$\frac{7\cdot 3}{12\cdot 3}+\frac{5\cdot 2}{18\cdot 2}$$
$$\frac{21}{36}+\frac{10}{36}$$

$$\begin{aligned}12&=2\cdot 2\cdot 3\\18&=2\cdot \quad 3\cdot 3\\\text{LCD}&=2\cdot 2\cdot 3\cdot 3\\\text{LCD}&=36\end{aligned}$$

We do the same thing for rational expressions. However, we leave the LCD in factored form.

FIND THE LEAST COMMON DENOMINATOR OF RATIONAL EXPRESSIONS.

1. Factor each denominator completely.
2. List the factors of each denominator. Match factors vertically when possible.
3. Bring down the columns by including all factors, but do not include common factors twice.
4. Write the LCD as the product of the factors.

Remember, we always exclude values that would make the denominator zero. What values of xx should we exclude in this next example?

Example 15.3.10

a. Find the LCD for the expressions $\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$ and b. rewrite them as equivalent rational expressions with the lowest common denominator.

Solution

a.

Find the LCD for $\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$.	
Factor each denominator completely, lining up common factors. Bring down the columns.	$x^2-2x-3=(x+1)(x-3)$ $x^2+4x+3=(x+1)(x+3)$ $\text{LCD}\quad =(x+1)(x-3)(x+3)$
Write the LCD as the product of the factors.	The LCD is $(x+1)(x-3)(x+3)$.

b.

	$\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$
Factor each denominator.	$\frac{8}{(x+1)(x-3)}, \frac{3x}{(x+1)(x+3)}$
Multiply each denominator by the 'missing' LCD factor and multiply each numerator by the same factor.	$\frac{8(x+3)}{(x+1)(x-3)(x+3)}, \frac{3x(x-3)}{(x+1)(x+3)(x-3)}$
Simplify the numerators.	$\frac{8x+24}{(x+1)(x-3)(x+3)}, \frac{3x^2-9x}{(x+1)(x+3)(x-3)}$

Try It 15.3.11

a. Find the LCD for the expressions $\frac{2}{x^2-x-12}$, $\frac{1}{x^2-16}$ b. rewrite them as equivalent rational expressions with the lowest common denominator.

Answer

a. $(x-4)(x+3)(x+4)$

b. $\frac{2x+8}{(x-4)(x+3)(x+4)}$, $\frac{x+3}{(x-4)(x+3)(x+4)}$

Try It 15.3.12

a. Find the LCD for the expressions $\frac{3x}{x^2-3x+10}$, $\frac{5}{x^2+3x+2}$ b. rewrite them as equivalent rational expressions with the lowest common denominator.

Answer

a. $(x+2)(x-5)(x+1)$

b. $\frac{3x^2+3x}{(x+2)(x-5)(x+1)}$, $\frac{5x-25}{(x+2)(x-5)(x+1)}$

Add and Subtract Rational Expressions with Unlike Denominators

Now we have all the steps we need to add or subtract rational expressions with unlike denominators.

Example 15.3.13: How to Add Rational Expressions with Unlike Denominators

Add: $\frac{3}{x-3}+\frac{2}{x-2}$.

Solution

Step 1. Determine if the expressions have a common denominator. • Yes–go to step 2. • No–Rewrite each rational expression with the LCD. ◦ Find the LCD. ◦ Rewrite each rational expression as an equivalent rational expression with the LCD.	No. Find the LCD of $(x-3)$ and $(x-2)$. Change into equivalent rational expressions with the LCD, $(x-3)$ and $(x-2)$. Keep the denominators factored!	$x-3:(x-3)$ $x-2$: $(x-2)$ LCD : $(x-3)(x-2)$ $\frac{3}{x-3}+\frac{2}{x-2}$ $\frac{3(x-2)}{(x-3)(x-2)}+\frac{2(x-3)}{(x-2)(x-3)}$ $\frac{3x-6}{(x-3)(x-2)}+\frac{2x-6}{(x-2)(x-3)}$
Step 2. Add or subtract the rational expressions.	Add the numerators and place the sum over the common denominator.	$\frac{3x-6+2x-6}{(x-3)(x-2)}$
Step 3. Simplify, if possible.	Because $5x-12$ cannot be factored, the answer is simplified.	$\frac{5x-12}{(x-3)(x-2)}$

Try It 15.3.14

Add: $\frac{2}{x-2}+\frac{5}{x+3}$.

Answer

$$\frac{7x-4}{(x-2)(x+3)}$$

Try It 15.3.15

Add: $\frac{4}{m+3}+\frac{3}{m+4}$.

Answer

$$\frac{7m+25}{(m+3)(m+4)}$$

The steps used to add rational expressions are summarized here.

ADD OR SUBTRACT RATIONAL EXPRESSIONS.

1. Determine if the expressions have a common denominator.
   - **Yes** – go to step 2.
   - **No** – Rewrite each rational expression with the LCD.
     - Find the LCD.
     - Rewrite each rational expression as an equivalent rational expression with the LCD.
2. Add or subtract the rational expressions.
3. Simplify, if possible.

Avoid the temptation to simplify too soon. In the example above, we must leave the first rational expression as $\frac{3x-6}{(x-3)(x-2)}$ to be able to add it to $\frac{2x-6}{(x-2)(x-3)}$. Simplify *only* after you have combined the numerators.

Example 15.3.16

Add: $\frac{8}{x^2-2x-3}+\frac{3x}{x^2+4x+3}$.

Solution

	$\frac{8}{x^2-2x-3}+\frac{3x}{x^2+4x+3}$
Do the expressions have a common denominator?	No.
Rewrite each expression with the LCD.	
Find the LCD. $x^2-2x-3=(x+1)(x-3)$, $x^2+4x+3=(x+1)(x+3)$, $LCD=(x+1)(x-3)(x+3)$	

Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{8(x+3)}{(x+1)(x-3)(x+3)}+\frac{3x(x-3)}{(x+1)(x+3)(x-3)}$
Simplify the numerators.	$\frac{8x+24}{(x+1)(x-3)(x+3)}+\frac{3x^2-9x}{(x+1)(x+3)(x-3)}$
Add the rational expressions.	$\frac{8x+24+3x^2-9x}{(x+1)(x-3)(x+3)}$
Simplify the numerator.	$\frac{3x^2-x+24}{(x+1)(x-3)(x+3)}$
	The numerator is prime, so there are no common factors.

Try It 15.3.17

Add: $\frac{1}{m^2-m-2}+\frac{5m}{m^2+3m+2}$.

Answer

$$\frac{5m^2-9m+2}{(m+1)(m-2)(m+2)}$$

Try It 15.3.18

Add: $\frac{2n}{n^2-3n-10}+\frac{6}{n^2+5n+6}$.

Answer

$$\frac{2n^2+12n-30}{(n+2)(n-5)(n+3)}$$

The process we use to subtract rational expressions with different denominators is the same as for addition. We just have to be very careful of the signs when subtracting the numerators.

Example 15.3.19

Subtract: $\frac{8y}{y^2-16}-\frac{4}{y-4}$.

Solution

	$\frac{8y}{y^2-16}-\frac{4}{y-4}$
Do the expressions have a common denominator?	No.
Rewrite each expression with the LCD.	
Find the LCD. $y^2-16=(y-4)(y+4)$, $y-4=y-4$, $LCD=(y-4)(y+4)$	
Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{8y}{(y-4)(y+4)}-\frac{4(y+4)}{(y-4)(y+4)}$
Simplify the numerators.	$\frac{8y}{(y-4)(y+4)}-\frac{4y+16}{(y-4)(y+4)}$

Subtract the rational expressions.	$\frac{8y-4y-16}{(y-4)(y+4)}$
Simplify the numerator.	$\frac{4y-16}{(y-4)(y+4)}$
Factor the numerator to look for common factors.	$\frac{4(y-4)}{(y-4)(y+4)}$
Remove common factors	$\frac{4(\cancel{y-4})}{(\cancel{y-4})(y+4)}$
Simplify.	$\frac{4}{(y+4)}$

Try It 15.3.20

Subtract: $\frac{2x}{x^2-4}-\frac{1}{x+2}$.

Answer

$\frac{1}{x-2}$

Try It 15.3.21

Subtract: $\frac{3}{z+3}-\frac{6z}{z^2-9}$.

Answer

$\frac{-3}{z-3}$

There are lots of negative signs in the next example. Be extra careful.

Example 15.3.22

Subtract: $\frac{-3n-9}{n^2+n-6}-\frac{n+3}{2-n}$.

Solution

	$\frac{-3n-9}{n^2+n-6}-\frac{n+3}{2-n}$
Factor the denominator.	$\frac{-3n-9}{(n-2)(n+3)}-\frac{n+3}{2-n}$
Since $n-2$ and $2-n$ are opposites, we will multiply the second rational expression by $\frac{-1}{-1}$.	$\frac{-3n-9}{(n-2)(n+3)}-\frac{(-1)(n+3)}{(-1)(2-n)}$
Write $(-1)(2-n)$ as $n-2$.	$\frac{-3n-9}{(n-2)(n+3)}-\frac{(-1)(n+3)}{(n-2)}$
Simplify. Remember, $a-(-b)=a+b$.	$\frac{-3n-9}{(n-2)(n+3)}+\frac{(n+3)}{(n-2)}$
Do the rational expressions have a common denominator? No.	

Find the LCD. $n^2+n-6=(n-2)(n+3)$ $n-2=(n-2)$ $LCD=\quad(n-2)(n+3)$	
Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{-3n-9}{(n-2)(n+3)}+\frac{(n+3)(n+3)}{(n-2)(n+3)}$
Simplify the numerators.	$\frac{-3n-9}{(n-2)(n+3)}+\frac{n^2+6n+9}{(n-2)(n+3)}$
Add the rational expressions.	$\frac{-3n-9+n^2+6n+9}{(n-2)(n+3)}$
Simplify the numerator.	$\frac{n^2+3n}{(n-2)(n+3)}$
Factor the numerator to look for common factors.	$\frac{n(n+3)}{(n-2)(n+3)}$
Simplify.	$\frac{n}{(n-2)}$

Try It 15.3.23

Subtract: $\frac{3x-1}{x^2-5x-6}-\frac{2}{6-x}$.

Answer

$\frac{5x+1}{(x-6)(x+1)}$

Try It 15.3.24

Subtract: $\frac{-2y-2}{y^2+2y-8}-\frac{y-1}{2-y}$.

Answer

$\frac{y+3}{y+4}$

Things can get very messy when both fractions must be multiplied by a binomial to get the common denominator.

Example 15.3.25

Subtract: $\frac{4}{a^2+6a+5}-\frac{3}{a^2+7a+10}$.

Solution

	$\frac{4}{a^2+6a+5}-\frac{3}{a^2+7a+10}$
Factor the denominators.	$\frac{4}{(a+1)(a+5)}-\frac{3}{(a+2)(a+5)}$
Do the rational expressions have a common denominator? No.	
Find the LCD. $a^2+6a+5=(a+1)(a+5)$ $a^2+7a+10=(a+5)(a+2)$ $LCD=(a+1)(a+5)(a+2)$	

Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{4(a+2)}{(a+1)(a+5)(a+2)} - \frac{3(a+1)}{(a+2)(a+5)(a+1)}$
Simplify the numerators.	$\frac{4a+8}{(a+1)(a+5)(a+2)} - \frac{3a+3}{(a+2)(a+5)(a+1)}$
Subtract the rational expressions.	$\frac{4a+8-(3a+3)}{(a+1)(a+5)(a+2)}$
Simplify the numerator.	$\frac{4a+8-3a+3}{(a+1)(a+5)(a+2)}$
	$\frac{a+5}{(a+1)(a+5)(a+2)}$
Look for common factors.	$\frac{\cancel{(a+5)}}{(a+1)\cancel{(a+5)}(a+2)}$
Simplify.	$\frac{1}{(a+1)(a+2)}$

Try It 15.3.26

Subtract: $\frac{3}{b^2-4b-5} - \frac{2}{b^2-6b+5}$.

Answer

$$\frac{1}{(b+1)(b-1)}$$

Try It 15.3.27

Subtract: $\frac{4}{x^2-4} - \frac{3}{x^2-x-2}$.

Answer

$$\frac{1}{(x+2)(x+1)}$$

We follow the same steps as before to find the LCD when we have more than two rational expressions. In the next example, we will start by factoring all three denominators to find their LCD.

Example 15.3.28

Simplify: $\frac{2u}{u-1} + \frac{1}{u} - \frac{2u-1}{u^2-u}$.

Solution

	$\frac{2u}{u-1} + \frac{1}{u} - \frac{2u-1}{u^2-u}$
Do the expressions have a common denominator? No. Rewrite each expression with the LCD.	
Find the LCD. $u-1=(u-1)$ $u=u$ $u^2-u=u(u-1)$ $LCD=u(u-1)$	

Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{2u \cdot u}{(u-1)u} + \frac{1 \cdot (u-1)}{u \cdot (u-1)} - \frac{2u-1}{u(u-1)}$
	$\frac{2u^2}{(u-1)u} + \frac{u-1}{u \cdot (u-1)} - \frac{2u-1}{u(u-1)}$
Write as one rational expression.	$\frac{2u^2+u-1-2u+1}{u(u-1)}$
Simplify.	$\frac{2u^2-u}{u(u-1)}$
Factor the numerator, and remove common factors.	$\frac{\cancel{u}(2u-1)}{\cancel{u}(u-1)}$
Simplify.	$\frac{2u-1}{u-1}$

? Try It 15.3.29

Simplify: $\frac{v}{v+1} + \frac{3}{v-1} - \frac{6}{v^2-1}$.

Answer

$\frac{v+3}{v+1}$

? Try It 15.3.30

Simplify: $\frac{3w}{w+2} + \frac{2}{w+7} - \frac{17w+4}{w^2+9w+14}$.

Answer

$\frac{3w}{w+7}$

Add and subtract rational functions

To add or subtract rational functions, we use the same techniques we used to add or subtract polynomial functions.

? Example 15.3.31

Find $R(x) = f(x) - g(x)$ where $f(x) = \frac{x+5}{x-2}$ and $g(x) = \frac{5x+18}{x^2-4}$.

xolution

	$R(x) = f(x) - g(x)$
Substitute in the functions $f(x)$, $g(x)$.	$R(x) = \frac{x+5}{x-2} - \frac{5x+18}{x^2-4}$
Factor the denominators.	$R(x) = \frac{x+5}{x-2} - \frac{5x+18}{(x-2)(x+2)}$
Do the expressions have a common denominator? No. Rewrite each expression with the LCD.	
Find the LCD. $x-2 = (x-2)$, $x^2-4 = (x-2)(x+2)$, $LCD = (x-2)(x+2)$	

Rewrite each rational expression as an equivalent rational expression with the LCD.	$R(x)=\frac{(x+5)(x+2)}{(x-2)(x+2)}-\frac{5x+18}{(x-2)(x+2)}$
Write as one rational expression.	$R(x)=\frac{(x+5)(x+2)-(5x+18)}{(x-2)(x+2)}$
Simplify.	$R(x)=\frac{x^2+7x+10-5x-18}{(x-2)(x+2)}$
	$R(x)=\frac{x^2+2x-8}{(x-2)(x+2)}$
Factor the numerator, and remove common factors.	$R(x)=\frac{(x+4)(x-2)}{(x-2)(x+2)}$
Simplify.	$R(x)=\frac{(x+4)}{(x+2)}$

Try It 15.3.32

Find $R(x)=f(x)-g(x)$ where $f(x)=\frac{x+1}{x+3}$ and $g(x)=\frac{x+17}{x^2-x-12}$.

Answer

$\frac{x-7}{x-4}$

Try It 15.3.33

Find $R(x)=f(x)+g(x)$ where $f(x)=\frac{x-4}{x+3}$ and $g(x)=\frac{4x+6}{x^2-9}$.

Answer

$\frac{x^2-3x+18}{(x+3)(x-3)}$

Access this online resource for additional instruction and practice with adding and subtracting rational expressions.

- Add and Subtract Rational Expressions- Unlike Denominators

Key Concepts

- **Rational Expression Addition and Subtraction**
  If p, q, and r are polynomials where $r\neq 0$, then
  $$\frac{p}{r}+\frac{q}{r}=\frac{p+q}{r} \quad \text{and} \quad \frac{p}{r}-\frac{q}{r}=\frac{p-q}{r}$$
- **How to find the least common denominator of rational expressions.**
  1. Factor each expression completely.
  2. List the factors of each expression. Match factors vertically when possible.
  3. Bring down the columns.
  4. Write the LCD as the product of the factors.
- **How to add or subtract rational expressions.**
  1. Determine if the expressions have a common denominator.
     - Yes – go to step 2.
     - No – Rewrite each rational expression with the LCD.
       - Find the LCD.

- Rewrite each rational expression as an equivalent rational expression with the LCD.

2. Add or subtract the rational expressions.
3. Simplify, if possible.

15.3E: Exercises

Practice Makes Perfect

Add and Subtract Rational Expressions with a Common Denominator

In the following exercises, add.

1. $\frac{2}{15}+\frac{7}{15}$

Answer

$\frac{3}{5}$

2. $\frac{7}{24}+\frac{11}{24}$

3. $\frac{3c}{4c-5}+\frac{5}{4c-5}$

Answer

$\frac{3c+5}{4c-5}$

4. $\frac{7m}{2m+n}+\frac{4}{2m+n}$

5. $\frac{2r^2}{2r-1}+\frac{15r-8}{2r-1}$

Answer

$r+8$

6. $\frac{3s^2}{3s-2}+\frac{13s-10}{3s-2}$

7. $\frac{2w^2}{w^2-16}+\frac{8w}{w^2-16}$

Answer

$\frac{2w}{w-4}$

8. $\frac{7x^2}{x^2-9}+\frac{21x}{x^2-9}$

In the following exercises, subtract.

9. $\frac{9a^2}{3a-7}-\frac{49}{3a-7}$

Answer

$3a+7$

10. $\frac{25b^2}{5b-6} - \frac{36}{5b-6}$

11. $\frac{3m^2}{6m-30} - \frac{21m-30}{6m-30}$

Answer

$\frac{m-2}{2}$

12. $\frac{2n^2}{4n-32} - \frac{18n-16}{4n-32}$

13. $\frac{6p^2+3p+4}{p^2+4p-5} - \frac{5p^2+p+7}{p^2+4p-5}$

Answer

$\frac{p+3}{p+5}$

14. $\frac{5q^2+3q-9}{q^2+6q+8} - \frac{4q^2+9q+7}{q^2+6q+8}$

15. $\frac{5r^2+7r-33}{r^2-49} - \frac{4r^2+5r+30}{r^2-49}$

Answer

$\frac{r+9}{r+7}$

16. $\frac{7t^2-t-4}{t^2-25} - \frac{6t^2+12t-44}{t^2-25}$

Add and Subtract Rational Expressions whose Denominators are Opposites

In the following exercises, add or subtract.

17. $\frac{10v}{2v-1} + \frac{2v+4}{1-2v}$

Answer

4

18. $\frac{20w}{5w-2} + \frac{5w+6}{2-5w}$

19. $\frac{10x^2+16x-7}{8x-3} + \frac{2x^2+3x-1}{3-8x}$

Answer

$x+2$

20. $\frac{6y^2+2y-11}{3y-7}+\frac{3y^2-3y+17}{7-3y}$

21. $\frac{z^2+6z}{z^2-25}-\frac{3z+20}{25-z^2}$

Answer

$\frac{z+4}{z-5}$

22. $\frac{a^2+3a}{a^2-9}-\frac{3a-27}{9-a^2}$

23. $\frac{2b^2+30b-13}{b^2-49}-\frac{2b^2-5b-8}{49-b^2}$

Answer

$\frac{4b-3}{b-7}$

24. $\frac{c^2+5c-10}{c^2-16}-\frac{c^2-8c-10}{16-c^2}$

Find the Least Common Denominator of Rational Expressions

In the following exercises, a. find the LCD for the given rational expressions b. rewrite them as equivalent rational expressions with the lowest common denominator.

25. $\frac{5}{x^2-2x-8}, \frac{2x}{x^2-x-12}$

Answer

a. $(x+2)(x-4)(x+3)$

b. $\frac{5x+15}{(x+2)(x-4)(x+3)}, \frac{2x^2+4x}{(x+2)(x-4)(x+3)}$

26. $\frac{8}{y^2+12y+35}, \frac{3y}{y^2+y-42}$

27. $\frac{9}{z^2+2z-8}, \frac{4z}{z^2-4}$

Answer

a. $(z-2)(z+4)(z-4)$

b. $\frac{9z-36}{(z-2)(z+4)(z-4)}, \frac{4z^2-8z}{(z-2)(z+4)(z-4)}$

28. $\frac{6}{a^2+14a+45}, \frac{5a}{a^2-81}$

29. $\frac{4}{b^2+6b+9}, \frac{2b}{b^2-2b-15}$

Answer

a. $(b+3)(b+3)(b-5)$

b. $\frac{4b-20}{(b+3)(b+3)(b-5)}, \frac{2b^2+6b}{(b+3)(b+3)(b-5)}$

30. $\frac{5}{c^2-4c+4}, \frac{3c}{c^2-7c+10}$

31. $\frac{2}{3d^2+14d-5}, \frac{5d}{3d^2-19d+6}$

Answer

a. $(d+5)(3d-1)(d-6)$

b. $\frac{2d-12}{(d+5)(3d-1)(d-6)}, \frac{5d^2+25d}{(d+5)(3d-1)(d-6)}$

32. $\frac{3}{5m^2-3m-2}, \frac{6m}{5m^2+17m+6}$

Add and Subtract Rational Expressions with Unlike Denominators

In the following exercises, perform the indicated operations.

33. $\frac{7}{10x^2y}+\frac{4}{15xy^2}$

Answer

$\frac{21y+8x}{30x^2y^2}$

34. $\frac{1}{12a^3b^2}+\frac{5}{9a^2b^3}$

35. $\frac{3}{r+4}+\frac{2}{r-5}$

Answer

$\frac{5r-7}{(r+4)(r-5)}$

36. $\frac{4}{s-7}+\frac{5}{s+3}$

37. $\frac{5}{3w-2}+\frac{2}{w+1}$

Answer

$$\frac{11w+1}{(3w-2)(w+1)}$$

38. $\frac{4}{2x+5}+\frac{2}{x-1}$

39. $\frac{2y}{y+3}+\frac{3}{y-1}$

Answer

$$\frac{2y^2+y+9}{(y+3)(y-1)}$$

40. $\frac{3z}{z-2}+\frac{1}{z+5}$

41. $\frac{5b}{a^2b-2a^2}+\frac{2b}{b^2-4}$

Answer

$$\frac{b(5b+10+2a^2)}{a^2(b-2)(b+2)}$$

42. $\frac{4}{cd+3c}+\frac{1}{d^2-9}$

43. $\frac{-3m}{3m-3}+\frac{5m}{m^2+3m-4}$

Answer

$$-\frac{m}{m+4}$$

44. $\frac{8}{4n+4}+\frac{6}{n^2-n-2}$

45. $\frac{3r}{r^2+7r+6}+\frac{9}{r^2+4r+3}$

Answer

$$\frac{3(r^2+6r+18)}{(r+1)(r+6)(r+3)}$$

46. $\frac{2s}{s^2+2s-8}+\frac{4}{s^2+3s-10}$

47. $\frac{t}{t-6}-\frac{t-2}{t+6}$

Answer

$$\frac{2(7t-6)}{(t-6)(t+6)}$$

48. $\frac{x-3}{x+6}-\frac{x}{x+3}$

49. $\frac{5a}{a+3}-\frac{a+2}{a+6}$

Answer

$\frac{4a^2+25a-6}{(a+3)(a+6)}$

50. $\frac{3b}{b-2}-\frac{b-6}{b-8}$

51. $\frac{6}{m+6}-\frac{12m}{m^2-36}$

Answer

$\frac{-6}{m-6}$

52. $\frac{4}{n+4}-\frac{8n}{n^2-16}$

53. $\frac{-9p-17}{p^2-4p-21}-\frac{p+1}{7-p}$

Answer

$\frac{p+2}{p+3}$

54. $\frac{-13q-8}{q^2+2q-24}-\frac{q+2}{4-q}$

55. $\frac{-2r-16}{r^2+6r-16}-\frac{5}{2-r}$

Answer

$\frac{3}{r-2}$

56. $\frac{2t-30}{t^2+6t-27}-\frac{2}{3-t}$

57. $\frac{2x+7}{10x-1}+3$

Answer

$\frac{4(8x+1)}{10x-1}$

58. $\frac{8y-4}{5y+2}-6$

59. $\dfrac{3}{x^2-3x-4}-\dfrac{2}{x^2-5x+4}$

Answer

$$\frac{x-5}{(x-4)(x+1)(x-1)}$$

60. $\dfrac{4}{x^2-6x+5}-\dfrac{3}{x^2-7x+10}$

61. $\dfrac{5}{x^2+8x-9}-\dfrac{4}{x^2+10x+9}$

Answer

$$\frac{1}{(x-1)(x+1)}$$

62. $\dfrac{3}{2x^2+5x+2}-\dfrac{1}{2x^2+3x+1}$

63. $\dfrac{5a}{a-2}+\dfrac{9}{a}-\dfrac{2a+18}{a^2-2a}$

Answer

$$\frac{5a^2+7a-36}{a(a-2)}$$

64. $\dfrac{2b}{b-5}+\dfrac{3}{2b}-\dfrac{2b-15}{2b^2-10b}$

65. $\dfrac{c}{c+2}+\dfrac{5}{c-2}-\dfrac{10c}{c^2-4}$

Answer

$$\frac{c-5}{c+2}$$

66. $\dfrac{6d}{d-5}+\dfrac{1}{d+4}+\dfrac{7d-5}{d^2-d-20}$

67. $\dfrac{3d}{d+2}+\dfrac{4}{d}-\dfrac{d+8}{d^2+2d}$

Answer

$$\frac{3(d+1)}{d+2}$$

68. $\dfrac{2q}{q+5}+\dfrac{3}{q-3}-\dfrac{13q+15}{q^2+2q-15}$

Add and Subtract Rational Functions

In the following exercises, find a. $R(x)=f(x)+g(x)$ b. $R(x)=f(x)-g(x)$.

69. $f(x)=\dfrac{-5x-5}{x^2+x-6}$ and $g(x)=\dfrac{x+1}{2-x}$

Answer

a. $R(x)=-\dfrac{(x+8)(x+1)}{(x-2)(x+3)}$

b. $R(x)=\dfrac{x+1}{x+3}$

70. $f(x)=\dfrac{-4x-24}{x^2+x-30}$ and $g(x)=\dfrac{x+7}{5-x}$

71. $f(x)=\dfrac{6x}{x^2-64}$ and $g(x)=\dfrac{3}{x-8}$

Answer

a. $R(x)=\dfrac{3(3x+8)}{(x-8)(x+8)}$

b. $R(x)=\dfrac{3}{x+8}$

72. $f(x)=\dfrac{5}{x+7}$ and $g(x)=\dfrac{10x}{x^2-49}$

Writing Exercises

73. Donald thinks that $\dfrac{3}{x}+\dfrac{4}{x}$ is $\dfrac{7}{2x}$. Is Donald correct? Explain.

Answer

Answers will vary.

74. Explain how you find the Least Common Denominator of x^2+5x+4 and x^2-16.

75. Felipe thinks $\dfrac{1}{x}+\dfrac{1}{y}$ is $\dfrac{2}{x+y}$.

a. Choose numerical values for *x* and *y* and evaluate $\dfrac{1}{x}+\dfrac{1}{y}$.

b. Evaluate $\dfrac{2}{x+y}$ for the same values of *x* and *y* you used in part a..

c. Explain why Felipe is wrong.

d. Find the correct expression for $1x+1y$.

Answer

a. Answers will vary.

b. Answers will vary.

c. Answers will vary.

d. $\dfrac{x+y}{x}$

76. Simplify the expression $\dfrac{4}{n^2+6n+9}-\dfrac{1}{n^2-9}$ and explain all your steps.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add and subtract rational expressions with a common denominator.			
add and subtract rational expressions whose denominators are opposites.			
find the least common denominator of rational expressions.			
add and subtract rational expressions with unlike denominators.			
add or subtract rational functions.			

b. After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 15.3E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

15.4: Simplify Complex Rational Expressions

Learning Objectives

By the end of this section, you will be able to:

- Simplify a complex rational expression by writing it as division
- Simplify a complex rational expression by using the LCD

Before you get started, take this readiness quiz.

1. Simplify: $\dfrac{\frac{3}{5}}{\frac{9}{10}}$.
   If you missed this problem, review [link].
2. Simplify: $\dfrac{1-\frac{1}{3}}{4^2+4\cdot 5}$.
   If you missed this problem, review [link].
3. Solve: $\dfrac{1}{2x}+\dfrac{1}{4}=\dfrac{1}{8}$.
   If you missed this problem, review [link].

Complex Fraction

A **complex fraction** is a fraction in which the numerator and/or the denominator contains a fraction.

We previously simplified complex fractions like these:

$$\frac{\frac{3}{4}}{\frac{5}{8}} \qquad \frac{\frac{x}{2}}{\frac{xy}{6}}$$

In this section, we will simplify complex rational expressions, which are rational expressions with rational expressions in the numerator or denominator.

Complex Rational Expression

A **complex rational expression** is a rational expression in which the numerator and/or the denominator contains a rational expression.

Here are a few complex rational expressions:

$$\frac{\frac{4}{y-3}}{\frac{8}{y^2-9}} \qquad \frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}} \qquad \frac{\frac{2}{x+6}}{\frac{4}{x-6}-\frac{4}{x^2-36}}$$

Remember, we always exclude values that would make any denominator zero.

We will use two methods to simplify complex rational expressions.

We have already seen this complex rational expression earlier in this chapter.

$$\frac{\frac{6x^2-7x+2}{4x-8}}{\frac{2x^2-8x+3}{x^2-5x+6}}$$

We noted that fraction bars tell us to divide, so rewrote it as the division problem:

$$\left(\frac{6x^2-7x+2}{4x-8}\right)\div\left(\frac{2x^2-8x+3}{x^2-5x+6}\right)$$

Then, we multiplied the first rational expression by the reciprocal of the second, just like we do when we divide two fractions.

This is one method to simplify complex rational expressions. We make sure the complex rational expression is of the form where one fraction is over one fraction. We then write it as if we were dividing two fractions.

Example 15.4.1

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{6}{x-4}}{\frac{3}{x^2-16}}$$

Solution

Rewrite the complex fraction as division.

$$\frac{6}{x-4}\div\frac{3}{x^2-16}$$

Rewrite as the product of first times the reciprocal of the second.Rewrite as the product of first times the reciprocal of the second.Rewrite as the product of first times the reciprocal of the second.

$$\frac{6}{x-4}\cdot\frac{x^2-16}{3}$$

Factor.

$$\frac{3\cdot 2}{x-4}\cdot\frac{(x-4)(x+4)}{3}$$

Multiply.

$$\frac{3\cdot 2(x-4)(x+4)}{3(x-4)}$$

Remove common factors.

$$\frac{\cancel{3}\cdot 2\ \cancel{(x-4)}(x+4)}{\cancel{3}\ \cancel{(x-4)}}$$

Simplify.

$$2(x+4)$$

Are there any value(s) of x that should not be allowed? The original complex rational expression had denominators of $x-4$ and x^2-16. This expression would be undefined if $x=4$ or $x=-4$.

Try It 15.4.1

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{2}{x^2-1}}{\frac{3}{x+1}}$$

Answer

$$\frac{2}{3(x-1)}$$

Try It 15.4.2

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{1}{x^2-7x+12}}{\frac{2}{x-4}}$$

Answer

$$\frac{1}{2(x-3)}$$

Fraction bars act as grouping symbols. So to follow the Order of Operations, we simplify the numerator and denominator as much as possible before we can do the division.

Example 15.4.2

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{1}{3}+\frac{1}{6}}{\frac{1}{2}-\frac{1}{3}}$$

Solution

Simplify the numerator and denominator. Find the LCD and add the fractions in the numerator. Find the LCD and subtract the fractions in the denominator.

$$\frac{\frac{1\cdot 2}{3\cdot 2}+\frac{1}{6}}{\frac{1\cdot 3}{2\cdot 3}-\frac{1\cdot 2}{3\cdot 2}}$$

Simplify the numerator and denominator.

$$\frac{\frac{2}{6}+\frac{1}{6}}{\frac{3}{6}-\frac{2}{6}}$$

Rewrite the complex rational expression as a division problem.

$$\frac{3}{6}\div\frac{1}{6}$$

Multiply the first by the reciprocal of the second.

$$\frac{3}{6} \cdot \frac{6}{1}$$

Simplify.

$$3$$

? Try It 15.4.3

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{1}{2}+\frac{2}{3}}{\frac{5}{6}+\frac{1}{12}}$$

Answer

$$\frac{14}{11}$$

? Try It 15.4.4

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{3}{4}-\frac{1}{3}}{\frac{1}{8}+\frac{5}{6}}$$

Answer

$$\frac{10}{23}$$

We follow the same procedure when the complex rational expression contains variables.

✓ Example 15.4.3: How to Simplify a Complex Rational Expression using Division

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$$

Solution

Step 1. Simplify the numerator.

We will simplify the sum in and denominator. the numerator and difference in the denominator.

$$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$$

Find a common denominator and add the fractions in the numerator.

$$\frac{\frac{1\cdot y}{x\cdot y}+\frac{1\cdot x}{y\cdot x}}{\frac{x\cdot x}{y\cdot x}-\frac{y\cdot y}{x\cdot y}}$$

$$\frac{\frac{y}{xy}+\frac{x}{xy}}{\frac{x^2}{xy}-\frac{y^2}{xy}}$$

Find a common denominator and subtract the fractions in the denominator.

$$\frac{\frac{y+x}{xy}}{\frac{x^2-y^2}{xy}}$$

We now have just one rational expression in the numerator and one in the denominator.

Step 2. Rewrite the complex rational expression as a division problem.

We write the numerator divided by the denominator.

$$\left(\frac{y+x}{xy}\right)\div\left(\frac{x^2-y^2}{xy}\right)$$

Step 3. Divide the expressions.

Multiply the first by the reciprocal of the second.

$$\left(\frac{y+x}{xy}\right)\cdot\left(\frac{xy}{x^2-y^2}\right)$$

Factor any expressions if possible.

$$\frac{xy(y+x)}{xy(x-y)(x+y)}$$

Remove common factors.

$$\frac{\cancel{xy}\ \cancel{(y+x)}}{\cancel{xy}(x-y)\ \cancel{(x+y)}}$$

Simplify.

$$\frac{1}{x-y}$$

? Try It 15.4.5

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{1}{x}-\frac{1}{y}}$$

Answer

$$\frac{y+x}{y-x}$$

Try It 15.4.6

Simplify the complex rational expression by writing it as division:

$$\frac{\frac{1}{a}+\frac{1}{b}}{\frac{1}{a^2}-\frac{1}{b^2}}$$

Answer

$$\frac{ab}{b-a}$$

We summarize the steps here.

How to simplify a complex rational expression by writing it as division.

1. Rewrite the complex rational expression as a division problem.
2. Divide the expressions.

Example 15.4.4

Simplify the complex rational expression by writing it as division:

$$\frac{n-\frac{4n}{n+5}}{\frac{1}{n+5}+\frac{1}{n-5}}$$

Solution

Simplify the numerator and denominator. Find common denominators for the numerator and denominator.

$$\frac{\frac{n(n+5)}{1(n+5)}-\frac{4n}{n+5}}{\frac{1(n-5)}{(n+5)(n-5)}+\frac{1(n+5)}{(n-5)(n+5)}}$$

Simplify the numerators.

$$\frac{\frac{n^2+5n}{n+5}-\frac{4n}{n+5}}{\frac{n-5}{(n+5)(n-5)}+\frac{n+5}{(n-5)(n+5)}}$$

Subtract the rational expressions in the numerator and add in the denominator.

$$\frac{\frac{n^2+5n-4n}{n+5}}{\frac{n-5+n+5}{(n+5)(n-5)}}$$

Simplify. (We now have one rational expression over one rational expression.)

$$\frac{\frac{n^2+n}{n+5}}{\frac{2n}{(n+5)(n-5)}}$$

Rewrite as fraction division.

$$\frac{n^2+n}{n+5} \div \frac{2n}{(n+5)(n-5)}$$

Multiply the first times the reciprocal of the second.

$$\frac{n^2+n}{n+5} \cdot \frac{(n+5)(n-5)}{2n}$$

Factor any expressions if possible.

$$\frac{n(n+1)(n+5)(n-5)}{(n+5)2n}$$

Remove common factors.

$$\frac{\cancel{n}(n+1)\ \cancel{(n+5)}(n-5)}{\cancel{(n+5)}2\ \cancel{n}}$$

Simplify.

$$\frac{(n+1)(n-5)}{2}$$

? Try It 15.4.7

Simplify the complex rational expression by writing it as division:

$$\frac{b-\frac{3b}{b+5}}{\frac{2}{b+5}+\frac{1}{b-5}}$$

Answer

$$\frac{b(b+2)(b-5)}{3b-5}$$

? Try It 15.4.8

Simplify the complex rational expression by writing it as division:

$$\frac{1-\frac{3}{c+4}}{\frac{1}{c+4}+\frac{c}{3}}$$

Answer

$$\frac{3}{c+3}$$

Simplify a Complex Rational Expression by Using the LCD

We "cleared" the fractions by multiplying by the LCD when we solved equations with fractions. We can use that strategy here to simplify complex rational expressions. We will multiply the numerator and denominator by the LCD of all the rational expressions.

Let's look at the complex rational expression we simplified one way in Example 7.4.2. We will simplify it here by multiplying the numerator and denominator by the LCD. When we multiply by $\frac{LCD}{LCD}$ we are multiplying by 1, so the value stays the same.

Example 15.4.5

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{1}{3}+\frac{1}{6}}{\frac{1}{2}-\frac{1}{3}}$$

Solution

The LCD of all the fractions in the whole expression is 6.

Clear the fractions by multiplying the numerator and denominator by that LCD.

$$\frac{6\cdot\left(\frac{1}{3}+\frac{1}{6}\right)}{6\cdot\left(\frac{1}{2}-\frac{1}{3}\right)}$$

Distribute.

$$\frac{6\cdot\frac{1}{3}+6\cdot\frac{1}{6}}{6\cdot\frac{1}{2}-6\cdot\frac{1}{3}}$$

Simplify.

$$\frac{2+1}{3-2}$$

$$\frac{3}{1}$$

$$3$$

Try It 15.4.9

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{1}{2}+\frac{1}{5}}{\frac{1}{10}+\frac{1}{5}}$$

Answer

$\frac{7}{3}$

Try It 15.4.10

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{1}{4}+\frac{3}{8}}{\frac{1}{2}-\frac{5}{16}}$$

Answer

$$\frac{10}{3}$$

We will use the same example as in Example 7.4.3. Decide which method works better for you.

Example 15.4.6: How to Simplify a Complex Rational Expressing using the LCD

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$$

Solution

Step 1. Find the LCD of all fractions in the is complex rational expression.

The LCD of all the fractions xy.

$$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$$

Step 2. Multiply the numerator and denominator by the LCD.

Multiply both the numerator and denominator by xy.

$$\frac{xy\cdot\left(\frac{1}{x}+\frac{1}{y}\right)}{xy\cdot\left(\frac{x}{y}-\frac{y}{x}\right)}$$

Step 3. Simplify the expression.

Distribute.

$$\frac{xy\cdot\frac{1}{x}+xy\cdot\frac{1}{y}}{xy\cdot\frac{x}{y}-xy\cdot\frac{y}{x}}$$

$$\frac{y+x}{x^2-y^2}$$

Simplify.

$$\frac{(y+x)}{(x-y)\ (x+y)}$$

Remove common factors.

$$\frac{1}{x-y}$$

Try It 15.4.11

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{1}{a}+\frac{1}{b}}{\frac{a}{b}+\frac{b}{a}}$$

Answer

$$\frac{b+a}{a^2+b^2}$$

Try It 15.4.12

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{1}{x^2}-\frac{1}{y^2}}{\frac{1}{x}+\frac{1}{y}}$$

Answer

$$\frac{y-x}{xy}$$

How to simplify a complex rational expression by using the LCD.

1. Multiply the numerator and denominator by the LCD.
2. Simplify the expression.

Be sure to start by factoring all the denominators so you can find the LCD.

Example 15.4.7

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{2}{x+6}}{\frac{4}{x-6}-\frac{4}{x^2-36}}$$

Solution

Find the LCD of all fractions in the complex rational expression. The LCD is:

$$x^2-36=(x+6)(x-6)$$

Multiply the numerator and denominator by the LCD.

$$\frac{(x+6)(x-6)\frac{2}{x+6}}{(x+6)(x-6)\left(\frac{4}{x-6}-\frac{4}{(x+6)(x-6)}\right)}$$

Simplify the expression.

Distribute in the denominator.

$$\frac{(x+6)(x-6)\frac{2}{x+6}}{(x+6)(x-6)\left(\frac{4}{x-6}\right)-(x+6)(x-6)\left(\frac{4}{(x+6)(x-6)}\right)}$$

Simplify.

$$\frac{\cancel{(x+6)}(x-6)\frac{2}{\cancel{x+6}}}{\cancel{(x+6)}\ \cancel{(x-6)}\left(\frac{4}{x-6}\right)-\ \cancel{(x+6)(x-6)}\left(\frac{4}{\cancel{(x+6)(x-6)}}\right)}$$

Simplify.

$$\frac{2(x-6)}{4(x+6)-4}$$

To simplify the denominator, distribute and combine like terms.

$$\frac{2(x-6)}{4x+20}$$

Factor the denominator.

$$\frac{2(x-6)}{4(x+5)}$$

Remove common factors.

$$\frac{\cancel{2}(x-6)}{\cancel{2}\cdot 2(x+5)}$$

Simplify.

$$\frac{x-6}{2(x+5)}$$

Notice that there are no more factors common to the numerator and denominator.

Try It 15.4.13

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{3}{x+2}}{\frac{5}{x-2}-\frac{3}{x^2-4}}$$

Answer

$$\frac{3(x-2)}{5x+7}$$

Try It 15.4.14

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{2}{x-7}-\frac{1}{x+7}}{\frac{6}{x+7}-\frac{1}{x^2-49}}$$

Answer

$$\frac{x+21}{6x-43}$$

Be sure to factor the denominators first. Proceed carefully as the math can get messy!

Example 15.4.8

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{4}{m^2-7m+12}}{\frac{3}{m-3}-\frac{2}{m-4}}$$

Solution

Find the LCD of all fractions in the complex rational expression.

The LCD is $(m-3)(m-4)$.

Multiply the numerator and denominator by the LCD.

$$\frac{(m-3)(m-4)\frac{4}{(m-3)(m-4)}}{(m-3)(m-4)\left(\frac{3}{m-3}-\frac{2}{m-4}\right)}$$

Simplify.

$$\frac{\cancel{(m-3)(m-4)}\frac{4}{\cancel{(m-3)(m-4)}}}{\cancel{(m-3)}(m-4)\left(\frac{3}{\cancel{m-3}}\right)-(m-3)\ \cancel{(m-4)}\left(\frac{2}{\cancel{m-4}}\right)}$$

Simplify.

$$\frac{4}{3(m-4)-2(m-3)}$$

Distribute.

$$\frac{4}{3m-12-2m+6}$$

Combine like terms.

$$\frac{4}{m-6}$$

Try It 15.4.15

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{3}{x^2+7x+10}}{\frac{4}{x+2}+\frac{1}{x+5}}$$

Answer

$$\frac{3}{5x+22}$$

Try It 15.4.16

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{4y}{y+5}+\frac{2}{y+6}}{\frac{3y}{y^2+11y+30}}$$

Answer

$$\frac{2\left(2y^2+13y+5\right)}{3y}$$

Example 15.4.9

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{y}{y+1}}{1+\frac{1}{y-1}}$$

Solution

Find the LCD of all fractions in the complex rational expression.

The LCD is $(y+1)(y-1)$.

Multiply the numerator and denominator by the LCD.

$$\frac{(y+1)(y-1)\frac{y}{y+1}}{(y+1)(y-1)\left(1+\frac{1}{y-1}\right)}$$

Distribute in the denominator and simplify.

$$\frac{\cancel{(y+1)}(y-1)\frac{y}{\cancel{y+1}}}{(y+1)(y-1)(1)+(y+1)\ \cancel{(y-1)}\left(\frac{1}{\cancel{(y-1)}}\right)}$$

Simplify.

$$\frac{(y-1)y}{(y+1)(y-1)+(y+1)}$$

Simplify the denominator and leave the numerator factored.

$$\frac{y(y-1)}{y^2-1+y+1}$$

$$\frac{y(y-1)}{y^2+y}$$

Factor the denominator and remove factors common with the numerator.

$$\frac{\cancel{y}(y-1)}{\cancel{y}(y+1)}$$

Simplify.

$$\frac{y-1}{y+1}$$

? Try It 15.4.17

Simplify the complex rational expression by using the LCD:

$$\frac{\frac{x}{x+3}}{1+\frac{1}{x+3}}$$

Answer

$$\frac{x}{x+4}$$

? Try It 15.4.18

Simplify the complex rational expression by using the LCD:

$$\frac{1+\frac{1}{x-1}}{\frac{3}{x+1}}$$

Answer

$$\frac{x(x+1)}{3(x-1)}$$

15.4E: Exercises

Simplify a Complex Rational Expression by Writing it as Division

In the following exercises, simplify each complex rational expression by writing it as division.

1. $\dfrac{\dfrac{2a}{a+4}}{\dfrac{4a^2}{a^2-16}}$

Answer

$\dfrac{a-4}{2a}$

2. $\dfrac{\dfrac{3b}{b-5}}{\dfrac{b^2}{b^2-25}}$

3. $\dfrac{\dfrac{5}{c^2+5c-14}}{\dfrac{10}{c+7}}$

Answer

$\dfrac{1}{2(c-2)}$

4. $\dfrac{\dfrac{8}{d^2+9d+18}}{\dfrac{12}{d+6}}$

5. $\dfrac{\frac{1}{2}+\frac{5}{6}}{\frac{2}{3}+\frac{7}{9}}$

Answer

$\dfrac{12}{13}$

6. $\dfrac{\frac{1}{2}+\frac{3}{4}}{\frac{3}{5}+\frac{7}{10}}$

7. $\dfrac{\frac{2}{3}-\frac{1}{9}}{\frac{3}{4}+\frac{5}{6}}$

Answer

$$\frac{20}{57}$$

8. $\dfrac{\frac{1}{2}-\frac{1}{6}}{\frac{2}{3}+\frac{3}{4}}$

9. $\dfrac{\frac{n}{m}+\frac{1}{n}}{\frac{1}{n}-\frac{n}{m}}$

Answer

$$\frac{n^2+m}{m-n^2}$$

10. $\dfrac{\frac{1}{p}+\frac{p}{q}}{\frac{q}{p}-\frac{1}{q}}$

11. $\dfrac{\frac{1}{r}+\frac{1}{t}}{\frac{1}{r^2}-\frac{1}{t^2}}$

Answer

$$\frac{rt}{t-r}$$

12. $\dfrac{\frac{2}{v}+\frac{2}{w}}{\frac{1}{v^2}-\frac{1}{w^2}}$

13. $\dfrac{x-\frac{2x}{x+3}}{\frac{1}{x+3}+\frac{1}{x-3}}$

Answer

$$\frac{(x+1)(x-3)}{2}$$

14. $\dfrac{y-\frac{2y}{y-4}}{\frac{2}{y-4}+\frac{2}{y+4}}$

https://math.libretexts.org/@go/page/46389

15. $\dfrac{2-\dfrac{2}{a+3}}{\dfrac{1}{a+3}+\dfrac{a}{2}}$

Answer

$\dfrac{4}{a+1}$

16. $\dfrac{4+\dfrac{4}{b-5}}{\dfrac{1}{b-5}+\dfrac{b}{4}}$

Simplify a Complex Rational Expression by Using the LCD

In the following exercises, simplify each complex rational expression by using the LCD.

17. $\dfrac{\dfrac{1}{3}+\dfrac{1}{8}}{\dfrac{1}{4}+\dfrac{1}{12}}$

Answer

$\dfrac{11}{8}$

18. $\dfrac{\dfrac{1}{4}+\dfrac{1}{9}}{\dfrac{1}{6}+\dfrac{1}{12}}$

19. $\dfrac{\dfrac{5}{6}+\dfrac{2}{9}}{\dfrac{7}{18}-\dfrac{1}{3}}$

Answer

19

20. $\dfrac{\dfrac{1}{6}+\dfrac{4}{15}}{\dfrac{3}{5}-\dfrac{1}{2}}$

21. $\dfrac{\dfrac{c}{d}+\dfrac{1}{d}}{\dfrac{1}{d}-\dfrac{d}{c}}$

Answer

$\dfrac{c^2+c}{c-d^2}$

22. $\dfrac{\frac{1}{m}+\frac{m}{n}}{\frac{n}{m}-\frac{1}{n}}$

23. $\dfrac{\frac{1}{p}+\frac{1}{q}}{\frac{1}{p^2}-\frac{1}{q^2}}$

Answer

$\dfrac{pq}{q-p}$

24. $\dfrac{\frac{2}{r}+\frac{2}{t}}{\frac{1}{r^2}-\frac{1}{t^2}}$

25. $\dfrac{\frac{2}{x+5}}{\frac{3}{x-5}+\frac{1}{x^2-25}}$

Answer

$\dfrac{2x-10}{3x+16}$

26. $\dfrac{\frac{5}{y-4}}{\frac{3}{y+4}+\frac{2}{y^2-16}}$

27. $\dfrac{\frac{5}{z^2-64}+\frac{3}{z+8}}{\frac{1}{z+8}+\frac{2}{z-8}}$

Answer

$\dfrac{3z-19}{3z+8}$

28. $\dfrac{\frac{3}{s+6}+\frac{5}{s-6}}{\frac{1}{s^2-36}+\frac{4}{s+6}}$

29. $\dfrac{\frac{4}{a^2-2a-15}}{\frac{1}{a-5}+\frac{2}{a+3}}$

Answer

$$\frac{4}{3a-7}$$

30. $$\frac{\frac{5}{b^2-6b-27}}{\frac{3}{b-9}+\frac{1}{b+3}}$$

31. $$\frac{\frac{5}{c+2}-\frac{3}{c+7}}{\frac{5c}{c^2+9c+14}}$$

Answer

$$\frac{2c+29}{5c}$$

32. $$\frac{\frac{6}{d-4}-\frac{2}{d+7}}{\frac{2d}{d^2+3d-28}}$$

33. $$\frac{2+\frac{1}{p-3}}{\frac{5}{p-3}}$$

Answer

$$\frac{2p-5}{5}$$

34. $$\frac{\frac{n}{n-2}}{3+\frac{5}{n-2}}$$

35. $$\frac{\frac{m}{m+5}}{4+\frac{1}{m-5}}$$

Answer

$$\frac{m(m-5)}{(4m-19)(m+5)}$$

36. $$\frac{7+\frac{2}{q-2}}{\frac{1}{q+2}}$$

In the following exercises, simplify each complex rational expression using either method.

37. $\dfrac{\frac{3}{4}-\frac{2}{7}}{\frac{1}{2}+\frac{5}{14}}$

Answer

$\frac{13}{24}$

38. $\dfrac{\frac{v}{w}+\frac{1}{v}}{\frac{1}{v}-\frac{v}{w}}$

39. $\dfrac{\frac{2}{a+4}}{\frac{1}{a^2-16}}$

Answer

$2(a-4)$

40. $\dfrac{\frac{3}{b^2-3b-40}}{\frac{5}{b+5}-\frac{2}{b-8}}$

41. $\dfrac{\frac{3}{m}+\frac{3}{n}}{\frac{1}{m^2}-\frac{1}{n^2}}$

Answer

$\frac{3mn}{n-m}$

42. $\dfrac{\frac{2}{r-9}}{\frac{1}{r+9}+\frac{3}{r^2-81}}$

43. $\dfrac{x-\frac{3x}{x+2}}{\frac{3}{x+2}+\frac{3}{x-2}}$

Answer

$\frac{(x-1)(x-2)}{6}$

https://math.libretexts.org/@go/page/46389

44. $\dfrac{\dfrac{y}{y+3}}{2+\dfrac{1}{y-3}}$

Writing Exercises

45. In this section, you learned to simplify the complex fraction $\dfrac{\dfrac{3}{x+2}}{\dfrac{x}{x^2-4}}$ two ways: rewriting it as a division problem or multiplying the numerator and denominator by the LCD. Which method do you prefer? Why?

Answer

Answers will vary.

44. Efraim wants to start simplifying the complex fraction $\dfrac{\frac{1}{a}+\frac{1}{b}}{\frac{1}{a}-\frac{1}{b}}$ by cancelling the variables from the numerator and denominator, $\dfrac{\frac{1}{\cancel{a}}+\frac{1}{\cancel{b}}}{\frac{1}{\cancel{a}}-\frac{1}{\cancel{b}}}$. Explain what is wrong with Efraim's plan.

15.5: Solve Rational Equations

Learning Objectives

- Solve rational equations
- Use rational functions
- Solve a rational equation for a specific variable

Before you get started, take this readiness quiz.

1. Solve: $\frac{1}{6}x+\frac{1}{2}=\frac{1}{3}$
   If you missed this problem, review Example 2.2.9.
2. Solve: $n^2-5n-36=0$
   If you missed this problem, review Example 6.6.4.
3. Solve the formula $5x+2y=10$ for y.
   If you missed this problem, review Example 2.4.10.

After defining the terms ‘expression’ and ‘equation’ earlier, we have used them throughout this book. We have simplified many kinds of expressions and solved many kinds of equations. We have simplified many rational expressions so far in this chapter. Now we will solve a **rational equation**.

Rational Equation

A **rational equation** is an equation that contains a rational expression.

You must make sure to know the difference between rational expressions and rational equations. The equation contains an equal sign.

Rational Expression	Rational Equation
$\frac{1}{8}x+\frac{1}{2}$	$\frac{1}{8}x+\frac{1}{2}=\frac{1}{4}$
$\frac{y+6}{y^2-36}$	$\frac{y+6}{y^2-36}=y+1$
$\frac{1}{n-3}+\frac{1}{n+4}$	$\frac{1}{n-3}+\frac{1}{n+4}=\frac{15}{n^2+n-12}$

Solve Rational Equations

We have already solved linear equations that contained fractions. We found the LCD of all the fractions in the equation and then multiplied both sides of the equation by the LCD to “clear” the fractions.

We will use the same strategy to solve rational equations. We will multiply both sides of the equation by the LCD. Then, we will have an equation that does not contain rational expressions and thus is much easier for us to solve. But because the original equation may have a variable in a denominator, we must be careful that we don’t end up with a solution that would make a denominator equal to zero.

So before we begin solving a rational equation, we examine it first to find the values that would make any denominators zero. That way, when we solve a rational equation we will know if there are any algebraic solutions we must discard.

An algebraic solution to a rational equation that would cause any of the rational expressions to be undefined is called an **extraneous solution to a rational equation**.

Extraneous Solution to a Rational Equation

An **extraneous solution to a rational equation** is an algebraic solution that would cause any of the expressions in the original equation to be undefined.

We note any possible extraneous solutions, c, by writing $x \neq c$ next to the equation.

Example 15.5.1: How to Solve a Rational Equation

Solve:

$$\frac{1}{x}+\frac{1}{3}=\frac{5}{6}$$

Solution

Step 1. Note any value of the variable that would make any denominator zero.

If $x=0$, then $\frac{1}{x}$ is undefined. So we'll write $x \neq 0$ next to the equation.

$$\frac{1}{x}+\frac{1}{3}=\frac{5}{6}, x \neq 0$$

Step 2. Find the least common denominator of all denominators in the equation.

Find the LCD of $\frac{1}{x}$, $\frac{1}{3}$, and $\frac{5}{6}$

The LCD is $6x$.

Step 3. Clear the fractions by multiplying both sides of the equation by the LCD.

Multiply both sides of the equation by the LCD, $6x$.

$$6x \cdot \left(\frac{1}{x}+\frac{1}{3}\right)=6x \cdot \left(\frac{5}{6}\right)$$

Use the Distributive Property.

$$6x \cdot \frac{1}{x}+6x \cdot \frac{1}{3}=6x \cdot \left(\frac{5}{6}\right)$$

Simplify - and notice, no more fractions!

$$6+2x=5x$$

Step 4. Solve the resulting equation.

Simplify.

$$6=3x$$
$$2=x$$

Step 5. Check.

If any values found in Step 1 are algebraic solutions, discard them. Check any remaining solutions in the original equation.

We did not get 0 as an algebraic solution.

$$\frac{1}{x}+\frac{1}{3}=\frac{5}{6}$$

We substitute $x=2$ into the original equation.

$$\frac{1}{2}+\frac{1}{3} \stackrel{?}{=} \frac{5}{6}$$
$$\frac{3}{6}+\frac{2}{6} \stackrel{?}{=} \frac{5}{6}$$
$$\frac{5}{6}=\frac{5}{6}\checkmark$$

The solution is $x=2$

Exercise 15.5.1

Solve:

$$\frac{1}{y}+\frac{2}{3}=\frac{1}{5}$$

Answer

$$y=-\frac{15}{7}$$

Exercise 15.5.2

Solve:

$$\frac{2}{3}+\frac{1}{5}=\frac{1}{x}$$

Answer

$$x=\frac{15}{3}$$

The steps of this method are shown.

how to Solve equations with rational expressions.

- Step 1. Note any value of the variable that would make any denominator zero.
- Step 2. Find the least common denominator of all denominators in the equation.
- Step 3. Clear the fractions by multiplying both sides of the equation by the LCD.
- Step 4. Solve the resulting equation.
- Step 5. Check:
  - If any values found in Step 1 are algebraic solutions, discard them.
  - Check any remaining solutions in the original equation.

We always start by noting the values that would cause any denominators to be zero.

Example 15.5.2: How to Solve a Rational Equation using the Zero Product Property

Solve:

$$1-\frac{5}{y}=-\frac{6}{y^2}$$

Solution

Note any value of the variable that would make any denominator zero.

$$1-\frac{5}{y}=-\frac{6}{y^2}, y\neq 0$$

Find the least common denominator of all denominators in the equation. The LCD is y^2.

Clear the fractions by multiplying both sides of the equation by the LCD.

$$y^2\left(1-\frac{5}{y}\right)=y^2\left(-\frac{6}{y^2}\right)$$

Distribute.

$$y^2\cdot 1-y^2\left(\frac{5}{y}\right)=y^2\left(-\frac{6}{y^2}\right)$$

Multiply.

$$y^2-5y=-6$$

Solve the resulting equation. First write the quadratic equation in standard form.

$$y^2-5y+6=0$$

Factor.

$$(y-2)(y-3)=0$$

Use the Zero Product Property.

$$y-2=0 \text{ or } y-3=0$$

Solve.

$$y=2 \text{ or } y=3$$

Check. We did not get 0 as an algebraic solution.

Check $y=2$ and $y=3$ in the original equation.

$$1-\frac{5}{y}=-\frac{6}{y^2} \qquad 1-\frac{5}{y}=-\frac{6}{y^2}$$

$$1-\frac{5}{2}\stackrel{?}{=}-\frac{6}{2^2} \qquad 1-\frac{5}{3}\stackrel{?}{=}-\frac{6}{3^2}$$

$$1-\frac{5}{2}\stackrel{?}{=}-\frac{6}{4} \qquad 1-\frac{5}{3}\stackrel{?}{=}-\frac{6}{9}$$

$$\frac{2}{2}-\frac{5}{2}\stackrel{?}{=}-\frac{6}{4} \qquad \frac{3}{3}-\frac{5}{3}\stackrel{?}{=}-\frac{6}{9}$$

$$-\frac{3}{2}\stackrel{?}{=}-\frac{6}{4} \qquad -\frac{2}{3}\stackrel{?}{=}-\frac{6}{9}$$

$$-\frac{3}{2}=-\frac{3}{2}\surd \qquad -\frac{2}{3}=-\frac{2}{3}\surd$$

The solution is $y=2, y=3$

? Exercise 15.5.3

Solve:

$$1-\frac{2}{x}=\frac{15}{x^2}$$

Answer

$x=-3, x=5$

Exercise 15.5.4

Solve:

$$1-\frac{4}{y}=\frac{12}{y^2}$$

Answer

$y=-2, y=6$

In the next example, the last denominators is a difference of squares. Remember to factor it first to find the LCD.

Example 15.5.3

Solve:

$$\frac{2}{x+2}+\frac{4}{x-2}=\frac{x-1}{x^2-4}$$

Solution

Note any value of the variable that would make any denominator zero.

$$\frac{2}{x+2}+\frac{4}{x-2}=\frac{x-1}{(x+2)(x-2)}, x\neq -2, x\neq 2$$

Find the least common denominator of all denominators in the equation. The LCD is $(x+2)(x-2)$.

Clear the fractions by multiplying both sides of the equation by the LCD.

$$(x+2)(x-2)\left(\frac{2}{x+2}+\frac{4}{x-2}\right)=(x+2)(x-2)\left(\frac{x-1}{x^2-4}\right)$$

Distribute.

$$(x+2)(x-2)\frac{2}{x+2}+(x+2)(x-2)\frac{4}{x-2}=(x+2)(x-2)\left(\frac{x-1}{x^2-4}\right)$$

Remove common factors.

$$\cancel{(x+2)}(x-2)\frac{2}{\cancel{x+2}}+(x+2)\ \cancel{(x-2)}\frac{4}{\cancel{x-2}}=\ \cancel{(x+2)(x-2)}\left(\frac{x-1}{\cancel{x^2-4}}\right)$$

Simplify.

$$2(x-2)+4(x+2)=x-1$$

Distribute.

$$2x-4+4x+8=x-1$$

Solve.

$$\begin{aligned}6x+4&=x-1\\5x&=-5\\x&=-1\end{aligned}$$

Check: We did not get 2 or −2 as algebraic solutions.

Check $x=-1$ in the original equation.

$$\frac{2}{x+2}+\frac{4}{x-2}=\frac{x-1}{x^2-4}$$
$$\frac{2}{(-1)+2}+\frac{4}{(-1)-2}\stackrel{?}{=}\frac{(-1)-1}{(-1)^2-4}$$
$$\frac{2}{1}+\frac{4}{-3}\stackrel{?}{=}\frac{-2}{-3}$$
$$\frac{6}{3}-\frac{4}{3}\stackrel{?}{=}\frac{2}{3}$$
$$\frac{2}{3}=\frac{2}{3}\surd$$

The solution is $x=-1$.

? Exercise 15.5.5

Solve:

$$\frac{2}{x+1}+\frac{1}{x-1}=\frac{1}{x^2-1}$$

Answer

$x=\frac{2}{3}$

? Exercise 15.5.6

Solve:

$$\frac{5}{y+3}+\frac{2}{y-3}=\frac{5}{y^2-9}$$

Answer

$y=2$

In the next example, the first denominator is a trinomial. Remember to factor it first to find the LCD.

✓ Example 15.5.4

Solve:

$$\frac{m+11}{m^2-5m+4}=\frac{5}{m-4}-\frac{3}{m-1}$$

Solution

Note any value of the variable that would make any denominator zero. Use the factored form of the quadratic denominator.

$$\frac{m+11}{(m-4)(m-1)}=\frac{5}{m-4}-\frac{3}{m-1}, m\neq 4, m\neq 1$$

Find the least common denominator of all denominators in the equation. The LCD is $(m-4)(m-1)$

Clear the fractions by multiplying both sides of the equation by the LCD.

$$(m-4)(m-1)\left(\frac{m+11}{(m-4)(m-1)}\right)=(m-4)(m-1)\left(\frac{5}{m-4}-\frac{3}{m-1}\right)$$

Distribute.

$$(m-4)(m-1)\left(\frac{m+11}{(m-4)(m-1)}\right)=(m-4)(m-1)\frac{5}{m-4}-(m-4)(m-1)\frac{3}{m-1}$$

Remove common factors.

$$\cancel{(m-4)(m-1)}\left(\frac{m+11}{\cancel{(m-4)(m-1)}}\right)=\cancel{(m-4)}(m-1)\frac{5}{\cancel{m-4}}-(m-4)\ \cancel{(m-1)}\frac{3}{\cancel{m-1}}$$

Simplify.

$$m+11=5(m-1)-3(m-4)$$

Solve the resulting equation.

$$\begin{aligned} m+11 &= 5m-5-3m+12 \\ 4 &= m \end{aligned}$$

Check. The only algebraic solution was 4, but we said that 4 would make a denominator equal to zero. The algebraic solution is an extraneous solution.

There is no solution to this equation.

? Exercise 15.5.7

Solve:

$$\frac{x+13}{x^2-7x+10}=\frac{6}{x-5}-\frac{4}{x-2}$$

Answer

There is no solution.

? Exercise 15.5.8

Solve:

$$\frac{y-6}{y^2+3y-4}=\frac{2}{y+4}+\frac{7}{y-1}$$

Answer

There is no solution.

The equation we solved in the previous example had only one algebraic solution, but it was an extraneous solution. That left us with no solution to the equation. In the next example we get two algebraic solutions. Here one or both could be extraneous solutions.

✓ Example 15.5.5

Solve:

$$\frac{y}{y+6}=\frac{72}{y^2-36}+4$$

Solution

Factor all the denominators, so we can note any value of the variable that would make any denominator zero.

$$\frac{y}{y+6}=\frac{72}{(y-6)(y+6)}+4, y\neq 6, y\neq -6$$

Find the least common denominator. The LCD is $(y-6)(y+6)$

Clear the fractions.

$$(y-6)(y+6)\left(\frac{y}{y+6}\right)=(y-6)(y+6)\left(\frac{72}{(y-6)(y+6)}+4\right)$$

Simplify.

$$(y-6)\cdot y=72+(y-6)(y+6)\cdot 4$$

Simplify.

$$y(y-6)=72+4\left(y^2-36\right)$$

Solve the resulting equation.

$$\begin{aligned} y^2-6y &= 72+4y^2-144 \\ 0 &= 3y^2+6y-72 \\ 0 &= 3\left(y^2+2y-24\right) \\ 0 &= 3(y+6)(y-4) \\ y &= -6, y=4 \end{aligned}$$

Check.

$y=-6$ is an extraneous solution. Check $y=4$ in the original equation.

$$\begin{aligned} \frac{y}{y+6} &= \frac{72}{y^2-36}+4 \\ \frac{4}{4+6} &\stackrel{?}{=} \frac{72}{4^2-36}+4 \\ \frac{4}{10} &\stackrel{?}{=} \frac{72}{-20}+4 \\ \frac{4}{10} &\stackrel{?}{=} -\frac{36}{10}+\frac{40}{10} \\ \frac{4}{10} &= \frac{4}{10}\surd \end{aligned}$$

The solution is $y=4$.

Exercise 15.5.9

Solve:

$$\frac{x}{x+4}=\frac{32}{x^2-16}+5$$

Answer

$x=3$

Exercise 15.5.10

Solve:

$$\frac{y}{y+8}=\frac{128}{y^2-64}+9$$

Answer

$y=7$

In some cases, all the algebraic solutions are extraneous.

Example 15.5.6

Solve:

$$\frac{x}{2x-2}-\frac{2}{3x+3}=\frac{5x^2-2x+9}{12x^2-12}$$

Solution

We will start by factoring all denominators, to make it easier to identify extraneous solutions and the LCD.

$$\frac{x}{2(x-1)}-\frac{2}{3(x+1)}=\frac{5x^2-2x+9}{12(x-1)(x+1)}$$

Note any value of the variable that would make any denominator zero.

$$\frac{x}{2(x-1)}-\frac{2}{3(x+1)}=\frac{5x^2-2x+9}{12(x-1)(x+1)}, x\neq 1, x\neq -1$$

Find the least common denominator. The LCD is $12(x-1)(x+1)$.

Clear the fractions.

$$12(x-1)(x+1)\left(\frac{x}{2(x-1)}-\frac{2}{3(x+1)}\right)=12(x-1)(x+1)\left(\frac{5x^2-2x+9}{12(x-1)(x+1)}\right)$$

Simplify.

$$6(x+1)\cdot x-4(x-1)\cdot 2=5x^2-2x+9$$

Simplify.

$$6x(x+1)-4\cdot 2(x-1)=5x^2-2x+9$$

Solve the resulting equation.

$$\begin{aligned} 6x^2+6x-8x+8 &= 5x^2-2x+9 \\ x^2-1 &= 0 \\ (x-1)(x+1) &= 0 \\ x &= 1 \text{ or } x=-1 \end{aligned}$$

Check.

$x=1$ and $x=-1$ are extraneous solutions.

The equation has no solution.

Exercise 15.5.11

Solve:

$$\frac{y}{5y-10}-\frac{5}{3y+6}=\frac{2y^2-19y+54}{15y^2-60}$$

Answer

There is no solution.

Exercise 15.5.12

Solve:

$$\frac{z}{2z+8}-\frac{3}{4z-8}=\frac{3z^2-16z-16}{8z^2+2z-64}$$

Answer

There is no solution.

Example 15.5.7

Solve:

$$\frac{4}{3x^2-10x+3}+\frac{3}{3x^2+2x-1}=\frac{2}{x^2-2x-3}$$

Solution

Factor all the denominators, so we can note any value of the variable that would make any denominator zero.

$$\frac{4}{(3x-1)(x-3)}+\frac{3}{(3x-1)(x+1)}=\frac{2}{(x-3)(x+1)}, x\neq -1, x\neq \frac{1}{3}, x\neq 3$$

Find the least common denominator. The LCD is $(3x-1)(x+1)(x-3)$.

Clear the fractions.

$$(3x-1)(x+1)(x-3)\left(\frac{4}{(3x-1)(x-3)}+\frac{3}{(3x-1)(x+1)}\right)=(3x-1)(x+1)(x-3)\left(\frac{2}{(x-3)(x+1)}\right)$$

Simplify.

$$4(x+1)+3(x-3)=2(3x-1)$$

Distribute.

$$4x+4+3x-9=6x-2$$

Simplify.

$$7x-5=6x-2$$

$$x=3$$

The only algebraic solution was $x=3$, but we said that $x=3$ would make a denominator equal to zero. The algebraic solution is an extraneous solution.

There is no solution to this equation.

Exercise 15.5.13

Solve:

$$\frac{15}{x^2+x-6}-\frac{3}{x-2}=\frac{2}{x+3}$$

Answer

There is no solution.

Exercise 15.5.14

Solve:

$$\frac{5}{x^2+2x-3}-\frac{3}{x^2+x-2}=\frac{1}{x^2+5x+6}$$

Answer

There is no solution.

Use Rational Functions

Working with functions that are defined by rational expressions often lead to rational equations. Again, we use the same techniques to solve them.

Example 15.5.8

For rational function, $f(x)=\frac{2x-6}{x^2-8x+15}$:

a. Find the domain of the function
b. Solve $f(x)=1$
c. Find the points on the graph at this function value.

Solution

a. The domain of a rational function is all real numbers except those that make the rational expression undefined. So to find them, we will set the denominator equal to zero and solve.

$$\begin{aligned} x^2-8x+15 &= 0 \\ (x-3)(x-5) &= 0 \quad \text{Factor the trinomial.} \\ x-3 &= 0 \quad \text{Use the Zero Product Property.} \\ x-5 &= 0 \quad \text{Use the Zero Product Property.} \\ x=3 \quad x &= 5 \quad \text{Solve.} \end{aligned}$$

The domain is all real numbers except $x\neq 3, x\neq 5$

b. $$f(x)=1$$

Substitute in the rational expression.

$$\frac{2x-6}{x^2-8x+15}=1$$

Factor the denominator.

$$\frac{2x-6}{(x-3)(x-5)}=1$$

Multiply both sides by the LCD, $(x-3)(x-5)$

$$(x-3)(x-5)\left(\frac{2x-6}{(x-3)(x-5)}\right)=(x-3)(x-5)(1)$$

Simplify.

$$2x-6=x^2-8x+15$$

Solve.

$$0=x^2-10x+21$$

Factor.

$$0 = (x-7)(x-3)$$

Use the Zero Product Property.

$$x-7=0 \quad x-3=0$$

Solve.

$$x=7 \quad x=3$$

c. The value of the function is 1 when $x=7, x=3$. So the points on the graph of this function when $f(x)=1$, will be $(7,1),(3,1)$. However, now we need to check for extraneous solutions. Since $x=3$ is not in the domain of the original function, we must remove $(3,1)$, since it would be considered extraneous.

? Exercise 15.5.15

For rational function, $f(x)=\dfrac{8-x}{x^2-7x+12}$

a. Find the domain of the function.
b. Solve $f(x)=3$.
c. Find the points on the graph at this function value.

Answer

a. The domain is all real numbers except $x \neq 3$ and $x \neq 4$
b. $x=2, x=\dfrac{14}{3}$
c. $(2,3), \left(\dfrac{14}{3},3\right)$

? Exercise 15.5.16

For rational function, $f(x)=\dfrac{x-1}{x^2-6x+5}$

a. Solve $f(x)=4$.
b. Find the points on the graph at this function value.

Answer

a. The domain is all real numbers except $x \neq 1$ and $x \neq 5$
b. $x=\dfrac{21}{4}$
c. $\left(\dfrac{21}{4},4\right)$

Solve a Rational Equation for a Specific Variable

When we solved linear equations, we learned how to solve a formula for a specific variable. Many formulas used in business, science, economics, and other fields use rational equations to model the relation between two or more variables. We will now see how to solve a rational equation for a specific variable.

When we developed the point-slope formula from our slope formula, we cleared the fractions by multiplying by the LCD.

$$
\begin{aligned}
m &= \frac{y-y_1}{x-x_1} \\
m\,(x-x_1) &= \left(\frac{y-y_1}{x-x_1}\right)(x-x_1) \quad \text{Multiply both sides of the equation by } x-x_1. \\
m\,(x-x_1) &= y-y_1 \quad \text{Simplify.} \\
y-y_1 &= m\,(x-x_1) \quad \text{Rewrite the equation with the y terms on the left.}
\end{aligned}
$$

In the next example, we will use the same technique with the formula for slope that we used to get the point-slope form of an equation of a line through the point $(2,3)$. We will add one more step to solve for y.

Example 15.5.9

Solve: $m=\dfrac{y-2}{x-3}$ for y.

Solution

$$m=\frac{y-2}{x-3}$$

Note any value of the variable that would make any denominator zero.

$$m=\frac{y-2}{x-3}, x\neq 3$$

Clear the fractions by multiplying both sides of the equation by the LCD, $x-3$.

$$(x-3)m=(x-3)\left(\frac{y-2}{x-3}\right)$$

Simplify.

$$xm-3m=y-2$$

Isolate the term with y.

$$xm-3m+2=y$$

Exercise 15.5.17

Solve: $m=\dfrac{y-5}{x-4}$ for y.

Answer

$y=mx-4m+5$

Exercise 15.5.18

Solve: $m=\dfrac{y-1}{x+5}$ for y.

Answer

$y=mx+5m+1$

Remember to multiply both sides by the LCD in the next example.

Example 15.5.10

Solve: $\frac{1}{c}+\frac{1}{m}=1$ for c

Solution

$$\frac{1}{c}+\frac{1}{m}=1 \text{ for } c$$

Note any value of the variable that would make any denominator zero.

$$\frac{1}{c}+\frac{1}{m}=1, c\neq 0, m\neq 0$$

Clear the fractions by multiplying both sides of the equations by the LCD, cm.

$$cm\left(\frac{1}{c}+\frac{1}{m}\right)=cm(1)$$

Distribute.

$$cm\left(\frac{1}{c}\right)+cm\frac{1}{m}=cm(1)$$

Simplify.

$$m+c=cm$$

Collect the terms with c to the right.

$$m=cm-c$$

Factor the expression on the right.

$$m=c(m-1)$$

To isolate c, divide both sides by $m-1$.

$$\frac{m}{m-1}=\frac{c(m-1)}{m-1}$$

Simplify by removing common factors.

$$\frac{m}{m-1}=c$$

Notice that even though we excluded $c=0$ and $m=0$ from the original equation, we must also now state that $m\neq 1$.

Exercise 15.5.19

Solve: $\frac{1}{a}+\frac{1}{b}=c$ for a.

Answer

$$a=\frac{b}{cb-1}$$

Exercise 15.5.20

Solve: $\frac{2}{x}+\frac{1}{3}=\frac{1}{y}$ for y

Answer

$$y = \frac{3x}{x+6}$$

15.5E: Exercises

Solve Rational Equations

In the following exercises, solve each rational equation.

1. $\frac{1}{a}+\frac{2}{5}=\frac{1}{2}$

Answer

$a=10$

2. $\frac{6}{3}-\frac{2}{d}=\frac{4}{9}$

3. $\frac{4}{5}+\frac{1}{4}=\frac{2}{v}$

Answer

$v=\frac{40}{21}$

4. $\frac{3}{8}+\frac{2}{y}=\frac{1}{4}$

5. $1-\frac{2}{m}=\frac{8}{m^2}$

Answer

$m=-2,\ m=4$

6. $1+\frac{4}{n}=\frac{21}{n^2}$

7. $1+\frac{9}{p}=\frac{-20}{p^2}$

Answer

$p=-5,\ p=-4$

8. $1-\frac{7}{q}=\frac{-6}{q^2}$

9. $\frac{5}{3v-2}=\frac{7}{4v}$

Answer

$v=14$

10. $\frac{8}{2w+1}=\frac{3}{w}$

11. $\frac{3}{x+4}+\frac{7}{x-4}=\frac{8}{x^2-16}$

Answer

$x=-\frac{4}{5}$

12. $\frac{5}{y-9}+\frac{1}{y+9}=\frac{18}{y^2-81}$

13. $\frac{8}{z-10}-\frac{7}{z+10}=\frac{5}{z^2-100}$

Answer

$z=-145$

14. $\frac{9}{a+11}-\frac{6}{a-11}=\frac{6}{a^2-121}$

15. $\frac{-10}{q-2}-\frac{7}{q+4}=1$

Answer

$q=-18,\ q=-1$

16. $\frac{2}{s+7}-\frac{3}{s-3}=1$

17. $\frac{v-10}{v^2-5v+4}=\frac{3}{v-1}-\frac{6}{v-4}$

Answer

no solution

18. $\frac{w+8}{w^2-11w+28}=\frac{5}{w-7}+\frac{2}{w-4}$

19. $\frac{x-10}{x^2+8x+12}=\frac{3}{x+2}+\frac{4}{x+6}$

Answer

no solution

20. $\frac{y-5}{y^2-4y-5}=\frac{1}{y+1}+\frac{1}{y-5}$

21. $\frac{b+3}{3b}+\frac{b}{24}=\frac{1}{b}$

Answer

$b=-8$

https://math.libretexts.org/@go/page/46391

22. $\frac{c+3}{12c}+\frac{c}{36}=\frac{1}{4c}$

23. $\frac{d}{d+3}=\frac{18}{d^2-9}+4$

Answer

$d=2$

24. $\frac{m}{m+5}=\frac{50}{m^2-25}+6$

25. $\frac{n}{n+2}-3=\frac{8}{n^2-4}$

Answer

$m=1$

26. $\frac{p}{p+7}-8=\frac{98}{p^2-49}$

27. $\frac{q}{3q-9}-\frac{3}{4q+12}=\frac{7q^2+6q+63}{24q^2-216}$

Answer

no solution

28. $\frac{r}{3r-15}-\frac{1}{4r+20}=\frac{3r^2+17r+40}{12r^2-300}$

29. $\frac{s}{2s+6}-\frac{2}{5s+5}=\frac{5s^2-3s-7}{10s^2+40s+30}$

Answer

$s=\frac{5}{4}$

30. $\frac{t}{6t-12}-\frac{5}{2t+10}=\frac{t^2-23t+70}{12t^2+36t-120}$

31. $\frac{2}{x^2+2x-8}-\frac{1}{x^2+9x+20}=\frac{4}{x^2+3x-10}$

Answer

$x=-\frac{4}{3}$

32. $\frac{5}{x^2+4x+3}+\frac{2}{x^2+x-6}=\frac{3}{x^2-x-2}$

33. $\frac{3}{x^2-5x-6}+\frac{3}{x^2-7x+6}=\frac{6}{x^2-1}$

Answer

no solution

34. $\dfrac{2}{x^2+2x-3}+\dfrac{3}{x^2+4x+3}=\dfrac{6}{x^2-1}$

Solve Rational Equations that Involve Functions

35. For rational function, $f(x)=\dfrac{x-2}{x^2+6x+8}$:

a. Find the domain of the function
b. Solve $f(x)=5$
c. Find the points on the graph at this function value

Answer

a. The domain is all real numbers except $x\neq -2$ and $x\neq -4$
b. $x=-3, x=-\dfrac{14}{5}$
c. $(-3,5), \left(-\dfrac{14}{5},5\right)$

36. For rational function, $f(x)=\dfrac{x+1}{x^2-2x-3}$:

a. Find the domain of the function
b. Solve $f(x)=1$
c. Find the points on the graph at this function value

37. For rational function, $f(x)=\dfrac{2-x}{x^2-7x+10}$:

a. Find the domain of the function
b. Solve $f(x)=2$
c. Find the points on the graph at this function value

Answer

a. The domain is all real numbers except $x\neq 2$ and $x\neq 5$
b. $x=\dfrac{9}{2}$
c. $\left(\dfrac{9}{2},2\right)$

38. For rational function, $f(x)=\dfrac{5-x}{x^2+5x+6}$:

a. Find the domain of the function
b. Solve $f(x)=3$
c. Find the points on the graph at this function value

Solve a Rational Equation for a Specific Variable

In the following exercises, solve:

39. $\dfrac{c}{r}=2\pi$ for r

Answer

$$r = \frac{C}{2\pi}$$

40. $\frac{I}{r} = P$ for r

41. $\frac{v+3}{w-1} = \frac{1}{2}$ for w

Answer

$$w = 2v+7$$

42. $\frac{x+5}{2-y} = \frac{4}{3}$ for y

43. $a = \frac{b+3}{c-2}$ for c

Answer

$$c = \frac{b+3+2a}{a}$$

44. $m = \frac{n}{2-n}$ for n

45. $\frac{1}{p} + \frac{2}{q} = 4$ for p

Answer

$$p = \frac{q}{4q-2}$$

46. $\frac{3}{s} + \frac{1}{t} = 2$ for s

47. $\frac{2}{v} + \frac{1}{5} = \frac{3}{w}$ for w

Answer

$$w = \frac{15v}{10+v}$$

48. $\frac{6}{x} + \frac{2}{3} = \frac{1}{y}$ for y

49. $\frac{m+3}{n-2} = \frac{4}{5}$ for n

Answer

$$n = \frac{5m+23}{4}$$

50. $r = \dfrac{s}{3-t}$ for t

51. $\dfrac{E}{c} = m^2$ for c

Answer

$$c = \frac{E}{m^2}$$

52. $\dfrac{R}{T} = W$ for T

53. $\dfrac{3}{x} - \dfrac{5}{y} = \dfrac{1}{4}$ for y

Answer

$$y = \frac{20x}{12-x}$$

54. $c = \dfrac{2}{a} + \dfrac{b}{5}$ for a

Writing Exercises

55. Your class mate is having trouble in this section. Write down the steps you would use to explain how to solve a rational equation.

Answer

Answers will vary.

56. Alek thinks the equation $\dfrac{y}{y+6} = \dfrac{72}{y^2-36} + 4$ has two solutions, $y = -6$ and $y = 4$. Explain why Alek is wrong.

This page titled 15.5E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

15.6: Solve Applications with Rational Equations

Learning Objectives

- Solve proportions
- Solve similar figure applications
- Solve uniform motion applications
- Solve work applications
- Solve direct variation problems
- Solve inverse variation problems

Note

Before you get started, take this readiness quiz.

1. Example 2.2.13. Example 2.5.13. Example 2.2.9.

Solve Proportions

When two rational expressions are equal, the equation relating them is called a **proportion**.

Proportion

A proportion is an equation of the form $\frac{a}{b}=\frac{c}{d}$, where $b\neq 0, d\neq 0$.

The proportion is read "a is to b as c is to d."

The equation $\frac{1}{2}=\frac{4}{8}$ is a proportion because the two fractions are equal. The proportion $\frac{1}{2}=\frac{4}{8}$ is read "1 is to 2 as 4 is to 8."

Since a proportion is an equation with rational expressions, we will solve proportions the same way we solved rational equations. We'll multiply both sides of the equation by the LCD to clear the fractions and then solve the resulting equation.

Example 15.6.1

Solve: $\frac{n}{n+14}=\frac{5}{7}$.

Solution

$$\frac{n}{n+14}=\frac{5}{7},\quad n\neq -14$$

Multiply both sides by LCD.

$$7(n+14)\left(\frac{n}{n+14}\right)=7(n+14)\left(\frac{5}{7}\right)$$

Remove common factors on each side.

$$7n=5(n+14)$$

Simplify.

$$7n=5n+70$$

Solve for n.

$$\begin{aligned}2n&=70\\ n&=35\end{aligned}$$

Check.

$$\frac{n}{n+14}=\frac{5}{7}$$

Substitute $n=35$

$$\frac{35}{35+14}\stackrel{?}{=}\frac{5}{7}$$

Simplify.

$$\frac{35}{49}\stackrel{?}{=}\frac{5}{7}$$

Show common factors.

$$\frac{5\cdot 7}{7\cdot 7}\stackrel{?}{=}\frac{5}{7}$$

Simplify.

$$\frac{5}{7}=\frac{5}{7}\ \surd$$

Exercise 15.6.1

Solve the proportion: $\frac{y}{y+55}=\frac{3}{8}$.

Answer

$y=33$

Exercise 15.6.2

Solve the proportion: $\frac{z}{z-84}=-\frac{1}{5}$.

Answer

$z=14$

Notice in the last example that when we cleared the fractions by multiplying by the LCD, the result is the same as if we had cross-multiplied.

$$\begin{array}{ll} \frac{n}{n+14}=\frac{5}{7} & \frac{n}{n+14}=\frac{5}{7} \\ 7(n+14)\left(\frac{n}{n+14}\right)=7(n+14)\left(\frac{5}{7}\right) & \frac{n}{n+14}=\frac{5}{7} \\ 7n=5(n+14) & 7n=5(n+14) \end{array}$$

For any proportion, $\frac{a}{b}=\frac{c}{d}$, we get the same result when we clear the fractions by multiplying by the LCD as when we cross-multiply.

$$\begin{array}{ll} \frac{a}{b}=\frac{c}{d} & \frac{a}{b}=\frac{c}{d} \\ bd\left(\frac{a}{b}=\frac{c}{d}\right)bd & \frac{a}{b}=\frac{c}{d} \\ ad=bc & ad=bc \end{array}$$

To solve applications with proportions, we will follow our usual strategy for solving applications But when we set up the proportion, we must make sure to have the units correct—the units in the numerators must match each other and the units in the denominators must also match each other.

When pediatricians prescribe acetaminophen to children, they prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of the child's weight. If Zoe weighs 80 pounds, how many milliliters of acetaminophen will her doctor prescribe?

Solution

Identify what we are asked to find, and choose a variable to represent it.

How many ml of acetaminophen will the doctor prescribe?

Let $a=ml$ of acetaminophen.

Write a sentence that gives the information to find it.

If 5 ml is prescribed for every 25 pounds, how much will be prescribed for 80 pounds?

Translate into a proportion—be careful of the units.

Step 1. Write the inequality as one quotient on the left and zero on the right. Our inequality is in this form.

$$\frac{x-1}{x+3}\geq 0$$

Step 2. Determine the critical points-the points where the rational expression will be zero or undefined.

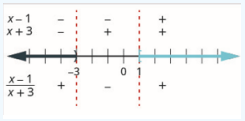
The rational expression will be zero when the numerator is zero. Since $x-1=0$ when $x=1$, then 1 is a critical point. The rational expression will be undefined when the denominator is zero. Since $x+3=0$ when $x=-3$, then -3 is a critical point.

Step 3. Use the critical points to divide the number line into intervals.

Step 4. Above the number line show the sign of each factor of the rational expression in each interval. Below the number line show the sign of the quotient.

Use values in each interval to determine the value of each factor in the interval. In the interval (-3,1), zero is a good value to test. For example, when $x=0$ then $x-1=-1$ and $x+3=3$ The factor $x-1$ is marked negative and $x+3$ marked positive. Since a negative divided by a positive is negative, the quotient is marked negative in that interval.

Step 5. Determine the intervals where the inequality is correct. Write the solution in interval notation.



We want the quotient to be greater than or equal to zero, so the numbers in the intervals $(-\infty,-3)$ and $(1,\infty)$ are solutions. Since 3 must be excluded since it makes the rational expression 0, we cannot include it in the solution. We can include 1 in our solution.

$$(-\infty,-3)\cup[1,\infty)$$

Multiply both sides by the LCD, 400. Remove common factors on each side. Simplify, but don't multiply on the left. Notice what the next step will be.

$$16\cdot 5=5a$$

Solve for a.

$$\begin{array}{c} \frac{16\cdot 5}{5}=\frac{5a}{5} \\ 16=a \end{array}$$

Check. Is the answer reasonable? Write a complete sentence.

The pediatrician would prescribe 16 ml of acetaminophen to Zoe.

Exercise 15.6.3

Pediatricians prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of a child's weight. How many milliliters of acetaminophen will the doctor prescribe for Emilia, who weighs 60 pounds?

Answer

The pediatrician will prescribe 12 ml of acetaminophen to Emilia.

Exercise 15.6.4

For every 1 kilogram (kg) of a child's weight, pediatricians prescribe 15 milligrams (mg) of a fever reducer. If Isabella weighs 12 kg, how many milligrams of the fever reducer will the pediatrician prescribe?

Answer

The pediatrician will prescribe 180 mg of fever reducer to Isabella.

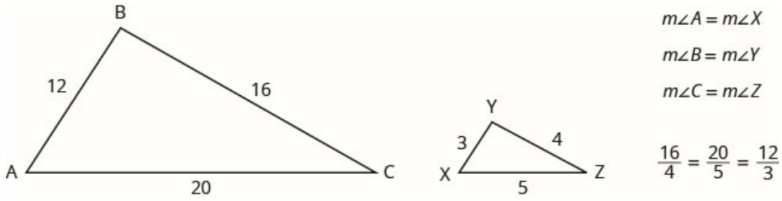
Solve similar figure applications

When you shrink or enlarge a photo on a phone or tablet, figure out a distance on a map, or use a pattern to build a bookcase or sew a dress, you are working with similar figures. If two figures have exactly the same shape, but different sizes, they are said to be similar. One is a scale model of the other. All their corresponding angles have the same measures and their corresponding sides have the same ratio.

Similar Figures

Two figures are similar if the measures of their corresponding angles are equal and their corresponding sides have the same ratio.

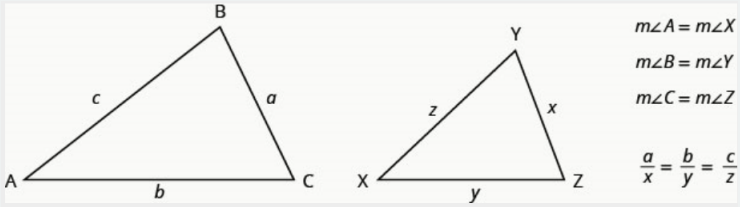
For example, the two triangles in Figure below are similar. Each side of ΔABC is four times the length of the corresponding side of ΔXYZ.



This is summed up in the Property of Similar Triangles.

Property of Similar Triangles

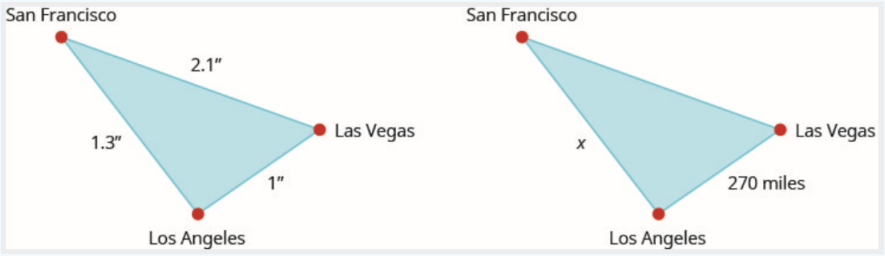
If ΔABC is similar to ΔXYZ, then their corresponding angle measure are equal and their corresponding sides have the same ratio.



To solve applications with similar figures we will follow the Problem-Solving Strategy for Geometry Applications we used earlier.

Example 15.6.3

On a map, San Francisco, Las Vegas, and Los Angeles form a triangle. The distance between the cities is measured in inches. The figure on the left below represents the triangle formed by the cities on the map. If the actual distance from Los Angeles to Las Vegas is 270 miles, find the distance from Los Angeles to San Francisco.



Solution

Since the triangles are similar, the corresponding sides are proportional.

Read the problem. Draw the figures and label it with the given information. The figures are shown above.

Identify what we are looking for: the actual distance from Los Angeles to San Francisco

Name the variables: Let x = distance from Los Angeles to San Francisco.

Translate into an equation. Since the triangles are similar, the corresponding sides are proportional. We'll make the numerators "miles" and the denominators "inches".

$$\$\frac{x \text{ miles}}{1.3 \text{ inches}} = \frac{270 \text{ miles}}{1 \text{ inch}}\$$$

Solve the equation.

$$1.3\left(\frac{x}{1.3}\right) = 1.3\left(\frac{270}{1}\right)$$
$$x = 351$$

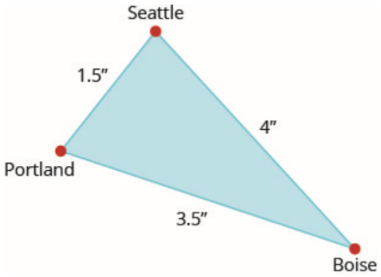
Check. On the map, the distance from Los Angeles to San Francisco is more than the distance from Los Angeles to Las Vegas. Since 351 is more than 270 the answer makes sense.

Check $x = 351$ in the original proportion. Use a calculator.

$$\frac{x \text{ miles}}{1.3 \text{ inches}} = \frac{270 \text{ miles}}{1 \text{ inch}}$$
$$\frac{351 \text{ miles}}{1.3 \text{ inches}} \stackrel{?}{=} \frac{270 \text{ miles}}{1 \text{ inch}}$$
$$\frac{270 \text{ miles}}{1 \text{ inch}} = \frac{270 \text{ miles}}{1 \text{ inch}} \surd$$

Answer the question: The distance from Los Angeles to San Francisco is 351 miles.

On the map, Seattle, Portland, and Boise form a triangle. The distance between the cities is measured in inches. The figure on the left below represents the triangle formed by the cities on the map. The actual distance from Seattle to Boise is 400 miles.



? Exercise 15.6.5

Find the actual distance from Seattle to Portland.

Answer

The distance is 150 miles.

? Exercise 15.6.6

Find the actual distance from Portland to Boise.

Answer

The distance is 350 miles.

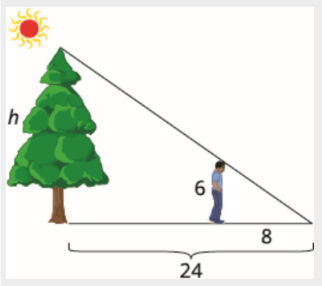
We can use similar figures to find heights that we cannot directly measure.

✓ Example 15.6.4

Tyler is 6 feet tall. Late one afternoon, his shadow was 8 feet long. At the same time, the shadow of a tree was 24 feet long. Find the height of the tree.

Solution

Read the problem and draw a figure. We are looking for h, the height of the tree.



We will use similar triangles to write an equation. The small triangle is similar to the large triangle.

$$\frac{h}{24} = \frac{6}{8}$$

Solve the proportion.

$$24\left(\frac{6}{8}\right) = 24\left(\frac{h}{24}\right)$$
$$18 = h$$

Simplify. Check.

Tyler's height is less than his shadow's length so it makes sense that the tree's height is less than the length of its shadow. Check $h = 18$ in the original proportion.

$$\frac{6}{8} = \frac{h}{24}$$
$$\frac{6}{8} \stackrel{?}{=} \frac{18}{24}$$
$$\frac{3}{4} = \frac{3}{4}\surd$$

Exercise 15.6.7

A telephone pole casts a shadow that is 50 feet long. Nearby, an 8 foot tall traffic sign casts a shadow that is 10 feet long. How tall is the telephone pole?

Answer

The telephone pole is 40 feet tall.

Exercise 15.6.8

A pine tree casts a shadow of 80 feet next to a 30 foot tall building which casts a 40 feet shadow. How tall is the pine tree?

Answer

The pine tree is 60 feet tall.

Solve Uniform Motion Applications

We have solved uniform motion problems using the formula $D = rt$ in previous chapters. We used a table like the one below to organize the information and lead us to the equation.

	Rate · Time = Distance		

The formula $D = rt$ assumes we know r and t and use them to find D. If we know D and r and need to find t, we would solve the equation for t and get the formula $t = \frac{D}{r}$.

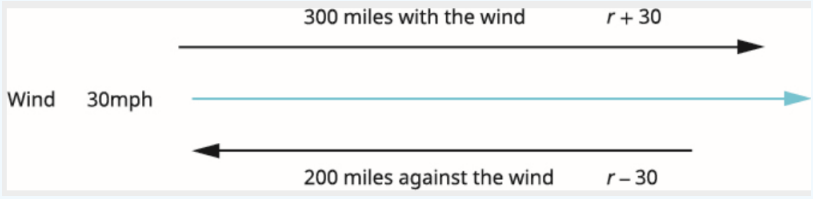
We have also explained how flying with or against the wind affects the speed of a plane. We will revisit that idea in the next example.

Example 15.6.5

An airplane can fly 200 miles into a 30 mph headwind in the same amount of time it takes to fly 300 miles with a 30 mph tailwind. What is the speed of the airplane?

Solution

This is a uniform motion situation. A diagram will help us visualize the situation.



We fill in the chart to organize the information.

We are looking for the speed of the airplane. Let r = the speed of the airplane.

When the plane flies with the wind, the wind increases its speed and so the rate is $r + 30$.

When the plane flies against the wind, the wind decreases its speed and the rate is $r - 30$.

Write in the rates. Write in the distances. Since $D = r \cdot t$, we solve for t and get $t = \frac{D}{r}$. We divide the distance by the rate in each row, and place the expression in the time column.

	Rate · Time = Distance		
Headwind	$r - 30$	$\frac{200}{r-30}$	200
Tailwind	$r + 30$	$\frac{300}{r+30}$	300

We know the times are equal and so we write our equation.

$$\frac{200}{r-30} = \frac{300}{r+30}$$

We multiply both sides by the LCD.

$$(r+30)(r-30)\left(\frac{200}{r-30}\right) = (r+30)(r-30)\left(\frac{300}{r+30}\right)$$

Simplify and solve.

$$\begin{aligned}(r+30)(200) &= (r-30)300\\ 200r+6000 &= 300r-9000\\ 15000 &= 100r\end{aligned}$$

Check.

Is 150mph a reasonable speed for an airplane? Yes. If the plane is traveling 150mph and the wind is 30mph,

$$\text{Tailwind} \quad 150+30=180\text{mph} \quad \frac{300}{180}=\frac{5}{3} \text{ hours}$$

$$\text{Headwind } 150-30=120\text{mph} \frac{200}{120}=\frac{5}{3} \text{ hours}$$

The times are equal, so it checks. The plane was traveling 150mph.

Exercise 15.6.9

Link can ride his bike 20 miles into a 3 mph headwind in the same amount of time he can ride 30 miles with a 3 mph tailwind. What is Link's biking speed?

Answer

Link's biking speed is 15 mph.

Exercise 15.6.10

Danica can sail her boat 5 miles into a 7 mph headwind in the same amount of time she can sail 12 miles with a 7 mph tailwind. What is the speed of Danica's boat without a wind?

Answer

The speed of Danica's boat is 17 mph.

In the next example, we will know the total time resulting from traveling different distances at different speeds.

Example 15.6.6

Jazmine trained for 3 hours on Saturday. She ran 8 miles and then biked 24 miles. Her biking speed is 4 mph faster than her running speed. What is her running speed?

Solution

This is a uniform motion situation. A diagram will help us visualize the situation.

We fill in the chart to organize the information. We are looking for Jazmine's running speed. Let r = Jazmine's running speed.

Her biking speed is 4 miles faster than her running speed. $r+4$ = her biking speed

The distances are given, enter them into the chart. Since $D=r\cdot t$, we solve for t and get $t=\frac{D}{r}$.We divide the distance by the rate in each row, and place the expression in the time column.

	Rate · Time = Distance		
Run	r	$\frac{8}{r}$	8
Bike	$r+4$	$\frac{24}{r+4}$	24
		3	

Write a word sentence: Her time plus the time biking is 3 hours.

Translate the sentence to get the equation.

$$\frac{8}{r}+\frac{24}{r+4}=3$$

Solve.

$$\begin{aligned} r(r+4)\left(\frac{8}{r}+\frac{24}{r+4}\right) &= 3\cdot r(r+4) \\ 8(r+4)+24r &= 3r(r+4) \\ 8r+32+24r &= 3r^2+12r \\ 32+32r &= 3r^2+12r \\ 0 &= 3r^2-20r-32 \\ 0 &= (3r+4)(r-8) \end{aligned}$$

$$(3r+4)=0 \quad (r-8)=0$$

$$r=\cancel{-\frac{4}{3}} \qquad r=8$$

Check.

A negative speed does not make sense in this problem, so $r=8$ is the solution.

Is 8 mph a reasonable running speed? Yes.

If Jazmine's running rate is 4, then her biking rate, $r+4$, which is $8+4=12$.

$$\text{Run } 8\text{mph} \quad \frac{8\text{miles}}{8\text{mph}}=1 \text{ hour}$$

$$\text{Bike } 12 \text{ mph} \quad \frac{24 \text{ miles}}{12\text{mph}}=2 \text{ hours}$$

Total 3 hours.

Jazmine's running speed is 8 mph.

Exercise 15.6.11

Dennis went cross-country skiing for 6 hours on Saturday. He skied 20 mile uphill and then 20 miles back downhill, returning to his starting point. His uphill speed was 5 mph slower than his downhil

Answer

Dennis's uphill speed was 10 mph and his downhill speed was 5 mph.

Exercise 15.6.12

Joon drove 4 hours to his home, driving 208 miles on the interstate and 40 miles on country roads. If he drove 15 mph faster on the interstate than on the country roads, what was his rate on the countr

Answer

Joon's rate on the country roads is 50 mph.

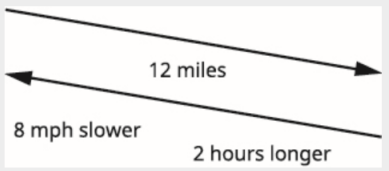
Once again, we will use the uniform motion formula solved for the variable t.

Example 15.6.7

Hamilton rode his bike downhill 12 miles on the river trail from his house to the ocean and then rode uphill to return home. His uphill speed was 8 miles per hour slower than his downhill speed. It too

Solution

This is a uniform motion situation. A diagram will help us visualize the situation.



We fill in the chart to organize the information.

We are looking for Hamilton's downhill speed. Let h= Hamilton's downhill speed.

His uphill speed is 8 miles per hour slower. $h-8$ = Hamilton's uphill speed.

Enter the rates into the chart.

The distance is the same in both directions: 12 miles.

Since $D=r\cdot t$, we solve for t and get $t=\frac{D}{r}$. We divide the distance by the rate in each row, and place the expression in the time column.

	Rate · Time = Distance		
Downhill	h	$\frac{12}{h}$	12
Uphill	$h-8$	$\frac{12}{h-8}$	12

Write a word sentence about the line: He took 2 hours longer uphill than downhill. The uphill time is 2 more than the downhill time.

Translate the sentence to get the equation.

$$\frac{12}{h-8}=\frac{12}{h}+2$$

Solve.

$$\begin{aligned} h(h-8)\left(\frac{12}{h-8}\right) &= h(h-8)\left(\frac{12}{h}+2\right) \\ 12h &= 12(h-8)+2h(h-8) \\ 12h &= 12h-96+2h^2-16h \\ 0 &= 2h^2-16h-96 \\ 0 &= 2\left(h^2-8h-48\right) \\ 0 &= 2(h-12)(h+4) \end{aligned}$$

$$\begin{aligned} h-12=0 \quad & \quad h+4=0 \\ h=12 \quad & \quad h=\cancel{-4} \end{aligned}$$

Check. Is 12mph a reasonable speed for biking downhill? Yes.

$$\text{Downhill } 12\text{mph} \quad \frac{12 \text{ miles}}{12\text{mph}}=1 \text{ hour}$$

$$\text{Uphill } 12-8=4\text{mph} \quad \frac{12 \text{ miles}}{4\text{mph}}=3 \text{ hours}$$

The uphill time is 2 hours more that the downhill time.

Hamilton's downhill speed is 12mph.

? Exercise 15.6.13

Kayla rode her bike 75 miles home from college one weekend and then rode the bus back to college. It took her 2 hours less to ride back to college on the bus than it took her to ride home on her bike,

Answer

Kayla's biking speed was 15 mph.

? Exercise 15.6.14

Victoria jogs 12 miles to the park along a flat trail and then returns by jogging on an 20 mile hilly trail. She jogs 1 mile per hour slower on the hilly trail than on the flat trail, and her return trip takes h

Answer

Victoria jogged 6 mph on the flat trail.

Solve Work Applications

The weekly gossip magazine has a big story about the Princess' baby and the editor wants the magazine to be printed as soon as possible. She has asked the printer to run an extra printing press to get the

This is a typical 'work' application. There are three quantities involved here—the time it would take each of the two presses to do the job alone and the time it would take for them to do the job together.

If Press #1 can complete the job in 6 hours, in one hour it would complete $\frac{1}{6}$ of the job.

If Press #2 can complete the job in 12 hours, in one hour it would complete $\frac{1}{12}$ of the job.

We will let t be the number of hours it would take the presses to print the magazines with both presses running together. So in 1 hour working together they have completed $\frac{1}{t}$ of the job.

We can model this with the word equation and then translate to a rational equation. To find the time it would take the presses to complete the job if they worked together, we solve for t.

Follow the steps to organize the information. We are looking for how many hours it would take to complete the job with both presses running together.

Step 1: Let t = the number of hours needed to complete the job together.

Step 2: Enter the hours per job for Press #1, Press #2, and when they work together.

If a job on Press #1 takes 6 hours, then in 1 hour $\frac{1}{6}$ of the job is completed.

Similarly find the part of the job completed/hours for Press #2 and when they both together.

	Number of hours to complete the job.	Part of job completed/hour
Press #1	6	$\frac{1}{6}$
Press #2	12	$\frac{1}{12}$
Together	t	$\frac{1}{t}$

Write a word sentence. The part completed by Press #1 plus the part completed by Press #2 equals the amount completed together.

Step 3: Translate into an equation.

$$\underbrace{\text{Press \#1} + \text{Press \#2} = \text{Together}}_{\text{Work completed by}}$$

$$\frac{1}{6} + \frac{1}{12} = \frac{1}{t}$$

Step 4: Solve. Simplify.

$$\frac{1}{6} + \frac{1}{12} = \frac{1}{t}$$

Multiply by the LCD, $12t$ and simplify.

$$\begin{aligned} 12t\left(\frac{1}{6} + \frac{1}{12}\right) &= 12t\left(\frac{1}{t}\right) \\ 2t + t &= 12 \\ 3t &= 12 \\ t &= 4 \end{aligned}$$

When both presses are running it takes 4 hours to do the job.

Keep in mind, it should take less time for two presses to complete a job working together than for either press to do it alone.

✓ Example 15.6.8

Suppose Pete can paint a room in 10 hours. If he works at a steady pace, in 1 hour he would paint $\frac{1}{10}$ of the room. If Alicia would take 8 hours to paint the same room, then in 1 hour she would paint

Solution

This is a 'work' application. The steps below will help us organize the information. We are looking for the numbers of hours it will take them to paint the room together.

In one hour Pete did $\frac{1}{10}$ of the job. Alicia did $\frac{1}{8}$ of the job. And together they did $\frac{1}{t}$ of the job.

Step 1: Let t be the number of hours needed to paint the room together.

Step 2: Enter the hours per job for Pete, Alicia, and when they work together. In 1 hour working together, they have completed $\frac{1}{t}$ of the job. Similarly, find the part of the job completed/hour by Pete

	Number of hours to complete the job.	Part of job completed/hour

	Number of hours to complete the job.	Part of job completed/hour
Pete	10	$\frac{1}{10}$
Alicia	8	$\frac{1}{8}$
Together	t	$\frac{1}{t}$

Write a word sentence. The work completed by Pete plus the work completed by Alicia equals the total work completed.

Step 3: Translate into an equation.

$$\underbrace{\text{Work completed by Pete}}+\underbrace{\text{Alicia}}=\underbrace{\text{Together}}$$

$$\frac{1}{10}+\frac{1}{8}=\frac{1}{t}$$

Step 4: Simplify. Solve.

Multiply by the LCD, $40t$.

$$40t\left(\frac{1}{10}+\frac{1}{8}\right)=40t\left(\frac{1}{t}\right)$$

Distribute.

$$40t\cdot\frac{1}{10}+40t\cdot\frac{1}{8}=40t\left(\frac{1}{t}\right)$$

Simplify and solve.

$$\begin{aligned}4t+5t&=40\\9t&=40\\t&=\frac{40}{9}\end{aligned}$$

We'll write as a mixed number so that we can convert it to hours and minutes.

$$t=4\frac{4}{9}\text{ hours}$$

Remember, 1 hour = 60 minutes.

$$t=4\text{ hours}+\frac{4}{9}(60\text{ minutes})$$

Multiply, and then round to the nearest minute.

$$t=4\text{ hours}+27\text{ minutes}$$

It would take Pete and Alica about 4 hours and 27 minutes to paint the room.

? Exercise 15.6.15

One gardener can mow a golf course in 4 hours, while another gardener can mow the same golf course in 6 hours. How long would it take if the two gardeners worked together to mow the golf course

Answer

When the two gardeners work together it takes 2 hours and 24 minutes.

? Exercise 15.6.16

Daria can weed the garden in 7 hours, while her mother can do it in 3. How long will it take the two of them working together?

Answer

When Daria and her mother work together it takes 2 hours and 6 minutes.

✓ Example 15.6.9

Ra'shon can clean the house in 7 hours. When his sister helps him it takes 3 hours. How long does it take his sister when she cleans the house alone?

Solution

This is a work problem. The steps below will help us organize the information. We are looking for how many hours it would take Ra'shon's sister to complete the job by herself.

Step 1: Let s be the number of hours Ra'shon's sister takes to clean the house alone.

Step 2: Enter the hours per job for Ra'shon, his sister, and when they work together. If Ra'shon takes 7 hours, then in 1 hour $\frac{1}{s}$ of the job is completed. If Ra'shon's sister takes s hours, then in 1 hour

	Number of hours to complete the job.	Part of job completed/hour
Ra'shon	7	$\frac{1}{7}$
His sister	s	$\frac{1}{s}$
Together	3	$\frac{1}{3}$

Write a word sentence. The part completed by Ra'shon plus the part by his sister equals the amount completed together.

Step 3: Translate to an equation.

$$\underbrace{\text{Ra'shon} + \text{His sister} = \text{Together}}_{\text{Work completed by}}$$
$$\frac{1}{7} + \frac{1}{s} = \frac{1}{3}$$

Step 4: Simplify. Solve.

$$\frac{1}{7}+\frac{1}{5}=\frac{1}{3}$$

Multiply by the LCD, 21s.

$$21s\left(\frac{1}{7}+\frac{1}{s}\right)=\left(\frac{1}{3}\right)21s$$
$$3s+21=7s$$

Simplify.

$$-4s=-21$$
$$s=\frac{-21}{-4}=\frac{21}{4}$$

Write as a mixed number to convert it to hours and minutes.

$$s=5\frac{1}{4}\text{ hours}$$

There are 60 minutes in 1 hour.

$$s=5\text{ hours}+\frac{1}{4}(60\text{ minutes})$$
$$s=5\text{ hours}+15\text{ minutes}$$

It would take Ra'shon's sister 5 hours and 15 minutes to clean the house alone.

Exercise 15.6.17

Alice can paint a room in 6 hours. If Kristina helps her it takes them 4 hours to paint the room. How long would it take Kristina to paint the room by herself?

Answer

Kristina can paint the room in 12 hours.

Exercise 15.6.18

Tracy can lay a slab of concrete in 3 hours, with Jordan's help they can do it in 2 hours. If Jordan works alone, how long will it take?

Answer

It will take Jordan 6 hours.

Solve Direct Variation Problems

When two quantities are related by a proportion, we say they are proportional to each other. Another way to express this relation is to talk about the variation of the two quantities. We will discuss direct

Lindsay gets paid $15 per hour at her job. If we let s be her salary and h be the number of hours she has worked, we could model this situation with the equation

$$s=15h$$

Lindsay's salary is the product of a constant, 15, and the number of hours she works. We say that Lindsay's salary varies directly with the number of hours she works. Two variables vary directly if one is

Direct Variation

For any two variables x and y, y varies directly with x if

$$y=kx\text{, where } k\neq 0$$

The constant k is called the constant of variation.

In applications using direct variation, generally we will know values of one pair of the variables and will be asked to find the equation that relates x and y. Then we can use that equation to find values o

We'll list the steps here.

How to Solve direct variation problems

Step 1. Write the formula for direct variation.

Step 2. Substitute the given values for the variables.

Step 3. Solve for the constant of variation.

Step 4. Write the equation that relates x and y using the constant of variation.

Now we'll solve an application of direct variation.

Example 15.6.10

When Raoul runs on the treadmill at the gym, the number of calories, c, he burns varies directly with the number of minutes, m, he uses the treadmill. He burned 315 calories when he used the treadm

a. Write the equation that relates c and m.
b. How many calories would he burn if he ran on the treadmill for 25 minutes?

Solution

a.

The number of calories, c, varies directly with the number of minutes, m, on the treadmill, and $c = 315$ when $m = 18$.

Write the formula for direct variation.

$$y = kx$$

We will use c in place of y and m in place of x.

$$c = km$$

Substitute the given values for the variables.

$$315 = k \cdot 18$$

Solve for the constant of variation.

$$\frac{315}{18} = \frac{k \cdot 18}{18}$$
$$17.5 = k$$

Write the equation that relates c and m.

$$c = km$$

Substitute in the constant of variation.

$$c = 17.5m$$

b.

Find c when $m = 25$.

Write the equation that relates c and m.

$$c = 17.5m$$

Substitute the given value for m.

$$c = 17.5(25)$$

Simplify.

$$c = 437.5$$

Raoul would burn 437.5 calories if he used the treadmill for 25 minutes.

? Exercise **15.6.19**

The number of calories, c, burned varies directly with the amount of time, t, spent exercising. Arnold burned 312 calories in 65 minutes exercising.

a. Write the equation that relates c and t.
b. How many calories would he burn if he exercises for 90 minutes?

Answer

a. $c = 4.8t$
b. He would burn 432 calories.

? Exercise **15.6.20**

The distance a moving body travels, d, varies directly with time, t, it moves. A train travels 100 miles in 2 hours.

a. Write the equation that relates d and t.
b. How many miles would it travel in 5 hours?

Answer

a. $d = 50t$
b. It would travel 250 miles.

Solve Inverse Variation Problems

Many applications involve two variable that vary inversely. As one variable increases, the other decreases. The equation that relates them is $y = \frac{k}{x}$.

Inverse Variation

For any two variables x and y, y varies inversely with x if

$$y = \frac{k}{x}, \text{ where } k \neq 0$$

The constant k is called the constant of variation.

The word ‘inverse’ in inverse variation refers to the multiplicative inverse. The multiplicative inverse of x is $\frac{1}{x}$.

We solve inverse variation problems in the same way we solved direct variation problems. Only the general form of the equation has changed. We will copy the procedure box here and just change ‘direc

how to Solve inverse variation problems

Step 1. Write the formula for inverse variation.

Step 2. Substitute the given values for the variables.

Step 3. Solve for the constant of variation.

Step 4. Write the equation that relates x and y using the constant of variation.

Example 15.6.11

The frequency of a guitar string varies inversely with its length. A 26 in.-long string has a frequency of 440 vibrations per second.

a. Write the equation of variation.
b. How many vibrations per second will there be if the string's length is reduced to 20 inches by putting a finger on a fret?

Solution

a.

The frequency varies inversely with the length.

Name the variables. Let f = frequency. L = length

Write the formula for inverse variation.

$$y = \frac{k}{x}$$

We will use f in place of y and L in place of x.

$$f = \frac{k}{L}$$

$$f = 440 \text{ when } L = 26$$

Substitute the given values for the variables.

$$440 = \frac{k}{26}$$

Solve for the constant of variation.

$$26(440) = 26\left(\frac{k}{26}\right)$$

$$11,440 = k$$

Write the equation that relates f and L.

$$f = \frac{k}{L}$$

Substitute the constant of variation.

$$f = \frac{11,440}{L}$$

b.

Find f when $L = 20$.

Write the equation that relates f and L.

$$f = \frac{11,440}{L}$$

Substitute the given value forL.

$$f = \frac{11,440}{20}$$

Simplify.

$$f = 572$$

A 20"-guitar string has frequency 572 vibrations per second.

Exercise 15.6.21

The number of hours it takes for ice to melt varies inversely with the air temperature. Suppose a block of ice melts in 2 hours when the temperature is 65 degrees Celsius.

a. Write the equation of variation.
b. How many hours would it take for the same block of ice to melt if the temperature was 78 degrees?

Answer

a. $h = \frac{130}{t}$
b. $1\frac{2}{3}$ hours

Exercise 15.6.22

Xander's new business found that the daily demand for its product was inversely proportional to the price, p. When the price is \$5, the demand is 700 units.

a. Write the equation of variation.
b. What is the demand if the price is raised to \$7?

Answer

a. $x = \frac{3500}{p}$
b. 500 units

15.6.1: More Examples of Applications

Learning Objectives

- Solve applications involving uniform motion (distance problems).
- Solve work-rate applications.
- Set up and solve applications involving direct, inverse, and joint variation.

Solving Uniform Motion Problems

Uniform motion (or distance)[37] problems involve the formula $D = rt$, where the distance D is given as the product of the average rate r and the time t traveled at that rate. If we divide both sides by the average rate r, then we obtain the formula

$$t = \frac{D}{r}$$

For this reason, when the unknown quantity is time, the algebraic setup for distance problems often results in a rational equation. We begin any uniform motion problem by first organizing our data with a chart. Use this information to set up an algebraic equation that models the application.

Example 15.6.1.1:

Sally traveled 15 miles on the bus and then another 72 miles on a train. The train was 18 miles per hour faster than the bus, and the total trip took 2 hours. What was the average speed of the train?

Solution

First, identify the unknown quantity and organize the data.

Let x represent the average speed (in miles per hour) of the bus.

Let $x + 18$ represent the average speed of the train.

	Distance =	***Rate*** ×	***Time***
Bus trip	15 mi	x	
Train trip	72 mi	$x + 18$	
Total			2 hours

Figure 15.6.1.1

To avoid introducing two more variables for the time column, use the formula $t = \frac{D}{r}$. The time for each leg of the trip is calculated as follows:

$$\textit{Time spent on the bus}: t = \frac{D}{r} = \frac{15}{x}$$

$$\textit{Time spent on the train}: t = \frac{D}{r} = \frac{72}{x+18}$$

Use these expressions to complete the chart.

	Distance =	Rate ×	Time
Bus trip	15 mi	x	$\frac{15}{x}$
Train trip	72 mi	$x+18$	$\frac{72}{x+18}$
Total			2 hours

$$\frac{15}{x}+\frac{72}{x+18}=2$$

Figure 15.6.1.2

The algebraic setup is defined by the time column. Add the time spent on each leg of the trip to obtain a total of 2 hours:

$$\overbrace{\frac{15}{x}}^{\text{time spent on the bus}} + \overbrace{\frac{72}{x+18}}^{\text{time spent on the train}} = \overbrace{2}^{\text{total time of trip}}$$

Figure 15.6.1.3

We begin solving this equation by first multiplying both sides by the LCD, $x(x+18)$.

$$\begin{aligned}
\frac{15}{x}+\frac{72}{x+18} &= 2 \\
x(x+18)\cdot\left(\frac{15}{x}+\frac{72}{x+18}\right) &= x(x+18)\cdot 2 \\
x(x+18)\cdot\frac{15}{x}+x(x+18)\cdot\frac{72}{x+18} &= x(x+18)\cdot 2 \\
15(x+18)\cdot 72x &= 2x(x+18) \\
15x+270+72x &= 2x^2+36x \\
87x+270 &= 2x^2+36x \\
0 &= 2x^2-51x-270
\end{aligned}$$

Solve the resulting quadratic equation by factoring.

$$\begin{aligned}
0 &= 2x^2-51x-270 \\
0 &= (2x+9)(x-30) \\
2x+9=0 \quad &\text{or} \quad x-30=0 \\
x=-\frac{9}{2} \quad &\qquad\quad x=30
\end{aligned}$$

Since we are looking for an average speed we will disregard the negative answer and conclude the bus averaged 30 mph. Substitute $x=30$ in the expression identified as the speed of the train.

$$x+18=30+18=48$$

Answer:

The speed of the train was 48 mph.

Example 15.6.1.2:

A boat can average 12 miles per hour in still water. On a trip downriver the boat was able to travel 29 miles with the current. On the return trip the boat was only able to travel 19 miles in the same amount of time against the current. What was the speed of the current?

Solution

First, identify the unknown quantities and organize the data.

Let c represent the speed of the river current.

Next, organize the given data in a chart. Traveling downstream, the current will increase the speed of the boat, so it adds to the average speed of the boat. Traveling upstream, the current slows the boat, so it will subtract from the average speed of the boat.

	Distance	= **Rate**	× **Time**
trip downriver	29 mi	$12 + c$	
trip upriver	19 mi	$12 - c$	
Total			

Figure 15.6.1.4

Use the formula $t = \frac{D}{r}$ to fill in the time column.

$$\textit{trip downriver}: t = \frac{D}{r} = \frac{29}{12+c}$$
$$\textit{trip upriver}: t = \frac{D}{r} = \frac{19}{12-c}$$

	Distance	= **Rate**	× **Time**
trip downriver	29 mi	$12 + c$	$\frac{29}{12 + c}$
trip upriver	19 mi	$12 - c$	$\frac{19}{12 - c}$
Total			

Figure 15.6.1.5

Because the boat traveled the same amount of time downriver as it did upriver, finish the algebraic setup by setting the expressions that represent the times equal to each other.

$$\frac{29}{12+c} = \frac{19}{12-c}$$

Since there is a single algebraic fraction on each side, we can solve this equation using cross multiplication.

$$\begin{aligned} \frac{29}{12+c} &= \frac{19}{12-c} \\ 29(12-c) &= 19(12+c) \\ 348 - 29c &= 228 + 19c \\ 120 &= 48c \\ \frac{120}{48} &= c \\ \frac{5}{2} &= c \end{aligned}$$

Answer:

The speed of the current was $2\frac{1}{2}$ miles per hour.

Exercise 15.6.1.1

A jet aircraft can average 160 miles per hour in calm air. On a trip, the aircraft traveled 600 miles with a tailwind and returned the 600 miles against a headwind of the same speed. If the total round trip took 8 hours, then what was the speed of the wind?

Answer

40 miles per hour

www.youtube.com/v/0NglBthTwss

Solving Work-Rate Problems

The rate at which a task can be performed is called a **work rate**[38]. For example, if a painter can paint a room in 6 hours, then the task is to paint the room, and we can write

$$\frac{1 \text{ task}}{6 \text{ hours}} \quad work\ rate$$

In other words, the painter can complete $\frac{1}{6}$ of the task per hour. If he works for less than 6 hours, then he will perform a fraction of the task. If he works for more than 6 hours, then he can complete more than one task. For example,

$$work-rate \times time = amount\ of\ task\ completed$$
$$\frac{1}{6} \times 3hrs = \frac{1}{2} \quad one-half\ of\ the\ room\ painted$$
$$\frac{1}{6} \times 6hrs = 1 \quad one\ whole\ room\ painted$$
$$\frac{1}{6} \times 12 \text{ hrs} = 2 \quad two\ whole\ rooms\ painted$$

Obtain the amount of the task completed by multiplying the work rate by the amount of time the painter works. Typically, work-rate problems involve people or machines working together to complete tasks. In general, if t represents the time two people work together, then we have the following **work-rate formula**[39]:

$$\frac{1}{t_1}t + \frac{1}{t_2}t = amount\ of\ task\ completed\ together$$

Here $\frac{1}{t_1}$ and $\frac{1}{t_2}$ are the individual work rates.

Example 15.6.1.3:

Joe can paint a typical room in 2 hours less time than Mark. If Joe and Mark can paint 5 rooms working together in a 12 hour shift, how long does it take each to paint a single room?

Solution

Let x represent the time it takes Mark to paint a typical room.

Let $x-2$ represent the time it takes Joe to paint a typical room.

Therefore, Mark's individual work-rate is $\frac{1}{x}$ rooms per hour and Joe's is $\frac{1}{x-2}$ rooms per hour. Both men worked for 12 hours. We can organize the data in a chart, just as we did with distance problems.

	Amount of Task Completed =	***Work - Rate*** ×	***Time***
Joe	$\frac{1}{x-2}\cdot 12$	$\frac{1}{x-2}$	12
Mark	$\frac{1}{x}\cdot 12$	$\frac{1}{x}$	12
Total	5		

$$\frac{1}{x-2}\cdot 12 + \frac{1}{x}\cdot 12 = 5$$

Figure 15.6.1.6

Working together, they can paint 5 total rooms in 12 hours. This leads us to the following algebraic setup:

$$\frac{12}{x-2}+\frac{12}{x}=5$$

Multiply both sides by the LCD, $x(x-2)$.

$$\begin{aligned} x(x-2)\cdot\left(\frac{12}{x-2}+\frac{12}{x}\right) &= x(x-2)\cdot 5 \\ x(x-2)\cdot\frac{12}{x-2}+x(x-2)\cdot\frac{12}{x} &= x(x-2)\cdot 5 \\ 12x+12(x-2) &= 5x(x-2) \\ 12x+12x-24 &= 5x^2-10x \\ 0 &= 5x^2-34x+24 \end{aligned}$$

Solve the resulting quadratic equation by factoring.

$$\begin{aligned} 0 &= 5x^2-34x+24 \\ 0 &= (5x-4)(x-6) \end{aligned}$$

$$\begin{aligned} 5x-4=0 \quad &\text{or} \quad x-6=0 \\ 5x=4 \quad &\quad\quad x=6 \\ x=\frac{4}{5} \quad &\end{aligned}$$

We can disregard $\frac{4}{5}$ because back substituting into $x-2$ would yield a negative time to paint a room. Take $x=6$ to be the only solution and use it to find the time it takes Joe to paint a typical room.

$$x-2=6-2=4$$

Answer:

Joe can paint a typical room in 4 hours and Mark can paint a typical room in 6 hours. As a check we can multiply both work rates by 12 hours to see that together they can paint 5 rooms.

$$\left.\begin{array}{l} Joe\ \frac{1\text{ room}}{4\text{hrs}}\cdot 12\text{ hrs}=3\text{ rooms} \\ Mark\ \frac{1\text{ room}}{6\text{hrs}}\cdot 12\text{hrs}=2\text{ rooms} \end{array}\right\} Total\ 5\ rooms\ \checkmark$$

Example 15.6.1.4:

It takes Bill twice as long to lay a tile floor by himself as it does Manny. After working together with Bill for 4 hours, Manny was able to complete the job in 2 additional hours. How long would it have taken Manny working alone?

Solution

Let x represent the time it takes Manny to lay the floor alone.

Let $2x$ represent the time it takes Bill to lay the floor alone.

Manny's work rate is $\frac{1}{x}$ of the floor per hour and Bill's work rate is $\frac{1}{2x}$. Bill worked on the job for 4 hours and Manny worked on the job for 6 hours.

	Amount of Task Completed =	***Work - Rate*** ×	***Time***
Manny	$\frac{1}{x}\cdot 6$	$\frac{1}{x}$	6 hours
Bill	$\frac{1}{2x}\cdot 4$	$\frac{1}{2x}$	4 hours
Total	1		

Figure 15.6.1.7

This leads us to the following algebraic setup:

$$\frac{1}{x}\cdot 6+\frac{1}{2x}\cdot 4=1$$

Solve.

$$\begin{aligned}\frac{6}{x}+\frac{4}{2x}&=1\\ x\cdot\left(\frac{6}{x}+\frac{2}{x}\right)&=x\cdot 1\\ 6+2&=x\\ 8&=x\end{aligned}$$

Answer:

It would have taken Manny 8 hours to complete the floor by himself.

Consider the work-rate formula where one task is to be completed.

$$\frac{1}{t_1}t+\frac{1}{t_2}t=1$$

Factor out the time t and then divide both sides by t. This will result in equivalent specialized work-rate formulas:

$$\begin{aligned}t\left(\frac{1}{t_1}+\frac{1}{t_2}\right)&=1\\ \frac{1}{t_1}+\frac{1}{t_2}&=\frac{1}{t}\end{aligned}$$

In summary, we have the following equivalent work-rate formulas:

Work rate formulas

$$\frac{1}{t_1}t+\frac{1}{t_2}t=1 \quad \text{or} \quad \frac{t}{t_1}+\frac{t}{t_2}=1 \quad \text{or} \quad \frac{1}{t_1}+\frac{1}{t_2}=\frac{1}{t}$$

Exercise 15.6.1.2

Matt can tile a countertop in 2 hours, and his assistant can do the same job in 3 hours. If Matt starts the job and his assistant joins him 1 hour later, then how long will it take to tile the countertop?

Answer

$1\frac{3}{5}$ hours

www.youtube.com/v/5g6sSFWGb7M

Solving Problems involving Direct, Inverse, and Joint variation

Many real-world problems encountered in the sciences involve two types of functional relationships. The first type can be explored using the fact that the distance s in feet an object falls from rest, without regard to air resistance, can be approximated using the following formula:

$$s=16t^2$$

Here t represents the time in seconds the object has been falling. For example, after 2 seconds the object will have fallen $s=16(2)^2=16\cdot 4=64$ feet.

Table 15.6.1.1

Time t in seconds	Distance $s=16t^2$ in feet
0	0
1	16
2	64
3	144

Time t in seconds	Distance $s = 16t^2$ in feet
4	256

In this example, we can see that the distance varies over time as the product of a constant 16 and the square of the time t. This relationship is described as **direct variation**[40] and 16 is called the **constant of variation**[41]. Furthermore, if we divide both sides of $s = 16t^2$ by t^2 we have

$$\frac{s}{t^2} = 16$$

In this form, it is reasonable to say that s is proportional to t^2, and 16 is called the **constant of proportionality**[42]. In general, we have

Table 15.6.1.2

Key words	Translation
"y varies x directly as x"	$y = kx$
"y is **directly proportional**[43] to x"	
"y is proportional to x"	

Here k is nonzero and is called the constant of variation or the constant of proportionality. Typically, we will be given information from which we can determine this constant.

Example 15.6.1.5:

An object's weight on Earth varies directly to its weight on the Moon. If a man weighs 180 pounds on Earth, then he will weigh 30 pounds on the Moon. Set up an algebraic equation that expresses the weight on Earth in terms of the weight on the Moon and use it to determine the weight of a woman on the Moon if she weighs 120 pounds on Earth.

Solution

Let y represent weight on Earth.

Let x represent weight on the Moon.

We are given that the "weight on Earth varies directly to the weight on the Moon."

$$y = kx$$

To find the constant of variation k, use the given information. A 180-lb man on Earth weighs 30 pounds on the Moon, or $y = 180$ when $x = 30$.

$$180 = k \cdot 30$$

Solve for k.

$$\frac{180}{30} = k$$
$$6 = k$$

Next, set up a formula that models the given information.

$$y = 6x$$

This implies that a person's weight on Earth is 6 times his weight on the Moon. To answer the question, use the woman's weight on Earth, $y = 120$ lbs, and solve for x.

$$120 = 6x$$
$$\frac{120}{6} = x$$
$$20 = x$$

Answer:

The woman weighs 20 pounds on the Moon.

The second functional relationship can be explored using the formula that relates the intensity of light I to the distance from its source d.

$$I = \frac{k}{d^2}$$

Here k represents some constant. A foot-candle is a measurement of the intensity of light. One foot-candle is defined to be equal to the amount of illumination produced by a standard candle measured one foot away. For example, a 125-Watt fluorescent growing light is advertised to produce 525 foot-candles of illumination. This means that at a distance $d = 1$ foot, $I = 525$ foot-candles and we have:

$$525 = \frac{k}{(1)^2}$$
$$525 = k$$

Using $k = 525$ we can construct a formula which gives the light intensity produced by the bulb:

$$I = \frac{525}{d^2}$$

Here d represents the distance the growing light is from the plants. In the following chart, we can see that the amount of illumination fades quickly as the distance from the plants increases.

Table 15.6.1.3

Distance t in feet	Light Intensity $I = \frac{525}{d^2}$
1	525
2	131.25
3	58.33
4	32.81
5	21

This type of relationship is described as an **inverse variation**[44]. We say that I is **inversely proportional**[45] to the square of the distance d, where 525 is the constant of proportionality. In general, we have

Table 15.6.1.4

Key words	Translation
"y varies inversely as x"	$y = \frac{k}{x}$
"y is inversely proportional to x"	

Again, k is nonzero and is called the constant of variation or the constant of proportionality.

Example 15.6.1.6:

The weight of an object varies inversely as the square of its distance from the center of Earth. If an object weighs 100 pounds on the surface of Earth (approximately $4,000$ miles from the center), how much will it weigh at $1,000$ miles above Earth's surface?

Solution

Let w represent the weight of the object.

Let d represent the object's distance from the center of Earth.

Since "w varies inversely as the square of d," we can write

$$w = \frac{k}{d^2}$$

Use the given information to find k. An object weighs 100 pounds on the surface of Earth, approximately $4,000$ miles from the center. In other words, $w = 100$ when $d = 4,000$:

$$100 = \frac{k}{(4{,}000)^2}$$

Solve for k.

$$(4,000)^2 \cdot 100 = (4,000)^2 \cdot \frac{k}{(4,000)^2}$$
$$1,600,000,000 = k$$
$$1.6 \times 10^9 = k$$

Therefore, we can model the problem with the following formula:

$$w = \frac{1.6 \times 10^9}{d^2}$$

To use the formula to find the weight, we need the distance from the center of Earth. Since the object is $1,000$ miles above the surface, find the distance from the center of Earth by adding $4,000$ miles:

$$d = 4,000 + 1,000 = 5,000 \text{ miles}$$

To answer the question, use the formula with $d = 5,000$.

$$\begin{aligned} y &= \frac{1.6 \times 10^9}{(5,000)^2} \\ &= \frac{1.6 \times 10^9}{25,000,000} \\ &= \frac{1.6 \times 10^9}{2.5 \times 10^9} \\ &= 0.64 \times 10^2 \\ &= 64 \end{aligned}$$

Answer:

The object will weigh 64 pounds at a distance $1,000$ miles above the surface of Earth.

Lastly, we define relationships between multiple variables, described as **joint variation**[46]. In general, we have

Table 15.6.1.5

Key Words	Translation
"y varies jointly as x and z"	$y = kxz$
"y is **jointly proportional**[47] to x and z"	

Here k is nonzero and is called the constant of variation or the constant of proportionality.

Example 15.6.1.7:

The area of an ellipse varies jointly as a, half of the ellipse's major axis, and b, half of the ellipse's minor axis as pictured. If the area of an ellipse is 300π cm^2, where $a = 10$ cm and $b = 30$ cm, what is the constant of proportionality? Give a formula for the area of an ellipse.

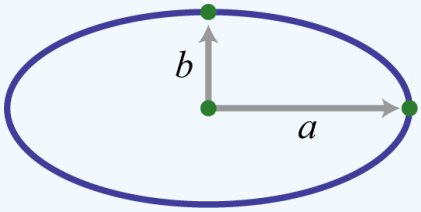

Figure 15.6.1.8

Solution

If we let A represent the area of an ellipse, then we can use the statement "area varies jointly as a and b" to write

$$A = kab$$

To find the constant of variation k, use the fact that the area is 300π when $a = 10$ and $b = 30$.

$$300\pi = k(10)(30)$$
$$300\pi = 300k$$
$$\pi = k$$

Therefore, the formula for the area of an ellipse is

$$A = \pi ab$$

Answer:

The constant of proportionality is π and the formula for the area of an ellipse is $A = ab\pi$.

Exercise 15.6.1.3

Given that y varies directly as the square of x and inversely with z, where $y = 2$ when $x = 3$ and $z = 27$, find y when $x = 2$ and $z = 16$.

Answer

$\frac{3}{2}$

www.youtube.com/v/ee3AFf7b6Kg

Key Takeaways

- When solving distance problems where the time element is unknown, use the equivalent form of the uniform motion formula, $t = \frac{D}{r}$, to avoid introducing more variables.
- When solving work-rate problems, multiply the individual work rate by the time to obtain the portion of the task completed. The sum of the portions of the task results in the total amount of work completed.
- The setup of variation problems usually requires multiple steps. First, identify the key words to set up an equation and then use the given information to find the constant of variation k. After determining the constant of variation, write a formula that models the problem. Once a formula is found, use it to answer the question.

Exercise 15.6.1.4

Use algebra to solve the following applications.

1. Every morning Jim spends 1 hour exercising. He runs 2 miles and then he bikes 16 miles. If Jim can bike twice as fast as he can run, at what speed does he average on his bike?
2. Sally runs 3 times as fast as she walks. She ran for $\frac{3}{4}$ of a mile and then walked another $3\frac{1}{2}$ miles. The total workout took $1\frac{1}{2}$ hours. What was Sally's average walking speed?
3. On a business trip, an executive traveled 720 miles by jet and then another 80 miles by helicopter. If the jet averaged 3 times the speed of the helicopter, and the total trip took 4 hours, what was the average speed of the jet?
4. A triathlete can run 3 times as fast as she can swim and bike 6 times as fast as she can swim. The race consists of a $\frac{1}{4}$ mile swim, 3 mile run, and a 12 mile bike race. If she can complete all of these events in $1\frac{5}{8}$ hour, then how fast can she swim, run and bike?
5. On a road trip, Marty was able to drive an average 4 miles per hour faster than George. If Marty was able to drive 39 miles in the same amount of time George drove 36 miles, what was Marty's average speed?
6. The bus is 8 miles per hour faster than the trolley. If the bus travels 9 miles in the same amount of time the trolley can travel 7 miles, what is the average speed of each?
7. Terry decided to jog the 5 miles to town. On the return trip, she walked the 5 miles home at half of the speed that she was able to jog. If the total trip took 3 hours, what was her average jogging speed?

8. James drove the 24 miles to town and back in 1 hour. On the return trip, he was able to average 20 miles per hour faster than he averaged on the trip to town. What was his average speed on the trip to town?
9. A light aircraft was able to travel 189 miles with a 14 mile per hour tailwind in the same time it was able to travel 147 miles against it. What was the speed of the aircraft in calm air?
10. A jet flew 875 miles with a 30 mile per hour tailwind. On the return trip, against a 30 mile per hour headwind, it was able to cover only 725 miles in the same amount of time. How fast was the jet in calm air?
11. A helicopter averaged 90 miles per hour in calm air. Flying with the wind it was able to travel 250 miles in the same amount of time it took to travel 200 miles against it. What is the speed of the wind?
12. Mary and Joe took a road-trip on separate motorcycles. Mary's average speed was 12 miles per hour less than Joe's average speed. If Mary drove 115 miles in the same time it took Joe to drive 145 miles, what was Mary's average speed?
13. A boat averaged 12 miles per hour in still water. On a trip downstream, with the current, the boat was able to travel 26 miles. The boat then turned around and returned upstream 33 miles. How fast was the current if the total trip took 5 hours?
14. If the river current flows at an average 3 miles per hour, a tour boat can make an 18-mile tour downstream with the current and back the 18 miles against the current in $4\frac{1}{2}$ hours. What is the average speed of the boat in still water?
15. Jose drove 10 miles to his grandmother's house for dinner and back that same evening. Because of traffic, he averaged 20 miles per hour less on the return trip. If it took $\frac{1}{4}$ hour longer to get home, what was his average speed driving to his grandmother's house?
16. Jerry paddled his kayak, upstream against a 1 mph current, for 12 miles. The return trip, downstream with the 1 mph current, took one hour less time. How fast did Jerry paddle the kayak in still water?
17. James and Mildred left the same location in separate cars and met in Los Angeles 300 miles away. James was able to average 10 miles an hour faster than Mildred on the trip. If James arrived 1 hour earlier than Mildred, what was Mildred's average speed?
18. A bus is 20 miles per hour faster than a bicycle. If Bill boards a bus at the same time and place that Mary departs on her bicycle, Bill will arrive downtown 5 miles away $\frac{1}{3}$ hour earlier than Mary. What is the average speed of the bus?

Answer

1. 20 miles per hour

3. 240 miles per hour

5. 52 miles per hour

7. 5 miles per hour

9. 112 miles per hour

11. 10 miles per hour

13. 1 mile per hour

15. 40 miles per hour

17. 50 miles per hour

Exercise 15.6.1.5

Use algebra to solve the following applications.

1. Mike can paint the office by himself in $4\frac{1}{2}$ hours. Jordan can paint the office in 6 hours. How long will it take them to paint the office working together?
2. Barry can lay a brick driveway by himself in $3\frac{1}{2}$ days. Robert does the same job in 5 days. How long will it take them to lay the brick driveway working together?
3. A larger pipe fills a water tank twice as fast as a smaller pipe. When both pipes are used, they fill the tank in 10 hours. If the larger pipe is left off, how long would it take the smaller pipe to fill the tank?
4. A newer printer can print twice as fast as an older printer. If both printers working together can print a batch of flyers in 45 minutes, then how long would it take the older printer to print the batch working alone?

5. Mary can assemble a bicycle for display in 2 hours. It takes Jane 3 hours to assemble a bicycle. How long will it take Mary and Jane, working together, to assemble 5 bicycles?
6. Working alone, James takes twice as long to assemble a computer as it takes Bill. In one 8-hour shift, working together, James and Bill can assemble 6 computers. How long would it take James to assemble a computer if he were working alone?
7. Working alone, it takes Harry one hour longer than Mike to install a fountain. Together they can install 10 fountains in 12 hours. How long would it take Mike to install 10 fountains by himself?
8. Working alone, it takes Henry 2 hours longer than Bill to paint a room. Working together they painted $2\frac{1}{2}$ rooms in 6 hours. How long would it have taken Henry to paint the same amount if he were working alone?
9. Manny, working alone, can install a custom cabinet in 3 hours less time than his assistant. Working together they can install the cabinet in 2 hours. How long would it take Manny to install the cabinet working alone?
10. Working alone, Garret can assemble a garden shed in 5 hours less time than his brother. Working together, they need 6 hours to build the garden shed. How long would it take Garret to build the shed working alone?
11. Working alone, the assistant-manager takes 2 more hours than the manager to record the inventory of the entire shop. After working together for 2 hours, it took the assistant-manager 1 additional hour to complete the inventory. How long would it have taken the manager to complete the inventory working alone?
12. An older printer can print a batch of sales brochures in 16 minutes. A newer printer can print the same batch in 10 minutes. After working together for some time, the newer printer was shut down and it took the older printer 3 more minutes to complete the job. How long was the newer printer operating?

Answer

1. $2\frac{4}{7}$ hours
3. 30 hours
5. 6 hours
7. 20 hours
9. 3 hours
11. 4 hours

Exercise 15.6.1.6

Translate each of the following sentences into a mathematical formula.

1. The distance D an automobile can travel is directly proportional to the time t that it travels at a constant speed.
2. The extension of a hanging spring d is directly proportional to the weight w attached to it.
3. An automobile's braking distance d is directly proportional to the square of the automobile's speed v.
4. The volume V of a sphere varies directly as the cube of its radius r.
5. The volume V of a given mass of gas is inversely proportional to the pressure p exerted on it.
6. Every particle of matter in the universe attracts every other particle with a force F that is directly proportional to the product of the masses m_1 and m_2 of the particles, and it is inversely proportional to the square of the distance d between them.
7. Simple interest I is jointly proportional to the annual interest rate r and the time t in years a fixed amount of money is invested.
8. The time t it takes an object to fall is directly proportional to the square root of the distance d it falls.

Answer

1. $D = kt$
3. $d = kv^2$
5. $V = \frac{k}{p}$
7. $I = krt$

Exercise 15.6.1.7

Construct a mathematical model given the following:

1. y varies directly as x, and $y = 30$ when $x = 6$.
2. y varies directly as x, and $y = 52$ when $x = 4$.
3. y is directly proportional to x, and $y = 12$ when $x = 3$.
4. y is directly proportional to x, and $y = 120$ when $x = 20$.
5. y is directly proportional to x, and $y = 3$ when $x = 9$.
6. y is directly proportional to x, and $y = 21$ when $x = 3$.
7. y varies inversely as x, and $y = 2$ when $x = \frac{1}{8}$.
8. y varies inversely as x, and $y = \frac{3}{2}$ when $x = \frac{1}{9}$.
9. y is jointly proportional to x and z, where $y = 2$ when $x = 1$ and $z = 3$.
10. y is jointly proportional to x and z, where $y = 15$ when $x = 3$ and $z = 7$.
11. y varies jointly as x and z, where $y = \frac{2}{3}$ when $x = \frac{1}{2}$ and $z = 12$.
12. y varies jointly as x and z, where $y = 5$ when $x = \frac{3}{2}$ and $z = \frac{2}{9}$.
13. y varies directly as the square of x, where $y = 45$ when $x = 3$.
14. y varies directly as the square of x, where $y = 3$ when $x = \frac{1}{2}$.
15. y is inversely proportional to the square of x, where $y = 27$ when $x = \frac{1}{3}$.
16. y is inversely proportional to the square of x, where $y = 9$ when $x = \frac{2}{3}$.
17. y varies jointly as x and the square of z, where $y = 6$ when $x = \frac{1}{4}$ and $z = \frac{2}{3}$.
18. y varies jointly as x and z and inversely as the square of w, where $y = 5$ when $z = 1, z = 3$, and $w = \frac{1}{2}$.
19. y varies directly as the square root of x and inversely as the square of z, where $y = 15$ when $x = 25$ and $z = 2$.
20. y varies directly as the square of x and inversely as z and the square of w, where $y = 14$ when $x = 4, w = 2$ and $z = 2$.

Answer

1. $y = 5x$
3. $y = 4x$
5. $y = \frac{27}{x}$
7. $y = \frac{1}{4x}$
9. $y = \frac{2}{3}xz$
11. $y = \frac{1}{9}xz$
13. $y = 5x^2$
15. $y = \frac{3}{x^2}$
17. $y = 54xz^2$
19. $y = \frac{12\sqrt{x}}{z^2}$

Exercise 15.6.1.8

Solve applications involving variation.

1. Revenue in dollars is directly proportional to the number of branded sweatshirts sold. The revenue earned from selling 25 sweatshirts is $\$318.75$. Determine the revenue if 30 sweatshirts are sold.
2. The sales tax on the purchase of a new car varies directly as the price of the car. If an $\$18,000$ new car is purchased, then the sales tax is $\$1,350$. How much sales tax is charged if the new car is priced at $\$22,000$?
3. The price of a share of common stock in a company is directly proportional to the earnings per share (EPS) of the previous 12 months. If the price of a share of common stock in a company is $22.55, and the EPS is published to be $\$1.10$, determine the value of the stock if the EPS increases by $\$0.20$.

4. The distance traveled on a road trip varies directly with the time spent on the road. If a 126-mile trip can be made in 3 hours, then what distance can be traveled in 4 hours?
5. The circumference of a circle is directly proportional to its radius. The circumference of a circle with radius 7 centimeters is measured as 14π centimeters. What is the constant of proportionality?
6. The area of circle varies directly as the square of its radius. The area of a circle with radius 7 centimeters is determined to be 49π square centimeters. What is the constant of proportionality?
7. The surface area of a sphere varies directly as the square of its radius. When the radius of a sphere measures 2 meters, the surface area measures 16π square meters. Find the surface area of a sphere with radius 3 meters.
8. The volume of a sphere varies directly as the cube of its radius. When the radius of a sphere measures 3 meters, the volume is 36π cubic meters. Find the volume of a sphere with radius 1 meter.
9. With a fixed height, the volume of a cone is directly proportional to the square of the radius at the base. When the radius at the base measures 10 centimeters, the volume is 200 cubic centimeters. Determine the volume of the cone if the radius of the base is halved.
10. The distance d an object in free fall drops varies directly with the square of the time t that it has been falling. If an object in free fall drops 36 feet in 1.5 seconds, then how far will it have fallen in 3 seconds?

Answer

1. $\$382.50$
3. $\$26.65$
5. 2π
7. 36π square meters
9. 50 cubic centimeters

Exercise 15.6.1.9

Hooke's law suggests that the extension of a hanging spring is directly proportional to the weight attached to it. The constant of variation is called the spring constant.

Figure 15.6.1.9: Robert Hooke (1635-1703)

1. A hanging spring is stretched 5 inches when a 20-pound weight is attached to it. Determine its spring constant.
2. A hanging spring is stretched 3 centimeters when a 2-kilogram weight is attached to it. Determine the spring constant.
3. If a hanging spring is stretched 3 inches when a 2-pound weight is attached, how far will it stretch with a 5-pound weight attached?
4. If a hanging spring is stretched 6 centimeters when a 4-kilogram weight is attached to it, how far will it stretch with a 2-kilogram weight attached?

Answer

1. $\frac{1}{4}$
3. 7.5 inches

Exercise 15.6.1.10

The braking distance of an automobile is directly proportional to the square of its speed.

1. It takes 36 feet to stop a particular automobile moving at a speed of 30 miles per hour. How much breaking distance is required if the speed is 35 miles per hour?

2. After an accident, it was determined that it took a driver 80 feet to stop his car. In an experiment under similar conditions, it takes 45 feet to stop the car moving at a speed of 30 miles per hour. Estimate how fast the driver was moving before the accident.

Figure 15.6.1.10: Robert Boyle (1627-1691)

Answer

1. 49 feet

Exercise 15.6.1.11

Boyle's law states that if the temperature remains constant, the volume V of a given mass of gas is inversely proportional to the pressure p exerted on it.

1. A balloon is filled to a volume of 216 cubic inches on a diving boat under 1 atmosphere of pressure. If the balloon is taken underwater approximately 33 feet, where the pressure measures 2 atmospheres, then what is the volume of the balloon?
2. A balloon is filled to 216 cubic inches under a pressure of 3 atmospheres at a depth of 66 feet. What would the volume be at the surface, where the pressure is 1 atmosphere?
3. To balance a seesaw, the distance from the fulcrum that a person must sit is inversely proportional to his weight. If a 72-pound boy is sitting 3 feet from the fulcrum, how far from the fulcrum must a 54-pound boy sit to balance the seesaw?
4. The current I in an electrical conductor is inversely proportional to its resistance R. If the current is $\frac{1}{4}$ ampere when the resistance is 100 ohms, what is the current when the resistance is 150 ohms?
5. The amount of illumination I is inversely proportional to the square of the distance d from a light source. If 70 foot-candles of illumination is measured 2 feet away from a lamp, what level of illumination might we expect $\frac{1}{2}$ foot away from the lamp?
6. The amount of illumination I is inversely proportional to the square of the distance d from a light source. If 40 foot-candles of illumination is measured 3 feet away from a lamp, at what distance can we expect 10 foot-candles of illumination?
7. The number of men, represented by y, needed to lay a cobblestone driveway is directly proportional to the area A of the driveway and inversely proportional to the amount of time t allowed to complete the job. Typically, 3 men can lay $1,200$ square feet of cobblestone in 4 hours. How many men will be required to lay $2,400$ square feet of cobblestone in 6 hours?
8. The volume of a right circular cylinder varies jointly as the square of its radius and its height. A right circular cylinder with a 3-centimeter radius and a height of 4 centimeters has a volume of 36π cubic centimeters. Find a formula for the volume of a right circular cylinder in terms of its radius and height.
9. The period T of a pendulum is directly proportional to the square root of its length L. If the length of a pendulum is 1 meter, then the period is approximately 2 seconds. Approximate the period of a pendulum that is 0.5 meter in length.
10. The time t it takes an object to fall is directly proportional to the square root of the distance d it falls. An object dropped from 4 feet will take $\frac{1}{2}$ second to hit the ground. How long will it take an object dropped from 16 feet to hit the ground?

Answer

1. 108 cubic inches

3. 4 feet

5. $1,120$ foot-candles

7. 4 men

9. 1.4 seconds

Exercise 15.6.1.12

Newton's universal law of gravitation states that every particle of matter in the universe attracts every other particle with a force F that is directly proportional to the product of the masses m_1 and m_2 of the particles and inversely proportional to the square of the distance d between them. The constant of proportionality is called the gravitational constant.

Figure 15.6.1.11: Sir Isaac Newton (1643-1727)

1. If two objects with masses 50 kilograms and 100 kilograms are $\frac{1}{2}$ meter apart, then they produce approximately 1.34×10^{-6} newtons (N) of force. Calculate the gravitational constant.
2. Use the gravitational constant from the previous exercise to write a formula that approximates the force F in newtons between two masses m_1 and m_2, expressed in kilograms, given the distance d between them in meters.
3. Calculate the force in newtons between Earth and the Moon, given that the mass of the Moon is approximately 7.3×10^{22} kilograms, the mass of Earth is approximately 6.0×10^{24} kilograms, and the distance between them is on average 1.5×10^{11} meters.
4. Calculate the force in newtons between Earth and the Sun, given that the mass of the Sun is approximately 2.0×10^{30} kilograms, the mass of Earth is approximately 6.0×10^{24} kilograms, and the distance between them is on average 3.85×10^{8} meters.
5. If y varies directly as the square of x, then how does y change if x is doubled?
6. If y varies inversely as square of t, then how does y change if t is doubled?
7. If y varies directly as the square of x and inversely as the square of t, then how does y change if both x and t are doubled?

Answer

1. $6.7 \times 10^{-11} \mathrm{Nm}^2/\mathrm{kg}^2$
3. $1.98 \times 10^{20} \mathrm{N}$
5. y changes by a factor of 4
7. y remains unchanged

Footnotes

[37] Described by the formula $D = rt$, where the distance D is given as the product of the average rate r and the time t traveled at that rate.

[38] The rate at which a task can be performed.

[39] $\frac{1}{t_1} \cdot t + \frac{1}{t_2} \cdot t = 1$, where $\frac{1}{t_1}$ and $\frac{1}{t_2}$ are the individual work rates and t is the time it takes to complete the task working together.

[40] Describes two quantities x and y that are constant multiples of each other: $y = kx$.

[41] The nonzero multiple k, when quantities vary directly or inversely.

[42] Used when referring to the constant of variation.

[43] Used when referring to direct variation.

[44] Describes two quantities x and y, where one variable is directly proportional to the reciprocal of the other: $y = \frac{k}{x}$.

[45] Used when referring to inverse variation.

[46] Describes a quantity y that varies directly as the product of two other quantities x and z : $y = kxz$.

[47] Used when referring to joint variation.

15.6E: Exercises

Solve Proportions

In the following exercises, solve each proportion.

1. $\frac{x}{56}=\frac{7}{8}$

Answer

$x=49$

2. $\frac{56}{72}=\frac{y}{9}$

3. $\frac{98}{154}=\frac{-7}{p}$

Answer

$p=-11$

4. $\frac{72}{156}=\frac{-6}{q}$

5. $\frac{a}{a+12}=\frac{4}{7}$

Answer

$a=16$

6. $\frac{b}{b-16}=\frac{11}{9}$

7. $\frac{m+90}{25}=\frac{m+30}{15}$

Answer

$m=60$

8. $\frac{n+10}{4}=\frac{40-n}{6}$

9. $\frac{2p+4}{8}=\frac{p+18}{6}$

Answer

$p=30$

10. $\frac{q-2}{2}=\frac{2q-7}{18}$

In the following exercises, solve.

11. Kevin wants to keep his heart rate at 160 beats per minute while training. During his workout he counts 27 beats in 10 seconds.

a. How many beats per minute is this?
b. Has Kevin met his target heart rate?

Answer

a. 162 beats per minute
b. yes

12. Jesse's car gets 30 miles per gallon of gas.
    a. If Las Vegas is 285 miles away, how many gallons of gas are needed to get there and then home?
    b. If gas is $3.09 per gallon, what is the total cost of the gas for the trip?
13. Pediatricians prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of a child's weight. How many milliliters of acetaminophen will the doctor prescribe for Jocelyn, who weighs 45 pounds?

Answer

9 ml

14. A veterinarian prescribed Sunny, a 65-pound dog, an antibacterial medicine in case an infection emerges after her teeth were cleaned. If the dosage is 5 mg for every pound, how much medicine was Sunny given?
15. A new energy drink advertises 106 calories for 8 ounces. How many calories are in 12 ounces of the drink?

Answer

159 calories

16. One 12-ounce can of soda has 150 calories. If Josiah drinks the big 32-ounce size from the local mini-mart, how many calories does he get?
17. Kyra is traveling to Canada and will change $250 US dollars into Canadian dollars. At the current exchange rate, $1 US is equal to $1.3 Canadian. How many Canadian dollars will she get for her trip?

Answer

325 Canadian Dollars

18. Maurice is traveling to Mexico and needs to exchange $450 into Mexican pesos. If each dollar is worth 12.29 pesos, how many pesos will he get for his trip?
19. Ronald needs a morning breakfast drink that will give him at least 390 calories. Orange juice has 130 calories in one cup. How many cups does he need to drink to reach his calorie goal?

Answer

3 cups

20. Sonya drinks a 32-ounce energy drink containing 80 calories per 12 ounce. How many calories did she drink?
21. Phil wants to fertilize his lawn. Each bag of fertilizer covers about 4,000 square feet of lawn. Phil's lawn is approximately 13,500 square feet. How many bags of fertilizer will he have to buy?

Answer

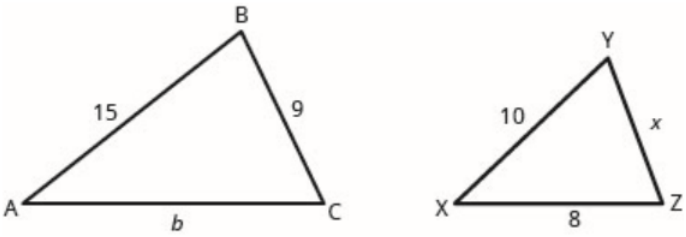
4 bags

22. An oatmeal cookie recipe calls for $\frac{1}{2}$ cup of butter to make 4 dozen cookies. Hilda needs to make 10 dozen cookies for the bake sale. How many cups of butter will she need?

Solve Similar Figure Applications

In the following exercises, the triangles are similar. Find the length of the indicated side.

23.

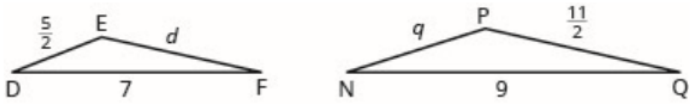


a. side x
b. side b

Answer

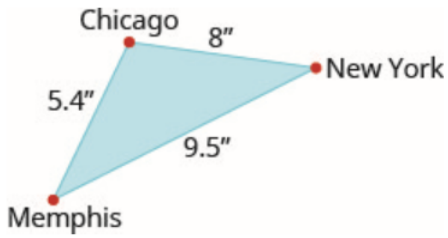
a. 6
b. 12

24.



a. side d
b. side q

In the following exercises, use the map shown. On the map, New York City, Chicago, and Memphis form a triangle. The actual distance from New York to Chicago is 800 miles.



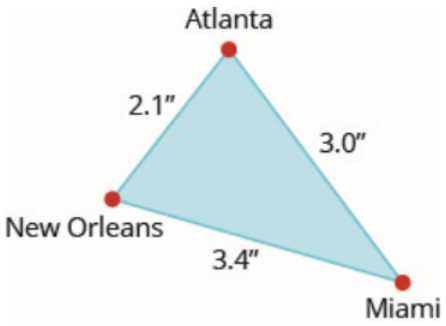
25. Find the actual distance from New York to Memphis.

Answer

950 miles

26. Find the actual distance from Chicago to Memphis.

In the following exercises, use the map shown. On the map, Atlanta, Miami, and New Orleans form a triangle. The actual distance from Atlanta to New Orleans is 420 miles.



27. Find the actual distance from New Orleans to Miami.

Answer

680 miles

28. Find the actual distance from Atlanta to Miami.

In the following exercises, answer each question.

29. A 2-foot-tall dog casts a 3-foot shadow at the same time a cat casts a one foot shadow. How tall is the cat?

Answer

$\frac{2}{3}$ foot (8 in.)

30. Larry and Tom were standing next to each other in the backyard when Tom challenged Larry to guess how tall he was. Larry knew his own height is 6.5 feet and when they measured their shadows, Larry's shadow was 8 feet and Tom's was 7.75 feet long. What is Tom's height?
31. The tower portion of a windmill is 212 feet tall. A six foot tall person standing next to the tower casts a seven-foot shadow. How long is the windmill's shadow?

Answer

247.3 feet

32. The height of the Statue of Liberty is 305 feet. Nikia, who is standing next to the statue, casts a 6-foot shadow and she is 5 feet tall. How long should the shadow of the statue be?

Solve Uniform Motion Applications

In the following exercises, solve the application problem provided.

33. Mary takes a sightseeing tour on a helicopter that can fly 450 miles against a 35-mph headwind in the same amount of time it can travel 702 miles with a 35-mph tailwind. Find the speed of the helicopter.

Answer

160 mph

34. A private jet can fly 1,210 miles against a 25-mph headwind in the same amount of time it can fly 1694 miles with a 25-mph tailwind. Find the speed of the jet.
35. A boat travels 140 miles downstream in the same time as it travels 92 miles upstream. The speed of the current is 6mph. What is the speed of the boat?

Answer

29 mph

36. Darrin can skateboard 2 miles against a 4-mph wind in the same amount of time he skateboards 6 miles with a 4-mph wind. Find the speed Darrin skateboards with no wind.
37. Jane spent 2 hours exploring a mountain with a dirt bike. First, she rode 40 miles uphill. After she reached the peak she rode for 12 miles along the summit. While going uphill, she went 5 mph slower than when she was on the summit. What was her rate along the summit?

Answer

30 mph

38. Laney wanted to lose some weight so she planned a day of exercising. She spent a total of 2 hours riding her bike and jogging. She biked for 12 miles and jogged for 6 miles. Her rate for jogging was 10 mph less than biking rate. What was her rate when jogging?

39. Byron wanted to try out different water craft. He went 62 miles downstream in a motor boat and 27 miles downstream on a jet ski. His speed on the jet ski was 10 mph faster than in the motor boat. Bill spent a total of 4 hours on the water. What was his rate of speed in the motor boat?

Answer

20 mph

40. Nancy took a 3-hour drive. She went 50 miles before she got caught in a storm. Then she drove 68 miles at 9 mph less than she had driven when the weather was good. What was her speed driving in the storm?
41. Chester rode his bike uphill 24 miles and then back downhill at 2 mph faster than his uphill. If it took him 2 hours longer to ride uphill than downhill, what was his uphill rate?

Answer

4 mph

42. Matthew jogged to his friend's house 12 miles away and then got a ride back home. It took him 2 hours longer to jog there than ride back. His jogging rate was 25 mph slower than the rate when he was riding. What was his jogging rate?
43. Hudson travels 1080 miles in a jet and then 240 miles by car to get to a business meeting. The jet goes 300 mph faster than the rate of the car, and the car ride takes 1 hour longer than the jet. What is the speed of the car?

Answer

60 mph

44. Nathan walked on an asphalt pathway for 12 miles. He walked the 12 miles back to his car on a gravel road through the forest. On the asphalt he walked 2 miles per hour faster than on the gravel. The walk on the gravel took one hour longer than the walk on the asphalt. How fast did he walk on the gravel.
45. John can fly his airplane 2800 miles with a wind speed of 50 mph in the same time he can travel 2400 miles against the wind. If the speed of the wind is 50 mph, find the speed of his airplane.

Answer

650 mph

46. Jim's speedboat can travel 20 miles upstream against a 3-mph current in the same amount of time it travels 22 miles downstream with a 3-mph current speed . Find the speed of the Jim's boat.
47. Hazel needs to get to her granddaughter's house by taking an airplane and a rental car. She travels 900 miles by plane and 250 miles by car. The plane travels 250 mph faster than the car. If she drives the rental car for 2 hours more than she rode the plane, find the speed of the car.

Answer

50 mph

48. Stu trained for 3 hours yesterday. He ran 14 miles and then biked 40 miles. His biking speed is 6 mph faster than his running speed. What is his running speed?
49. When driving the 9-hour trip home, Sharon drove 390 miles on the interstate and 150 miles on country roads. Her speed on the interstate was 15 more than on country roads. What was her speed on country roads?

Answer

50 mph

50. Two sisters like to compete on their bike rides. Tamara can go 4 mph faster than her sister, Samantha. If it takes Samantha 1 hours longer than Tamara to go 80 miles, how fast can Samantha ride her bike?
51. Dana enjoys taking her dog for a walk, but sometimes her dog gets away, and she has to run after him. Dana walked her dog for 7 miles but then had to run for 1 mile, spending a total time of 2.5 hours with her dog. Her running speed was 3 mph faster than her walking speed. Find her walking speed.

Answer

4.2 mph

52. Ken and Joe leave their apartment to go to a football game 45 miles away. Ken drives his car 30 mph faster Joe can ride his bike. If it takes Joe 2 hours longer than Ken to get to the game, what is Joe's speed?

Solve Work Applications

53. Mike, an experienced bricklayer, can build a wall in 3 hours, while his son, who is learning, can do the job in 6 hours. How long does it take for them to build a wall together?

Answer

2 hours

54. It takes Sam 4 hours to rake the front lawn while his brother, Dave, can rake the lawn in 2 hours. How long will it take them to rake the lawn working together?
55. Mia can clean her apartment in 6 hours while her roommate can clean the apartment in 5 hours. If they work together, how long would it take them to clean the apartment?

Answer

2 hours and 44 minutes

56. Brian can lay a slab of concrete in 6 hours, while Greg can do it in 4 hours. If Brian and Greg work together, how long will it take?
57. Josephine can correct her students test papers in 5 hours, but if her teacher's assistant helps, it would take them 3 hours. How long would it take the assistant to do it alone?

Answer

7 hours and 30 minutes

58. Washing his dad's car alone, eight year old Levi takes 2.5 hours. If his dad helps him, then it takes 1 hour. How long does it take Levi's dad to wash the car by himself?
59. At the end of the day Dodie can clean her hair salon in 15 minutes. Ann, who works with her, can clean the salon in 30 minutes. How long would it take them to clean the shop if they work together?

Answer

10 min

60. Ronald can shovel the driveway in 4 hours, but if his brother Donald helps it would take 2 hours. How long would it take Donald to shovel the driveway alone?

Solve Direct Variation Problems

In the following exercises, solve.

61. If y varies directly as x and $y = 14$, when $x = 3$. Find the equation that relates x and y.

Answer

$y = \frac{14}{3}x$

62. If a varies directly as b and $a = 16$, when $b = 4$. Find the equation that relates a and b.
63. If p varies directly as q and $p = 9$, when $q = 3$. Find the equation that relates p and q.

Answer

$p = 3.2q$

64. If v varies directly as w and $v = 8$, when $w = 12$. Find the equation that relates v and w.
65. The price, P, that Eric pays for gas varies directly with the number of gallons, g, he buys. It costs him \$50 to buy 20 gallons of gas.
    a. Write the equation that relates P and g.
    b. How much would 33 gallons cost Eric?

Answer

a. $P = 2.5g$
b. $\$82.50$

66. Joseph is traveling on a road trip. The distance, d, he travels before stopping for lunch varies directly with the speed, v, he travels. He can travel 120 miles at a speed of 60 mph.
    a. Write the equation that relates d and v.
    b. How far would he travel before stopping for lunch at a rate of 65 mph?
67. The mass of a liquid varies directly with its volume. A liquid with mass 16 kilograms has a volume of 2 liters.
    a. Write the equation that relates the mass to the volume.
    b. What is the volume of this liquid if its mass is 128 kilograms?

Answer

a. $m = 8v$
b. 16 liters

68. The length that a spring stretches varies directly with a weight placed at the end of the spring. When Sarah placed a 10-pound watermelon on a hanging scale, the spring stretched 5 inches.
    a. Write the equation that relates the length of the spring to the weight.
    b. What weight of watermelon would stretch the spring 6 inches?
69. The maximum load a beam will support varies directly with the square of the diagonal of the beam's cross-section. A beam with diagonal 6 inch will support a maximum load of 108 pounds.
    a. Write the equation that relates the load to the diagonal of the cross-section.
    b. What load will a beam with a 10-inch diagonal support?

Answer

a. $L = 3d^2$
b. 300 pounds

70. The area of a circle varies directly as the square of the radius. A circular pizza with a radius of 6 inches has an area of 113.04 square inches.
    a. Write the equation that relates the area to the radius.
    b. What is the area of a personal pizza with a radius 4 inches?

Solve Inverse Variation Problems

In the following exercises, solve.

71. If y varies inversely with x and $y = 5$, when $x = 4$. Find the equation that relates x and y.

Answer

$$y = \frac{20}{x}$$

72. If p varies inversely with q and $p = 2$, when $q = 1$. Find the equation that relates p and q.
73. If v varies inversely with w and $v = 6$, when $w = 12$. Find the equation that relates v and w.

Answer

$v = \frac{3}{w}$

74. If a varies inversely with b and $a = 12$, when $b = 13$. Find the equation that relates a and b.

In the following exercises, write an inverse variation equation to solve the following problems.

75. The fuel consumption (mpg) of a car varies inversely with its weight. A Toyota Corolla weighs 2800 pounds getting 33 mpg on the highway.
    a. Write the equation that relates the mpg to the car's weight.
    b. What would the fuel consumption be for a Toyota Sequoia that weighs 5500 pounds?

Answer

a. $g = \frac{92,400}{w}$
b. 16.8 mpg

76. A car's value varies inversely with its age. Jackie bought a 10-year-old car for $2,400.
    a. Write the equation that relates the car's value to its age.
    b. What will be the value of Jackie's car when it is 15 years old?

77. The time required to empty a tank varies inversely as the rate of pumping. It took Ada 5 hours to pump her flooded basement using a pump that was rated at 200 gpm (gallons per minute).
    a. Write the equation that relates the number of hours to the pump rate.
    b. How long would it take Ada to pump her basement if she used a pump rated at 400 gpm?

Answer

1. $t = \frac{1000}{r}$
2. 2.5 hours

78. On a string instrument, the length of a string varies inversely as the frequency of its vibrations. An 11-inch string on a violin has a frequency of 400 cycles per second.
    a. Write the equation that relates the string length to its frequency.
    b. What is the frequency of a 10 inch string?

79. Paul, a dentist, determined that the number of cavities that develops in his patient's mouth each year varies inversely to the number of minutes spent brushing each night. His patient, Lori, had four cavities when brushing her teeth 30 seconds (0.5 minutes) each night.
    a. Write the equation that relates the number of cavities to the time spent brushing.
    b. How many cavities would Paul expect Lori to have if she had brushed her teeth for 2 minutes each night?

Answer

a. $c = \frac{2}{t}$
b. 1 cavity

80. Boyle's law states that if the temperature of a gas stays constant, then the pressure varies inversely to the volume of the gas. Braydon, a scuba diver, has a tank that holds 6 liters of air under a pressure of 220 psi.
    a. Write the equation that relates pressure to volume.
    b. If the pressure increases to 330 psi, how much air can Braydon's tank hold?

81. The cost of a ride service varies directly with the distance traveled. It costs $35 for a ride from the city center to the airport, 14 miles away.
    a. Write the equation that relates the cost, c, with the number of miles, m.
    b. What would it cost to travel 22 miles with this service?

Answer

a. $c = 2.5m$
b. $\$55$

82. The number of hours it takes Jack to drive from Boston to Bangor is inversely proportional to his average driving speed. When he drives at an average speed of 40 miles per hour, it takes him 6 hours for the trip.
    a. Write the equation that relates the number of hours, h, with the speed, s.
    b. How long would the trip take if his average speed was 75 miles per hour?

Writing Exercises

83. Marisol solves the proportion $\frac{144}{a} = \frac{9}{4}$ by 'cross multiplying,' so her first step looks like $4 \cdot 144 = 9 \cdot a$. Explain how this differs from the method of solution shown in Example 7.6.2.

Answer

Answers will vary.

84. Paula and Yuki are roommates. It takes Paula 3 hours to clean their apartment. It takes Yuki 4 hours to clean the apartment. The equation $\frac{1}{3} + \frac{1}{4} = \frac{1}{t}$ can be used to find t, the number of hours it would take both of them, working together, to clean their apartment. Explain how this equation models the situation.
85. In your own words, explain the difference between direct variation and inverse variation.

Answer

Answers will vary.

86. Make up an example from your life experience of inverse variation.

15.E: Review Exercises

Simplify, Multiply, and Divide Rational Expressions

Determine the Values for Which a Rational Expression is Undefined

In the following exercises, determine the values for which the rational expression is undefined.

1. $\frac{5a+3}{3a-2}$

Answer

$a \neq \frac{2}{3}$

2. $\frac{b-7}{b^2-25}$

3. $\frac{5x^2y^2}{8y}$

Answer

$y \neq 0$

4. $\frac{x-3}{x^2-x-30}$

Simplify Rational Expressions

In the following exercises, simplify.

5. $\frac{18}{24}$

Answer

$\frac{3}{4}$

6. $\frac{9m^4}{18mn^3}$

7. $\frac{x^2+7x+12}{x^2+8x+16}$

Answer

$\frac{x+3}{x+4}$

8. $\frac{7v-35}{25-v^2}$

Multiply Rational Expressions

In the following exercises, multiply.

9. $\frac{5}{8} \cdot \frac{4}{15}$

Answer

$\frac{1}{6}$

10. $\frac{3xy^2}{8y^3} \cdot \frac{16y^2}{24x}$

11. $\frac{72x-12x^2}{8x+32} \cdot \frac{x^2+10x+24}{x^2-36}$

Answer

$\frac{-3x}{2}$

12. $\frac{6y^2-2y-10}{9-y^2} \cdot \frac{y^2-6y+9}{6y^2+29y-20}$

Divide Rational Expressions

In the following exercises, divide.

13. $\frac{x^2-4x-12}{x^2+8x+12} \div \frac{x^2-36}{3x}$

Answer

$\frac{3x}{(x+6)(x+6)}$

14. $\frac{y^2-16}{4} \div \frac{y^3-64}{2y^2+8y+32}$

15. $\frac{11+w}{w-9} \div \frac{121-w^2}{9-w}$

Answer

$\frac{1}{11+w}$

16. $\frac{3y^2-12y-63}{4y+3} \div \left(6y^2-42y\right)$

17. $\frac{\frac{c^2-64}{3c^2+26c+16}}{\frac{c^2-4c-32}{15c+10}}$

Answer

$\frac{5}{c+4}$

18. $\frac{8a^2+16a}{a-4} \cdot \frac{a^2+2a-24}{a^2+7a+10} \div \frac{2a^2-6a}{a+5}$

Multiply and Divide Rational Functions

19. Find $R(x)=f(x)\cdot g(x)$ where $f(x)=\frac{9x^2+9x}{x^2-3x-4}$ and $g(x)=\frac{x^2-16}{3x^2+12x}$.

Answer

$R(x)=3$

20. Find $R(x)=\frac{f(x)}{g(x)}$ where $f(x)=\frac{27x^2}{3x-21}$ and $g(x)=\frac{9x^2+54x}{x^2-x-42}$.

Add and Subtract Rational Expressions

Add and Subtract Rational Expressions with a Common Denominator

In the following exercises, perform the indicated operations.

21. $\frac{7}{15}+\frac{8}{15}$

Answer

1

22. $\frac{4a^2}{2a-1}-\frac{1}{2a-1}$

23. $\frac{y^2+10y}{y+5}+\frac{25}{y+5}$

Answer

$y+5$

24. $\frac{7x^2}{x^2-9}+\frac{21x}{x^2-9}$

25. $\frac{x^2}{x-7}-\frac{3x+28}{x-7}$

Answer

$x+4$

26. $\frac{y^2}{y+11}-\frac{121}{y+11}$

27. $\frac{4q^2-q+3}{q^2+6q+5}-\frac{3q^2-q-6}{q^2+6q+5}$

Answer

$\frac{q-3}{q+5}$

28. $\frac{5t+4t+3}{t^2-25}-\frac{4t^2-8t-32}{t^2-25}$

Add and Subtract Rational Expressions Whose Denominators Are Opposites

In the following exercises, add and subtract.

29. $\frac{18w}{6w-1}+\frac{3w-2}{1-6w}$

Answer

$\frac{15w+2}{6w-1}$

30. $\frac{a^2+3a}{a^2-4}-\frac{3a-8}{4-a^2}$

31. $\frac{2b^2+3b-15}{b^2-49}-\frac{b^2+16b-1}{49-b^2}$

Answer

$\frac{3b-2}{b+7}$

32. $\frac{8y^2-10y+7}{2y-5}+\frac{2y^2+7y+2}{5-2y}$

Find the Least Common Denominator of Rational Expressions

In the following exercises, find the LCD.

33. $\frac{7}{a^2-3a-10}, \frac{3a}{a^2-a-20}$

Answer

$(a+2)(a-5)(a+4)$

34. $\frac{6}{n^2-4}, \frac{2n}{n^2-4n+4}$

35. $\frac{5}{3p^2+17p-6}, \frac{2m}{3p^2-23p-8}$

Answer

$(3p+1)(p+6)(p+8)$

Add and Subtract Rational Expressions with Unlike Denominators

In the following exercises, perform the indicated operations.

36. $\frac{7}{5a}+\frac{3}{2b}$

37. $\frac{2}{c-2}+\frac{9}{c+3}$

Answer

$$\frac{11c-12}{(c-2)(c+3)}$$

38. $\frac{3x}{x^2-9}+\frac{5}{x^2+6x+9}$

39. $\frac{2x}{x^2+10x+24}+\frac{3x}{x^2+8x+16}$

Answer

$$\frac{5x^2+26x}{(x+4)(x+4)(x+6)}$$

40. $\frac{5q}{p^2q-p^2}+\frac{4q}{q^2-1}$

41. $\frac{3y}{y+2}-\frac{y+2}{y+8}$

Answer

$$\frac{2\left(y^2+10y-2\right)}{(y+2)(y+8)}$$

42. $\frac{-3w-15}{w^2+w-20}-\frac{w+2}{4-w}$

43. $\frac{7m+3}{m+2}-5$

Answer

$$\frac{2m-7}{m+2}$$

44. $\frac{n}{n+3}+\frac{2}{n-3}-\frac{n-9}{n^2-9}$

45. $\frac{8a}{a^2-64}-\frac{4}{a+8}$

Answer

$$\frac{4}{a-8}$$

46. $\frac{5}{12x^2y}+\frac{7}{20xy^3}$

Add and Subtract Rational Functions

In the following exercises, find $R(x)=f(x)+g(x)$ where $f(x)$ and $g(x)$ are given.

47. $f(x)=\frac{2x^2+12x-11}{x^2+3x-10}, g(x)=\frac{x+1}{2-x}$

Answer

$$R(x) = \frac{x+8}{x+5}$$

48. $f(x) = \frac{-4x+31}{x^2+x-30}, g(x) = \frac{5}{x+6}$

In the following exercises, find $R(x) = f(x) - g(x)$ where $f(x)$ and $g(x)$ are given.

49. $f(x) = \frac{4x}{x^2-121}, g(x) = \frac{2}{x-11}$

Answer

$$R(x) = \frac{2}{x+11}$$

50. $f(x) = \frac{7}{x+6}, g(x) = \frac{14x}{x^2-36}$

Simplify Complex Rational Expressions

Simplify a Complex Rational Expression by Writing It as Division

In the following exercises, simplify.

51. $\frac{\frac{7x}{x+2}}{\frac{14x^2}{x^2-4}}$

Answer

$$\frac{x-2}{2x}$$

52. $\frac{\frac{2}{5}+\frac{5}{6}}{\frac{1}{3}+\frac{1}{4}}$

53. $\frac{x-\frac{3x}{x+5}}{\frac{1}{x+5}+\frac{1}{x-5}}$

Answer

$$\frac{(x-8)(x-5)}{2}$$

54. $\frac{\frac{2}{m}+\frac{m}{n}}{\frac{n}{m}-\frac{1}{n}}$

Simplify a Complex Rational Expression by Using the LCD

In the following exercises, simplify.

55. $\dfrac{\frac{1}{3}+\frac{1}{8}}{\frac{1}{4}+\frac{1}{12}}$

Answer

$\frac{11}{8}$

56. $\dfrac{\frac{3}{a^2}-\frac{1}{b}}{\frac{1}{a}+\frac{1}{b^2}}$

57. $\dfrac{\frac{2}{z^2-49}+\frac{1}{z+7}}{\frac{9}{z+7}+\frac{12}{z-7}}$

Answer

$\frac{z-5}{21z+21}$

58. $\dfrac{\frac{3}{y^2-4y-32}}{\frac{2}{y-8}+\frac{1}{y+4}}$

Solve Rational Equations

Solve Rational Equations

In the following exercises, solve.

59. $\frac{1}{2}+\frac{2}{3}=\frac{1}{x}$

Answer

$x=\frac{6}{7}$

60. $1-\frac{2}{m}=\frac{8}{m^2}$

61. $\frac{1}{b-2}+\frac{1}{b+2}=\frac{3}{b^2-4}$

Answer

$b=\frac{3}{2}$

62. $\frac{3}{q+8}-\frac{2}{q-2}=1$

63. $\frac{v-15}{v^2-9v+18}=\frac{4}{v-3}+\frac{2}{v-6}$

Answer

no solution

64. $\frac{z}{12}+\frac{z+3}{3z}=\frac{1}{z}$

Solve Rational Equations that Involve Functions

65. For rational function, $f(x)=\frac{x+2}{x^2-6x+8}$,

a. Find the domain of the function
b. Solve $f(x)=1$
c. Find the points on the graph at this function value.

Answer

a. The domain is all real numbers except $x\neq 2$ and $x\neq 4$
b. $x=1, x=6$
c. $(1,1),(6,1)$

66. For rational function, $f(x)=\frac{2-x}{x^2+7x+10}$,

a. Solve $f(x)=2$
b. Find the points on the graph at this function value.

Solve a Rational Equation for a Specific Variable

In the following exercises, solve for the indicated variable.

67. $\frac{V}{l}=hw$ for l

Answer

$l=\frac{V}{hw}$

68. $\frac{1}{x}-\frac{2}{y}=5$ for y

69. $x=\frac{y+5}{z-7}$ for z

Answer

$z=\frac{y+5+7x}{x}$

70. $P=\frac{k}{V}$ for V

Solve Applications with Rational Equations

Solve Proportions

In the following exercises, solve.

71. $\frac{x}{4} = \frac{3}{5}$

Answer

$x = \frac{12}{5}$

72. $\frac{3}{y} = \frac{9}{5}$

73. $\frac{s}{s+20} = \frac{3}{7}$

Answer

$s = 15$

74. $\frac{t-3}{5} = \frac{t+2}{9}$

Solve Applications Using Proportions

In the following exercises, solve.

75. Rachael had a 21-ounce strawberry shake that has 739 calories. How many calories are there in a 32-ounce shake?

Answer

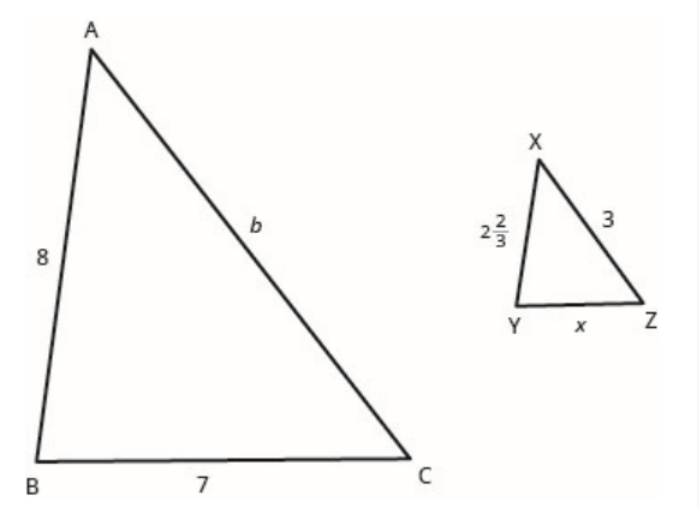
1161 calories

76. Leo went to Mexico over Christmas break and changed $525 dollars into Mexican pesos. At that time, the exchange rate had $1 US is equal to 16.25 Mexican pesos. How many Mexican pesos did he get for his trip?

Solve Similar Figure Applications

In the following exercises, solve.

77. ΔABC is similar to ΔXYZ. The lengths of two sides of each triangle are given in the figure. Find the lengths of the third sides.

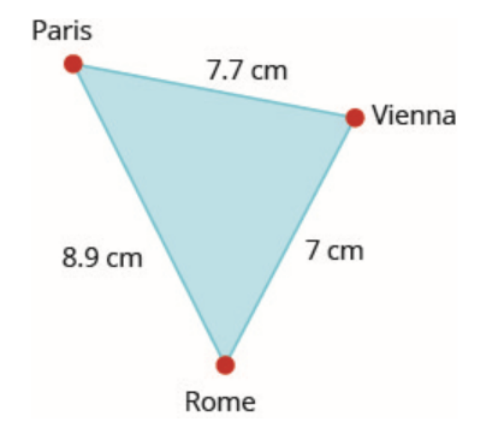


Answer

$b = 9;\ x = 2\frac{1}{3}$

78. On a map of Europe, Paris, Rome, and Vienna form a triangle whose sides are shown in the figure below. If the actual distance from Rome to Vienna is 700 miles, find the distance from

a. Paris to Rome
b. Paris to Vienna



79. Francesca is 5.75 feet tall. Late one afternoon, her shadow was 8 feet long. At the same time, the shadow of a nearby tree was 32 feet long. Find the height of the tree.

Answer

23 feet

80. The height of a lighthouse in Pensacola, Florida is 150 feet. Standing next to the statue, 5.5-foot-tall Natasha cast a 1.1-foot shadow. How long would the shadow of the lighthouse be?

Solve Uniform Motion Applications

In the following exercises, solve.

81. When making the 5-hour drive home from visiting her parents, Lolo ran into bad weather. She was able to drive 176 miles while the weather was good, but then driving 10 mph slower, went 81 miles when it turned bad. How fast did she drive when the weather was bad?

Answer

45 mph

82. Mark is riding on a plane that can fly 490 miles with a tailwind of 20 mph in the same time that it can fly 350 miles against a tailwind of 20 mph. What is the speed of the plane?

83. Josue can ride his bicycle 8 mph faster than Arjun can ride his bike. It takes Luke 3 hours longer than Josue to ride 48 miles. How fast can John ride his bike?

Answer

16 mph

84. Curtis was training for a triathlon. He ran 8 kilometers and biked 32 kilometers in a total of 3 hours. His running speed was 8 kilometers per hour less than his biking speed. What was his running speed?

Solve Work Applications

In the following exercises, solve.

85. Brandy can frame a room in 1 hour, while Jake takes 4 hours. How long could they frame a room working together?

Answer

$\frac{4}{5}$ hour

86. Prem takes 3 hours to mow the lawn while her cousin, Barb, takes 2 hours. How long will it take them working together?

87. Jeffrey can paint a house in 6 days, but if he gets a helper he can do it in 4 days. How long would it take the helper to paint the house alone?

Answer

12 days

88. Marta and Deb work together writing a book that takes them 90 days. If Sue worked alone it would take her 120 days. How long would it take Deb to write the book alone?

Solve Direct Variation Problems

In the following exercises, solve.

89. If y varies directly as x when $y = 9$ and $x = 3$, find x when $y = 21$.

Answer

7

90. If y varies inversely as x when $y = 20$ and $x = 2$ find y when $x = 4$.

91. Vanessa is traveling to see her fiancé. The distance, d, varies directly with the speed, v, she drives. If she travels 258 miles driving 60 mph, how far would she travel going 70 mph?

Answer

301 mph

92. If the cost of a pizza varies directly with its diameter, and if an 8” diameter pizza costs $12, how much would a 6” diameter pizza cost?

93. The distance to stop a car varies directly with the square of its speed. It takes 200 feet to stop a car going 50 mph. How many feet would it take to stop a car going 60 mph?

Answer

288 feet

Solve Inverse Variation Problems

In the following exercises, solve.

94. If m varies inversely with the square of n, when $m = 4$ and $n = 6$ find m when $n = 2$.

95. The number of tickets for a music fundraiser varies inversely with the price of the tickets. If Madelyn has just enough money to purchase 12 tickets for $6, how many tickets can Madelyn afford to buy if the price increased to $8?

Answer

97 tickets

96. On a string instrument, the length of a string varies inversely with the frequency of its vibrations. If an 11-inch string on a violin has a frequency of 360 cycles per second, what frequency does a 12-inch string have?

Solve Rational Inequalities

Solve Rational Inequalities

In the following exercises, solve each rational inequality and write the solution in interval notation.

97. $\frac{x-3}{x+4} \leq 0$

Answer

$(-4, 3]$

98. $\frac{5x}{x-2} > 1$

99. $\frac{3x-2}{x-4} \leq 2$

Answer

$[-6, 4)$

100. $\frac{1}{x^2-4x-12} < 0$

101. $\frac{1}{2} - \frac{4}{x^2} \geq \frac{1}{x}$

Answer

$(-\infty, -2] \cup [4, \infty)$

102. $\dfrac{4}{x-2} < \dfrac{3}{x+1}$

Solve an Inequality with Rational Functions

In the following exercises, solve each rational function inequality and write the solution in interval notation

103. Given the function, $R(x) = \dfrac{x-5}{x-2}$, find the values of x that make the function greater than or equal to 0.

Answer

$(-\infty, 2) \cup [5, \infty)$

104. Given the function, $R(x) = \dfrac{x+1}{x+3}$, find the values of x that make the function greater than or equal to 0.

105. The function $C(x) = 150x + 100,000$ represents the cost to produce x, number of items. Find

a. The average cost function, $c(x)$
b. How many items should be produced so that the average cost is less than $160.

Answer

a. $c(x) = \dfrac{150x + 100000}{x}$
b. More than 10,000 items must be produced to keep the average cost below $160 per item.

106. Tillman is starting his own business by selling tacos at the beach. Accounting for the cost of his food truck and ingredients for the tacos, the function $C(x) = 2x + 6,000$ represents the cost for Tillman to produce x, tacos. Find

a. The average cost function, $c(x)$ for Tillman's Tacos
b. How many tacos should Tillman produce so that the average cost is less than $4.

Practice Test

In the following exercises, simplify.

1. $\dfrac{4a^2b}{12ab^2}$

Answer

$\dfrac{a}{3b}$

2. $\dfrac{6x-18}{x^2-9}$

In the following exercises, perform the indicated operation and simplify.

3. $\dfrac{4x}{x+2} \cdot \dfrac{x^2+5x+6}{12x^2}$

Answer

$\frac{x+3}{3x}$

4. $\frac{2y^2}{y^2-1} \div \frac{y^3-y^2+y}{y^3-1}$

5. $\frac{6x^2-x+20}{x^2-81} - \frac{5x^2+11x-7}{x^2-81}$

Answer

$\frac{x-3}{x+9}$

6. $\frac{-3a}{3a-3} + \frac{5a}{a^2+3a-4}$

7. $\frac{2n^2+8n-1}{n^2-1} - \frac{n^2-7n-1}{1-n^2}$

Answer

$\frac{3n-2}{n-1}$

8. $\frac{10x^2+16x-7}{8x-3} + \frac{2x^2+3x-1}{3-8x}$

9. $\frac{\frac{1}{m}-\frac{1}{n}}{\frac{1}{n}+\frac{1}{m}}$

Answer

$\frac{n-m}{m+n}$

In the following exercises, solve each equation.

10. $\frac{1}{x} + \frac{3}{4} = \frac{5}{8}$

11. $\frac{1}{z-5} + \frac{1}{z+5} = \frac{1}{z^2-25}$

Answer

$z = \frac{1}{2}$

12. $\frac{z}{2z+8} - \frac{3}{4z-8} = \frac{3z^2-16z-16}{8z^2+2z-64}$

In the following exercises, solve each rational inequality and write the solution in interval notation.

13. $\frac{6x}{x-6} \leq 2$

Answer

$[-3, 6)$

14. $\dfrac{2x+3}{x-6} > 1$

15. $\dfrac{1}{2} + \dfrac{12}{x^2} \geq \dfrac{5}{x}$

Answer

$(-\infty, 0) \cup (0, 4] \cup [6, \infty)$

In the following exercises, find $R(x)$ given $f(x) = \dfrac{x-4}{x^2-3x-10}$ and $g(x) = \dfrac{x-5}{x^2-2x-8}$.

16. $R(x) = f(x) - g(x)$

17. $R(x) = f(x) \cdot g(x)$

Answer

$R(x) = \dfrac{1}{(x+2)(x+2)}$

18. $R(x) = f(x) \div g(x)$

19. Given the function, $R(x) = \dfrac{2}{2x^2+x-15}$, find the values of x that make the function less than or equal to 0.

Answer

$(2, 5]$

In the following exercises, solve.

20. If y varies directly with x, and $x = 5$ when $y = 30$, find x when $y = 42$.

21. If y varies inversely with the square of x and $x = 3$ when $y = 9$, find y when $x = 4$.

Answer

$y = \dfrac{81}{16}$

22. Matheus can ride his bike for 30 miles with the wind in the same amount of time that he can go 21 miles against the wind. If the wind's speed is 6 mph, what is Matheus' speed on his bike?

23. Oliver can split a truckload of logs in 8 hours, but working with his dad they can get it done in 3 hours. How long would it take Oliver's dad working alone to split the logs?

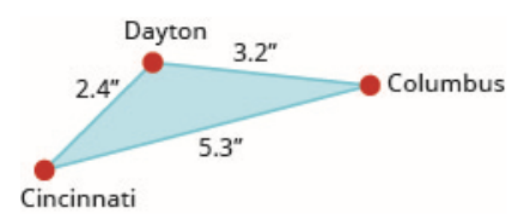
Answer

Oliver's dad would take $4\dfrac{4}{5}$ hours to split the logs himself.

24. The volume of a gas in a container varies inversely with the pressure on the gas. If a container of nitrogen has a volume of 29.5 liters with 2000 psi, what is the volume if the tank has a 14.7 psi rating? Round to the nearest whole number.

25.

The cities of Dayton, Columbus, and Cincinnati form a triangle in southern Ohio. The diagram gives the map distances between these cities in inches.



The actual distance from Dayton to Cincinnati is 48 miles. What is the actual distance between Dayton and Columbus?

Answer

The distance between Dayton and Columbus is 64 miles.

16.1: Relations and Functions

Learning Objectives

By the end of this section, you will be able to:

- Find the domain and range of a relation
- Determine if a relation is a function
- Find the value of a function

Before you get started, take this readiness quiz.

1. Evaluate $3x-5$ when $x=-2$.
   If you missed this problem, review [link].
2. Evaluate $2x^2-x-3$ when $x=a$.
   If you missed this problem, review [link].
3. Simplify: $7x-1-4x+5$.
   If you missed this problem, review [link].

Find the Domain and Range of a Relation

As we go about our daily lives, we have many data items or quantities that are paired to our names. Our social security number, student ID number, email address, phone number and our birthday are matched to our name. There is a relationship between our name and each of those items.

When your professor gets her class roster, the names of all the students in the class are listed in one column and then the student ID number is likely to be in the next column. If we think of the correspondence as a set of ordered pairs, where the first element is a student name and the second element is that student's ID number, we call this a **relation**.

$$(\text{Student name},\ \text{Student ID }\#)$$

The set of all the names of the students in the class is called the **domain** of the relation and the set of all student ID numbers paired with these students is the range of the relation.

There are many similar situations where one variable is paired or matched with another. The set of ordered pairs that records this matching is a relation.

Definition: Relation

A **relation** is any set of ordered pairs, (x,y). All the x-values in the ordered pairs together make up the **domain**. All the y-values in the ordered pairs together make up the **range**.

Example 16.1.1

For the relation $(1,1),(2,4),(3,9),(4,16),(5,25)$:

a. Find the domain of the relation.
b. Find the range of the relation.

Answer

$\{(1,1),(2,4),(3,9),(4,16),(5,25)\}$

ⓐ The domain is the set of all x-values of the relation. $\{1,2,3,4,5\}$

ⓑ The range is the set of all y-values of the relation. $\{1,4,9,16,25\}$

Example 16.1.2

For the relation $\{(1,1),(2,8),(3,27),(4,64),(5,125)\}$

a. Find the domain of the relation.
b. Find the range of the relation.

Answer a

$\{1,2,3,4,5\}$

Answer b

$\{1,8,27,64,125\}$

Example 16.1.3

For the relation $\{(1,3),(2,6),(3,9),(4,12),(5,15)\}$

a. Find the domain of the relation.
b. Find the range of the relation.

Answer a

$\{1,2,3,4,5\}$

Answer b

$\{3,6,9,12,15\}$

MAPPING

A **mapping** is sometimes used to show a relation. The arrows show the pairing of the elements of the domain with the elements of the range.

Example 16.1.4

Use the **mapping** of the relation shown to

a. list the ordered pairs of the relation,
b. find the domain of the relation, and
c. find the range of the relation.

Answer

ⓐ The arrow shows the matching of the person to their birthday. We create ordered pairs with the person's name as the *x*-value and their birthday as the *y*-value.

{(Alison, April 25), (Penelope, May 23), (June, August 2), (Gregory, September 15), (Geoffrey, January 12), (Lauren, May 10), (Stephen, July 24), (Alice, February 3), (Liz, August 2), (Danny, July 24)}

ⓑ The domain is the set of all x-values of the relation.

{Alison, Penelope, June, Gregory, Geoffrey, Lauren, Stephen, Alice, Liz, Danny}

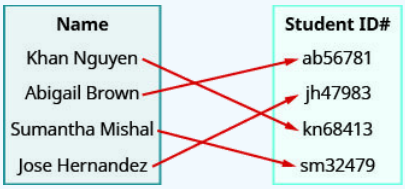
ⓒ The range is the set of all y-values of the relation.

{January 12, February 3, April 25, May 10, May 23, July 24, August 2, September 15}

Example 16.1.5

Use the mapping of the relation shown to

a. list the ordered pairs of the relation
b. find the domain of the relation
c. find the range of the relation.



Answer

ⓐ (Khanh Nguyen, kn68413), (Abigail Brown, ab56781), (Sumantha Mishal, sm32479), (Jose Hern and ez, jh47983)

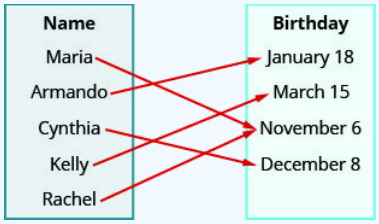
ⓑ {Khanh Nguyen, Abigail Brown, Sumantha Mishal, Jose Hern and ez}

ⓒ {kn68413, ab56781, sm32479, jh47983}

Example 16.1.6

Use the mapping of the relation shown to

a. list the ordered pairs of the relation
b. find the domain of the relation
c. find the range of the relation.



Answer

ⓐ (Maria, November 6), (Arm and o, January 18), (Cynthia, December 8), (Kelly, March 15), (Rachel, November 6)

ⓑ {Maria, Arm and o, Cynthia, Kelly, Rachel}

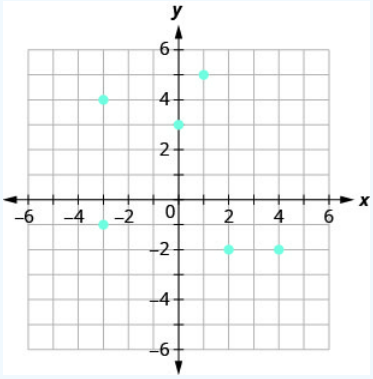
ⓒ{November 6, January 18, December 8, March 15}

A graph is yet another way that a relation can be represented. The set of ordered pairs of all the points plotted is the relation. The set of all x-coordinates is the domain of the relation and the set of all y-coordinates is the range. Generally we write the numbers in ascending order for both the domain and range.

Example 16.1.7

Use the graph of the relation to

a. list the ordered pairs of the relation
b. find the domain of the relation
c. find the range of the relation.



Answer

ⓐ The ordered pairs of the relation are:

$$\{(1,5),(-3,-1),(4,-2),(0,3),(2,-2),(-3,4)\}.$$

ⓑ The domain is the set of all x-values of the relation: $\{-3,0,1,2,4\}$

Notice that while -3 repeats, it is only listed once.

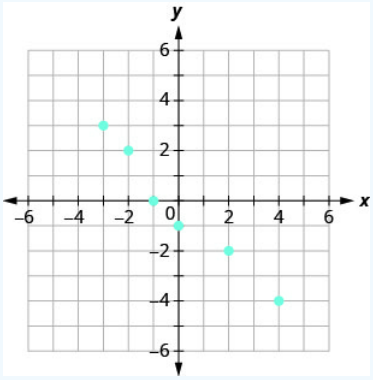
ⓒ The range is the set of all y-values of the relation: $\{-2,-1,3,4,5\}$

Notice that while -2 repeats, it is only listed once.

Example 16.1.8

Use the graph of the relation to

a. list the ordered pairs of the relation
b. find the domain of the relation
c. find the range of the relation.



Answer

a. $(-3,3),(-2,2),(-1,0),(0,-1),(2,-2),(4,-4)$

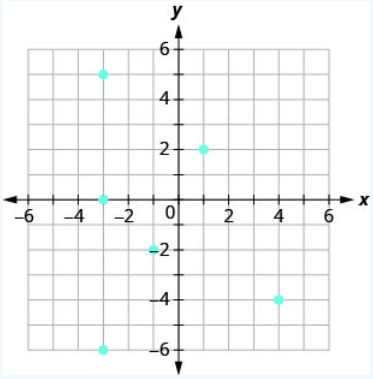
b. $\{-3,-2,-1,0,2,4\}$

c. $\{3, 2, 0, -1, -2, -4\}$

Example 16.1.9

Use the graph of the relation to

a. list the ordered pairs of the relation
b. find the domain of the relation
c. find the range of the relation.



Answer

ⓐ $(-3, 0), (-3, 5), (-3, -6), (-1, -2), (1, 2), (4, -4)$
ⓑ $\{-3, -1, 1, 4\}$
ⓒ $\{-6, 0, 5, -2, 2, -4\}$

Determine if a Relation is a Function

A special type of relation, called a **function**, occurs extensively in mathematics. A function is a relation that assigns to each element in its domain exactly one element in the range. For each ordered pair in the relation, each *x*-value is matched with only one *y*-value.

Definition: Function

A **function** is a relation that assigns to each element in its domain exactly one element in the range.

The birthday example from Example helps us understand this definition. Every person has a birthday but no one has two birthdays. It is okay for two people to share a birthday. It is okay that Danny and Stephen share July 24th as their birthday and that June and Liz share August 2nd. Since each person has exactly one birthday, the relation in Example is a function.

The relation shown by the graph in Example includes the ordered pairs $(-3, -1)$ and $(-3, 4)$. Is that okay in a function? No, as this is like one person having two different birthdays.

Example 16.1.10

Use the set of ordered pairs to (i) determine whether the relation is a function (ii) find the domain of the relation (iii) find the range of the relation.

a. $\{(-3, 27), (-2, 8), (-1, 1), (0, 0), (1, 1), (2, 8), (3, 27)\}$
b. $\{(9, -3), (4, -2), (1, -1), (0, 0), (1, 1), (4, 2), (9, 3)\}$

Answer

ⓐ $\{(-3, 27), (-2, 8), (-1, 1), (0, 0), (1, 1), (2, 8), (3, 27)\}$

(i) Each x-value is matched with only one y-value. So this relation is a function.

(ii) The domain is the set of all x-values in the relation.
The domain is: $\{-3, -2, -1, 0, 1, 2, 3\}$

(iii) The range is the set of all y-values in the relation. Notice we do not list range values twice.
The range is: $\{27, 8, 1, 0\}$

ⓑ $\{(9, -3), (4, -2), (1, -1), (0, 0), (1, 1), (4, 2), (9, 3)\}$

(i) The x-value 9 is matched with two y-values, both 3 and -3. So this relation is not a function.

(ii) The domain is the set of all x-values in the relation. Notice we do not list domain values twice.
The domain is: $\{0, 1, 2, 4, 9\}$

(iii) The range is the set of all y-values in the relation.
The range is: $\{-3, -2, -1, 0, 1, 2, 3\}$

Example 16.1.11

Use the set of ordered pairs to (i) determine whether the relation is a function (ii) find the domain of the relation (iii) find the range of the function.

a. $\{(-3, -6), (-2, -4), (-1, -2), (0, 0), (1, 2), (2, 4), (3, 6)\}$
b. $\{(8, -4), (4, -2), (2, -1), (0, 0), (2, 1), (4, 2), (8, 4)\}$

Answer

ⓐ Yes; $\{-3, -2, -1, 0, 1, 2, 3\}$
$\{-6, -4, -2, 0, 2, 4, 6\}$
ⓑ No; $\{0, 2, 4, 8\}$
$\{-4, -2, -1, 0, 1, 2, 4\}$

Example 16.1.12

Use the set of ordered pairs to (i) determine whether the relation is a function (ii) find the domain of the relation (iii) find the range of the relation.

a. $\{(27, -3), (8, -2), (1, -1), (0, 0), (1, 1), (8, 2), (27, 3)\}$
b. $\{(7, -3), (-5, -4), (8, -0), (0, 0), (-6, 4), (-2, 2), (-1, 3)\}$

Answer

ⓐ No; $\{0, 1, 8, 27\}$
$\{-3, -2, -1, 0, 2, 2, 3\}$
ⓑ Yes; $\{7, -5, 8, 0, -6, -2, -1\}$
$\{-3, -4, 0, 4, 2, 3\}$

Example 16.1.13

Use the mapping to

a. determine whether the relation is a function
b. find the domain of the relation
c. find the range of the relation.

NAME	PHONE

Lydia	321-549-3327 427-658-2314
Eugene	321-964-7324
Janet	684-358-7961
Rick	
Marty	684-369-7231 798-367-8541

Answer

ⓐ Both Lydia and Marty have two phone numbers. So each x-value is not matched with only one y-value. So this relation is not a function.

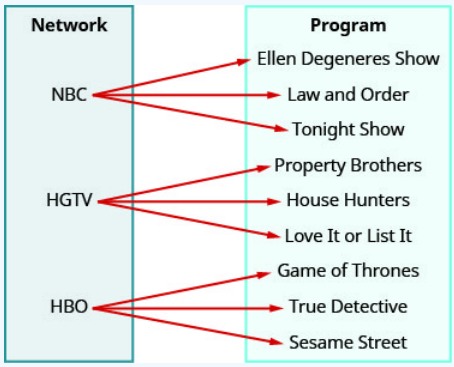
ⓑ The domain is the set of all x-values in the relation. The domain is: {Lydia, Eugene, Janet, Rick, Marty}

ⓒ The range is the set of all y-values in the relation. The range is:

$\{321-549-3327, 427-658-2314, 321-964-7324, 684-358-7961, 684-369-7231, 798-367-8541\}$

Example 16.1.14

Use the mapping to ⓐ determine whether the relation is a function ⓑ find the domain of the relation ⓒ find the range of the relation.



Answer

ⓐ no ⓑ {NBC, HGTV, HBO} ⓒ {Ellen Degeneres Show, Law and Order, Tonight Show, Property Brothers, House Hunters, Love it or List it, Game of Thrones, True Detective, Sesame Street}

Example 16.1.15

Use the mapping to

a. determine whether the relation is a function
b. find the domain of the relation
c. find the range of the relation.

Neal	123-567-4839 work 231-378-5941 cell
Krystal	743-469-9731 cell
Kelvin	567-534-2970 work
George	684-369-7231 cell
Christa	684-369-7231 cell
Mike	639-847-6971 cell

Answer

ⓐ No ⓑ {Neal, Krystal, Kelvin, George, Christa, Mike} ⓒ {123-567-4839 work, 231-378-5941 cell, 743-469-9731 cell, 567-534-2970 work, 684-369-7231 cell, 798-367-8541 cell, 639-847-6971 cell}

In algebra, more often than not, functions will be represented by an equation. It is easiest to see if the equation is a function when it is solved for *y*. If each value of *x* results in only one value of *y*, then the equation defines a function.

? Example 16.1.16

Determine whether each equation is a function.

a. $2x+y=7$
b. $y=x^2+1$
c. $x+y^2=3$

Answer

ⓐ $2x+y=7$

For each value of *x*, we multiply it by -2 and then add 7 to get the *y*-value

	$y=-2x+7$
For example, if $x=3$:	$y=-2\cdot 3+7$
	$y=1$

We have that when $x=3$, then $y=1$. It would work similarly for any value of *x*. Since each value of *x*, corresponds to only one value of *y* the equation defines a function.

ⓑ $y=x^2+1$

For each value of *x*, we square it and then add 1 to get the *y*-value.

	$y=x^2+1$
For example, if $x=2$:	$y=2^2+1$
	$y=5$

We have that when $x=2$, then $y=5$. It would work similarly for any value of *x*. Since each value of *x*, corresponds to only one value of *y* the equation defines a function.

ⓒ

	$x+y^2=3$
Isolate the y term.	$y^2=-x+3$
Let's substitute $x=2$.	$y^2=-2+3$
	$y^2=1$
This give us two values for y.	$y=1\ y=-1$

We have shown that when $x=2$, then $y=1$ and $y=-1$. It would work similarly for any value of x. Since each value of x does not corresponds to only one value of y the equation does not define a function.

Example 16.1.17

Determine whether each equation is a function.

a. $4x+y=-3$
b. $x+y^2=1$
c. $y-x^2=2$

Answer

ⓐ yes ⓑ no ⓒ yes

Example 16.1.18

Determine whether each equation is a function.

a. $x+y^2=4$
b. $y=x^2-7$
c. $y=5x-4$

Answer

ⓐ no ⓑ yes ⓒ yes

Find the Value of a Function

It is very convenient to name a function and most often we name it f, g, h, F, G, or H. In any function, for each x-value from the domain we get a corresponding y-value in the range. For the function f, we write this range value y as $f(x)$. This is called **function notation** and is read f of x or the value of f at x. In this case the parentheses does not indicate multiplication.

Definition: Function Notation

For the function $y=f(x)$

f is the name of the function
x is the domain value
$f(x)$ is the range value y corresponding to the value x

We read $f(x)$ as f of x or the value of f at x.

We call x the independent variable as it can be any value in the domain. We call y the dependent variable as its value depends on x.

INDEPENDENT AND DEPENDENT VARIABLES

For the function $y = f(x)$,

x is the independent variable as it can be any value in the domain
y the dependent variable as its value depends on x

Much as when you first encountered the variable *x*, function notation may be rather unsettling. It seems strange because it is new. You will feel more comfortable with the notation as you use it.

Let's look at the equation $y = 4x - 5$. To find the value of *y* when $x = 2$, we know to substitute $x = 2$ into the equation and then simplify.

	$y = 4x - 5$
Let x=2.	$y = 4 \cdot 2 - 5$
	$y = 3$

The value of the function at $x = 2$ is 3.

We do the same thing using function notation, the equation $y = 4x - 5$ can be written as $f(x) = 4x - 5$. To find the value when $x = 2$, we write:

	$f(x) = 4x - 5$
Let x=2.	$f(2) = 4 \cdot 2 - 5$
	$f(2) = 3$

The value of the function at $x = 2$ is 3.

This process of finding the value of $f(x)$ for a given value of *x* is called *evaluating the function.*

Example 16.1.19

For the function $f(x) = 2x^2 + 3x - 1$, evaluate the function.

a. $f(3)$
b. $f(-2)$
c. $f(a)$

Answer

ⓐ

	$f(x) = 2x^2 + 3x - 1$
To evaluate $f(3)$, substitute 3 for *x*.	$f(3) = 2(3)^2 + 3 \cdot 3 - 1$
Simplify.	$f(3) = 2 \cdot 9 + 3 \cdot 3 - 1$
	$f(3) = 18 + 9 - 1$
	$f(3) = 26$

ⓑ

		$f(x) = 2x^2 + 3x - 1$
To evaluate $f(-2)$, substitute -2 for *x*.		$f(-2) = 2(-2)^2 + 3(-2) - 1$

Simplify.		$f(-2) = 2 \cdot 4 + (-6) - 1$
		$f(-2) = 8 + (-6) - 1$
		$f(-2) = 1$

ⓒ

	$f(x) = 2x^2 + 3x - 1$
To evaluate f(a),f(a), substitute a for x.	$f(a) = 2(a)^2 + 3 \cdot a - 1$
Simplify.	$f(a) = 2a^2 + 3a - 1$

Example 16.1.20

For the function $f(x) = 3x^2 - 2x + 1$, evaluate the function.

a. $f(3)$
b. $f(-1)$
c. $f(t)$

Answer

ⓐ $f(3) = 22$ ⓑ $f(-1) = 6$ ⓒ $f(t) = 3t^2 - 2t - 1$

Example 16.1.21

For the function $f(x) = 2x^2 + 4x - 3$, evaluate the function.

a. $f(2)$
b. $f(-3)$
c. $f(h)$

Answer

ⓐ $(2) = 13$ ⓑ $f(-3) = 3$
ⓒ $f(h) = 2h2 + 4h - 3$

In the last example, we found $f(x)$ for a constant value of x. In the next example, we are asked to find $g(x)$ with values of x that are variables. We still follow the same procedure and substitute the variables in for the x.

Example 16.1.22

For the function $g(x) = 3x - 5$, evaluate the function.

a. $g(h^2)$
b. $g(x + 2)$
c. $g(x) + g(2)$

Answer

ⓐ

			$g(x) = 3x - 5$
To evaluate $g(h^2)$, substitute h^2 for x.			$g(h^2) = 3h^2 - 5$

			$g(h^2) = 3h^2 - 5$

ⓑ

	$g(x) = 3x - 5$
To evaluate $g(x+2)$, substitute $x+2$ for x.	$g(x+2) = 3(x+2) - 5$
Simplify.	$g(x+2) = 3x + 6 - 5$
	$g(x+2) = 3x + 1$

ⓒ

		$g(x) = 3x - 5$
To evaluate $g(x) + g(2)$, first find $g(2)$.		$g(2) = 3 \cdot 2 - 5$
		$g(2) = 1$
Now find $g(x) + g(2)$		$g(x) + g(2) = \underbrace{3x - 5}_{g(x)} + \underbrace{1}_{g(2)}$
Simplify.		$g(x) + g(2) = 3x - 5 + 1$
		$g(x) + g(2) = 3x - 4$

Notice the difference between part ⓑ and ⓒ. We get $g(x+2) = 3x+1$ and $g(x) + g(2) = 3x - 4$. So we see that $g(x+2) \neq g(x) + g(2)$.

Example 16.1.23

For the function $g(x) = 4x - 7$, evaluate the function.

a. $g(m^2)$
b. $g(x-3)$
c. $g(x) - g(3)$

Answer

ⓐ $4m^2 - 7$ ⓑ $4x - 19$
ⓒ $x - 12$

Example 16.1.24

For the function $h(x) = 2x + 1$, evaluate the function.

a. $h(k^2)$
b. $h(x+1)$
c. $h(x) + h(1)$

Answer

ⓐ $2k^2 + 1$ ⓑ $2x + 3$
ⓒ $2x + 4$

Many everyday situations can be modeled using functions.

Example 16.1.25

The number of unread emails in Sylvia's account is 75. This number grows by 10 unread emails a day. The function $N(t) = 75 + 10t$ represents the relation between the number of emails, *N*, and the time, *t*, measured in days.

a. Determine the independent and dependent variable.
b. Find $N(5)$. Explain what this result means.

Answer

ⓐ The number of unread emails is a function of the number of days. The number of unread emails, *N*, depends on the number of days, *t*. Therefore, the variable *N*, is the dependent variable and the variable tt is the independent variable.

ⓑ Find $N(5)$. Explain what this result means.

	$N(t) = 75 + 10t$
Substitute in t=5.t=5.	$N(5) = 75 + 10 \cdot 5$
Simplify.	$N(5) = 75 + 50$
	$N(5) = 125$

Since 5 is the number of days, $N(5)$, is the number of unread emails after 5 days. After 5 days, there are 125 unread emails in the account.

Example 16.1.26

The number of unread emails in Bryan's account is 100. This number grows by 15 unread emails a day. The function $N(t) = 100 + 15t$ represents the relation between the number of emails, *N*, and the time, *t*, measured in days.

a. Determine the independent and dependent variable.
b. Find $N(7)]$. Explain what this result means.

Answer

ⓐ *t* IND; *N* DEP ⓑ 205; the number of unread emails in Bryan's account on the seventh day.

Example 16.1.27

The number of unread emails in Anthony's account is 110. This number grows by 25 unread emails a day. The function $N(t) = 110 + 25t$ represents the relation between the number of emails, *N*, and the time, *t*, measured in days.

a. Determine the independent and dependent variable.
b. Find $N(14)$. Explain what this result means.

Answer

ⓐ *t* IND; *N* DEP ⓑ 460; the number of unread emails in Anthony's account on the fourteenth day

Access this online resource for additional instruction and practice with relations and functions.

- Introduction to Functions

Key Concepts

- **Function Notation:** For the function $y = f(x)$
  - f is the name of the function
  - x is the domain value

- $f(x)$ is the range value y corresponding to the value x
  We read $f(x)$ as f of x or the value of f at x.

- **Independent and Dependent Variables:** For the function $y = f(x)$,
  - x is the independent variable as it can be any value in the domain
  - y is the dependent variable as its value depends on x

Glossary

domain of a relation

The domain of a relation is all the x-values in the ordered pairs of the relation.

function

A function is a relation that assigns to each element in its domain exactly one element in the range.

mapping

A mapping is sometimes used to show a relation. The arrows show the pairing of the elements of the domain with the elements of the range.

range of a relation

The range of a relation is all the y-values in the ordered pairs of the relation.

relation

A relation is any set of ordered pairs,(x,y).(x,y). All the x-values in the ordered pairs together make up the domain. All the y-values in the ordered pairs together make up the range.

16.1E: Exercises

Practice Makes Perfect

Find the Domain and Range of a Relation

In the following exercises, for each relation a. find the domain of the relation b. find the range of the relation.

1. $\{(1,4),(2,8),(3,12),(4,16),(5,20)\}$

Answer

a. $\{1,2,3,4,5\}$b. $\{4,8,12,16,20\}$

2. $\{(1,-2),(2,-4),(3,-6),(4,-8),(5,-10)\}$

3. $\{(1,7),(5,3),(7,9),(-2,-3),(-2,8)\}$

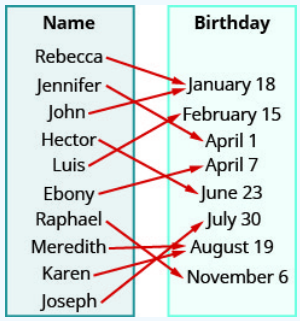
Answer

a. $\{1,5,7,-2\}$b. $\{7,3,9,-3,8\}$

4. $\{(11,3),(-2,-7),(4,-8),(4,17),(-6,9)\}$

In the following exercises, use the mapping of the relation to a. list the ordered pairs of the relation, b. find the domain of the relation, and c. find the range of the relation.

5.

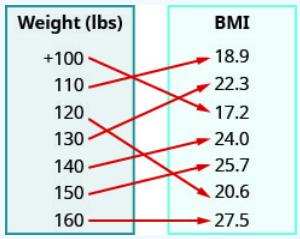


Answer

a. (Rebecca, January 18), (Jennifer, April 1), (John, January 18), (Hector, June 23), (Luis, February 15), (Ebony, April 7), (Raphael, November 6), (Meredith, August 19), (Karen, August 19), (Joseph, July 30)
b. {Rebecca, Jennifer, John, Hector, Luis, Ebony, Raphael, Meredith, Karen, Joseph}
c. {January 18, April 1, June 23, February 15, April 7, November 6, August 19, July 30}

6.

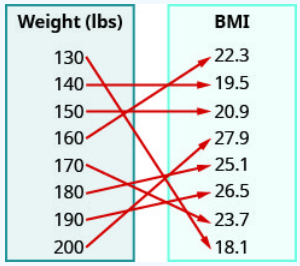
7. For a woman of height $5'4''$ the mapping below shows the corresponding Body Mass Index (BMI). The body mass index is a measurement of body fat based on height and weight. A BMI of $18.5–24.9$is considered healthy.



Answer

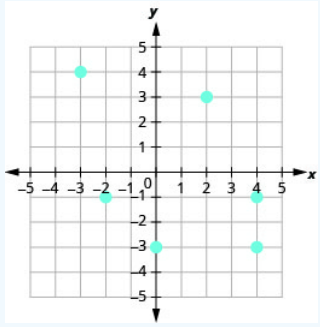
a. $(+100, 17.2), (110, 18.9), (120, 20.6), (130, 22.3), (140, 24.0), (150, 25.7), (160, 27.5)$ b. $\{+100, 110, 120, 130, 140, 150, 160\}$c. $\{17.2, 18.9, 20.6, 22.3, 24.0, 25.7, 27.5\}$

8. For a man of height $5'11''$ the mapping below shows the corresponding Body Mass Index (BMI). The body mass index is a measurement of body fat based on height and weight. A BMI of $18.5–24.9$is considered healthy.



In the following exercises, use the graph of the relation to a. list the ordered pairs of the relation b. find the domain of the relation c. find the range of the relation.

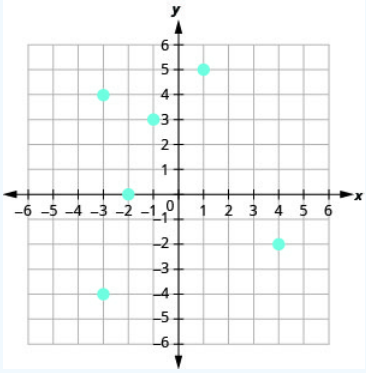
9.



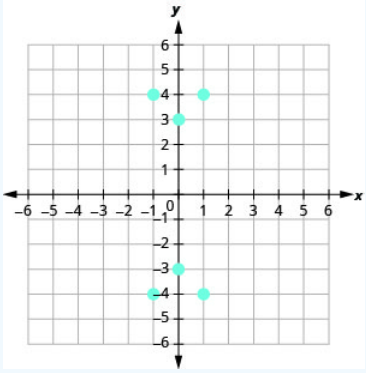
Answer

a. $(2, 3), (4, -3), (-2, -1), (-3, 4), (4, -1), (0, -3)$b. $\{-3, -2, 0, 2, 4\}$
c. $\{-3, -1, 3, 4\}$

10.



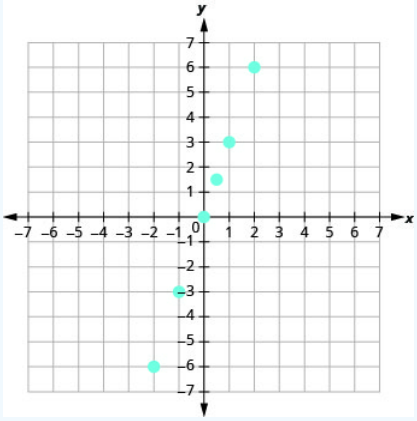
11.



Answer

a. $(1,4),(1,-4),(-1,4),(-1,-4),(0,3),(0,-3)$b. $\{-1,0,1\}$c. $\{-4,-3,3,4\}$

12.



Determine if a Relation is a Function

In the following exercises, use the set of ordered pairs to a. determine whether the relation is a function, b. find the domain of the relation, and c. find the range of the relation.

13. $\{(-3,9),(-2,4),(-1,1),(0,0),(1,1),(2,4),(3,9)\}$

Answer

a. yes b. $\{-3,-2,-1,0,1,2,3\}$c. $\{9,4,1,0\}$

14. $\{(9,-3),(4,-2),(1,-1),(0,0),(1,1),(4,2),(9,3)\}$

15. $\{(-3,27),(-2,8),(-1,1),(0,0),(1,1),(2,8),(3,27)\}$

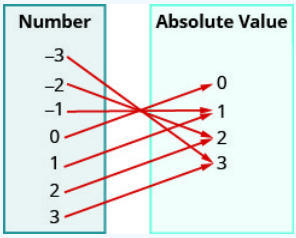
Answer

a. yes b. $\{-3,-2,-1,0,1,2,3\}$c. $\{0,1,8,27\}$

16. $\{(-3,-27),(-2,-8),(-1,-1),(0,0),(1,1),(2,8),(3,27)\}$

In the following exercises, use the mapping to a. determine whether the relation is a function, b. find the domain of the function, and c. find the range of the function.

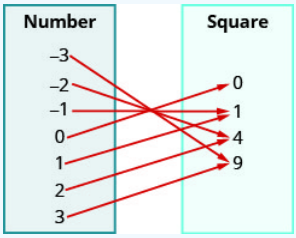
17.



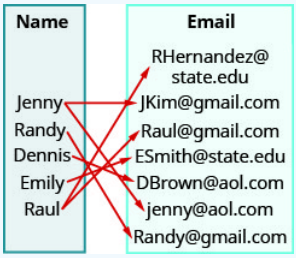
Answer

a. yes b. $\{-3,-2,-1,0,1,2,3\}$c. $\{0,1,2,3\}$

18.



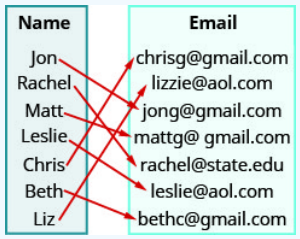
19.



Answer

a. no b. {Jenny, R and y, Dennis, Emily, Raul} c. {RHern and ez@state.edu, JKim@gmail.com, Raul@gmail.com, ESmith@state.edu, DBroen@aol.com, jenny@aol.cvom, R and y@gmail.com}

20.



In the following exercises, determine whether each equation is a function.

21. a. $2x+y=-3$
b. $y=x^2$
c. $x+y^2=-5$

Answer

a. yes b. yes c. no

22. a. $y=3x-5$
b. $y=x^3$
c. $2x+y^2=4$

23. a. $y-3x^3=2$
b. $x+y^2=3$
c. $3x-2y=6$

Answer

a. yes b. no c. yes

24. a. $2x-4y=8$
b. $-4=x^2-y$
c. $y^2=-x+5$

Find the Value of a Function

In the following exercises, evaluate the function: a. $f(2)$ b. $f(-1)$ c. $f(a)$.

25. $f(x)=5x-3$

Answer

a. $f(2)=7$ b. $f(-1)=-8$ c. $f(a)=5a-3$

26. $f(x)=3x+4$

27. $f(x)=-4x+2$

Answer

a. $f(2)=-6$ b. $f(-1)=6$ c. $f(a)=-4a+2$

28. $f(x)=-6x-3$

29. $f(x)=x^2-x+3$

Answer

a. $f(2)=5$ b. $f(-1)=5$
c. $f(a)=a^2-a+3$

30. $f(x)=x^2+x-2$

31. $f(x)=2x^2-x+3$

Answer

a. $f(2)=9$ b. $f(-1)=6$
c. $f(a)=2a^2-a+3$

32. $f(x)=3x^2+x-2$

In the following exercises, evaluate the function: a. $g(h^2)$ b. $g(x+2)$ c. $g(x)+g(2)$.

33. $g(x)=2x+1$

Answer

a. $g(h^2)=2h^2+1$
b. $g(x+2)=4x+5$
c. $g(x)+g(2)=2x+6$

34. $g(x)=5x-8$

35. $g(x)=-3x-2$

Answer

a. $g(h^2)=-3h^2-2$
b. $g(x+2)=-3x-8$
c. $g(x)+g(2)=-3x-10$

36. $g(x)=-8x+2$

37. $g(x)=3-x$

Answer

a. $g(h^2)=3-h^2$
b. $g(x+2)=1-x$
c. $g(x)+g(2)=4-x$

38. $g(x)=7-5x$

In the following exercises, evaluate the function.

39. $f(x)=3x^2-5x;\ f(2)$

Answer

2

40. $g(x) = 4x^2 - 3x$; $g(3)$

41. $F(x) = 2x^2 - 3x + 1$; $F(-1)$

Answer

6

42. $G(x) = 3x^2 - 5x + 2$; $G(-2)$

43. $h(t) = 2|t - 5| + 4$; $f(-4)$

Answer

22

44. $h(y) = 3|y - 1| - 3$; $h(-4)$

45. $f(x) = x + 2x - 1$; $f(2)$

Answer

4

46. $g(x) = x - 2x + 2$; $g(4)$

In the following exercises, solve.

47. The number of unwatched shows in Sylvia's DVR is 85. This number grows by 20 unwatched shows per week. The function $N(t) = 85 + 20t$ represents the relation between the number of unwatched shows, *N*, and the time, *t*, measured in weeks.

a. Determine the independent and dependent variable.

b. Find $N(4)$. Explain what this result means

Answer

a. *t* IND; *N* DEP
b. $N(4) = 165$ the number of unwatched shows in Sylvia's DVR at the fourth week.

48. Every day a new puzzle is downloaded into Ken's account. Right now he has 43 puzzles in his account. The function $N(t) = 43 + t$ represents the relation between the number of puzzles, *N*, and the time, *t*, measured in days.

a. Determine the independent and dependent variable.

b. Find $N(30)$. Explain what this result means.

49. The daily cost to the printing company to print a book is modeled by the function $C(x) = 3.25x + 1500$ where *C* is the total daily cost and *x* is the number of books printed.

a. Determine the independent and dependent variable.

b. Find $N(0)$. Explain what this result means.

c. Find $N(1000)$. Explain what this result means.

Answer

a. x IND; C DEP
b. $N(0) = 1500$ the daily cost if no books are printed
c. $N(1000) = 4750$the daily cost of printing 1000 books

50. The daily cost to the manufacturing company is modeled by the function $C(x) = 7.25x + 2500$ where $C(x)$ is the total daily cost and x is the number of items manufactured.

a. Determine the independent and dependent variable.

b. Find $C(0)$. Explain what this result means.

c. Find $C(1000)$. Explain what this result means.

Writing Exercises

51. In your own words, explain the difference between a relation and a function.

52. In your own words, explain what is meant by domain and range.

53. Is every relation a function? Is every function a relation?

54. How do you find the value of a function?

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find the domain and range of a relation.			
determine if a relation is a function.			
find the value of a function.			

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

16.2: Basic Classes of Functions

We have studied the general characteristics of functions, so now let's examine some specific classes of functions. We begin by reviewing the basic properties of linear and quadratic functions, and then generalize to include higher-degree polynomials. By combining root functions with polynomials, we can define general algebraic functions and distinguish them from the transcendental functions we examine later in this chapter. We finish the section with examples of piecewise-defined functions and take a look at how to sketch the graph of a function that has been shifted, stretched, or reflected from its initial form.

Linear Functions and Slope

The easiest type of function to consider is a **linear function**. Linear functions have the form $f(x) = ax + b$, where a and b are constants. In Figure 16.2.1, we see examples of linear functions when a is positive, negative, and zero. Note that if $a > 0$, the graph of the line rises as x increases. In other words, $f(x) = ax + b$ is increasing on $(-\infty, \infty)$. If $a < 0$, the graph of the line falls as x increases. In this case, $f(x) = ax + b$ is decreasing on $(-\infty, \infty)$. If $a = 0$, the line is horizontal.

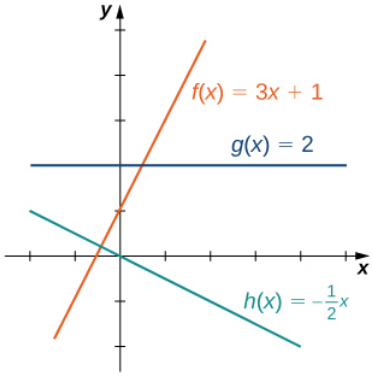

***Figure* 16.2.1:** *These linear functions are increasing or decreasing on (∞, ∞) and one function is a horizontal line.*

As suggested by Figure, the graph of any linear function is a line. One of the distinguishing features of a line is its slope. The **slope** is the change in y for each unit change in x. The slope measures both the steepness and the direction of a line. If the slope is positive, the line points upward when moving from left to right. If the slope is negative, the line points downward when moving from left to right. If the slope is zero, the line is horizontal. To calculate the slope of a line, we need to determine the ratio of the change in y versus the change in x. To do so, we choose any two points (x_1, y_1) and (x_2, y_2) on the line and calculate $\dfrac{y_2 - y_1}{x_2 - x_1}$. In Figure 16.2.2, we see this ratio is independent of the points chosen.

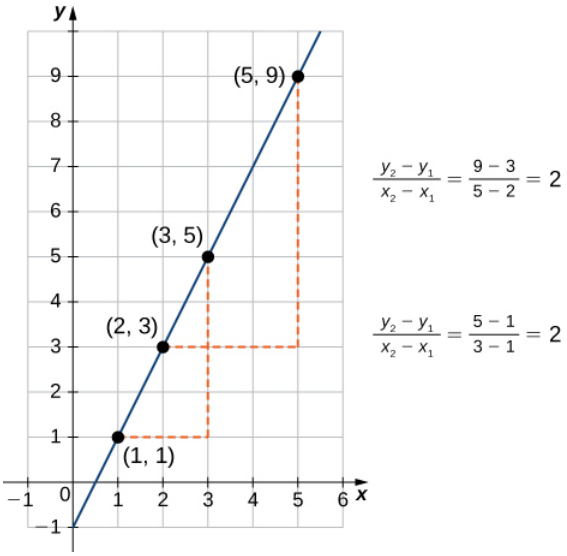

***Figure* 16.2.2**: *For any linear function, the slope $(y_2 - y_1)/(x_2 - x_1)$ is independent of the choice of points (x_1, y_1) and (x_2, y_2) on the line.*

Definition: Linear Functions

Consider line L passing through points (x_1, y_1) and (x_2, y_2). Let $\Delta y = y_2 - y_1$ and $\Delta x = x_2 - x_1$ denote the changes in y and x,respectively. The slope of the line is

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\Delta y}{\Delta x} \tag{16.2.1}$$

We now examine the relationship between slope and the formula for a linear function. Consider the linear function given by the formula $f(x) = ax + b$. As discussed earlier, we know the graph of a linear function is given by a line. We can use our definition of slope to calculate the slope of this line. As shown, we can determine the slope by calculating $(y_2 - y_1)/(x_2 - x_1)$ for any points (x_1, y_1) and (x_2, y_2) on the line. Evaluating the function f at $x = 0$, we see that $(0, b)$ is a point on this line. Evaluating this function at $x = 1$, we see that $(1, a + b)$ is also a point on this line. Therefore, the slope of this line is

$$\frac{(a+b) - b}{1 - 0} = a. \tag{16.2.2}$$

We have shown that the coefficient a is the slope of the line. We can conclude that the formula $f(x) = ax + b$ describes a line with slope a. Furthermore, because this line intersects the y-axis at the point $(0, b)$, we see that the y-intercept for this linear function is $(0, b)$. We conclude that the formula $f(x) = ax + b$ tells us the slope, a, and the y-intercept, $(0, b)$, for this line. Since we often use the symbol m to denote the slope of a line, we can write

$$f(x) = mx + b \tag{16.2.3}$$

to denote the **slope-intercept form** of a linear function.

Sometimes it is convenient to express a linear function in different ways. For example, suppose the graph of a linear function passes through the point (x_1, y_1) and the slope of the line is m. Since any other point $(x, f(x))$ on the graph of f must satisfy the equation

$$m = \frac{f(x) - y_1}{x - x_1}, \tag{16.2.4}$$

this linear function can be expressed by writing

$$f(x) - y_1 = m(x - x_1). \tag{16.2.5}$$

We call this equation the **point-slope equation** for that linear function.

Since every nonvertical line is the graph of a linear function, the points on a nonvertical line can be described using the slope-intercept or point-slope equations. However, a vertical line does not represent the graph of a function and cannot be expressed in either of these forms. Instead, a vertical line is described by the equation $x = k$ for some constant k. Since neither the slope-intercept form nor the point-slope form allows for vertical lines, we use the notation

$$ax + by = c, \tag{16.2.6}$$

where a, b are both not zero, to denote the **standard form of a line.**

Definition: point-slope equation, point-slope equation and the standard form of a line

Consider a line passing through the point (x_1, y_1) with slope m. The equation

$$y - y_1 = m(x - x_1) \tag{16.2.7}$$

is the *point-slope equation* for that line.

Consider a line with slope m and y-intercept $(0, b)$. The equation

$$y = mx + b \tag{16.2.8}$$

is an equation for that line in *point-slope equation.*

The *standard form of a line* is given by the equation

$$ax + by = c, \tag{16.2.9}$$

where a and b are both not zero. This form is more general because it allows for a vertical line, $x = k$.

Example 16.2.1: Finding the Slope and Equations of Lines

Consider the line passing through the points $(11, -4)$ and $(-4, 5)$, as shown in Figure.

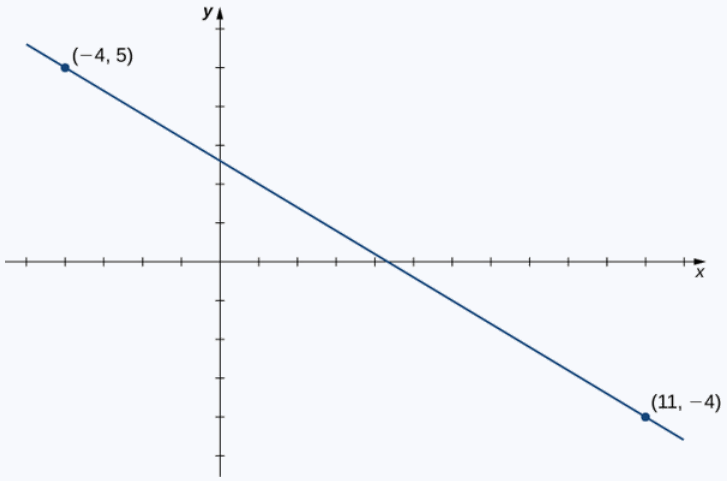

***Figure* 16.2.3:** *Finding the equation of a linear function with a graph that is a line between two given points.*

1. Find the slope of the line.
2. Find an equation for this linear function in point-slope form.
3. Find an equation for this linear function in slope-intercept form.

Solution

1. The slope of the line is

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{5 - (-4)}{-4 - 11} = -\frac{9}{15} = -\frac{3}{5}. \tag{16.2.10}$$

2. To find an equation for the linear function in point-slope form, use the slope $m = -3/5$ and choose any point on the line. If we choose the point $(11, -4)$, we get the equation

$$f(x) + 4 = -\frac{3}{5}(x - 11). \tag{16.2.11}$$

3. To find an equation for the linear function in slope-intercept form, solve the equation in part b. for $f(x)$. When we do this, we get the equation

$$f(x) = -\frac{3}{5}x + \frac{13}{5}. \tag{16.2.12}$$

Exercise 16.2.1

Consider the line passing through points $(-3, 2)$ and $(1, 4)$.

a. Find the slope of the line.
b. Find an equation of that line in point-slope form.
c. Find an equation of that line in slope-intercept form.

Hint

The slope $m = \Delta y / \Delta x$.

Answer a

$m = 1/2$.

Answer b

The point-slope form is $y-4=\frac{1}{2}(x-1)$.

Answer c

The slope-intercept form is $y=\frac{1}{2}x+\frac{7}{2}$.

Example 16.2.2:

Jessica leaves her house at 5:50 a.m. and goes for a 9-mile run. She returns to her house at 7:08 a.m. Answer the following questions, assuming Jessica runs at a constant pace.

a. Describe the distance D (in miles) Jessica runs as a linear function of her run time t (in minutes).
b. Sketch a graph of D.
c. Interpret the meaning of the slope.

Solution:

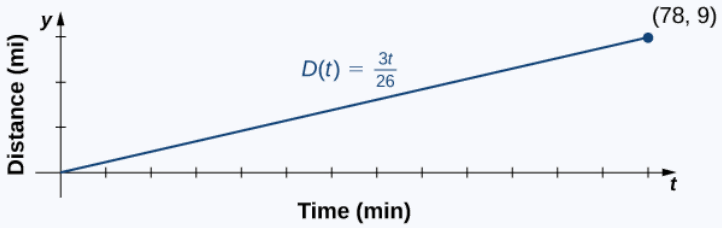
a. At time $t=0$, Jessica is at her house, so $D(0)=0$. At time $t=78$ minutes, Jessica has finished running 9 mi, so $D(78)=9$. The slope of the linear function is

$$m=\frac{9-0}{78-0}=\frac{3}{26}.$$

The y-intercept is $(0,0)$, so the equation for this linear function is

$$D(t)=\frac{3}{26}t.$$

b. To graph D, use the fact that the graph passes through the origin and has slope $m=3/26$.



c. The slope $m=3/26\approx 0.115$ describes the distance (in miles) Jessica runs per minute, or her average velocity.

Polynomials

A linear function is a special type of a more general class of functions: polynomials. A polynomial function is any function that can be written in the form

$$f(x)=a_nx^n+a_{n-1}x^{n-1}+\ldots+a_1x+a_0 \tag{16.2.13}$$

for some integer $n\geq 0$ and constants $a_n, a+n-1, \ldots, a_0$, where $a_n\neq 0$. In the case when $n=0$, we allow for $a_0=0$; if $a_0=0$, the function $f(x)=0$ is called the **zero function**. The value n is called the **degree** of the polynomial; the constant an is called the **leading coefficient**. A linear function of the form $f(x)=mx+b$ is a polynomial of degree 1 if $m\neq 0$ and degree 0 if $m=0$. A polynomial of degree 0 is also called a **constant function**. A polynomial function of degree 2 is called a **quadratic function**. In particular, a quadratic function has the form $f(x)=ax^2+bx+c$, where $a\neq 0$. A polynomial function of degree 3 is called a **cubic function**.

Power Functions

Some polynomial functions are power functions. A **power function** is any function of the form $f(x)=ax^b$, where a and b are any real numbers. The exponent in a power function can be any real number, but here we consider the case when the exponent is a positive integer. (We consider other cases later.) If the exponent is a positive integer, then $f(x)=ax^n$ is a polynomial. If n is even, then $f(x)=ax^n$ is an even function because $f(-x)=a(-x)^n=ax^n$ if n is even. If n is odd, then $f(x)=ax^n$ is an odd function because $f(-x)=a(-x)^n=-ax^n$ if n is odd (Figure 16.2.3).

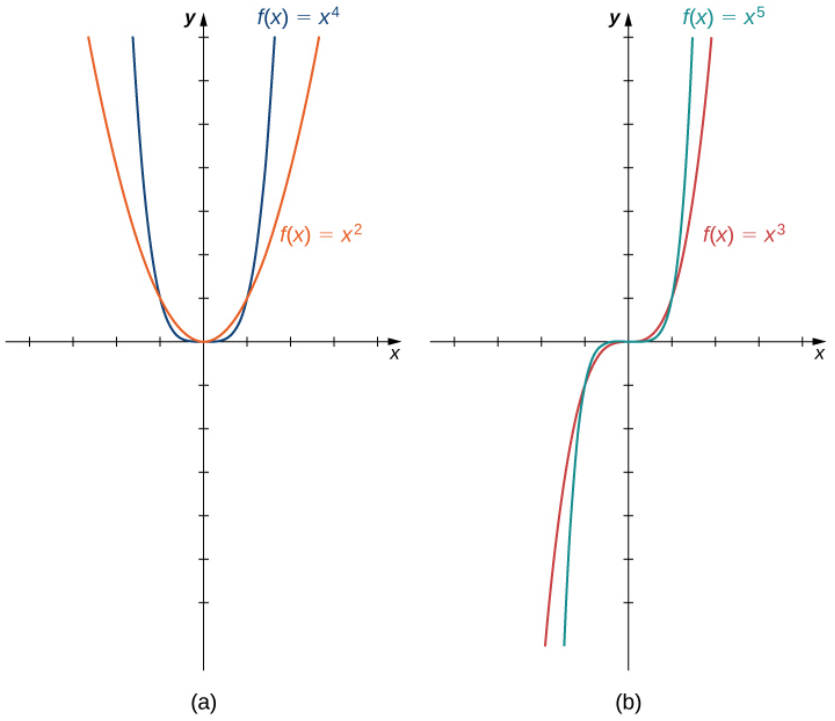


***Figure* 16.2.4:** *(a) For any even integer $n, f(x) = ax^n$ is an even function. (b) For any odd integer $n, f(x) = ax^n$ is an odd function.*

Mathematical Models

A large variety of real-world situations can be described using **mathematical models**. A mathematical model is a method of simulating real-life situations with mathematical equations. Physicists, engineers, economists, and other researchers develop models by combining observation with quantitative data to develop equations, functions, graphs, and other mathematical tools to describe the behavior of various systems accurately. Models are useful because they help predict future outcomes. Examples of mathematical models include the study of population dynamics, investigations of weather patterns, and predictions of product sales.

As an example, let's consider a mathematical model that a company could use to describe its revenue for the sale of a particular item. The amount of revenue R a company receives for the sale of n items sold at a price of p dollars per item is described by the equation $R = p \cdot n$. The company is interested in how the sales change as the price of the item changes. Suppose the data in Table show the number of units a company sells as a function of the price per item.

Number of Units Sold n (in Thousands) as a Function of Price per Unit p (in Dollars)

p	6	8	10	12	14
n	19.4	18.5	16.2	13.8	12.2

In Figure, we see the graph the number of units sold (in thousands) as a function of price (in dollars). We note from the shape of the graph that the number of units sold is likely a linear function of price per item, and the data can be closely approximated by the linear function $n = -1.04p + 26$ for $0 \le p \le 25$, where n predicts the number of units sold in thousands. Using this linear function, the revenue (in thousands of dollars) can be estimated by the quadratic function

$$R(p) = p \cdot (-1.04p + 26) = -1.04p^2 + 26p \tag{16.2.14}$$

for $0 \le p \le 25$ In Example 16.2.1, we use this quadratic function to predict the amount of revenue the company receives depending on the price the company charges per item. Note that we cannot conclude definitively the actual number of units sold for

values of p, for which no data are collected. However, given the other data values and the graph shown, it seems reasonable that the number of units sold (in thousands) if the price charged is p dollars may be close to the values predicted by the linear function $n = -1.04p + 26$.

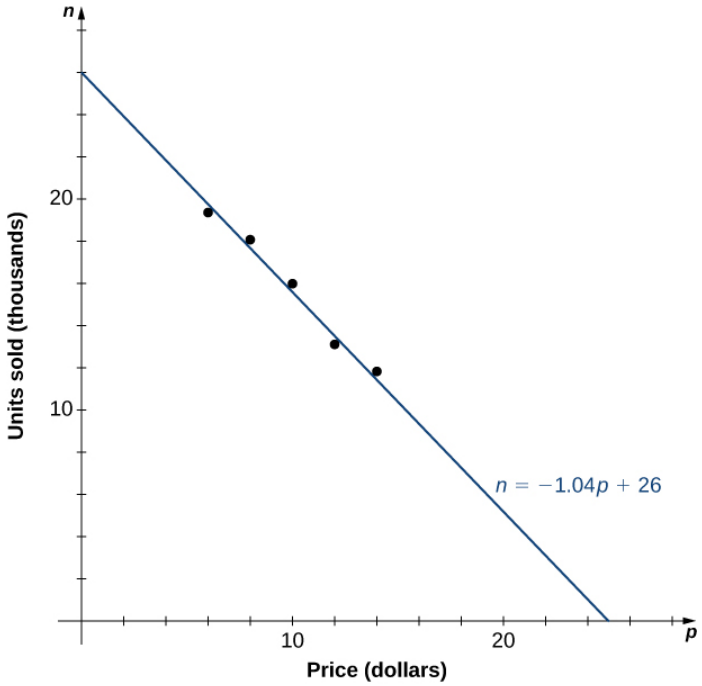

***Figure* 16.2.6:** *The data collected for the number of items sold as a function of price is roughly linear. We use the linear function $n = -1.04p + 26$ to estimate this function.*

Algebraic Functions

By allowing for quotients and fractional powers in polynomial functions, we create a larger class of functions. An **algebraic function** is one that involves addition, subtraction, multiplication, division, rational powers, and roots. Two types of algebraic functions are rational functions and root functions.

Just as rational numbers are quotients of integers, rational functions are quotients of polynomials. In particular, a **rational function** is any function of the form $f(x) = p(x)/q(x)$,where $p(x)$ and $q(x)$ are polynomials. For example,

$$f(x) = \frac{3x-1}{5x+2} \text{ and } g(x) = \frac{4}{x^2+1}$$

are rational functions. A **root function** is a power function of the form $f(x) = x^{1/n}$, where n is a positive integer greater than one. For example, f(x)=x1/2=x√ is the square-root function and $g(x) = x^{1/3} = \sqrt[3]{x})$ is the cube-root function. By allowing for compositions of root functions and rational functions, we can create other algebraic functions. For example, $f(x) = \sqrt{4-x^2}$ is an algebraic function.

Example 16.2.5: Finding Domain and Range for Algebraic Functions

For each of the following functions, find the domain and range.

a. $f(x) = \dfrac{3x-1}{5x+2}$
b. $f(x) = \sqrt{4-x^2}$

Solution

1.It is not possible to divide by zero, so the domain is the set of real numbers x such that $x \neq -2/5$. To find the range, we need to find the values y for which there exists a real number x such that

$$y = \frac{3x-1}{5x+2}$$

When we multiply both sides of this equation by $5x+2$, we see that x must satisfy the equation

$$5xy+2y=3x-1.$$

From this equation, we can see that x must satisfy

$$2y+1=x(3-5y).$$

If y=$3/5$, this equation has no solution. On the other hand, as long as $y \neq 3/5$,

$$x=\frac{2y+1}{3-5y}$$

satisfies this equation. We can conclude that the range of f is $y|y \neq 3/5$.

2. To find the domain of f, we need $4-x^2 \geq 0$. When we factor, we write $4-x^2=(2-x)(2+x) \geq 0$. This inequality holds if and only if both terms are positive or both terms are negative. For both terms to be positive, we need to find x such that

$$2-x \geq 0 \text{ and } 2+x \geq 0.$$

These two inequalities reduce to $2 \geq x$ and $x \geq -2$. Therefore, the set $x|-2 \leq x \leq 2$ must be part of the domain. For both terms to be negative, we need

$$2-x \leq 0 \text{ and } 2+x \geq 0.$$

These two inequalities also reduce to $2 \leq x$ and $x \geq -2$. There are no values of x that satisfy both of these inequalities. Thus, we can conclude the domain of this function is $x|-2 \leq x \leq 2$.

If $-2 \leq x \leq 2$, then $0 \leq 4-x^2 \leq 4$. Therefore, $0 \leq \sqrt{4-x2} \leq 2$, and the range of f is $y|0 \leq y \leq 2$.

Exercise 16.2.3

Find the domain and range for the function $f(x)=(5x+2)/(2x-1)$.

Hint

The denominator cannot be zero. Solve the equation $y=(5x+2)/(2x-1)$ for x to find the range.

Answer

The domain is the set of real numbers x such that $x \neq 1/2$. The range is the set $\{y|y \neq 5/2\}$

The root functions $f(x)=x^{1/n}$ have defining characteristics depending on whether n is odd or even. For all even integers $n \geq 2$, the domain of $f(x)=x^{1/n}$ is the interval $[0,\infty)$. For all odd integers $n \geq 1$, the domain of $f(x)=x^{1/n}$ is the set of all real numbers. Since $x^{1/n}=(-x)^{1/n}$ for odd integers n ,$f(x)=x^{1/n}$ is an odd function if$n$ is odd. See the graphs of root functions for different values of n in Figure.

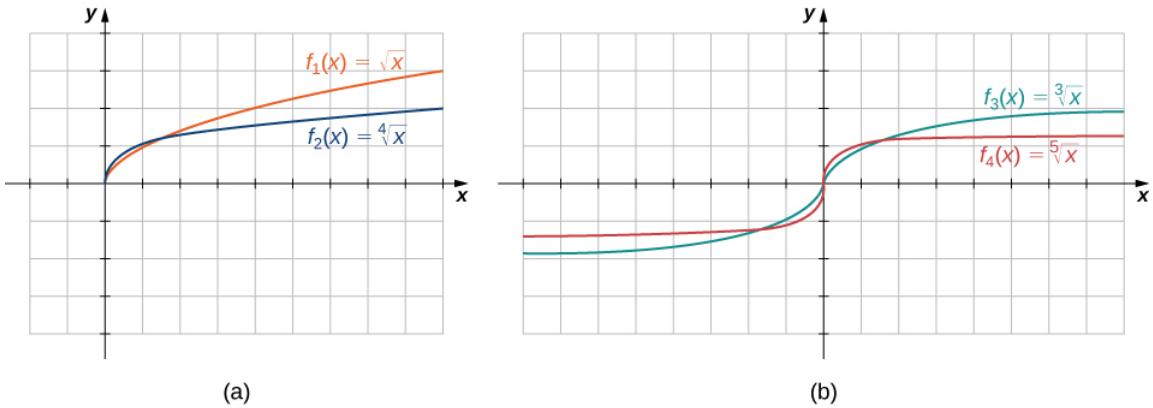

Figure* 16.2.7*: *(a) If n is even, the domain of $f(x)=\sqrt[n]{x}$ is $[0,\infty)$. (b) If n is odd, the domain of $f(x)=\frac{[}{n}]x$ is $(-\infty,\infty)$ and the function $f(x)=\frac{[}{n}]x$ is an odd function.*

Example 16.2.6: Finding Domains for Algebraic Functions

For each of the following functions, determine the domain of the function.

a. $f(x) = \dfrac{3}{x^2 - 1}$
b. $f(x) = \dfrac{2x + 5}{3x^2 + 4}$
c. $f(x) = \sqrt{4 - 3x}$
d. $f(x) = \sqrt[3]{2x - 1}$

Solution

a. You cannot divide by zero, so the domain is the set of values x such that $x^2 - 1 \neq 0$. Therefore, the domain is $x|x \neq \pm 1$.
b. You need to determine the values of x for which the denominator is zero. Since $3x^2 + 4 \geq 4$ for all real numbers x, the denominator is never zero. Therefore, the domain is $(-\infty, \infty)$.
c. Since the square root of a negative number is not a real number, the domain is the set of values x for which $4 - 3x \geq 0$. Therefore, the domain is $x|x \leq 4/3$.
d. The cube root is defined for all real numbers, so the domain is the interval $(-\infty, \infty)$.

Exercise 16.2.4

Find the domain for each of the following functions: $f(x) = (5 - 2x)/(x^2 + 2)$ and $g(x) = \sqrt{5x - 1}$.

Hint

Determine the values of x when the expression in the denominator of f is nonzero, and find the values of x when the expression inside the radical of g is nonnegative.

Answer

The domain of f is $(-\infty, \infty)$. The domain of g is $x|x \geq 1/5$.

Transformations of Functions

We have seen several cases in which we have added, subtracted, or multiplied constants to form variations of simple functions. In the previous example, for instance, we subtracted 2 from the argument of the function $y = x^2$ to get the function $f(x) = (x - 2)^2$). $This subtraction represents a shift of the function \(y = x^2$ two units to the right. A shift, horizontally or vertically, is a type of **transformation of a function**. Other transformations include horizontal and vertical scalings, and reflections about the axes.

A vertical shift of a function occurs if we add or subtract the same constant to each output y. For $c > 0$, the graph of $f(x) + c$ is a shift of the graph of $f(x)$ up c units, whereas the graph of $f(x) - c$ is a shift of the graph of $f(x)$ down c units. For example, the graph of the function $f(x) = x^3 + 4$ is the graph of $y = x^3$ shifted up 4 units; the graph of the function $f(x) = x^3 - 4$ is the graph of $y = x^3$ shifted down 4 units (Figure 16.2.6).

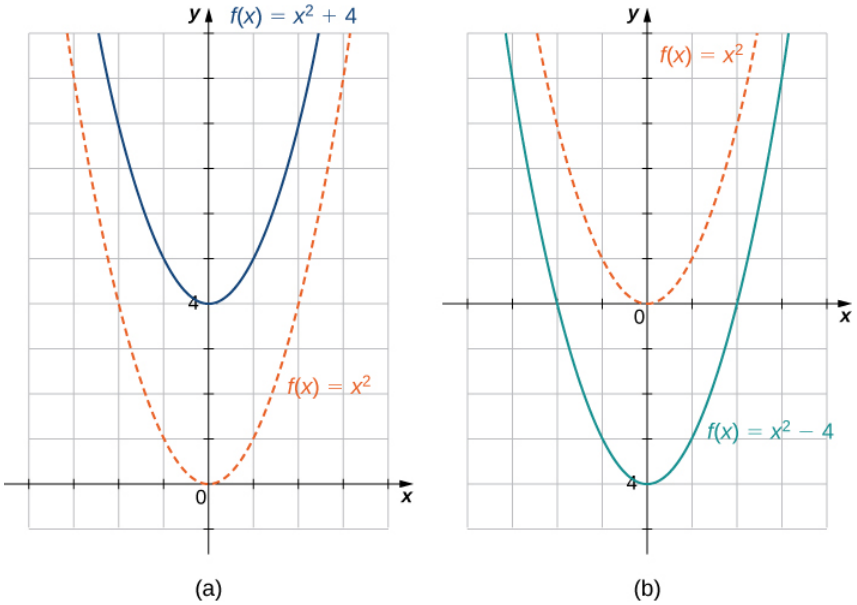

***Figure* 16.2.9:** *(a) For $c > 0$, the graph of $y = f(x) + c$ is a vertical shift up c units of the graph of $y = f(x)$. (b) For $c > 0$, the graph of $y = f(x) - c$ is a vertical shift down c units of the graph of $y = f(x)$.*

A horizontal shift of a function occurs if we add or subtract the same constant to each input x. For $c > 0$, the graph of $f(x + c)$ is a shift of the graph of $f(x)$ to the left c units; the graph of $f(x - c)$ is a shift of the graph of $f(x)$ to the right c units. Why does the graph shift left when adding a constant and shift right when subtracting a constant? To answer this question, let's look at an example.

Consider the function $f(x) = |x + 3|$ and evaluate this function at $x - 3$. Since $f(x - 3) = |x|$ and $x - 3 < x$, the graph of $f(x) = |x + 3|$ is the graph of $y = |x|$ shifted left 3 units. Similarly, the graph of $f(x) = |x - 3|$ is the graph of $y = |x|$ shifted right 3 units (Figure 16.2.7).

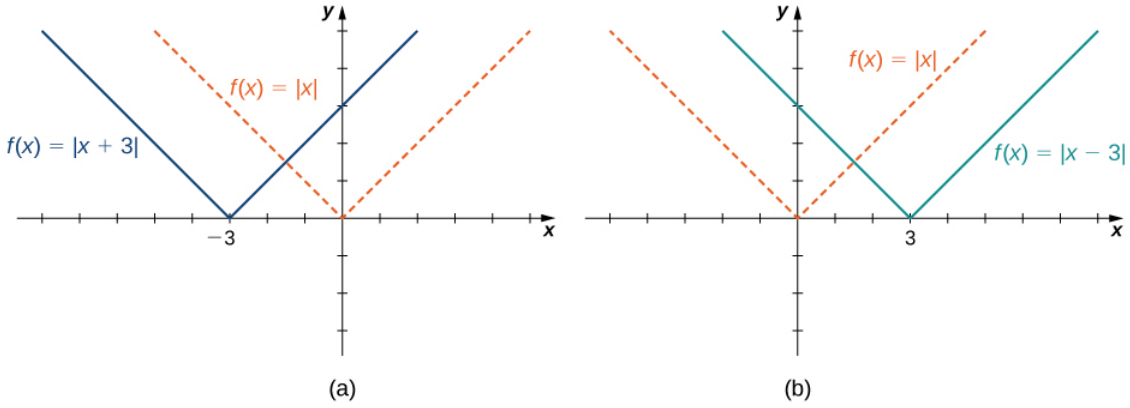

***Figure* 16.2.10:** *(a) For $c > 0$, the graph of $y = f(x + c)$ is a horizontal shift left c units of the graph of $y = f(x)$. (b) For $c > 0$, the graph of $y = f(x - c)$ is a horizontal shift right c units of the graph of $y = f(x)$.*

A vertical scaling of a graph occurs if we multiply all outputs y of a function by the same positive constant. For $c > 0$, the graph of the function $cf(x)$ is the graph of $f(x)$ scaled vertically by a factor of c. If $c > 1$, the values of the outputs for the function $cf(x)$ are larger than the values of the outputs for the function $f(x)$; therefore, the graph has been stretched vertically. If $0 < c < 1$, then the outputs of the function $cf(x)$ are smaller, so the graph has been compressed. For example, the graph of the function $f(x) = 3x^2$ is the graph of $y = x^2$ stretched vertically by a factor of 3, whereas the graph of $f(x) = x^2/3$ is the graph of $y = x^2$ compressed vertically by a factor of 3 (Figure 16.2.8).

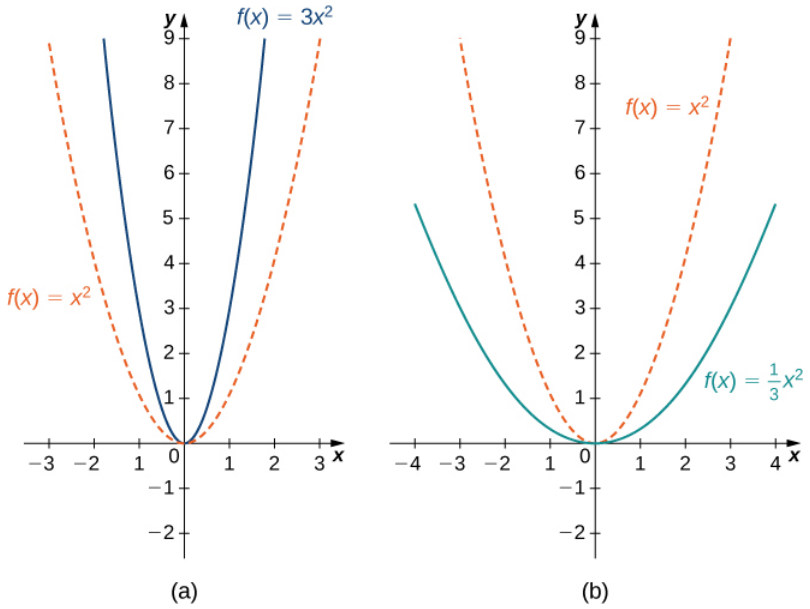

***Figure* 16.2.11:** *(a) If $c > 1$, the graph of $y = cf(x)$ is a vertical stretch of the graph of $y = f(x)$. (b) If $0 < c < 1$, the graph of $y = cf(x)$ is a vertical compression of the graph of $y = f(x)$.*

The horizontal scaling of a function occurs if we multiply the inputs x by the same positive constant. For $c > 0$, the graph of the function $f(cx)$ is the graph of $f(x)$ scaled horizontally by a factor of c. If $c > 1$, the graph of $f(cx)$ is the graph of $f(x)$ compressed horizontally. If $0 < c < 1$, the graph of $f(cx)$ is the graph of $f(x)$ stretched horizontally. For example, consider the function $f(x) = \sqrt{2x}$ and evaluate f at $x/2$. Since $f(x/2) = \sqrt{x}$, the graph of $f(x) = \sqrt{2x}$ is the graph of $y = \sqrt{x}$ compressed horizontally. The graph of $y = \sqrt{x/2}$ is a horizontal stretch of the graph of $y = \sqrt{x}$ (Figure 16.2.9).

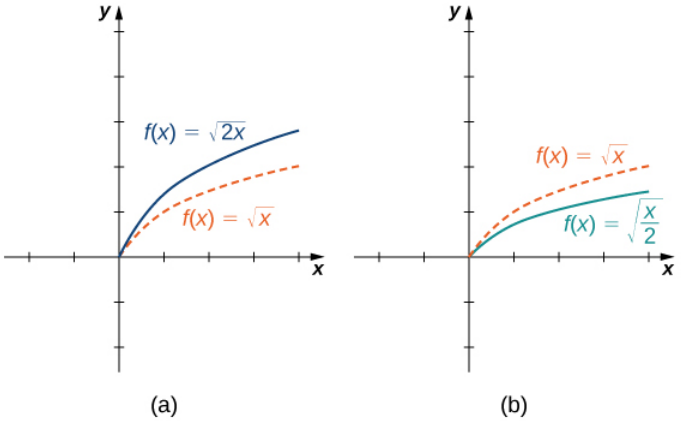

***Figure* 16.2.12:** *(a) If $c > 1$, the graph of $y = f(cx)$ is a horizontal compression of the graph of $y = f(x)$. (b) If $0 < c < 1$, the graph of $y = f(cx)$ is a horizontal stretch of the graph of $y = f(x)$.*

We have explored what happens to the graph of a function f when we multiply f by a constant $c > 0$ to get a new function $cf(x)$. We have also discussed what happens to the graph of a function $f$when we multiply the independent variable x by $c > 0$ to get a new function $f(cx)$. However, we have not addressed what happens to the graph of the function if the constant c is negative. If we have a constant $c < 0), we can write \(c$ as a positive number multiplied by -1; but, what kind of transformation do we get when we multiply the function or its argument by -1? When we multiply all the outputs by -1, we get a reflection about the x-axis. When we multiply all inputs by -1, we get a reflection about the y-axis. For example, the graph of $f(x) = -(x^3 + 1)$ is the graph of $y = (x^3 + 1)$ reflected about the x-axis. The graph of $f(x) = (-x)^3 + 1$ is the graph of $y = x^3 + 1$ reflected about the y-axis (Figure 16.2.10).

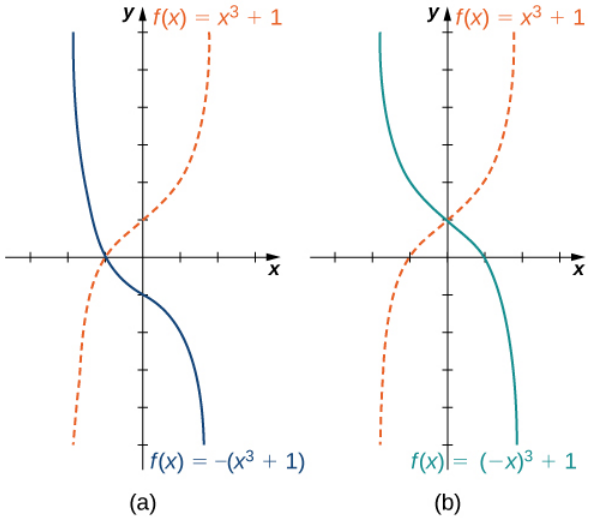

***Figure* 16.2.13:** (a) The graph of $y = -f(x)$ is the graph of $y = f(x)$ reflected about the x-axis. (b) The graph of $y = f(-x)$ is the graph of $y = f(x)$ reflected about the y-axis.

If the graph of a function consists of more than one transformation of another graph, it is important to transform the graph in the correct order. Given a function $f(x)$, the graph of the related function $y = cf(a(x+b))+d$ can be obtained from the graph of $y = f(x)$by performing the transformations in the following order.

- Horizontal shift of the graph of $y = f(x)$. If $b > 0$, shift left. If $b < 0$ shift right.
- Horizontal scaling of the graph of $y = f(x+b)$ by a factor of $|a|$. If $a < 0$, reflect the graph about the y-axis.
- Vertical scaling of the graph of $y = f(a(x+b))$ by a factor of $|c|$. If $c < 0$, reflect the graph about the x -axis.
- Vertical shift of the graph of $y = cf(a(x+b))$. If $d > 0$, shift up. If $d < 0$, shift down.

We can summarize the different transformations and their related effects on the graph of a function in the following table.

Transformation of $f(c > 0)$	**Effect of the graph of f**
$f(x)+c$	Vertical shift up c units
$f(x)-c$	Vertical shift down c units
$f(x+c)$	Shift left by c units
$f(x-c)$	Shift right by c units
$cf(x)$	Vertical stretch if $c > 1$; vertical compression if $0 < c < 1$
$f(cx)$	Horizontal stretch if $0 < c < 1$; horizontal compression if $c > 1$
$-f(x)$	Reflection about the x-axis
$-f(x)$	Reflection about the y-axis

Example 16.2.10: Transforming a Function

For each of the following functions, a. and b., sketch a graph by using a sequence of transformations of a well-known function.

a. $f(x) = -|x+2|-3$
b. $f(x) = \sqrt[3]{x}+1$

Solution:

1.Starting with the graph of $y = |x|$, shift 2 units to the left, reflect about the x-axis, and then shift down 3 units.

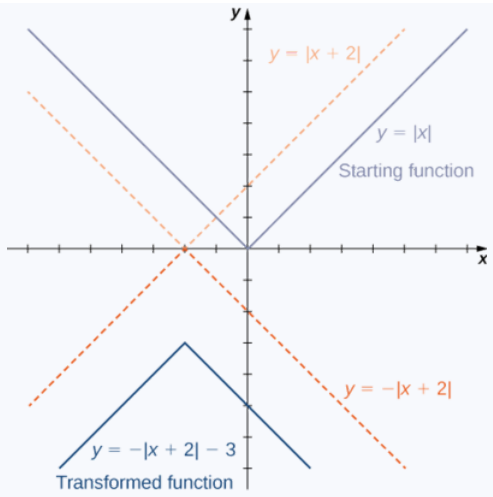

***Figure* 16.2.14:** *The function* $f(x) = -|x+2| - 3$ *can be viewed as a sequence of three transformations of the function* $y = |x|$.

2. Starting with the graph of y=x√, reflect about the y-axis, stretch the graph vertically by a factor of 3, and move up 1 unit.

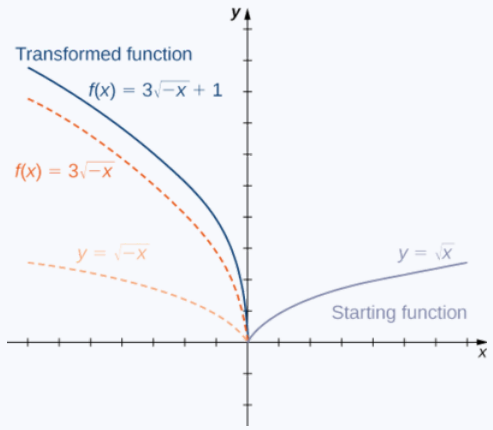

***Figure* 16.2.15:** *The function* $f(x) = \sqrt[3]{x} + 1$ *can be viewed as a sequence of three transformations of the function* $y = \sqrt{x}$.

Exercise 16.2.7

Describe how the function $f(x) = -(x+1)^2 - 4$ can be graphed using the graph of $y = x^2$ and a sequence of transformations

Answer

Shift the graph $y = x^2$ to the left 1 unit, reflect about the x-axis, then shift down 4 units.

Key Concepts

- The power function $f(x) = x^n$ is an even function if n is even and $n \neq 0$, and it is an odd function if n is odd.
- The root function $f(x) = x^{1/n}$ has the domain $[0, \infty)$ if n is even and the domain $(-\infty, \infty)$ if n is odd. If n is odd, then $f(x) = x^{1/n}$ is an odd function.
- The domain of the rational function $f(x) = p(x)/q(x)$, where $p(x)$ and $q(x)$ are polynomial functions, is the set of x such that $q(x) \neq 0$.
- Functions that involve the basic operations of addition, subtraction, multiplication, division, and powers are algebraic functions.
- Vertical and horizontal shifts, vertical and horizontal scalings, and reflections about the x- and y-axes are examples of transformations of functions.

Key Equations

- **Point-slope equation of a line**

  $y - y1 = m(x - x_1)$

- **Slope-intercept form of a line**

  $y = mx + b$

- **Standard form of a line**

  $ax + by = c$

- **Polynomial function**

  $f(x) = a_n^{x^n} + a_{n-1}x^{n-1} + \cdots + a_1x + a_0$

Glossary

algebraic function

a function involving any combination of only the basic operations of addition, subtraction, multiplication, division, powers, and roots applied to an input variable x

cubic function

a polynomial of degree 3; that is, a function of the form $f(x) = ax^3 + bx^2 + cx + d$, where $a \neq 0$

degree

for a polynomial function, the value of the largest exponent of any term

linear function

a function that can be written in the form $f(x) = mx + b$

mathematical model

A method of simulating real-life situations with mathematical equations

point-slope equation

equation of a linear function indicating its slope and a point on the graph of the function

polynomial function

a function of the form $f(x) = a_nx^n + a_{n-1}x^{n-1} + \ldots + a_1x + a_0$

power function

a function of the form $f(x) = x^n$ for any positive integer $n \geq 1$

quadratic function

a polynomial of degree 2; that is, a function of the form $f(x) = ax^2 + bx + c$ where $a \neq 0$

rational function

a function of the form $f(x) = p(x)/q(x)$, where $p(x)$ and $q(x)$ are polynomials

root function

a function of the form $f(x) = x^{1/n}$ for any integer $n \geq 2$

slope

the change in *y* for each unit change in *x*

slope-intercept form

equation of a linear function indicating its slope and *y*-intercept

transformation of a function

a shift, scaling, or reflection of a function

16.2.1: Linear Functions and Slope

In the previous section on Linear Models, we saw that if the dependent variable was changing at a constant rate with respect to the independent variable, then the graph was a line. If the rate was positive, then as we swept our eyes from left to right, the line rose upward, the dependent variable increasing with increasing changes in the independent variable. If the rate was negative, then the graph fell downward, the dependent variable decreasing with increasing changes in the independent variable. You may have also learned that higher rates led to steeper lines (lines that rose more quickly) and lower rates led to lines that were less steep.

In this section, we will connect the intuitive concept of rate developed in the previous section with a formal definition of the slope of a line. To start, let's state up front what is meant by the slope of a line.

Definition

Slope is a number that tells us how quickly a line rises or falls.

If slope is a number that is directly connected to the "steepness" of a line, then we should have certain expectations.

Expectations

1. Lines with positive slope should slant uphill (as our eyes sweep from left to right).
2. Lines with negative slope should slant downhill (as our eyes sweep from left to right).
3. Because any horizontal line neither slants uphill nor downhill, we expect that it should have slope equal to zero.
4. Lines with a larger positive slope should rise more quickly than lines with a smaller positive slope.
5. If two lines have negative slope, then the line having the slope with larger absolute value should fall more quickly than the other line.

It remains to define how to compute the slope of a particular line. Whatever definition we choose, it should conform with the expectations outlined above. We also would like the definition of slope to conform with the concept of rate developed in the previous section. Thus, we make the following definition.

Definition: Slope

The **slope** of a line is the rate at which the dependent variable is changing with respect to the independent variable.

Note how the word "change" is used Definition. It is important to understand that the change in some quantity can be positive, negative, or zero. For example, if the temperature outside is $40^{\circ}\mathrm{F}$ when I leave my home at 6 AM, and at noon the temperature is $65\circ$ F, then the change in temperature is a positive $25^{\circ}\mathrm{F}$. On the other hand, if the temperature outside is $65^{\circ}\mathrm{F}$ at noon, and the temperature is $50^{\circ}\mathrm{F}$ when I return home in the evening, then the change in temperature is a negative 15 degrees Fahrenheit.

In calculating the change in a quantity, follow this rule.

Definition: Change in Quantity

Change in Quantity = Latter Measurement − Former Measurement.

Thus, if T represents the temperature and ΔT represents the change in the temperature, then in our first case (taking the temperature in the morning then later at noon), the change in temperature is

$$\Delta T = \text{ Latter } - \text{ Former } = 65^{\circ}\mathrm{F} - 40^{\circ}\mathrm{F} = 25^{\circ}\mathrm{F}$$

This positive result represents an increase in the temperature of $25^{\circ}\mathrm{F}$.

In the second case (taking the temperature at noon then later in the evening), the change in temperature is

$$\begin{aligned} \Delta T &= \text{Latter} - \text{Former} \\ &= 50^{\circ}\mathrm{F} - 65^{\circ}\mathrm{F} \\ &= -15^{\circ}\mathrm{F} \end{aligned}$$

This negative result represents a decrease in the temperature of $15^\circ \mathrm{F}$

Tip 3

Readers should note that the direction of subtraction is extremely important. To detect the change in a quantity, always subtract the former (earlier) measurement from the latter (later) measurement.

Example 16.2.1.1

A ball is perched at rest at the top of a long ramp. It's given a little tap and it begins to roll down the ramp. The speed v of the ball (in meters per second) is plotted versus the time t (in seconds) in Figure 16.2.1.1.

Determine the slope of the line.

Solution

We've defined the slope as the rate at which the dependent variable is changing with respect to the independent variable. In this case, the speed v of the ball "depends" upon the amount of time t that has elapsed. Consequently, v is the dependent variable and has been placed on the vertical axis.3 On the other hand, t is the independent variable and has been assigned the horizontal axis.

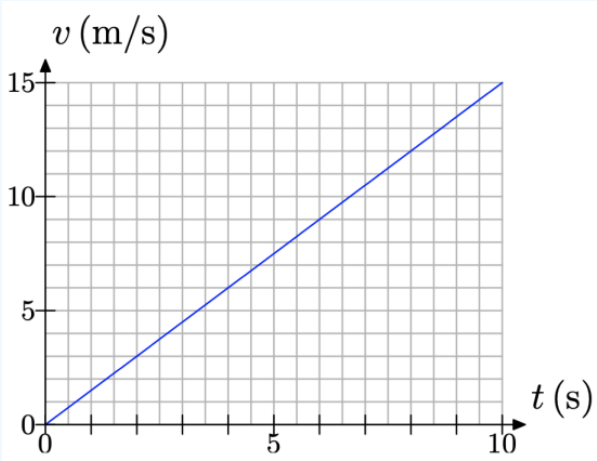

Figure 16.2.1.1. Speed versus time.

To determine the rate at which v is changing with respect to t (the slope of the line), we first select two points P(2, 3) and Q(8, 12) on the line, as shown in Figure 16.2.1.2 As we sweep our eyes from left to right (a convention we will always follow when dealing with slope), the point P occurs before the point Q. Hence, we consider P the "former" measurement and point Q the "latter" measurement.

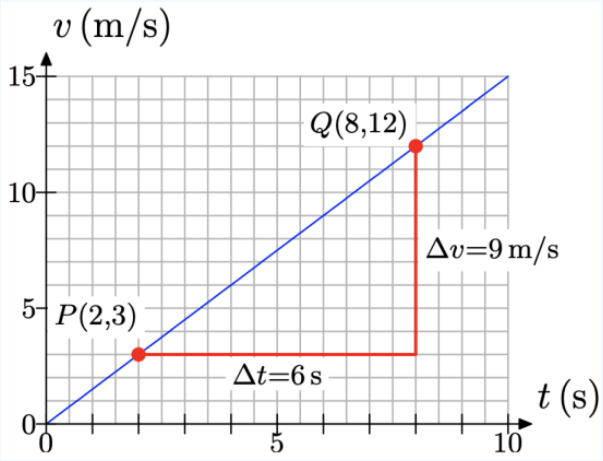

Figure 16.2.1.2. Determining the slope of the line.

At point P, the time is t = 2 seconds, then at point Q the time is t = 8 seconds. The change in t is found by subtracting the former measurement from the latter measurement.

$$\Delta t = 8s - 2s = 6s$$

At point P, the speed is v = 3 meters per second, then at point Q the speed is v = 12 meters per second. Hence, the change in v is

$$\Delta v = 12\text{m/s} - 3\text{m/s} = 9\text{m/s}$$

Finally, the slope of the line is defined as the rate at which the dependent variable v is changing with respect to the independent variable t. That is,

$$\text{Slope} = \frac{\Delta v}{\Delta t} = \frac{9\text{m/s}}{6\text{s}} = \frac{3\text{m/s}}{\text{s}}$$

Scientists prefer to write this as 1.5 m/s^2, but this might not be as intuitive as writing 1.5 (m/s)/s, which indicates that the speed is increasing at a rate of 1.5 m/s every second. This makes good sense as a ball rolling down a ramp will pick up speed with the passage of time. The slope provides an exact numerical description of how the speed increases with respect to time.

Note that our definition of the slope of the line satisfies one of our goals: the slope is precisely the same as the notion of rate described in the previous section. Indeed, note the right triangle we've drawn in Figure 16.2.1.2 The bottom edge of the triangle is 12 boxes long, but every 2 boxes represents one second, so this displacement in the time t direction is 6 seconds. The vertical side of the right triangle is 9 boxes in height where each box represents 1 meter per second. Consequently, this vertical edge of the right triangle represents a positive displacement of 9 meters per second. Thus, every 6 seconds, there is an increase in speed of 9 meters per second. Hence, the ball is picking up speed at the rate of 9 meters per second every 6 seconds, or equivalently, 1.5 meters per second every second.

Note

In Figure 16.2.1.2 the rate at which the speed is increasing with respect to time is equivalent to the slope of the line.

Suppose that we had labeled our points $P\left(t_{\text{initial}}, v_{\text{initial}}\right)$ and $Q\left(t_{\text{final}}, v_{\text{final}}\right)$ as shown in Figure 16.2.1.3

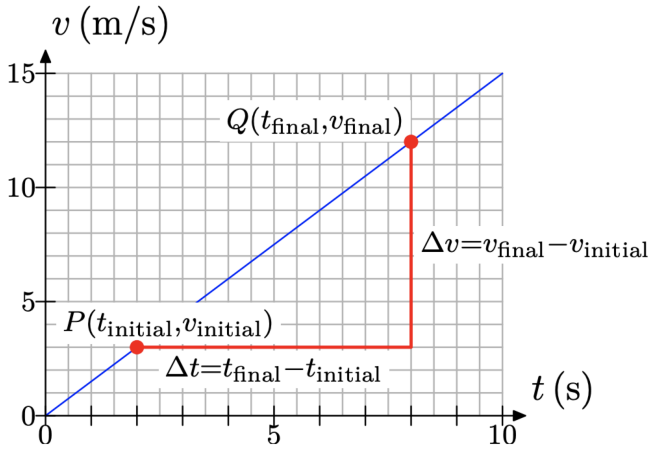

Figure 16.2.1.3. Initial and final measurements.

Now the change in speed v would be

$$\Delta v = v_{\text{final}} - v_{\text{initial}}$$

and the change in time t would be

$$\Delta t = t_{\text{final}} - t_{\text{initial}}$$

Therefore, the slope of the line would be computed with the following formula.

$$\text{Slope} = \frac{\Delta v}{\Delta t} = \frac{v_{\text{final}} - v_{\text{initial}}}{t_{\text{final}} - t_{\text{initial}}}$$

With $P\left(t_{\text{initial}}, v_{\text{initial}}\right) = (2\text{s}, 3\text{m/s})$ and $Q\left(t_{\text{final}}, v_{\text{final}}\right) = (8\text{s}, 12\text{m/s})$, this becomes

$$\text{Slope} = \frac{12\text{m/s} - 3\text{m/s}}{8\text{s} - 2\text{s}} = \frac{9\text{m/s}}{6\text{s}} = 1.5\text{m/s}^2$$

The Slope Formula

The last calculation in Example 16.2.1.1 allows us to discuss the slope of a line as a purely mathematical concept, one that is not rooted in a supporting application as in Example 16.2.1.1. Take, for example, the line shown in Figure 16.2.1.4 that passes through the points $P(-3, -3)$ and $Q(2, 1)$.

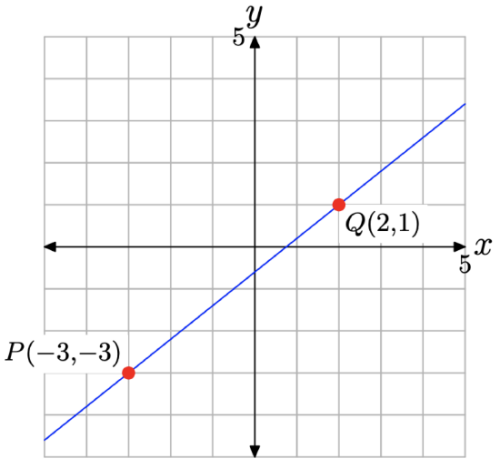

Figure 16.2.1.4. Computing the slope of a line in an xy-coordinate system.

In this example, the dependent variable is y and the independent variable is x, so the slope of the line is Δy (the change in y) divided by Δx (the change in x).

$$\text{Slope} = \frac{\Delta y}{\Delta x}$$

Sweeping our eyes from left to right, the point P comes first, followed by the point Q. Keeping "latter minus former" in mind, the change in y is computed by subtracting the y-value of point P from the y-value of point Q. That is,

$$\Delta y = 1 - (-3) = 4$$

Similarly, the change in x is computed by subtracting the x-value of point P from the x-value of point Q. That is,

$$\Delta x = 2 - (-3) = 5$$

Thus, the slope of the line is

$$\text{Slope} = \frac{\Delta y}{\Delta x} = \frac{4}{5}$$

Alternatively, we can use the points P and Q as vertices of a right triangle with sides parallel to the axes (shown in Figure 16.2.1.5(a)). The horizontal edge of the right triangle is 5 boxes (each representing 1 unit), so the displacement in x is 5 units. The vertical edge is 4 boxes (each representing 1 unit), so the displacement in y is 4 units. Hence, each time x is increased by 5 units, y experiences an increase of 4 units. Therefore, the slope of the line is again 4/5.

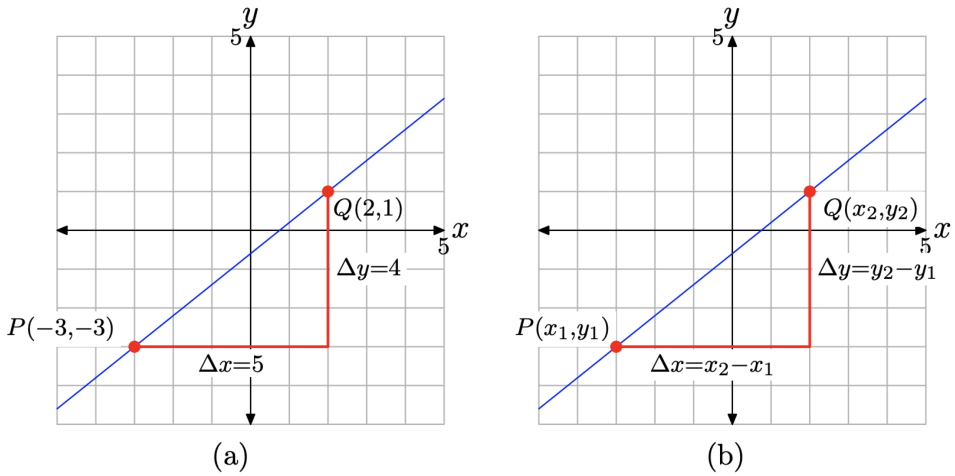

Figure 16.2.1.5. Using a right triangle to determine the slope.

Suppose that we had labeled our points $P\left(x_1, y_1\right)$ and $Q\left(x_2, y_2\right)$ as shown in Figure 16.2.1.5(b). Now the change in y would be

$$\Delta y = y_2 - y_1$$

and the change in x would be

$$\Delta x = x_2 - x_1$$

Therefore, the slope of the line would be computed with the following formula.

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$$

With $P\left(x_1, y_1\right) = (-3, -3)$ and $Q\left(x_2, y_2\right) = (2, 1)$, this becomes

$$\text{Slope } = \frac{1 - (-3)}{2 - (-3)} = \frac{4}{5}$$

The slope formula is worth summarizing in a definition.

Definition 5

The slope of the line that passes through the points $P\left(x_1, y_1\right)$ and $Q\left(x_2, y_2\right)$ is given by the formula

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$$

Let's look at some more examples.

Example 16.2.1.2

Find the slope of the line passing through the points P(−3, −2) and Q(3, 1).

Solution

We can use the slope formula in Definition 5 to determine the slope. With $(x_1, y_1) = P(-3, -2)$ and $(x_2, y_2) = Q(3, 1)$,

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{1 - (-2)}{3 - (-3)} = \frac{3}{6} = \frac{1}{2}$$

Readers will sometimes ask, "Which point should be (x_1, y_1) and which should be (x_2, y_2)?" The short answer is, "It doesn't matter!" Suppose instead, that we let $(x_1, y_1) = Q(3, 1)$ and $(x_2, y_2) = P(-3, -2)$. Then,

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-2 - 1}{-3 - 3} = \frac{-3}{-6} = \frac{1}{2}$$

Because the change in any quantity is found by subtracting the earlier measurement from the later measurement, we will continue to stress the first order. However, if we reverse the points as we did in our second calculation, both numerator and denominator reverse sign with this interchange, so we get the same answer.

Of course, we can also determine the slope by plotting P(−3, −2) and Q(3, 1) and the line that passes through P and Q, as we've done in Figure 16.2.1.6

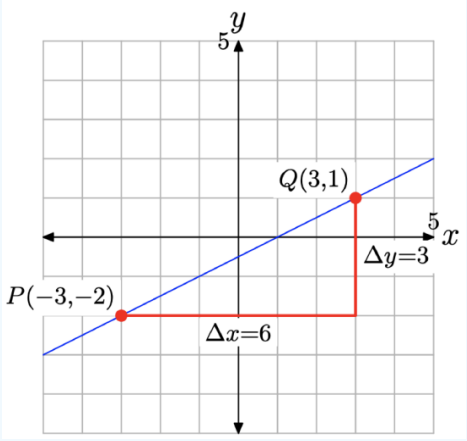

Figure 16.2.1.6. Determining the slope from the graph.

Starting at the point P, to get to the point Q, we move 6 boxes to the right, then 3 boxes up, as shown in Figure 16.2.1.6 Hence, the slope of the line is

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{3}{6} = \frac{1}{2}$$

Note that two of our expectations regarding the slope of a line are met with this example.

1. The line through P(−3, −2) and Q(3, 1) in Figure 16.2.1.6has slope 1/2. This is a positive number and the line slants uphill (as expected) as we sweep our eyes from left to right.
2. The slope in this example is 1/2, which is less than the slope of the line in Figure 16.2.1.5(a), which was 4/5. Note that the line in Figure 16.2.1.6is less steep than the line in Figure 16.2.1.5(a), which was another of our earlier expectations regarding the slope of a line.

Example 16.2.1.3

Find the slope of the line passing through the points P(−4, 4) and Q(4, −2).

Solution

We can use the slope formula in Definition 5 to determine the slope. With $(x_1, y_1) = P(-4, 4)$ and $(x_2, y_2) = Q(4, -2)$,

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{-2 - 4}{4 - (-4)} = \frac{-6}{8} = -\frac{3}{4}$$

We can also get the slope of the line from the graph in Figure 16.2.1.7. Starting at the point P(−4, 4), move 8 units to the right, then 6 units downward, as shown in Figure 16.2.1.7.

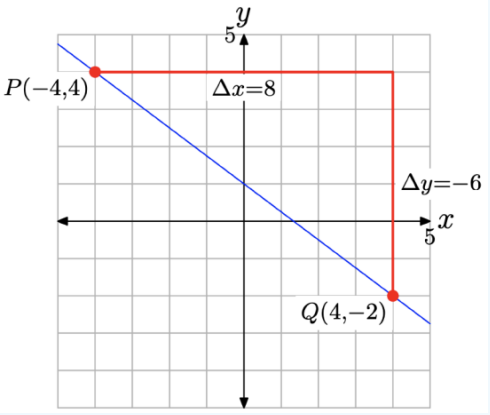

Figure 16.2.1.7. Determining the slope from the graph.

Thus, the slope of the line is

$$\text{Slope} = \frac{\Delta y}{\Delta x} = \frac{-6}{8} = -\frac{3}{4}$$

Again, one of our earlier expectations regarding the slope of a line is met in this example. The slope is −3/4, which is a negative number, and the line in Figure 16.2.1.7slants downhill (as we sweep our eyes from left to right).

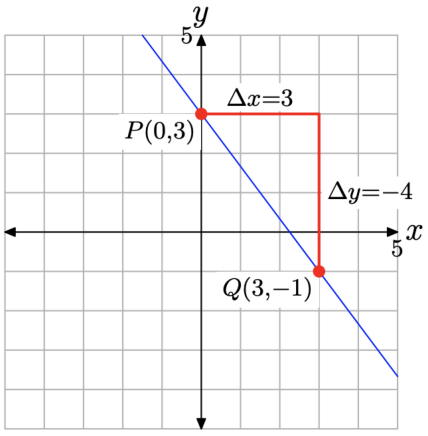
Example 16.2.1.4

Draw a line that intercepts the y-axis at (0, 3) so that the line has slope −4/3. Draw a second line that passes through the point P(−1, −1) with slope 3/5.

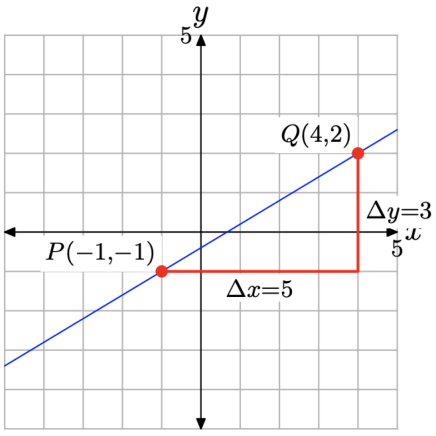
Solution

The slope of the first line is −4/3. This means that our line must slant downhill (as we sweep our eyes from left to right). The slope is the change in y over the change in x. Therefore, every time x increases by 3 units, y must decrease by 4 units. Plot the point P(0, 3), as shown in Figure 16.2.1.8(a). Then, starting at P, move 3 units to the right, followed by 4 units downward to the point Q(3, −1), as shown in Figure 16.2.1.8(a). Draw the required line, which must pass through the points P and Q.

To draw the second line, first plot the point P(−1, −1), as shown in Figure 16.2.1.8(b). Starting at the point P, move 5 units to the right, then upward 3 units to the point Q(4, 2), as shown in Figure 16.2.1.8(b). Draw the required line passing through the points P and Q.



(a) A line having y-intercept at $(0, 3)$ with slope $-4/3$.



(b) A line having slope $3/5$ that passes through the point $P(-1, -1)$.

Figure 16.2.1.8

Parallel Lines

Because slope controls the “steepness” of a line, it is a simple matter to see that parallel lines must have the same slope.

property

Let L_1 be a line having slope m_1. Let L_2 be a line having slope m_2. If L_1 and L_2 are parallel, then

$$m_1 = m_2$$

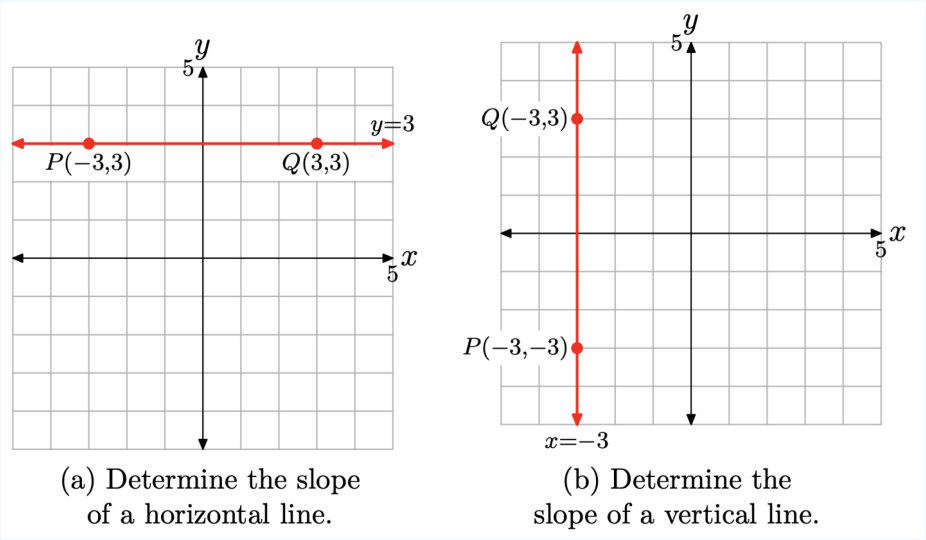
That is, any two parallel lines have the same slope.

Example 16.2.1.5

What is the slope of any horizontal line? What is the slope of any vertical line?

Solution

One would expect that our definition would verify that the slope of any horizontal line is zero. Select, for example, the horizontal line shown in Figure 9(a). Select the points (−3, 3) and (3, 3) on this line.



(a) Determine the slope of a horizontal line.

(b) Determine the slope of a vertical line.

Figure 16.2.1.9

With $(x_1, y_1) = (-3, 3)$ and $(x_2, y_2) = (3, 3)$

$$\text{Slope} = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{3-3}{3-(-3)} = \frac{0}{6} = 0$$

Thus, the horizontal line in Figure 16.2.1.9(a) has slope equal to zero, exactly as expected. Further, all horizontal lines are parallel to this horizontal line and have the same slope. Therefore, all horizontal lines have slope zero.

We would surmise that the vertical line in Figure 16.2.1.9(b) has undefined slope (we’ll explore this more fully in the exercises). In Figure 16.2.1.9(b), we’ve selected the points P(−3, −3) and Q(−3, 3) on the vertical line. With $(x_1, y_1) = P(-3, -3)$ and $(x_2, y_2) = Q(-3, -3)$,

$$\text{Slope} = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{3-(-3)}{-3-(-3)} = \frac{6}{0}, \text{ which is undefined.}$$

The slope of the vertical line in Figure 16.2.1.9(b) is undefined because division by zero is meaningless. Further, all vertical lines are parallel to this vertical line and have undefined slope.

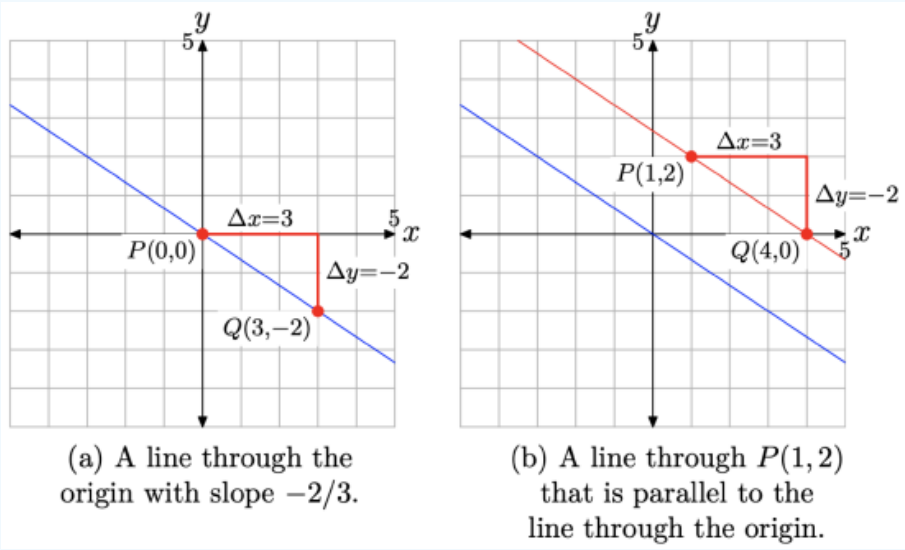
Example 16.2.1.6

Draw a line through the point P(1, 2) that is parallel to the line passing through the origin with slope −2/3.

Solution

We will first draw a line through the origin with slope −2/3. Plot the point P(0, 0), then move 3 units to the right and 2 units downward to the point Q(3, −2), as shown in Figure 16.2.1.10(a). Draw a line through the points P and Q as shown in Figure 16.2.1.10(a).

Next, plot the point P(1, 2) as shown in Figure 16.2.1.10(b). To draw a line through this point that is parallel to the line through the origin, this second line must have the same slope as the first line. Therefore, start at the point P(1, 2), as shown in Figure 16.2.1.10(b), then move 3 units to the right and 2 units downward to the point Q(4, 0). Draw a line through the points P and Q as shown in Figure 16.2.1.10(b). Note that this second line is parallel to the first.



(a) A line through the origin with slope −2/3.

(b) A line through $P(1,2)$ that is parallel to the line through the origin.

Figure 16.2.1.10

Perpendicular Lines

The relationship between the slopes of two perpendicular lines is not as straightforward as the relation between the slopes of two parallel lines. Let's begin by stating the pertinent property.

Property 13

Let L_1 be a line having slope m_1. Let L_2 be a line having slope m_2. If L_1 and L_2 are perpendicular, then

$$m_1 m_2 = -1$$

That is, the product of the slopes of two perpendicular lines is −1.

We can solve equation (14) for m_1 in terms of m_2.

$$m_1 = -\frac{1}{m_2}$$

Equation (15) tells us that the slope of the first line is the negative reciprocal of the slope of the second line.

For example, suppose that L_1 and L_2 are perpendicular lines with slopes m_1 and m_2, respectively

- If $m_2 = 2$, then $m_1 = -\frac{1}{2}$
- If $m_2 = \frac{3}{5}$, then $m_1 = -\frac{5}{3}$
- If $m_2 = -\frac{2}{3}$, then $m_1 = \frac{3}{2}$

Note that in each bulleted item, the product of the slopes is −1.

We won't provide a proof of equation (15), but we will provide some motivating evidence in the form of a graph.

Example 16.2.1.7

Sketch the graphs of the lines passing through the origin having slopes 2 and −1/2.

Solution

In Figure 16.2.1.11(a), we've plotted the point P(0, 0) at the origin, then moved 1 unit to the right and 2 units upward to the point Q(1, 2). The resulting line passes through the origin and has slope $m_1 = 2$ (alternatively, $m_1 = 2/1$).

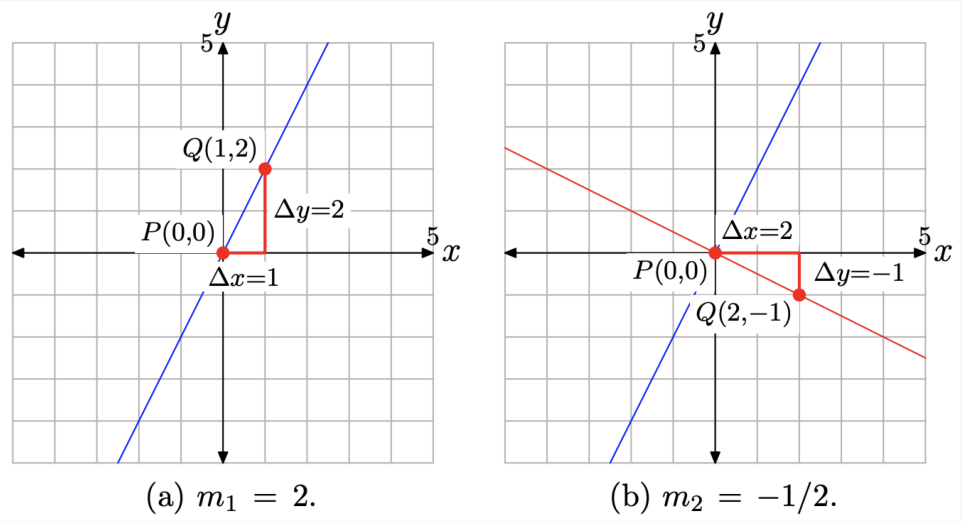
In Figure 16.2.1.11(b), we've again plotted the point P(0, 0) at the origin, then moved 2 units to the right and 1 unit downward to the point Q(2, −1). The resulting line passes through the origin and has slope $m_2 = -1/2$.

There are two important points that need to be made about the lines in Figure 16.2.1.11(b).

The two lines in Figure 16.2.1.11(b) are perpendicular. They meet and form a right angle of 90°. If you have a protractor available, you might want to measure the angle between the two lines and note that the measure of the angle is 90°.

The product of the two slopes is

$$m_1 m_2 = 2 \cdot \left(-\frac{1}{2}\right) = -1$$



(a) $m_1 = 2$. (b) $m_2 = -1/2$.

Figure 16.2.1.11. Sketching perpendicular lines.

This page titled 16.2.1: Linear Functions and Slope is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

16.2.2: Equations of Lines

In this section we will develop the slope-intercept form of a line. When you have completed the work in this section, you should be able to look at the graph of a line and determine its equation in slope-intercept form.

The Slope-Intercept Form

In the previous section, we developed the formula for the slope of a line. Let's assume that the dependent variable is y and the independent variable is x and we have a line passing through the points $P\left(x_1, y_1\right)$ and $Q\left(x_2, y_2\right)$, as shown in Figure 16.2.2.1.

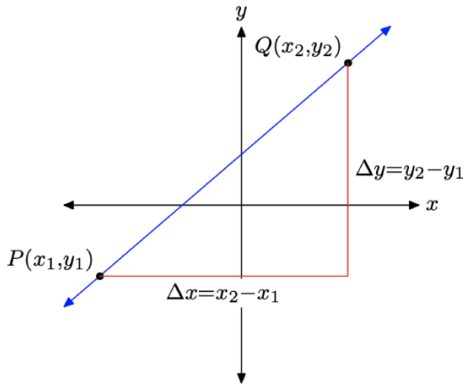

Figure 16.2.2.1. Determining the slope of a line through two points.

As we sweep our eyes from left to right, note that the change in x is $\Delta x = x_2 - x_1$ and the change in y is $\Delta y = y_2 - y_1$. Thus, the slope of the line is determined by the formula

$$\text{Slope } = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}$$

Now consider the line in Figure 16.2.2.2 Suppose that we are given two facts about this line:

1. The point where the line crosses the y-axis (the y-intercept) is (0, b).
2. The "slope" of the line is some number m.

To find the equation of the line pictured in Figure 16.2.2.2, select an arbitrary point Q(x, y) on the line, then compute the slope of the line using $(x_1, y_1) = P(0, b)$ and $(x_2, y_2) = Q(x, y)$ in the slope formula (1).

$$\text{Slope } = \frac{y_2 - y_1}{x_2 - x_1} = \frac{y - b}{x - 0}$$

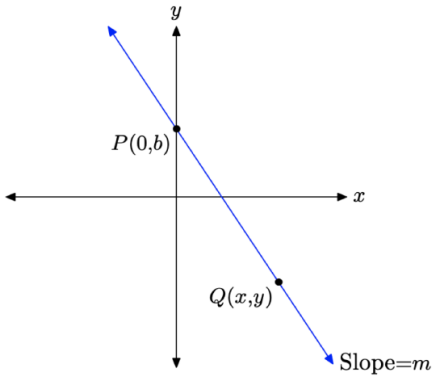

Figure 16.2.2.2. Find the equation of the line in slope-intercept form.

Simplify.

$$\text{Slope } = \frac{y - b}{x}$$

We're given that the slope is the number m, so substitute this number for the word "Slope" in the last result.

$$m = \frac{y-b}{x}$$

Multiply both sides of the last equation by x.

$$mx = y - b$$

Add b to both sides of the last equation to obtain

$$mx + b = y$$

or upon exchanging sides of the equation,

$$y = mx + b$$

The above discussion leads to the following result.

Definition: The Slope-Intercept Form of a Line

If the line L intercepts the y-axis at the point (0, b) and has slope m, then the equation of the line is

$$y = mx + b. \tag{16.2.2.1}$$

This form of the equation of a line is called the slope-intercept form. The function defined by the equation

$$f(x) = mx + b$$

is called a **linear function**.

It is important to note two key facts about the slope-intercept form y = mx + b.

- The coefficient of x (the m in y = mx + b) is the slope of the line.
- The constant term (the b in y = mx+b) is the y-coordinate of the y-intercept (0, b).

Procedure for Using the Slope-Intercept Form of a Line

When given the slope of a line and the y-intercept of the line, use the slope-intercept form as follows:

1. Substitute the given slope for m in the formula $y = mx + b$.
2. Substitute the y-coordinate of the y-intercept for b in the formula $y = mx + b$.

For example, if the line has slope −2 and the y-intercept (the point where the line crosses the y-axis) is (0, 3), then substitute m = −2 and b = 3 into Equation 16.2.2.1to obtain

$$y = -2x + 3$$

.

Let's look at some examples of use of this all-important formula.

Example 16.2.2.1

What is the equation of the line having slope −2/3 and y-intercept at (0, 3)? Sketch the line on graph paper.

Solution

The equation of the line is

$$y = mx + b$$

We're given that the slope is −2/3. Hence, m = −2/3. Secondly, we're given that the line intercepts the y-axis at the point (0, 3). In the slope-intercept form y = mx + b, recall that b represents the y-coordinate of the y-intercept. Hence, b = 3. Substitute m = −2/3 and b = 3 in equation (4), obtaining

$$y = -\frac{2}{3}x + 3$$

To sketch the graph of the line, first locate the y-intercept at P(0, 3), as shown in Figure 16.2.2.3 Starting from the y-intercept at P(0, 3), move 3 units to the right and 2 units downward to the point Q(3, 1). The required line passes through the points P and Q.

Note that the line “intercepts” the y-axis at 3 and slants downhill, in accordance with the fact that the slope is negative in this example.

Example 16.2.2.2

Given the graph of the line in Figure 16.2.2.4(a), determine the equation of the line.

Solution

First, locate the y-intercept of the line, which we’ve labeled P(0, −1) in Figure 16.2.2.4(b). In the formula y = mx + b, recall that b represents the y-coordinate of the y-intercept. Thus, b = −1.

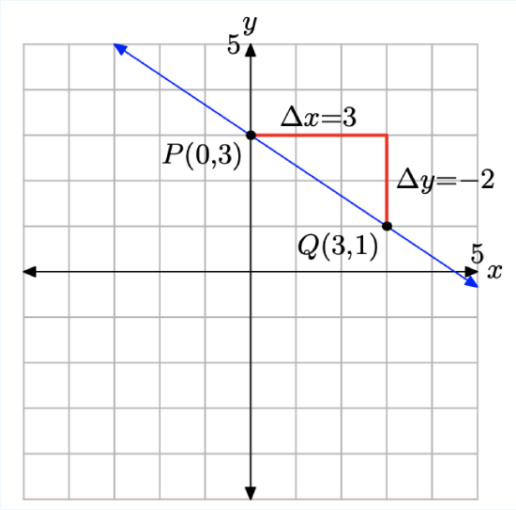

Figure 16.2.2.3. The line has y-intercept at (0, 3) and slope −2/3.

Secondly, we need to determine the slope of the line. In Figure 16.2.2.4(b), start at the point P, move 2 units to the right, then 3 units upward to the point Q(2, 2). This makes the slope

$$m = \frac{\Delta y}{\Delta x} = \frac{3}{2}$$

Substitute m = 3/2 and b = −1 into the slope-intercept form y = mx + b to obtain

$$y = \frac{3}{2}x - 1$$

which is the desired equation of the line.

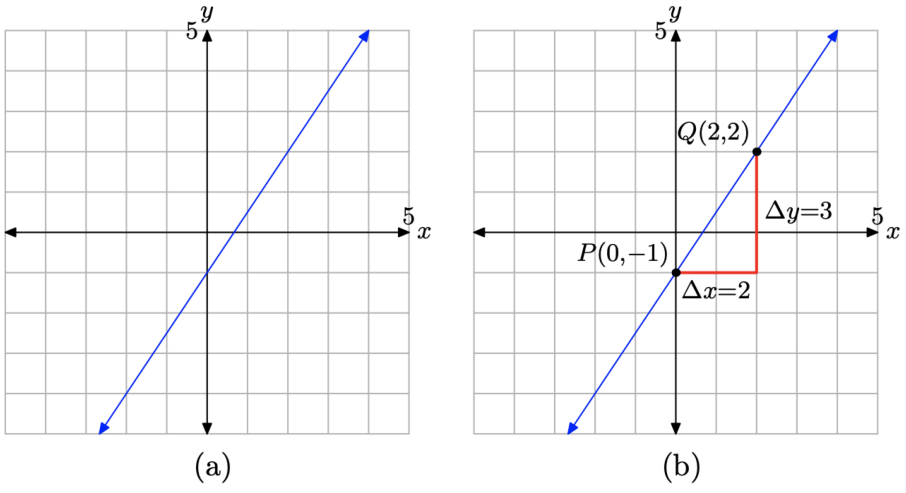

Figure 16.2.2.4. Determining the equation of a line from its graph.

Making Connections

If the connection between rate and slope is still not clear, let's recall an example we did earlier in the chapter.

Sebastian waves good-bye to his brother, who is talking to a group of his friends approximately 20 feet away. Sebastian then begins to walk away from his brother at a constant rate of 4 feet per second.

The distance between the brothers depends upon the amount of time that has passed, so we set distance d on the vertical axis and time t on the horizontal axis, as shown in Figure 16.2.2.5 Note that d and t are taking the "usual" place of y and x, respectively. The distance separating the brothers at time t = 0 is d = 20 feet. This is indicated with the "d-intercept" at P(0, 20) in Figure 16.2.2.5

Next, the distance between the brothers is increasing at a rate of 4 feet per second. Starting at the point P(0, 20), move 1 second to the right (2 boxes) and 4 units up (1 box) to the point Q(1, 24), as shown in Figure 16.2.2.5 The line through the points P and Q then models the distance between the brothers as a function of time.

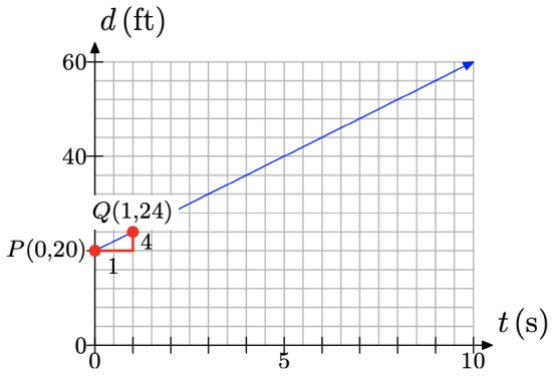

Figure 16.2.2.5. Distance between brothers as a function of time.

If you recall, we then determined a relation between distance d and time t by examining the distance between the brothers at times t = 0, 1, 2, and 3, and summarizing the results in Table 16.2.2.1

Table 16.2.2.1 Determining a model equation.

t	d
0	20
1	20+4(1)
2	20+4(2)

t	d
3	20+4(3)

Intuition then led to the following model, which provides the distance d between the brothers as a function of time t.

$$d = 20 + 4t$$

Again, readers should check that equation (6) produces the results in Table $16.2.2.1$at t = 0, 1, 2, and 3.

Alternatively, with the theory developed in this section, we would develop the equation of the line by using the slope-intercept form of the line; that is,

$$y = mx + b$$

However, in this case, the dependent variable is d, not y, and the independent variable is t, not x. So, replace y and x in equation (7) with d and t, respectively, obtaining

$$d = mt + b$$

Next, the line intercepts the d-axis at P(0, 20), so b = 20. Furthermore, the slope of the line is 4 feet per second, so m = 4. Substitute m = 4 and b = 20 in equation (8) to obtain

$$d = 4t + 20$$

or using function notation, $d(t) = 4t + 20$. Note that equation (9) is identical to the intuitively generated model of equation (6).

Hopefully, this development should cement for all time the idea that slope of the line is the rate at which the dependent variable is changing with respect to the independent variable.

The Standard Form of a Line

We now know that if our equation has the form $y = mx + b$ (or can be manipulated into this form), the graph will be a line. Let's take a moment to demonstrate that the graph of the equation $Ax + By = C$, where A, B, and C are constants, is a line.

If we can place the form $Ax + By = C$ into slope-intercept form $y = mx + b$, then that will demonstrate that the graph of $Ax + By = C$ is a line. So, start with $Ax + By = C$ and subtract Ax from both sides of the equation.

$$By = -Ax + C$$

Divide both sides of this last equation by B. Note that there is an assumption here that $B \neq 0$. We will handle the case when B = 0 separately, at the end of this section.

$$\frac{By}{B} = \frac{-Ax + C}{B}$$
$$y = -\frac{A}{B}x + \frac{C}{B}$$

When we compare $y = -(A/B)x + (C/B)$ with y = mx + b, we note that the slope is m = −A/B and the y-coordinate of the y-intercept is b = C/B. Because we were successful in placing the equation $Ax + By = C$ into slope-intercept form, we now know that the graph of $Ax + By = C$ is a line (we'll need this result in later work).

The Standard Form of a Line

The graph of the equation Ax + By = C is a line. The form

$$Ax + By = C$$

is called the standard form of a line.

Let's look at an example.

Example 16.2.2.3

The equation 3x+4y = 12 is in standard form. Place this equation in slope-intercept form, determine the slope and y-intercept, then use these results to draw the graph of the line.

Solution

First, solve the equation 3x + 4y = 12 for y.

$$\begin{aligned} 3x+4y &= 12 \\ 4y &= -3x+12 \\ y &= -\frac{3}{4}x+3 \end{aligned}$$

Note in the last step how the distributive property came into play. When we divided −3x + 12 by 4, we divided each term by 4, getting (−3/4)x + 3.

When we compare y = (−3/4)x+3 with the general slope-intercept form y = mx+b, we determine that the slope is m = −3/4 and the y-coordinate of the y-intercept is b = 3. To sketch the graph of the line, as we've done in Figure 16.2.2.6, plot the y-intercept at P(0, 3), then move 4 units to the right and 3 units down to the point Q(4, 0). The line passing through the points P and Q is the required line.

Note again that the slope is m = −3/4 and the line slants "downhill." Also, b = 3 and the line "intercepts" the y-axis at P(0, 3).

Let's look at another example.

Example 16.2.2.4

In Example 16.2.2.1, we determined that the given line had the equation

$$y = \frac{3}{2}x - 1$$

Place this equation in standard from $Ax + By = C$, where A, B, and C are integers and $A > 0$.

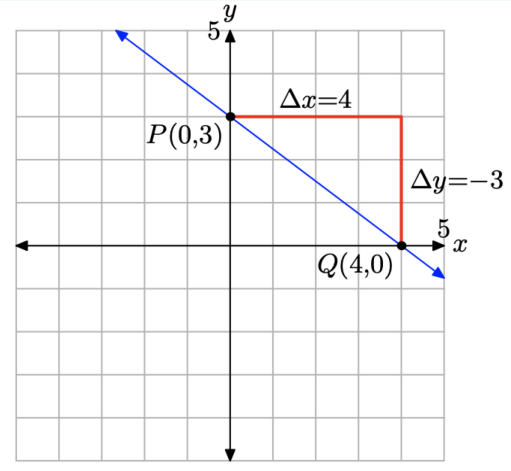

Figure 16.2.2.6. The graph of $3x + 4y = 12$.

Solution

We're requested to place the equation $y = (3/2)x - 1$ in the form $Ax + By = C$, where A, B, and C are integers, so let's begin by clearing fractions from the equation. Multiply both sides of the equation by the common denominator 2.

$$\begin{aligned} y &= \frac{3}{2}x - 1 \\ 2y &= 2\left(\frac{3}{2}x - 1\right) \\ 2y &= 3x - 2 \end{aligned}$$

Now, subtract 2y from both sides of the equation, then add 2 to both sides of the equation to obtain

$$2 = 3x - 2y$$

or equivalently,

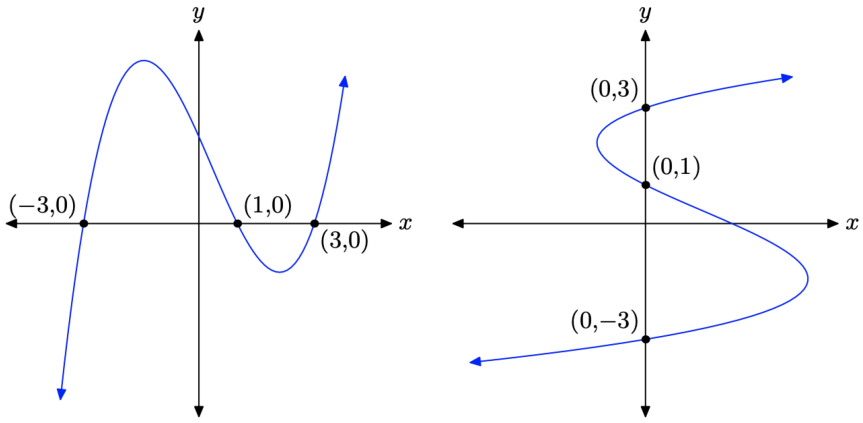
$$3x - 2y = 2$$

Note that this last result is in standard form $Ax + By = C$, where A, B, and C are integers and A > 0.

Intercepts

We now know that the graph of the equation $Ax + By = C$, where A, B, and C are constants, is a line. Because the graph of $Ax + By = C$ is a line, to draw the graph of the line, we need only find two points that satisfy the equation, plot them, then draw a line through them. Our two favorite points to work with are the x- and y-intercepts, because each involves the number zero, an easy number to work with.

Consider the graph in Figure 16.2.2.7(a). Note that the graph passes through the x-axis three times. The points where the graph intercepts the x-axis are called x-intercepts. Note that each of these points has a defining value in common: the y-value of each of these x-intercepts is equal to zero.



(a) x-intercepts. (b) y-intercepts.

Figure 16.2.2.7.

How to Find an x-intercept

To find an x intercept, let y = 0 in the equation and solve for x.

On the other hand, consider the graph in Figure 16.2.2.7(b). Note that this is not a function (fails the vertical line test) but the graph intercepts the y-axis three separate times. The points where the graph intercepts the y-axis are called y-intercepts. Note that each of the y-intercepts in Figure 16.2.2.7(b) has a defining value in common: the x-value of each of the y-intercepts is equal to zero.

How to Find a y-intercept

To find a y-intercept, let x = 0 in the equation and solve for y.

Let's put what we've learned into practice.

Example 16.2.2.5

Sketch the graph of 3x + 4y = 12.

Solution

We drew the graph of the equation 3x + 4y = 12 in Figure 16.2.2.6 There we solved the equation for y to determine the slope and the y-intercept. These, in turn, were used to draw the graph of 3x + 4y = 12 in Figure 16.2.2.6

Here, our approach will be different. We will first determine the x- and y-intercepts, plot them, then draw a line through these intercepts. Hopefully, we will get a result that matches that in Figure 16.2.2.6

To find the x-intercept, let $y = 0$ in $3x + 4y = 12$ and solve for x.

$$\begin{aligned} 3x + 4y &= 12 \\ 3x + 4(0) &= 12 \\ 3x &= 12 \\ x &= 4 \end{aligned}$$

Hence, the x-intercept is the point Q(4, 0). To find the y-intercept, let x = 0 in $3x + 4y = 12$ and solve for y.

$$\begin{aligned} 3x + 4y &= 12 \\ 3(0) + 4y &= 12 \\ 4y &= 12 \\ y &= 3 \end{aligned}$$

Hence, the y-intercept is the point P(0, 3). In Figure 16.2.2.8, we've plotted both x- and y-intercepts and drawn a line through them. Note that the resulting line in Figure 16.2.2.8matches the same line drawn in Figure 16.2.2.6(where we used a different method).

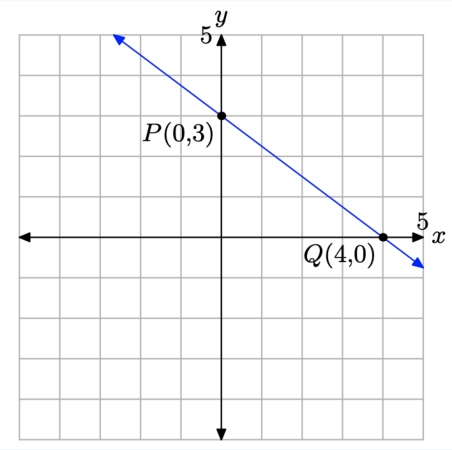


Figure 16.2.2.8 Plotting the x- and y-intercepts.

We recommend that whenever the line is given in Standard Form $Ax + By = C$, find the x- and y-intercepts, plot them, then draw a line through them. This technique is quite efficient because working with the number zero greatly simplifies the calculations.

Horizontal and Vertical Lines

We've introduced the standard form of the line $Ax + By = C$. The case where A and B are simultaneously equal to zero is not very interesting.4 However, the following two cases are of interest.

1. If we let A = 0 and B 6= 0 in the standard form $Ax + By = C$, then By = C, or equivalently y = C/B. Note that this has the form y = b, where b is some constant.
2. Similarly, if we let B = 0 and A 6= 0 in the standard form $Ax + By = C$, then Ax = C, or equivalently, x = C/A. Note that this has the form x = a, where a is some constant.

The lines having the form x = a and y = b are two of the easiest lines to plot. Let's look at an example of each.

Example 16.2.2.6

Sketch the graph of the equation x = 3.

Solution

The direction “sketch the graph of the equation x = 3” can be quite vexing unless one remembers that a graph of an equation is the set of all points that satisfy the equation. Thus, the direction is better posed if we say “sketch the set of all points (x, y) that satisfy x = 3,” or equivalently, “sketch the set of all points (x, y) that have an x-value of 3.” Then it is an easy matter to sketch the vertical line shown in Figure 16.2.2.9

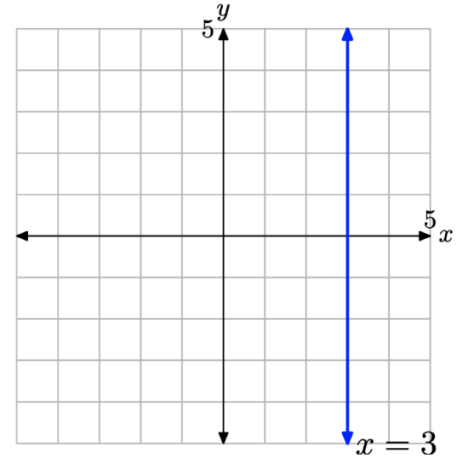

Figure 16.2.2.9. The graph of the equation x = 3.

Note that each point on the line has an x-value equal to 3. Also, note that the slope of this vertical line is undefined.

Example 16.2.2.7

Sketch the graph of the equation y = 3.

Solution

This direction is better posed if we say “sketch the set of all points (x, y) that satisfy y = 3,” or equivalently, “sketch the set of all points (x, y) that have a y-value of 3.” Then it is an easy matter to sketch the horizontal line shown in Figure 16.2.2.10

Note that each point on the line has a y-value equal to 3. Also, note that this horizontal line has slope zero.

Two final comments are in order. Because the line in Figure 10 has slope zero and y-intercept (0, 3), we can insert m = 0 and b = 3 into the slope intercept form y = mx + b and obtain

$$y = 0x + 3$$

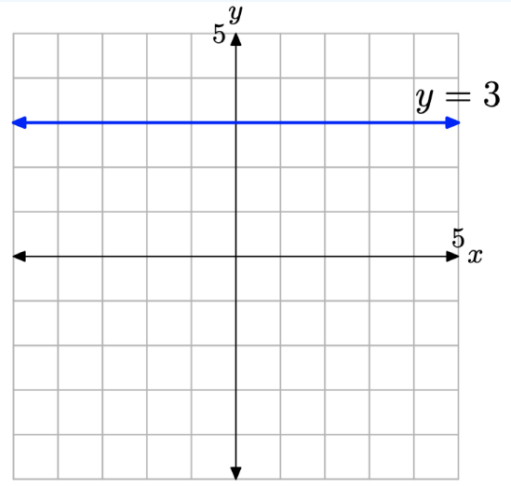

Figure 16.2.2.10. The graph of the equation y = 3.

which of course, is equivalent to y = 3. However, the vertical line shown in Figure 16.2.2.9 has “undefined” slope, so this approach is unavailable. We must simply recognize that the vertical line in Figure 16.2.2.9 consists of all points having an x-value equal to 3, and then intuit that its equation is x = 3.

This page titled 16.2.2: Equations of Lines is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

- **3.3: Equations of Lines** by David Arnold is licensed CC BY-NC-SA 2.5. Original source: https://web.archive.org/web/20200814023923/http://msenux2.redwoods.edu/IntAlgText/.

16.2.3: Rational Functions

Learning Objectives

- Use arrow notation.
- Solve applied problems involving rational functions.
- Find the domains of rational functions.
- Identify vertical asymptotes.
- Identify horizontal asymptotes.
- Graph rational functions.

Suppose we know that the cost of making a product is dependent on the number of items, x, produced. This is given by the equation $C(x) = 15,000x - 0.1x^2 + 1000$. If we want to know the average cost for producing x items, we would divide the cost function by the number of items, x. The average cost function, which yields the average cost per item for x items produced, is

$$f(x) = \frac{15,000x - 0.1x^2 + 1000}{x}$$

Many other application problems require finding an average value in a similar way, giving us variables in the denominator. Written without a variable in the denominator, this function will contain a negative integer power.

In the last few sections, we have worked with polynomial functions, which are functions with non-negative integers for exponents. In this section, we explore rational functions, which have variables in the denominator.

Using Arrow Notation

We have seen the graphs of the basic **reciprocal function** and the squared reciprocal function from our study of toolkit functions. Examine these graphs, as shown in Figure 16.2.3.1, and notice some of their features.

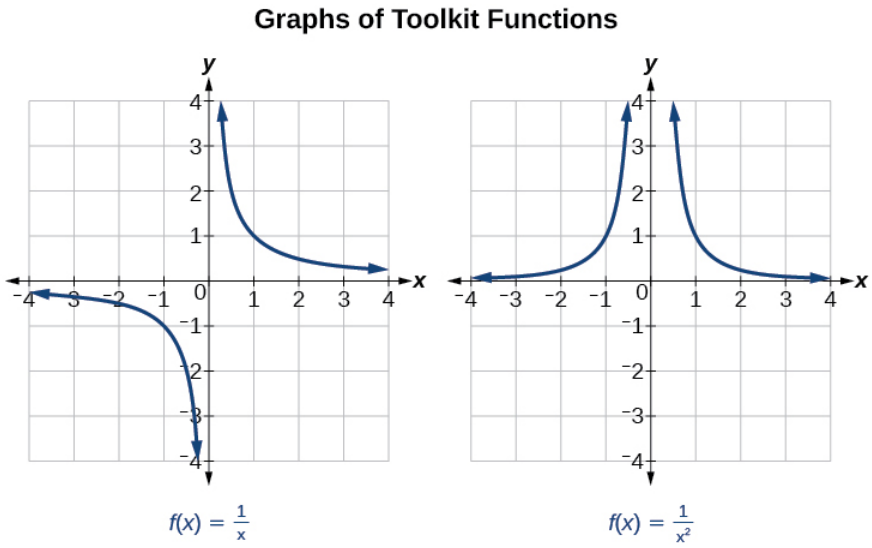

Figure 16.2.3.1

Several things are apparent if we examine the graph of $f(x) = \frac{1}{x}$.

- On the left branch of the graph, the curve approaches the x-axis $(y = 0)$ as $x \to -\infty$.
- As the graph approaches $x = 0$ from the left, the curve drops, but as we approach zero from the right, the curve rises.
- Finally, on the right branch of the graph, the curves approaches the x-axis $(y = 0)$ as $x \to \infty$.

To summarize, we use **arrow notation** to show that x or $f(x)$ is approaching a particular value (Table 16.2.3.1).

Table 16.2.3.1

Symbol	Meaning

Symbol	Meaning
$x \to a^-$	x approaches a from the left ($x < a$ but close to a)
$x \to a^+$	x approaches a from the right ($x > a$ but close to a)
$x \to \infty$	x approaches infinity (x increases without bound)
$x \to -\infty$	x approaches negative infinity (x decreases without bound)
$f(x) \to \infty$	the output approaches infinity (the output increases without bound)
$f(x) \to -\infty$	the output approaches negative infinity (the output decreases without bound)
$f(x) \to a$	the output approaches a

Local Behavior of $f(x) = \frac{1}{x}$

Let's begin by looking at the reciprocal function, $f(x) = \frac{1}{x}$. We cannot divide by zero, which means the function is undefined at $x = 0$; so zero is not in the domain. As the input values approach zero from the left side (becoming very small, negative values), the function values decrease without bound (in other words, they approach negative infinity). We can see this behavior in Table 16.2.3.2

Table 16.2.3.2

x	–0.1	–0.01	–0.001	–0.0001
$f(x) = \frac{1}{x}$	–10	–100	–1000	–10,000

We write in arrow notation

$$\text{as } x \to 0^-, f(x) \to -\infty$$

As the input values approach zero from the right side (becoming very small, positive values), the function values increase without bound (approaching infinity). We can see this behavior in Table 16.2.3.3

Table 16.2.3.3

x	0.1	0.01	0.001	0.0001
$f(x) = \frac{1}{x}$	10	100	1000	10,000

We write in arrow notation

$$\text{As } x \to 0^+, f(x) \to \infty \text{ .}$$

See Figure 16.2.3.2

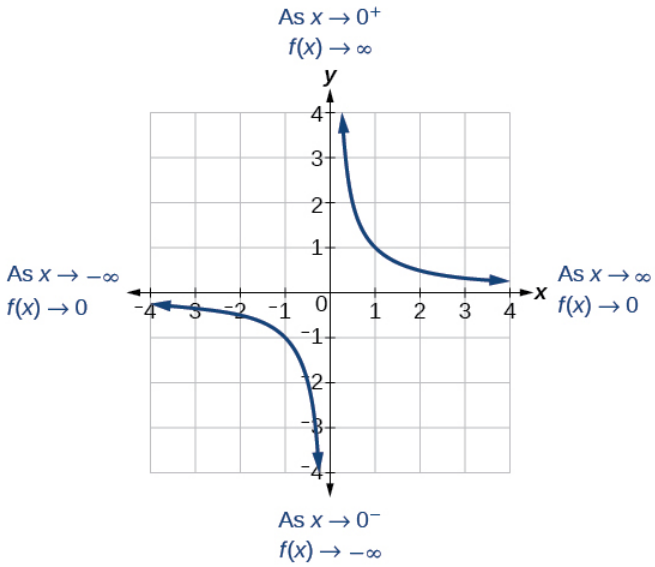

Figure 16.2.3.2.

This behavior creates a **vertical asymptote**, which is a vertical line that the graph approaches but never crosses. In this case, the graph is approaching the vertical line $x = 0$ as the input becomes close to zero (Figure 16.2.3.3).

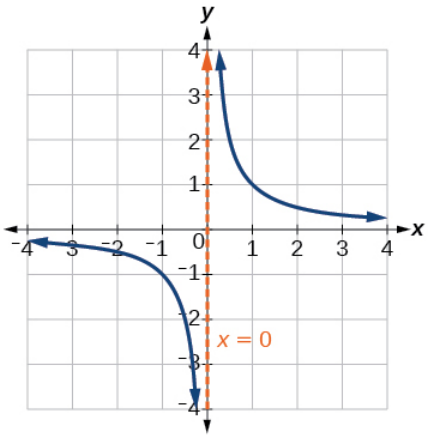

Figure 16.2.3.3.

Definition: VERTICAL ASYMPTOTE

A vertical asymptote of a graph is a vertical line $x = a$ where the graph tends toward positive or negative infinity as the inputs approach a. We write

As $x \to a$, $f(x) \to \infty$, or as $x \to a$, $f(x) \to -\infty$.

End Behavior of $f(x) = \frac{1}{x}$

As the values of x approach infinity, the function values approach 0. As the values of x approach negative infinity, the function values approach 0 (Figure 16.2.3.4). Symbolically, using arrow notation

As $x \to \infty$, $f(x) \to 0$,and as $x \to -\infty$, $f(x) \to 0$.

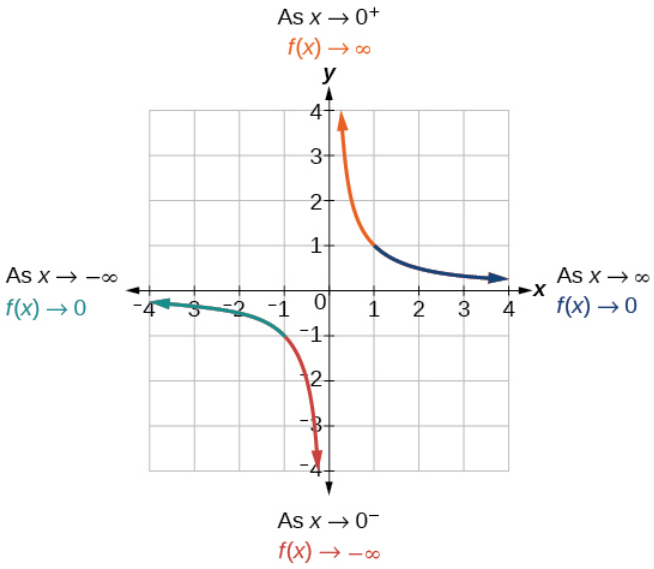

Figure 16.2.3.4.

Based on this overall behavior and the graph, we can see that the function approaches 0 but never actually reaches 0; it seems to level off as the inputs become large. This behavior creates a **horizontal asymptote**, a horizontal line that the graph approaches as the input increases or decreases without bound. In this case, the graph is approaching the horizontal line $y = 0$. See Figure 16.2.3.5

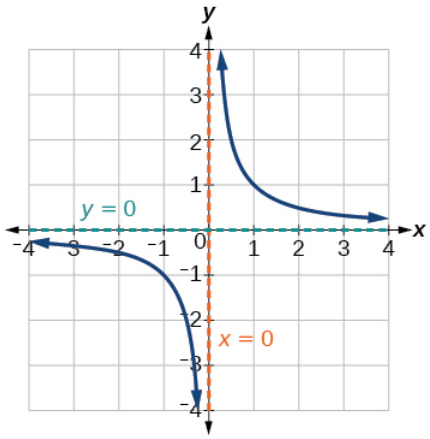

Figure 16.2.3.5.

Definition: HORIZONTAL ASYMPTOTE

A *horizontal asymptote* of a graph is a horizontal line $y = b$ where the graph approaches the line as the inputs increase or decrease without bound. We write

$$\text{As } x \to \infty \text{ or } x \to -\infty \text{ , } f(x) \to b.$$

Example 16.2.3.1: Using Arrow Notation.

Use arrow notation to describe the end behavior and local behavior of the function graphed in Figure 16.2.3.6

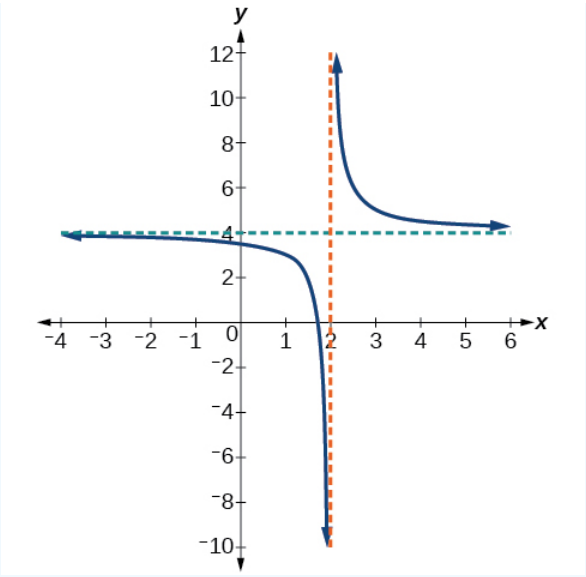

Figure 16.2.3.6.

Solution

Notice that the graph is showing a vertical asymptote at $x = 2$, which tells us that the function is undefined at $x = 2$.

$$\text{As } x \to 2^-,\ f(x) \to -\infty, \text{ and as } x \to 2^+,\ f(x) \to \infty.$$

And as the inputs decrease without bound, the graph appears to be leveling off at output values of 4, indicating a horizontal asymptote at $y = 4$. As the inputs increase without bound, the graph levels off at 4.

$$\text{As } x \to \infty,\ f(x) \to 4 \text{ and as } x \to -\infty,\ f(x) \to 4.$$

Exercises 16.2.3.1

Use arrow notation to describe the end behavior and local behavior for the reciprocal squared function.

Answer

End behavior: as $x \to \pm\infty$, $f(x) \to 0$;

Local behavior: as $x \to 0$, $f(x) \to \infty$ (there are no x- or y-intercepts)

Example 16.2.3.2: Using Transformations to Graph a Rational Function.

Sketch a graph of the reciprocal function shifted two units to the left and up three units. Identify the horizontal and vertical asymptotes of the graph, if any.

Solution

Shifting the graph left 2 and up 3 would result in the function

$$f(x) = \frac{1}{x+2} + 3 \tag{16.2.3.1}$$

or equivalently, by giving the terms a common denominator,

$$f(x) = \frac{3x+7}{x+2} \tag{16.2.3.2}$$

The graph of the shifted function is displayed in Figure 16.2.3.7.

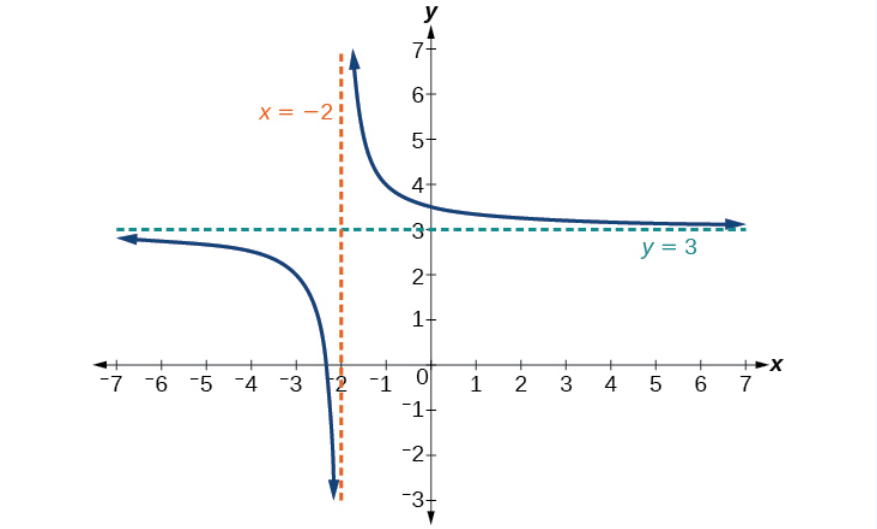

Figure 16.2.3.7.

Notice that this function is undefined at $x = -2$, and the graph also is showing a vertical asymptote at $x = -2$.

$$\text{As } x \to -2^{-}\text{, } f(x) \to -\infty\text{, and as } x \to -2^{+}\text{, } f(x) \to \infty\text{.}$$

As the inputs increase and decrease without bound, the graph appears to be leveling off at output values of 3, indicating a horizontal asymptote at $y = 3$.

$$\text{As } x \to \pm\infty\text{, } f(x) \to 3\text{.}$$

Analysis

Notice that horizontal and vertical asymptotes are shifted left 2 and up 3 along with the function.

Exercise 16.2.3.2

Sketch the graph, and find the horizontal and vertical asymptotes of the reciprocal squared function that has been shifted right 3 units and down 4 units.

Solution

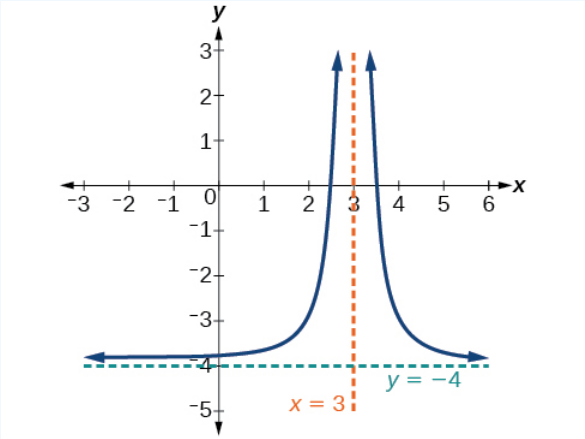

Figure 16.2.3.8.

The function and the asymptotes are shifted 3 units right and 4 units down. As $x \to 3$, $f(x) \to \infty$, and as $x \to \pm\infty$, $f(x) \to -4$.

The function is $f(x) = \frac{1}{(x-3)^2} - 4$.

Solving Applied Problems Involving Rational Functions

In Example 16.2.3.2 we shifted a toolkit function in a way that resulted in the function $f(x)=\frac{3x+7}{x+2}$. This is an example of a rational function. A *rational function* is a function that can be written as the quotient of two polynomial functions. Many real-world problems require us to find the ratio of two polynomial functions. Problems involving rates and concentrations often involve rational functions.

Definition: RATIONAL FUNCTION

A ***rational function*** is a function that can be written as the quotient of two polynomial functions $P(x)$ and $Q(x)$.

$$f(x)=\frac{P(x)}{Q(x)}=\frac{a_p x^p+a_{p-1}x^{p-1}+\ldots+a_1 x+a_0}{b_q x^q+b_{q-1}x^{q-1}+\ldots+b_1 x+b_0},\ Q(x)\neq 0 \tag{16.2.3.3}$$

Example 16.2.3.3: Solving an Applied Problem Involving a Rational Function

A large mixing tank currently contains 100 gallons of water into which 5 pounds of sugar have been mixed. A tap will open pouring 10 gallons per minute of water into the tank at the same time sugar is poured into the tank at a rate of 1 pound per minute. Find the concentration (pounds per gallon) of sugar in the tank after 12 minutes. Is that a greater concentration than at the beginning?

Solution

Let t be the number of minutes since the tap opened. Since the water increases at 10 gallons per minute, and the sugar increases at 1 pound per minute, these are constant rates of change. This tells us the amount of water in the tank is changing linearly, as is the amount of sugar in the tank. We can write an equation independently for each:

$$\begin{array}{c}\text{water: } W(t)=100+10t \text{ in gallons}\\ \text{sugar: } S(t)=5+1t \text{ in pounds}\end{array}$$

The concentration, C, will be the ratio of pounds of sugar to gallons of water

$$C(t)=\frac{5+t}{100+10t} \tag{16.2.3.4}$$

The concentration after 12 minutes is given by evaluating $C(t)$ at $t=12$.

$$C(12)=\frac{5+12}{100+10(12)} \tag{16.2.3.5}$$

$$=\frac{17}{220} \tag{16.2.3.6}$$

This means the concentration is 17 pounds of sugar to 220 gallons of water.

At the beginning, the concentration is

$$C(0)=\frac{5+0}{100+10(0)} \tag{16.2.3.7}$$

$$=\frac{1}{20} \tag{16.2.3.8}$$

Since $\frac{17}{220}\approx 0.08>\frac{1}{20}=0.05$, the concentration is greater after 12 minutes than at the beginning.

Analysis

To find the horizontal asymptote, divide the leading coefficient in the numerator by the leading coefficient in the denominator:

$$\frac{1}{10}=0.1 \tag{16.2.3.9}$$

Notice the horizontal asymptote is $y=0.1$. This means the concentration, C, the ratio of pounds of sugar to gallons of water, will approach 0.1 in the long term.

Exercise 16.2.3.3

There are 1,200 freshmen and 1,500 sophomores at a prep rally at noon. After 12 p.m., 20 freshmen arrive at the rally every five minutes while 15 sophomores leave the rally. Find the ratio of freshmen to sophomores at 1 p.m.

Answer

$\frac{12}{11}$

Finding the Domains of Rational Functions

A *vertical asymptote* represents a value at which a rational function is undefined, so that value is not in the domain of the function. A reciprocal function cannot have values in its domain that cause the denominator to equal zero. In general, to find the domain of a rational function, we need to determine which inputs would cause division by zero.

Definition: DOMAIN OF A RATIONAL FUNCTION

The domain of a rational function includes all real numbers except those that cause the denominator to equal zero.

How To: Given a rational function, find the domain.

1. Set the denominator equal to zero.
2. Solve to find the x-values that cause the denominator to equal zero.
3. The domain is all real numbers except those found in Step 2.

Example 16.2.3.4: Finding the Domain of a Rational Function

Find the domain of $f(x) = \dfrac{x+3}{x^2-9}$.

Solution

Begin by setting the denominator equal to zero and solving.

$$x^2 - 9 = 0$$

$$x^2 = 9$$

$$x = \pm 3$$

The denominator is equal to zero when $x = \pm 3$. The domain of the function is all real numbers except $x = \pm 3$.

Analysis

A graph of this function, as shown in Figure 16.2.3.9, confirms that the function is not defined when $x = \pm 3$.

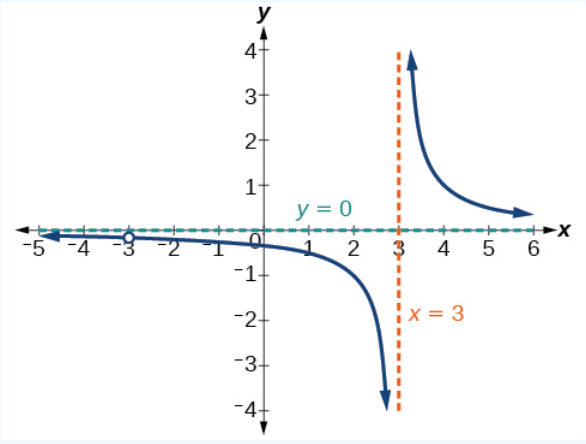

Figure 16.2.3.9.

There is a vertical asymptote at $x = 3$ and a hole in the graph at $x = -3$. We will discuss these types of holes in greater detail later in this section.

Exercise 16.2.3.4

Find the domain of $f(x) = \dfrac{4x}{5(x-1)(x-5)}$.

Answer

The domain is all real numbers except $x = 1$ and $x = 5$.

Identifying Vertical Asymptotes of Rational Functions

By looking at the graph of a rational function, we can investigate its local behavior and easily see whether there are asymptotes. We may even be able to approximate their location. Even without the graph, however, we can still determine whether a given rational function has any asymptotes, and calculate their location.

Vertical Asymptotes

The vertical asymptotes of a rational function may be found by examining the factors of the denominator that are not common to the factors in the numerator. Vertical asymptotes occur at the zeros of such factors.

How To: Given a rational function, identify any vertical asymptotes of its graph

1. Factor the numerator and denominator.
2. Note any restrictions in the domain of the function.
3. Reduce the expression by canceling common factors in the numerator and the denominator.
4. Note any values that cause the denominator to be zero in this simplified version. These are where the vertical asymptotes occur.
5. Note any restrictions in the domain where asymptotes do not occur. These are removable discontinuities, or "holes."

Example 16.2.3.5: Identifying Vertical Asymptotes

Find the vertical asymptotes of the graph of $k(x) = \dfrac{5+2x^2}{2-x-x^2}$.

Solution

First, factor the numerator and denominator.

$$k(x) = \frac{5+2x^2}{2-x-x^2}$$
$$= \frac{5+2x^2}{(2+x)(1-x)}$$

To find the vertical asymptotes, we determine where this function will be undefined by setting the denominator equal to zero:

$$(2+x)(1-x) = 0$$
$$x = -2,\ x = 1$$

Neither $x = -2$ nor $x = 1$ are zeros of the numerator, so the two values indicate two vertical asymptotes. The graph in Figure 16.2.3.10confirms the location of the two vertical asymptotes.

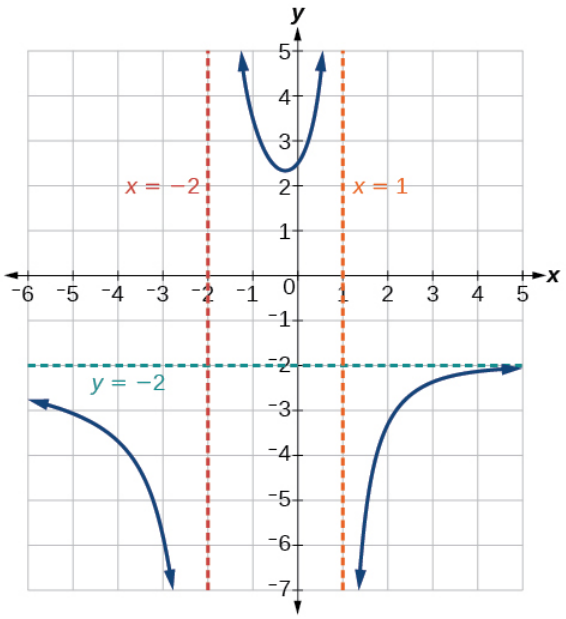

***Figure* 16.2.3.10.**

Removable Discontinuities

Occasionally, a graph will contain a hole: a single point where the graph is not defined, indicated by an open circle. We call such a hole a *removable discontinuity*. For example, the function $f(x) = \dfrac{x^2-1}{x^2-2x-3}$ may be re-written by factoring the numerator and the denominator.

$$f(x) = \frac{(x+1)(x-1)}{(x+1)(x-3)}$$

Notice that $x+1$ is a common factor to the numerator and the denominator. The zero of this factor, $x=-1$, is the location of the removable discontinuity. Notice also that $(x-3)$ is not a factor in both the numerator and denominator. The zero of this factor, $x=3$, is the vertical asymptote. See Figure 16.2.3.11 [Note that removable discontinuities may not be visible when we use a graphing calculator, depending upon the window selected.]

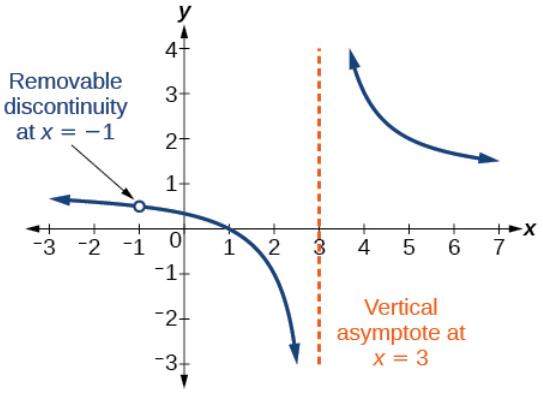

Figure 16.2.3.11.

REMOVABLE DISCONTINUITIES OF RATIONAL FUNCTIONS

A **removable discontinuity** occurs in the graph of a rational function at $x=a$ if a is a zero for a factor in the denominator that is common with a factor in the numerator. We factor the numerator and denominator and check for common factors. If we find any, we set the common factor equal to 0 and solve. This is the location of the removable discontinuity. This is true if the

multiplicity of this factor is greater than or equal to that in the denominator. If the multiplicity of this factor is greater in the denominator, then there is still an asymptote at that value.

Example 16.2.3.6: Identifying Vertical Asymptotes and Removable Discontinuities for a Graph

Find the vertical asymptotes and removable discontinuities of the graph of $k(x) = \dfrac{x-2}{x^2-4}$.

Solution

Factor the numerator and the denominator.

$$k(x) = \frac{x-2}{(x-2)(x+2)}$$

Notice that there is a common factor in the numerator and the denominator, $x-2$. The zero for this factor is $x = 2$. This is the location of the removable discontinuity.

Notice that there is a factor in the denominator that is not in the numerator, $x+2$. The zero for this factor is $x = -2$. The vertical asymptote is $x = -2$. See Figure 16.2.3.12

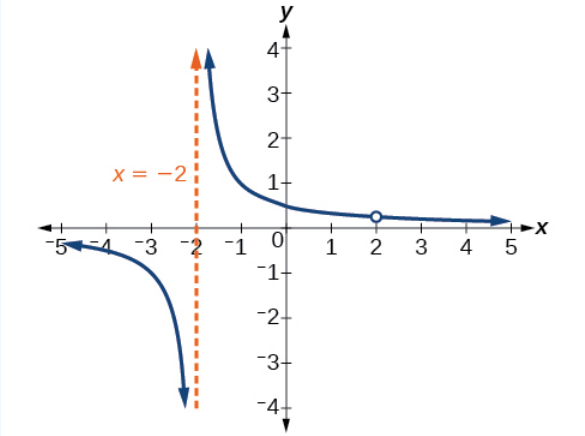

Figure 16.2.3.12.

The graph of this function will have the vertical asymptote at $x = -2$, but at $x = 2$ the graph will have a hole.

Exercise 16.2.3.5

Find the vertical asymptotes and removable discontinuities of the graph of $f(x) = \dfrac{x^2-25}{x^3-6x^2+5x}$.

Answer

Removable discontinuity at $x = 5$.

Vertical asymptotes: $x = 0$, $x = 1$.

Identifying Horizontal Asymptotes of Rational Functions

While vertical asymptotes describe the behavior of a graph as the *output* gets very large or very small, horizontal asymptotes help describe the behavior of a graph as the *input* gets very large or very small. Recall that a polynomial's end behavior will mirror that of the leading term. Likewise, a rational function's end behavior will mirror that of the ratio of the function that is the ratio of the leading terms.

There are three distinct outcomes when checking for horizontal asymptotes:

Case 1: If the degree of the denominator > degree of the numerator, there is a **horizontal asymptote** at $y = 0$.

Example: $f(x)=\dfrac{4x+2}{x^2+4x-5}$

In this case, the end behavior is $f(x)\approx\dfrac{4x}{x^2}=\dfrac{4}{x}$. This tells us that, as the inputs increase or decrease without bound, this function will behave similarly to the function $g(x)=\dfrac{4}{x}$, and the outputs will approach zero, resulting in a horizontal asymptote at $y=0$. See **Figure** 16.2.3.13 Note that this graph crosses the horizontal asymptote.

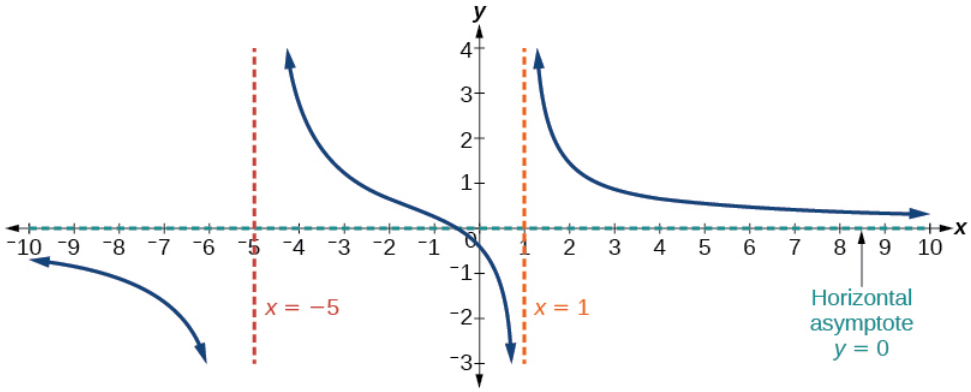

Figure 16.2.3.13: Horizontal asymptote $y=0$ when $f(x)=\dfrac{p(x)}{q(x)}$, $q(x)\neq 0$ where degree of p < degree of q.

Case 2: If the degree of the denominator < degree of the numerator by one, we get a slant asymptote.

Example: $f(x)=\dfrac{3x^2-2x+1}{x-1}$

In this case, the end behavior is $f(x)\approx\dfrac{3x^2}{x}=3x$. This tells us that as the inputs increase or decrease without bound, this function will behave similarly to the function $g(x)=3x$. As the inputs grow large, the outputs will grow and not level off, so this graph has no horizontal asymptote. However, the graph of $g(x)=3x$ looks like a diagonal line, and since f will behave similarly to g, it will approach a line close to $y=3x$. This line is a slant asymptote.

To find the equation of the slant asymptote, divide $\dfrac{3x^2-2x+1}{x-1}$. The quotient is $3x+1$, and the remainder is 2. The slant asymptote is the graph of the line $g(x)=3x+1$. See Figure 16.2.3.14

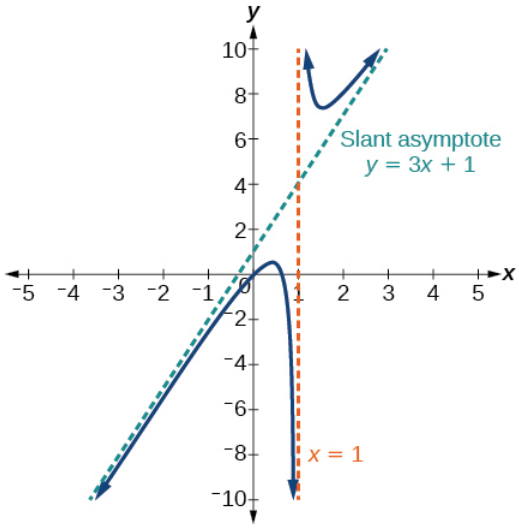

Figure 16.2.3.14: Slant asymptote when $f(x)=\dfrac{p(x)}{q(x)}$, $q(x)\neq 0$ where degree of p >degree of q by 1.

Case 3: If the degree of the denominator = degree of the numerator, there is a horizontal asymptote at $y = \frac{a_n}{b_n}$, where a_n and b_n are respectively the leading coefficients of $p(x)$ and $q(x)$ for $f(x) = \frac{p(x)}{q(x)}$, $q(x) \neq 0$.

Example: $f(x) = \frac{3x^2 + 2}{x^2 + 4x - 5}$

In this case, the end behavior is $f(x) \approx \frac{3x^2}{x^2} = 3$. This tells us that as the inputs grow large, this function will behave like the function $g(x) = 3$, which is a horizontal line. As $x \to \pm\infty$, $f(x) \to 3$, resulting in a horizontal asymptote at $y = 3$. See Figure 16.2.3.15 Note that this graph crosses the horizontal asymptote.

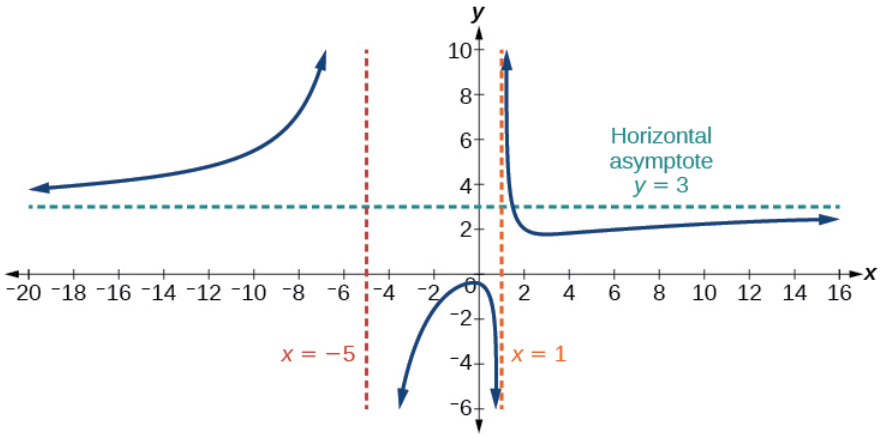

Figure 16.2.3.15: Horizontal asymptote when $f(x) = \frac{p(x)}{q(x)}$, $q(x) \neq 0$ where degree of p = degree of q.

Notice that, while the graph of a rational function will never cross a **vertical asymptote**, the graph may or may not cross a horizontal or slant asymptote. Also, although the graph of a rational function may have many vertical asymptotes, the graph will have at most one horizontal (or slant) asymptote.

It should be noted that, if the degree of the numerator is larger than the degree of the denominator by more than one, the **end behavior** of the graph will mimic the behavior of the reduced end behavior fraction. For instance, if we had the function

$$f(x) = \frac{3x^5 - x^2}{x + 3}$$

with end behavior

$$f(x) \approx \frac{3x^5}{x} = 3x^4$$

the end behavior of the graph would look similar to that of an even polynomial with a positive leading coefficient.

$$x \to \pm\infty, f(x) \to \infty$$

HORIZONTAL ASYMPTOTES OF RATIONAL FUNCTIONS

The **horizontal asymptote** of a rational function can be determined by looking at the degrees of the numerator and denominator.

- Degree of numerator is less than degree of denominator: horizontal asymptote at $y = 0$.
- Degree of numerator is greater than degree of denominator by one: no horizontal asymptote; slant asymptote.
- Degree of numerator is equal to degree of denominator: horizontal asymptote at ratio of leading coefficients.

Example 16.2.3.7: Identifying Horizontal and Slant Asymptotes

For the functions listed, identify the horizontal or slant asymptote.

1. $g(x) = \dfrac{6x^3 - 10x}{2x^3 + 5x^2}$
2. $h(x) = \dfrac{x^2 - 4x + 1}{x + 2}$
3. $k(x) = \dfrac{x^2 + 4x}{x^3 - 8}$

Solution

For these solutions, we will use $f(x) = \dfrac{p(x)}{q(x)},\ q(x) \neq 0$.

1. $g(x) = \dfrac{6x^3 - 10x}{2x^3 + 5x^2}$: The degree of $p =$ degree of $q = 3$, so we can find the horizontal asymptote by taking the ratio of the leading terms. There is a horizontal asymptote at $y = \frac{6}{2}$ or $y = 3$.
2. $h(x) = \dfrac{x^2 - 4x + 1}{x + 2}$: The degree of $p = 2$ and degree of $q = 1$. Since $p > q$ by 1, there is a slant asymptote found at $\dfrac{x^2 - 4x + 1}{x + 2}$.

$$\begin{array}{r|rrr} -2 & 1 & -4 & 1 \\ & & -2 & 12 \\ \hline & 1 & -6 & 13 \end{array}$$

3. $k(x) = \dfrac{x^2 + 4x}{x^3 - 8}$: The degree of $p = 2 <$ degree of $q = 3$, so there is a horizontal asymptote $y = 0$.

Example 16.2.3.8 Identifying Horizontal Asymptotes

In the sugar concentration problem earlier, we created the equation $C(t) = \dfrac{5 + t}{100 + 10t}$.

Find the horizontal asymptote and interpret it in context of the problem.

Solution

Both the numerator and denominator are linear (degree 1). Because the degrees are equal, there will be a horizontal asymptote at the ratio of the leading coefficients. In the numerator, the leading term is t, with coefficient 1. In the denominator, the leading term is 10t, with coefficient 10. The horizontal asymptote will be at the ratio of these values:

$$t \to \infty,\ C(t) \to \tfrac{1}{10}$$

This function will have a horizontal asymptote at $y = \frac{1}{10}$.

This tells us that as the values of t increase, the values of C will approach $\frac{1}{10}$. In context, this means that, as more time goes by, the concentration of sugar in the tank will approach one-tenth of a pound of sugar per gallon of water or $\frac{1}{10}$ pounds per gallon.

Example 16.2.3.9: Identifying Horizontal and Vertical Asymptotes

Find the horizontal and vertical asymptotes of the function $f(x) = \dfrac{(x-2)(x+3)}{(x-1)(x+2)(x-5)}$

Solution

First, note that this function has no common factors, so there are no potential removable discontinuities.

The function will have vertical asymptotes when the denominator is zero, causing the function to be undefined. The denominator will be zero at $x = 1, -2$,and 5, indicating vertical asymptotes at these values.

The numerator has degree 2, while the denominator has degree 3. Since the degree of the denominator is greater than the degree of the numerator, the denominator will grow faster than the numerator, causing the outputs to tend towards zero as the inputs get large, and so as $x \to \pm\infty$, $f(x) \to 0$. This function will have a horizontal asymptote at $y = 0$. See Figure $16.2.3.16$

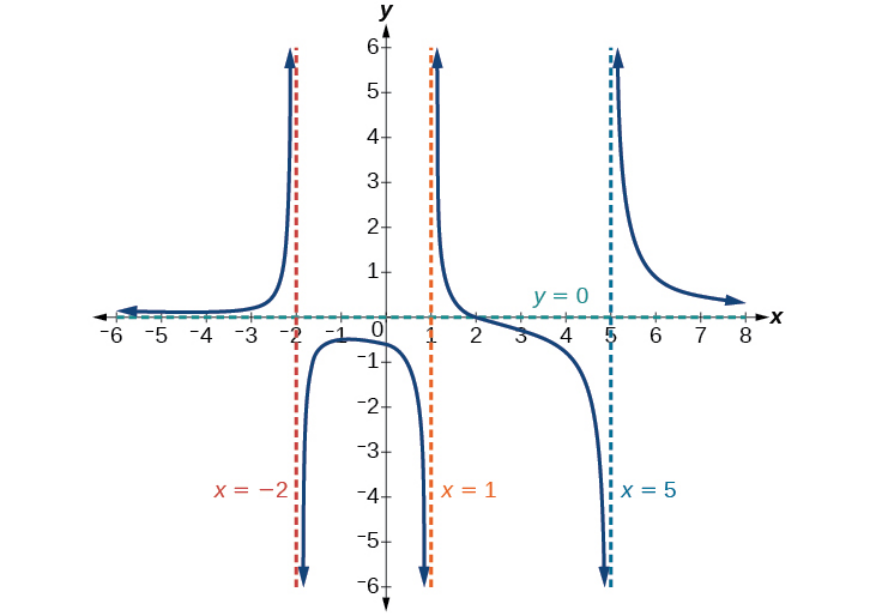

Figure 16.2.3.16.

Exercise 16.2.3.6

Find the vertical and horizontal asymptotes of the function:

$$f(x) = \frac{(2x-1)(2x+1)}{(x-2)(x+3)}$$

Answer

Vertical asymptotes at $x = 2$ and $x = -3$

horizontal asymptote at $y = 4$.

INTERCEPTS OF RATIONAL FUNCTIONS

A *rational function* will have a y-intercept at $f(0)$, if the function is defined at zero. A rational function will not have a y-intercept if the function is not defined at zero.

Likewise, a rational function will have x-intercepts at the inputs that cause the output to be zero. Since a fraction is only equal to zero when the numerator is zero, x-intercepts can only occur when the numerator of the rational function is equal to zero.

Example 16.2.3.10: Finding the Intercepts of a Rational Function

Find the intercepts of $f(x) = \dfrac{(x-2)(x+3)}{(x-1)(x+2)(x-5)}$.

Solution

We can find the y-intercept by evaluating the function at zero

$$f(0) = \frac{(0-2)(0+3)}{(0-1)(0+2)(0-5)}$$
$$= -\frac{6}{10}$$
$$= -\frac{3}{5}$$
$$= -0.6$$

The x-intercepts will occur when the function is equal to zero:

$$0 = \frac{(x-2)(x+3)}{(x-1)(x+2)(x-5)} \text{ This is zero when the numerator is zero.}$$

$$0 = (x-2)(x+3)$$

$$x = 2, x = -3$$

The y-intercept is $(0, -0.6)$, the x-intercepts are $(2, 0)$ and $(-3, 0)$. See Figure 16.2.3.17.

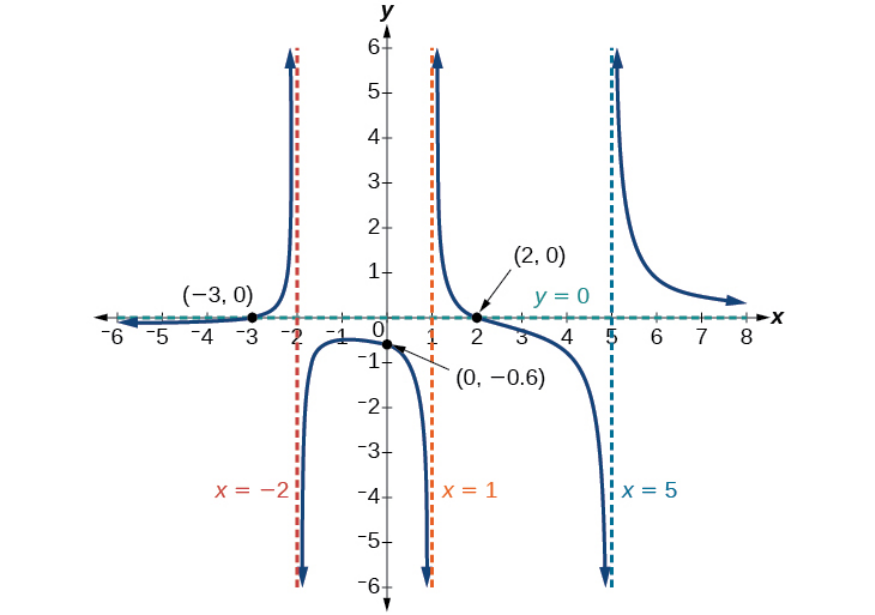

Figure 16.2.3.17.

Exercise 16.2.3.7

Given the reciprocal squared function that is shifted right 3 units and down 4 units, write this as a rational function. Then, find the x- and y-intercepts and the horizontal and vertical asymptotes.

Answer

For the transformed reciprocal squared function, we find the rational form.

$$f(x) = \frac{1}{(x-3)^2} - 4 = \frac{1-4(x-3)^2}{(x-3)^2} = \frac{1-4(x^2-6x+9)}{(x-3)(x-3)} = \frac{-4x^2+24x-35}{x^2-6x+9}$$

Because the numerator is the same degree as the denominator we know that as $x \to \pm\infty$, $f(x) \to -4$; so $y = -4$ is the horizontal asymptote. Next, we set the denominator equal to zero, and find that the vertical asymptote is $x = 3$, because as $x \to 3$, $f(x) \to \infty$. We then set the numerator equal to 0 and find the x-intercepts are at $(2.5, 0)$ and $(3.5, 0)$. Finally, we evaluate the function at 0 and find the y-intercept to be at $(0, -\frac{35}{9})$.

Graphing Rational Functions

In Example 16.2.3.10 we see that the numerator of a rational function reveals the *x*-intercepts of the graph, whereas the denominator reveals the vertical asymptotes of the graph. As with polynomials, factors of the numerator may have integer powers greater than one. Fortunately, the effect on the shape of the graph at those intercepts is the same as we saw with polynomials.

The vertical asymptotes associated with the factors of the denominator will mirror one of the two toolkit reciprocal functions. When the degree of the factor in the denominator is odd, the distinguishing characteristic is that on one side of the vertical asymptote the graph heads towards positive infinity, and on the other side the graph heads towards negative infinity. See Figure 16.2.3.18

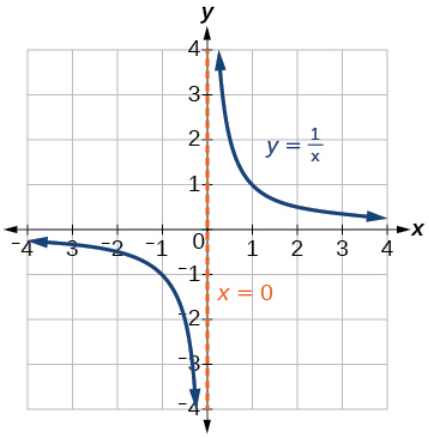

Figure 16.2.3.18.

When the degree of the factor in the denominator is even, the distinguishing characteristic is that the graph either heads toward positive infinity on both sides of the vertical asymptote or heads toward negative infinity on both sides. See Figure 16.2.3.19

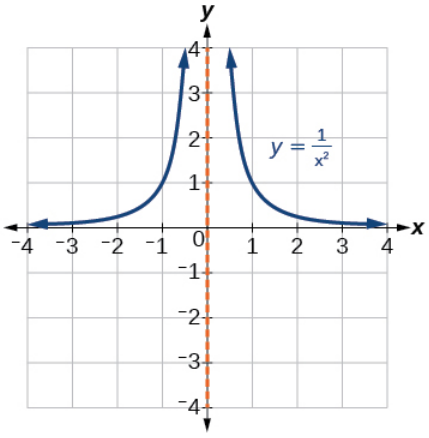

Figure 16.2.3.19.

For example, the graph of $f(x) = \dfrac{(x+1)^2(x-3)}{(x+3)^2(x-2)}$ is shown in Figure 16.2.3.20

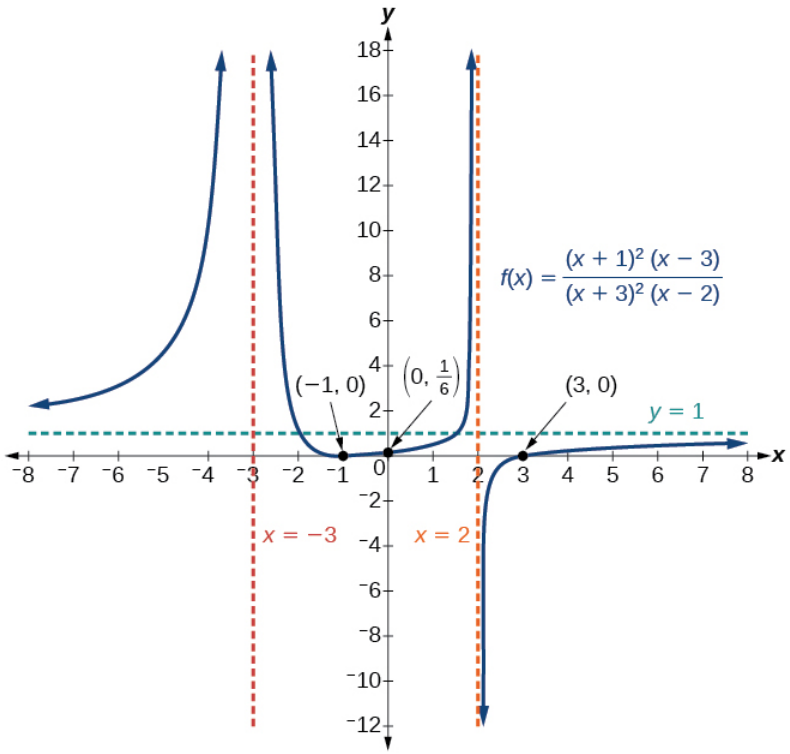

Figure 16.2.3.20.

- At the x-intercept $x=-1$ corresponding to the $(x+1)^2$ factor of the numerator, the graph "bounces", consistent with the quadratic nature of the factor.
- At the x-intercept $x=3$ corresponding to the $(x-3)$ factor of the numerator, the graph passes through the axis as we would expect from a linear factor.
- At the vertical asymptote $x=-3$ corresponding to the $(x+3)^2$ factor of the denominator, the graph heads towards positive infinity on both sides of the asymptote, consistent with the behavior of the function $f(x)=\dfrac{1}{x^2}$.
- At the vertical asymptote $x=2$, corresponding to the $(x-2)$ factor of the denominator, the graph heads towards positive infinity on the left side of the asymptote and towards negative infinity on the right side, consistent with the behavior of the function $f(x)=\dfrac{1}{x}$.

Howto: Given a rational function, sketch a graph.

1. Evaluate the function at 0 to find the y-intercept.
2. Factor the numerator and denominator.
3. For factors in the numerator not common to the denominator, determine where each factor of the numerator is zero to find the x-intercepts.
4. Find the multiplicities of the x-intercepts to determine the behavior of the graph at those points.
5. For factors in the denominator, note the multiplicities of the zeros to determine the local behavior. For those factors not common to the numerator, find the vertical asymptotes by setting those factors equal to zero and then solve.
6. For factors in the denominator common to factors in the numerator, find the removable discontinuities by setting those factors equal to 0 and then solve.
7. Compare the degrees of the numerator and the denominator to determine the horizontal or slant asymptotes.
8. Sketch the graph.

Example 16.2.3.11: Graphing a Rational Function

Sketch a graph of $f(x)=\frac{(x+2)(x-3)}{(x+1)^2(x-2)}$.

Solution

We can start by noting that the function is already factored, saving us a step.

Next, we will find the intercepts. Evaluating the function at zero gives the y-intercept:

$$f(0)=\frac{(0+2)(0-3)}{(0+1)^2(0-2)}=3$$

To find the x-intercepts, we determine when the numerator of the function is zero. Setting each factor equal to zero, we find x-intercepts at $x=-2$ and $x=3$. At each, the behavior will be linear (multiplicity 1), with the graph passing through the intercept.

We have a y-intercept at $(0,3)$ and x-intercepts at $(-2,0)$ and $(3,0)$.

To find the vertical asymptotes, we determine when the denominator is equal to zero. This occurs when $x+1=0$ and when $x-2=0$, giving us vertical asymptotes at $x=-1$ and $x=2$.

There are no common factors in the numerator and denominator. This means there are no removable discontinuities.

Finally, the degree of denominator is larger than the degree of the numerator, telling us this graph has a horizontal asymptote at $y=0$.

To sketch the graph, we might start by plotting the three intercepts. Since the graph has no x-intercepts between the vertical asymptotes, and the y-intercept is positive, we know the function must remain positive between the asymptotes, letting us fill in the middle portion of the graph as shown in Figure 16.2.3.21

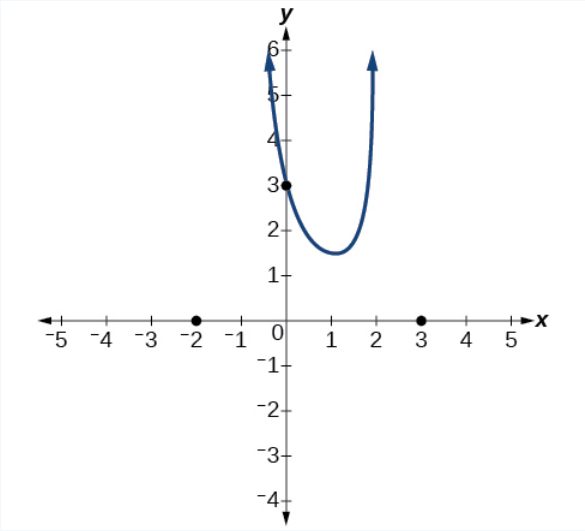

Figure 16.2.3.21.

The factor associated with the vertical asymptote at $x=-1$ was squared, so we know the behavior will be the same on both sides of the asymptote. The graph heads toward positive infinity as the inputs approach the asymptote on the right, so the graph will head toward positive infinity on the left as well.

For the vertical asymptote at $x=2$, the factor was not squared, so the graph will have opposite behavior on either side of the asymptote. See Figure 16.2.3.22 After passing through the x-intercepts, the graph will then level off toward an output of zero, as indicated by the horizontal asymptote.

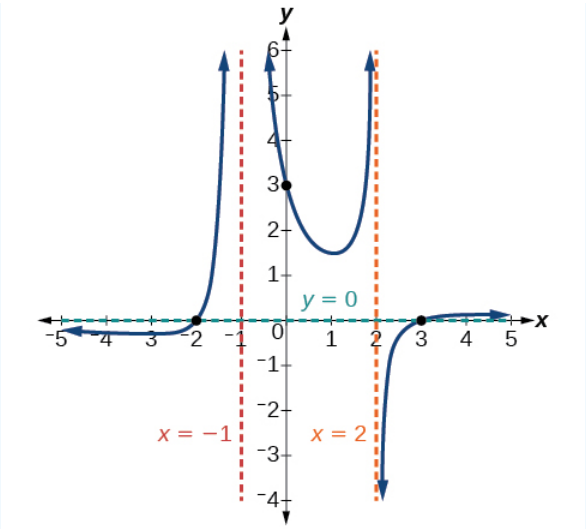

Figure 16.2.3.22.

Exercise 16.2.3.8

Given the function $f(x) = \frac{(x+2)^2(x-2)}{2(x-1)^2(x-3)}$, use the characteristics of polynomials and rational functions to describe its behavior and sketch the function.

Answer

Horizontal asymptote at $y = \frac{1}{2}$. Vertical asymptotes at $x = 1$ and $x = 3$. y-intercept at $(0, \frac{4}{3})$.

x-intercepts at $(2, 0)$ and $(-2, 0)$. $(-2, 0)$ is a zero with multiplicity 2, and the graph bounces off the x-axis at this point. $(2, 0)$ is a single zero and the graph crosses the axis at this point.

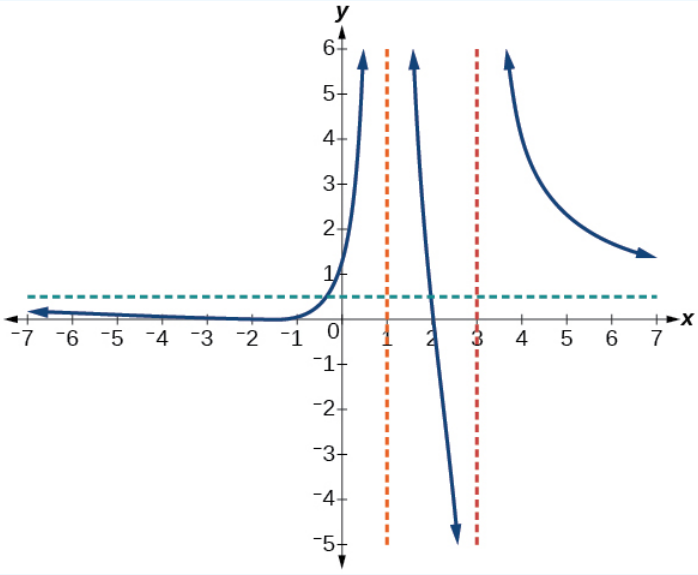

Figure 16.2.3.23

Writing Rational Functions

Now that we have analyzed the equations for rational functions and how they relate to a graph of the function, we can use information given by a graph to write the function. A rational function written in factored form will have an *x*-intercept where each factor of the numerator is equal to zero. (An exception occurs in the case of a removable discontinuity.) As a result, we can form a

numerator of a function whose graph will pass through a set of *x*-intercepts by introducing a corresponding set of factors. Likewise, because the function will have a vertical asymptote where each factor of the denominator is equal to zero, we can form a denominator that will produce the vertical asymptotes by introducing a corresponding set of factors.

WRITING RATIONAL FUNCTIONS FROM INTERCEPTS AND ASYMPTOTES

If a **rational function** has x-intercepts at $x = x_1, x_2, \ldots, x_n$, vertical asymptotes at $x = v_1, v_2, \ldots, v_m$, and no $x_i =$ any v_j, then the function can be written in the form:

$$f(x) = a\frac{(x-x_1)^{p_1}(x-x_2)^{p_2}\cdots(x-x_n)^{p_n}}{(x-v_1)^{q_1}(x-v_2)^{q_2}\cdots(x-v_m)^{q_n}}$$

where the powers p_i or q_i on each factor can be determined by the behavior of the graph at the corresponding intercept or asymptote, and the stretch factor a can be determined given a value of the function other than the x-intercept or by the horizontal asymptote if it is nonzero.

Given a graph of a rational function, write the function.

1. Determine the factors of the numerator. Examine the behavior of the graph at the *x*-intercepts to determine the zeroes and their multiplicities. (This is easy to do when finding the "simplest" function with small multiplicities—such as 1 or 3—but may be difficult for larger multiplicities—such as 5 or 7, for example.)
2. Determine the factors of the denominator. Examine the behavior on both sides of each vertical asymptote to determine the factors and their powers.
3. Use any clear point on the graph to find the stretch factor.

Example 16.2.3.12: Writing a Rational Function from Intercepts and Asymptotes

Write an equation for the rational function shown in Figure 16.2.3.24

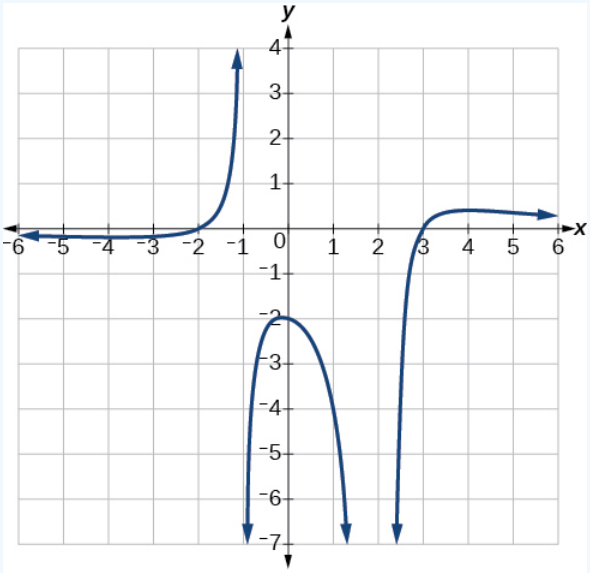

Figure 16.2.3.24.

Solution

The graph appears to have x-intercepts at $x = -2$ and $x = 3$. At both, the graph passes through the intercept, suggesting linear factors. The graph has two vertical asymptotes. The one at $x = -1$ seems to exhibit the basic behavior similar to $\frac{1}{x}$, with the graph heading toward positive infinity on one side and heading toward negative infinity on the other. The asymptote at $x = 2$ is exhibiting a behavior similar to $\frac{1}{x^2}$, with the graph heading toward negative infinity on both sides of the asymptote. See Figure 16.2.3.25

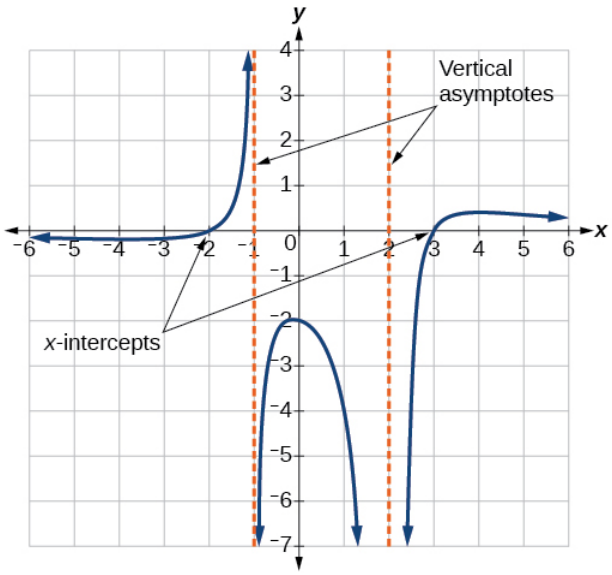

Figure 16.2.3.25.

We can use this information to write a function of the form

$$f(x) = a\frac{(x+2)(x-3)}{(x+1)(x-2)^2}$$

To find the stretch factor, we can use another clear point on the graph, such as the *y*-intercept $(0,-2)$.

$$-2 = a\frac{(0+2)(0-3)}{(0+1)(0-2)^2}$$
$$-2 = a\frac{-6}{4}$$
$$a = \frac{-8}{-6} = \frac{4}{3}$$

This gives us a final function of $f(x) = \dfrac{4(x+2)(x-3)}{3(x+1)(x-2)^2}$.

- Find the Intercepts, Asymptotes, and Hole of a Rational Function

Key Equations

Rational Function $\quad f(x) = \dfrac{P(x)}{Q(x)} = \dfrac{a_p x^p + a_{p-1}x^{p-1} + \ldots + a_1 x + a_0}{b_q x^q + b_{q-1}x^{q-1} + \ldots + b_1 x + b_0},\ Q(x) \neq 0$

Key Concepts

- We can use arrow notation to describe local behavior and end behavior of the toolkit functions $f(x) = \frac{1}{x}$ and $f(x) = \frac{1}{x^2}$. See Example 16.2.3.1.
- A function that levels off at a horizontal value has a horizontal asymptote. A function can have more than one vertical asymptote. See Example.

- Application problems involving rates and concentrations often involve rational functions. See Example.
- The domain of a rational function includes all real numbers except those that cause the denominator to equal zero. See Example.
- The vertical asymptotes of a rational function will occur where the denominator of the function is equal to zero and the numerator is not zero. See Example.
- A removable discontinuity might occur in the graph of a rational function if an input causes both numerator and denominator to be zero. See Example.
- A rational function's end behavior will mirror that of the ratio of the leading terms of the numerator and denominator functions. See Example, Example, Example, and Example.
- Graph rational functions by finding the intercepts, behavior at the intercepts and asymptotes, and end behavior. See Example.
- If a rational function has x-intercepts at $x = x_1, x_2, \ldots, x_n$, vertical asymptotes at $x = v_1, v_2, \ldots, v_m$, and no $x_i =$ any v_j, then the function can be written in the form

16.2.4: Power Functions and Polynomial Functions

Learning Objectives

- Identify power functions.
- Identify end behavior of power functions.
- Identify polynomial functions.
- Identify the degree and leading coefficient of polynomial functions.

Suppose a certain species of bird thrives on a small island. Its population over the last few years is shown in Table 16.2.4.1

Table 16.2.4.1

Year	2009	2010	2011	2012	2013
Bird Population	800	897	992	1,083	1,169

The population can be estimated using the function $P(t) = -0.3t^3 + 97t + 800$, where $P(t)$ represents the bird population on the island t years after 2009. We can use this model to estimate the maximum bird population and when it will occur. We can also use this model to predict when the bird population will disappear from the island. In this section, we will examine functions that we can use to estimate and predict these types of changes.

Figure 16.2.4.1: (credit: Jason Bay, Flickr)

Identifying Power Functions

In order to better understand the bird problem, we need to understand a specific type of function. A power function is a function with a single term that is the product of a real number, a coefficient, and a variable raised to a fixed real number. (A number that multiplies a variable raised to an exponent is known as a coefficient.)

As an example, consider functions for area or volume. The function for the area of a circle with radius r is

$$A(r) = \pi r^2$$

and the function for the volume of a sphere with radius r is

$$V(r) = \frac{4}{3}\pi r^3$$

Both of these are examples of power functions because they consist of a coefficient, π or $\frac{4}{3}\pi$, multiplied by a variable r raised to a power.

Definition: Power Function

A *power function* is a function that can be represented in the form

$$f(x) = kx^p \tag{16.2.4.1}$$

where k and p are real numbers, and k is known as the *coefficient*.

Q&A: Is $f(x) = 2^x$ a power function?

No. A power function contains a variable base raised to a fixed power (Equation 16.2.4.1). This function has a constant base raised to a variable power. This is called an exponential function, not a power function. This function will be discussed later.

Example 16.2.4.1: Identifying Power Functions

Which of the following functions are power functions?

$f(x) = 1$	Constant function
$f(x) = x$	Identify function
$f(x) = x^2$	Quadratic function
$f(x) = x^3$	Cubic function
$f(x) = \frac{1}{x}$	Reciprocal function
$f(x) = \frac{1}{x^2}$	Reciprocal squared function
$f(x) = \sqrt{x}$	Square root function
$f(x) = \sqrt[3]{x}$	Cube root function

Solution

All of the listed functions are power functions.

The constant and identity functions are power functions because they can be written as $f(x) = x^0$ and $f(x) = x^1$ respectively.

The quadratic and cubic functions are power functions with whole number powers $f(x) = x^2$ and $f(x) = x^3$.

The **reciprocal** and reciprocal squared functions are power functions with negative whole number powers because they can be written as $f(x) = x^{-1}$ and $f(x) = x^{-2}$.

The square and **cube root** functions are power functions with fractional powers because they can be written as $f(x) = x^{1/2}$ or $f(x) = x^{1/3}$.

Exercise 16.2.4.1

Which functions are power functions?

- $f(x) = 2x^2 \cdot 4x^3$
- $g(x) = -x^5 + 5x^3 - 4x$
- $h(x) = \frac{2x^5 - 1}{3x^2 + 4}$

Answer

$f(x)$ is a power function because it can be written as $f(x) = 8x^5$. The other functions are not power functions.

Identifying End Behavior of Power Functions

Figure 16.2.4.2 shows the graphs of $f(x) = x^2$, $g(x) = x^4$ and and $h(x) = x^6$, which are all power functions with even, whole-number powers. Notice that these graphs have similar shapes, very much like that of the quadratic function in the toolkit. However, as the power increases, the graphs flatten somewhat near the origin and become steeper away from the origin.

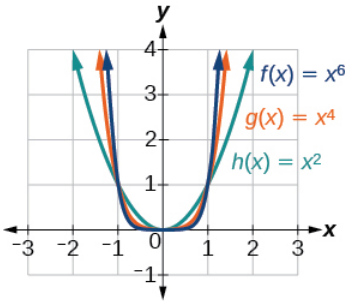

Figure 16.2.4.2: Even-power functions

To describe the behavior as numbers become larger and larger, we use the idea of infinity. We use the symbol ∞ for positive infinity and $-\infty$ for negative infinity. When we say that "x approaches infinity," which can be symbolically written as $x \to \infty$, we are describing a behavior; we are saying that x is increasing without bound.

With the even-power function, as the input increases or decreases without bound, the output values become very large, positive numbers. Equivalently, we could describe this behavior by saying that as x approaches positive or negative infinity, the $f(x)$ values increase without bound. In symbolic form, we could write

$$\text{as } x \to \pm\infty,\ f(x) \to \infty$$

Figure 16.2.4.3 shows the graphs of $f(x) = x^3$, $g(x) = x^5$, and $h(x) = x^7$, which are all power functions with odd, whole-number powers. Notice that these graphs look similar to the cubic function in the toolkit. Again, as the power increases, the graphs flatten near the origin and become steeper away from the origin.

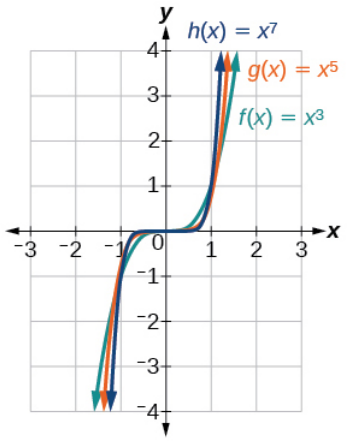

Figure 16.2.4.3: Odd-power function

These examples illustrate that functions of the form $f(x) = x^n$ reveal symmetry of one kind or another. First, in Figure 16.2.4.2 we see that even functions of the form $f(x) = x^n$, n even, are symmetric about the y-axis. In Figure 16.2.4.3 we see that odd functions of the form $f(x) = x^n$, n odd, are symmetric about the origin.

For these odd power functions, as x approaches negative infinity, $f(x)$ decreases without bound. As x approaches positive infinity, $f(x)$ increases without bound. In symbolic form we write

$$\text{as } x \to -\infty,\ f(x) \to -\infty$$
$$\text{as } x \to \infty,\ f(x) \to \infty$$

The behavior of the graph of a function as the input values get very small $(x \to -\infty)$ and get very large $x \to \infty$ is referred to as the *end behavior* of the function. We can use words or symbols to describe end behavior.

Figure 16.2.4.4 shows the end behavior of power functions in the form $f(x) = kx^n$ where n is a non-negative integer depending on the power and the constant.

	Even power	Odd power
Positive constant $k > 0$	 $x \to -\infty$, $f(x) \to \infty$ and $x \to \infty$, $f(x) \to \infty$	 $x \to -\infty$, $f(x) \to -\infty$ and $x \to \infty$, $f(x) \to \infty$
Negative constant $k < 0$	 $x \to -\infty$, $f(x) \to -\infty$ and $x \to \infty$, $f(x) \to -\infty$	 $x \to -\infty$, $f(x) \to \infty$ and $x \to \infty$, $f(x) \to -\infty$

Figure 16.2.4.4

How To: Given a power function $f(x) = kx^n$ where n is a non-negative integer, identify the end behavior.

1. Determine whether the power is even or odd.
2. Determine whether the constant is positive or negative.
3. Use Figure 16.2.4.4to identify the end behavior.

Example 16.2.4.2: Identifying the End Behavior of a Power Function

Describe the end behavior of the graph of $f(x) = x^8$.

Solution

The coefficient is 1 (positive) and the exponent of the power function is 8 (an even number). As x approaches infinity, the output (value of $f(x)$) increases without bound. We write as $x \to \infty$, $f(x) \to \infty$. As x approaches negative infinity, the output increases without bound. In symbolic form, as $x \to -\infty$, $f(x) \to \infty$. We can graphically represent the function as shown in Figure 16.2.4.5

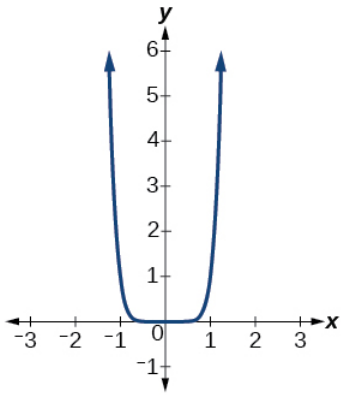

Figure 16.2.4.5: Graph of $f(x) = x^8$.

Example 16.2.4.3: Identifying the End Behavior of a Power Function.

Describe the end behavior of the graph of $f(x) = -x^9$.

Solution

The exponent of the power function is 9 (an odd number). Because the coefficient is –1 (negative), the graph is the reflection about the x-axis of the graph of $f(x) = x^9$. Figure 16.2.4.6 shows that as x approaches infinity, the output decreases without bound. As x approaches negative infinity, the output increases without bound. In symbolic form, we would write

$$\text{as } x \to -\infty,\ f(x) \to \infty$$
$$\text{as } x \to \infty,\ f(x) \to -\infty$$

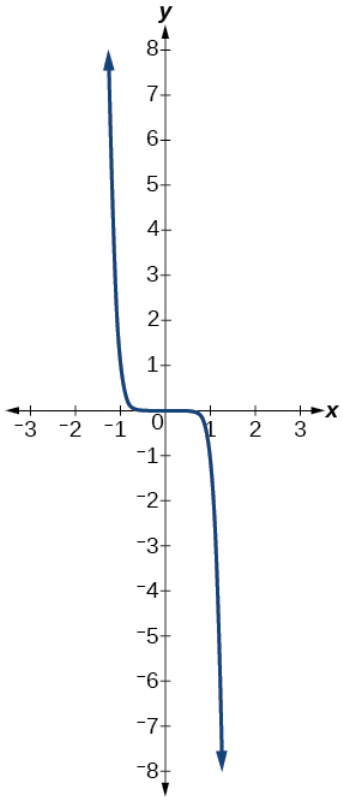

Figure 16.2.4.6: Graph of $f(x) = -x^9$.

Analysis

We can check our work by using the table feature on a graphing utility.

Table 16.2.4.2

x	$f(x)$
-10	1,000,000,000
-5	1,953,125
0	0
5	-1,953,125
10	-1,000,000,000

We can see from Table $16.2.4.2$ that, when we substitute very small values for x, the output is very large, and when we substitute very large values for x, the output is very small (meaning that it is a very large negative value).

Exercise 16.2.4.2

Describe in words and symbols the end behavior of $f(x) = -5x^4$.

Answer

As x approaches positive or negative infinity, $f(x)$ decreases without bound: as $x \to \pm\infty$, $f(x) \to -\infty$ because of the negative coefficient.

Identifying Polynomial Functions

An oil pipeline bursts in the Gulf of Mexico, causing an oil slick in a roughly circular shape. The slick is currently 24 miles in radius, but that radius is increasing by 8 miles each week. We want to write a formula for the area covered by the oil slick by combining two functions. The radius r of the spill depends on the number of weeks w that have passed. This relationship is linear.

$$r(w) = 24 + 8w$$

We can combine this with the formula for the area A of a circle.

$$A(r) = \pi r^2$$

Composing these functions gives a formula for the area in terms of weeks.

$$\begin{aligned} A(w) &= A(r(w)) \\ &= A(24 + 8w) \\ &= \pi(24 + 8w)^2 \end{aligned}$$

Multiplying gives the formula.

$$A(w) = 576\pi + 384\pi w + 64\pi w^2$$

This formula is an example of a polynomial function. A polynomial function consists of either zero or the sum of a finite number of non-zero terms, each of which is a product of a number, called the coefficient of the term, and a variable raised to a non-negative integer power.

Definition: Polynomial Functions

Let n be a non-negative integer. A *polynomial function* is a function that can be written in the form

$$f(x) = a_n x^n + \ldots + a_2 x^2 + a_1 x + a_0 \qquad (16.2.4.2)$$

This is called the general form of a polynomial function. Each a_i is a coefficient and can be any real number. Each product $a_i x^i$ is a *term of a polynomial function.*

Example 16.2.4.4: Identifying Polynomial Functions

Which of the following are polynomial functions?

- $f(x) = 2x^3 \cdot 3x + 4$
- $g(x) = -x(x^2 - 4)$
- $h(x) = 5\sqrt{x} + 2$

Solution

The first two functions are examples of polynomial functions because they can be written in the form of Equation 16.2.4.2, where the powers are non-negative integers and the coefficients are real numbers.

- $f(x)$ can be written as $f(x) = 6x^4 + 4$.
- $g(x)$ can be written as $g(x) = -x^3 + 4x$.
- $h(x)$ cannot be written in this form and is therefore not a polynomial function.

Identifying the Degree and Leading Coefficient of a Polynomial Function

Because of the form of a polynomial function, we can see an infinite variety in the number of terms and the power of the variable. Although the order of the terms in the polynomial function is not important for performing operations, we typically arrange the terms in descending order of power, or in general form. The degree of the polynomial is the highest power of the variable that occurs in the polynomial; it is the power of the first variable if the function is in general form. The leading term is the term containing the highest power of the variable, or the term with the highest degree. The leading coefficient is the coefficient of the leading term.

Terminology of Polynomial Functions

We often rearrange polynomials so that the powers are descending.

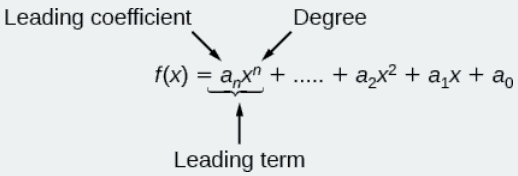

Figure 16.2.4.7

When a polynomial is written in this way, we say that it is in *general form*.

How To: Given a polynomial function, identify the degree and leading coefficient

1. Find the highest power of x to determine the degree function.
2. Identify the term containing the highest power of x to find the leading term.
3. Identify the coefficient of the leading term.

Example 16.2.4.5: Identifying the Degree and Leading Coefficient of a Polynomial Function

Identify the degree, leading term, and leading coefficient of the following polynomial functions.

$$f(x) = 3 + 2x^2 - 4x^3$$

$$g(t) = 5t^5 - 2t^3 + 7t$$

$$h(p) = 6p - p^3 - 2$$

Solution

For the function $f(x)$, the highest power of x is 3, so the degree is 3. The leading term is the term containing that degree, $-4x^3$. The leading coefficient is the coefficient of that term, −4.

For the function $g(t)$, the highest power of t is 5, so the degree is 5. The leading term is the term containing that degree, $5t^5$. The leading coefficient is the coefficient of that term, 5.

For the function $h(p)$, the highest power of p is 3, so the degree is 3. The leading term is the term containing that degree, $-p^3$; the leading coefficient is the coefficient of that term, -1.

Exercise 16.2.4.3

Identify the degree, leading term, and leading coefficient of the polynomial $f(x) = 4x^2 - x^6 + 2x - 6$.

Answer

The degree is 6. The leading term is $-x^6$. The leading coefficient is -1.

Identifying End Behavior of Polynomial Functions

Knowing the degree of a polynomial function is useful in helping us predict its end behavior. To determine its end behavior, look at the leading term of the polynomial function. Because the power of the leading term is the highest, that term will grow significantly faster than the other terms as x gets very large or very small, so its behavior will dominate the graph. For any polynomial, the end behavior of the polynomial will match the end behavior of the term of highest degree (Table $16.2.4.3$).

Table 16.2.4.3

Polynomial Function	Leading Term	Graph of Polynomial Function
$f(x) = 5x^4 + 2x^3 - x - 4$	$5x^4$	$f(x) = -2x^6 - x^5 + 3x^4 + x^3$	$-2x^6$	
Polynomial Function	Leading Term	Graph of Polynomial Function
$f(x) = 3x^5 - 4x^4 + 2x^2 + 1$	$3x^5$	$f(x) = -6x^3 + 7x^2 + 3x + 1$	$-6x^3$	
Example 16.2.4.6: Identifying End Behavior and Degree of a Polynomial Function

Describe the end behavior and determine a possible degree of the polynomial function in Figure 16.2.4.8

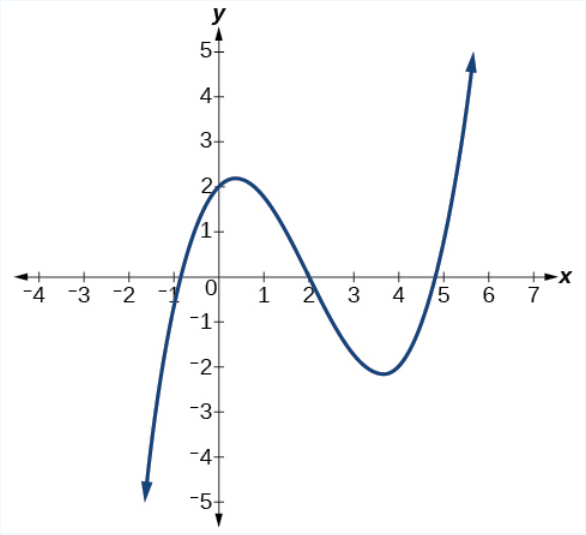

Figure 16.2.4.8.

Solution

As the input values x get very large, the output values $f(x)$ increase without bound. As the input values x get very small, the output values $f(x)$ decrease without bound. We can describe the end behavior symbolically by writing

$$\text{as } x\to\infty,\ f(x)\to\infty$$

$$\text{as } x\to-\infty,\ f(x)\to-\infty$$

In words, we could say that as x values approach infinity, the function values approach infinity, and as x values approach negative infinity, the function values approach negative infinity.

We can tell this graph has the shape of an odd degree power function that has not been reflected, so the degree of the polynomial creating this graph must be odd and the leading coefficient must be positive.

Exercise 16.2.4.1

Describe the end behavior, and determine a possible degree of the polynomial function in Figure 16.2.4.9

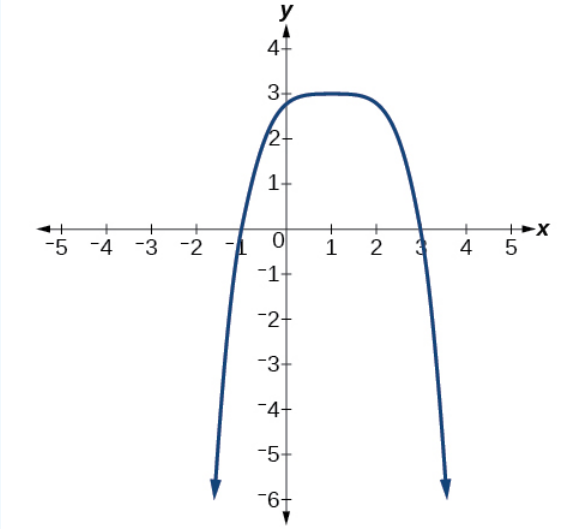

Figure 16.2.4.9

Answer

As $x\to\infty$, $f(x)\to-\infty$; as $x\to-\infty$, $f(x)\to-\infty$. It has the shape of an even degree power function with a negative coefficient.

Example 16.2.4.7: Identifying End Behavior and Degree of a Polynomial Function

Given the function $f(x)=-3x^2(x-1)(x+4)$, express the function as a polynomial in general form, and determine the leading term, degree, and end behavior of the function.

Solution

Obtain the general form by expanding the given expression for $f(x)$.

$$\begin{aligned} f(x) &= -3x^2(x-1)(x+4) \\ &= -3x^2(x^2+3x-4) \\ &= -3x^4-9x^3+12x^2 \end{aligned}$$

The general form is $f(x)=-3x^4-9x^3+12x^2$. The leading term is $-3x^4$; therefore, the degree of the polynomial is 4. The degree is even (4) and the leading coefficient is negative (–3), so the end behavior is

$$\text{as } x\to-\infty,\ f(x)\to-\infty$$

$$\text{as } x\to\infty,\ f(x)\to-\infty$$

Exercise 16.2.4.7

Given the function $f(x) = 0.2(x-2)(x+1)(x-5)$, express the function as a polynomial in general form and determine the leading term, degree, and end behavior of the function.

Answer

The leading term is $0.2x^3$, so it is a degree 3 polynomial. As x approaches positive infinity, $f(x)$ increases without bound; as x approaches negative infinity, $f(x)$ decreases without bound.

Identifying Local Behavior of Polynomial Functions

In addition to the end behavior of polynomial functions, we are also interested in what happens in the "middle" of the function. In particular, we are interested in locations where graph behavior changes. A **turning point** is a point at which the function values change from increasing to decreasing or decreasing to increasing.

We are also interested in the intercepts. As with all functions, the y-intercept is the point at which the graph intersects the vertical axis. The point corresponds to the coordinate pair in which the input value is zero. Because a polynomial is a function, only one output value corresponds to each input value so there can be only one y-intercept $(0, a_0)$. The x-intercepts occur at the input values that correspond to an output value of zero. It is possible to have more than one x-intercept. See Figure 16.2.4.10

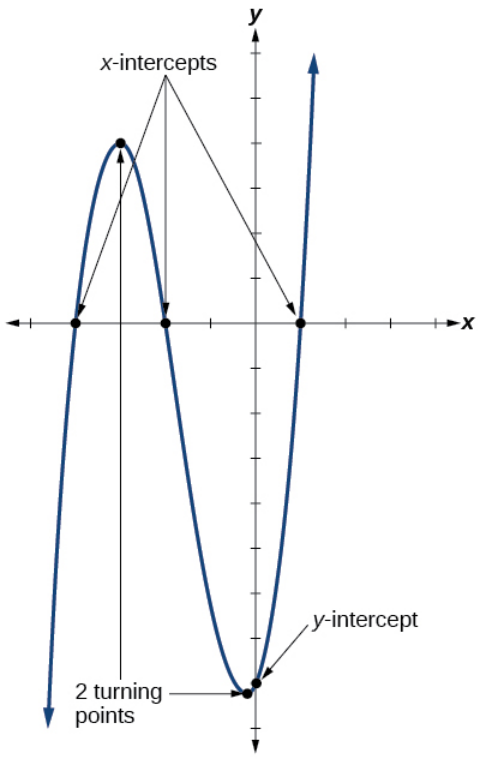

Figure 16.2.4.10

Defintion: Intercepts and Turning Points of Polynomial Functions

A **turning point** of a graph is a point at which the graph changes direction from increasing to decreasing or decreasing to increasing. The y-intercept is the point at which the function has an input value of zero. The x-intercepts are the points at which the output value is zero.

How To: Given a polynomial function, determine the intercepts.

1. Determine the y-intercept by setting $x = 0$ and finding the corresponding output value.
2. Determine the x-intercepts by solving for the input values that yield an output value of zero.

Example 16.2.4.8: Determining the Intercepts of a Polynomial Function

Given the polynomial function $f(x) = (x-2)(x+1)(x-4)$, written in factored form for your convenience, determine the y- and x-intercepts.

Solution

The y-intercept occurs when the input is zero, so substitute 0 for x.

$$\begin{aligned} f(0) &= (0-2)(0+1)(0-4) \\ &= (-2)(1)(-4) \\ &= 8 \end{aligned}$$

The y-intercept is $(0, 8)$.

The x-intercepts occur when the output is zero.

$$0 = (x-2)(x+1)(x-4)$$

$$\begin{aligned} x-2 &= 0 \quad \text{or} \quad x+1 = 0 \quad \text{or} \quad x-4 = 0 \\ x &= 2 \quad \text{or} \quad x = -1 \quad \text{or} \quad x = 4 \end{aligned}$$

The x-intercepts are $(2, 0)$,$(-1, 0)$, and $(4, 0)$.

We can see these intercepts on the graph of the function shown in Figure 16.2.4.11

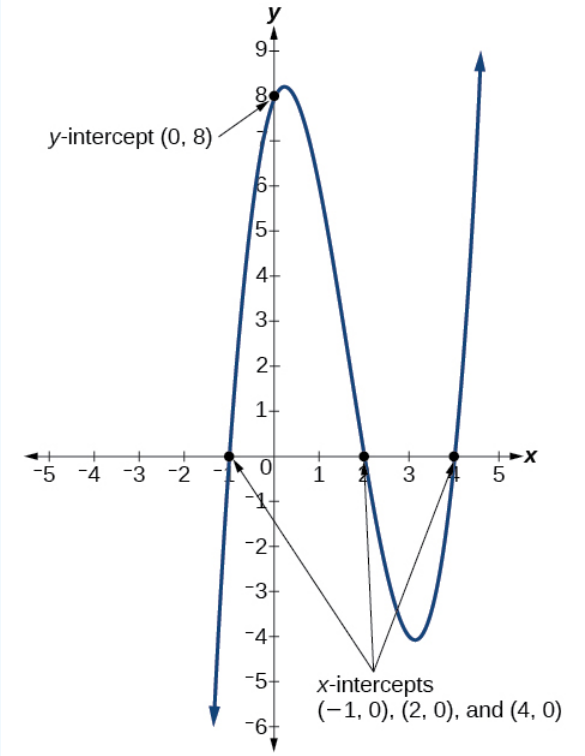

Figure 16.2.4.11: Graph of $f(x) = (x-2)(x+1)(x-4)$.

Example 16.2.4.9: Determining the Intercepts of a Polynomial Function with Factoring

Given the polynomial function $f(x) = x^4 - 4x^2 - 45$, determine the y- and x-intercepts.

Solution

The y-intercept occurs when the input is zero.

$$\begin{aligned} f(0) &= (0)^4 - 4(0)^2 - 45 \\ &= -45 \end{aligned}$$

The y-intercept is $(0, -45)$.

The x-intercepts occur when the output is zero. To determine when the output is zero, we will need to factor the polynomial.

$$\begin{aligned} f(x) &= x^4 - 4x^2 - 45 \\ &= (x^2 - 9)(x^2 + 5) \\ &= (x-3)(x+3)(x^2+5) \end{aligned}$$

$$0 = (x-3)(x+3)(x^2+5)$$

$$\begin{array}{lllll} x-3=0 & \text{or} & x+3=0 & \text{or} & x^2+5=0 \\ x=3 & \text{or} & x=-3 & \text{or} & \text{(no real solution)} \end{array}$$

The x-intercepts are $(3, 0)$ and $(-3, 0)$.

We can see these intercepts on the graph of the function shown in Figure 16.2.4.12 We can see that the function is even because $f(x) = f(-x)$.

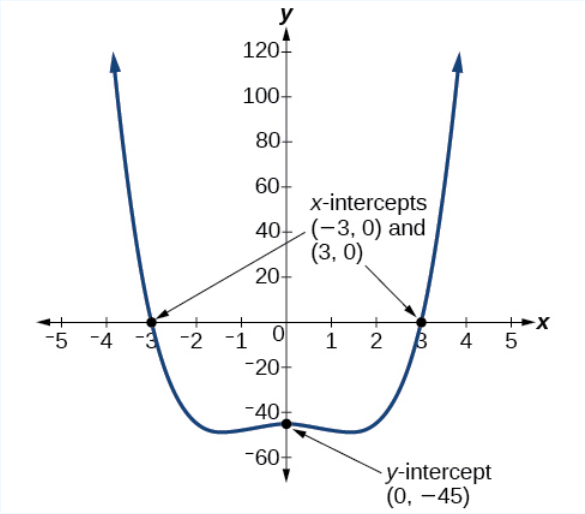

Figure 16.2.4.12: Graph of $f(x) = x^4 - 4x^2 - 45$.

Exercise 16.2.4.5

16.2.4.5: Given the polynomial function $f(x) = 2x^3 - 6x^2 - 20x$, determine the y- and x-intercepts.

Solution

y-intercept $(0, 0)$; x-intercepts $(0, 0)$,$(-2, 0)$, and $(5, 0)$

Comparing Smooth and Continuous Graphs

The degree of a polynomial function helps us to determine the number of x-intercepts and the number of turning points. A polynomial function of n^{th} degree is the product of n factors, so it will have at most n roots or zeros, or x-intercepts. The graph of the polynomial function of degree n must have at most $n-1$ turning points. This means the graph has at most one fewer turning point than the degree of the polynomial or one fewer than the number of factors.

A **continuous function** has no breaks in its graph: the graph can be drawn without lifting the pen from the paper. A smooth curve is a graph that has no sharp corners. The turning points of a smooth graph must always occur at rounded curves. The graphs of polynomial functions are both continuous and smooth.

Intercepts and Turning Points of Polynomials

A polynomial of degree n will have, at most, n x-intercepts and $n-1$ turning points.

Example 16.2.4.10: Determining the Number of Intercepts and Turning Points of a Polynomial

Without graphing the function, determine the local behavior of the function by finding the maximum number of x-intercepts and turning points for $f(x)=-3x^{10}+4x^7-x^4+2x^3$.

Solution

The polynomial has a degree of **10**, so there are at most n x-intercepts and at most $n-1$ turning points.

Exercise 16.2.4.6

Without graphing the function, determine the maximum number of x-intercepts and turning points for $f(x)=108-13x^9-8x^4+14x^{12}+2x^3$

Answer

There are at most 12 x-intercepts and at most 11 turning points.

Example 16.2.4.11: Drawing Conclusions about a Polynomial Function from the Graph

What can we conclude about the polynomial represented by the graph shown in Figure 16.2.4.12based on its intercepts and turning points?

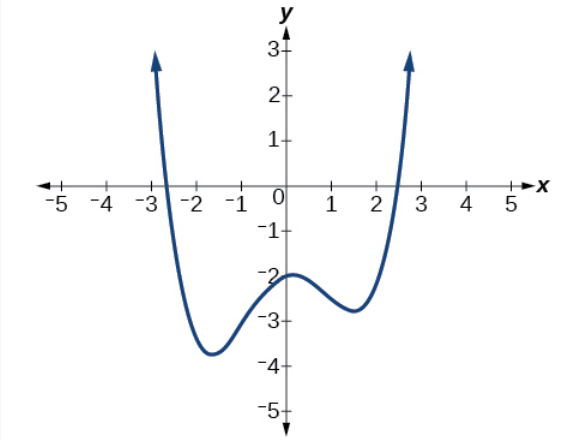

Figure 16.2.4.13.

Solution

The end behavior of the graph tells us this is the graph of an even-degree polynomial. See Figure 16.2.4.14

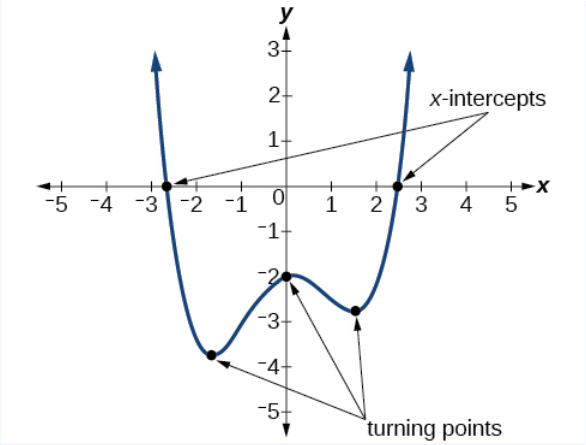

Figure 16.2.4.14: Graph of an even-degree polynomial.

The graph has 2 x-intercepts, suggesting a degree of 2 or greater, and 3 turning points, suggesting a degree of 4 or greater. Based on this, it would be reasonable to conclude that the degree is even and at least 4.

Exercise 16.2.4.7

What can we conclude about the polynomial represented by the graph shown in Figure 16.2.4.15based on its intercepts and turning points?

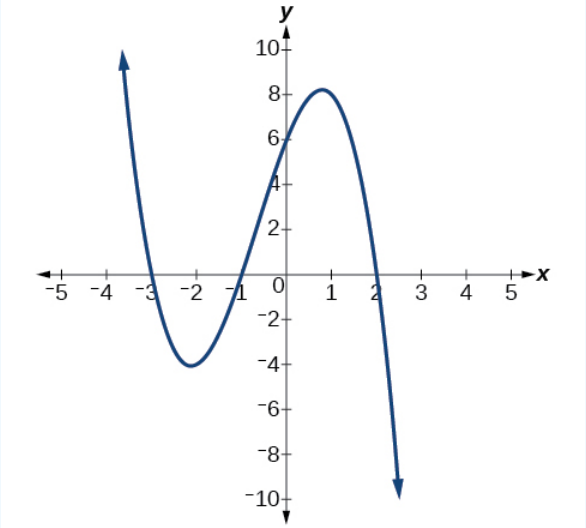

Figure 16.2.4.15.

Answer

Add texts here. Do not delete this text first.

Solution

The end behavior indicates an odd-degree polynomial function; there are 3 x-intercepts and 2 turning points, so the degree is odd and at least 3. Because of the end behavior, we know that the lead coefficient must be negative.

Example 16.2.4.12: Drawing Conclusions about a Polynomial Function from the Factors

Given the function $f(x) = -4x(x+3)(x-4)$, determine the local behavior.

Solution

The y-intercept is found by evaluating $f(0)$.

$$\begin{aligned} f(0) &= -4(0)(0+3)(0-4) \\ &= 0 \end{aligned}$$

The y-intercept is $(0, 0)$.

The x-intercepts are found by determining the zeros of the function.

$$\begin{aligned} 0 &= -4x(x+3)(x-4) \\ x &= 0 \quad \text{or} \quad x+3 = 0 \quad \text{or} \quad x-4 = 0 \\ x &= 0 \quad \text{or} \quad x = -3 \quad \text{or} \quad x = 4 \end{aligned}$$

The x-intercepts are $(0, 0)$,$(-3, 0)$, and $(4, 0)$.

The degree is 3 so the graph has at most 2 turning points.

Exercise 16.2.4.8

Given the function $f(x) = 0.2(x-2)(x+1)(x-5)$, determine the local behavior.

Answer

The x-intercepts are $(2, 0)$, $(-1, 0)$, and $(5, 0)$, the y-intercept is $(0, 2)$, and the graph has at most 2 turning points.

Key Equations

- general form of a polynomial function: $f(x) = a_n x^n + a_{n-1} x^{n-1} \ldots + a_2 x^2 + a_1 x + a_0$

Key Concepts

- A power function is a variable base raised to a number power.
- The behavior of a graph as the input decreases without bound and increases without bound is called the end behavior.
- The end behavior depends on whether the power is even or odd.
- A polynomial function is the sum of terms, each of which consists of a transformed power function with positive whole number power.
- The degree of a polynomial function is the highest power of the variable that occurs in a polynomial. The term containing the highest power of the variable is called the leading term. The coefficient of the leading term is called the leading coefficient.
- The end behavior of a polynomial function is the same as the end behavior of the power function represented by the leading term of the function.
- A polynomial of degree n will have at most n x-intercepts and at most $n-1$ turning points.

Glossary

coefficient

a nonzero real number that is multiplied by a variable raised to an exponent (only the number factor is the coefficient)

continuous function

a function whose graph can be drawn without lifting the pen from the paper because there are no breaks in the graph

degree

the highest power of the variable that occurs in a polynomial

end behavior

the behavior of the graph of a function as the input decreases without bound and increases without bound

leading coefficient

the coefficient of the leading term

leading term

the term containing the highest power of the variable

polynomial function

a function that consists of either zero or the sum of a finite number of non-zero terms, each of which is a product of a number, called the coefficient of the term, and a variable raised to a non-negative integer power.

power function

a function that can be represented in the form $f(x) = kx^p$ where k is a constant, the base is a variable, and the exponent, p, is a constant

smooth curve

a graph with no sharp corners

term of a polynomial function

any $a_i x^i$ of a polynomial function in the form $f(x) = a_n x^n + a_{n-1} x^{n-1} \ldots + a_2 x^2 + a_1 x + a_0$

turning point

the location at which the graph of a function changes direction

16.2E: Exercises

1.2E: Exercises

Exercises

For the following exercises, for each pair of points, a. find the slope of the line passing through the points and b. indicate whether the line is increasing, decreasing, horizontal, or vertical.

59) $(-2, 4)$ and $(1, 1)$

Answer:

a. -1 b. Decreasing

Answer:

$a. -1$
$b. Decreasing$

60) $(-1, 4)$ and $(3, -1)$

61) $(3, 5)$ and $(-1, 2)$

Answer:

a. 3/4 b. Increasing

62) $(6, 4)$ and $(4, -3)$

63) $(2, 3)$ and $(5, 7)$

Answer:

a. 4/3 b. Decreasing

64) $(1, 9)$ and $(-8, 5)$

65) $(2, 4)$ and $(1, 4)$

Answer:

a. 0 b. Horizontal

66) $(1, 4)$ and $(1, 0)$

For the following exercises, write the equation of the line satisfying the given conditions in slope-intercept form.

67) Slope $=-6$, passes through $(1, 3)$

Answer:

$y = -6x + 9$

68) Slope $=3$, passes through $(-3, 2)$

69) Slope $=\frac{1}{3}$, passes through $(0, 4)$

Answer:

$y = \frac{1}{3}x + 4$

70) Slope $=\frac{2}{5}$, x-intercept $=8$

71) Passing through $(2, 1$ and $(-2, -1)$

Answer:

$y = \frac{1}{2}x$

Solution: $y = \frac{1}{2}x$

72) Passing through $(-3, 7)$ and $(1, 2)$

73) x-intercept =5 and y-intercept =-3

Answer:

$y = \frac{3}{5}x - 3$

74) x-Intercept =-6 and y-intercept =9

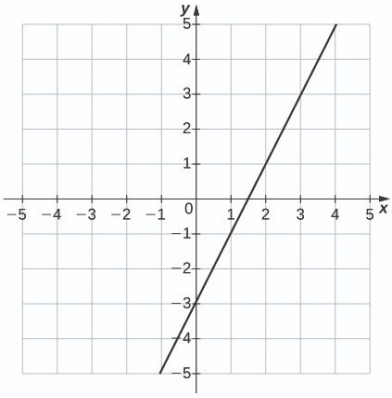
For the following exercises, for each linear equation, a. give the slope m and y-intercept b, if any, and b. graph the line.

75) $y = 2x - 3$

Answer:

a. $(m = 2, b = -3)$

b.



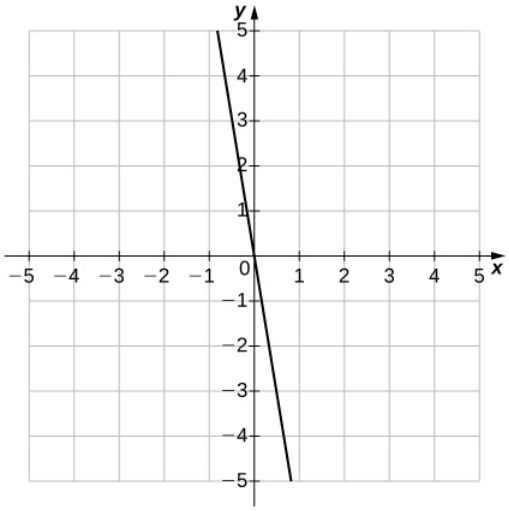
76) $y = -\frac{1}{7}x + 1$

77) $f(x) = -6x$

Answer:

a. $(m = -6, b = 0)$

b.



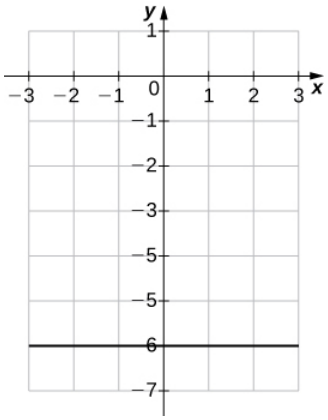
a. $(m=-6, b=0)$

b.

78) $f(x)=-5x+4$

79) $4y+24=0$

Answer:



a. $m=0$ b.

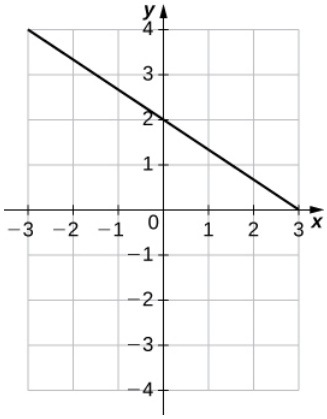
80) $8x-4=0$

81) $2x+3y=6$

Answer:

a. $(m=-\frac{2}{3}, b=2)$

b.



82) $6x-5y+15=0$

For the following exercises, for each polynomial, a. find the degree; b. find the zeros, if any; c. find the y-intercept(s), if any; d. use the leading coefficient to determine the graph's end behavior; and e. determine algebraically whether the polynomial is even, odd, or neither.

83) $f(x)=2x^2-3x-5$

Answer:

$a.\ 2$
$b.\ \frac{5}{2}, -1;$
$c.\ -5$
$d.\ Both\ ends\ rise$
$e.\ Neither$

84) $f(x) = -3x^2 + 6x$

85) $f(x) = \frac{1}{2}x^2 - 1$

Answer:

$a.\ 2$
$b.\ \pm\sqrt{2}$
$c.\ -1$
$d.\ Both\ ends\ rise$
$e.\ Even$

86) $f(x) = x^3 + 3x^2 - x - 3$

87) $f(x) = 3x - x^3$

Answer:

$a.\ 3$
$b.\ 0, \pm\sqrt{3}$
$c.\ 0$
$d.$ Left end rises, right end falls
$e.\ Odd$

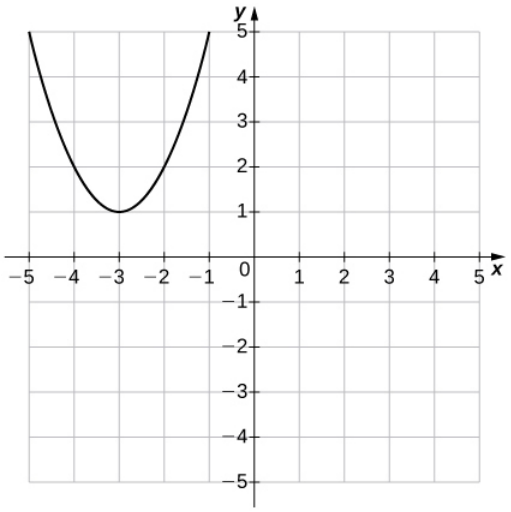
For the following exercises, use the graph of $f(x) = x^2$ to graph each transformed function g.

Exercise:

88) $g(x) = x^2 - 1$

89) $g(x) = (x+3)^2 + 1$

Answer:



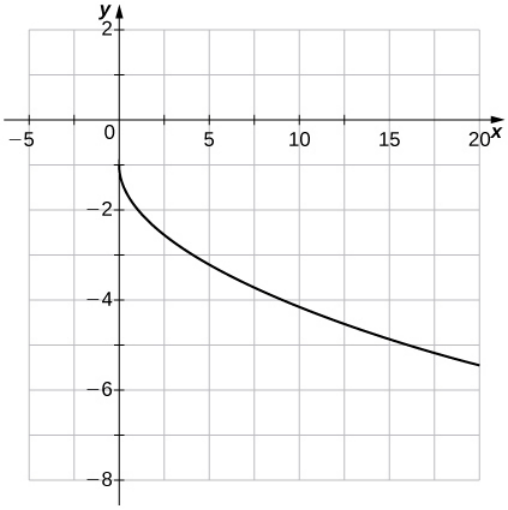
For the following exercises, use the graph of $f(x) = \sqrt{x}$ to graph each transformed function g.

90) $g(x) = \sqrt{x+2}$

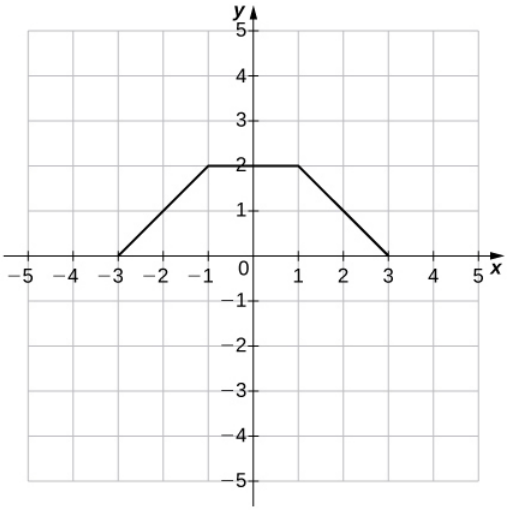
91) $g(x) = -\sqrt{x} - 1$

https://math.libretexts.org/@go/page/46403

Answer:



For the following exercises, use the graph of $y = f(x)$ to graph each transformed function g.

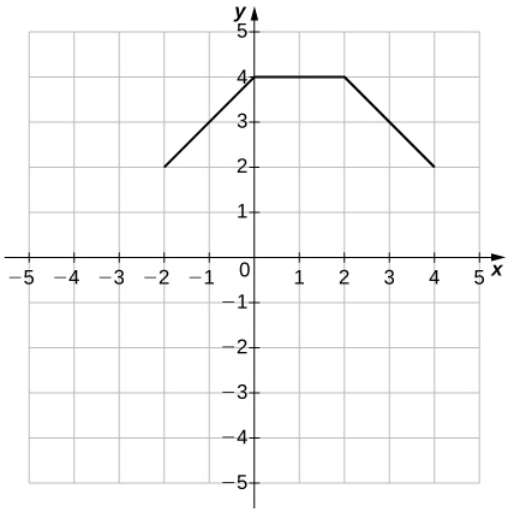


92) $g(x) = f(x) + 1$

93) $g(x) = f(x - 1) + 2$

Answer:

https://math.libretexts.org/@go/page/46403



For the following exercises, for each of the piecewise-defined functions, a. evaluate at the given values of the independent variable and b. sketch the graph.

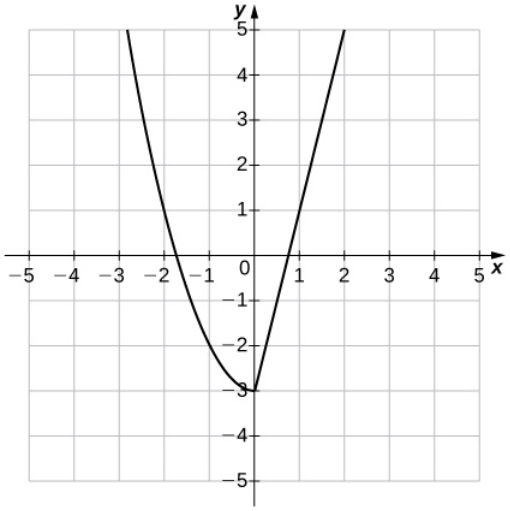
94) $f(x)=\begin{cases}4x+3, & x\le 0\\ -x+1, & x>0\end{cases}$; $f(-3); f(0); f(2)$

95) $f(x)=\begin{cases}x^2-3, & x\le 0\\ 4x+3, & x>0\end{cases}$; $f(-4); f(0); f(2)$

Answer:

a. $13, -3, 5$

b.



96) $h(x)=\begin{cases}x+1, & x\le 5\\ 4, & x>5\end{cases}$; $h(0); h(\pi); h(5)$

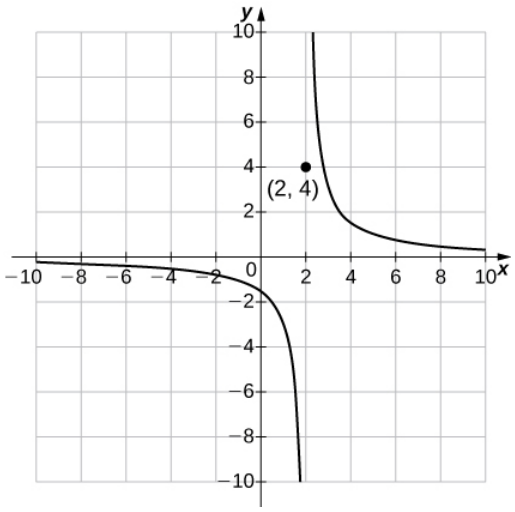
97) $g(x)=\begin{cases}\frac{3}{x-2}, & x\ne 2\\ 4, & x=2\end{cases}$; $g(0); g(-4); g(2)$

Answer:

a. $\frac{-3}{2}, \frac{-1}{2}, 4$

b.

https://math.libretexts.org/@go/page/46403



For the following exercises, determine whether the statement is *true or false*. Explain why.

98) $f(x) = (4x+1)/(7x-2)$ is a transcendental function.

99) $g(x) = \sqrt[3]{x}$ is an odd root function

Answer:

True; $n = 3$

100) A logarithmic function is an algebraic function.

101) A function of the form $f(x) = x^b$, where b is a real valued constant, is an exponential function.

Answer:

False; $f(x) = x^b$, where b is a real-valued constant, is a power function

102) The domain of an even root function is all real numbers.

103) [T] A company purchases some computer equipment for $20,500. At the end of a 3-year period, the value of the equipment has decreased linearly to $12,300.

a. Find a function $y = V(t)$ that determines the value V of the equipment at the end of t years.

b. Find and interpret the meaning of the x- and y-intercepts for this situation.

c. What is the value of the equipment at the end of 5 years?

d. When will the value of the equipment be $3000?

Answer:

$a.\ V(t) = -2733t + 20500$

$b.\ (0, 20,500)$ means that the initial purchase price of the equipment is $\$20,500$;
$(7.5, 0)$ means that in 7.5 years the computer equipment has no value.

$c.\ \$6835$

$d.$ In approximately 6.4 years.

104) [T] Total online shopping during the Christmas holidays has increased dramatically during the past 5 years. In 2012 $(t = 0)$,total online holiday sales were $42.3 billion, whereas in 2013 they were $48.1 billion.

a. Find a linear function S that estimates the total online holiday sales in the year t.

b. Interpret the slope of the graph of S.

c. Use part a. to predict the year when online shopping during Christmas will reach $60 billion.

105) [T] A family bakery makes cupcakes and sells them at local outdoor festivals. For a music festival, there is a fixed cost of $125 to set up a cupcake stand. The owner estimates that it costs $0.75 to make each cupcake. The owner is interested in determining the total cost C as a function of number of cupcakes made.

a. Find a linear function that relates cost C to x, the number of cupcakes made.

b. Find the cost to bake 160 cupcakes.

c. If the owner sells the cupcakes for $1.50 apiece, how many cupcakes does she need to sell to start making profit? (Hint: Use the INTERSECTION function on a calculator to find this number.)

Answer:

$a. C = 0.75x + 125$
$b. \$245$
$c. 167 cupcakes$

106) [T] A house purchased for $250,000 is expected to be worth twice its purchase price in 18 years.

a. Find a linear function that models the price P of the house versus the number of years t since the original purchase.

b. Interpret the slope of the graph of P.

c. Find the price of the house 15 years from when it was originally purchased.

107) [T] A car was purchased for $26,000. The value of the car depreciates by $1500 per year.

a. Find a linear function that models the value V of the car after t years.

b. Find and interpret $V(4)$.

Answer:

a. $V(t) = -1500t + 26,000$b. In 4 years, the value of the car is $20,000.

108) [T] A condominium in an upscale part of the city was purchased for $432,000. In 35 years it is worth $60,500. Find the rate of depreciation.

109) [T] The total cost C (in thousands of dollars) to produce a certain item is modeled by the function $C(x) = 10.50x + 28,500$, where x is the number of items produced. Determine the cost to produce 175 items.

Answer:

$30,337.50

110) [T] A professor asks her class to report the amount of time t they spent writing two assignments. Most students report that it takes them about 45 minutes to type a four-page assignment and about 1.5 hours to type a nine-page assignment.

a. Find the linear function $y = N(t)$ that models this situation, where N is the number of pages typed and t is the time in minutes.

b. Use part a. to determine how many pages can be typed in 2 hours.

c. Use part a. to determine how long it takes to type a 20-page assignment.

111) [T] The output (as a percent of total capacity) of nuclear power plants in the United States can be modeled by the function $P(t) = 1.8576t + 68.052$, where t is time in years and $t = 0$ corresponds to the beginning of 2000. Use the model to predict the percentage output in 2015.

Answer:

96% of the total capacity

112) [T] The admissions office at a public university estimates that 65% of the students offered admission to the class of 2019 will actually enroll.

a. Find the linear function $y = N(x)$, where N is the number of students that actually enroll and x is the number of all students offered admission to the class of 2019.

b. If the university wants the 2019 freshman class size to be 1350, determine how many students should be admitted.

16.3: Graphs of Functions

Learning Objectives

By the end of this section, you will be able to:

- Use the vertical line test
- Identify graphs of basic functions
- Read information from a graph of a function

Before you get started, take this readiness quiz.

1. Evaluate: ⓐ 2^3 ⓑ 3^2.
   If you missed this problem, review [link].
2. Evaluate: ⓐ $|7|$ ⓑ $|-3|$.
   If you missed this problem, review [link].
3. Evaluate: ⓐ $\sqrt{4}$ ⓑ $\sqrt{16}$.
   If you missed this problem, review [link].

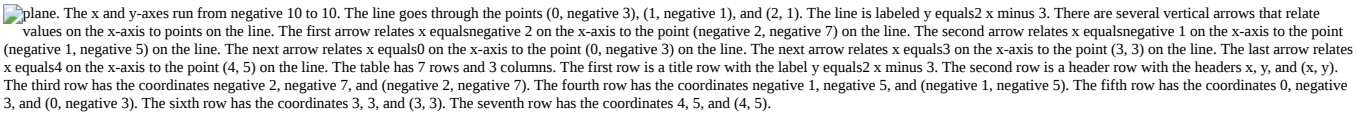
Use the Vertical Line Test

In the last section we learned how to determine if a relation is a function. The relations we looked at were expressed as a set of ordered pairs, a mapping or an equation. We will now look at how to tell if a graph is that of a function.

An ordered pair (x, y) is a solution of a linear equation, if the equation is a true statement when the *x*- and *y*-values of the ordered pair are substituted into the equation.

The graph of a linear equation is a straight line where every point on the line is a solution of the equation and every solution of this equation is a point on this line.

In Figure, we can see that, in graph of the equation $y = 2x - 3$, for every *x*-value there is only one *y*-value, as shown in the accompanying table.



plane. The x and y-axes run from negative 10 to 10. The line goes through the points (0, negative 3), (1, negative 1), and (2, 1). The line is labeled y equals2 x minus 3. There are several vertical arrows that relate values on the x-axis to points on the line. The first arrow relates x equalsnegative 2 on the x-axis to the point (negative 2, negative 7) on the line. The second arrow relates x equalsnegative 1 on the x-axis to the point (negative 1, negative 5) on the line. The next arrow relates x equals0 on the x-axis to the point (0, negative 3) on the line. The next arrow relates x equals3 on the x-axis to the point (3, 3) on the line. The last arrow relates x equals4 on the x-axis to the point (4, 5) on the line. The table has 7 rows and 3 columns. The first row is a title row with the label y equals2 x minus 3. The second row is a header row with the headers x, y, and (x, y). The third row has the coordinates negative 2, negative 7, and (negative 2, negative 7). The fourth row has the coordinates negative 1, negative 5, and (negative 1, negative 5). The fifth row has the coordinates 0, negative 3, and (0, negative 3). The sixth row has the coordinates 3, 3, and (3, 3). The seventh row has the coordinates 4, 5, and (4, 5).

Figure 16.3.1

A relation is a function if every element of the domain has exactly one value in the range. So the relation defined by the equation $y = 2x - 3$ is a function.

If we look at the graph, each vertical dashed line only intersects the line at one point. This makes sense as in a function, for every *x*-value there is only one *y*-value.

If the vertical line hit the graph twice, the *x*-value would be mapped to two *y*-values, and so the graph would not represent a function.

This leads us to the vertical line test. A set of points in a rectangular coordinate system is the graph of a function if every vertical line intersects the graph in at most one point. If any vertical line intersects the graph in more than one point, the graph does not represent a function.

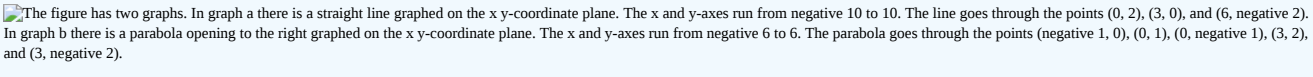
VERTICAL LINE TEST

A set of points in a rectangular coordinate system is the graph of a function if every vertical line intersects the graph in at most one point.

If any vertical line intersects the graph in more than one point, the graph does not represent a function.

Example 16.3.1

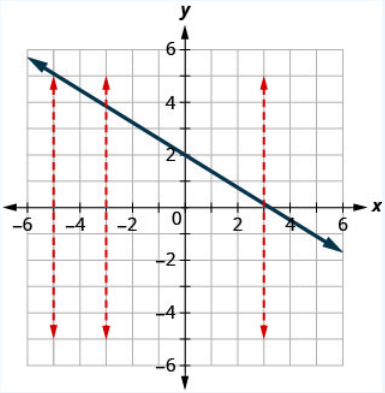
Determine whether each graph is the graph of a function.



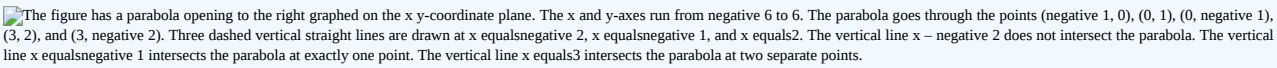
The figure has two graphs. In graph a there is a straight line graphed on the x y-coordinate plane. The x and y-axes run from negative 10 to 10. The line goes through the points (0, 2), (3, 0), and (6, negative 2). In graph b there is a parabola opening to the right graphed on the x y-coordinate plane. The x and y-axes run from negative 6 to 6. The parabola goes through the points (negative 1, 0), (0, 1), (0, negative 1), (3, 2), and (3, negative 2).

Answer

ⓐ Since any vertical line intersects the graph in at most one point, the graph is the graph of a function.



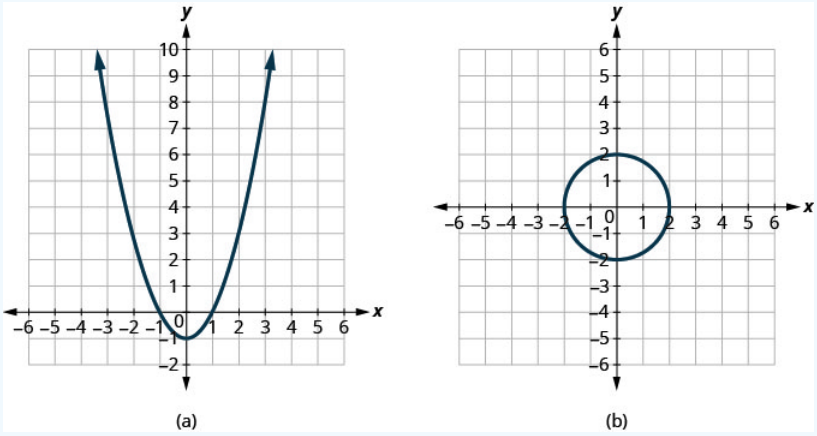
ⓑ One of the vertical lines shown on the graph, intersects it in two points. This graph does not represent a function.



The figure has a parabola opening to the right graphed on the x y-coordinate plane. The x and y-axes run from negative 6 to 6. The parabola goes through the points (negative 1, 0), (0, 1), (0, negative 1), (3, 2), and (3, negative 2). Three dashed vertical straight lines are drawn at x equalsnegative 2, x equalsnegative 1, and x equals2. The vertical line x – negative 2 does not intersect the parabola. The vertical line x equalsnegative 1 intersects the parabola at exactly one point. The vertical line x equals3 intersects the parabola at two separate points.

Example 16.3.2

Determine whether each graph is the graph of a function.

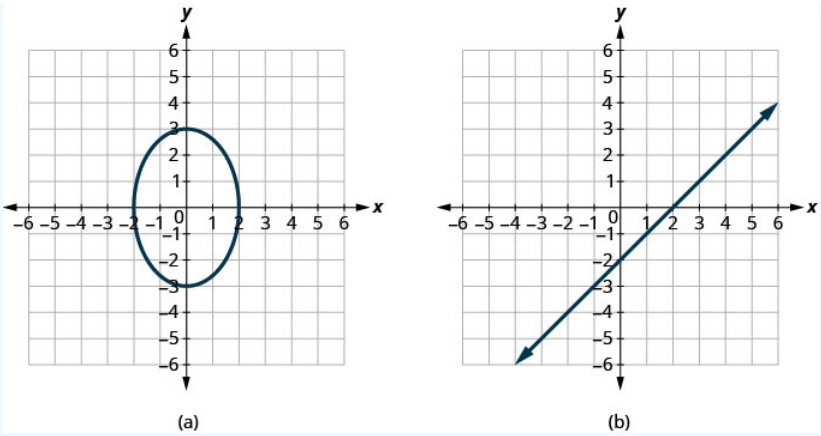


Answer

ⓐ yes ⓑ no

Example 16.3.3

Determine whether each graph is the graph of a function.



Answer

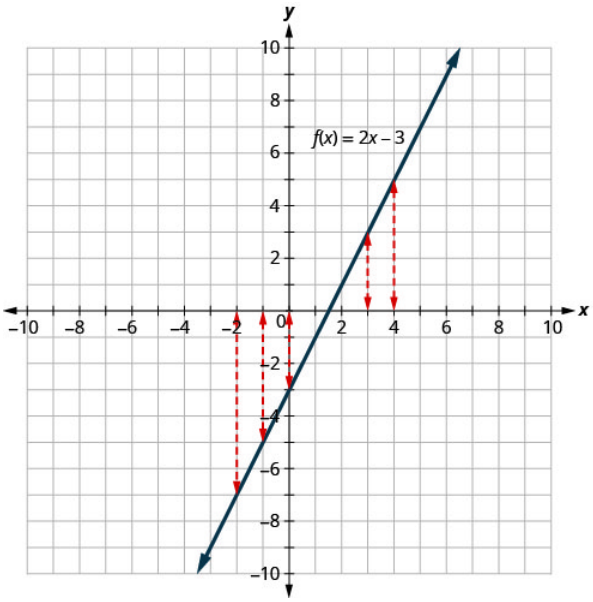
ⓐ no ⓑ yes

Identify Graphs of Basic Functions

We used the equation $y = 2x - 3$ and its graph as we developed the vertical line test. We said that the relation defined by the equation $y = 2x - 3$ is a function.

We can write this as in function notation as $f(x) = 2x - 3$. It still means the same thing. The graph of the function is the graph of all ordered pairs (x, y) where $y = f(x)$. So we can write the ordered pairs as $(x, f(x))$. It looks different but the graph will be the same.

Compare the graph of $y = 2x - 3$ previously shown in Figure with the graph of $f(x) = 2x - 3$ shown in Figure. Nothing has changed but the notation.



$f(x) = 2x - 3$		
x	$f(x)$	$(x, f(x))$
–2	–7	(–2, –7)
–1	–5	(–1, –5)
0	–3	(0, –3)
3	3	(3, 3)
4	5	(4, 5)

Figure 16.3.2

GRAPH OF A FUNCTION

The graph of a function is the graph of all its ordered pairs, (x,y)(x,y) or using function notation, (x,f(x))(x,f(x)) where y=f(x).y=f(x).

f	name of function
x	x-coordinate of the ordered pair
$f(x)$	y-coordinate of the ordered pair

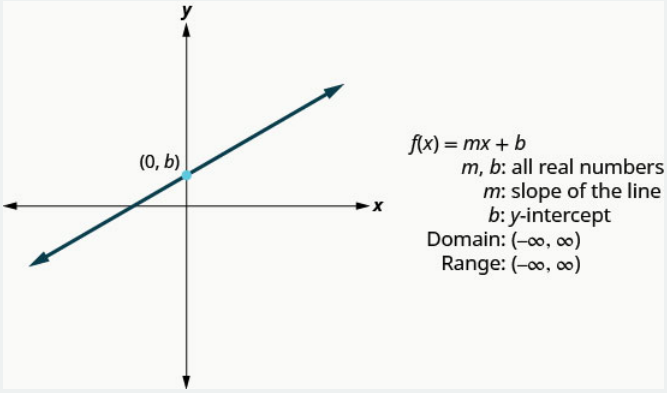
As we move forward in our study, it is helpful to be familiar with the graphs of several basic functions and be able to identify them.

Through our earlier work, we are familiar with the graphs of linear equations. The process we used to decide if $y = 2x - 3$ is a function would apply to all linear equations. All non-vertical linear equations are functions. Vertical lines are not functions as the *x*-value has infinitely many *y*-values.

We wrote linear equations in several forms, but it will be most helpful for us here to use the slope-intercept form of the linear equation. The slope-intercept form of a linear equation is $y = mx + b$. In function notation, this linear function becomes $f(x) = mx + b$ where *m* is the slope of the line and *b* is the *y*-intercept.

The domain is the set of all real numbers, and the range is also the set of all real numbers.

LINEAR FUNCTION



We will use the graphing techniques we used earlier, to graph the basic functions.

Example 16.3.4

Graph: $f(x) = -2x - 4$.

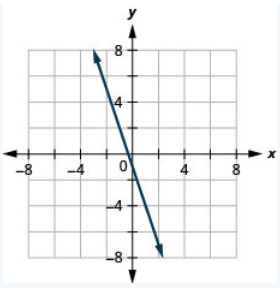
Answer

	$f(x) = -2x - 4$
We recognize this as a linear function.	
Find the slope and *y*-intercept.	$m = -2$ $b = -4$
Graph using the slope intercept.	

Example 16.3.5

Graph: $f(x) = -3x - 1$

Answer



Example 16.3.6

Graph: $f(x) = -4x - 5$

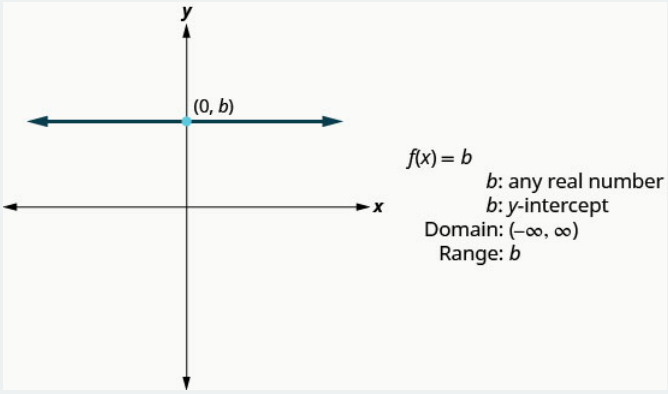
Answer

The figure has the graph of a linear function on the x y-coordinate plane. The x and y-axes run from negative 6 to 6. The line goes through the points (negative 2, 3), (0, negative 5), and (negative 1, negative 1).

The next function whose graph we will look at is called the constant function and its equation is of the form $f(x) = b$, where b is any real number. If we replace the $f(x)$ with y, we get $y = b$. We recognize this as the horizontal line whose *y*-intercept is b. The graph of the function $f(x) = b$, is also the horizontal line whose *y*-intercept is b.

Notice that for any real number we put in the function, the function value will be b. This tells us the range has only one value, b.

CONSTANT FUNCTION



Example 16.3.7

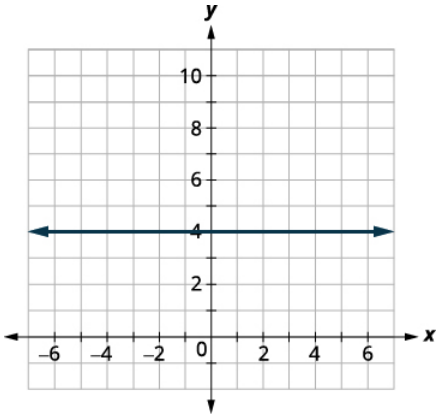
Graph: $f(x) = 4$.

Answer

	$f(x) = 4$
We recognize this as a constant function.	

https://math.libretexts.org/@go/page/46404

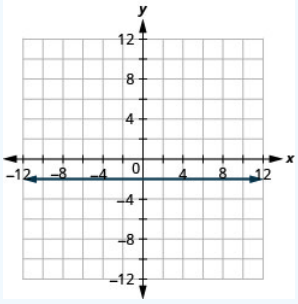
The graph will be a horizontal line through $(0, 4)$.



Example 16.3.8

Graph: $f(x) = -2$.

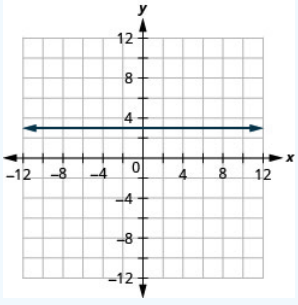
Answer



Example 16.3.9

Graph: $f(x) = 3$.

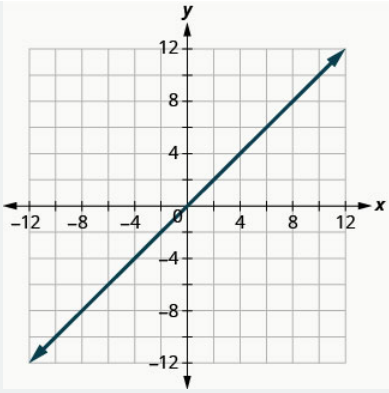
Answer



The identity function, $f(x) = x$ is a special case of the linear function. If we write it in linear function form, $f(x) = 1x + 0$, we see the slope is 1 and the *y*-intercept is 0.

IDENTITY FUNCTION

https://math.libretexts.org/@go/page/46404



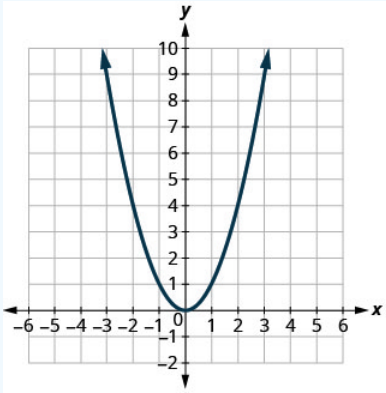
$f(x) = x$
m: 1
b: 0
Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

The next function we will look at is not a linear function. So the graph will not be a line. The only method we have to graph this function is point plotting. Because this is an unfamiliar function, we make sure to choose several positive and negative values as well as 0 for our x-values.

Graph: $f(x) = x^2$.

Answer

We choose x-values. We substitute them in and then create a chart as shown.

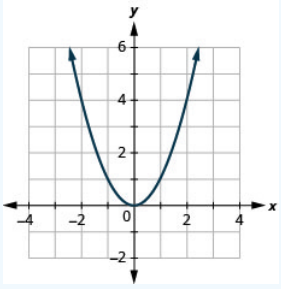


x	$f(x) = x^2$	$(x, f(x))$
−3	9	(−3, 9)
−2	4	(−2, 4)
−1	1	(−1, 1)
0	0	(0, 0)
1	1	(1, 1)
2	4	(2, 4)
3	9	(3, 9)

Example 16.3.11

Graph: $f(x) = x^2$.

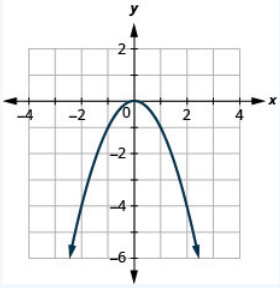
Answer



Example 16.3.12

$f(x) = -x^2$

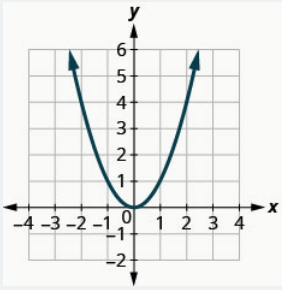
Answer



Looking at the result in Example, we can summarize the features of the square function. We call this graph a parabola. As we consider the domain, notice any real number can be used as an *x*-value. The domain is all real numbers.

The range is not all real numbers. Notice the graph consists of values of *y* never go below zero. This makes sense as the square of any number cannot be negative. So, the range of the square function is all non-negative real numbers.

SQUARE FUNCTION



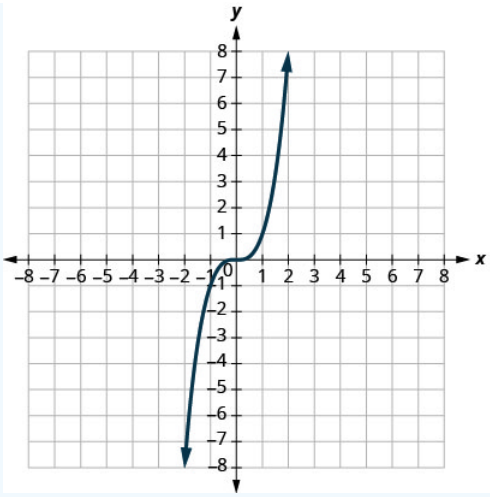
$f(x) = x^2$
Domain: $(-\infty, \infty)$
Range: $[0, \infty)$

The next function we will look at is also not a linear function so the graph will not be a line. Again we will use point plotting, and make sure to choose several positive and negative values as well as 0 for our *x*-values.

Graph: $f(x) = x^3$.

Answer

We choose *x*-values. We substitute them in and then create a chart.

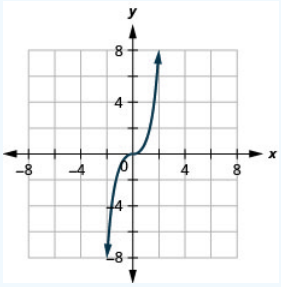


x	$f(x)=x^3$	$(x, f(x))$
–2	–8	(–2, –8)
–1	–1	(–1, –1)
0	0	(0, 0)
1	1	(1, 1)
2	8	(2, 8)

Example 16.3.14

Graph: $f(x)=x^3$.

Answer



Example 16.3.15

Graph: $f(x)=-x^3$.

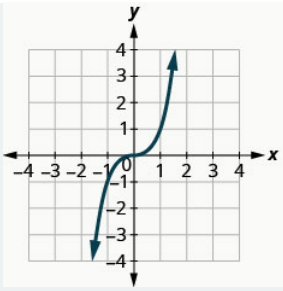
Answer

This figure has a curved line graphed on the x y-coordinate plane. The x-axis runs from negative 6 to 6. The y-axis runs from negative 6 to 6. The curved line goes through the points (negative 2, 8), (negative 1, 1), (0, 0), (1, negative 1), and (2, negative 8).

Looking at the result in Example, we can summarize the features of the cube function. As we consider the domain, notice any real number can be used as an x-value. The domain is all real numbers.

The range is all real numbers. This makes sense as the cube of any non-zero number can be positive or negative. So, the range of the cube function is all real numbers.

CUBE FUNCTION



$f(x) = x^3$
Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

The next function we will look at does not square or cube the input values, but rather takes the square root of those values.

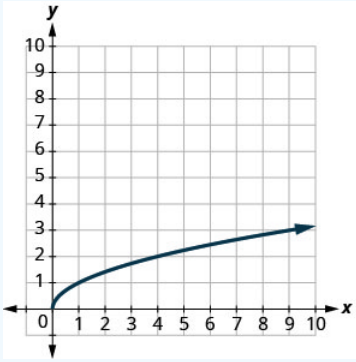
Let's graph the function $f(x) = \sqrt{x}$ and then summarize the features of the function. Remember, we can only take the square root of non-negative real numbers, so our domain will be the non-negative real numbers.

Example 16.3.16

$f(x) = \sqrt{x}$

Answer

We choose *x*-values. Since we will be taking the square root, we choose numbers that are perfect squares, to make our work easier. We substitute them in and then create a chart.

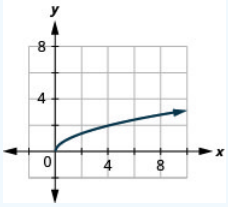


x	$f(x) = \sqrt{x}$	$(x, f(x))$
0	0	(0, 0)
1	1	(1, 1)
4	2	(4, 2)
9	3	(9, 3)

Example 16.3.17

Graph: $f(x) = x$.

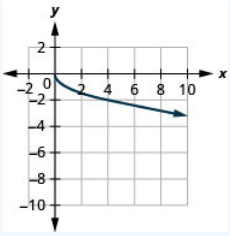
Answer



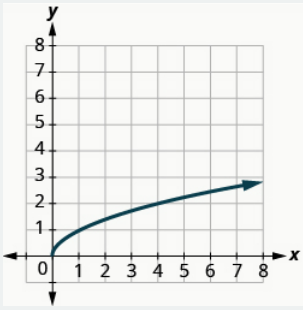
Example 16.3.18

Graph: $f(x) = -\sqrt{x}$.

Answer



SQUARE ROOT FUNCTION



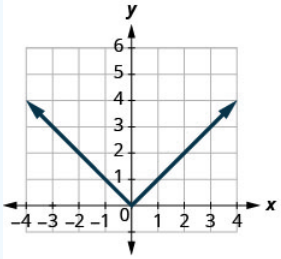
$f(x) = \sqrt{x}$
Domain: $[0, \infty)$
Range: $[0, \infty)$

Our last basic function is the absolute value function, $f(x) = |x|$. Keep in mind that the absolute value of a number is its distance from zero. Since we never measure distance as a negative number, we will never get a negative number in the range.

Graph: $f(x) = |x|$.

Answer

We choose *x*-values. We substitute them in and then create a chart.

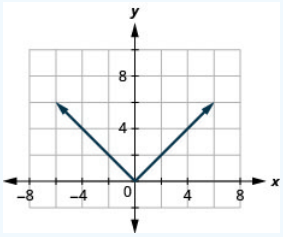


x	$f(x) = \lvert x \rvert$	$(x, f(x))$
−3	3	(−3, 3)
−2	2	(−2, 2)
−1	1	(−1, 1)
0	0	(0, 0)
1	1	(1, 1)
2	2	(2, 2)
3	3	(3, 3)

Example 16.3.20

Graph: $f(x) = |x|$.

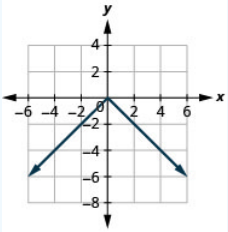
Answer



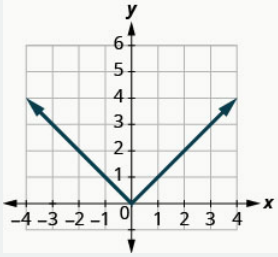
Example 16.3.21

Graph: $f(x) = -|x|$.

Answer



ABSOLUTE VALUE FUNCTION



$f(x) = |x|$
Domain: $(-\infty, \infty)$
Range: $[0, \infty)$

Read Information from a Graph of a Function

In the sciences and business, data is often collected and then graphed. The graph is analyzed, information is obtained from the graph and then often predictions are made from the data.

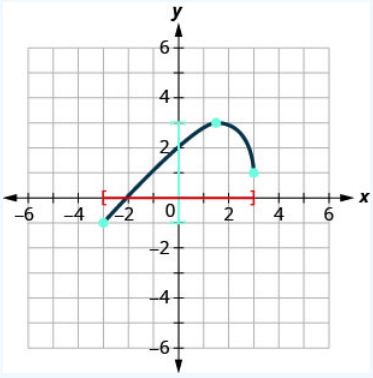
We will start by reading the domain and range of a function from its graph.

Remember the domain is the set of all the *x*-values in the ordered pairs in the function. To find the domain we look at the graph and find all the values of *x* that have a corresponding value on the graph. Follow the value *x* up or down vertically. If you hit the graph of the function then *x* is in the domain.

Remember the range is the set of all the *y*-values in the ordered pairs in the function. To find the range we look at the graph and find all the values of *y* that have a corresponding value on the graph. Follow the value *y* left or right horizontally. If you hit the graph of the function then *y* is in the range.

Example 16.3.22

Use the graph of the function to find its domain and range. Write the domain and range in interval notation.



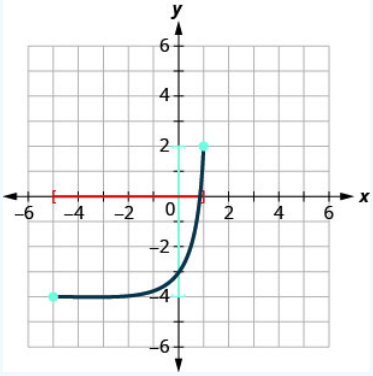
Answer

To find the domain we look at the graph and find all the values of x that correspond to a point on the graph. The domain is highlighted in red on the graph. The domain is $[-3, 3]$.

To find the range we look at the graph and find all the values of y that correspond to a point on the graph. The range is highlighted in blue on the graph. The range is $[-1, 3]$.

Example 16.3.23

Use the graph of the function to find its domain and range. Write the domain and range in interval notation.

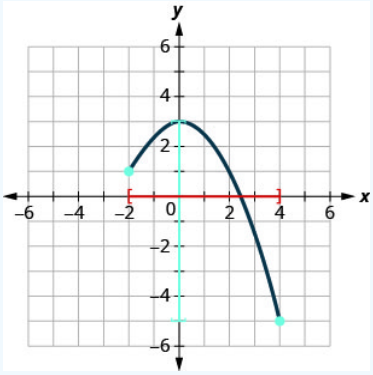


Answer

The domain is $[-5, 1]$. The range is $[-4, 2]$.

Example 16.3.24

Use the graph of the function to find its domain and range. Write the domain and range in interval notation.



Answer

The domain is $[-2, 4]$. The range is $[-5, 3]$.

Access this online resource for additional instruction and practice with graphs of functions.

- Find Domain and Range

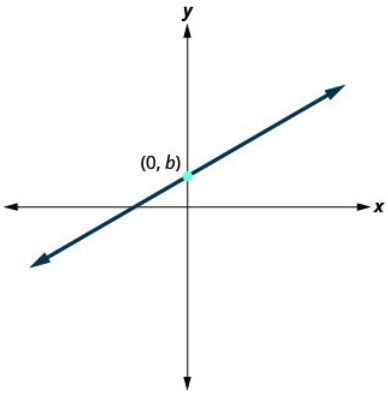
Key Concepts

- **Vertical Line Test**
  - A set of points in a rectangular coordinate system is the graph of a function if every vertical line intersects the graph in at most one point.
  - If any vertical line intersects the graph in more than one point, the graph does not represent a function.

- **Graph of a Function**
  - The graph of a function is the graph of all its ordered pairs, (x,y)(x,y) or using function notation, (x,f(x))(x,f(x)) where y=f(x).y=f(x).

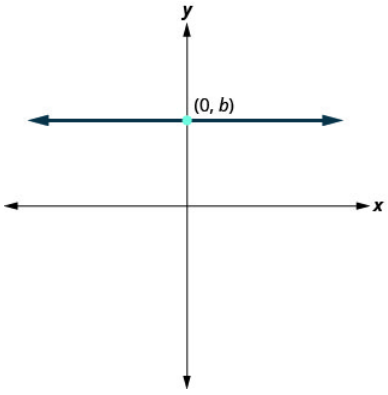
    fxf(x)name of functionx-coordinate of the ordered pairy-coordinate of the ordered pairfname of functionxx-coordinate of the ordered pairf(x)y-coordinate of the ordered pair

- **Linear Function**



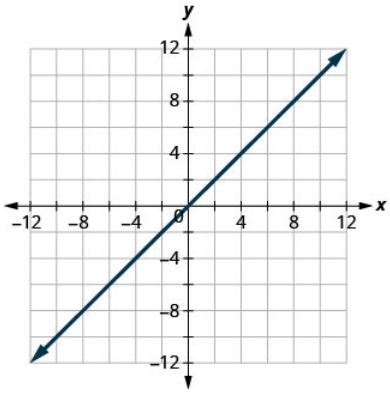
$f(x) = mx + b$
m, b: all real numbers
m: slope of the line
b: y-intercept
Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

- **Constant Function**



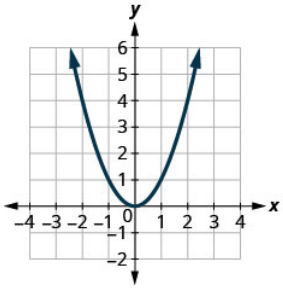
$f(x) = b$
b: any real number
b: y-intercept
Domain: $(-\infty, \infty)$
Range: b

- **Identity Function**



$f(x) = x$
m: 1
b: 0
Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

- **Square Function**



$f(x) = x^2$
Domain: $(-\infty, \infty)$
Range: $[0, \infty)$

- **Cube Function**

This figure has a curved line graphed on the x y-coordinate plane. The x-axis runs from negative 4 to 4. The y-axis runs from negative 4 to 4. The curved line goes through the points (negative 2, negative 8), (negative 1, negative 1), (0, 0), (1, 1), and (2, 8).). Next to the graph are the following: “f of x equalsx cubed”, “Domain: (negative infinity, infinity)”, and “Range: (negative infinity, infinity)”.

- **Square Root Function**

This figure has a curved half-line graphed on the x y-coordinate plane. The x-axis runs from 0 to 8. The y-axis runs from 0 to 8. The curved half-line starts at the point (0, 0) and then goes up and to the right. The curved half line goes through the points (1, 1) and (4, 2). Next to the graph are the following: “f of x equalssquare root of x”, “Domain: [0, infinity)”, and “Range: [0, infinity)”.

- **Absolute Value Function**

This figure has a v-shaped line graphed on the x y-coordinate plane. The x-axis runs from negative 4 to 4. The y-axis runs from negative 1 to 6. The v-shaped line goes through the points (negative 3, 3), (negative 2, 2), (negative 1, 1), (0, 0), (1, 1), (2, 2), and (3, 3). The point (0, 0) where the line changes slope is called the vertex. Next to the graph are the following: “f of x equalsabsolute value of x”, “Domain: (negative infinity, infinity)”, and “Range: [0, infinity)”.

16.3.1: Domain and Range

Learning Objectives

- Find the domain of a function defined by an equation.

If you're in the mood for a scary movie, you may want to check out one of the five most popular horror movies of all time—I am Legend, Hannibal, The Ring, The Grudge, and The Conjuring. Figure 16.3.1.1shows the amount, in dollars, each of those movies grossed when they were released as well as the ticket sales for horror movies in general by year. Notice that we can use the data to create a function of the amount each movie earned or the total ticket sales for all horror movies by year. In creating various functions using the data, we can identify different independent and dependent variables, and we can analyze the data and the functions to determine the domain and range. In this section, we will investigate methods for determining the domain and range of functions such as these.

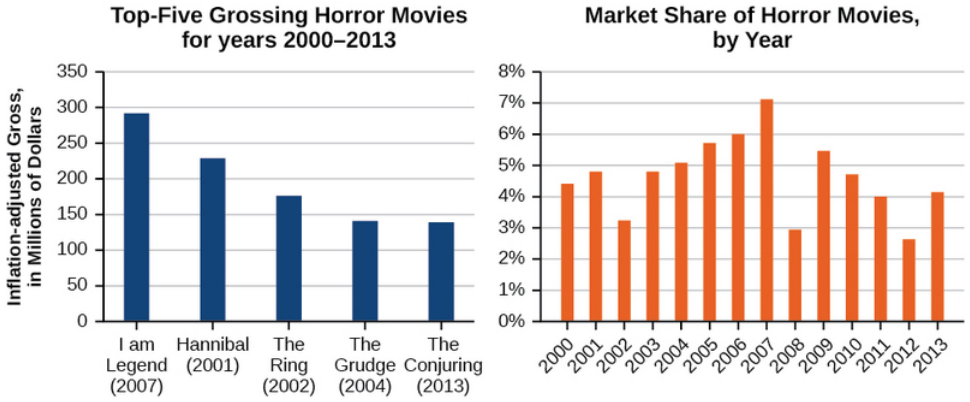

Figure 16.3.1.1: Graph of the Top-Five Grossing Horror Movies for years 2000-2003, and a Graph of the Market Share of Horror Movies by Year. Based on data compiled by www.the-numbers.com.

Finding the Domain of a Function Defined by an Equation

In Functions and Function Notation, we were introduced to the concepts of **domain and range**. In this section, we will practice determining domains and ranges for specific functions. Keep in mind that, in determining domains and ranges, we need to consider what is physically possible or meaningful in real-world examples, such as tickets sales and year in the horror movie example above. We also need to consider what is mathematically permitted. For example, we cannot include any input value that leads us to take an even root of a negative number if the domain and range consist of real numbers. Or in a function expressed as a formula, we cannot include any input value in the domain that would lead us to divide by 0.

We can visualize the domain as a "holding area" that contains "raw materials" for a "function machine" and the range as another "holding area" for the machine's products (Figure 16.3.1.2).

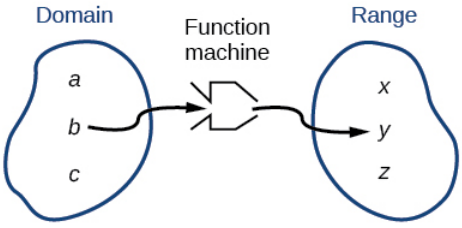

Figure 16.3.1.2: Diagram of how a function relates two relations

We can write the **domain and range** in **interval notation**, which uses values within brackets to describe a set of numbers. In interval notation, we use a square bracket [when the set includes the endpoint and a parenthesis (to indicate that the endpoint is either not included or the interval is unbounded. For example, if a person has $100 to spend, he or she would need to express the interval that is more than 0 and less than or equal to 100 and write $(0, 100]$. We will discuss interval notation in greater detail later.

Let's turn our attention to finding the domain of a function whose equation is provided. Oftentimes, finding the domain of such functions involves remembering three different forms. First, if the function has no denominator or an even root, consider whether

the domain could be all real numbers. Second, if there is a denominator in the function's equation, exclude values in the domain that force the denominator to be zero. Third, if there is an even root, consider excluding values that would make the radicand negative.

Before we begin, let us review the conventions of interval notation:

- The smallest term from the interval is written first.
- The largest term in the interval is written second, following a comma.
- Parentheses, (or), are used to signify that an endpoint is not included, called exclusive.
- Brackets, [or], are used to indicate that an endpoint is included, called inclusive.

See Figure 16.3.1.3for a summary of interval notation.

Inequality	Interval Notation	Graph on Number Line	Description
$x > a$	(a, ∞)		x is greater than a
$x < a$	$(-\infty, a)$		x is less than a
$x \geq a$	$[a, \infty)$		x is greater than or equal to a
$x \leq a$	$(-\infty, a]$		x is less than or equal to a
$a < x < b$	(a, b)		x is strictly between a and b
$a \leq x < b$	$[a, b)$		x is between a and b, to include a
$a < x \leq b$	$(a, b]$		x is between a and b, to include b
$a \leq x \leq b$	$[a, b]$		x is between a and b, to include a and b

Figure 16.3.1.3: Summary of interval notation.

Example 16.3.1.1: Finding the Domain of a Function as a Set of Ordered Pairs

Find the domain of the following function: $\{(2, 10), (3, 10), (4, 20), (5, 30), (6, 40)\}$

Solution

First identify the input values. The input value is the first coordinate in an ordered pair. There are no restrictions, as the ordered pairs are simply listed. The domain is the set of the first coordinates of the ordered pairs.

$$\{2, 3, 4, 5, 6\}$$

Exercse 16.3.1.1

Find the domain of the function:

$$\{(-5,4),(0,0),(5,-4),(10,-8),(15,-12)\}$$

Answer

$\{-5,0,5,10,15\}$

How To: Given a function written in equation form, find the domain.

1. Identify the input values.
2. Identify any restrictions on the input and exclude those values from the domain.
3. Write the domain in interval form, if possible.

Example 16.3.1.2: Finding the Domain of a Function

Find the domain of the function $f(x)=x^2-1$.

Solution

The input value, shown by the variable x in the equation, is squared and then the result is lowered by one. Any real number may be squared and then be lowered by one, so there are no restrictions on the domain of this function. The domain is the set of real numbers.

In interval form, the domain of f is $(-\infty,\infty)$.

Exercse 16.3.1.2

Find the domain of the function:

$$f(x)=5-x+x^3$$

Answer

$(-\infty,\infty)$

Howto: Given a function written in an equation form that includes a fraction, find the domain

1. Identify the input values.
2. Identify any restrictions on the input. If there is a denominator in the function's formula, set the denominator equal to zero and solve for x . If the function's formula contains an even root, set the radicand greater than or equal to 0, and then solve.
3. Write the domain in interval form, making sure to exclude any restricted values from the domain.

Example 16.3.1.3: Finding the Domain of a Function Involving a Denominator

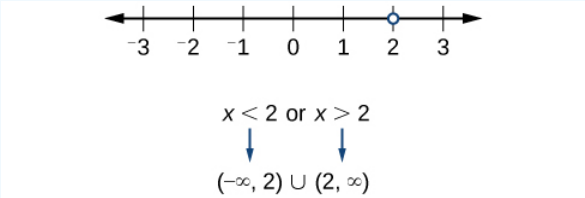
Find the domain of the function $f(x)=\dfrac{x+1}{2-x}$.

Solution

When there is a denominator, we want to include only values of the input that do not force the denominator to be zero. So, we will set the denominator equal to 0 and solve for x.

$$\begin{aligned} 2-x&=0\\ -x&=-2\\ x&=2 \end{aligned}$$

Now, we will exclude 2 from the domain. The answers are all real numbers where $x < 2$ or $x > 2$. We can use a symbol known as the union, $\cup$,to combine the two sets. In interval notation, we write the solution:$(-\infty, 2) \cup (2, \infty)$.



In interval form, the domain of f is $(-\infty, 2) \cup (2, \infty)$.

Exercse 16.3.1.3

Find the domain of the function:

$$f(x) = \frac{1+4x}{2x-1}$$

Answer

$$(-\infty, \frac{1}{2}) \cup (\frac{1}{2}, \infty)$$

How To: Given a function written in equation form including an even root, find the domain.

1. Identify the input values.
2. Since there is an even root, exclude any real numbers that result in a negative number in the radicand. Set the radicand greater than or equal to zero and solve for x.
3. The solution(s) are the domain of the function. If possible, write the answer in interval form.

Example 16.3.1.4: Finding the Domain of a Function with an Even Root

Find the domain of the function:

$$f(x) = \sqrt{7-x}.$$

Solution

When there is an even root in the formula, we exclude any real numbers that result in a negative number in the radicand.

Set the radicand greater than or equal to zero and solve for x.

$$\begin{aligned} 7 - x &\geq 0 \\ -x &\geq -7 \\ x &\leq 7 \end{aligned}$$

Now, we will exclude any number greater than 7 from the domain. The answers are all real numbers less than or equal to 7, or $(-\infty, 7]$.

Exercse 16.3.1.4

Find the domain of the function

$$f(x) = \sqrt{5+2x}.$$

Answer

$$[-2.5, \infty)$$

Q&A: Can there be functions in which the domain and range do not intersect at all?

Yes. For example, the function $f(x) = -\frac{1}{\sqrt{x}}$ *has the set of all positive real numbers as its domain but the set of all negative real numbers as its range. As a more extreme example, a function's inputs and outputs can be completely different categories (for example, names of weekdays as inputs and numbers as outputs, as on an attendance chart), in such cases the domain and range have no elements in common.*

Using Notations to Specify Domain and Range

In the previous examples, we used inequalities and lists to describe the domain of functions. We can also use inequalities, or other statements that might define sets of values or data, to describe the behavior of the variable in set-builder notation. For example, $\{x|10 \leq x < 30\}$ describes the behavior of x in set-builder notation. The braces $\{\}$ are read as "the set of," and the vertical bar $|$ is read as "such that," so we would read $\{x|10 \leq x < 30\}$ as "the set of x-values such that 10 is less than or equal to x, and x is less than 30."

Figure $16.3.1.4$compares inequality notation, set-builder notation, and interval notation.

	Inequality Notation	Set-builder Notation	Interval Notation
	$5 < h \leq 10$	$\{h \mid 5 < h \leq 10\}$	$(5, 10]$
	$5 \leq h < 10$	$\{h \mid 5 \leq h < 10\}$	$[5, 10)$
	$5 < h < 10$	$\{h \mid 5 < h < 10\}$	$(5, 10)$
	$h < 10$	$\{h \mid h < 10\}$	$(-\infty, 10)$
	$h \geq 10$	$\{h \mid h \geq 10\}$	$[10, \infty)$
	All real numbers	$\mathbb{R}$	$(-\infty, \infty)$

Figure 16.3.1.4: Summary of notations for inequalities, set-builder, and interval.

To combine two intervals using inequality notation or set-builder notation, we use the word "or." As we saw in earlier examples, we use the union symbol, $\cup$,to combine two unconnected intervals. For example, the union of the sets $\{2, 3, 5\}$ and $\{4, 6\}$ is the set $\{2, 3, 4, 5, 6\}$ It is the set of all elements that belong to one or the other (or both) of the original two sets. For sets with a finite number of elements like these, the elements do not have to be listed in ascending order of numerical value. If the original two sets have some elements in common, those elements should be listed only once in the union set. For sets of real numbers on intervals, another example of a union is

$$\{x||x| \geq 3\} = (-\infty, -3] \cup [3, \infty) \tag{16.3.1.1}$$

Set-Builder Notation and Interval Notation

Set-builder notation is a method of specifying a set of elements that satisfy a certain condition. It takes the form $\{x|$ statement about x$\}$ which is read as, "the set of all x such that the statement about x is true." For example,

$$\{x|4 < x \leq 12\}$$

Interval notation is a way of describing sets that include all real numbers between a lower limit that may or may not be included and an upper limit that may or may not be included. The endpoint values are listed between brackets or parentheses. A square bracket indicates inclusion in the set, and a parenthesis indicates exclusion from the set. For example,

$$(4, 12]$$

Given a line graph, describe the set of values using interval notation.

1. Identify the intervals to be included in the set by determining where the heavy line overlays the real line.
2. At the left end of each interval, use [with each end value to be included in the set (solid dot) or (for each excluded end value (open dot).
3. At the right end of each interval, use] with each end value to be included in the set (filled dot) or) for each excluded end value (open dot).
4. Use the union symbol $\cup$ to combine all intervals into one set.

Example 16.3.1.5: Describing Sets on the Real-Number Line

Describe the intervals of values shown in Figure 16.3.1.5using inequality notation, set-builder notation, and interval notation.

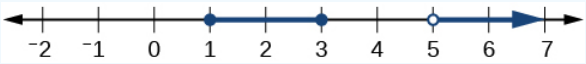


Figure 16.3.1.5: Line graph of $1 \leq x \leq 3$ or $x > 5$.

Solution

To describe the values, x, included in the intervals shown, we would say, "x is a real number greater than or equal to 1 and less than or equal to 3, or a real number greater than 5."

Inequality

$$1 \leq x \leq 3 \text{ or } x > 5$$

Set-builder Notation

$$\{x|1 \leq x \leq 3 \text{ or } x > 5\}$$

Interval notation

$$[1, 3] \cup (5, \infty)$$

Remember that, when writing or reading interval notation, using a square bracket means the boundary is included in the set. Using a parenthesis means the boundary is not included in the set.

Exercse 16.3.1.5

Given Figure 16.3.1.6, specify the graphed set in

a. words
b. set-builder notation
c. interval notation

Figure 16.3.1.6: Line graph of $-2 \leq x$, $-1 \leq x < 3$ .leq}x\), $-1 \leq x < 3$.

Answer a

Values that are less than or equal to –2, or values that are greater than or equal to –1 and less than 3;

Answer b

$\{x|x \leq -2 or -1 \leq x < 3\}$

Answer c

$(-\infty, -2] \cup [-1, 3)$

Finding Domain and Range from Graphs

Another way to identify the domain and range of functions is by using graphs. Because the domain refers to the set of possible input values, the domain of a graph consists of all the input values shown on the x-axis. The range is the set of possible output values, which are shown on the y-axis. Keep in mind that if the graph continues beyond the portion of the graph we can see, the domain and range may be greater than the visible values. See Figure 16.3.1.7.

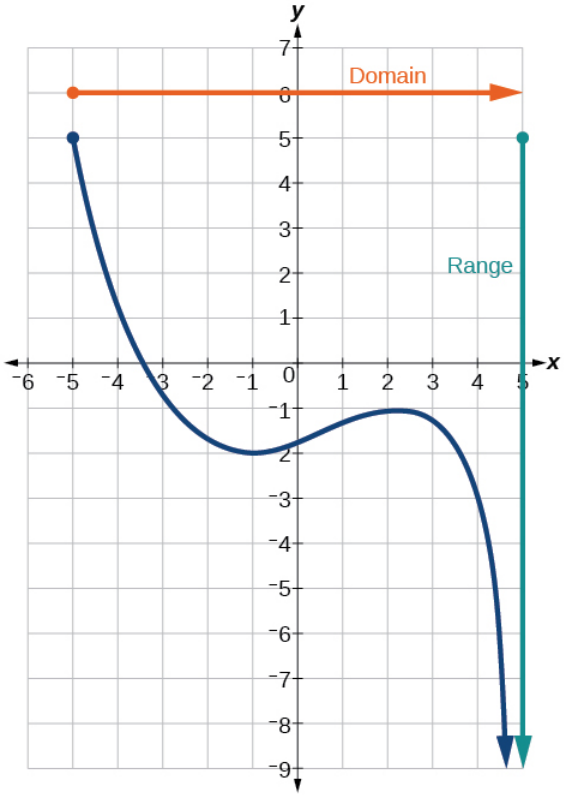

Figure 16.3.1.7: Graph of a polynomial that shows the x-axis is the domain and the y-axis is the range

We can observe that the graph extends horizontally from −5 to the right without bound, so the domain is $[-5, \infty)$. The vertical extent of the graph is all range values 5 and below, so the range is $(-\infty, 5]$. Note that the domain and range are always written from smaller to larger values, or from left to right for domain, and from the bottom of the graph to the top of the graph for range.

Example 16.3.1.6A: Finding Domain and Range from a Graph

Find the domain and range of the function f whose graph is shown in Figure 1.2.8.

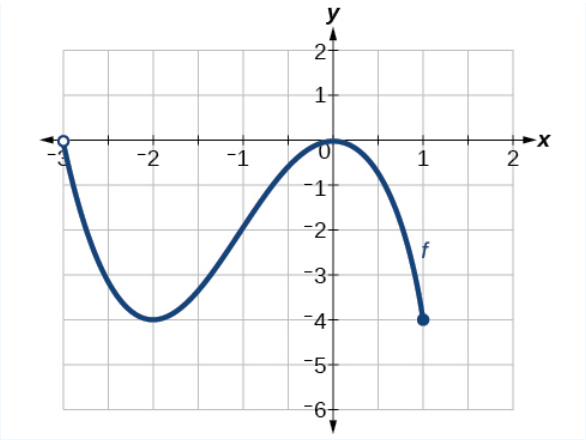

Figure 16.3.1.8: Graph of a function from (-3, 1].

Solution

We can observe that the horizontal extent of the graph is –3 to 1, so the domain of f is $(-3, 1]$.

The vertical extent of the graph is 0 to –4, so the range is $[-4, 0)$. See Figure 16.3.1.9

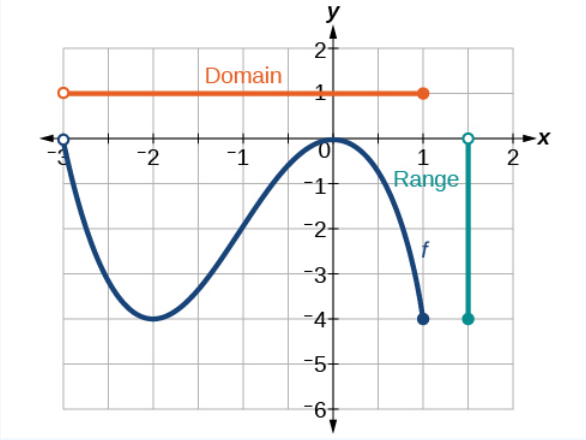

Figure 16.3.1.9: Graph of the previous function shows the domain and range

Example 16.3.1.6*B*: Finding Domain and Range from a Graph of Oil Production

Find the domain and range of the function f whose graph is shown in Figure 16.3.1.10

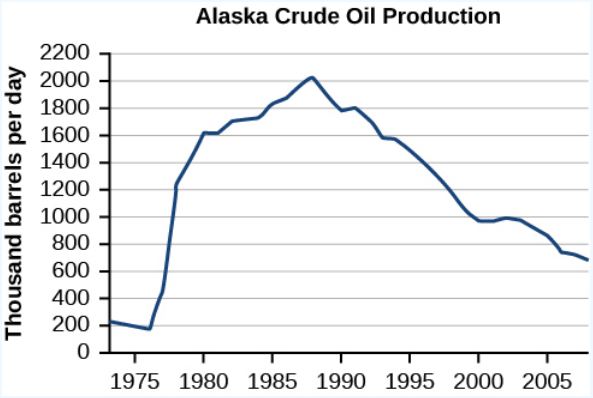

Figure 16.3.1.10: Graph of the Alaska Crude Oil Production where the y-axis is thousand barrels per day and the -axis is the years(credit: modification of work by the U.S. Energy Information Administration)

Solution

The input quantity along the horizontal axis is “years,” which we represent with the variable t for time. The output quantity is “thousands of barrels of oil per day,” which we represent with the variable b for barrels. The graph may continue to the left and right beyond what is viewed, but based on the portion of the graph that is visible, we can determine the domain as $1973 \leq t \leq 2008$ and the range as approximately $180 \leq b \leq 2010$.

In interval notation, the domain is $[1973, 2008]$ and the range is about $[180, 2010]$. For the domain and the range, we approximate the smallest and largest values since they do not fall exactly on the grid lines.

Exercse 16.3.1.6

Given Figure 16.3.1.11, identify the domain and range using interval notation.

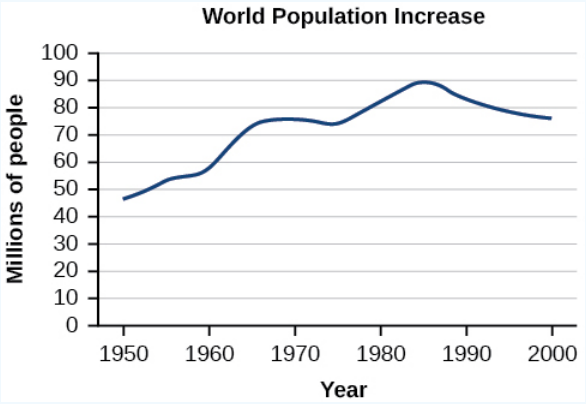

Figure 16.3.1.11: Graph of World Population Increase where the y-axis represents millions of people and the x-axis represents the year.

Answer

domain =$[1950, 2002]$

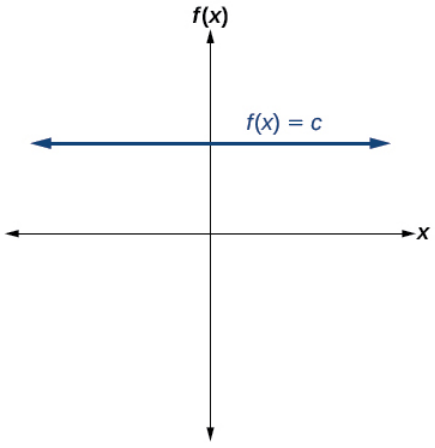
range = $[47,000,000, 89,000,000]$

Can a function’s domain and range be the same?

Yes. For example, the domain and range of the cube root function are both the set of all real numbers.

Finding Domains and Ranges of the Toolkit Functions

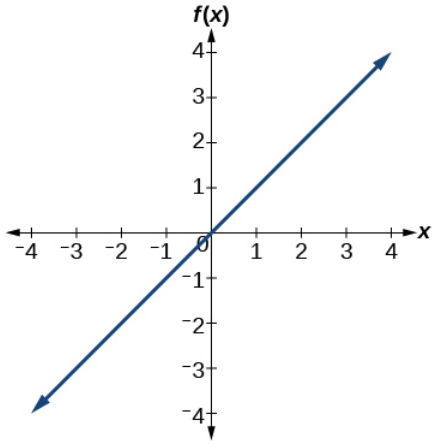
We will now return to our set of toolkit functions to determine the domain and range of each.



Domain: $(-\infty, \infty)$
Range: $[c,c]$

Figure 16.3.1.12: Constant function $f(x) = c$.

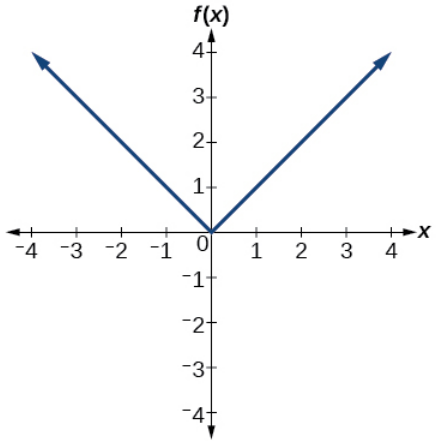
For the **constant function** $f(x) = c$, the domain consists of all real numbers; there are no restrictions on the input. The only output value is the constant c, so the range is the set $\{c\}$ that contains this single element. In interval notation, this is written as $[c, c]$, the interval that both begins and ends with c.



Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

Figure* 16.3.1.13*: *Identity function f(x)=x.*

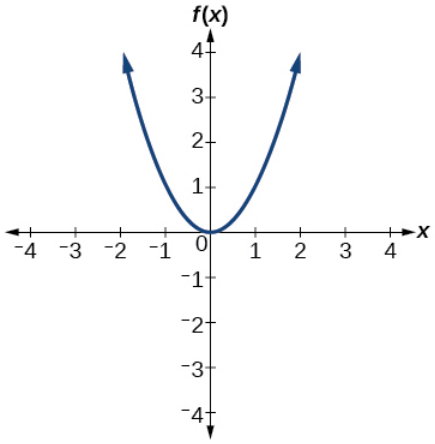
For the **identity function** $f(x) = x$, there is no restriction on x. Both the domain and range are the set of all real numbers.



Domain: $(-\infty, \infty)$
Range: $[0, \infty)$

Figure 16.3.1.14: Absolute function $f(x) = |x|$.

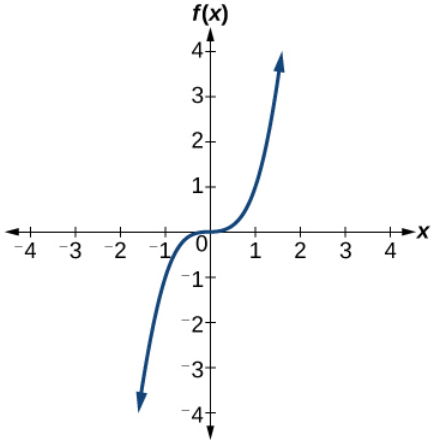
For the **absolute value function** $f(x) = |x|$, there is no restriction on x. However, because absolute value is defined as a distance from 0, the output can only be greater than or equal to 0.



Domain: $(-\infty, \infty)$
Range: $[0, \infty)$

Figure 16.3.1.15: Quadratic function $f(x) = x^2$.

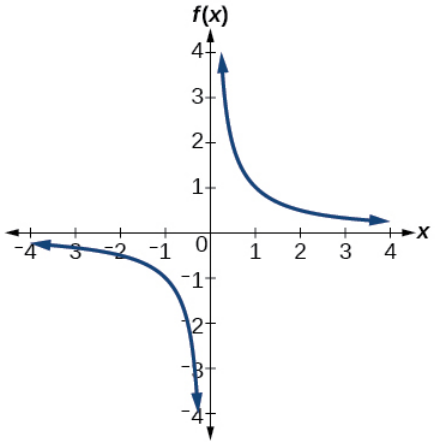
For the **quadratic function** $f(x) = x^2$, the domain is all real numbers since the horizontal extent of the graph is the whole real number line. Because the graph does not include any negative values for the range, the range is only nonnegative real numbers.



Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

Figure 16.3.1.16: Cubic function $f(x) - x^3$.

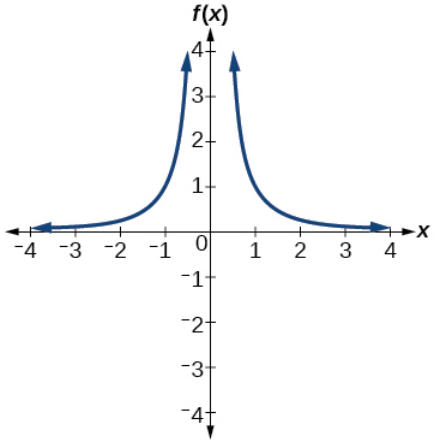
For the **cubic function** $f(x) = x^3$, the domain is all real numbers because the horizontal extent of the graph is the whole real number line. The same applies to the vertical extent of the graph, so the domain and range include all real numbers.



Domain: $(-\infty, 0) \cup (0, \infty)$
Range: $(-\infty, 0) \cup (0, \infty)$

Figure 16.3.1.17: Reciprocal function $f(x) = \frac{1}{x}$.

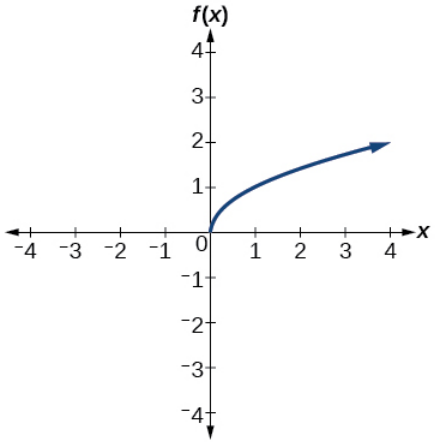
For the **reciprocal function** $f(x) = \frac{1}{x}$, we cannot divide by 0, so we must exclude 0 from the domain. Further, 1 divided by any value can never be 0, so the range also will not include 0. In set-builder notation, we could also write $\{x | x \neq 0\}$,the set of all real numbers that are not zero.



Domain: $(-\infty, 0) \cup (0, \infty)$
Range: $(0, \infty)$

Figure 16.3.1.18: Reciprocal squared function $f(x) = \frac{1}{x^2}$

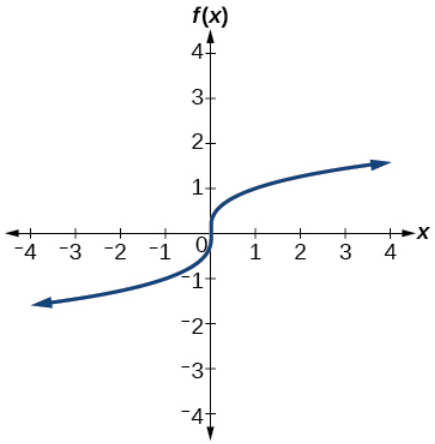
For the **reciprocal squared function** $f(x) = \frac{1}{x^2}$,we cannot divide by 0, so we must exclude 0 from the domain. There is also no x that can give an output of 0, so 0 is excluded from the range as well. Note that the output of this function is always positive due to the square in the denominator, so the range includes only positive numbers.



Domain: [0, ∞)
Range: [0, ∞)

***Figure* 16.3.1.19:** *Square root function* $f(x) = \sqrt{(x)}$.

For the **square root function** $f(x) = \sqrt{x}$, we cannot take the square root of a negative real number, so the domain must be 0 or greater. The range also excludes negative numbers because the square root of a positive number x is defined to be positive, even though the square of the negative number $-\sqrt{x}$ also gives us x.



Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$

Figure 16.3.1.20: Cube root function $f(x) = \sqrt[3]{x}$.

For the **cube root function** $f(x) = \sqrt[3]{x}$, the domain and range include all real numbers. Note that there is no problem taking a cube root, or any odd-integer root, of a negative number, and the resulting output is negative (it is an odd function).

How To: Given the formula for a function, determine the domain and range.

1. Exclude from the domain any input values that result in division by zero.
2. Exclude from the domain any input values that have nonreal (or undefined) number outputs.
3. Use the valid input values to determine the range of the output values.
4. Look at the function graph and table values to confirm the actual function behavior.

Finding the Domain and Range Using Toolkit Functions

Find the domain and range of $f(x) = 2x^3 - x$.

Solution

There are no restrictions on the domain, as any real number may be cubed and then subtracted from the result.

The domain is $(-\infty, \infty)$ and the range is also $(-\infty, \infty)$.

Example 16.3.1.7B: Finding the Domain and Range

Find the domain and range of $f(x) = \frac{2}{x+1}$.

Solution

We cannot evaluate the function at -1 because division by zero is undefined. The domain is $(-\infty, -1) \cup (-1, \infty)$. Because the function is never zero, we exclude 0 from the range. The range is $(-\infty, 0) \cup (0, \infty)$.

Example 16.3.1.7C: Finding the Domain and Range

Find the domain and range of $f(x) = 2\sqrt{x+4}$.

Solution

We cannot take the square root of a negative number, so the value inside the radical must be nonnegative.

$x + 4 \geq 0$ when $x \geq -4$

The domain of $f(x)$ is $[-4, \infty)$.

We then find the range. We know that $f(-4) = 0$, and the function value increases as x increases without any upper limit. We conclude that the range of f is $[0, \infty)$.

Analysis

Figure 16.3.1.19represents the function f.

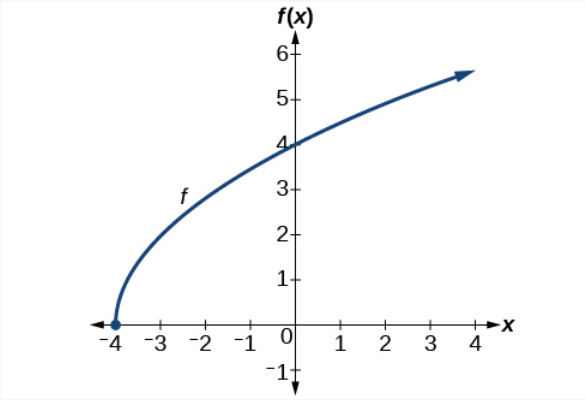


Figure 16.3.1.19: Graph of a square root function at $(-4, 0)$.

Exercise 16.3.1.7

Find the domain and range of

$f(x) = \sqrt{-2 - x}$.

Answer

domain: $(-\infty, -2]$

range: $[0, \infty)$

Key Concepts

- The domain of a function includes all real input values that would not cause us to attempt an undefined mathematical operation, such as dividing by zero or taking the square root of a negative number.
- The domain of a function can be determined by listing the input values of a set of ordered pairs.
- The domain of a function can also be determined by identifying the input values of a function written as an equation.

- Interval values represented on a number line can be described using inequality notation, set-builder notation, and interval notation.
- For many functions, the domain and range can be determined from a graph.
- An understanding of toolkit functions can be used to find the domain and range of related functions.

Glossary

interval notation

a method of describing a set that includes all numbers between a lower limit and an upper limit; the lower and upper values are listed between brackets or parentheses, a square bracket indicating inclusion in the set, and a parenthesis indicating exclusion

set-builder notation

a method of describing a set by a rule that all of its members obey; it takes the form {x| statement about x}

Answer

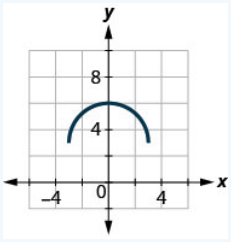
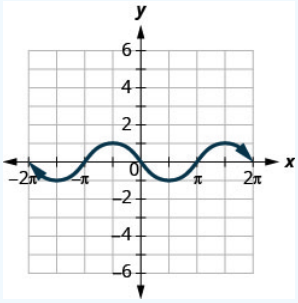
$D: [-2, 2],\ R: [0, 2]$

46.



In the following exercises, use the graph of the function to find the indicated values.

47.

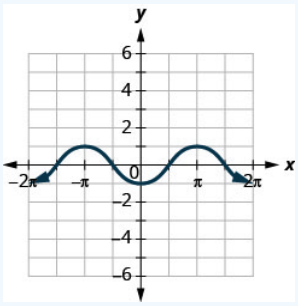


ⓐ Find: $f(0)$.
ⓑ Find: $f(12\pi)$.
ⓒ Find: $f(-32\pi)$.
ⓓ Find the values for x when $f(x) = 0$.
ⓔ Find the x-intercepts.
ⓕ Find the y-intercepts.
ⓖ Find the domain. Write it in interval notation.
ⓗ Find the range. Write it in interval notation.

Answer

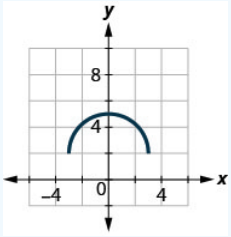
ⓐ $f(0) = 0$ ⓑ $(\pi/2) = -1$
ⓒ $f(-3\pi/2) = -1$ ⓓ $f(x) = 0$ for $x = -2\pi, -\pi, 0, \pi, 2\pi$
ⓔ $(-2\pi, 0), (-\pi, 0), (0, 0), (\pi, 0), (2\pi, 0)(f)(0, 0)$
ⓖ $[-2\pi, 2\pi]$ ⓗ $[-1, 1]$

48.



ⓐ Find: $f(0)$.
ⓑ Find: $f(\pi)$.
ⓒ Find: $f(-\pi)$.
ⓓ Find the values for x when $f(x)=0$.
ⓔ Find the x-intercepts.
ⓕ Find the y-intercepts.
ⓖ Find the domain. Write it in interval notation.
ⓗ Find the range. Write it in interval notation

49.

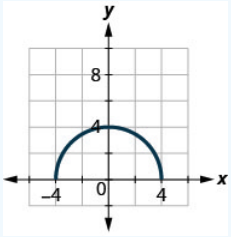


ⓐ Find: $f(0)$.
ⓑ Find: $f(-3)$.
ⓒ Find: $f(3)$.
ⓓ Find the values for x when $f(x)=0$.
ⓔ Find the x-intercepts.
ⓕ Find the y-intercepts.
ⓖ Find the domain. Write it in interval notation.
ⓗ Find the range. Write it in interval notation.

Answer

ⓐ $f(0)=-6$ ⓑ $f(-3)=3$ ⓒ $f(3)=3$ ⓓ $f(x)=0$ for no x ⓔ none ⓕ $y=6$ ⓖ $[-3,3]$ ⓗ $[-3,6]$

50.



ⓐ Find: $f(0)$.
ⓑ Find the values for x when $f(x)=0$.
ⓒ Find the x-intercepts.
ⓓ Find the y-intercepts.
ⓔ Find the domain. Write it in interval notation.
ⓕ Find the range. Write it in interval notation

Writing Exercises

51. Explain in your own words how to find the domain from a graph.

52. Explain in your own words how to find the range from a graph.

53. Explain in your own words how to use the vertical line test.

54. Draw a sketch of the square and cube functions. What are the similarities and differences in the graphs?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the vertical line test.			
identify graphs of basic functions.			
read information from a graph.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

16.4: Graph Quadratic Functions Using Properties

Learning Objectives

By the end of this section, you will be able to:

- Recognize the graph of a quadratic function
- Find the axis of symmetry and vertex of a parabola
- Find the intercepts of a parabola
- Graph quadratic functions using properties
- Solve maximum and minimum applications

Before you get started, take this readiness quiz.

1. Graph the function $f(x) = x^2$ by plotting points.
   If you missed this problem, review Example 3.54.
2. Solve: $2x^2 + 3x - 2 = 0$.
   If you missed this problem, review Example 6.45.
3. Evaluate $-\frac{b}{2a}$ when $a = 3$ and $b = -6$.
   If you missed this problem, review Example 1.21.

Recognize the Graph of a Quadratic Function

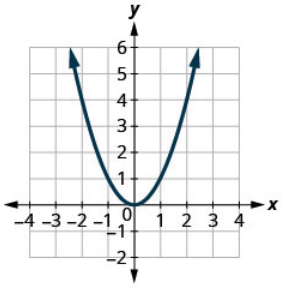
Previously we very briefly looked at the function $f(x) = x^2$, which we called the square function. It was one of the first non-linear functions we looked at. Now we will graph functions of the form $f(x) = ax^2 + bx + c$ if $a \neq 0$. We call this kind of function a quadratic function.

Definition 16.4.1

A **quadratic function**, where a, b, and c are real numbers and $a \neq 0$, is a function of the form

$$f(x) = ax^2 + bx + c$$

We graphed the quadratic function $f(x) = x^2$ by plotting points.



x	$f(x) = x^2$	$(x, f(x))$
−3	9	(−3, 9)
−2	4	(−2, 4)
−1	1	(−1, 1)
0	0	(0, 0)
1	1	(1, 1)
2	4	(2, 4)
3	9	(3, 9)

Figure 9.6.1

Every quadratic function has a graph that looks like this. We call this figure a **parabola**. Let's practice graphing a parabola by plotting a few points.

Example 16.4.1

Graph: $f(x) = x^2 - 1$.

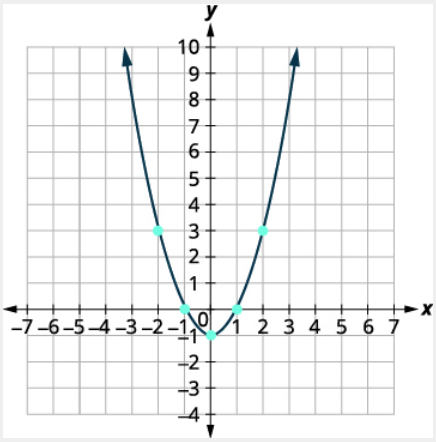
Solution:

We will graph the function by plotting points.

Choose integer values for x, substitute them into the equation and simplify to find $f(x)$. Record the values of the ordered pairs in the chart.

$f(x) = x^2 - 1$	
x	$f(x)$
0	–1
1	0
–1	0
2	3
–2	3

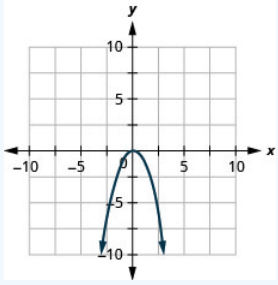
Plot the points, and then connect them with a smooth curve. The result will be the graph of the function $f(x) = x^2 - 1$.



Exercise 16.4.1

Graph $f(x) = -x^2$.

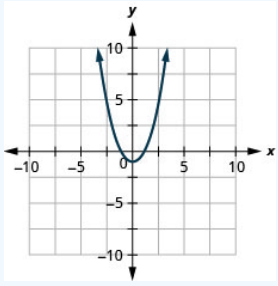
Answer



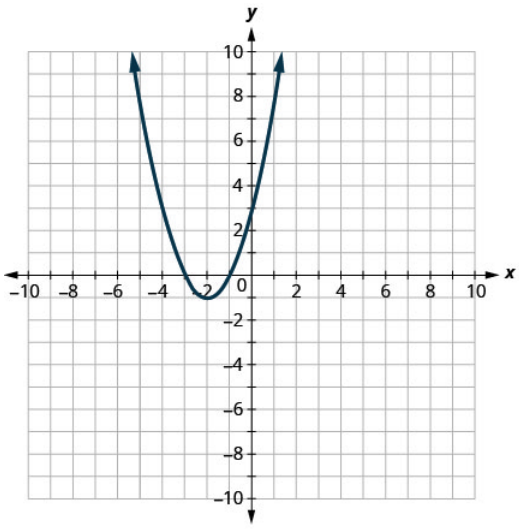
Exercise 16.4.2

Graph $f(x) = x^2 - 1$.

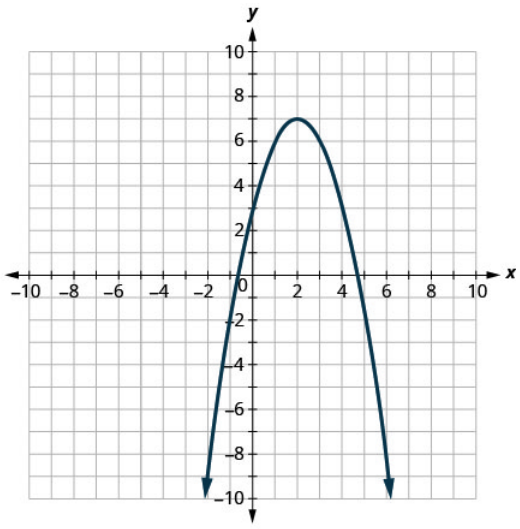
Answer



All graphs of quadratic functions of the form $f(x) = ax^2 + bx + c$ are parabolas that open upward or downward. See *Figure 9.6.6*



$f(x) = ax^2 + bx + c$
$f(x) = x^2 + 4x + 3$
$a > 0$
opens upward



$f(x) = ax^2 + bx + c$
$f(x) = -x^2 + 4x + 3$
$a < 0$
opens downward

Notice that the only difference in the two functions is the negative sign before the quadratic term (x^2 in the equation of the graph in *Figure 9.6.6*). When the quadratic term, is positive, the parabola opens upward, and when the quadratic term is negative, the parabola opens downward.

Definition 16.4.2

Parabola Orientation

For the graph of the quadratic function $f(x) = ax^2 + bx + c$, if

- $a > 0$, the parabola opens upward
- $a < 0$, the parabola opens downward

Example 16.4.2

Determine whether each parabola opens upward or downward:

a. $f(x) = -3x^2 + 2x - 4$
b. $f(x) = 6x^2 + 7x - 9$

Solution:

a. Find the value of a.

$f(x) = ax^2 + bx + c$
$f(x) = -3x^2 + 2x - 4$
$a = -3$

Since the a is negative, the parabola will open downward.

b. Find the value of a.

$f(x) = ax^2 + bx + c$
$f(x) = 6x^2 + 7x - 9$
$a = 6$

Since the a is positive, the parabola will open upward.

Exercise 16.4.3

Determine whether the graph of each function is a parabola that opens upward or downward:

a. $f(x) = 2x^2 + 5x - 2$
b. $f(x) = -3x^2 - 4x + 7$

Answer

a. up
b. down

Exercise 16.4.4

Determine whether the graph of each function is a parabola that opens upward or downward:

a. $f(x) = -2x^2 - 2x - 3$
b. $f(x) = 5x^2 - 2x - 1$

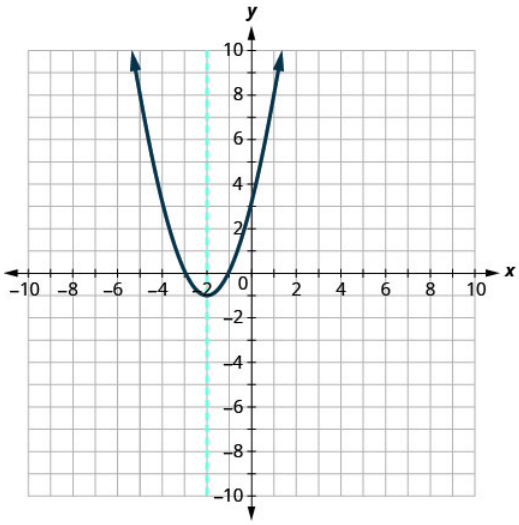
Answer

a. down
b. up

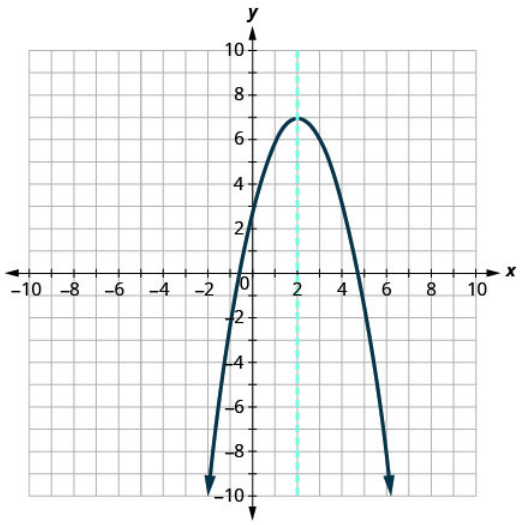
Find the Axis of Symmetry and Vertex of a Parabola

Look again at *Figure 9.6.10*. Do you see that we could fold each parabola in half and then one side would lie on top of the other? The 'fold line' is a line of symmetry. We call it the **axis of symmetry** of the parabola.

We show the same two graphs again with the axis of symmetry.



$f(x) = x^2 + 4x + 3$



$f(x) = -x^2 + 4x + 3$

The equation of the axis of symmetry can be derived by using the Quadratic Formula. We will omit the derivation here and proceed directly to using the result. The equation of the axis of symmetry of the graph of $f(x) = ax^2 + bx + c$ is $x = -\frac{b}{2a}$.

So to find the equation of symmetry of each of the parabolas we graphed above, we will substitute into the formula $x = -\frac{b}{2a}$.

$f(x) = ax^2 + bx + c$	$f(x) = ax^2 + bx + c$
$f(x) = x^2 + 4x + 3$	$f(x) = -x^2 + 4x + 3$
axis of symmetry	axis of symmetry
$x = -\frac{b}{2a}$	$x = -\frac{b}{2a}$
$x = -\frac{4}{2 \cdot 1}$	$x = -\frac{4}{2(-1)}$
$x = -2$	$x = 2$

Notice that these are the equations of the dashed blue lines on the graphs.

The point on the parabola that is the lowest (parabola opens up), or the highest (parabola opens down), lies on the axis of symmetry. This point is called the **vertex** of the parabola.

We can easily find the coordinates of the vertex, because we know it is on the axis of symmetry. This means its x-coordinate is $-\frac{b}{2a}$. To find the y-coordinate of the vertex we substitute the value of the x-coordinate into the quadratic function.

$f(x) = x^2 + 4x + 3$	$f(x) = -x^2 + 4x + 3$
axis of symmetry is $x = -2$	axis of symmetry is $x = 2$
vertex is $(-2, ___)$	vertex is $(2, ___)$
$f(x) = x^2 + 4x + 3$	$f(x) = -x^2 + 4x + 3$
$f(x) = (-2)^2 + 4(-2) + 3$	$f(x) = -(2)^2 + 4(2) + 3$
$f(x) = -1$	$f(x) = 7$
vertex is $(-2, -1)$	vertex is $(2, 7)$

Axis of Symmetry and Vertex of a Parabola

The graph of the function $f(x) = ax^2 + bx + c$ is a parabola where:

- the axis of symmetry is the vertical line $x = -\frac{b}{2a}$.
- the vertex is a point on the axis of symmetry, so its x-coordinate is $-\frac{b}{2a}$
- the y-coordinate of the vertex is found by substituting $x = -\frac{b}{2a}$ into the quadratic equation.

Example 16.4.3

For the graph of $f(x) = 3x^2 - 6x + 2$ find:

a. the axis of symmetry
b. the vertex

Solution:

a.

	$f(x) = ax^2 + bx + c$ $f(x) = 3x^2 - 6x + 2$
The axis of symmetry is the vertical line $x = -\frac{b}{2a}$.	
Substitute the values a, b into the equation.	$x = -\frac{-6}{2 \cdot 3}$
Simplify.	$x = 1$
	The axis of symmetry is the line $x = 1$.

b.

	$f(x) = 3x^2 - 6x + 2$
The vertex is a point on the line of symmetry, so its x-coordinate will be $x = 1$. Find $f(1)$.	$f(1) = 3(1)^2 - 6(1) + 2$
Simplify.	$f(1) = 3 \cdot 1 - 6 + 2$

The result is the y-coordinate.	$f(1) = -1$
	The vertex is $(1, -1)$.

Exercise 16.4.5

For the graph of $f(x) = 2x^2 - 8x + 1$ find:

a. the axis of symmetry
b. the vertex

Answer

a. $x = 2$
b. $(2, -7)$

Exercise 16.4.6

For the graph of $f(x) = 2x^2 - 4x - 3$ find:

a. the axis of symmetry
b. the vertex

Answer

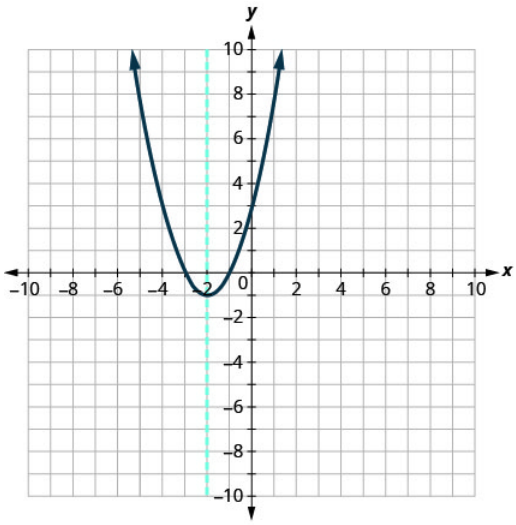
a. $x = 1$
b. $(1, -5)$

Find the Intercepts of a Parabola

When we graphed linear equations, we often used the x- and y-intercepts to help us graph the lines. Finding the coordinates of the intercepts will help us to graph parabolas, too.

Remember, at the y-intercept the value of x is zero. So to find the y-intercept, we substitute $x = 0$ into the function.

Let's find the y-intercepts of the two parabolas shown in *Figure 9.6.20*.

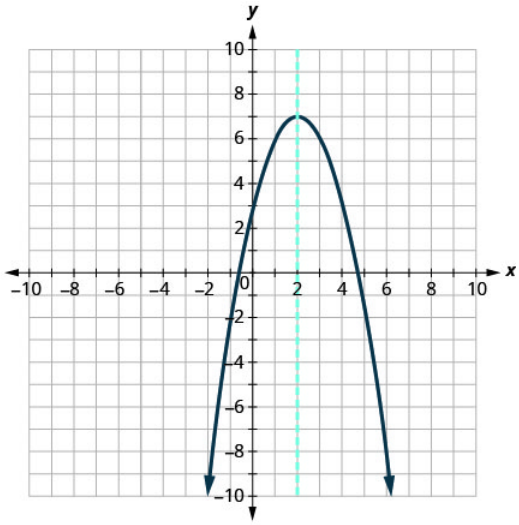


$f(x) = x^2 + 4x + 3$

$x = 0 \quad f(0) = 0^2 + 4 \cdot 0 + 3$

$f(0) = 3$

y-intercept $(0, 3)$



$f(x) = -x^2 + 4x + 3$

$x = 0 \quad f(0) = -0^2 + 4 \cdot 0 + 3$

$f(0) = 3$

y-intercept $(0, 3)$

An x-intercept results when the value of $f(x)$ is zero. To find an x-intercept, we let $f(x)=0$. In other words, we will need to solve the equation $0=ax^2+bx+c$ for x.

$$f(x)=ax^2+bx+c$$
$$0=ax^2+bx+c$$

Solving quadratic equations like this is exactly what we have done earlier in this chapter!

We can now find the x-intercepts of the two parabolas we looked at. First we will find the x-intercepts of the parabola whose function is $f(x)=x^2+4x+3$.

	$f(x)=x^2+4x+3$
Let $f(x)=0$.	$0=x^2+4x+3$
Factor.	$0=(x+1)(x+3)$
Use the Zero Product Property.	$x+1=0 \quad x+3=0$
Solve.	$x=-1 \quad x=-3$
	The x-intercepts are $(-1,0)$ and $(-3,0)$.

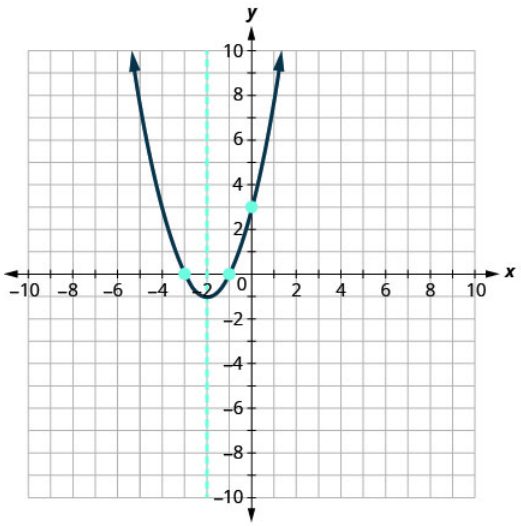
Now we will find the x-intercepts of the parabola whose function is $f(x)=-x^2+4x+3$.

	$f(x)=-x^2+4x+3$
Let $f(x)=0$.	$0=-x^2+4x+3$
This quadratic does not factor, so we use the Quadratic Formula.	$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$
$a=-1, b=4, c=3$	$x=\frac{-4\pm\sqrt{4^2-4(-1)(3)}}{2(-1)}$
Simplify.	$x=\frac{-4\pm\sqrt{28}}{-2}$
	$x=\frac{-4\pm2\sqrt{7}}{-2}$
	$x=\frac{-2(2\pm\sqrt{7})}{-2}$
	$x=2\pm\sqrt{7}$
	The x-intercepts are $(2+\sqrt{7},0)$ and $(2-\sqrt{7},0)$.

We will use the decimal approximations of the x-intercepts, so that we can locate these points on the graph,

$$(2+\sqrt{7},0)\approx(4.6,0) \quad (2-\sqrt{7},0)\approx(-0.6,0)$$

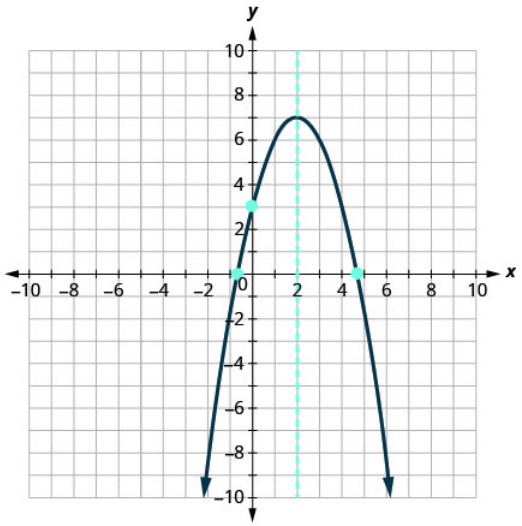
Do these results agree with our graphs? See *Figure 9.6.34*



$f(x) = x^2 + 4x + 3$

y-intercept $(0, 3)$

x-intercepts $(-1, 0)$ and $(-3, 0)$



$f(x) = -x^2 + 4x + 3$

y-intercept $(0, 3)$

x-intercepts $(2 + \sqrt{7}, 0) \approx (4.6, 0)$

$(2 - \sqrt{7}, 0) \approx (-0.6, 0)$

Find the Intercepts of a Parabola

To find the intercepts of a parabola whose function is $f(x) = ax^2 + bx + c$:

y-intercept

Let $x = 0$ and solve for $f(x)$.

x-intercepts

Let $f(x) = 0$ and solve for x

Example 16.4.4

Find the intercepts of the parabola whose function is $f(x) = x^2 - 2x - 8$.

Solution:

To find the y-intercept, let $x = 0$ and solve for $f(x)$.	$f(x) = x^2 - 2x - 8$
	$f(0) = 0^2 - 2 \cdot 0 - 8$
	$f(0) = -8$
	When $x = 0$, then $f(0) = -8$. The y-intercept is the point $(0, -8)$.
To find the x-intercept, let $f(x) = 0$ and solve for x.	$f(x) = x^2 - 2x - 8$
	$0 = x^2 - 2x - 8$
Solve by factoring.	$0 = (x - 4)(x + 2)$
	$0 = x - 4 \quad 0 = x + 2$
	$4 = x \quad -2 = x$
	When $f(x) = 0$, then $x = 4$ or $x = -2$. The x-intercepts are the points $(4, 0)$ and $(-2, 0)$.

Exercise 16.4.7

Find the intercepts of the parabola whose function is $f(x) = x^2 + 2x - 8$.

Answer

y -intercept: $(0, -8)$ x -intercepts $(-4, 0), (2, 0)$

Exercise 16.4.8

Find the intercepts of the parabola whose function is $f(x) = x^2 - 4x - 12$.

Answer

y -intercept: $(0, -12)$ x -intercepts $(-2, 0), (6, 0)$

In this chapter, we have been solving quadratic equations of the form $ax^2 + bx + c = 0$. We solved for x and the results were the solutions to the equation.

We are now looking at quadratic functions of the form $f(x) = ax^2 + bx + c$. The graphs of these functions are parabolas. The x-intercepts of the parabolas occur where $f(x) = 0$.

For example:

Quadratic equation

$$\begin{aligned} x^2 - 2x - 15 &= 0 \quad \text{Let } f(x) = 0 \\ (x-5)(x+3) &= 0 \\ x - 5 = 0 \quad x + 3 &= 0 \\ x = 5 \quad x &= -3 \end{aligned}$$

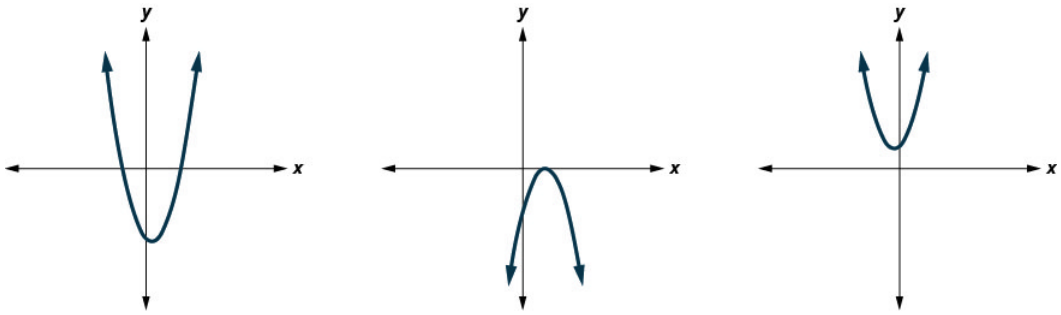
Quadratic function

$$\begin{aligned} f(x) &= x^2 - 2x - 15 \\ 0 &= x^2 - 2x - 15 \\ 0 &= (x-5)(x+3) \\ x - 5 = 0 \quad & x + 3 = 0 \\ x = 5 \quad & x = -3 \\ (5, 0) \text{ and } &(-3, 0) \\ x \text{ -intercepts} & \end{aligned}$$

The solutions of the quadratic function are the x values of the x-intercepts.

Earlier, we saw that quadratic equations have $2, 1$, or 0 solutions. The graphs below show examples of parabolas for these three cases. Since the solutions of the functions give the x-intercepts of the graphs, the number of x-intercepts is the same as the number of solutions.

Previously, we used the **discriminant** to determine the number of solutions of a quadratic function of the form $ax^2 + bx + c = 0$. Now we can use the discriminant to tell us how many x-intercepts there are on the graph.



$b^2 - 4ac > 0$
Two solutions
Two x-intercepts

$b^2 - 4ac = 0$
One solution
One x-intercept

$b^2 - 4ac < 0$
No real solution
No x-intercept

Before you to find the values of the x-intercepts, you may want to evaluate the discriminant so you know how many solutions to expect.

Example 16.4.5

Find the intercepts of the parabola for the function $f(x) = 5x^2 + x + 4$.

Solution:

	$f(x) = 5x^2 + x + 4$
To find the y-intercept, let $x = 0$ and solve for $f(x)$.	$f(0) = 5 \cdot 0^2 + 0 + 4$
	$f(0) = 4$
	When $x = 0$, then $f(0) = 4$. The y-intercept is the point $(0, 4)$.
To find the x-intercept, let $f(x) = 0$ and solve for x.	$f(x) = 5x^2 + x + 4$
	$0 = 5x^2 + x + 4$
Find the value of the discriminant to predict the number of solutions which is also the number of x-intercepts.	
$b^2 - 4ac$ $1^2 - 4 \cdot 5 \cdot 4$ $1 - 80$ -79	
	Since the value of the discriminant is negative, there is no real solution to the equation. There are no x-intercepts.

Exercise 16.4.9

Find the intercepts of the parabola whose function is $f(x) = 3x^2 + 4x + 4$.

Answer

y-intercept: $(0, 4)$ no x-intercept

Exercise 16.4.10

Find the intercepts of the parabola whose function is $f(x) = x^2 - 4x - 5$

Answer

y-intercept: $(0,-5)$ x-intercepts $(-1,0),(5,0)$

Graph Quadratic Functions Using Properties

Now we have all the pieces we need in order to graph a quadratic function. We just need to put them together. In the next example we will see how to do this.

Example 16.4.6 How to Graph a Quadratic Function Using Properties

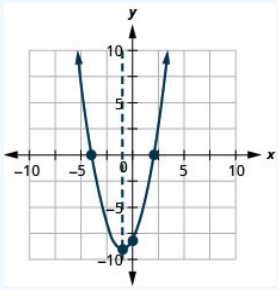
Graph $f(x)=x^2-6x+8$ by using its properties.

Solution:

Step 1: Determine whether the parabola opens upward or downward.	Look a in the equation $f(x)=x^2-6x+8$ Since a is positive, the parabola opens upward.	$f(x)=x^2-6x+8$ $a=1, b=-6, c=8$ **The parabola opens upward.**
Step 2: Find the axis of symmetry.	$f(x)=x^2-6x+8$ The axis of symmetry is the line $x=-\frac{b}{2a}$.	Axis of Symmetry $x=-\frac{b}{2a}$ $x=-\frac{(-6)}{2\cdot 1}$ $x=3$ **The axis of symmetry is the line $x=3$.**
Step 3: Find the vertex.	The vertex is on the axis of symmetry. Substitute $x=3$ into the function.	Vertex $f(x)=x^2-6x+8$ $f(3)=(3)^2-6(3)+8$ $f(3)=-1$ **The vertex is $(3,-1)$.**
Step 4: Find the y-intercept. Find the point symmetric to the y-intercept across the axis of symmetry.	We find $f(0)$. We use the axis of symmetry to find a point symmetric to the y-intercept. The y-intercept is 3 units left of the axis of symmetry, $x=3$. A point 3 units to the right of the axis of symmetry has $x=6$.	y-intercept $f(x)=x^2-6x+8$ $f(0)=(0)^2-6(0)+8$ $f(0)=8$ **The y-intercept is $(0,8)$.** Point symmetric to y-intercept: **The point is $(6,8)$.**
Step 5: Find the x-intercepts. Find additional points if needed.	We solve $f(x)=0$. We can solve this quadratic equation by factoring.	x-intercepts $f(x)=x^2-6x+8$ $0=x^2-6x+8$ $0=(x-2)(x-4)$ $x=2 or x=4$ **The x-intercepts are $(2,0)$ and $(4,0)$.**
Step 6: Graph the parabola.	We graph the vertex, intercepts, and the point symmetric to the y-intercept. We connect these 5 points to sketch the parabola.	
Exercise 16.4.11

Graph $f(x) = x^2 + 2x - 8$ by using its properties.

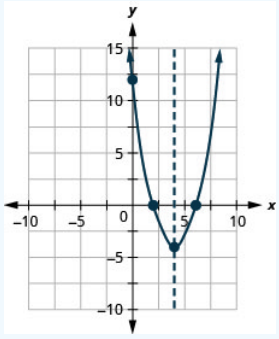
Answer



Exercise 16.4.12

Graph $f(x) = x^2 - 8x + 12$ by using its properties.

Answer



We list the steps to take in order to graph a quadratic function here.

To Graph a Quadratic Function Using Properties

1. Determine whether the parabola opens upward or downward.
2. Find the equation of the axis of symmetry.
3. Find the vertex.
4. Find the y-intercept. Find the point symmetric to the y-intercept across the axis of symmetry.
5. Find the x-intercepts. Find additional points if needed.
6. Graph the parabola.

We were able to find the x-intercepts in the last example by factoring. We find the x-intercepts in the next example by factoring, too.

Example 16.4.7

Graph $f(x) = -x^2 + 6x - 9$ by using its properties.

Solution:

	$f(x) = ax^2 + bx + c$ $f(x) = -x^2 + 6x - 9$
Since a is -1, the parabola opens downward.	

To find the equation of the axis of symmetry, use $x = -\frac{b}{2a}$.	$x = -\frac{b}{2a}$
	$x = -\frac{6}{2(-1)}$
	$x = 3$
	The axis of symmetry is $x = 3$. The vertex is on the line $x = 3$.
	Find $f(3)$.	$f(x) = -x^2 + 6x - 9$
	$f(3) = -3^2 + 6 \cdot 3 - 9$
	$f(3) = -9 + 18 - 9$
	$f(3) = 0$
	The vertex is $(3, 0)$.
	The y-intercept occurs when $x = 0$. Find $f(0)$.	$f(x) = -x^2 + 6x - 9$
Substitute $x = 0$.	$f(0) = -0^2 + 6 \cdot 0 - 9$

Simplify.	$f(0) = -9$
The point $(0, -9)$ is three units to the left of the line of symmetry. The point three units to the right of the line of symmetry is $(6, -9)$.		Point symmetric to the y-intercept is $(6, -9)$
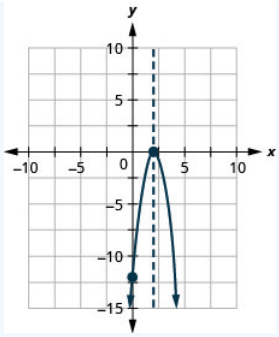
The x-intercept occurs when $f(x) = 0$.	$f(x) = -x^2 + 6x - 9$
Find $f(x) = 0$.	$0 = -x^2 + 6x - 9$
Factor the GCF.	$0 = -(x^2 - 6x + 9)$
Factor the trinomial.	$0 = -(x - 3)^2$
Solve for x.	$0 = 3$
Connect the points to graph the parabola.	
? Exercise 16.4.13

Graph $f(x) = 3x^2 + 12x - 12$ by using its properties.

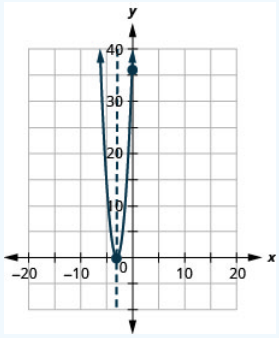
Answer



Exercise 16.4.14

Graph $f(x) = 4x^2 + 24x + 36$ by using its properties.

Answer



For the graph of $f(x) = -x^2 + 6x - 9$, the vertex and the x-intercept were the same point. Remember how the discriminant determines the number of solutions of a quadratic equation? The discriminant of the equation $0 = -x^2 + 6x - 9$ is 0, so there is only one solution. That means there is only one x-intercept, and it is the vertex of the parabola.

How many x-intercepts would you expect to see on the graph of $f(x) = x^2 + 4x + 5$?

Example 16.4.8

Graph $f(x) = x^2 + 4x + 5$ by using its properties.

Solution:

	$f(x) = ax^2 + bx + c$ $f(x) = -x^2 + 6x - 9$
Since a is -1, the parabola opens downward.	
To find the equation of the axis of symmetry, use $x = -\frac{b}{2a}$.	$x = -\frac{b}{2a}$
	$x = -\frac{4}{(2)1}$
	$x = -2$
	The equation of the axis of symmetry is \(x=-2).

	The vertex is on the line $x = -2$.	
Find $f(x)$ when $x = -2$.	$f(x) = x^2 + 4x + 5$
	$f(-2) = (-2)^2 + 4(-2) + 5$
	$f(-2) = 4 - 8 + 5$
	$f(-2) = 1$
	The vertex is $(-2, 1)$.
	The y-intercept occurs when $x = 0$.	$f(x) = x^2 + 4x - 5$
Find $f(0)$.	$f(0) = 5$
Simplify.	$f(0) = 5$
	The y-intercept is $(0, 5)$.

The point $(-4, 5)$ is two units to the left of the line of symmetry. The point to units to the right of the line of symmetry is \((0,5)\.		Point symmetric to the y-intercept is $(-4, 5)$.
The x-intercept occurs when $f(x) = 0$.	Find $f(x) = 0$.	$0 = x^2 + 4x + 5$
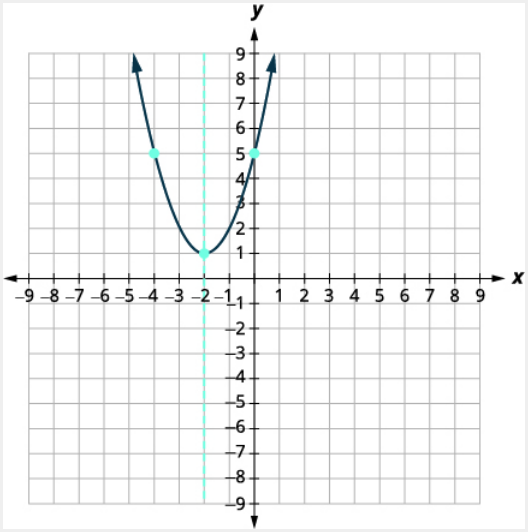
Test the discriminant.	
	$b^2 - 4ac$
	$4^2 - 4 \cdot 1 \cdot 5$
	$16 - 20$
	-4
Since the value of the discriminant is negative, there is no real solution and so no x-intercept.	

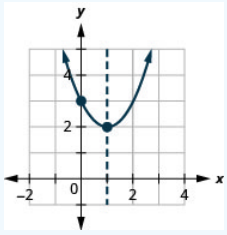
Connect the points to graph the parabola. You may want to choose two more points for greater accuracy.



Exercise 16.4.15

Graph $f(x) = x^2 - 2x + 3$ by using its properties.

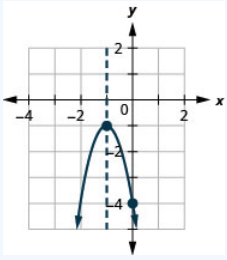
Answer



Exercise 16.4.16

Graph $f(x) = -3x^2 - 6x - 4$ by using its properties.

Answer



Finding the y-intercept by finding $f(0)$ is easy, isn't it? Sometimes we need to use the **Quadratic Formula** to find the x-intercepts.

Example 16.4.9

Graph $f(x) = 2x^2 - 4x - 3$ by using its properties.

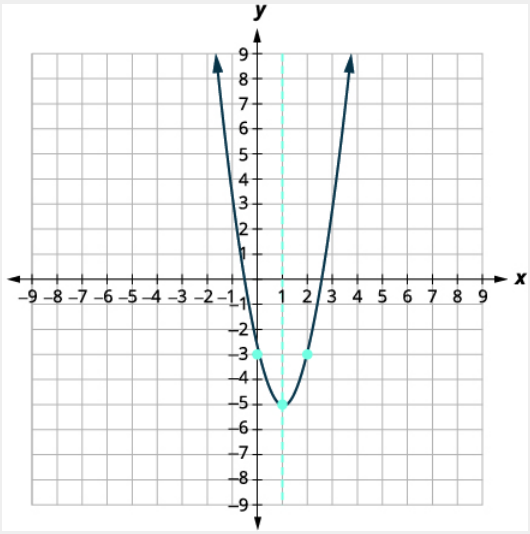
Solution:

$f(x) = ax^2 + bx + c$

$f(x) = 2x^2 - 4x - 3$

Since a is 2, the parabola opens upward.	
To find the equation of the axis of symmetry, use $x=-\frac{b}{2a}$.	$x=-\frac{b}{2a}$
	$x=-\frac{-4}{2\cdot 2}$
	$x=1$
	The equation of the axis of symmetry is $x=1$.
The vertex is on the line $x=1$.	$f(x)=2x^2-4x-3$
Find $f(1)$.	$f(x)=2(1)^2-4(1)-3$
	$f(1)=2-4-3$
	\(\f(1)=-5)
	The vertex is $(1,-5)$.
The y-intercept occurs when $x=0$.	$f(x)=2x^2-4x-3$
Find $f(0)$.	$f(0)=2(0)^2-4(0)-3$
Simplify.	$f(0)=-3$
	The y-intercept is $(0,-3)$.
The point $(0,-3)$ is one unit to the left of the line of symmetry.	Point symmetric to the y-intercept is $(2,-3)$
The point one unit to the right of the line of symmetry is $(2,3)$.	
The x-intercept occurs when $y=0$.	$f(x)=2x^2-4x-3$
Find $f(x)=0$.	$0=2x^2-4x-3$
Use the Quadratic Formula.	$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$
Substitute in the values of a, b and c.	$x=\frac{-(-4)\pm\sqrt{(-4)^2-4(2)(3)}}{2(2)}$
Simplify.	$x=\frac{-4\pm\sqrt{16+24}}{4}$
Simplify inside the radical.	$x=\frac{4\pm\sqrt{40}}{4}$
Simplify the radical.	$x=\frac{4\pm2\sqrt{10}}{4}$
Factor the GCF.	$x=\frac{2(2\pm\sqrt{10})}{4}$
Remove common factors.	$x=\frac{2\pm\sqrt{10}}{2}$
Write as two equations.	$x=\frac{2+\sqrt{10}}{2}, \quad x=\frac{2-\sqrt{10}}{2}$
Approximate the values.	$x\approx 2.5, \quad x\approx -0.6$
	The approximate values of the x-intercepts are $(2.5,0)$ and $(-0.6,0)$.

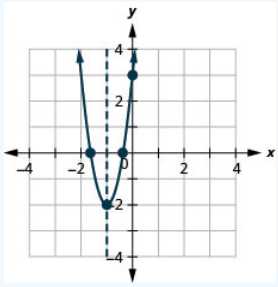
Graph the parabola using the points found.



Exercise 16.4.17

Graph $f(x) = 5x^2 + 10x + 3$ by using its properties.

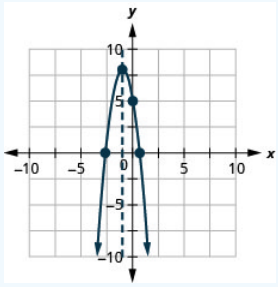
Answer



Exercise 16.4.18

Graph $f(x) = -3x^2 - 6x + 5$ by using its properties.

Answer



Solve Maximum and Minimum Applications

Knowing that the **vertex** of a parabola is the lowest or highest point of the parabola gives us an easy way to determine the minimum or maximum value of a quadratic function. The *y*-coordinate of the vertex is the **minimum** value of a parabola that opens upward. It is the **maximum** value of a parabola that opens downward. See *Figure 9.6.124*.

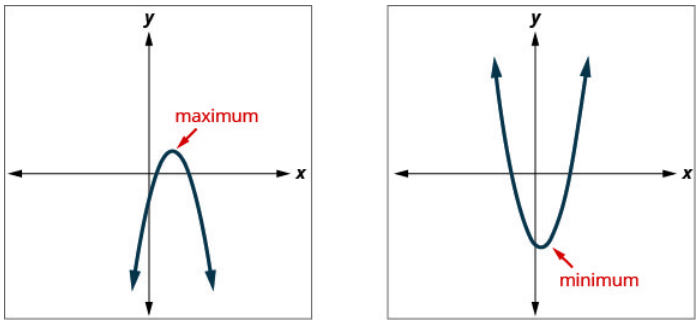


Figure 9.6.124

Minimum or Maximum Values of a Quadratic Function

The ***y*-coordinate of the vertex** of the graph of a quadratic function is the

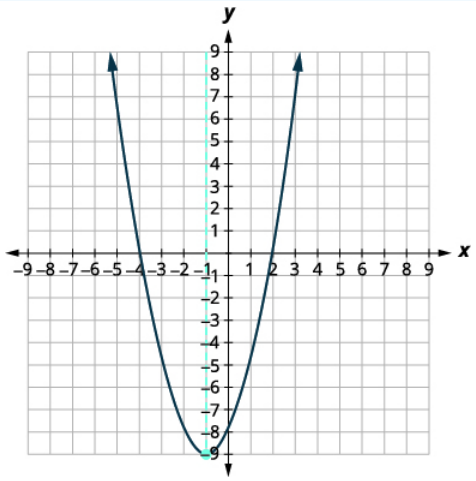
- *minimum* value of the quadratic equation if the parabola opens *upward*.
- *maximum* value of the quadratic equation if the parabola opens *downward*.

Example 16.4.10

Find the minimum or maximum value of the quadratic function $f(x) = x^2 + 2x - 8$.

Solution:

	$f(x) = x^2 + 2x - 8$
Since a is positive, the parabola opens upward. The quadratic equation has a minimum.	
Find the equation of the axis of symmetry.	$x = -\frac{b}{2a}$
	$x = -\frac{2}{2\times 1}$
	$x = -1$
	The equation of the axis of symmetry is $x = -1$.
The vertex is on the line $x = -1$.	$f(x) = x^2 + 2x - 8$
Find $f(-1)$.	$f(-1) = (-1)^2 + 2(-1) - 8$
	$f(-1) = 1 - 2 - 8$
	$f(-1) = -9$
	The vertex is $(-1, -9)$.
Since the parabola has a minimum, the y-coordinate of the vertex is the minimum y-value of the quadratic equation. The minimum value of the quadratic is -9 and it occurs when $x = -1$.	



Show the graph to verify the result.

? Exercise 16.4.19

Find the maximum or minimum value of the quadratic function $f(x) = x^2 - 8x + 12$.

Answer

The minimum value of the quadratic function is -4 and it occurs when $x = 4$.

? Exercise 16.4.20

Find the maximum or minimum value of the quadratic function $f(x) = -4x^2 + 16x - 11$.

Answer

The maximum value of the quadratic function is 5 and it occurs when $x = 2$.

We have used the formula

$$h(t) = -16t^2 + v_0 t + h_0$$

to calculate the height in feet, h, of an object shot upwards into the air with initial velocity, v_0, after t seconds .

This formula is a quadratic function, so its graph is a parabola. By solving for the coordinates of the vertex (t, h), we can find how long it will take the object to reach its maximum height. Then we can calculate the maximum height.

✓ Example 16.4.11

The quadratic equation $h(t) = -16t^2 + 176t + 4$ models the height of a volleyball hit straight upwards with velocity 176 feet per second from a height of 4 feet.

a. How many seconds will it take the volleyball to reach its maximum height?
b. Find the maximum height of the volleyball.

Solution:

$$h(t) = -16t^2 + 176t + 4$$

Since a is negative, the parabola opens downward. The quadratic function has a maximum.

a. Find the equation of the axis of symmetry.

$$t = -\frac{b}{2a}$$
$$t = -\frac{176}{2(-16)}$$
$$t = 5.5$$

The equation of the axis of symmetry is $t = 5.5$.

The vertex is on the line $t = 5.5$.

The maximum occurs when $t = 5.5$ seconds.

b. Find $h(5.5)$.

$$h(t) = -16t^2 + 176t + 4$$
$$h(t) = -16(5.5)^2 + 176(5.5) + 4$$

Use a calculator to simplify.

$$h(t) = 488$$

The vertex is $(5.5, 488)$.

Since the parabola has a maximum, the h-coordinate of the vertex is the maximum value of the quadratic function.

The maximum value of the quadratic is 488 feet and it occurs when $t = 5.5$ seconds.

After 5.5 seconds, the volleyball will reach its maximum height of 488 feet.

? Exercise 16.4.21

Solve, rounding answers to the nearest tenth.

The quadratic function $h(t) = -16t^2 + 128t + 32$ is used to find the height of a stone thrown upward from a height of 32 feet at a rate of 128 ft/sec. How long will it take for the stone to reach its maximum height? What is the maximum height?

Answer

It will take 4 seconds for the stone to reach its maximum height of 288 feet.

? Exercise 16.4.22

A path of a toy rocket thrown upward from the ground at a rate of 208 ft/sec is modeled by the quadratic function of $h(t) = -16t^2 + 208t$. When will the rocket reach its maximum height? What will be the maximum height?

Answer

It will take 6.5 seconds for the rocket to reach its maximum height of 676 feet.

Key Concepts

- Parabola Orientation
  - For the graph of the quadratic function $f(x) = ax^2 + bx + c$, if
    - $a > 0$, the parabola opens upward.
    - $a < 0$, the parabola opens downward.
- Axis of Symmetry and Vertex of a Parabola The graph of the function $f(x) = ax^2 + bx + c$ is a parabola where:
  - the axis of symmetry is the vertical line $x = -\frac{b}{2a}$.
  - the vertex is a point on the axis of symmetry, so its x-coordinate is $-\frac{b}{2a}$.
  - the y-coordinate of the vertex is found by substituting $x = -\frac{b}{2a}$ into the quadratic equation.
- Find the Intercepts of a Parabola
  - To find the intercepts of a parabola whose function is $f(x) = ax^2 + bx + c$:

- **y-intercept**
  - Let $x = 0$ and solve for $f(x)$.
- **x-intercepts**
  - Let \(f(x)=0\) and solve for x.

- How to graph a quadratic function using properties.
  1. Determine whether the parabola opens upward or downward.
  2. Find the equation of the axis of symmetry.
  3. Find the vertex.
  4. Find the y-intercept. Find the point symmetric to the *y*-intercept across the axis of symmetry.
  5. Find the x-intercepts. Find additional points if needed.
  6. Graph the parabola.
- Minimum or Maximum Values of a Quadratic Equation
  - The y-coordinate of the vertex of the graph of a quadratic equation is the
  - *minimum* value of the quadratic equation if the parabola opens *upward*.
  - *maximum* value of the quadratic equation if the parabola opens *downward*.

Glossary

quadratic function

A quadratic function, where a, b, and c are real numbers and $a \neq 0$, is a function of the form $f(x) = ax^2 + bx + c$.

16.4E: Exercises

Practice Makes Perfect

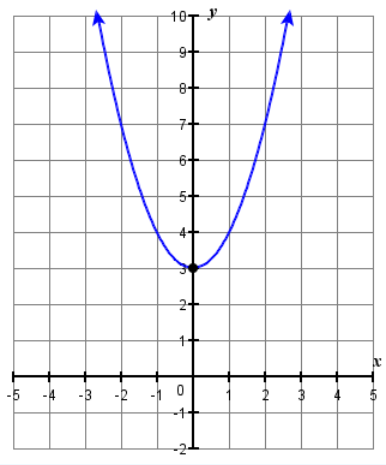
Exercises 1 - 4: Recognize the Graph of a Quadratic Function

In the following exercises, graph the functions by plotting points.

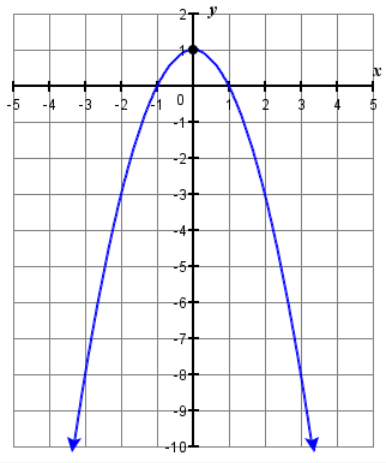
1. $f(x) = x^2 + 3$
2. $f(x) = x^2 - 3$
3. $y = -x^2 + 1$
4. $f(x) = -x^2 - 1$

Answer

1.



3.



Exercises 5 - 8: Recognize the Graph of a Quadratic Function

For each of the following exercises, determine if the parabola opens up or down.

5. a. $f(x) = -2x^2 - 6x - 7$ b. $f(x) = 6x^2 + 2x + 3$
6. a. $f(x) = 4x^2 + x - 4$ b. $f(x) = -9x^2 - 24x - 16$

https://math.libretexts.org/@go/page/46413

7. a. $f(x) = -3x^2 + 5x - 1$ b. $f(x) = 2x^2 - 4x + 5$

8. a. $f(x) = x^2 + 3x - 4$ b. $f(x) = -4x^2 - 12x - 9$

Answer

5. a. down b. up

7. a. down b. up

Exercises 9 - 12: Find the Axis of Symmetry and Vertex of a Parabola

In the following functions, find

a. The equation of the axis of symmetry
b. The vertex of its graph

9. $f(x) = x^2 + 8x - 1$

10. $f(x) = x^2 + 10x + 25$

11. $f(x) = -x^2 + 2x + 5$

12. $f(x) = -2x^2 - 8x - 3$

Answer

9. a. Axis of symmetry: $x = -4$ b. Vertex: $(-4, -17)$

11. a. Axis of symmetry: $x = 1$ b. Vertex: $(1, 2)$

Exercises 13 - 24: Find the Intercepts of a Parabola

In the following exercises, find the intercepts of the parabola whose function is given.

13. $f(x) = x^2 + 7x + 6$

14. $f(x) = x^2 + 10x - 11$

15. $f(x) = x^2 + 8x + 12$

16. $f(x) = x^2 + 5x + 6$

17. $f(x) = -x^2 + 8x - 19$

18. $f(x) = -3x^2 + x - 1$

19. $f(x) = x^2 + 6x + 13$

20. $f(x) = x^2 + 8x + 12$

21. $f(x) = 4x^2 - 20x + 25$

22. $f(x) = -x^2 - 14x - 49$

23. $f(x) = -x^2 - 6x - 9$

24. $f(x) = 4x^2 + 4x + 1$

Answer

13. y-intercept: $(0, 6)$; x-intercept(s): $(-1, 0), (-6, 0)$

15. y-intercept: $(0, 12)$; x-intercept(s): $(-2, 0), (-6, 0)$

17. y-intercept: $(0, -19)$; x-intercept(s): none

19. y-intercept: $(0, 13)$; x-intercept(s): none

21. y-intercept: $(0, -16)$; x-intercept(s): $(\frac{5}{2}, 0)$

23. y-intercept: $(0, 9)$; x-intercept(s): $(-3, 0)$

Exercises 25 - 42: Graph Quadratic Functions Using Properties

In the following exercises, graph the function by using its properties.

25. $f(x) = x^2 + 6x + 5$
26. $f(x) = x^2 + 4x - 12$
27. $f(x) = x^2 + 4x + 3$
28. $f(x) = x^2 - 6x + 8$
29. $f(x) = 9x^2 + 12x + 4$
30. $f(x) = -x^2 + 8x - 16$
31. $f(x) = -x^2 + 2x - 7$
32. $f(x) = 5x^2 + 2$
33. $f(x) = 2x^2 - 4x + 1$
34. $f(x) = 3x^2 - 6x - 1$
35. $f(x) = 2x^2 - 4x + 2$
36. $f(x) = -4x^2 - 6x - 2$
37. $f(x) = -x^2 - 4x + 2$
38. $f(x) = x^2 + 6x + 8$
39. $f(x) = 5x^2 - 10x + 8$
40. $f(x) = -16x^2 + 24x - 9$
41. $f(x) = 3x^2 + 18x + 20$
42. $f(x) = -2x^2 + 8x - 10$

Exercises 43 - 48: Solve Maximum and Minimum Applications

In the following exercises, find the maximum or minimum value of each function.

43. $f(x) = 2x^2 + x - 1$

44. $y = -4x^2 + 12x - 5$

45. $y = x^2 - 6x + 15$

46. $y = -x^2 + 4x - 5$

https://math.libretexts.org/@go/page/46413

47. $y = -9x^2 + 16$

48. $y = 4x^2 - 49$

Answer

43. The minimum value is $-\frac{9}{8}$ when $x = -\frac{1}{4}$.

45. The maximum value is 6 when $x = 3$.

47. The maximum value is 16 when $x = 0$.

Exercises 49 - 60: Solve Maximum and Minimum Applications

In the following exercises, solve. Round answers to the nearest tenth.

49. An arrow is shot vertically upward from a platform 45 feet high at a rate of 168 ft/sec. Use the quadratic function $h(t) = -16t^2 + 168t + 45$ find how long it will take the arrow to reach its maximum height, and then find the maximum height.

50. A stone is thrown vertically upward from a platform that is 20 feet height at a rate of 160 ft/sec. Use the quadratic function $h(t) = -16t^2 + 160t + 20$ to find how long it will take the stone to reach its maximum height, and then find the maximum height.

51. A ball is thrown vertically upward from the ground with an initial velocity of 109 ft/sec. Use the quadratic function $h(t) = -16t^2 + 109t + 0$ to find how long it will take for the ball to reach its maximum height, and then find the maximum height.

52. A ball is thrown vertically upward from the ground with an initial velocity of 122 ft/sec. Use the quadratic function $h(t) = -16t^2 + 122t + 0$ to find how long it will take for the ball to reach its maximum height, and then find the maximum height.

53. A computer store owner estimates that by charging x dollars each for a certain computer, he can sell $40 - x$ computers each week. The quadratic function $R(x) = -x^2 + 40x$ is used to find the revenue, R, received when the selling price of a computer is x, Find the selling price that will give him the maximum revenue, and then find the amount of the maximum revenue.

54. A retailer who sells backpacks estimates that by selling them for x dollars each, he will be able to sell $100 - x$ backpacks a month. The quadratic function $R(x) = -x^2 + 100x$ is used to find the R, received when the selling price of a backpack is x. Find the selling price that will give him the maximum revenue, and then find the amount of the maximum revenue.

55. A retailer who sells fashion boots estimates that by selling them for x dollars each, he will be able to sell $70 - x$ boots a week. Use the quadratic function $R(x) = -x^2 + 70x$ to find the revenue received when the average selling price of a pair of fashion boots is x. Find the selling price that will give him the maximum revenue, and then find the amount of the maximum revenue per day.

56. A cell phone company estimates that by charging x dollars each for a certain cell phone, they can sell $8 - x$ cell phones per day. Use the quadratic function $R(x) = -x^2 + 8x$ to find the revenue received per day when the selling price of a cell phone is x. Find the selling price that will give them the maximum revenue per day, and then find the amount of the maximum revenue.

57. A rancher is going to fence three sides of a corral next to a river. He needs to maximize the corral area using 240 feet of fencing. The quadratic equation $A(x) = x(240 - 2x)$ gives the area of the corral, A, for the length, x, of the corral along the river. Find the length of the corral along the river that will give the maximum area, and then find the maximum area of the corral.

58. A veterinarian is enclosing a rectangular outdoor running area against his building for the dogs he cares for. He needs to maximize the area using 100 feet of fencing. The quadratic function $A(x) = x(100 - 2x)$ gives the area, A, of the dog run for the length, x, of the building that will border the dog run. Find the length of the building that should border the dog run to give the maximum area, and then find the maximum area of the dog run.

59. A land owner is planning to build a fenced in rectangular patio behind his garage, using his garage as one of the "walls." He wants to maximize the area using 80 feet of fencing. The quadratic function $A(x) = x(80 - 2x)$ gives the area of the patio, where x is the width of one side. Find the maximum area of the patio.

60. A family of three young children just moved into a house with a yard that is not fenced in. The previous owner gave them 300 feet of fencing to use to enclose part of their backyard. Use the quadratic function $A(x) = x(300 - 2x)$ to determine the maximum area of the fenced in yard.

Answer

49. In 5.3 sec the arrow will reach maximum height of 486 ft.

51. In 3.4 seconds the ball will reach its maximum height of 185.6 feet.

53. 20 computers will give the maximum of $\$400$ in receipts.

55. He will be able to sell 35 pairs of boots at the maximum revenue of $\$1,225$

57. The length of the side along the river of the corral is 120 feet and the maximum area is $7,200$ square feet.

59. The maximum area of the patio is 800 feet.

? Exercises 61 - 64: Writing Exercises

61. How do the graphs of the functions $f(x) = x^2$ and $f(x) = x^2 - 1$ differ? We graphed them at the start of this section. What is the difference between their graphs? How are their graphs the same?

62. Explain the process of finding the vertex of a parabola.

63. Explain how to find the intercepts of a parabola.

64. How can you use the discriminant when you are graphing a quadratic function?

Answer

1. Answers will vary.

3. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
recognize the graph of a quadratic equation.			
find the axis of symmetry and vertex of a parabola.			
find the intercepts of a parabola.			
graph quadratic equations in two variables.			
solve maximum and minimum applications.			

Figure 9.6.145

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

16.5: Transformation of Functions

Learning Objectives

- Graph functions using vertical and horizontal shifts.
- Graph functions using reflections about the x-axis and the y-axis.
- Determine whether a function is even, odd, or neither from its graph.
- Graph functions using compressions and stretches.
- Combine transformations.

We all know that a flat mirror enables us to see an accurate image of ourselves and whatever is behind us. When we tilt the mirror, the images we see may shift horizontally or vertically. But what happens when we bend a flexible mirror? Like a carnival funhouse mirror, it presents us with a distorted image of ourselves, stretched or compressed horizontally or vertically. In a similar way, we can distort or transform mathematical functions to better adapt them to describing objects or processes in the real world. In this section, we will take a look at several kinds of transformations.

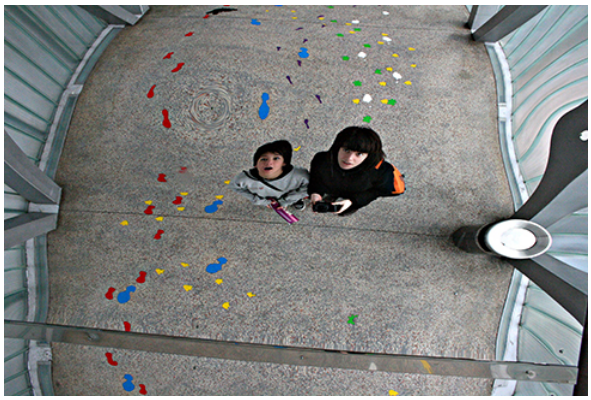

Figure 16.5.1: (credit: "Misko"/Flickr)

Often when given a problem, we try to model the scenario using mathematics in the form of words, tables, graphs, and equations. One method we can employ is to adapt the basic graphs of the toolkit functions to build new models for a given scenario. There are systematic ways to alter functions to construct appropriate models for the problems we are trying to solve.

Identifying Vertical Shifts

One simple kind of transformation involves shifting the entire graph of a function up, down, right, or left. The simplest shift is a vertical shift, moving the graph up or down, because this transformation involves adding a positive or negative constant to the function. In other words, we add the same constant to the output value of the function regardless of the input. For a function $g(x) = f(x) + k$, the function $f(x)$ is shifted vertically k units. See Figure $16.5.2$ for an example.

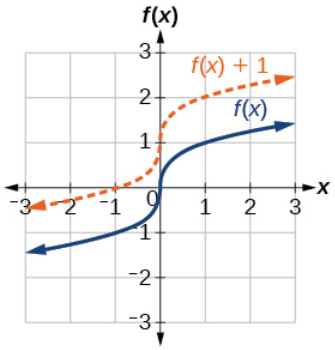

Figure 16.5.2: Vertical shift by $k = 1$ of the cube root function $f(x) = \sqrt[3]{x}$.

To help you visualize the concept of a vertical shift, consider that $y = f(x)$. Therefore, $f(x) + k$ is equivalent to $y + k$. Every unit of y is replaced by $y + k$, so the y-value increases or decreases depending on the value of k. The result is a shift upward or downward.

Definition: Vertical Shift

Given a function $f(x)$, a new function $g(x) = f(x) + k$, where k is a constant, is a **vertical shift** of the function $f(x)$. All the output values change by k units. If k is positive, the graph will shift up. If k is negative, the graph will shift down.

Example 16.5.1: Adding a Constant to a Function

To regulate temperature in a green building, airflow vents near the roof open and close throughout the day. Figure 16.5.3 shows the area of open vents V (in square feet) throughout the day in hours after midnight, t. During the summer, the facilities manager decides to try to better regulate temperature by increasing the amount of open vents by 20 square feet throughout the day and night. Sketch a graph of this new function.

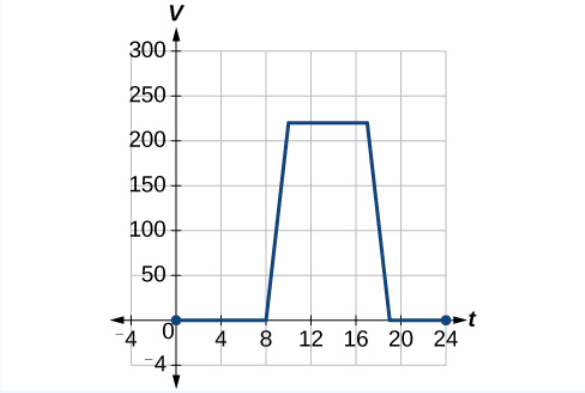

Figure 16.5.3

Solution

We can sketch a graph of this new function by adding 20 to each of the output values of the original function. This will have the effect of shifting the graph vertically up, as shown in Figure 16.5.4

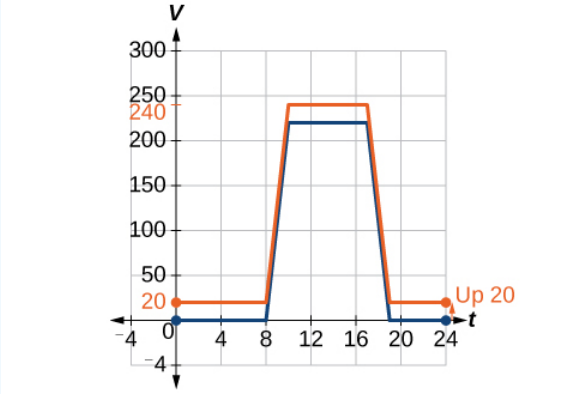

Figure 16.5.4

Notice that in Figure 16.5.4, for each input value, the output value has increased by 20, so if we call the new function $S(t)$,we could write

$$S(t) = V(t) + 20 \tag{16.5.1}$$

This notation tells us that, for any value of t,$S(t)$ can be found by evaluating the function V at the same input and then adding 20 to the result. This defines S as a transformation of the function V, in this case a vertical shift up 20 units. Notice that, with a vertical shift, the input values stay the same and only the output values change. See Table 16.5.1.

Table 16.5.1

t	0	8	10	17	19	24
$V(t)$	0	0	220	220	0	0

$S(t)$	20	20	240	240	20	20

How To...

Given a tabular function, create a new row to represent a vertical shift.

1. Identify the output row or column.
2. Determine the **magnitude** of the shift.
3. Add the shift to the value in each output cell. Add a positive value for up or a negative value for down.

Example 16.5.2: Shifting a Tabular Function Vertically

A function $f(x)$ is given in Table 16.5.2 Create a table for the function $g(x) = f(x) - 3$.

Table 16.5.2

x	2	4	6	8
$f(x)$	1	3	7	11

Solution

The formula $g(x) = f(x) - 3$ tells us that we can find the output values of g by subtracting 3 from the output values of f. For example:

$$\begin{aligned} f(x) &= 1 && \text{Given} \\ g(x) &= f(x) - 3 && \text{Given Transformation} \\ g(2) &= f(2) - 3 \\ &= 1 - 3 \\ &= -2 \end{aligned}$$

Subtracting 3 from each $f(x)$ value, we can complete a table of values for $g(x)$ as shown in Table 16.5.3

Table 16.5.3

x	2	4	6	8
$f(x)$	1	3	7	11
$g(x)$	-2	0	4	8

Analysis

As with the earlier vertical shift, notice the input values stay the same and only the output values change.

Exercise 16.5.1

The function $h(t) = -4.9t^2 + 30t$ gives the height h of a ball (in meters) thrown upward from the ground after t seconds. Suppose the ball was instead thrown from the top of a 10-m building. Relate this new height function $b(t)$ to $h(t)$, and then find a formula for $b(t)$.

Answer

$b(t) = h(t) + 10 = -4.9t^2 + 30t + 10$

Identifying Horizontal Shifts

We just saw that the vertical shift is a change to the output, or outside, of the function. We will now look at how changes to input, on the inside of the function, change its graph and meaning. A shift to the input results in a movement of the graph of the function

left or right in what is known as a **horizontal shift**, shown in Figure 16.5.4

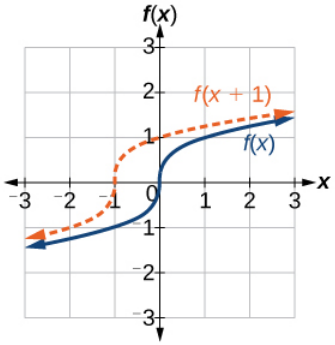

Figure 16.5.4: Horizontal shift of the function $f(x) = \sqrt[3]{x}$. Note that $h = -1$ shifts the graph to the left, that is, towards negative values of x.

For example, if $f(x) = x^2$, then $g(x) = (x-2)^2$ is a new function. Each input is reduced by 2 prior to squaring the function. The result is that the graph is shifted 2 units to the right, because we would need to increase the prior input by 2 units to yield the same output value as given in f.

Definition: Horizontal Shift

Given a function f, a new function $g(x) = f(x-h)$, where h is a constant, is a **horizontal shift** of the function f. If h is positive, the graph will shift right. If h is negative, the graph will shift left.

Example 16.5.4: Adding a Constant to an Input

Returning to our building airflow example from Figure 16.5.2, suppose that in autumn the facilities manager decides that the original venting plan starts too late, and wants to begin the entire venting program 2 hours earlier. Sketch a graph of the new function.

Solution

We can set $V(t)$ to be the original program and $F(t)$ to be the revised program.

$$V(t) = \text{ the original venting plan}$$

$$F(t) = \text{ starting 2 hrs sooner}$$

In the new graph, at each time, the airflow is the same as the original function V was 2 hours later. For example, in the original function V, the airflow starts to change at 8 a.m., whereas for the function F, the airflow starts to change at 6 a.m. The comparable function values are $V(8) = F(6)$. See Figure 16.5.5. Notice also that the vents first opened to 220ft^2 at 10 a.m. under the original plan, while under the new plan the vents reach 220ft^2 at 8 a.m., so $V(10) = F(8)$.

In both cases, we see that, because $F(t)$ starts 2 hours sooner, $h = -2$. That means that the same output values are reached when $F(t) = V(t-(-2)) = V(t+2)$.

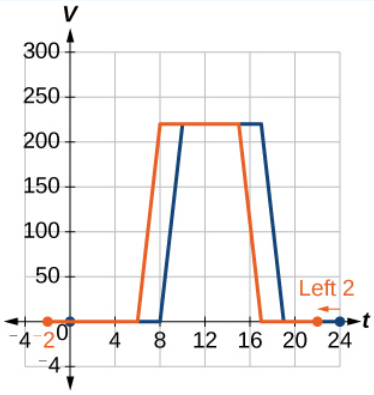

Figure 16.5.5

Analysis

Note that $V(t+2)$ has the effect of shifting the graph to the left.

Horizontal changes or "inside changes" affect the domain of a function (the input) instead of the range and often seem counterintuitive. The new function $F(t)$ uses the same outputs as $V(t)$, but matches those outputs to inputs 2 hours earlier than those of $V(t)$. Said another way, we must add 2 hours to the input of V to find the corresponding output for F : $F(t) = V(t+2)$.

How To...

Given a tabular function, create a new row to represent a horizontal shift.

1. Identify the input row or column.
2. Determine the magnitude of the shift.
3. Add the shift to the value in each input cell.

Example 16.5.5: Shifting a Tabular Function Horizontally

A function $f(x)$ is given in Table 16.5.4 Create a table for the function $g(x) = f(x-3)$.

Table 16.5.4

x	2	4	6	8
$f(x)$	1	3	7	11

Solution

The formula $g(x) = f(x-3)$ tells us that the output values of g are the same as the output value of f when the input value is 3 less than the original value. For example, we know that $f(2) = 1$. To get the same output from the function g, we will need an input value that is 3 larger. We input a value that is 3 larger for $g(x)$ because the function takes 3 away before evaluating the function f.

$$\begin{aligned} g(5) &= f(5-3) \\ &= f(2) \\ &= 1 \end{aligned}$$

We continue with the other values to create Table 16.5.5

Table 16.5.5

x	5	7	9	11
$x-3$	2	4	6	8
$f(x)$	1	3	7	11
$g(x)$	1	3	7	11

The result is that the function $g(x)$ has been shifted to the right by 3. Notice the output values for $g(x)$ remain the same as the output values for $f(x)$, but the corresponding input values, x, have shifted to the right by 3. Specifically, 2 shifted to 5, 4 shifted to 7, 6 shifted to 9, and 8 shifted to 11.

Analysis

Figure 16.5.6represents both of the functions. We can see the horizontal shift in each point.

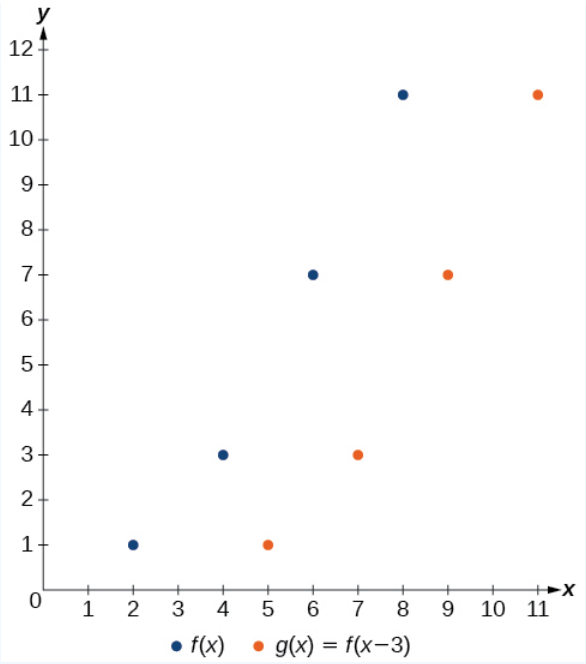

Figure 16.5.6: Graph of the points from the previous table for $f(x)$ and $g(x) = f(x-3)$

Example 16.5.6: Identifying a Horizontal Shift of a Toolkit Function

Figure 16.5.7 represents a transformation of the toolkit function $f(x) = x^2$. Relate this new function $g(x)$ to $f(x)$, and then find a formula for $g(x)$.

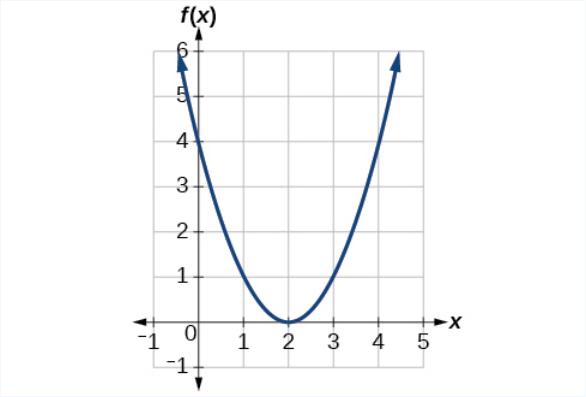

Figure 16.5.7: Graph of a parabola

Solution

Notice that the graph is identical in shape to the $f(x) = x^2$ function, but the x-values are shifted to the right 2 units. The vertex used to be at $(0, 0)$, but now the vertex is at $(2, 0)$. The graph is the basic quadratic function shifted 2 units to the right, so

$$g(x) = f(x-2)$$

Notice how we must input the value $x = 2$ to get the output value $y = 0$; the x-values must be 2 units larger because of the shift to the right by 2 units. We can then use the definition of the $f(x)$ function to write a formula for $g(x)$ by evaluating $f(x-2)$.

$$\begin{aligned} f(x) &= x^2 \\ g(x) &= f(x-2) \\ g(x) &= f(x-2) = (x-2)^2 \end{aligned}$$

Analysis

To determine whether the shift is $+2$ or -2, consider a single reference point on the graph. For a quadratic, looking at the vertex point is convenient. In the original function, $f(0)=0$. In our shifted function, $g(2)=0$. To obtain the output value of 0 from the function f, we need to decide whether a plus or a minus sign will work to satisfy $g(2)=f(x-2)=f(0)=0$. For this to work, we will need to subtract 2 units from our input values.

Example 16.5.7: Interpreting Horizontal versus Vertical Shifts

The function $G(m)$ gives the number of gallons of gas required to drive m miles. Interpret $G(m)+10$ and $G(m+10)$

Solution

$G(m)+10$ can be interpreted as adding 10 to the output, gallons. This is the gas required to drive m miles, plus another 10 gallons of gas. The graph would indicate a vertical shift.

$G(m+10)$ can be interpreted as adding 10 to the input, miles. So this is the number of gallons of gas required to drive 10 miles more than m miles. The graph would indicate a horizontal shift.

Exercise 16.5.7

Given the function $f(x)=\sqrt{x}$, graph the original function $f(x)$ and the transformation $g(x)=f(x+2)$ on the same axes. Is this a horizontal or a vertical shift? Which way is the graph shifted and by how many units?

Answer

The graphs of $f(x)$ and $g(x)$ are shown below. The transformation is a horizontal shift. The function is shifted to the left by 2 units.

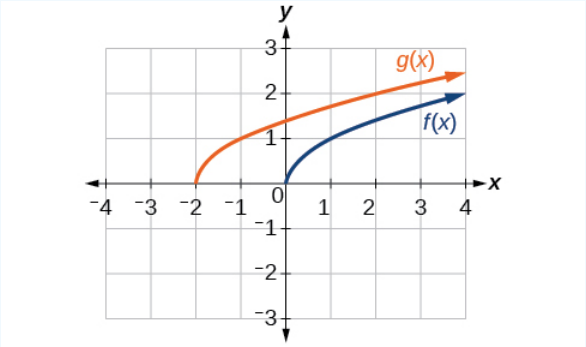

Figure 16.5.8

Combining Vertical and Horizontal Shifts

Now that we have two transformations, we can combine them together. Vertical shifts are outside changes that affect the output $(y-)$ axis values and shift the function up or down. Horizontal shifts are inside changes that affect the input $(x-)$ axis values and shift the function left or right. Combining the two types of shifts will cause the graph of a function to shift up or down and right or left.

How To...

Given a function and both a vertical and a horizontal shift, sketch the graph.

1. Identify the vertical and horizontal shifts from the formula.
2. The vertical shift results from a constant added to the output. Move the graph up for a positive constant and down for a negative constant.
3. The horizontal shift results from a constant added to the input. Move the graph left for a positive constant and right for a negative constant.
4. Apply the shifts to the graph in either order.

Example 16.5.8: Graphing Combined Vertical and Horizontal Shifts

Given $f(x)=|x|$, sketch a graph of $h(x)=f(x+1)-3$.

Solution

The function f is our toolkit absolute value function. We know that this graph has a V shape, with the point at the origin. The graph of h has transformed f in two ways: $f(x+1)$ is a change on the inside of the function, giving a horizontal shift left by 1, and the subtraction by 3 in $f(x+1)-3$ is a change to the outside of the function, giving a vertical shift down by 3. The transformation of the graph is illustrated in Figure 16.5.9.

Let us follow one point of the graph of $f(x)=|x|$.

- The point $(0,0)$ is transformed first by shifting left 1 unit:$(0,0)\rightarrow(-1,0)$
- The point $(-1,0)$ is transformed next by shifting down 3 units:$(-1,0)\rightarrow(-1,-3)$

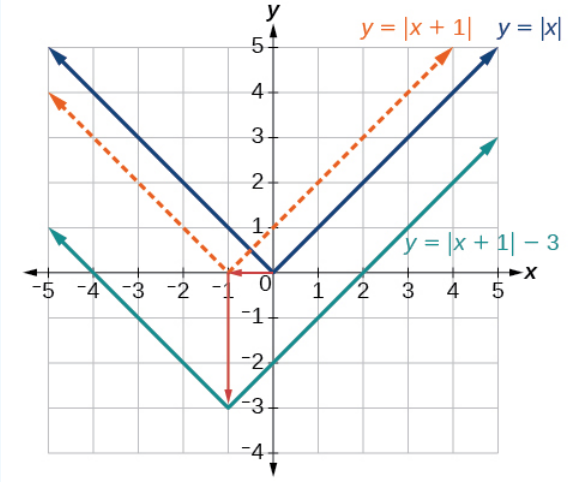

Figure 16.5.9: Graph of an absolute function, $y=|x|$, and how it was transformed to $y=|x+1|-3$

Figure 16.5.10shows the graph of h.

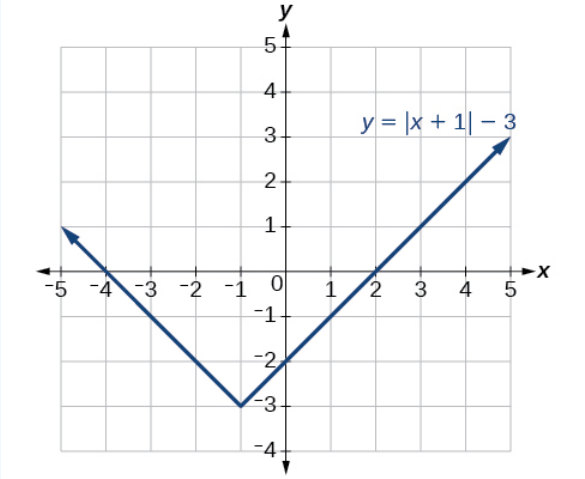

Figure 16.5.10: The final function $y=|x+1|-3$.

Exercise 16.5.8

Given $f(x)=|x|$, sketch a graph of $h(x)=f(x-2)+4$.

Answer

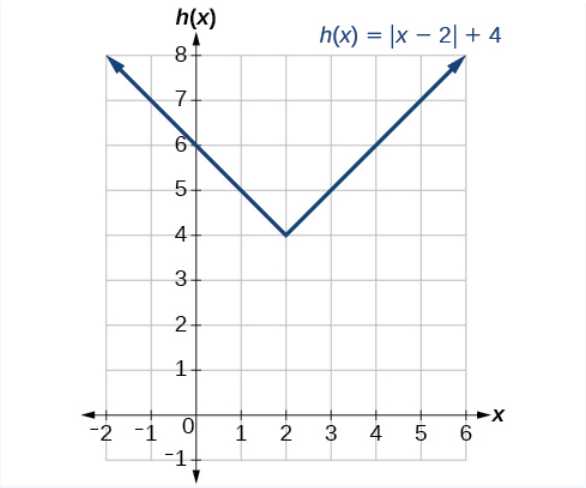

Figure 16.5.11

Example 16.5.9: Identifying Combined Vertical and Horizontal Shifts

Write a formula for the graph shown in Figure 16.5.12 which is a transformation of the toolkit square root function.

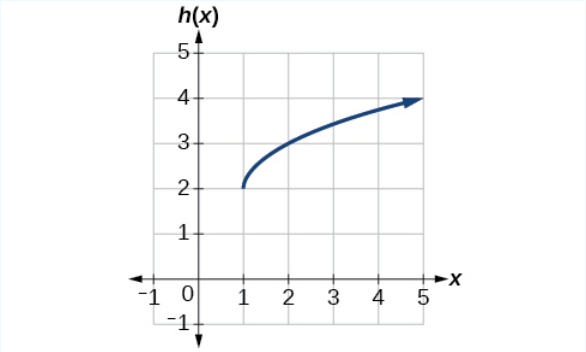

Figure 16.5.12: Graph of a square root function transposed right one unit and up 2.

Solution

The graph of the toolkit function starts at the origin, so this graph has been shifted 1 to the right and up 2. In function notation, we could write that as

$$h(x) = f(x-1)+2$$

Using the formula for the square root function, we can write

$$h(x) = \sqrt{x-1}+2$$

Analysis

Note that this transformation has changed the domain and range of the function. This new graph has domain $[1, \infty)$ and range $[2, \infty)$.

Exercise 16.5.9

Write a formula for a transformation of the toolkit reciprocal function $f(x) = \frac{1}{x}$ that shifts the function's graph one unit to the right and one unit up.

Answer

$$g(x) = \frac{1}{x-1}+1$$

Graphing Functions Using Reflections about the Axes

Another transformation that can be applied to a function is a reflection over the x- or y-axis. A **vertical reflection** reflects a graph vertically across the x-axis, while a **horizontal reflection** reflects a graph horizontally across the y-axis. The reflections are shown in Figure 16.5.13

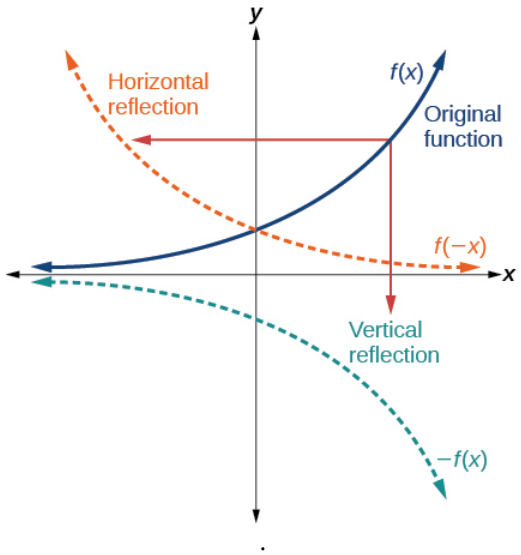

Figure 16.5.13: Graph of the vertical and horizontal reflection of a function.

Notice that the vertical reflection produces a new graph that is a mirror image of the base or original graph about the x-axis. The horizontal reflection produces a new graph that is a mirror image of the base or original graph about the y-axis.

Definitions: Reflections

Given a function $f(x)$, a new function $g(x) = -f(x)$ is a **vertical reflection** of the function $f(x)$, sometimes called a reflection about (or over, or through) the x-axis.

Given a function $f(x)$, a new function $g(x) = f(-x)$ is a **horizontal reflection** of the function $f(x)$, sometimes called a reflection about the y-axis.

How To...

Given a function, reflect the graph both vertically and horizontally.

1. Multiply all outputs by –1 for a vertical reflection. The new graph is a reflection of the original graph about the x-axis.
2. Multiply all inputs by –1 for a horizontal reflection. The new graph is a reflection of the original graph about the y-axis.

Example 16.5.10: Reflecting a Graph Horizontally and Vertically

Reflect the graph of $s(t) = \sqrt{t}$ (a) vertically and (b) horizontally.

Solution

a. Reflecting the graph vertically means that each output value will be reflected over the horizontal t-axis as shown in Figure 16.5.14

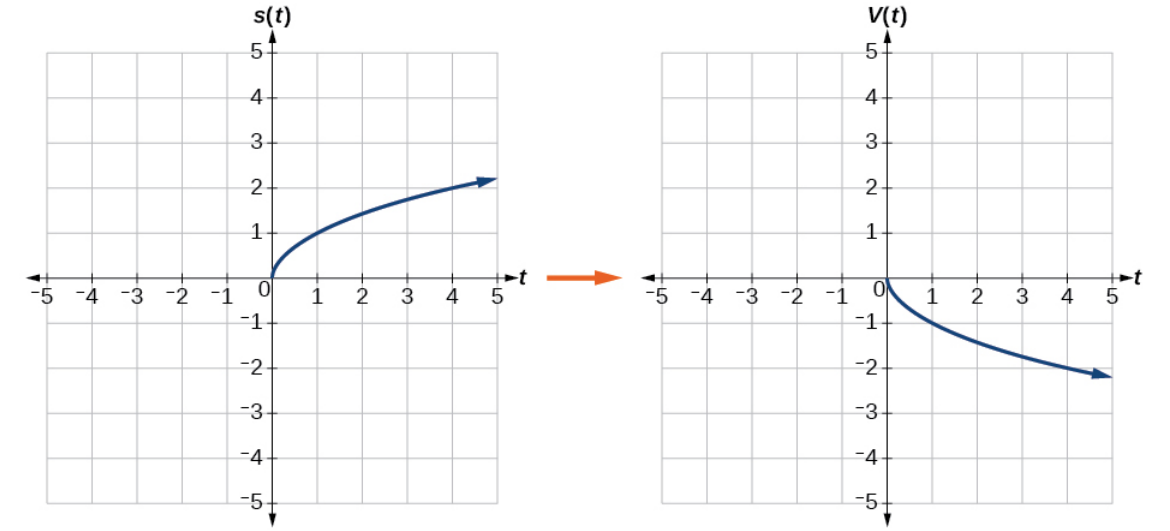

Figure 16.5.14: Graph of the vertical reflection of the square root function.

Because each output value is the opposite of the original output value, we can write

$$V(t) = -s(t) \text{ or } V(t) = -\sqrt{t}$$

Notice that this is an outside change, or vertical shift, that affects the output $s(t)$ values, so the negative sign belongs outside of the function.

b. Reflecting horizontally means that each input value will be reflected over the vertical axis as shown in Figure 16.5.15

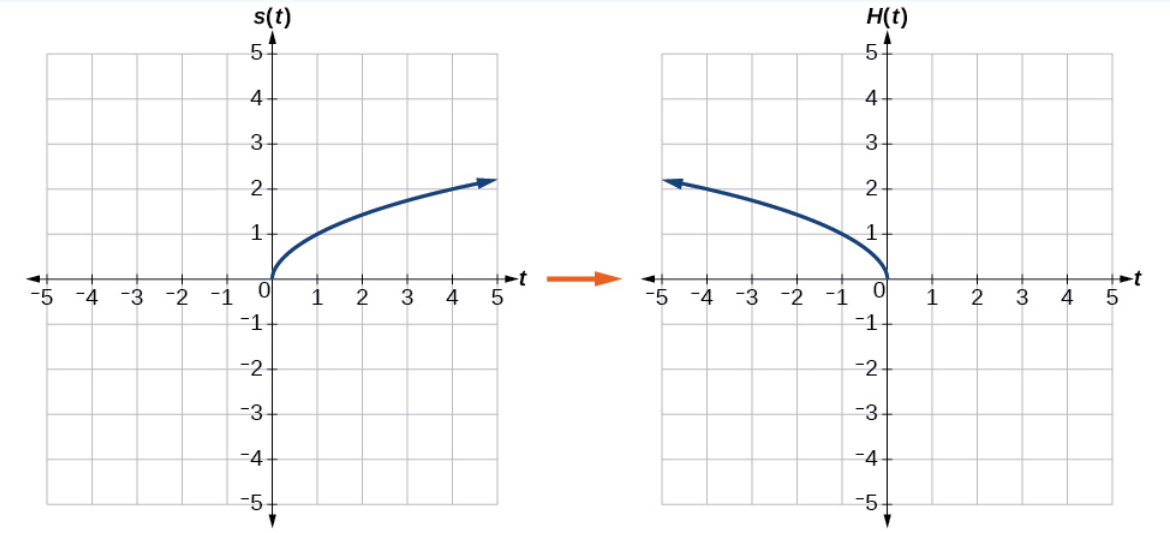

Figure 16.5.15: Horizontal reflection of the square root function

Because each input value is the opposite of the original input value, we can write

$$H(t) = s(-t) \text{ or } H(t) = \sqrt{-t}$$

Notice that this is an inside change or horizontal change that affects the input values, so the negative sign is on the inside of the function.

Note that these transformations can affect the domain and range of the functions. While the original square root function has domain $[0, \infty)$ and range $[0, \infty)$, the vertical reflection gives the $V(t)$ function the range $(-\infty, 0]$ and the horizontal reflection gives the $H(t)$ function the domain $(-\infty, 0]$.

Exercise 16.5.5

Reflect the graph of $f(x) = |x - 1|$ (a) vertically and (b) horizontally.

Answer

a.

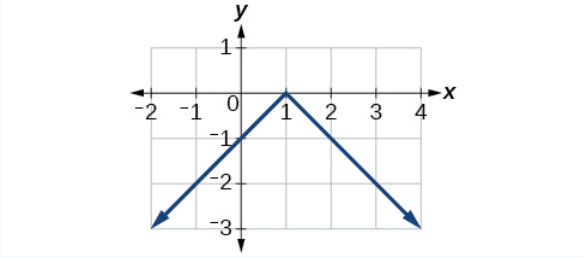

Figure 16.5.16: Graph of a vertically reflected absolute function.

b.

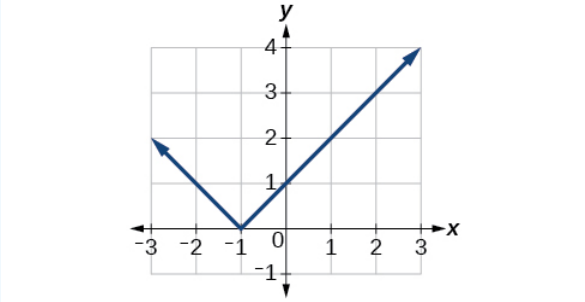

Figure 16.5.17: Graph of an absolute function translated one unit left.

Example 16.5.11: Reflecting a Tabular Function Horizontally and Vertically

A function $f(x)$ is given as Table 16.5.6. Create a table for the functions below.

a. $g(x) = -f(x)$
b. $h(x) = f(-x)$

Table 16.5.6

x	2	4	6	8
$f(x)$	1	3	7	11

a. For $g(x)$, the negative sign outside the function indicates a vertical reflection, so the x-values stay the same and each output value will be the opposite of the original output value. See Table 16.5.7.

Table 16.5.7

x	2	4	6	8
$g(x)$	-1	-3	-7	-11

b. For $h(x)$, the negative sign inside the function indicates a horizontal reflection, so each input value will be the opposite of the original input value and the $h(x)$ values stay the same as the $f(x)$ values. See Table 16.5.8

Table 16.5.8

x	-2	-4	-6	-8

Exercise 16.5.6

A function $f(x)$ is given as Table 16.5.9 Create a table for the functions below.

a. $g(x) = -f(x)$
b. $h(x) = f(-x)$

Table 16.5.9

x	-2	0	2	4
$f(x)$	5	10	15	20

Answer

a. $g(x) = -f(x)$

Table 16.5.10

x	-2	0	2	4
$g(x)$	-5	-10	-15	-20

b. $h(x) = f(-x)$

x	-2	0	2	-4
$h(x)$	15	10	5	20

Example 16.5.12: Applying a Learning Model Equation

A common model for learning has an equation similar to $k(t) = -2^{-t} + 1$, where k is the percentage of mastery that can be achieved after t practice sessions. This is a transformation of the function $f(t) = 2^t$ shown in Figure 16.5.18 Sketch a graph of $k(t)$.

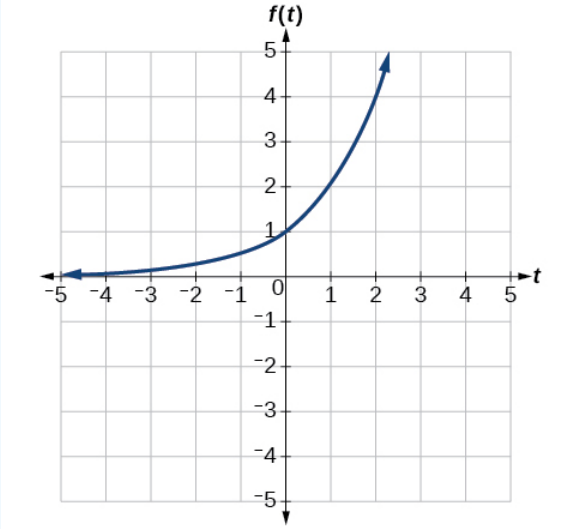

Figure 16.5.18: Graph of $k(t)$

Solution

This equation combines three transformations into one equation.

- A horizontal reflection: $f(-t) = 2^{-t}$

- A vertical reflection: $-f(-t) = -2^{-t}$
- A vertical shift: $-f(-t)+1 = -2^{-t}+1$

We can sketch a graph by applying these transformations one at a time to the original function. Let us follow two points through each of the three transformations. We will choose the points $(0, 1)$ and $(1, 2)$.

- First, we apply a horizontal reflection: $(0, 1)$ $(-1, 2)$.
- Then, we apply a vertical reflection: $(0, -1)$ $(-1, -2)$.
- Finally, we apply a vertical shift: $(0, 0)$ $(-1, -1)$.

This means that the original points, $(0, 1)$ and $(1, 2)$ become $(0, 0)$ and $(-1, -1)$ after we apply the transformations.

In Figure 16.5.19, the first graph results from a horizontal reflection. The second results from a vertical reflection. The third results from a vertical shift up 1 unit.

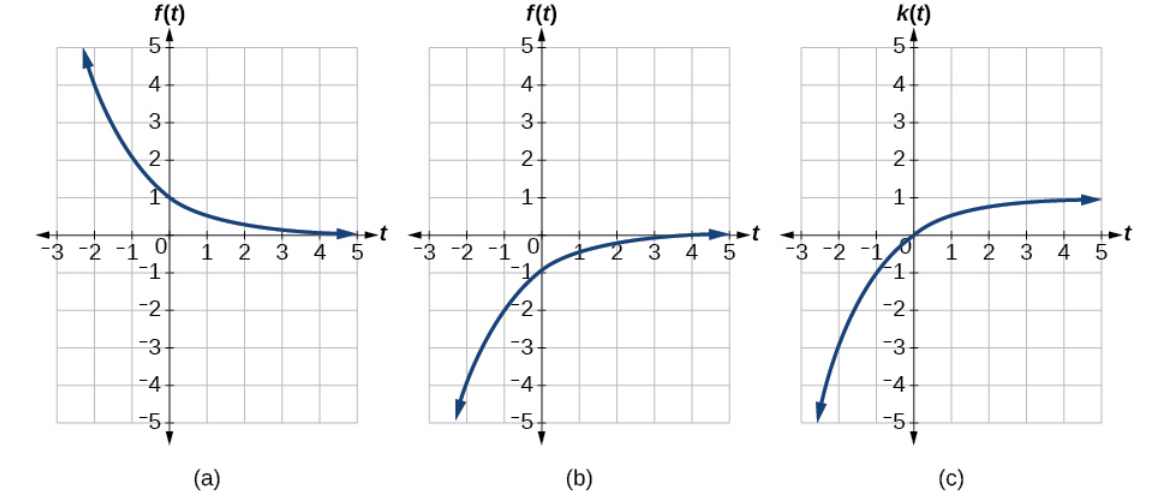

Figure 16.5.19: Graphs of all the transformations.

Analysis

As a model for learning, this function would be limited to a domain of $t \geq 0$, with corresponding range $[0, 1)$.

Exercise 16.5.7

Given the toolkit function $f(x) = x^2$, graph $g(x) = -f(x)$ and $h(x) = f(-x)$. Take note of any surprising behavior for these functions.

Answer

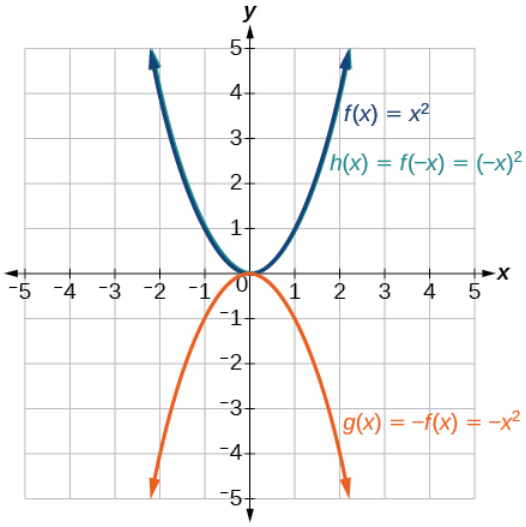

Figure 16.5.20: Graph of x^2 and its reflections.

Notice: $g(x) = f(-x)$ looks the same as $f(x)$.

Determining Even and Odd Functions

Some functions exhibit symmetry so that reflections result in the original graph. For example, horizontally reflecting the toolkit functions $f(x) = x^2$ or $f(x) = |x|$ will result in the original graph. We say that these types of graphs are symmetric about the y-axis. Functions whose graphs are symmetric about the y-axis are called **even functions**.

If the graphs of $f(x) = x^3$ or $f(x) = \frac{1}{x}$ were reflected over both axes, the result would be the original graph, as shown in Figure 16.5.21

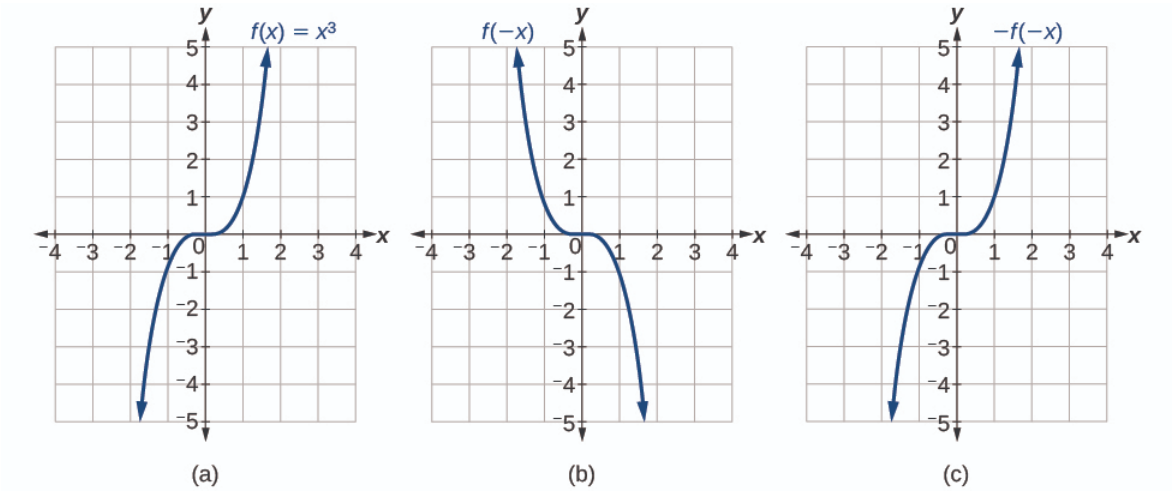

Figure 16.5.21: (a) The cubic toolkit function (b) Horizontal reflection of the cubic toolkit function (c) Horizontal and vertical reflections reproduce the original cubic function.

We say that these graphs are symmetric about the origin. A function with a graph that is symmetric about the origin is called an **odd function**.

Note: A function can be neither even nor odd if it does not exhibit either symmetry. For example, $f(x) = 2^x$ is neither even nor odd. Also, the only function that is both even and odd is the constant function $f(x) = 0$.

Definitions: Even and Odd Functions

A function is called an **even function** if for every input x

$f(x) = f(-x)$

The graph of an even function is symmetric about the y-axis.

A function is called an **odd function** if for every input x

$f(x) = -f(-x)$

The graph of an odd function is symmetric about the origin.

How To...

Given the formula for a function, determine if the function is even, odd, or neither.

1. Determine whether the function satisfies $f(x) = f(-x)$. If it does, it is even.
2. Determine whether the function satisfies $f(x) = -f(-x)$. If it does, it is odd.
3. If the function does not satisfy either rule, it is neither even nor odd.

Example 16.5.13: Determining whether a Function Is Even, Odd, or Neither

Is the function $f(x) = x^3 + 2x$ even, odd, or neither?

Solution

Without looking at a graph, we can determine whether the function is even or odd by finding formulas for the reflections and determining if they return us to the original function. Let's begin with the rule for even functions.

$$f(-x) = (-x)^3 + 2(-x) = -x^3 - 2x$$

This does not return us to the original function, so this function is not even. We can now test the rule for odd functions.

$$-f(-x) = -(-x^3 - 2x) = x^3 + 2x$$

Because $-f(-x) = f(x)$, this is an odd function.

Analysis

Consider the graph of f in Figure 16.5.22 Notice that the graph is symmetric about the origin. For every point (x, y) on the graph, the corresponding point $(-x, -y)$ is also on the graph. For example, $(1, 3)$ is on the graph of f, and the corresponding point $(-1, -3)$ is also on the graph.

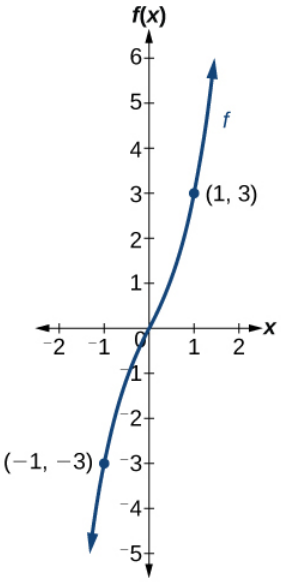

Figure 16.5.22: Graph of $f(x)$ with labeled points at $(1, 3)$ and $(-1, -3)$.

Exercise 16.5.8

Is the function $f(s) = s^4 + 3s^2 + 7$ even, odd, or neither?

Answer

even

Graphing Functions Using Stretches and Compressions

Adding a constant to the inputs or outputs of a function changed the position of a graph with respect to the axes, but it did not affect the shape of a graph. We now explore the effects of multiplying the inputs or outputs by some quantity.

We can transform the inside (input values) of a function or we can transform the outside (output values) of a function. Each change has a specific effect that can be seen graphically.

Vertical Stretches and Compressions

When we multiply a function by a positive constant, we get a function whose graph is stretched or compressed vertically in relation to the graph of the original function. If the constant is greater than 1, we get a **vertical stretch**; if the constant is between 0 and 1, we get a **vertical compression**. Figure 16.5.23shows a function multiplied by constant factors 2 and 0.5 and the resulting vertical stretch and compression.

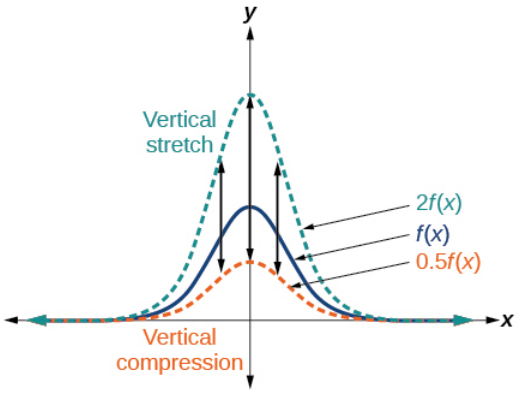

Figure 16.5.23: Vertical stretch and compression

Definitions: Vertical Stretches and Compressions

Given a function $f(x)$, a new function $g(x) = af(x)$, where a is a constant, is a **vertical stretch** or **vertical compression** of the function $f(x)$.

- If $a > 1$, then the graph will be stretched.
- If $0 < a < 1$, then the graph will be compressed.
- If $a < 0$, then there will be combination of a vertical stretch or compression with a vertical reflection.

How To...

Given a function, graph its vertical stretch.

a. Identify the value of a.
b. Multiply all range values by a
c. If $a > 1$, the graph is stretched by a factor of a.
d. If $0 < a < 1$, the graph is compressed by a factor of a.
e. If $a < 0$, the graph is either stretched or compressed and also reflected about the x-axis.

Example 1.5.14: Graphing a Vertical Stretch

A function $P(t)$ models the population of fruit flies. The graph is shown in Figure $16.5.24$

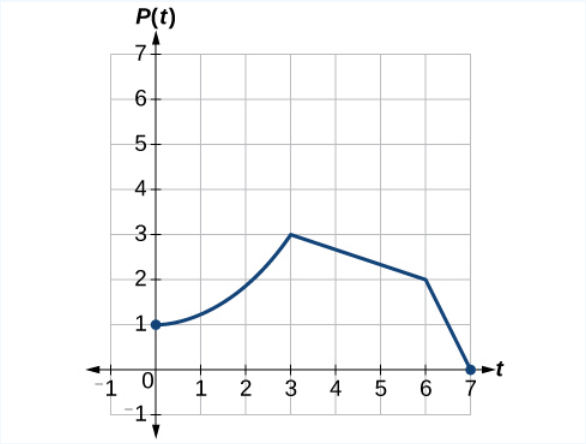

Figure 16.5.24: Graph to represent the growth of the population of fruit flies.

A scientist is comparing this population to another population, Q, whose growth follows the same pattern, but is twice as large. Sketch a graph of this population.

Solution

Because the population is always twice as large, the new population's output values are always twice the original function's output values. Graphically, this is shown in Figure $16.5.25$

If we choose four reference points, $(0, 1)$, $(3, 3)$, $(6, 2)$ and $(7, 0)$ we will multiply all of the outputs by 2.

The following shows where the new points for the new graph will be located.

$$(0, 1) \to (0, 2) \tag{16.5.2}$$
$$(3, 3) \to (3, 6) \tag{16.5.3}$$
$$(6, 2) \to (6, 4) \tag{16.5.4}$$
$$(7, 0) \to (7, 0) \tag{16.5.5}$$

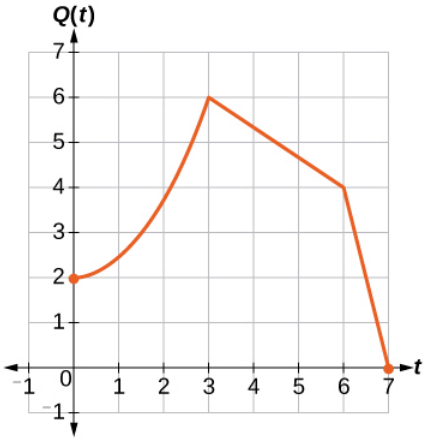

Figure 16.5.25: Graph of the population function doubled.

Symbolically, the relationship is written as

$$Q(t) = 2P(t)$$

This means that for any input t, the value of the function Q is twice the value of the function P. Notice that the effect on the graph is a vertical stretching of the graph, where every point doubles its distance from the horizontal axis. The input values, t, stay the same while the output values are twice as large as before.

How To...

Given a tabular function and assuming that the transformation is a vertical stretch or compression, create a table for a vertical compression.

1. Determine the value of a.
2. Multiply all of the output values by a.

Example 16.5.15: Finding a Vertical Compression of a Tabular Function

A function f is given as Table 16.5.12 Create a table for the function $g(x) = \frac{1}{2}f(x)$.

Table 16.5.12

x	2	4	6	8
$f(x)$	1	3	7	11

Solution

The formula $g(x) = \frac{1}{2}f(x)$ tells us that the output values of g are half of the output values of f with the same inputs. For example, we know that $f(4) = 3$. Then

$$g(4) = \frac{1}{2}f(4) = \frac{1}{2}(3) = \frac{3}{2}$$

We do the same for the other values to produce Table 16.5.13

Table 16.5.13

x	2	4	6	8
$g(x)$	$\frac{1}{2}$	$\frac{3}{2}$	$\frac{7}{2}$	$\frac{11}{2}$

Analysis

The result is that the function $g(x)$ has been compressed vertically by $\frac{1}{2}$. Each output value is divided in half, so the graph is half the original height.

Exercise 16.5.9

A function f is given as Table 16.5.14 Create a table for the function $g(x) = \frac{3}{4}f(x)$.

Table 16.5.14

x	2	4	6	8
$f(x)$	12	16	20	0

Answer

Table 16.5.15

x	2	4	6	8
$g(x)$	9	12	15	0

Example 16.5.16: Recognizing a Vertical Stretch

The graph in Figure 16.5.26is a transformation of the toolkit function $f(x) = x^3$. Relate this new function $g(x)$ to $f(x)$, and then find a formula for $g(x)$.

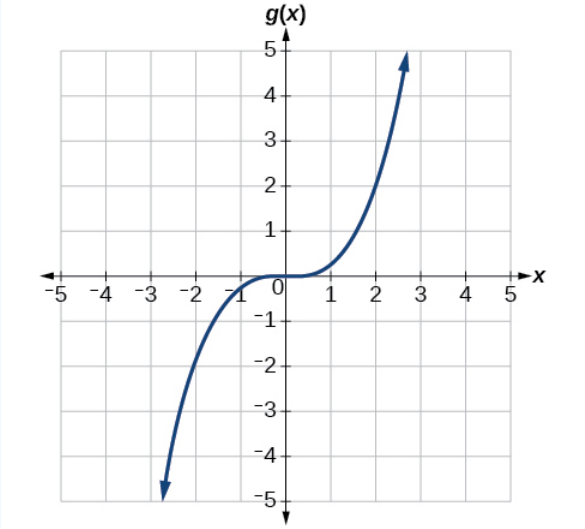

Figure 16.5.26: Graph of a transformation of $f(x) = x^3$

When trying to determine a vertical stretch or shift, it is helpful to look for a point on the graph that is relatively clear. In this graph, it appears that $g(2) = 2$. With the basic cubic function at the same input, $f(2) = 2^3 = 8$. Based on that, it appears that the outputs of g are $\frac{1}{4}$ the outputs of the function f because $g(2) = \frac{1}{4}f(2)$. From this we can fairly safely conclude that $g(x) = \frac{1}{4}f(x)$.

We can write a formula for g by using the definition of the function f.

$$g(x) = \frac{1}{4}f(x) = \frac{1}{4}x^3. \tag{16.5.6}$$

Exercise 16.5.1

Write the formula for the function that we get when we stretch the identity toolkit function by a factor of 3, and then shift it down by 2 units.

Answer

$g(x) = 3x - 2$

Horizontal Stretches and Compressions

Now we consider changes to the inside of a function. When we multiply a function's input by a positive constant, we get a function whose graph is stretched or compressed horizontally in relation to the graph of the original function. If the constant is between 0 and 1, we get a **horizontal stretch**; if the constant is greater than 1, we get a **horizontal compression** of the function.

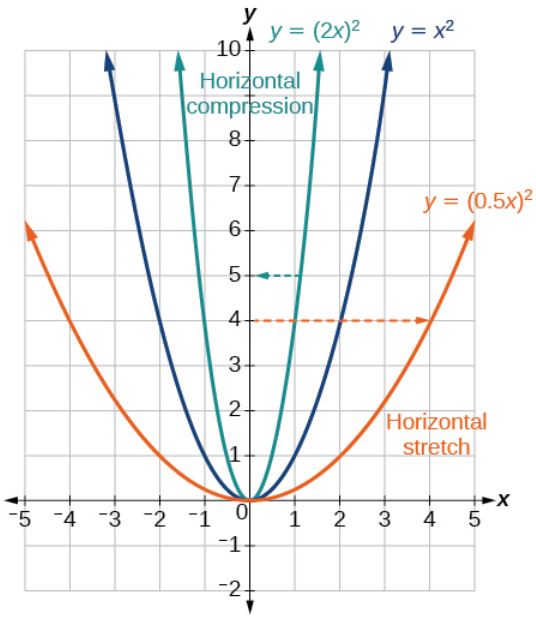

Figure 16.5.27: Graph of the vertical stretch and compression of x^2.

Given a function $y = f(x)$, the form $y = f(bx)$ results in a horizontal stretch or compression. Consider the function $y = x^2$. Observe Figure 16.5.27. The graph of $y = (0.5x)^2$ is a horizontal stretch of the graph of the function $y = x^2$ by a factor of 2. The graph of $y = (2x)^2$ is a horizontal compression of the graph of the function $y = x^2$ by a factor of 2.

Definitions: Horizontal Stretches and Compressions

Given a function $f(x)$, a new function $g(x) = f(bx)$, where b is a constant, is a **horizontal stretch** or **horizontal compression** of the function $f(x)$.

- If $b > 1$, then the graph will be compressed by $\frac{1}{b}$.
- If $0 < b < 1$, then the graph will be stretched by $\frac{1}{b}$.
- If $b < 0$, then there will be combination of a horizontal stretch or compression with a horizontal reflection.

How To...

Given a description of a function, sketch a horizontal compression or stretch.

1. Write a formula to represent the function.
2. Set $g(x) = f(bx)$ where $b > 1$ for a compression or $0 < b < 1$ for a stretch.

Example 16.5.17: Graphing a Horizontal Compression

Suppose a scientist is comparing a population of fruit flies to a population that progresses through its lifespan twice as fast as the original population. In other words, this new population, R, will progress in 1 hour the same amount as the original population does in 2 hours, and in 2 hours, it will progress as much as the original population does in 4 hours. Sketch a graph of this population.

Solution

Symbolically, we could write

$$R(1) = P(2), \tag{16.5.7}$$
$$R(2) = P(4), \quad \text{and in general,} \tag{16.5.8}$$
$$R(t) = P(2t). \tag{16.5.9}$$

See Figure 16.5.28for a graphical comparison of the original population and the compressed population.

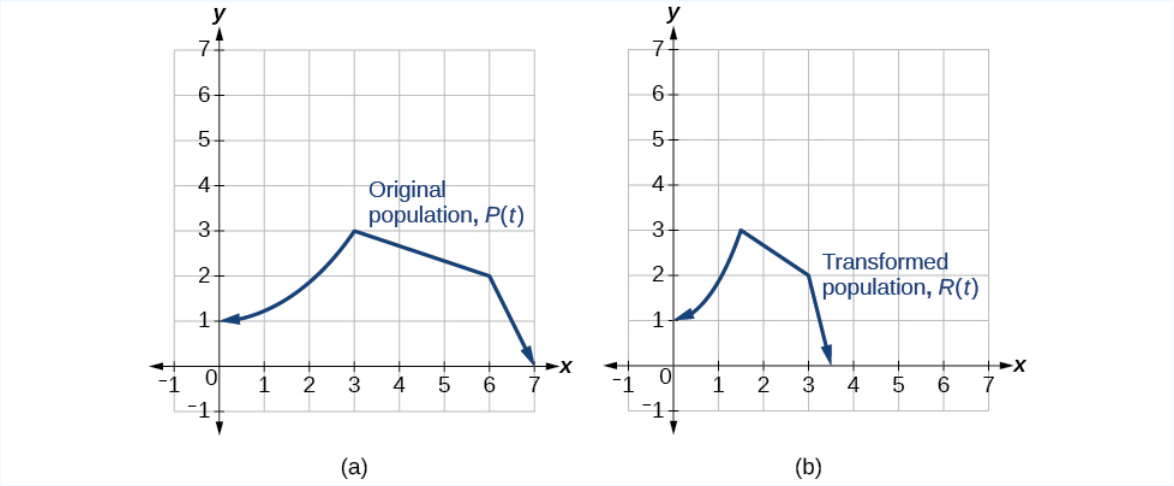

Figure 16.5.28: (a) Original population graph (b) Compressed population graph

Analysis

Note that the effect on the graph is a horizontal compression where all input values are half of their original distance from the vertical axis.

Example 16.5.18: Finding a Horizontal Stretch for a Tabular Function

A function $f(x)$ is given as Table 16.5.16 Create a table for the function $g(x) = f(\frac{1}{2}x)$.

Table 16.5.16

x	2	4	6	8
$f(x)$	1	3	7	11

The formula $g(x) = f(\frac{1}{2}x)$ tells us that the output values for g are the same as the output values for the function f at an input half the size. Notice that we do not have enough information to determine $g(2)$ because $g(2) = f(\frac{1}{2} \cdot 2) = f(1)$, and we do not have a value for $f(1)$ in our table. Our input values to g will need to be twice as large to get inputs for f that we can evaluate. For example, we can determine $g(4)$.

$$g(4) = f(\frac{1}{2} \cdot 4) = f(2) = 1 \tag{16.5.10}$$

We do the same for the other values to produce Table 16.5.17.

Table 16.5.17

x	4	8	12	16

$g(x)$	1	3	7	11

Figure 16.5.29shows the graphs of both of these sets of points.

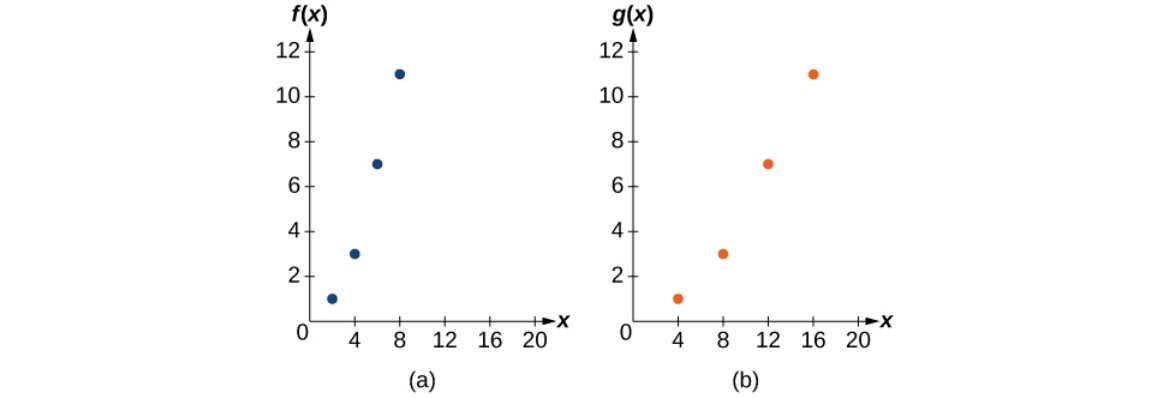

Figure 16.5.29: Graph of the previous table.

Analysis

Because each input value has been doubled, the result is that the function $g(x)$ has been stretched horizontally by a factor of 2.

Example 16.5.19: Recognizing a Horizontal Compression on a Graph

Relate the function $g(x)$ to $f(x)$ in Figure 16.5.30

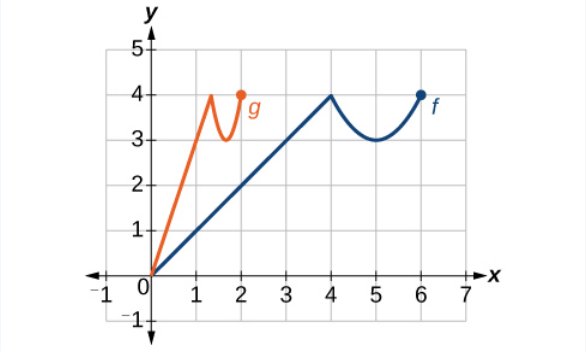

Figure 16.5.30: Graph of $f(x)$ being vertically compressed to $g(x)$.

Solution

The graph of $g(x)$ looks like the graph of $f(x)$ horizontally compressed. Because $f(x)$ ends at (6,4) and $g(x)$ ends at (2,4), we can see that the x-values have been compressed by $\frac{1}{3}$, because $6(\frac{1}{3}) = 2$. We might also notice that $g(2) = f(6)$ and $g(1) = f(3)$. Either way, we can describe this relationship as $g(x) = f(3x)$. This is a horizontal compression by $\frac{1}{3}$.

Analysis

Notice that the coefficient needed for a horizontal stretch or compression is the reciprocal of the stretch or compression. So to stretch the graph horizontally by a scale factor of 4, we need a coefficient of $\frac{1}{4}$ in our function: $f(\frac{1}{4}x)$. This means that the input values must be four times larger to produce the same result, requiring the input to be larger, causing the horizontal stretching.

Exercise 16.5.11

Write a formula for the toolkit square root function horizontally stretched by a factor of 3.

Answer

$g(x) = f(\frac{1}{3}x)$, so using the square root function we get $g(x) = \sqrt{\frac{1}{3}x}$

Performing a Sequence of Transformations

When combining transformations, it is very important to consider the order of the transformations. For example, vertically shifting by 3 and then vertically stretching by 2 does not create the same graph as vertically stretching by 2 and then vertically shifting by 3, because when we shift first, both the original function and the shift get stretched, while only the original function gets stretched when we stretch first.

When we see an expression such as $2f(x)+3$, which transformation should we start with? The answer here follows nicely from the order of operations. Given the output value of $f(x)$, we first multiply by 2, causing the vertical stretch, and then add 3, causing the vertical shift. In other words, multiplication before addition.

Horizontal transformations are a little trickier to think about. When we write $g(x) = f(2x+3)$, for example, we have to think about how the inputs to the function g relate to the inputs to the function f. Suppose we know $f(7) = 12$. What input to g would produce that output? In other words, what value of x will allow $g(x) = f(2x+3) = 12$? We would need $2x+3 = 7$. To solve for x, we would first subtract 3, resulting in a horizontal shift, and then divide by 2, causing a horizontal compression.

This format ends up being very difficult to work with, because it is usually much easier to horizontally stretch a graph before shifting. We can work around this by factoring inside the function.

$$f(bx+p) = f(b(x+\frac{p}{b}))$$

Let's work through an example.

$$f(x) = (2x+4)^2$$

We can factor out a 2.

$$f(x) = (2(x+2))^2$$

Now we can more clearly observe a horizontal shift to the left 2 units and a horizontal compression. Factoring in this way allows us to horizontally stretch first and then shift horizontally.

Combining Transformations

- When combining vertical transformations written in the form $af(x)+k$, first vertically stretch by a and then vertically shift by k.
- When combining horizontal transformations written in the form $f(bx+h)$, first horizontally shift by h and then horizontally stretch by $\frac{1}{b}$.
- When combining horizontal transformations written in the form $f(b(x+h))$, first horizontally stretch by $\frac{1}{b}$ and then horizontally shift by h.
- Horizontal and vertical transformations are independent. It does not matter whether horizontal or vertical transformations are performed first.

Example 16.5.20: Finding a Triple Transformation of a Tabular Function

Given Table 16.5.18for the function $f(x)$, create a table of values for the function $g(x) = 2f(3x)+1$.

Table 16.5.18

x	6	12	18	24
$f(x)$	10	14	15	17

Solution

There are three steps to this transformation, and we will work from the inside out. Starting with the horizontal transformations, $f(3x)$ is a horizontal compression by $\frac{1}{3}$, which means we multiply each x-value by $\frac{1}{3}$.See Table 16.5.19

Table 16.5.19

x	2	4	6	8
$f(3x)$	10	14	15	17

Looking now to the vertical transformations, we start with the vertical stretch, which will multiply the output values by 2. We apply this to the previous transformation. See Table 16.5.20

Table 16.5.20

x	2	4	6	8
$2f(3x)$	20	28	30	34

Finally, we can apply the vertical shift, which will add 1 to all the output values. See Table 16.5.21

Table 16.5.21

x	2	4	6	8
$g(x)=2f(3x)+1+1$	21	29	31	35

Example 16.5.21: Finding a Triple Transformation of a Graph

Use the graph of $f(x)$ in Figure 16.5.31to sketch a graph of $k(x)=f\left(\frac{1}{2}x+1\right)-3$.

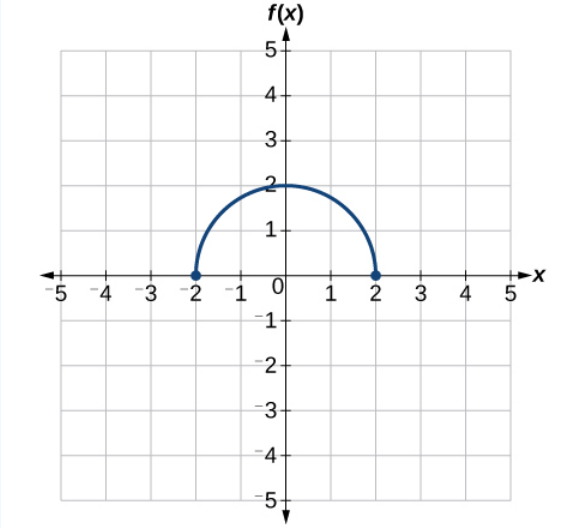

Figure 16.5.31: Graph of a half-circle.

To simplify, let's start by factoring out the inside of the function.

$$f\left(\frac{1}{2}x+1\right)-3=f\left(\frac{1}{2}(x+2)\right)-3 \tag{16.5.11}$$

By factoring the inside, we can first horizontally stretch by 2, as indicated by the $\frac{1}{2}$ on the inside of the function. Remember that twice the size of 0 is still 0, so the point $(0,2)$ remains at $(0,2)$ while the point $(2,0)$ will stretch to $(4,0)$. See Figure 16.5.32

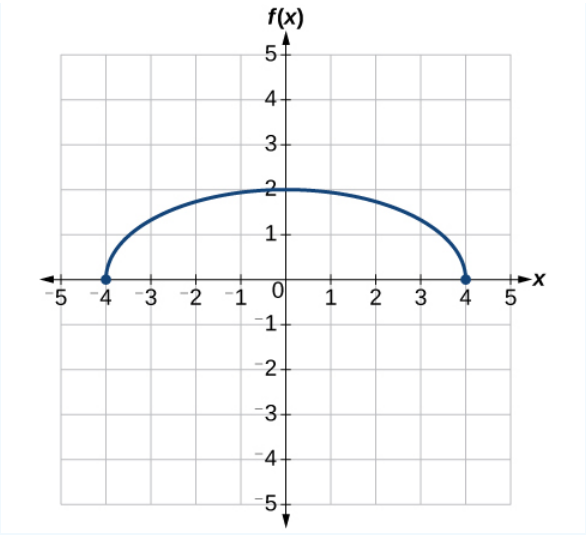

Figure 16.5.32: Graph of a vertically stretch half-circle.

Next, we horizontally shift left by 2 units, as indicated by $x+2$. See Figure 16.5.33

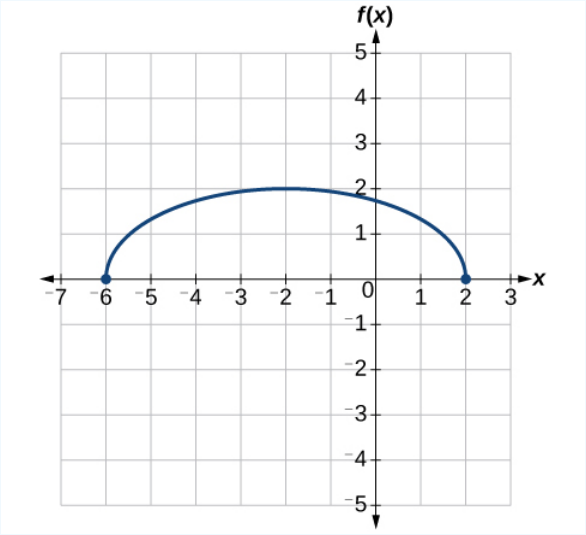

Figure 16.5.33: Graph of a vertically stretch and translated half-circle.

Last, we vertically shift down by 3 to complete our sketch, as indicated by the -3 on the outside of the function. See Figure 16.5.34

https://math.libretexts.org/@go/page/46406

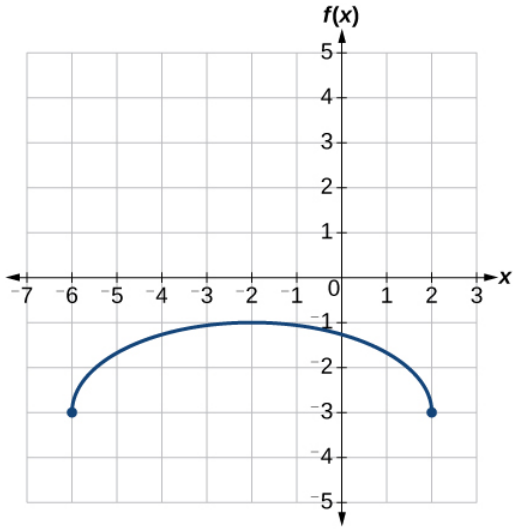

Figure 16.5.34: Graph of a vertically stretch and translated half-circle.

Key Equations

- Vertical shift $g(x) = f(x) + k$ (up for $k > 0$)
- Horizontal shift $g(x) = f(x - h)$ (right) for $h > 0$
- Vertical reflection $g(x) = -f(x)$
- Horizontal reflection $g(x) = f(-x)$
- Vertical stretch $g(x) = af(x)$ (a>0)
- Vertical compression $g(x) = af(x)$ (0<a<1)
- Horizontal stretch $g(x) = f(bx)(0 < b < 1)$
- Horizontal compression $g(x) = f(bx)$ (b>1)

Key Concepts

- A function can be shifted vertically by adding a constant to the output.
- A function can be shifted horizontally by adding a constant to the input.
- Relating the shift to the context of a problem makes it possible to compare and interpret vertical and horizontal shifts.
- Vertical and horizontal shifts are often combined.
- A vertical reflection reflects a graph about the x-axis. A graph can be reflected vertically by multiplying the output by –1.
- A horizontal reflection reflects a graph about the y-axis. A graph can be reflected horizontally by multiplying the input by –1.
- A graph can be reflected both vertically and horizontally. The order in which the reflections are applied does not affect the final graph.
- A function presented in tabular form can also be reflected by multiplying the values in the input and output rows or columns accordingly.
- A function presented as an equation can be reflected by applying transformations one at a time.
- Even functions are symmetric about the y-axis, whereas odd functions are symmetric about the origin.
- Even functions satisfy the condition $f(x) = f(-x)$.
- Odd functions satisfy the condition $f(x) = -f(-x)$.
- A function can be odd, even, or neither.
- A function can be compressed or stretched vertically by multiplying the output by a constant.
- A function can be compressed or stretched horizontally by multiplying the input by a constant.
- The order in which different transformations are applied does affect the final function. Both vertical and horizontal transformations must be applied in the order given. However, a vertical transformation may be combined with a horizontal transformation in any order.

Glossary

even function

a function whose graph is unchanged by horizontal reflection, $f(x) = f(-x)$, and is symmetric about the y-axis

horizontal compression
a transformation that compresses a function's graph horizontally, by multiplying the input by a constant b>1

horizontal reflection
a transformation that reflects a function's graph across the y-axis by multiplying the input by −1

horizontal shift
a transformation that shifts a function's graph left or right by adding a positive or negative constant to the input

horizontal stretch
a transformation that stretches a function's graph horizontally by multiplying the input by a constant 0<b<1

odd function
a function whose graph is unchanged by combined horizontal and vertical reflection, $f(x) = -f(-x)$, and is symmetric about the origin

vertical compression
a function transformation that compresses the function's graph vertically by multiplying the output by a constant 0<a<1

vertical reflection
a transformation that reflects a function's graph across the x-axis by multiplying the output by −1

vertical shift
a transformation that shifts a function's graph up or down by adding a positive or negative constant to the output

vertical stretch
a transformation that stretches a function's graph vertically by multiplying the output by a constant a>1

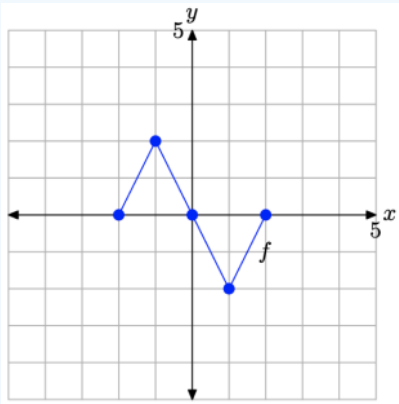
16.5.1: Vertical Transformations

In this section we study the art of transformations: scalings, reflections, and translations. We will restrict our attention to transformations in the vertical or y-direction. Our goal is to apply certain transformations to the equation of a function, then ask what effect it has on the graph of the function.

We begin our task with an example that requires that we read the graph of a function to capture several key points that lie on the graph of the function.

Example 16.5.1.1

Consider the graph of f presented in Figure 16.5.1.1(a). Use the graph of f to complete the table in Figure 16.5.1.1(b).



(a) The graph of f.

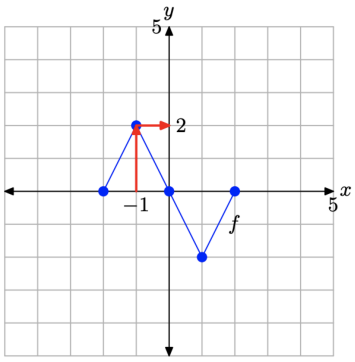
x	$f(x)$	$(x, f(x))$
-2		
-1		
0		
1		
2		

(b) The table.

Figure 16.5.1.1 Reading key values from the graph of f.

Solution

To compute f(−1), we would locate −1 on the x-axis, draw a vertical arrow to the graph of f, then a horizontal arrow to the y-axis, as shown in Figure 16.5.1.2(a). The y-value of this final destination is the value of f(−1). That is, f(−1) = 2. This allows us to complete one entry in the table, as shown in Figure 16.5.1.2(b). Continue in this manner to complete all of the entries in the table. The result is shown in Figure 16.5.1.2(c).



(a) The graph of f.

x	$f(x)$	$(x, f(x))$

(b) Recording $f(-1) = 2$.

x	$f(x)$	$(x, f(x))$
-2	0	$(-2, 0)$
-1	2	$(-1, 2)$
0	0	$(0, 0)$
1	-2	$(1, -2)$
2	0	$(2, 0)$

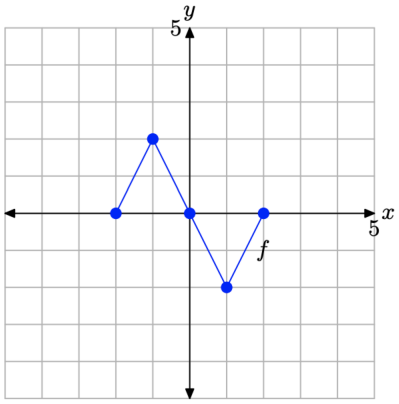
(c) Completed table.

Figure 16.5.1.2 Recording coordinates of points on the graph of f in the tables.

Vertical Scaling

In the narrative that follows, we will have repeated need of the graph in Figure 16.5.1.2(a) and the table in Figure 16.5.1.2(c). They characterize the basic function that will be the starting point for the concepts of scaling, reflection, and translation that we

develop in this section. Consequently, let's place them side-by-side for emphasis in Figure 16.5.1.3



(a)

x	$f(x)$	$(x, f(x))$
-2	0	$(-2, 0)$
-1	2	$(-1, 2)$
0	0	$(0, 0)$
1	-2	$(1, -2)$
2	0	$(2, 0)$

(b)

Figure 16.5.1.3 The original graph of f and a table of key points on the graph of f.

We are now going to scale the graph of f in the vertical direction.

Example 16.5.1.2

If y = f(x) has the graph shown in Figure 16.5.1.3(a), sketch the graph of y = 2f(x).

Solution

What do we do when we meet a graph whose shape we are unsure of? The answer to this question is we plot some points that satisfy the equation in order to get an idea of the shape of the graph. With that thought in mind, let's evaluate the function y = 2f(x) at x = −2.

The letter f refers to the original function shown in Figure 16.5.1.3(a) and the table in Figure 16.5.1.3(b) contains the values of that function at the given values of x. Thus, in computing y = 2f(−2), the first step is to look up the value of f(−2) in the table in Figure 16.5.1.3(b). There we find that f(−2) = 0. Thus, we can write

$$y = 2f(-2) = 2(0) = 0$$

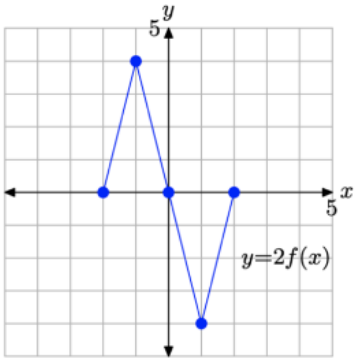
In similar fashion, let's evaluate the function y = 2f(x) at x = −1. First, look up the value of f(−1) in the table in Figure 16.5.1.3(b). There we find that f(−1) = 2. Thus, we can write

$$y = 2f(-1) = 2(2) = 4$$

We finish by evaluating the function y = 2f(x) at x = 0, 1, and 2. Each time you need to evaluate the function f at a number, take the result from the table or graph in Figure 3. What follows are the evaluations of y = 2f(x) at x = −2, −1, 0, 1, and 2.

$$y = 2f(-2) = 2(0) = 0$$
$$y = 2f(-1) = 2(2) = 4$$
$$y = 2f(0) = 2(0) = 0$$
$$y = 2f(1) = 2(-2) = -4$$
$$y = 2f(2) = 2(0) = 0$$

We can arrange these results in a table shown in Figure 16.5.1.4(b), then plot them in the figure shown in Figure 16.5.1.4(a).



(a)

x	$y = 2f(x)$	$(x, 2f(x))$
-2	0	$(-2, 0)$
-1	4	$(-1, 4)$
0	0	$(0, 0)$
1	-4	$(1, -4)$
2	0	$(2, 0)$

(b)

Figure 16.5.1.4 The points in the table are points on the graph of y = 2f(x).

At this point, there are a number of comparisons you can make.

1. Compare the data in the tables in Figure 16.5.1.3(b) and Figure 16.5.1.4(b). Note that the x-values are identical. In both tables, x = −2, −1, 0, 1, and 2. However, note that each y-value in the table in Figure 16.5.1.4(b) is precisely double the corresponding y-value in the table in Figure 16.5.1.3(b).
2. Compare the graphs in Figure 16.5.1.3(a) and Figure 16.5.1.4(a). Note that the y-value of each point in the graph of y = 2f(x) in Figure 16.5.1.4(a) is precisely double the y-value of the corresponding point in Figure 16.5.1.3(a).

Note the result. The graph of y = 2f(x) has been stretched vertically (away from the x-axis) , both positively and negatively, by a factor of 2.

Let's look at another example.

Example 16.5.1.3

If y = f(x) has the graph shown in Figure 16.5.1.3(a), sketch the graph of y = (1/2)f(x).

Solution

Let's begin by evaluating the function y = (1/2)f(x) at x = −2. First, look up the value of f(−2) in the table in Figure 16.5.1.3(b). There we find that f(−2) = 0. Thus, we can write

$$y = (1/2)f(-2) = (1/2)(0) = 0$$

In similar fashion, let's evaluate the function y = (1/2)f(x) at x = −1. First, look up the value of f(−1) in the table in Figure 16.5.1.3(b). There we find that f(−1) = 2. Thus, we can write

$$y = (1/2)f(-1) = (1/2)(2) = 1$$

Continuing in this manner, we can evaluate the function y = (1/2)f(x) at x = 0, 1, and 2.

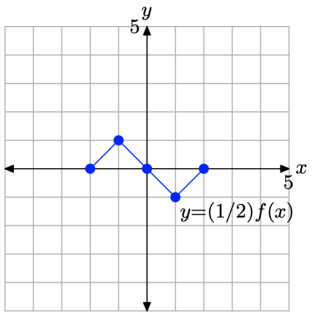
$$y = (1/2)f(0) = (1/2)(0) = 0$$
$$y = (1/2)f(1) = (1/2)(-2) = -1$$
$$y = (1/2)f(2) = (1/2)(0) = 0$$

The results are recorded in the table in Figure 16.5.1.5(b). Rather than double each value of y as did the function y = 2f(x) in Example 16.5.1.2, this function y = (1/2)f(x) halves each value of y. The graph of y = (1/2)f(x) and a table of key points on the graph are presented in Figures 16.5.1.5(a) and (b), respectively.

Again, there are a number of comparisons.

1. Compare the data in the tables in Figure 16.5.1.5(b) and Figure 16.5.1.3(b). Note that the x-values are identical. In both tables x = −2, −1, 0, 1, and 2. However, note that each y-value in the table in Figure 16.5.1.5(b) is precisely half the corresponding y-value in the table in Figure 16.5.1.3(b).

2. When you compare the graph of y = (1/2)f(x) in Figure 16.5.1.5(a) with the original graph of y = f(x) in Figure 16.5.1.3(a), note that each point on the graph of y = (1/2)f(x) has a y-value that is precisely half of the corresponding y-value on the original graph of y = f(x) in Figure 16.5.1.3(a).



(a)

x	$y=(1/2)f(x)$	$(x,(1/2)f(x))$
-2	0	$(-2,0)$
-1	1	$(-1,1)$
0	0	$(0,0)$
1	-1	$(1,-1)$
2	0	$(2,0)$

(b)

Figure 16.5.1.5 The points in the table are points on the graph of y = (1/2)f(x).

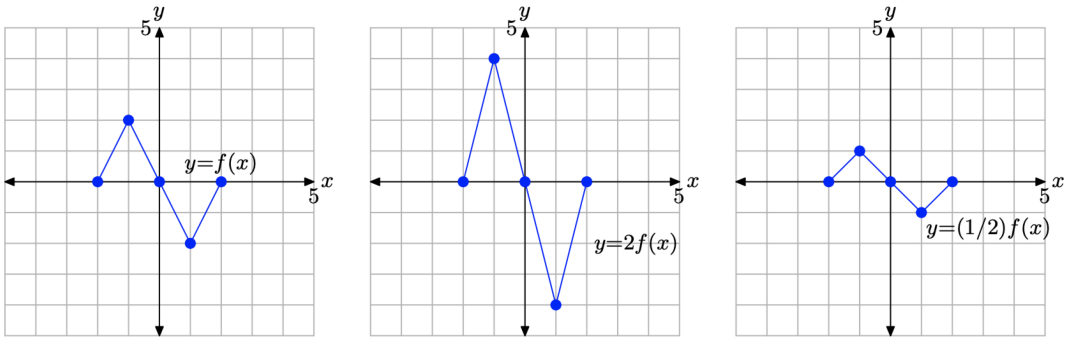
Note the result. The graph of f has been compressed vertically (toward the x-axis), both positively and negatively, by a factor of 2.

Let's summarize our findings.

A Visual Summary — Vertical Scaling.

Consider the images in Figure 16.5.1.6

- In Figure 16.5.1.6(a), we see pictured the graph of the original function y = f(x).
- In Figure 16.5.1.6(b), note that each key point on the graph of y = 2f(x) has a y-value that is precisely double the y-value of the corresponding point on the graph of y = f(x) in Figure 16.5.1.6(a).
- In Figure 16.5.1.6(c), note that each key point on the graph of y = (1/2)f(x) has a y-value that is precisely half the y-value of the corresponding point on the graph of y = f(x) in Figure 16.5.1.6(a).
- Note that the x-value of each transformed point remains the same.



(a) $y = f(x)$ (b) $y = 2f(x)$ (c) $y = (1/2)f(x)$

Figure 16.5.1.6 The graph of y = 2f(x) stretches vertically (away from the x-axis) by a factor of 2. The graph of y = (1/2)f(x) compresses vertically (toward the x-axis) by a factor of 2.

The visual summary in Figure 16.5.1.6makes sketching the graphs of y = 2f(x) and y = (1/2)f(x) an easy task.

- Given the graph of y = f(x), to sketch the graph of y = 2f(x), simply take each point on the graph of y = f(x) and double its y-value, keeping the same x-value.
- Given the graph of y = f(x), to sketch the graph of y = (1/2)f(x), simply take each point on the graph of y = f(x) and halve its y-value, keeping the same x-value.

Follow the same procedures for other scaling factors. For example, in the case of y = 3f(x), take each point on the graph of y = f(x) and multiply its y-value by 3, keeping the same x-value. On the other hand, to draw the graph of y = (1/3)f(x), take each point on the graph of f and multiply its y-value by 1/3, keeping the same y-value.

In general, we can state the following.

summary

Suppose we are given the graph of y = f(x).

- If a > 1, then the graph of y = af(x) is stretched vertically (away from the x-axis), both positively and negatively, by a factor of a.
- If 0 < a < 1, then the graph of y = af(x) is compressed vertically (toward the x-axis), both positively and negatively, by a factor of 1/a.

The second item in Summary warrants a word of explanation. Compare the general form y = af(x) with the function of Example 16.5.1.3, y = (1/2)f(x). In this case, a = 1/2, so

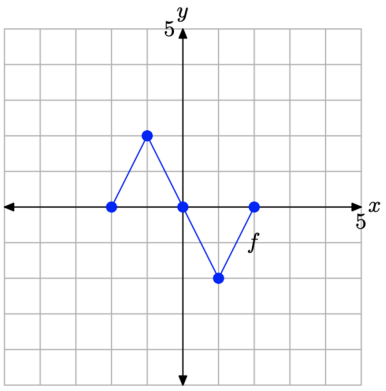
$$\frac{1}{a} = \frac{1}{1/2} = 1 \times 2 = 2$$

The second item says that when 0 < a < 1, the graph of y = af(x) is compressed vertically by a factor of 1/a. Indeed, this is exactly what happens in the case of y = (1/2)f(x), which is compressed by a factor of 1/(1/2), or 2.

Vertical Reflections

For convenience, we begin by repeating the original graph of y = f(x) and its accompanying data.

We are now going to reflect the graph in the vertical direction (across the x-axis).



(a)

x	$f(x)$	$(x, f(x))$
-2	0	$(-2, 0)$
-1	2	$(-1, 2)$
0	0	$(0, 0)$
1	-2	$(1, -2)$
2	0	$(2, 0)$

(b)

Figure 16.5.1.7. The original graph of f and a table of key points on the graph of f.

Example 16.5.1.4

If y = f(x) has the graph shown in Figure 16.5.1.7(a), sketch the graph of y = −f(x).

Solution

To set up a table of points in preparation for the plot of y = −f(x), we'll use exactly the same values of x that you see in the table in Figure 16.5.1.7(b), namely x = −2, −1, 0, 1, and 2. To evaluate y = −f(x) at the first value of x, namely x = −2, we make the following calculation,

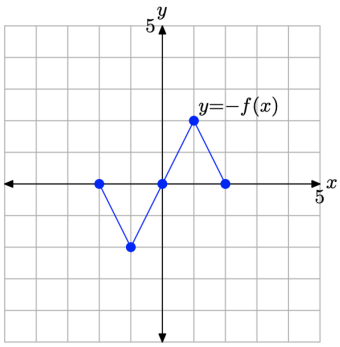
$$y = -f(-2) = -(0) = 0$$

where we've used the fact that f(−2) = 0 from the table in Figure 16.5.1.7(b). In similar fashion, we evaluate y = −f(x) at each of the remaining values of x, namely x = −1, 0, 1, and 2.

$$y = -f(-1) = -(2) = -2$$
$$y = -f(0) = -(0) = 0$$
$$y = -f(1) = -(-2) = 2$$
$$y = -f(2) = -(0) = 0$$

We assemble these points in the table in Figure 16.5.1.8(b) and plot them in Figure 16.5.1.8(a).

Note that the graph of y = −f(x) in Figure 16.5.1.8(a) is a reflection of the graph of y = f(x) in Figure 16.5.1.7(a) across the x-axis.



(a)

x	$y = -f(x)$	$(x, -f(x))$
-2	0	$(-2, 0)$
-1	-2	$(-1, -2)$
0	0	$(0, 0)$
1	2	$(1, 2)$
2	0	$(2, 0)$

(b)

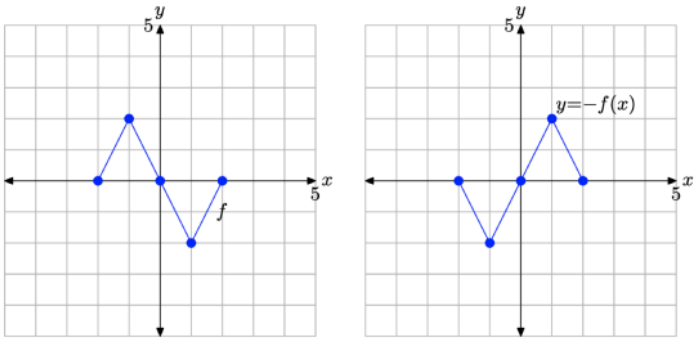
Figure 16.5.1.8 The graph of y = −f(x) and a table of key points on the graph.

Let's summarize what we've learned about vertical reflections.

A Visual Summary — Vertical Reflections

Consider the images in Figure 16.5.1.9

- In Figure 16.5.1.9(a), we see pictured the original graph of y = f(x).
- In Figure 16.5.1.9(b), the graph of y = −f(x) is a reflection of the graph of y = f(x) across the x-axis.



(a) $y = f(x)$ (b) $y = -f(x)$

Figure 16.5.1.9 The graph of y = −f(x) is a reflection of the graph of y = f(x) across the x-axis.

Thus, given the graph of y = f(x), it is a simple task to draw the graph of y = −f(x).

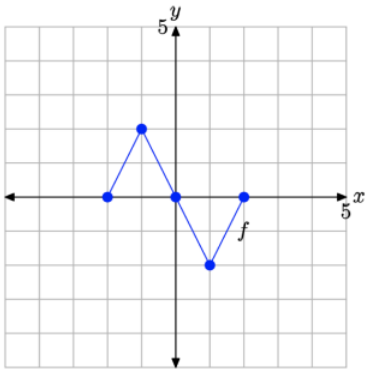
- To draw the graph of y = −f(x), take each point on the graph of y = f(x) and reflect it across the x-axis, keeping the x-value the same, but negating the y-value.

Vertical Translations

Translations are perhaps the easiest transformation of all. A translation is a "shift" or a "slide." Pretend, for a moment, that you've placed a transparent sheet of thin plastic over a sheet of graph paper. You've drawn a Cartesian coordinate system on your graph paper, but you've plotted your graph on the transparent sheet of plastic. Now, "shift" or "slide" the transparency over your graph

paper in a constant direction without rotating the transparency. This is what we mean by a “translation.” In this section, we will focus strictly on vertical translations.

For convenience, we begin by repeating the original graph of y = f(x) and its accompanying data in Figure 16.5.1.10(a) and(b), respectively. We will now translate this graph in the vertical direction.



(a)

x	$f(x)$	$(x, f(x))$
-2	0	$(-2,0)$
-1	2	$(-1,2)$
0	0	$(0,0)$
1	-2	$(1,-2)$
2	0	$(2,0)$

(b)

Figure 16.5.1.10 The original graph of f and a table of key points on the graph of f.

Example 16.5.1.5

If y = f(x) has the graph shown in Figure 16.5.1.10(a), sketch the graph of y = f(x) + 1.

Solution

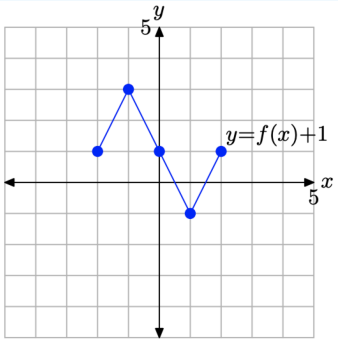
We will evaluate y = f(x)+1 at the same values shown in the table in Figure 16.5.1.10(b), namely x = −2, −1, 0, 1, and 2. To evaluate y = f(x)+1 at the first value of x, namely x = −2, we make the following calculation

$$y = f(-2) + 1 = 0 + 1 = 1$$

where we’ve used that fact that f(−2) = 0 from the table in Figure 16.5.1.10(b). In similar fashion, we can evaluate y = f(x) + 1 at each of the remaining values of x, namely x = −1, 0, 1, and 2.

$$y = f(-1) + 1 = 2 + 1 = 3$$
$$y = f(0) + 1 = 0 + 1 = 1$$
$$y = f(1) + 1 = -2 + 1 = -1$$
$$y = f(2) + 1 = 0 + 1 = 1$$

We assemble these points in the table in Figure 16.5.1.11(b) and plot them in Figure 16.5.1.11(a).



(a)

x	$y = f(x) + 1$	$(x, f(x) + 1)$
-2	1	$(-2,1)$
-1	3	$(-1,3)$
0	1	$(0,1)$
1	-1	$(1,-1)$
2	1	$(2,1)$

(b)

Figure 16.5.1.11 The graph of y = f(x) + 1 and a table of key points on the graph.

When you compare the entries in the table in Figure 16.5.1.11(b) with the original values in the table in Figure 16.5.1.10(b), you’ll note that the x-values in each table are identical, but the y-values in the table in Figure 16.5.1.11(b) are all increased by

1. This makes sense, because these are the y-values of the points associated with the function y = f(x) + 1. Of course, all the y-values should be 1 larger than the y-values associated with the original equation y = f(x).

Note the result. The graph of y = f(x) + 1 in Figure 16.5.1.11(a), when compared with the graph of y = f(x) in Figure 16.5.1.10(a), is shifted 1 unit upwards.

Let's look at another example.

Example 16.5.1.6

If y = f(x) has the graph shown in Figure 16.5.1.10(a), sketch the graph of y = f(x) − 2.

Solution

Evaluate the function y = f(x) − 2 at each value of x in the table in Figure 16.5.1.10(b). At x = −2,

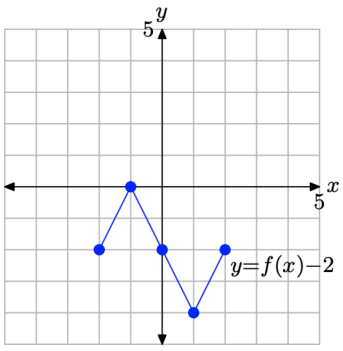
$$y = f(-2) - 2 = 0 - 2 = -2$$

In similar fashion, evaluate y = f(x) − 2 at each remaining x-value in the table in Figure 16.5.1.10(b).

$$\begin{aligned} y &= f(-1) - 2 = 2 - 2 = 0 \\ y &= f(0) - 2 = 0 - 2 = -2 \\ y &= f(1) - 2 = -2 - 2 = -4 \\ y &= f(2) - 2 = 0 - 2 = -2 \end{aligned}$$

We assemble these points in the table in Figure 16.5.1.12(b) and plot them in Figure 16.5.1.12(a).

When you compare the entries in the table in Figure 16.5.1.12(b) with the original values in the table in Figure 16.5.1.10(b), you'll note that the x-values in each table are identical, but the y-values in the table in Figure 16.5.1.12(b) are all decremented by 2. This makes



(a)

x	$y = f(x) - 2$	$(x, f(x) - 2)$
-2	-2	$(-2, -2)$
-1	0	$(-1, 0)$
0	-2	$(0, -2)$
1	-4	$(1, -4)$
2	-2	$(2, -2)$

(b)

Figure 16.5.1.12 The graph of y = f(x) − 2 and a table of key points on the graph.

sense, because these are the y-values of the points associated with the function y = f(x) − 2. Of course, all the y-values should be 2 less than the y-values associated with the original equation y = f(x).

Note the result. The graph of y = f(x) − 2 in Figure 16.5.1.12(a), when compared with the graph of y = f(x) in Figure 16.5.1.10(a), is shifted downward 2 units.

Let's summarize what we've learned about vertical translations.

A Visual Summary — Vertical Translations (Shifts)

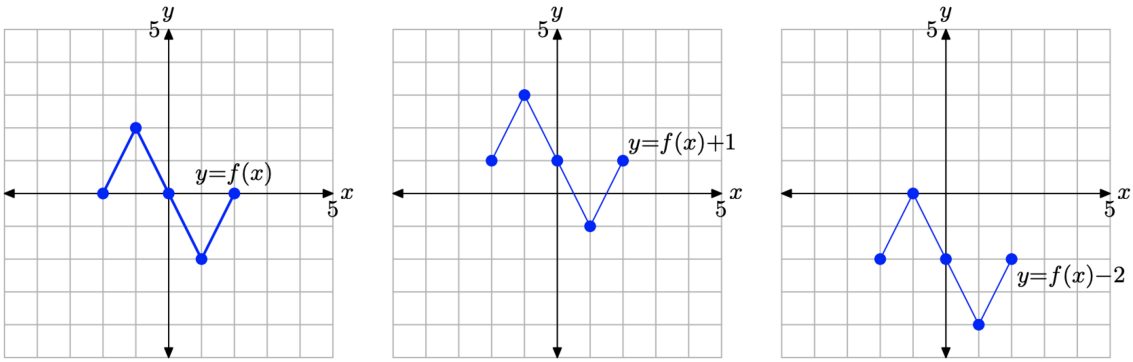
Consider the images in Figure 16.5.1.13

- In Figure 16.5.1.13(a), we see pictured the graph of the original function y = f(x).
- In Figure 16.5.1.13(b), note that each key point on the graph of y = f(x) + 1 has a y-value that is precisely 1 unit larger than the y-value of the corresponding point on the graph of y = f(x) in in Figure 16.5.1.13(a).

- In Figure 16.5.1.13(c), note that each key point on the graph of y = f(x) − 2 has a y-value that is precisely 2 units smaller than the y-value of the corresponding point on the graph of y = f(x) in in Figure 16.5.1.13(a).
- Note that the x-value of each transformed point remains the same.

The visual summary in Figure 16.5.1.13 makes sketching the graphs of y = f(x) + 1 and y = f(x) − 2 an easy task.

- Given the graph of y = f(x), to sketch the graph of y = f(x) + 1, simply take each point on the graph of y = f(x) and move it upwards 1 unit, keeping the same x-value.
- Given the graph of y = f(x), to sketch the graph of y = f(x) − 2, simply take each point on the graph of y = f(x) and move it downwards 2 units, keeping the same x-value.



(a) $y = f(x)$ (b) $y = f(x) + 1$ (c) $y = f(x) - 2$

Figure 16.5.1.13 The graph of y = f(x) + 1 is formed by shifting (vertically) the graph of y = f(x) upward 1 unit. The graph of y = f(x) − 2 is formed by shifting (vertically) the graph of y = f(x) downward 2 units.

In general, we can state the following.

summary

Suppose that we are given the graph of y = f(x) and suppose that c is any positive real number.

- The graph of y = f(x)+c is shifted c units upward from the graph of y = f(x).
- The graph of y = f(x) − c is shifted c units downward from the graph of y = f(x).

Composing Transformations

Sometimes we will want to perform one transformation, then take the result of the first transformation and apply a second transformation. Let's look at an example.

Example 16.5.1.7

Consider the graph of y = f(x) presented in Figure 16.5.1.14

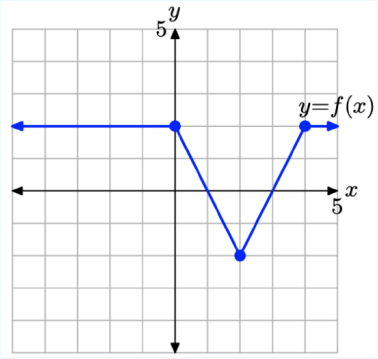


Figure 16.5.1.14 The graph of y = f(x) that will be transformed in Example 16.5.1.7.

Use the concepts discussed in the Visual Summaries to sketch the graph of y = −2f(x) without creating and referring to a table of points.

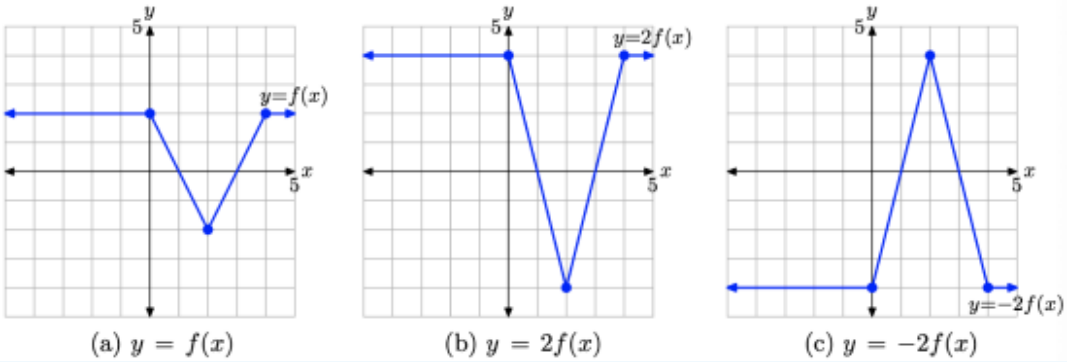
Solution

Note that the equation y = −2f(x) can be formed by a sequence of two transformations.

1. First, scale the original function y = f(x) to obtain the equation y = 2f(x).
2. Second, negate the resulting function y = 2f(x) to obtain the equation y = −2f(x).

Thus, the graph of y = −2f(x) can be formed as follows:

1. Start with the graph of y = f(x) and double the y-value of each point on the graph of y = f(x), keeping the same x-value. The result is the graph of y = 2f(x) shown in Figure 16.5.1.15(b).
2. Next, negate the y-value of each point on the graph of y = 2f(x), keeping the same x-value. The result is the graph of y = −2f(x) in Figure 16.5.1.15(c).



(a) $y = f(x)$ (b) $y = 2f(x)$ (c) $y = -2f(x)$

Figure 16.5.1.15 Transforming the graph of y = f(x) with a sequence of two transformations.

It is interesting to note that you will get the same result if you negate first, then scale the result. We will leave it to our readers to check that this is true.

Let's look at one final example.

Example 16.5.1.8

Consider the graph of y = f(x) presented in Figure 16.5.1.16

Use the concepts discussed in the Visual Summaries to sketch the graph of y = −f(x)+2 without creating and referring to a table of points.

Solution

Note that the equation y = −f(x) + 2 can be formed by a sequence of two transformations.

1. First, negate the original function y = f(x) to obtain the equation y = −f(x).
2. Second, add 2 to the resulting function y = −f(x) to obtain the equation y = −f(x) + 2.

Thus, the graph of y = −f(x) + 2 can be formed as follows.

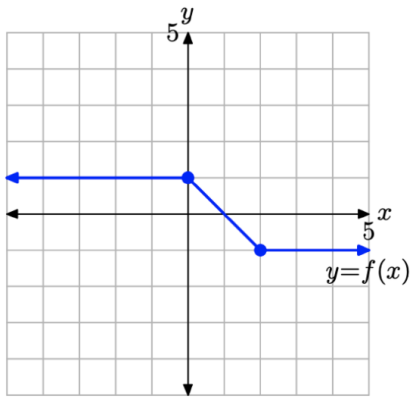


Figure 16.5.1.16 The graph of y = f(x) that will be transformed in Example 16.5.1.8

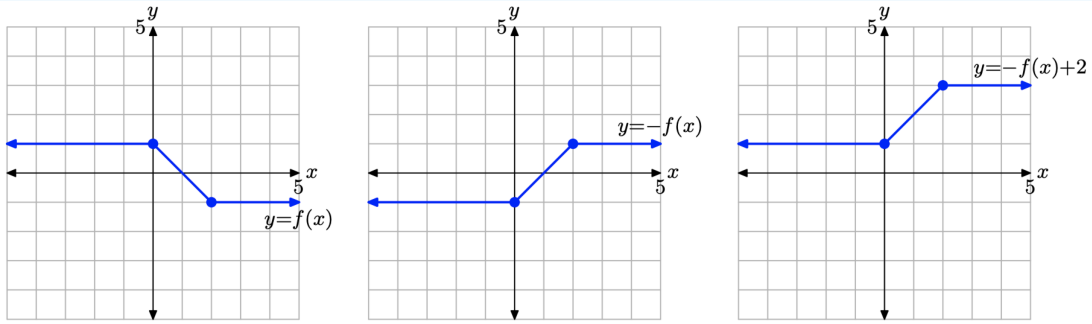
1. First, start with the graph of y = f(x) in Figure 16.5.1.17(a) and negate the y-value of each point to produce the graph of y = −f(x) Figure 16.5.1.17(b).

2. Next, add 2 to the y-value of each point on the graph of y = −f(x) in Figure 16.5.1.17(b) to produce the graph of y = −f(x) + 2 in Figure 16.5.1.17(c).



(a) $y = f(x)$ (b) $y = -f(x)$ (c) $y = -f(x) + 2$

Figure 16.5.1.17 Transforming the graph of y = f(x), first reflecting across the x-axis, then shifting 2 units upward to obtain the graph of y = −f(x) + 2.

In Example 16.5.1.7, where we started with the graph of y = f(x) and then graphed y = 2f(x), the order of the transformations did not matter. Scale by 2, then negate, or negate and scale by 2, you get the same result (readers should verify this claim). However, in this example, the order in which the transformations are applied does matter. To see this, let's do the following:

1. Add 2 to shift the graph of y = f(x) in Figure 16.5.1.18(a) two units upward to obtain the graph of y = f(x) + 2 in Figure 16.5.1.18(b).
2. Negate the y-value of each point on the graph of y = f(x) + 2 in Figure 16.5.1.18(b) to obtain the graph of y = −(f(x) + 2) in Figure 16.5.1.18(c). Note that we must negate the entire y-value. Hence the parentheses.

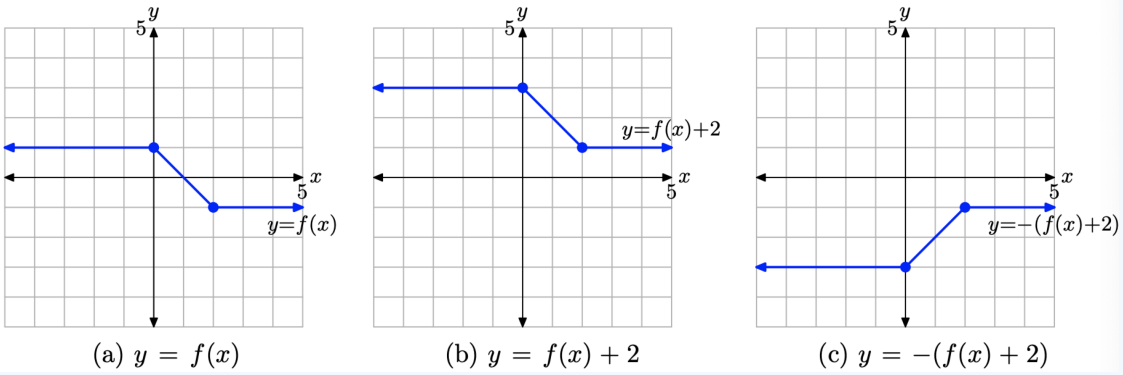
Unfortunately, the graph of y = −(f(x)+ 2) in Figure 16.5.1.18(c) is not the same as the graph of y = −f(x) + 2 in Figure 16.5.1.17(c). But of course, this makes complete sense, as the equations (in the case of Figure 16.5.1.18(c))

$$y = -(f(x) + 2) = -f(x) - 2$$

and (in the case of Figure 16.5.1.17(c))

$$y = -f(x) + 2$$

are also not the same.



(a) $y = f(x)$ (b) $y = f(x) + 2$ (c) $y = -(f(x) + 2)$

Figure 16.5.1.18 Transforming the graph of y = f(x), shifting 2 units upward to obtain the graph of y = f(x) + 2, then reflecting across the x-axis to obtain the graph of y = −(f(x) + 2).

Therefore, care must be taken when applying more than one transformation. Here is a good rule of thumb to live by.

Do Vertical Scalings and Reflections First, then Vertical Translations. When performing a sequence of vertical transformations, it is usually easier (less confusing) to apply vertical scalings and reflections before vertical translations.

However, as long as you perform the transformations correctly, you should obtain the correct result. In Example 16.5.1.8 if you want to sketch the graph of y = −f(x)+2 by doing the translation first, the correct way to proceed is as follows (though somewhat counterintuitive):

1. First, shift the graph of y = f(x) downward 2 units to obtain the graph of y = f(x) − 2.
2. Second, reflect the graph of y = f(x) − 2 across the x-axis to obtain the graph of y = −(f(x) − 2). Again, note the use of parentheses as we negate the entire y-value.

Finally, note that

$$y = -(f(x) - 2) = -f(x) + 2$$

We will leave it to our readers to show that this sequence produces the correct result, a graph identical to the correct answer shown in Figure 16.5.1.17(c).

Summary

In this section we've seen how a handful of transformations greatly enhance our graphing capability. We end this section by listing the transformations presented in this section and their effects on the graph of a function.

Vertical Transformations.

Vertical Transformations. Suppose we are given the graph of y = f(x).

- If $a > 1$, then the graph of y = af(x) is stretched vertically (away from the x-axis), both positively and negatively, by a factor of a.
- If $0 < a < 1$, then the graph of y = af(x) is compressed vertically (toward the x-axis), both positively and negatively, by a factor of 1/a.
- The graph of y = −f(x) is a reflection of the graph of y = f(x) across the x-axis.
- If $c > 0$, then the graph of y = f(x) + c is shifted c units upward from the graph of y = f(x).
- If $c > 0$, then the graph of y = f(x) − c is shifted c units downward from the graph of y = f(x).

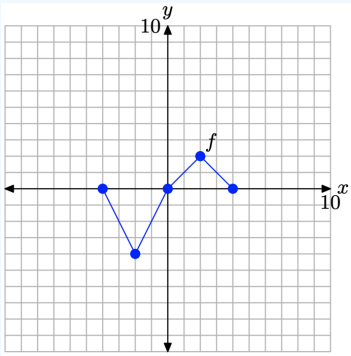
16.5.2: Horizontal Transformations

In the previous section, we introduced the concept of transformations. We made a change to the basic equation y = f(x), such as y = af(x), y = −f(x), y = f(x) − c, or y = f(x) + c, then studied how these changes affected the shape of the graph of y = f(x). In that section, we concentrated strictly on transformations that applied in th vertical direction. In this section, we will study transformations that will affect the shape of the graph in the horizontal direction.

We begin our task with an example that requires that we read the graph of a function to capture several key points that lie on the graph of the function.

Example 16.5.2.1

Consider the graph of f presented in Figure 16.5.2.1(a). Use the graph of f to complete the table in Figure 16.5.2.1(b).



(a) The graph of f.

-4		
-2		
0		
2		
4		

(b) The table.

Figure 16.5.2.1 Reading key values from the graph of f.

Solution

To compute f(−2), for example, we would first locate −2 on the x-axis, draw a vertical arrow to the graph of f, then a horizontal arrow to the y-axis, as shown in Figure 16.5.2.2(a). The y-value of this final destination is the value of f(−2). That is, f(−2) = −4. This allows us to complete one entry in the table, as shown in Figure 16.5.2.2(b). Continue in this manner to complete all of the entries in the table. The result is shown in Figure 16.5.2.2(c).

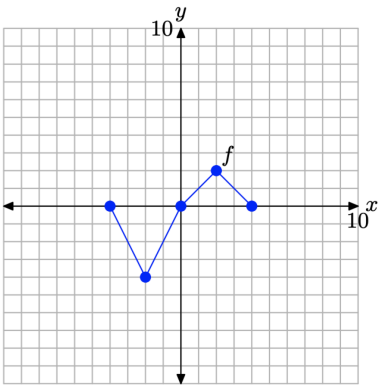
4	0	$(4, 0)$

(c) Completed table.

Figure 16.5.2.2 Recording coordinates of points on the graph of f in the tables

Horizontal Scaling

In the narrative that follows, we will have repeated need of the graph in Figure 16.5.2.2(a) and the table in Figure 16.5.2.2(c). They characterize the basic function that will be the starting point for the concepts of scaling, reflection, and translation that we develop in this section. Consequently, let's place them side-by-side for emphasis in Figure 16.5.2.3



(a)

x	$f(x)$	$(x, f(x))$
-4	0	$(-4, 0)$
-2	-4	$(-2, -4)$
0	0	$(0, 0)$
2	2	$(2, 2)$
4	0	$(4, 0)$

(b)

Figure 16.5.2.3 The original graph of f and a table of key points on the graph of f

We are now going to scale the graph of f in the horizontal direction.

Example 16.5.2.2

If y = f(x) has the graph shown in Figure 16.5.2.3(a), sketch the graph of y = f(2x).

Solution

In the previous section, we investigated the graph of y = 2f(x). The number 2 was outside the function notation and as a result we stretched the graph of y = f(x) vertically by a factor of 2. However, note that the 2 is now inside the function notation y = f(2x). Intuition would demand that this might have something to do with scaling in the x-direction (horizontal direction), but how?

Again, when we're unsure of the shape of the graph, we rely on plotting a table of points. We begin by picking these x-values: x = −2, −1, 0, 1, and 2. Note that these are precisely half of each of the x-values presented in the table in Figure 16.5.2.3(b). We will now evaluate the function y = f(2x) at each of these x-values. For example, to compute y = f(2x) at x = −2, we first insert x = −2 for x to obtain

$$y = f(2(-2)) = f(-4)$$

To complete the computation, we must now evaluate f(−4). However, this result is recorded in the table in Figure 16.5.2.3(b). There we find that f(−4) = 0, and we can complete the computation started above.

$$y = f(2(-2)) = f(-4) = 0$$

In similar fashion, to evaluate the function y = f(2x) at x = −1, first substitute x = −1 in y = f(2x) to obtain

$$y = f(2(-1)) = f(-2)$$

Now, note that f(−2) is the next recorded value in the table in Figure 16.5.2.3(b). There we find that f(−2) = −4, so we can complete the computation started above.

$$y = f(2(-1)) = f(-2) = -4$$

At this point, you might see why we chose x-values: −2, −1, 0, 1, and 2. These are precisely half of the x-values in the table of original values for the function y = f(x) in Figure 16.5.2.3(b). When the values −2, −1, 0, 1, and 2 are substituted into the function y = f(2x), they are first doubled before we go to look up the function value in the table in Figure 16.5.2.3(b).

Continuing in this manner, we evaluate the function y = f(2x) at the remaining values of x, namely, 0, 1, and 2.

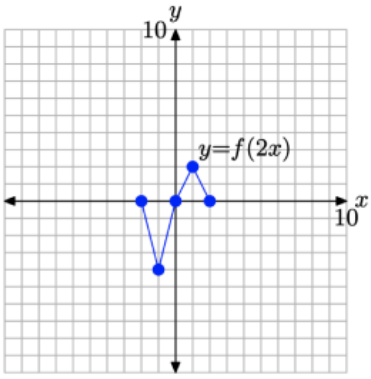
$$\begin{aligned} y &= f(2(0)) = f(0) = 0 \\ y &= f(2(1)) = f(2) = 2 \\ y &= f(2(2)) = f(4) = 0 \end{aligned}$$

We enter these values into the table in Figure 4(b) and plot them to determine the graph of y = f(2x) in Figure 16.5.2.4(a).

At this point, there are a number of comparisons you can make.

1. Compare the data in the table in Figure 16.5.2.4(b) with the original function data in the table in Figure 16.5.2.3(b). Note that the y-values in each table are identical. However, note that each x-value in the table of Figure 16.5.2.4(b) is precisely half of the corresponding x-value in the table of Figure 16.5.2.3(b).

2. Compare the graph of y = f(2x) in Figure 16.5.2.4(a) with the original graph of y = f(x) in Figure 16.5.2.3(a). Note that each x-value at each point on the graph of y = f(2x) in



(a)

x	$y = f(2x)$	$(x, f(2x))$
-2	0	$(-2, 0)$
-1	-4	$(-1, -4)$
0	0	$(0, 0)$
1	2	$(1, 2)$
2	0	$(2, 0)$

(b)

Figure 16.5.2.4 The points in the table are points on the graph of y = f(2x).

Figure 16.5.2.4(a) is precisely half the x-value of the corresponding point on the graph of y = f(x) in Figure 16.5.2.3(a).

Note the result. The graph of y = f(2x) is compressed horizontally (toward the y-axis), both positively and negatively, by a factor of 2. Note that this is exactly the opposite of what you might expect by intuition, but a careful examination of the data in the tables in Figures 16.5.2.3(b) and 16.5.2.4(b) will explain why.

Let's look at another example.

Example 16.5.2.3

If y = f(x) has the graph shown in Figure 16.5.2.3(a), sketch the graph of y = f((1/2)x).

Solution

Rather than doubling each value of x at the start, this function first halves each value of x. Thus, we will want to evaluate the function y = f((1/2)x) at x = −8, −4, 0, 4, and 8. For example, to evaluate the function y = f((1/2)x) at x = −8, first substitute x = −8 to obtain

$$y = f((1/2)(-8)) = f(-4)$$

Now, look up this value in the table in Figure 16.5.2.3(b) and note that f(−4) = 0. Thus, we can complete the computation as follows.

$$y = f((1/2)(-8)) = f(-4) = 0$$

Similarly, to evaluate the function y = f((1/2)x) at x = −4, first substitute x = −4 to obtain

$$y = f((1/2)(-4)) = f(-2)$$

Now, look up this value in the table in Figure 16.5.2.3(b) and note that f(−2) = −4. Thus, we can complete the computation as follows.

$$y = f((1/2)(-4)) = f(-2) = -4$$

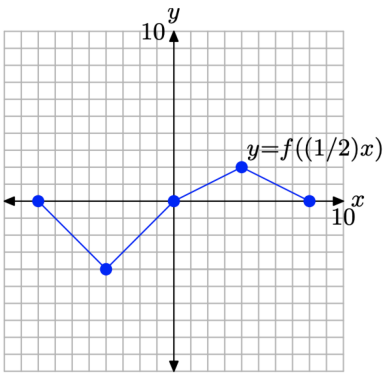
At this point, you will see why we chose x-values: −8, −4, 0, 4, and 8. These values are precisely double the x-values in the table of original values for the function y = f(x) in Figure 16.5.2.3(b). When the values −8, −4, 0, 4, and 8 are substituted into

the function y = f((1/2)x), they are first halved before we go to look up the function value in the table in Figure 16.5.2.3(b). This halving leads to the values −4, −2, 0, 2, and 4, which are precisely the values available in the table in Figure 16.5.2.3(b).

We make similar computations at the remaining values of x, namely x = 0, 4, and 8.

$$y = f((1/2)(0)) = f(0) = 0$$
$$y = f((1/2)(4)) = f(2) = 2$$
$$y = f((1/2)(8)) = f(4) = 0$$

Hopefully, these computations explain our choice of x-values above. Each of these results is recorded in the table in Figure 16.5.2.5(b) and plotted on the graph shown in Figure 16.5.2.5(a).



(a)

x	$y = f((1/2)x)$	$(x, f((1/2)x))$
-8	0	$(-8, 0)$
-4	-4	$(-4, -4)$
0	0	$(0, 0)$
4	2	$(4, 2)$
8	0	$(8, 0)$

(b)

Figure 16.5.2.5 The points in the table are points on the graph of y = f((1/2)x).

Again, note that the y-values in the table in Figure 16.5.2.5(b) are identical to the y-values in the table in Figure 16.5.2.3(b). However, each x-value in the table in Figure 16.5.2.5(b) is precisely double the corresponding x-value in the table in Figure 16.5.2.3(b).

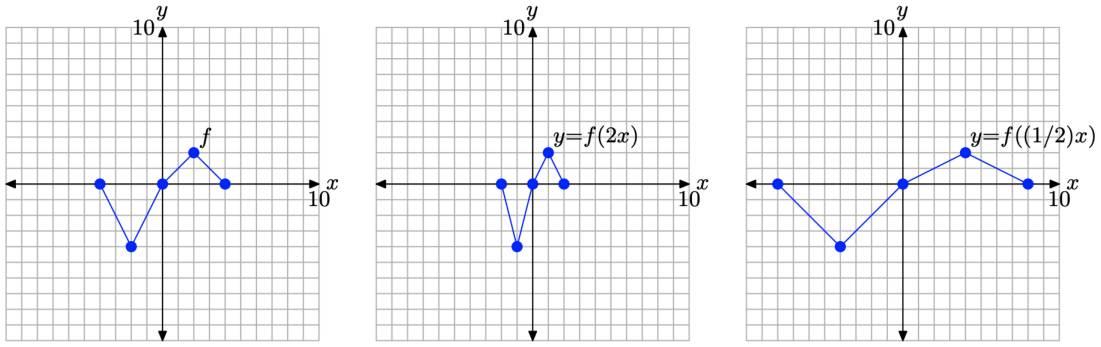
This doubling of the x-values is apparent in the graph of y = f((1/2)x) shown in Figure 16.5.2.5(a), where the graph is stretched by a factor of 2 horizontally (away from the y-axis), both positively and negatively. Note that this is exactly the opposite of what you might expect by intuition, but a careful examination of the data in the tables in Figures 16.5.2.3(b) and 16.5.2.5(b) will explain why.

Let's summarize our findings.

A Visual Summary — Horizontal Scaling

Consider the images in Figure 16.5.2.6

- In Figure 16.5.2.6(a), we see pictured the graph of the original function y = f(x).
- In Figure 16.5.2.6(b), note that each key point on the graph of y = f(2x) has an x-value that is precisely half the x-value of the corresponding point on the graph of y = f(x) in Figure 16.5.2.6(a).
- In Figure 16.5.2.6(c), note that each key point on the graph of y = f((1/2)x) has an x-value that is twice the x-value of the corresponding point on the graph of y = f(x) in Figure 16.5.2.6(a).
- Note that the y-value of each transformed point remains the same.



(a) $y = f(x)$ (b) $y = f(2x)$ (c) $y = f((1/2)x)$

Figure 16.5.2.6 The graph of y = f(2x) compresses horizontally (toward the y-axis) by a factor of 2. The graph of y = f((1/2)x) stretches horizontally (away from the y-axis) by a factor of 2.

The visual summary in Figure 16.5.2.6 makes sketching the graphs of y = f(2x) and y = f(1/2)x) an easy task.

- Given the graph of y = f(x), to sketch the graph of y = f(2x), simply take each point on the graph of y = f(x) and cut its x-value in half, keeping the same y-value.
- Given the graph of y = f(x), to sketch the graph of y = f((1/2)x), simply take each point on the graph of y = f(x) and double its x-value, keeping the same y-value.

Follow the same procedures for other scaling factors. For example, in the case of y = f(3x), take each point on the graph of y = f(x) and divide its x-value by 3, keeping the same y-value. On the other hand, to draw the graph of y = f((1/3)x), take each point on the graph of f and multiply its x-value by 3, keeping the same y-value.

In general, we can state the following.

summary

Suppose we are given the graph of y = f(x).

- If a > 1, the graph of y = f(ax) compresses horizontally (toward the y-axis) , both positively and negatively, by a factor of a.
- If 0 < a < 1, the graph of y = f(ax) stretches horizontally (away from the y-axis), both positively and negatively, by a factor of 1/a.

In the case of the first item in Summary, when we compare the general form y = f(ax) with y = f(2x), we see that a = 2. In this case, note that a > 1 and the graph of y = f(2x) compresses horizontally by a factor of 2 when compared with the graph of y = f(x) (see Figure 16.5.2.6(b)).

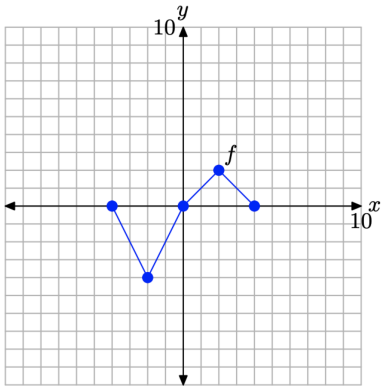
In the case of the second item in Summary, when we compare the general form y = f(ax) with the equation y = f((1/2)x), we see that a = 1/2, so

$$\frac{1}{a} = \frac{1}{1/2} = 2$$

The second item in Summary 4 says that when 0 < a < 1, the graph of y = f(ax) stretches horizontally by a factor of 1/a. Indeed, this is exactly what happened in the case of y = f((1/2)x), which stretched in the horizontal direction by a factor of 1/(1/2), or 2 (see Figure 16.5.2.6(c)).

Horizontal Reflections

For convenience, we begin by repeating the original graph of y = f(x) and its accompanying data in Figure 16.5.2.7. We are now going to reflect the graph of y = f(x) in the horizontal direction (across the y-axis).



(a)

x	$f(x)$	$(x, f(x))$
-4	0	$(-4, 0)$
-2	-4	$(-2, -4)$
0	0	$(0, 0)$
2	2	$(2, 2)$
4	0	$(4, 0)$

(b)

Figure 16.5.2.7 The original graph of f and a table of key points on the graph of f

Example 16.5.2.4

If y = f(x) has the graph shown in Figure 16.5.2.7(a), draw the graph of y = f(−x).

Solution

In the previous section, we were asked to draw the graph of y = −f(x). Note how the minus sign appears on the outside of the function. Clearly, the y-values of y = −f(x) must be opposite in sign to the y-values of y = f(x). That is why the graph of y = −f(x) was a reflection of the graph of y = f(x) across the x-axis.

However, in this example, the minus sign is inside the function, leaving one to intuit that it is the x-values, not the y-values, that are being negated. We will choose the following x-values: x = 4, 2, 0, −2, and −4. This is a bit deceptive, as it looks like we are choosing the same x-values, only in reverse order. This is not the case. We are choosing the negative of each x-value in the table in Figure 16.5.2.7(b).

To evaluate y = f(−x) at our first x-value, namely x = 4, we perform the following calculation. First substitute x = 4 to obtain

$$y = f(-(4)) = f(-4)$$

Now, look up this value in the table in Figure 16.5.2.7(b) and note that f(−4) = 0. Thus, we can complete the computation as follows.

$$y = f(-(4)) = f(-4) = 0$$

Similarly, to evaluate the function y = f(−x) at x = 2, first substitute x = 2 to obtain

$$y = f(-(2)) = f(-2)$$

Now, look up this value in the table in Figure 16.5.2.7(b) and note that f(−2) = −4. Thus, we can complete the computation as follows.

$$y = f(-(2)) = f(-2) = -4$$

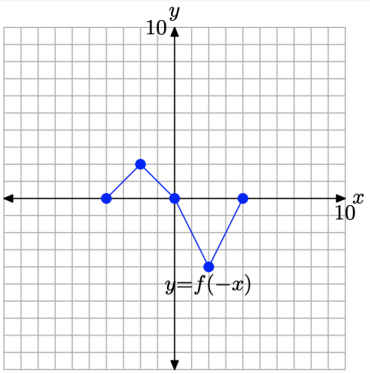
At this point, you will see why we chose x-values: 4, 2, 0, −2, and −4. These values are the negatives of the x-values in the table of original values for the function y = f(x) in Figure 16.5.2.7(b). When the values 4, 2, 0, −2, and −4 are substituted into the function y = f(−x), they are first negated before we go to look up the function value in the table in Figure 16.5.2.7(b). This negating leads to the values −4, −2, 0, 2, and 4, which are precisely the values available in the table in Figure 16.5.2.7(b).

We make similar computations at the remaining values of x, namely x = 0, −2, and −4.

$$y = f(-(0)) = f(0) = 0$$
$$y = f(-(-2)) = f(2) = 2$$
$$y = f(-(-4)) = f(4) = 0$$

We organize these points in the table in Figure 16.5.2.8(b), then plot them in Figure 16.5.2.8(a).

When you compare the entries in the table in Figure 16.5.2.8(b) with those in the table in Figure 16.5.2.7(b), note that the y-values appear in the same order, but the x-values of the table in Figure 16.5.2.7(b) have been negated in the table in Figure 16.5.2.8(b). This means that a former point such as (−2, −4) is transformed to the point (2, −4), which is a reflection of the point (−2, −4) across the y-axis.



(a)

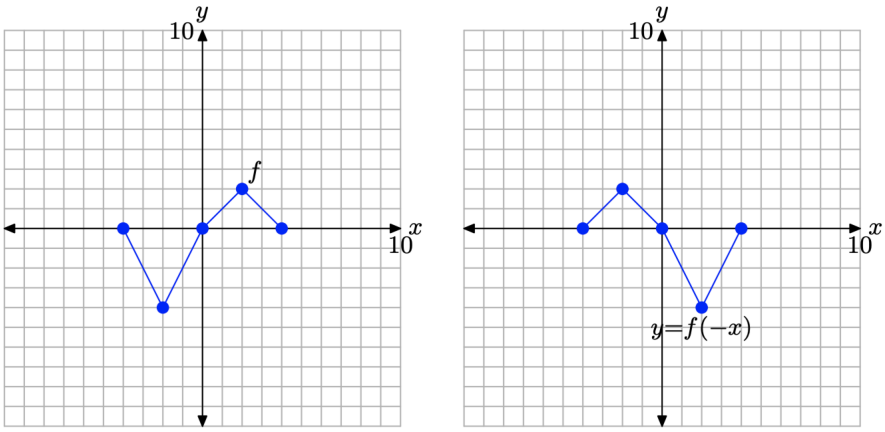
x	$y = f(-x)$	$(x, f(-x))$
4	0	$(4, 0)$
2	−4	$(2, -4)$
0	0	$(0, 0)$
−2	2	$(-2, 2)$
−4	0	$(-4, 0)$

(b)

Figure 16.5.2.8 The graph of y = f(−x) and a table of key points on the graph.

Thus, to produce the graph of y = f(−x), simply reflect the graph of y = f(x) across the y-axis.

Let's summarize what we've learned about horizontal reflections.



(a) $y = f(x)$ (b) $y = f(-x)$

Figure 16.5.2.9 The graph of y = f(−x) is a reflection of the graph of y = f(x) across the y-axis.

A Visual Summary — Horizontal Reflections

Consider the images in Figure 16.5.2.9

- In Figure 16.5.2.9(a), we see pictured the original graph of y = f(x).
- In Figure 16.5.2.9(b), the graph of y = f(−x) is a reflection of the graph of y = f(x) across the y-axis.

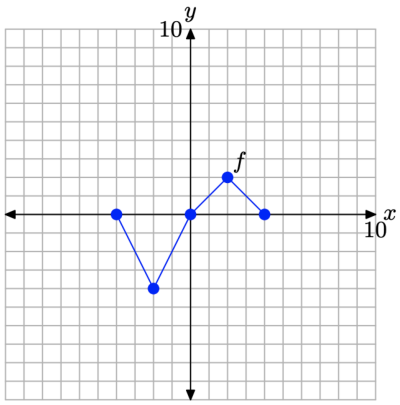
Thus, given the graph of y = f(x), it is a simple task to draw the graph of y = f(−x).

- To draw the graph of y = f(−x), take each point on the graph of y = f(x) and reflect it across the y-axis, keeping the y-value the same, but negating the x-value.

Horizontal Translations

In the previous section, we saw that the graphs of y = f(x) + c and y = f(x) − c were vertical translations of the graph of y = f(x). If c is a positive number, then the graph of y = f(x) + c shifts c units upward while the graph of y = f(x) − c shifts c units downward.

In this section, we will study horizontal translations. For convenience, we begin by repeating the original graph of y = f(x) and its accompanying data in Figure 10.



(a)

x	$f(x)$	$(x, f(x))$
-4	0	$(-4, 0)$
-2	-4	$(-2, -4)$
0	0	$(0, 0)$
2	2	$(2, 2)$
4	0	$(4, 0)$

(b)

Figure 16.5.2.10 The original graph of f and a table of key points on the graph of f

Example 16.5.2.5

If y = f(x) has the graph shown in Figure 16.5.2.10(a), sketch the graph of y = f(x + 1).

Solution

In the previous section, we drew the graph of y = f(x)+1. Note that in y = f(x)+1, the number 1 is outside the function. The result was a graph that was shifted 1 unit upwards in the y-direction.

In this case, y = f(x + 1) and the 1 is inside the function notation, leading one to intuit that the translation might be in the horizontal direction (x-direction). But how?

Again, we will set up a table of points that satisfy the equation y = f(x + 1), then plot them. Because this function requires that we first add 1 to each x-value before inserting it into the function, we will choose x-values appropriately, namely x = −5, −3, −1, 1, and 3. In a moment, it will be clear why we have chosen these particular values of x. Perhaps you already see why?

We need to evaluate the function y = f(x + 1) at each of these chosen values of x. To evaluate y = f(x+ 1) at the first value, namely x = −5, we insert x = −5 and make the calculation

$$y = f(-5+1) = f(-4)$$

To complete the calculation, we must now evaluate f(−4). However, this result is recorded in the table in Figure 16.5.2.10(b). There we find that f(−4) = 0, and we can complete the calculation started above.

$$y = f(-5+1) = f(-4) = 0$$

In similar fashion, we can evaluate the function y = f(x+1) at x = −3. First, substitute x = −3 in y = f(x + 1) to obtain

$$y = f(-3+1) = f(-2)$$

To complete the calculation, we must now evaluate f(−2). However, this result is recorded in the table in Figure 16.5.2.10(b). There we find that f(−2) = −4, and we can complete the calculation started above.

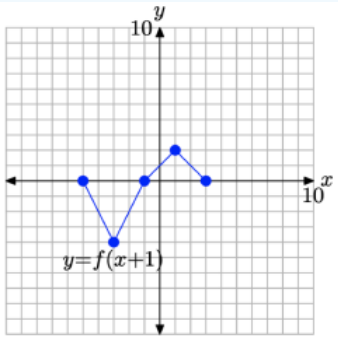
$$y = f(-3+1) = f(-2) = -4$$

At this point, you might see why we chose x-values: −5, −3, −1, 1, and 3. These are precisely one less than the x-values in the table of original values for the function y = f(x) in Figure 16.5.2.10(b). When the values −5, −3, −1, 1, and 3 are substituted into the function y = f(x + 1), we first add 1 to each value before we go to look up the function value in the table in Figure 16.5.2.10(b). This adding of 1 leads to the values −4, −2, 0, 2, and 4, which are precisely the values available in the table in Figure 16.5.2.10(b).

Continuing in this manner, we evaluate the function y = f(x + 1) at the remaining values of x, namely, −1, 1, and 3.

$$y = f(-1+1) = f(0) = 0$$
$$y = f(1+1) = f(2) = 2$$
$$y = f(3+1) = f(4) = 0$$

We assemble these results in the table in Figure 16.5.2.11(b) and plot them in Figure 16.5.2.11(a).



(a)

x	$y = f(x+1)$	$(x, f(x+1))$
-5	0	$(-5, 0)$
-3	-4	$(-3, -4)$
-1	0	$(-1, 0)$
1	2	$(1, 2)$
3	0	$(3, 0)$

(b)

Figure 16.5.2.11 The graph of y = f(x + 1) and a table of key points on the graph

When you compare the points on the graph of y = f(x+1) in the table in Figure 16.5.2.11(b) with the original points on the graph of y = f(x) in the table in Figure 16.5.2.10(b), note that the y-values are identical, but the x-values in the table in Figure 16.5.2.11(b) are all 1 unit less than the corresponding x-values in the table in Figure 16.5.2.10(b). It is no wonder that the graph of y = f(x + 1) in Figure 16.5.2.11(a) is shifted 1 unit to the left of the original graph of y = f(x) in Figure 16.5.2.10(a).

Note that this is somewhat counterintuitive, because we're seemingly adding 1 to each x-value in y = f(x + 1). Why doesn't the graph move one unit to the right? Well, a careful comparison of the x-values in the tables in Figures 16.5.2.10(b) and 16.5.2.11(b) reveals the answer. In order to use the data in the table in Figure 16.5.2.10(b), we must first subtract 1 from each x-value to produce the x-values in the table in Figure 16.5.2.11(b). This is why the graph of y = f(x + 1) moves 1 unit to the left instead of 1 unit to the right.

You might also recall that the function y = f(2x) compressed by a factor of 2, which is also the opposite of what intuition might dictate. Similarly, the function y = f((1/2)x) stretches by a factor of 2, which also goes counter to intuition. With these thoughts in mind, it is not surprising that y = f(x+ 1) shifts one unit to the left. Still, a comparison of the x-values in the tables in Figures 16.5.2.10(b) and 16.5.2.11(b) provide irrefutable evidence that the shift is 1 unit to the left.

Let's look at another example.

Example 16.5.2.6

If y = f(x) has the graph shown in Figure 16.5.2.10(a), sketch the graph of y = f(x − 2).

Solution

Again, we will set up a table of points that satisfy the equation y = f(x − 2), then plot them. Because this function requires that we first subtract 2 from each x-value before inserting it into the function, we will choose x-values: −2, 0, 2, 4, and 6. We need to evaluate the function y = f(x − 2) at each of these values of x.

To evaluate y = f(x − 2) at the first value, namely x = −2, insert x = −2 into the function y = f(x − 2) to obtain

$$y = f(-2-2) = f(-4)$$

In the table in Figure 16.5.2.10(b), we find that f(−4) = 0, which allows us to complete the calculation above.

$$y = f(-2-2) = f(-4) = 0$$

In similar fashion, we evaluate y = f(x − 2) at x = 0 to obtain

$$y = f(0-2) = f(-2)$$

In the table in Figure 16.5.2.10(b), we find that f(−2) = −4, which allows us to complete the calculation above.

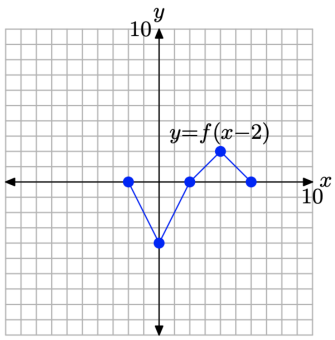
$$y = f(0-2) = f(-2) = -4$$

Hopefully, you see why we chose the x-values: −2, 0, 2, 4, and 6. These values are 2 larger than the x-values in the table of original values for the function y = f(x) in Figure 16.5.2.10(b). When the values −2, 0, 2, 4, and 6 are substituted into the function y = f(x − 2), we first subtract 2 from each value before we go to look up the function value in the table in Figure 16.5.2.10(b). This subtracting of 2 leads to −4, −2, 0, 2, and 4, precisely the values that are available in the table in Figure 16.5.2.10(b).

Continuing in this manner, we evaluate y = f(x − 2) at the remaining values of x, namely, x = 2, 4, and 6.

$$y = f(2-2) = f(0) = 0$$
$$y = f(4-2) = f(2) = 2$$
$$y = f(6-2) = f(4) = 0$$

We assemble these results in the table in Figure 16.5.2.12(b) and plot them in Figure 16.5.2.12(a).



(a)

x	$y = f(x-2)$	$(x, f(x-2))$
-2	0	$(-2, 0)$
0	-4	$(0, -4)$
2	0	$(2, 0)$
4	2	$(4, 2)$
6	0	$(6, 0)$

(b)

Figure 16.5.2.12 The graph of y = f(x − 2) and a table of key points on the graph.

When you compare the points on the graph of y = f(x−2) in the table in Figure 16.5.2.12(b) with the original points on the graph of y = f(x) in the table in Figure 16.5.2.10(b), note that the y-values are identical, but the x-values in the table in Figure 16.5.2.12(b) are all 2 larger than the corresponding x-values in the table in Figure 16.5.2.10(b). It is no wonder that the graph of y = f(x − 2) in Figure 16.5.2.12(a) is shifted 2 units to the right of the original graph of y = f(x) in Figure 16.5.2.10(a).

Again, this runs counterintuitive (why doesn't the graph of y = f(x − 2) shift 2 units to the left?), but a comparison of the x-values in the tables in Figures 16.5.2.10(b) and 16.5.2.12(b) clearly indicates a shift to the right.

Let's summarize what we've learned about horizontal translations.

Visual Summary — Horizontal Translations (Shifts)

Consider the images in Figure 16.5.2.13

- In Figure 16.5.2.13(a), we see pictured the graph of the original function y = f(x).
- In Figure 16.5.2.13(b), note that each point on the graph of y = f(x + 1) has an x-value that is 1 unit less than the x-value of the corresponding point on the graph of y = f(x) in Figure 16.5.2.13(a).
- In Figure 16.5.2.13(c), note that each point on the graph of y = f(x − 2) has an x-value that is 2 units greater than the x-value of the corresponding point on the graph of y = f(x) in Figure 16.5.2.13(a).
- Note that the y-value of each transformed point remains the same.

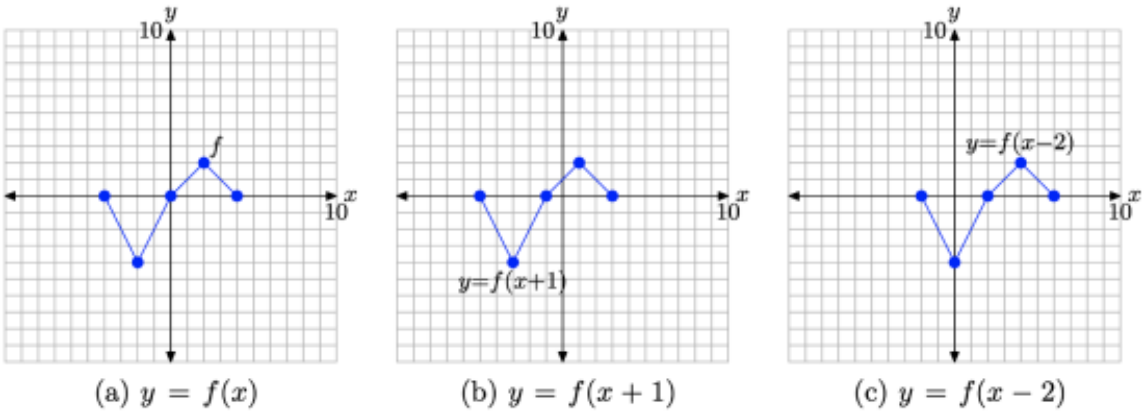


Figure 16.5.2.13 The graph of y = f(x + 1) is formed by shifting (horizontally) the graph of y = f(x) one unit to the left. The graph of y = f(x − 2) is formed by shifting (horizontally) the graph of y = f(x) two units to the right.

The visual summary in Figure 16.5.2.13makes sketching the graphs of y = f(x + 1) and y = f(x − 2) an easy task.

- Given the graph of y = f(x), to sketch the graph of y = f(x + 1), simply take each point on the graph of y = f(x) and shift it 1 unit to the left, keeping the same y-value.
- Given the graph of y = f(x), to sketch the graph of y = f(x − 2), simply take each point on the graph of y = f(x) and shift it 2 units to the right, keeping the same y-value.

In general, we can state the following.

Summary

Suppose that we are given the graph of y = f(x) and suppose that c is any positive real number.

- The graph of y = f(x+c) is shifted c units to the left of the graph of y = f(x).
- The graph of y = f(x−c) is shifted c units to the right of the graph of y = f(x).

When we looked at vertical translations in the previous section, a translation was described by first imagining a graph on a sheet of transparent plastic, then sliding the transparency (without rotating it) over a coordinate system on a sheet of graph paper. Horizontal translations can be thought of in the same way, as sliding the graph on the transparency c units to the left, or c units to the right.

Extra Practice

In this section, let's take the concepts from the Visual Summaries and put them to work on some final examples.

Example 16.5.2.7

Consider the graph of f in Figure 16.5.2.14

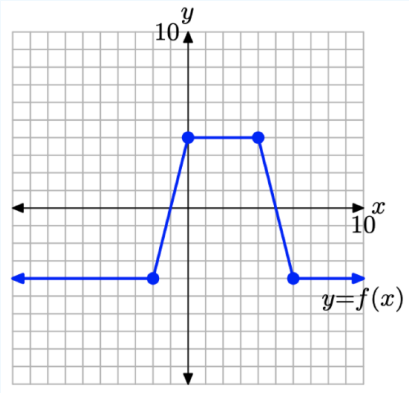

Figure 16.5.2.14 The graph of y = f(x) for Example 16.5.2.7.

Use the concepts from the Visual Summaries (scaling, reflection, and translation) to sketch the graphs of y = f(2x), y = f(−x), and y = f(x + 2) without creating and referring to tables.

Solution

To sketch the graph of y = f(2x), simply take each point on the graph of y = f(x) in Figure 16.5.2.15(a) and divide its x-value by 2, keeping the same y-value. The result is shown in Figure 16.5.2.15(b).

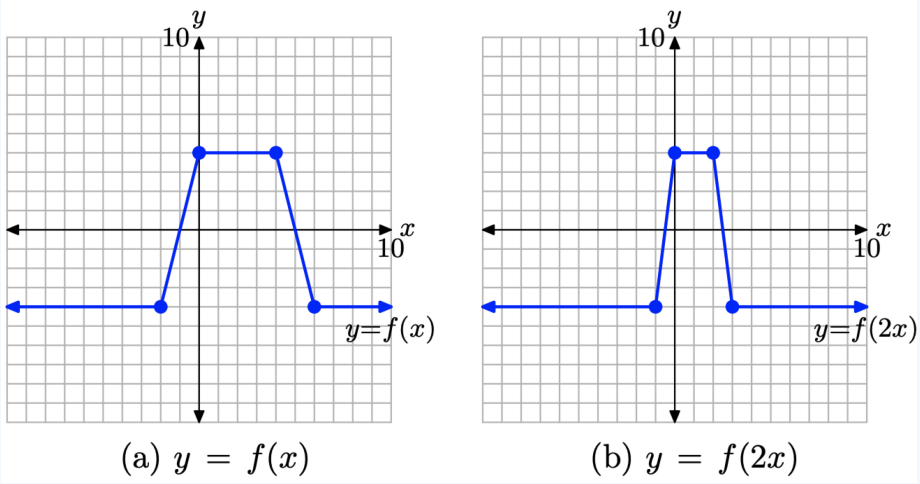

Figure 16.5.2.15 Compress the graph of y = f(x) by a factor of 2 to produce the graph of y = f(2x).

To sketch the graph of y = f(−x), simply take each point on the graph of y = f(x) in Figure 16.5.2.16(a) and negate its x-value, keeping the same y-value. The result is shown in Figure 16.5.2.16(b).

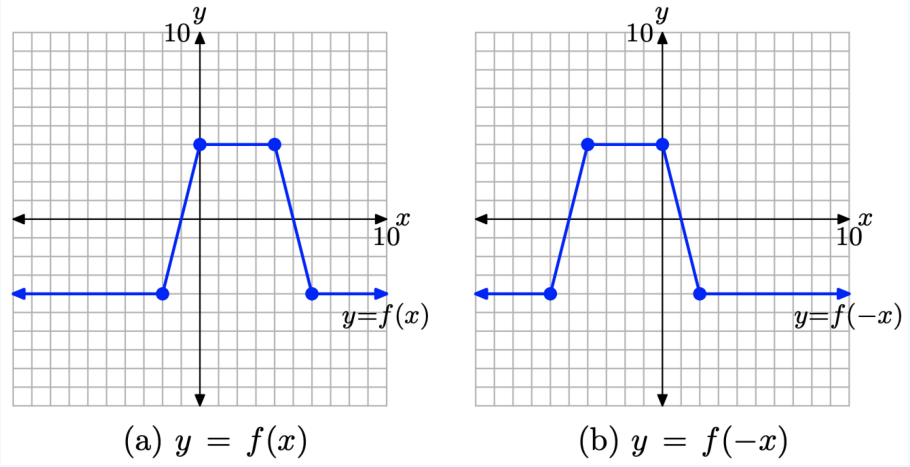

Figure 16.5.2.16 Reflect the graph of y = f(x) across the y-axis to produce the graph of y = f(−x).

To sketch the graph of y = f(x + 2), simply take each point on the graph of y = f(x) in Figure 16.5.2.17(a) and subtract 2 from its x-value, keeping the same y-value. The result is shown in Figure 16.5.2.17(b).

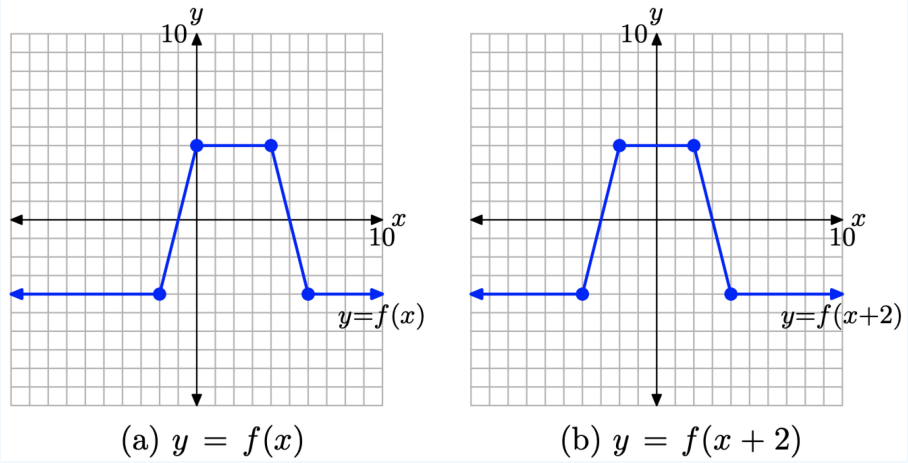

Figure 16.5.2.17 Shift the graph of y = f(x) to the left 2 units to produce the graph of y = f(x + 2).

Summary

In this section we've seen how a handful of transformations greatly enhance our graphing capability. We end this section by listing the transformations presented in this section and their effects on the graph of a function.

Vertical Transformations

Suppose we are given the graph of y = f(x).

- If a > 1, the graph of y = f(ax) compresses horizontally (toward the y-axis) , both positively and negatively, by a factor of a.
- If 0 < a < 1, the graph of y = f(ax) stretches horizontally (away from the y-axis), both positively and negatively, by a factor of 1/a.
- The graph of y = f(−x) is a reflection of the graph of y = f(x) across the y-axis.
- If c > 0, then the graph of y = f(x + c) is shifted c units to the left of the graph of y = f(x).
- If c > 0, then the graph of y = f(x − c) is shifted c units to the right of the graph of y = f(x).

16.5.3: Graph Quadratic Functions Using Transformations

Learning Objectives

By the end of this section, you will be able to:

- Graph quadratic functions of the form $f(x) = x^2 + k$
- Graph quadratic functions of the form $f(x) = (x - h)^2$
- Graph quadratic functions of the form $f(x) = ax^2$
- Graph quadratic functions using transformations
- Find a quadratic function from its graph

Before you get started, take this readiness quiz.

1. Graph the function $f(x) = x^2$ by plotting points.
   If you missed this problem, review Example 3.54.
2. Factor completely: $y^2 - 14y + 49$.
   If you missed this problem, review Example 6.24.
3. Factor completely: $2x^2 - 16x + 32$.
   If you missed this problem, review Example 6.26.

Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the last section, we learned how to graph quadratic functions using their properties. Another method involves starting with the basic graph of $f(x) = x^2$ and 'moving' it according to information given in the function equation. We call this graphing quadratic functions using transformations.

In the first example, we will graph the quadratic function $f(x) = x^2$ by plotting points. Then we will see what effect adding a constant, k, to the equation will have on the graph of the new function $f(x) = x^2 + k$.

Example 16.5.3.1

Graph $f(x) = x^2$, $g(x) = x^2 + 2$, and $h(x) = x^2 - 2$ on the same rectangular coordinate system. Describe what effect adding a constant to the function has on the basic parabola.

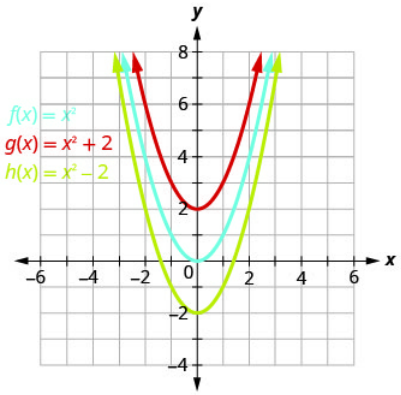
Solution:

Plotting points will help us see the effect of the constants on the basic $f(x) = x^2$ graph. We fill in the chart for all three functions.

x	$f(x) = x^2$	$(x, f(x))$	$g(x) = x^2 + 2$	$(x, g(x))$	$h(x) = x^2 - 2$	$(x, h(x))$
–3	9	(–3, 9)	9 + 2	(–3, 11)	9 – 2	(–3, 7)
–2	4	(–2, 4)	4 + 2	(–2, 6)	4 – 2	(–2, 2)
–1	1	(–1, 1)	1 + 2	(–1, 3)	1 – 2	(–1, 1)
0	0	(0, 0)	0 + 2	(0, 2)	0 – 2	(0, –2)
1	1	(1, 1)	1 + 2	(1, 3)	1 – 2	(1, –1)
2	4	(2, 4)	4 + 2	(2, 6)	4 – 2	(2, 2)
3	9	(3, 9)	9 + 2	(3, 11)	9 – 2	(3, 7)

Figure 9.7.1

The $g(x)$ values are two more than the $f(x)$ values. Also, the $h(x)$ values are two less than the $f(x)$ values. Now we will graph all three functions on the same rectangular coordinate system.



The graph of $g(x) = x^2 + 2$ is the same as the graph of $f(x) = x^2$ but shifted up 2 units.

The graph of $h(x) = x^2 - 2$ is the same as the graph of $f(x) = x^2$ but shifted down 2 units.

Figure 9.7.2

The graph of $g(x) = x^2 + 2$ is the same as the graph of $f(x) = x^2$ but shifted up 2 units.

The graph of $h(x) = x^2 - 2$ is the same as the graph of $f(x) = x^2$ but shifted down 2 units.

Exercise 16.5.3.1

a. Graph $f(x) = x^2, g(x) = x^2 + 1,$ and $h(x) = x^2 - 1$ on the same rectangular coordinate system.
b. Describe what effect adding a constant to the function has on the basic parabola.

Answer

a.

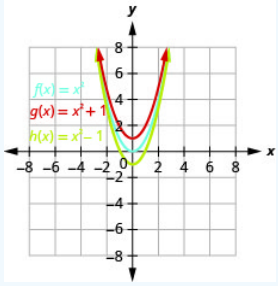


Figure 9.7.3

b. The graph of $g(x) = x^2 + 1$ is the same as the graph of $f(x) = x^2$ but shifted up 1 unit. The graph of $h(x) = x^2 - 1$ is the same as the graph of $f(x) = x^2$ but shifted down 1 unit.

Exercise 16.5.3.2

a. Graph $f(x) = x^2, g(x) = x^2 + 6,$ and $h(x) = x^2 - 6$ on the same rectangular coordinate system.
b. Describe what effect adding a constant to the function has on the basic parabola.

Answer

a.

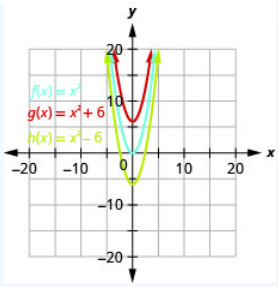

Figure 9.7.4

b. The graph of $h(x) = x^2 + 6$ is the same as the graph of $f(x) = x^2$ but shifted up 6 units. The graph of $h(x) = x^2 - 6$ is the same as the graph of $f(x) = x^2$ but shifted down 6 units.

The last example shows us that to graph a quadratic function of the form $f(x) = x^2 + k$, we take the basic parabola graph of $f(x) = x^2$ and vertically shift it up $(k > 0)$ or shift it down $(k < 0)$.

This transformation is called a vertical shift.

Graph a Quadratic Function of the Form $f(x) = x^2 + k$ Using a Vertical Shift

The graph of $f(x) = x^2 + k$ shifts the graph of $f(x) = x^2$ vertically k units.

- If $k > 0$, shift the parabola vertically up k units.
- If $k < 0$, shift the parabola vertically down $|k|$ units.

Now that we have seen the effect of the constant, k, it is easy to graph functions of the form $f(x) = x^2 + k$. We just start with the basic parabola of $f(x) = x^2$ and then shift it up or down.

It may be helpful to practice sketching $f(x) = x^2$ quickly. We know the values and can sketch the graph from there.

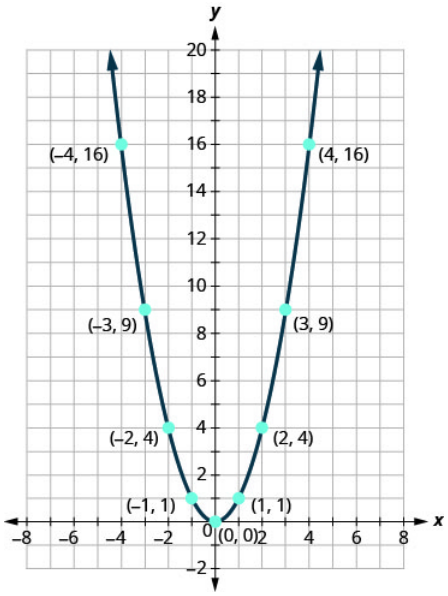

Figure 9.7.5

Once we know this parabola, it will be easy to apply the transformations. The next example will require a vertical shift.

Example 16.5.3.2

Graph $f(x) = x^2 - 3$ using a vertical shift.

Solution:

Table 9.7.1

We first draw the graph of $f(x) = x^2$ on the grid.	Determine k.	$f(x) = x^2 + k$ $f(x) = x^2 - 3$
	$k = -3$
Shift the graph $f(x) = x^2$ down 3.	
Exercise 16.5.3.3

Graph $f(x) = x^2 - 5$ using a vertical shift.

Answer

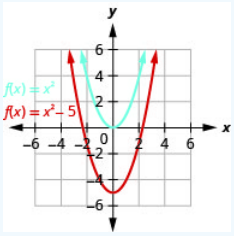

Figure 9.7.10

Exercise 16.5.3.4

Graph $f(x) = x^2 + 7$ using a vertical shift.

Answer

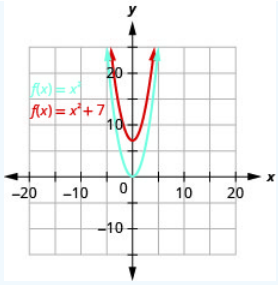

Figure 9.7.11

Graph Quadratic Functions of the Form $f(x) = (x - h)^2$

In the first example, we graphed the quadratic function $f(x) = x^2$ by plotting points and then saw the effect of adding a constant k to the function had on the resulting graph of the new function $f(x) = x^2 + k$.

We will now explore the effect of subtracting a constant, h, from x has on the resulting graph of the new function $f(x) = (x - h)^2$.

Example 16.5.3.3

Graph $f(x) = x^2, g(x) = (x - 1)^2,$ and $h(x) = (x + 1)^2$ on the same rectangular coordinate system. Describe what effect adding a constant to the function has on the basic parabola.

Solution:

Plotting points will help us see the effect of the constants on the basic $f(x) = x^2$ graph. We fill in the chart for all three functions.

x	$f(x) = x^2$	$(x, f(x))$	$g(x) = (x - 1)^2$	$(x, g(x))$	$h(x) = (x + 1)^2$	$(x, h(x))$
–3	9	(–3, 9)	16	(–3, 16)	4	(–3, 4)
–2	4	(–2, 4)	9	(–2, 9)	1	(–2, 1)
–1	1	(–1, 1)	4	(–1, 4)	0	(–1, 0)
0	0	(0, 0)	1	(0, 1)	1	(0, 1)
1	1	(1, 1)	0	(1, 0)	4	(1, 4)
2	4	(2, 4)	1	(2, 1)	9	(2, 9)
3	9	(3, 9)	4	(3, 4)	16	(3, 16)

Figure 9.7.12

The $g(x)$ values and the $h(x)$ values share the common numbers $0, 1, 4, 9,$ and 16, but are shifted.

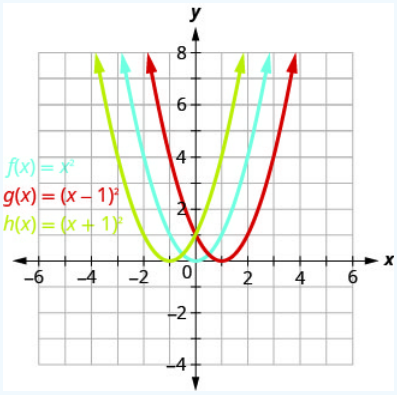

Figure 9.7.13

The graph of $g(x) = (x - 1)^2$ is the same as the graph of $f(x) = x^2$ but shifted right 1 unit.

The graph of $h(x) = (x + 1)^2$ is the same as the graph of $f(x) = x^2$ but shifted left 1 unit.

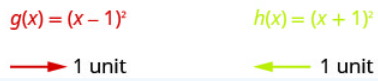

Figure 9.7.14

? Exercise 16.5.3.5

a. Graph $f(x) = x^2, g(x) = (x+2)^2,$ and $h(x) = (x-2)^2$ on the same rectangular coordinate system.
b. Describe what effect adding a constant to the function has on the basic parabola.

Answer

a.

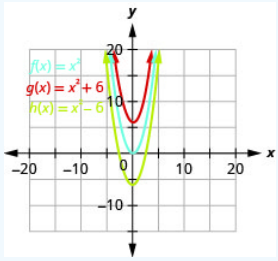

Figure 9.7.15

b. The graph of $g(x) = (x+2)^2$ is the same as the graph of $f(x) = x^2$ but shifted left 2 units. The graph of $h(x) = (x-2)^2$ is the same as the graph of $f(x) = x^2$ but shift right 2 units.

? Exercise 16.5.3.6

a. Graph $f(x) = x^2, g(x) = x^2 + 5,$ and $h(x) = x^2 - 5$ on the same rectangular coordinate system.
b. Describe what effect adding a constant to the function has on the basic parabola.

Answer

a.

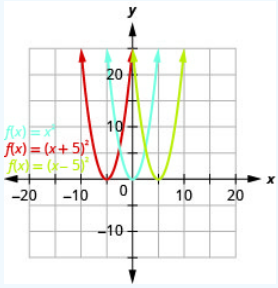

Figure 9.7.16

b. The graph of $g(x) = (x+5)^2$ is the same as the graph of $f(x) = x^2$ but shifted left 5 units. The graph of $h(x) = (x-5)^2$ is the same as the graph of $f(x) = x^2$ but shifted right 5 units.

The last example shows us that to graph a quadratic function of the form $f(x) = (x-h)^2$, we take the basic parabola graph of $f(x) = x^2$ and shift it left $(h > 0)$ or shift it right $(h < 0)$.

This transformation is called a horizontal shift.

Graph a Quadratic Function of the Form $f(x) = (x - h)^2$ Using a Horizontal Shift

The graph of $f(x) = (x - h)^2$ shifts the graph of $f(x) = x^2$ horizontally h units.

- If $h > 0$, shift the parabola horizontally left h units.
- If $h < 0$, shift the parabola horizontally right $|h|$ units.

Now that we have seen the effect of the constant, h, it is easy to graph functions of the form $f(x) = (x - h)^2$. We just start with the basic parabola of $f(x) = x^2$ and then shift it left or right.

The next example will require a horizontal shift.

Example 16.5.3.4

Graph $f(x) = (x - 6)^2$ using a horizontal shift.

Solution:

Table 9.7.2

We first draw the graph of $f(x) = x^2$ on the grid.	Determine h.	$f(x) = (x - h)^2$ $f(x) = (x - 6)^2$ $h = 6$
Shift the graph $f(x) = x^2$ to the right 6 units.	
Exercise 16.5.3.7

Graph $f(x) = (x-4)^2$ using a horizontal shift.

Answer

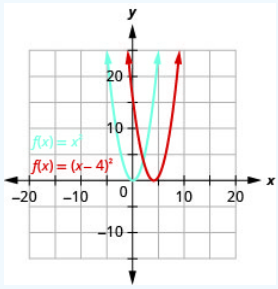

Figure 9.7.21

Exercise 16.5.3.8

Graph $f(x) = (x+6)^2$ using a horizontal shift.

Answer

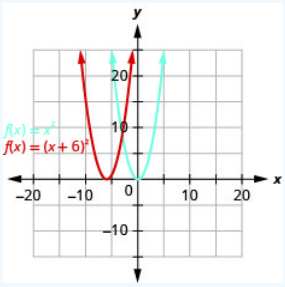

Figure 9.7.22

Now that we know the effect of the constants h and k, we will graph a quadratic function of the form $f(x) = (x-h)^2 + k$ by first drawing the basic parabola and then making a horizontal shift followed by a vertical shift. We could do the vertical shift followed by the horizontal shift, but most students prefer the horizontal shift followed by the vertical.

Example 16.5.3.5

Graph $f(x) = (x+1)^2 - 2$ using transformations.

Solution:

This function will involve two transformations and we need a plan.

Let's first identify the constants h, k.

$$f(x) = (x+1)^2 - 2$$

$$f(x) = (x-h)^2 + k$$

$$f(x) = (x-(-1))^2 + (-2)$$

$$h = -1 \quad k = -2$$

Figure 9.7.23

The h constant gives us a horizontal shift and the k gives us a vertical shift.

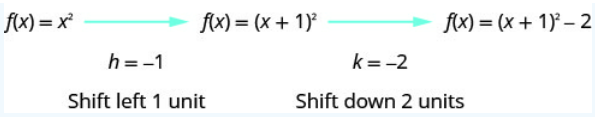

Figure 9.7.24

We first draw the graph of $f(x) = x^2$ on the grid.

To graph $f(x) = (x + 1)^2$, shift the graph $f(x) = x^2$ to the left 1 unit.

To graph $f(x) = (x + 1)^2 - 2$, shift the graph $f(x) = (x + 1)^2$ down 2 units.

Figure 9.7.25

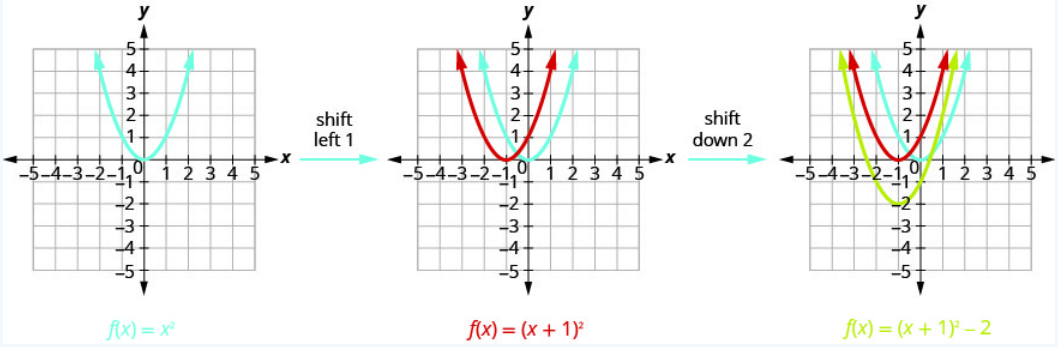

Figure 9.7.26

Exercise 16.5.3.9

Graph $f(x) = (x+2)^2 - 3$ using transformations.

Answer

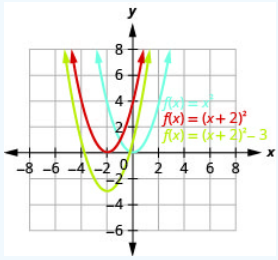

Figure 9.7.27

Exercise 16.5.3.10

Graph $f(x) = (x-3)^2 + 1$ using transformations.

Answer

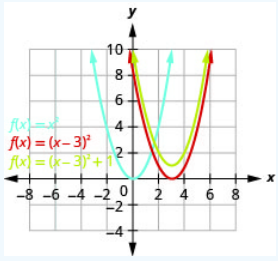

Figure 9.7.28

Graph Quadratic Functions of the Form $f(x) = ax^2$

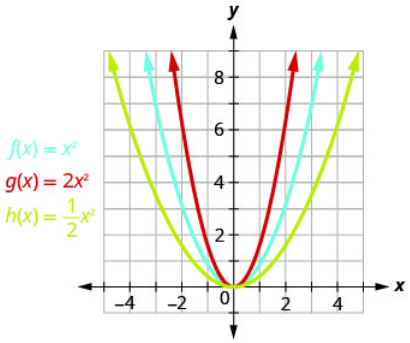
So far we graphed the quadratic function $f(x) = x^2$ and then saw the effect of including a constant h or k in the equation had on the resulting graph of the new function. We will now explore the effect of the coefficient a on the resulting graph of the new function $f(x) = ax^2$.

Let's look at the quadratic functions $f(x) = x^2$, $g(x) = 2x^2$ and $h(x) = \frac{1}{2}x^2$.

x	$f(x) = x^2$	$(x, f(x))$	$g(x) = 2x^2$	$(x, g(x))$	$h(x) = \frac{1}{2}x^2$	$(x, h(x))$
–2	4	(–2, 4)	2 • 4	(–2, 8)	$\frac{1}{2}$ • 4	(–2, 2)
–1	1	(–1, 1)	2 • 1	(–1, 2)	$\frac{1}{2}$ • 1	$\left(-1, \frac{1}{2}\right)$
0	0	(0, 0)	2 • 0	(0, 0)	$\frac{1}{2}$ • 0	(0, 0)
1	1	(1, 1)	2 • 1	(1, 2)	$\frac{1}{2}$ • 1	$\left(1, \frac{1}{2}\right)$
2	4	(2, 4)	2 • 4	(2, 8)	$\frac{1}{2}$ • 4	(2, 2)

Figure 9.7.29

If we graph these functions, we can see the effect of the constant a, assuming $a > 0$.



The graph of the function $g(x) = 2x^2$ is "skinnier" than the graph of $f(x) = x^2$.

The graph of the function $h(x) = \frac{1}{2}x^2$ is "wider" than the graph of $f(x) = x^2$.

Figure 9.7.30

To graph a function with constant a it is easiest to choose a few points on $f(x) = x^2$ and multiply the y-values by a.

Graph of a Quadratic Function of the Form $f(x) = ax^2$

The coefficient a in the function $f(x) = ax^2$ affects the graph of $f(x) = x^2$ by stretching or compressing it.

- If $0 < |a| < 1$, the graph of $f(x) = ax^2$ will be "wider" than the graph of $f(x) = x^2$.
- If $|a| > 1$, the graph of $f(x) = ax^2$ will be "skinnier" than the graph of $f(x) = x^2$.

Example 16.5.3.6

Graph $f(x) = 3x^2$.

Solution:

We will graph the functions $f(x) = x^2$ and $g(x) = 3x^2$ on the same grid. We will choose a few points on $f(x) = x^2$ and then multiply the y-values by 3 to get the points for $g(x) = 3x^2$.

	$f(x) = x^2$	$g(x) = 3x^2$	
x	$(x, f(x))$	$(x, g(x))$	
–2	(–2, 4)	(–2, 12)	$3 \cdot 4 = 12$
–1	(–1, 1)	(–1, 3)	$3 \cdot 1 = 3$
0	(0, 0)	(0, 0)	$3 \cdot 0 = 0$
1	(1, 1)	(1, 3)	$3 \cdot 1 = 3$
2	(2, 4)	(2, 12)	$3 \cdot 4 = 12$

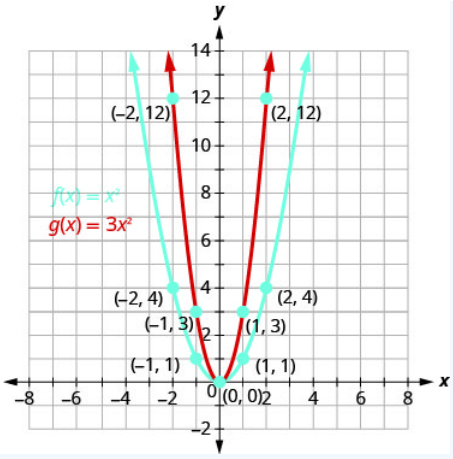


Figure 9.7.31

? Exercise 16.5.3.11

Graph $f(x) = -3x^2$.

Answer

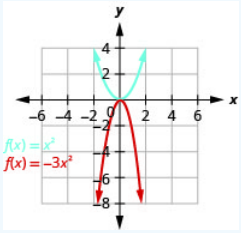

Figure 9.7.32

? Exercise 16.5.3.12

Graph $f(x) = 2x^2$.

Answer

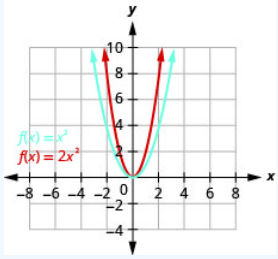

Figure 9.7.33

Graph Quadratic Functions Using Transformations

We have learned how the constants a, h, and k in the functions, $f(x) = x^2 + k, f(x) = (x - h)^2$, and $f(x) = ax^2$ affect their graphs. We can now put this together and graph quadratic functions $f(x) = ax^2 + bx + c$ by first putting them into the form $f(x) = a(x - h)^2 + k$ by completing the square. This form is sometimes known as the vertex form or standard form.

We must be careful to both add and subtract the number to the SAME side of the function to complete the square. We cannot add the number to both sides as we did when we completed the square with quadratic equations.

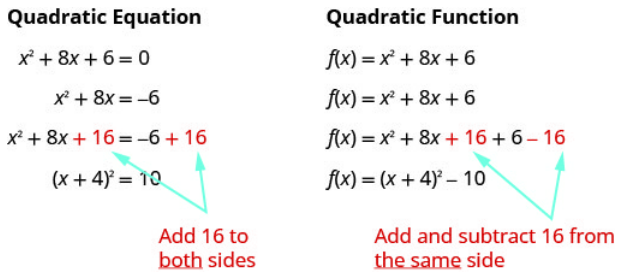

Figure 9.7.34

When we complete the square in a function with a coefficient of x^2 that is not one, we have to factor that coefficient from just the x-terms. We do not factor it from the constant term. It is often helpful to move the constant term a bit to the right to make it easier to focus only on the x-terms.

Once we get the constant we want to complete the square, we must remember to multiply it by that coefficient before we then subtract it.

Example 16.5.3.7

Rewrite $f(x) = -3x^2 - 6x - 1$ in the $f(x) = a(x-h)^2 + k$ form by completing the square.

Solution:

Table 9.7.3

	$f(x) = -3x^2 - 6x - 1$
Separate the x terms from the constant.	$f(x) = -3x^2 - 6x \quad - 1$
Factor the coefficient of x^2, -3.	$f(x) = -3(x^2 + 2x) \quad - 1$
Prepare to complete the square.	$f(x) = -3(x^2 + 2x \quad) \; - 1$
Take half of 2 and then square it to complete the square $(\frac{1}{2} \cdot 2)^2 = 1$	
The constant 1 completes the square in the parentheses, but the parentheses is multiplied by -3. So we are really adding -3. We must then add 3 to not change the value of the function.	$f(x) = -3(x^2 + 2x + 1) - 1 + 3$ $-3 \cdot 1 = -3$ so add 3
Rewrite the trinomial as a square and subtract the constants.	$f(x) = -3(x+1) + 2$
The function is now in the $f(x) = a(x-h)^2 + k$ form.	$f(x) = \quad a(x-h)^2 \quad + k$ $f(x) = -3(x+1)^2 + 2$

Exercise 16.5.3.13

Rewrite $f(x) = -4x^2 - 8x + 1$ in the $f(x) = a(x-h)^2 + k$ form by completing the square.

Answer

$f(x) = -4(x+1)^2 + 5$

Exercise 16.5.3.14

Rewrite $f(x) = 2x^2 - 8x + 3$ in the $f(x) = a(x-h)^2 + k$ form by completing the square.

Answer

$f(x) = 2(x-2)^2 - 5$

Once we put the function into the $f(x)=(x-h)^2+k$ form, we can then use the transformations as we did in the last few problems. The next example will show us how to do this.

Example 16.5.3.8

Graph $f(x)=x^2+6x+5$ by using transformations.

Solution:

Step 1: Rewrite the function in $f(x)=a(x-h)^2+k$ vertex form by completing the square.

Table 9.7.4

	$f(x)=x^2+6x+5$
Separate the x terms from the constant.	$f(x)=x^2+6x+5$
Take half of 6 and then square it to complete the square. $(\frac{1}{2}\cdot 6)^2=9$	
We both add 9 and subtract 9 to not change the value of the function.	$f(x)=x^2+6x+9+5-9$
Rewrite the trinomial as a square and subtract the constants.	$f(x)=(x+3)^2-4$
The function is now in the $f(x)=(x-h)^2+k$ form.	$f(x)=(x-h)^2+k$ $f(x)=(x+3)^2-4$

Step 2: Graph the function using transformations.

Looking at the h, k values, we see the graph will take the graph of $f(x)=x^2$ and shift it to the left 3 units and down 4 units.

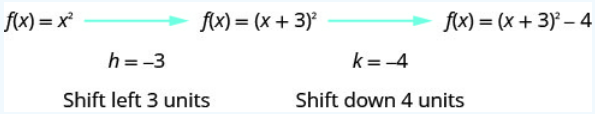

Figure 9.7.47

We first draw the graph of $f(x)=x^2$ on the grid.

To graph $f(x)=(x+3)^2$, shift the graph $f(x)=x^2$ to the left 3 units.

To graph $f(x)=(x+3)^2-4$, shift the graph $f(x)=(x+3)^2$ down 4 units.

Figure 9.7.48

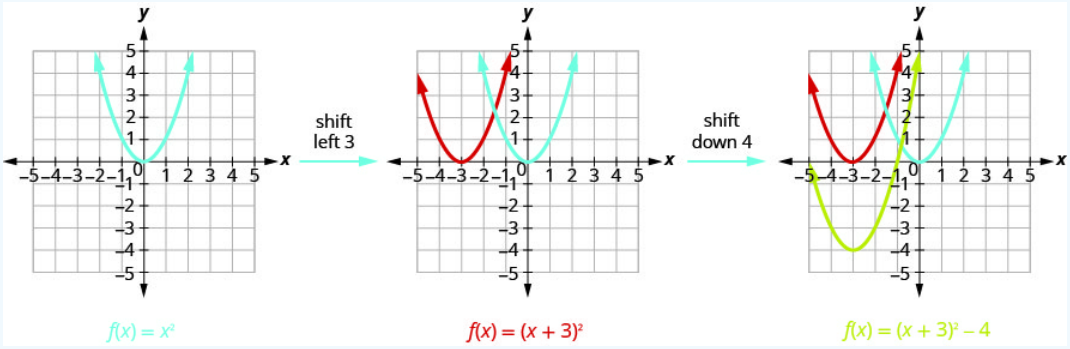

Figure 9.7.49

Exercise 16.5.3.15

Graph $f(x)=x^2+2x-3$ by using transformations.

Answer

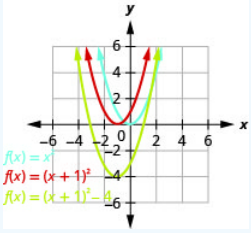

Figure 9.7.50

? Exercise 16.5.3.16

Graph $f(x) = x^2 - 8x + 12$ by using transformations.

Answer

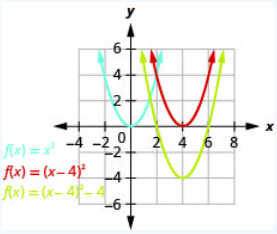

Figure 9.7.51

We list the steps to take a graph a quadratic function using transformations here.

Graph a Quadratic Function Using Transformations

1. Rewrite the function in $f(x) = a(x-h)^2 + k$ form by completing the square.
2. Graph the function using transformations.

✓ Example 16.5.3.9

Graph $f(x) = -2x^2 - 4x + 2$ by using transformations.

Solution:

Step 1: Rewrite the function in $f(x) = a(x-h)^2 + k$ vertex form by completing the square.

Table 9.7.5

	$f(x) = -2x^2 - 4x + 2$
Separate the x terms from the constant.	$f(x) = -2x^2 - 4x + 2$
We need the coefficient of x^2 to be one. We factor -2 from the x-terms.	$f(x) = -2(x^2 + 2x) + 2$
Take half of 2 and then square it to complete the square. $(\frac{1}{2} \cdot 2)^2 = 1$	
We add 1 to complete the square in the parentheses, but the parentheses is multiplied by -2. So we are really adding -2. To not change the value of the function we add 2.	$f(x) = -2(x^2 + 2x + 1) + 2 + 2$
Rewrite the trinomial as a square ad subtract the constants.	$f(x) = -2(x+1)^2 + 4$
The function is now in the $f(x) = a(x-h)^2 + k$ form.	$f(x) = a(x-h)^2 + k$ $f(x) = -2(x+1)^2 + 4$

Step 2: Graph the function using transformations.

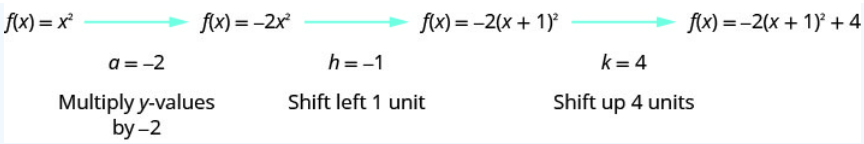

Figure 9.7.58

We first draw the graph of $f(x) = x^2$ on the grid.

To graph $f(x) = -2x^2$, multiply the y-values in parabola of $f(x) = x^2$ by -2.
To graph $f(x) = -2(x + 1)^2$, shift the graph $f(x) = -2x^2$ to the left 1 unit.
To graph $f(x) = -2(x + 1)^2 + 4$, shift the graph $f(x) = (x + 1)^2$ up 4 units.

Figure 9.7.59

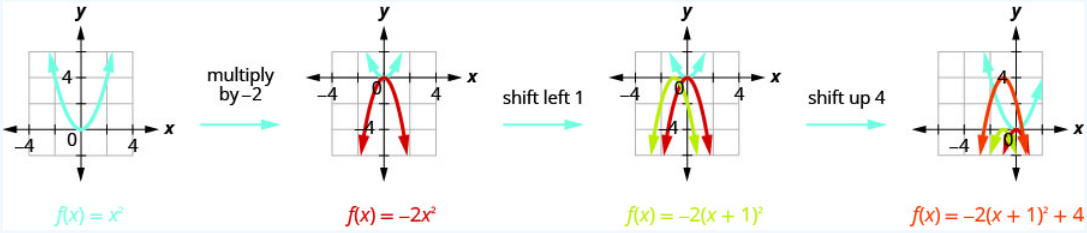

Figure 9.7.60

? Exercise 16.5.3.17

Graph $f(x) = -3x^2 + 12x - 4$ by using transformations.

Answer

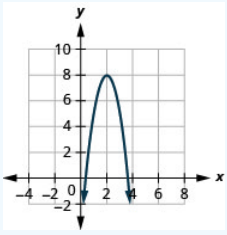

Figure 9.7.61

? Exercise 16.5.3.18

Graph $f(x) = -2x^2 + 12x - 9$ by using transformations.

Answer

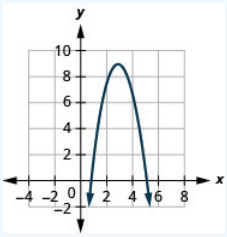

Figure 9.7.62

Now that we have completed the square to put a quadratic function into $f(x) = a(x - h)^2 + k$ form, we can also use this technique to graph the function using its properties as in the previous section.

If we look back at the last few examples, we see that the vertex is related to the constants h and k.

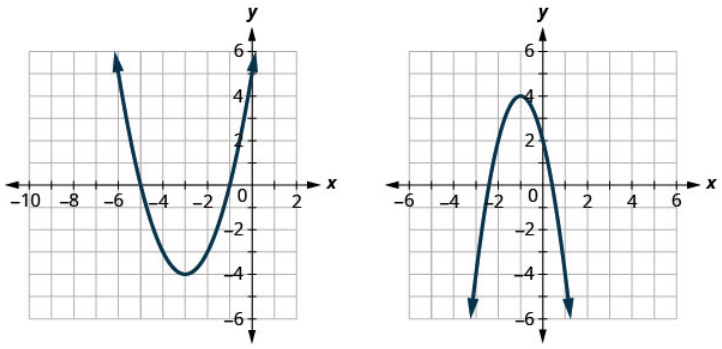

Figure 9.7.63

In each case, the vertex is (h, k). Also the **axis of symmetry** is the line $x = h$.

We rewrite our steps for graphing a quadratic function using properties for when the function is in $f(x) = a(x-h)^2 + k$ form.

Graph a Quadratic Function in the Form $f(x) = a(x-h)^2 + k$ Using Properties

1. Rewrite the function $f(x) = a(x-h)^2 + k$ form.
2. Determine whether the parabola opens upward, $a > 0$, or downward, $a < 0$.
3. Find the axis of symmetry, $x = h$.
4. Find the vertex, $(h, k$.
5. Find the y-intercept. Find the point symmetric to the y-intercept across the axis of symmetry.
6. Find the x-intercepts.
7. Graph the parabola.

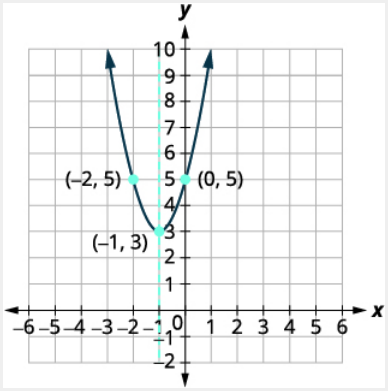
Example 16.5.3.10

a. Rewrite $f(x) = 2x^2 + 4x + 5$ in $f(x) = a(x-h)^2 + k$ form
b. Graph the function using properties

Solution:

Table 9.7.6

Rewrite the function in $f(x) = a(x-h)^2 + k$ form by completing the square.	$f(x) = 2x^2 + 4x + 5$
	$f(x) = 2\left(x^2 + 2x\right) + 5$
	$f(x) = 2\left(x^2 + 2x + 1\right) + 5 - 2$
	$f(x) = 2(x+1)^2 + 3$
Identify the constants a, h, k.	$a = 2 h = -1 k = 3$
Since $a = 2$, the parabola opens upward.	
The axis of symmetry is $x = h$.	The axis of symmetry is $x = -1$.
The vertex is (h, k).	The vertex is $(-1, 3)$.
Find the y-intercept by finding $f(0)$.	$f(0) = 2 \cdot 0^2 + 4 \cdot 0 + 5$
	$f(0) = 5$
	y-intercept $(0, 5)$

Find the point symmetric to $(0, 5)$ across the axis of symmetry.	$(-2, 5)$
Find the x-intercepts.	The discriminant is negative, so there are no x-intercepts. Graph the parabola.
	


Exercise 16.5.3.19

a. Rewrite $f(x) = 3x^2 - 6x + 5$ in $f(x) = a(x - h)^2 + k$ form
b. Graph the function using properties

Answer

a. $f(x) = 3(x - 1)^2 + 2$
b.

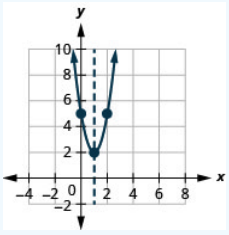


Figure 9.7.66

Exercise 16.5.3.20

a. Rewrite $f(x) = -2x^2 + 8x - 7$ in $f(x) = a(x - h)^2 + k$ form
b. Graph the function using properties

Answer

a. $f(x) = -2(x - 2)^2 + 1$
b.

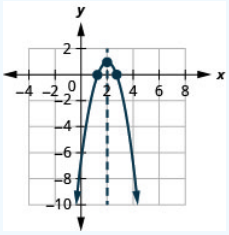

Figure 9.7.67

Find a Quadratic Function from its Graph

So far we have started with a function and then found its graph.

Now we are going to reverse the process. Starting with the graph, we will find the function.

Example 16.5.3.11

Determine the quadratic function whose graph is shown.

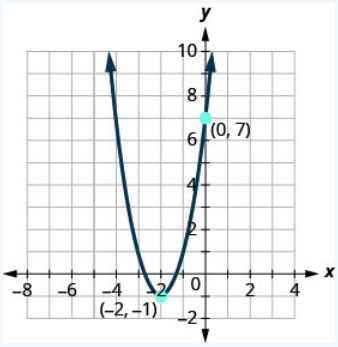

Figure 9.7.68

Solution:

Since it is quadratic, we start with the $f(x)=a(x-h)^2+k$ form.

The vertex, (h,k), is $(-2,-1)$ so $h=-2$ and $k=-1$.

$$f(x)=a(x-(-2))^2-1$$

To find a, we use the y-intercept, $(0,7)$.

So $f(0)=7$.

$$7=a(0+2)^2-1$$

Solve for a.

$$\begin{aligned} 7&=4a-1\\ 8&=4a\\ 2&=a \end{aligned}$$

Write the function.

$$f(x)=a(x-h)^2+k$$

Substitute in $h=-2, k=-1$ and $a=2$.

$$f(x)=2(x+2)^2-1$$

Exercise 16.5.3.21

Write the quadratic function in $f(x)=a(x-h)^2+k$ form whose graph is shown.

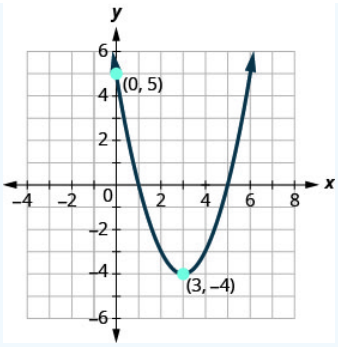

Figure 9.7.69

Answer

$f(x) = (x-3)^2 - 4$

? Exercise 16.5.3.22

Determine the quadratic function whose graph is shown.

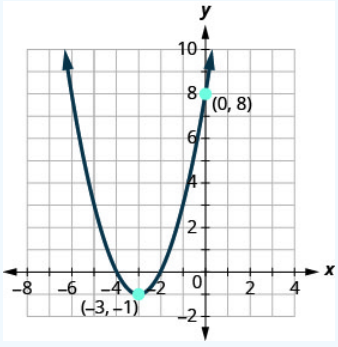

Figure 9.7.70

Answer

$f(x) = (x+3)^2 - 1$

Access these online resources for additional instruction and practice with graphing quadratic functions using transformations.

- Function Shift Rules Applied to Quadratic Functions
- Changing a Quadratic from Standard Form to Vertex Form
- Using Transformations to Graph Quadratic Functions
- Finding Quadratic Equation in Vertex Form from Graph

Key Concepts

- Graph a Quadratic Function of the form $f(x) = x^2 + k$ Using a Vertical Shift
  - The graph of $f(x) = x^2 + k$ shifts the graph of $f(x) = x^2$ vertically k units.
    - If $k > 0$, shift the parabola vertically up k units.
    - If $k < 0$, shift the parabola vertically down $|k|$ units.
- Graph a Quadratic Function of the form $f(x) = (x-h)^2$ Using a Horizontal Shift
  - The graph of $f(x) = (x-h)^2$ shifts the graph of $f(x) = x^2$ horizontally h units.
    - If $h > 0$, shift the parabola horizontally left h units.
    - If $h < 0$, shift the parabola horizontally right $|h|$ units.
- Graph of a Quadratic Function of the form $f(x) = ax^2$

- The coefficient a in the function $f(x) = ax^2$ affects the graph of $f(x) = x^2$ by stretching or compressing it.
  If $0 < |a| < 1$, then the graph of $f(x) = ax^2$ will be "wider" than the graph of $f(x) = x^2$.
  If $|a| > 1$, then the graph of $f(x) = ax^2$ will be "skinnier" than the graph of $f(x) = x^2$.

- How to graph a quadratic function using transformations
  1. Rewrite the function in $f(x) = a(x-h)^2 + k$ form by completing the square.
  2. Graph the function using transformations.

- Graph a quadratic function in the vertex form $f(x) = a(x-h)^2 + k$ using properties
  1. Rewrite the function in $f(x) = a(x-h)^2 + k$ form.
  2. Determine whether the parabola opens upward, $a > 0$, or downward, $a < 0$.
  3. Find the axis of symmetry, $x = h$.
  4. Find the vertex, (h, k).
  5. Find the y-intercept. Find the point symmetric to the y-intercept across the axis of symmetry.
  6. Find the x-intercepts, if possible.
  7. Graph the parabola.

16.5.3E: Exercises

Practice Makes Perfect

Exercise 16.5.3E. 23 Graph Quadratic Functions of the Form $f(x) = x^2 = k$

In the following exercises,

a. Graph the quadratic functions on the same rectangular coordinate system
b. Describe what effect adding a constant, k, to the function has on the basic parabola.

1. $f(x) = x^2, g(x) = x^2 + 4, \text{ and } h(x) = x^2 - 4$
2. $f(x) = x^2, g(x) = x^2 + 7, \text{ and } h(x) = x^2 - 7$

Answer

1.

a.

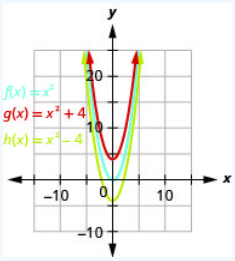

Figure 9.7.71

b. The graph of $g(x) = x^2 + 4$ is the same as the graph of $f(x) = x^2$ but shifted up 4 units. The graph of $h(x) = x^2 - 4$ is the same as the graph of $f(x) = x^2$ but shift down 4 units.

Exercise 16.5.3E. 24 Graph Quadratic Functions of the Form $f(x) = x^2 = k$

In the following exercises, graph each function using a vertical shift.

1. $f(x) = x^2 + 3$
2. $f(x) = x^2 - 7$
3. $g(x) = x^2 + 2$
4. $g(x) = x^2 + 5$
5. $h(x) = x^2 - 4$
6. $h(x) = x^2 - 5$

16.5E: Exercises

2.1 Exercises

In Exercises $16.5E.1$-$16.5E.6$, state the domain and range of the given relation.

Exercise $16.5E.1$

R = {(1, 3),(2, 4),(3, 4)}

Answer

The domain is the set of all first coordinates = {1, 2, 3}. The range is the set of all second coordinates {3, 4} (note that in a set you do not list an object twice, so we only list 4 once).

Exercise $16.5E.2$

R = {(1, 3),(2, 4),(2, 5)}

Exercise $16.5E.3$

R = {(1, 4),(2, 5),(2, 6)}

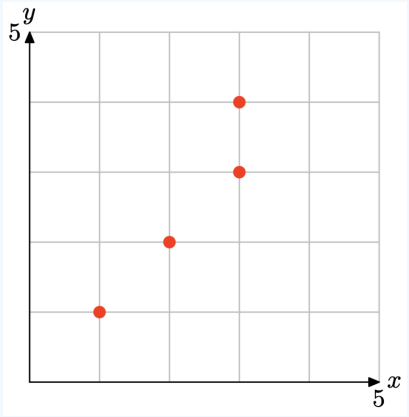
Answer

The domain is the set of all first coordinates = {1, 2} (note that in a set you do not list an object twice, so we only list 2 once). The range is the set of all second coordinates {4, 5, 6}.

Exercise $16.5E.4$

R = {(1, 5),(2, 4),(3, 6)}

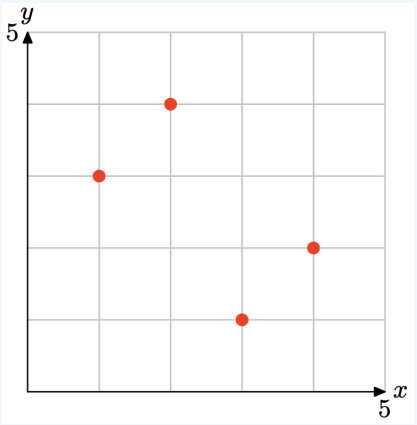
Exercise $16.5E.5$



Answer

Read off the x-coordinate of each point to get that the domain is {1, 2, 3}. Then read off the y-coordinates to get that the range is {1, 2, 3, 4}

Exercise 16.5E.6



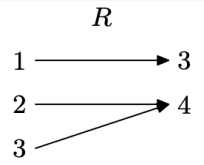
In Exercises 16.5E.7-16.5E.12, create a mapping diagram for the given relation and state whether or not it is a function.

Exercise 16.5E.7

The relation in Exercise 16.5E.1.

Answer

Create a mapping diagram for R.



Since no domain value is paired with two range values, this is a function (each x maps to a single y). Note that having two different domain values go to a single range value (2 and 3 both map to 4) is permissible for a function.

Exercise 16.5E.8

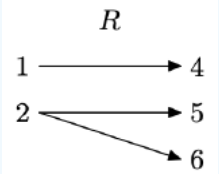
The relation in Exercise 16.5E.2.

Exercise 16.5E.9

The relation in Exercise 16.5E.3.

Answer

Create a mapping diagram for R.



The number 2 is mapped to two different range values (one x maps to two y's), so this is not a function.

Exercise 16.5E.10

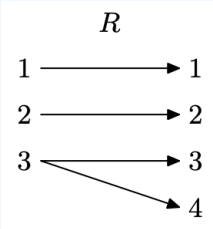
The relation in Exercise 16.5E.4.

Exercise 16.5E.11

The relation in Exercise 16.5E.5.

Answer

Create a mapping diagram for R.



The number 3 is mapped to two different range values (one x maps to two y's), so this is not a function.

Exercise 16.5E.12

The relation in Exercise 16.5E.6.

Exercise 16.5E.13

Given that g takes a real number and doubles it, then $g: x \rightarrow ?$.

Answer

Doubles means 'multiplies by 2,' so $g: x \rightarrow 2x$.

Exercise 16.5E.14

Given that f takes a real number and divides it by 3, then $f: x \rightarrow ?$.

Exercise 16.5E.15

Given that g takes a real number and adds 3 to it, then $g: x \rightarrow ?$.

Answer

$g: x \rightarrow x+3$

Exercise 16.5E.16

Given that h takes a real number and subtracts 4 from it, then $h: x \rightarrow ?$.

Exercise 16.5E.17

Given that g takes a real number, doubles it, then adds 5, then $g: x \rightarrow ?$

Answer

For an x put into g, g doubles it, giving 2x, and then adds five, resulting in 2x + 5. Therefore, $g: x \rightarrow 2x+5$

Exercise 16.5E.18

Given that h takes a real number, subtracts 3 from it, then divides the result by 4, then $h: x \rightarrow ?$

Given that the function f is defined by the rule $h: x \rightarrow 3x-5$, determine where the input number is mapped in Exercises 16.5E.19-16.5E.22.

Exercise 16.5E.19

$f: 3 \rightarrow ?$

Answer

Put 3 into f. This means, replace x with 3 and compute the output. $f: 3 \rightarrow 3(3)-5=4$, so $f: 3 \rightarrow 4$.

Exercise 16.5E.20

$f: -5 \rightarrow ?$

Exercise 16.5E.21

$f: a \rightarrow ?$

Answer

Put a into f, just like you would a number. This means, replace x with a and compute the output. $f: a \rightarrow 3(a)-5=3a-5$, so $f: 3 \rightarrow 3a-5$.

Exercise 16.5E.22

$f: 2a+3 \rightarrow ?$

Given that the function f is defined by the rule $f: x \rightarrow 4-5x$, determine where the input number is mapped in Exercises 16.5E.23-16.5E.26.

Exercise 16.5E.23

$f: 2 \rightarrow ?$

Answer

Put 2 into f by replacing x with it. $f: 2 \rightarrow 4-5(2)=-6$, so $f: 2 \rightarrow -6$.

Exercise 16.5E.24

$f: -3 \rightarrow ?$

Exercise 16.5E.25

$f: a \rightarrow ?$

Answer

Put a into f by replacing x with it, just as you would with a number. $f: a \rightarrow 4-5(a)$, so $f: 2 \rightarrow 4-5a$.

Exercise 16.5E.26

$f: 2a+11 \rightarrow ?$

Given that the function f is defined by the rule $f: x \rightarrow x^2 - 4x - 6$, determine where the input number is mapped in Exercises 16.5E.27-16.5E.30.

Exercise 16.5E.27

$f: 1 \rightarrow ?$

Answer

Put 1 into f by replacing x with it. $f: 1 \rightarrow (1)2 - 4(1) - 6 = 1 - 4 - 6 = -9$, so $f: 1 \rightarrow -9$.

Exercise 16.5E.28

$f: -2 \rightarrow ?$

Exercise 16.5E.29

$f: -1 \rightarrow ?$

Answer

Put −1 into f by replacing x with it. $f: -1 \rightarrow (-1)2 - 4(-1) - 6 = 1 + 4 - 6 = -1$, so $f: 1 \rightarrow -1$.

Exercise 16.5E.30

$f: a \rightarrow ?$

Given that the function f is defined by the rule $f: x \rightarrow 3x - 9$, determine where the input number is mapped in Exercises 16.5E.31-16.5E.34.

Exercise 16.5E.31

$f: a \rightarrow ?$

Answer

Put a into f by replacing x with it, just as you would with a number. $f: a \rightarrow 3a - 9$.

Exercise 16.5E.32

$f: a+1 \rightarrow ?$

Exercise 16.5E.33

$f: 2a - 5 \rightarrow ?$

Answer

Put 2a − 5 into f by replacing x with it, just as you would with a number. We get $f: 2a - 5 \rightarrow 3(2a - 5) - 9 = 6a - 15 - 9 = 6a - 24$, so $f: 2a - 5 \rightarrow 6a - 24$

Exercise 16.5E.34

$f: a+h \rightarrow ?$

Given that the functions f and g are defined by the rules $f: x \rightarrow 2x+3$ and $g: x \rightarrow 4-x$, determine where the input number is mapped in Exercises 16.5E.35- 16.5E.38.

Exercise 16.5E.35

$f: 2 \rightarrow ?$

Answer

Put 2 into f by replacing x with it. We get $f: 2 \rightarrow 2(2)+3=7$, so $f: 2 \rightarrow 7$.

Exercise 16.5E.36

$f: 2 \rightarrow ?$

Exercise 16.5E.37

$f: a+1 \rightarrow ?$

Answer

Put a + 1 into f by replacing x with it, just as you would with a number. We get $f: a+1 \rightarrow 2(a+1)+3=2a+2+3=2a+5$, so $f: a+1 \rightarrow 2a+5$

Exercise 16.5E.38

$f: a-3 \rightarrow ?$

Exercise 16.5E.39

Given that g takes a real number and triples it, then g(x) = ?.

Answer

Triples means 'multiplies by 3,' so g(x) = 3x

Exercise 16.5E.40

Given that f takes a real number and divides it by 5, then f(x) = ?.

Exercise 16.5E.41

Given that g takes a real number and subtracts it from 10, then g(x) = ?.

Answer

g takes an input x and subtracts it FROM 10, so g(x) = 10 − x.

Exercise 16.5E.42

Given that f takes a real number, multiplies it by 5 and then adds 4 to the result, then f(x) = ?.

Exercise 16.5E.43

Given that f takes a real number, doubles it, then subtracts the result from 11, then f(x) = ?.

Answer

f takes an input x, doubles it to get 2x, and takes this away FROM 11, getting 11 − 2x. Therefore, f(x) = 11 − 2x.

Exercise 16.5E.44

Given that h takes a real number, doubles it, adds 5, then takes the square root of the result, then h(x) = ?.

In Exercises 16.5E.45-16.5E.54, evaluate the given function at the given value b.

Exercise 16.5E.45

f(x) = 12x + 2 for b = 6.

Answer

Substitute 6 for x in 12x + 2 and simplify to get 74: f(6) = 12(6) + 2 = 74.

Exercise 16.5E.46

f(x) = −11x − 4 for b = −3.

Exercise 16.5E.47

f(x) = −9x − 1 for b = −5.

Answer

Substitute −5 for x in −9x−1 and simplify to get 44: f(−5) = −9(−5)−1 = 44.

Exercise 16.5E.48

f(x) = 11x + 4 for b = −4.

Exercise 16.5E.49

f(x) = 4 for b = −12.

Answer

f is a constant function, so f(x) = 4 for all x. Therefore, f(−12) = 4.

Exercise 16.5E.50

f(x) = 7 for b = −7.

Exercise 16.5E.51

f(x) = 0 for b = −7.

Answer

f is a constant function, so f(x) = 0 for all x. Therefore, f(−7) = 0.

Exercise 16.5E.52

f(x) = 12x + 8 for b = −3.

Exercise 16.5E.53

f(x) = −9x + 3 for b = −1.

Answer

Substitute −1 for x in −9x+3 and simplify to get 12: f(−1) = −9(−1)+3 = 12

Exercise 16.5E.54

f(x) = 6x − 3 for b = 3.

In Exercises 16.5E.55-16.5E.58, given that the function f is defined by the rule f(x) = 2x+ 7, determine where the input number is mapped.

Exercise 16.5E.55

f(a) = ?

Answer

Put a into f by replacing x with it, just as you would with a number. This yields f(a) = 2a + 7.

Exercise 16.5E.56

f(a + 1) = ?

Exercise 16.5E.57

f(3a − 2) = ?

Answer

Put 3a − 2 into f by replacing x with it, just as you would with a number. This yields f(3a − 2) = 2(3a − 2) + 7 = 6a − 4 + 7 = 6a + 3.

Exercise 16.5E.58

f(a + h) = ?

In Exercises 16.5E.59-16.5E.62, given that the function g is defined by the rule g(x) = 3 − 2x, determine where the input number is mapped.

Exercise 16.5E.59

g(a) = ?

Answer

Put a into g by replacing x with it, just as you would with a number. This yields g(a) = 3 − 2a.

Exercise 16.5E.60

g(a + 3) = ?

Exercise 16.5E.61

g(2 − 5a) = ?

Answer

Put 2 − 5a into g by replacing x with it, just as you would with a number. This yields g(2 − 5a) = 3 − 2(2 − 5a) = 3 − 4 + 10a = −1 + 10a or 10a − 1.

Exercise 16.5E.62

g(a + h) = ?

Given that the functions f and g are defined by the rules f(x) = 1 − x and g(x) = 2x + 13, determine where the input number is mapped in Exercises 16.5E.63- 16.5E.66.

Exercise 16.5E.63

f(a) = ?

Answer

Put a into f by replacing x with it, just as you would with a number. This yields f(a) = 1 − a.

Exercise 16.5E.64

g(a) = ?

Exercise 16.5E.65

f(a + 3) = ?

Answer

Put a + 3 into f by replacing x with it, just as you would with a number. This yields f(a + 3) = 1 − (a + 3) = 1 − a − 3 = −a − 2.

Exercise 16.5E.66

g(4 − a) = ?

Given that the functions f and g are defined by the rules f(x) = 3x + 4 and g(x) = 2x−5, determine where the input number is mapped in Exercises 16.5E.67-16.5E.70.

Exercise 16.5E.67

f(g(2)) = ?

Answer

First compute g(2) = 2(2) − 5 = −1. This means that f(g(2)) is really f(−1). Plugging −1 in for x into the function f, we get f(g(2)) = f(−1) = 3(−1) + 4 = −3 + 4 = 1.

Exercise 16.5E.68

g(f(2)) = ?

Exercise 16.5E.69

f(g(a)) = ?

Answer

First compute g(a) = 2a−5. This means that f(g(a)) is really f(2a−5). Plugging 2a − 5 in for x into the function f, we get f(g(a)) = f(2a − 5) = 3(2a − 5) + 4 = 6a − 15 + 4 = 6a − 11.

Exercise 16.5E.70

g(f(a)) = ?

Given that the functions f and g are defined by the rules f(x) = 2x − 9 and g(x) = 11, determine where the input number is mapped in Exercises 16.5E.71-16.5E.74.

Exercise 16.5E.71

f(g(2)) = ?

Answer

First compute g(2) = 11 (note that, no matter what you put into g, it outputs 11). This means that f(g(2)) is really f(11). Plugging 11 in for x into the function f, we get f(g(2)) = f(11) = 2(11) − 9 = 22 − 9 = 13.

Exercise 16.5E.72

g(f(2)) = ?

Exercise 16.5E.73

f(g(a)) = ?

Answer

First compute g(a) = 11 (note that, no matter what you put into g, it outputs 11). This means that f(g(a)) is really f(11). Plugging 11 in for x into the function f, we get f(g(2)) = f(11) = 2(11) − 9 = 22 − 9 = 13.

Exercise 16.5E.74

g(f(a)) = ?

Use set-builder notation to describe the domain of each of the functions defined in Exercises 16.5E.75-16.5E.78.

Exercise 16.5E.75

$$f(x) = \frac{93}{x+98}$$

Answer

An input of x = −98 would cause division by zero, so −98 is not in the domain. All other possible inputs are valid. The domain, in set-builder notation, is $\{x : x \neq -98\}$.

Exercise 16.5E.76

$$f(x) = \frac{54}{x+65}$$

Exercise 16.5E.77

$$f(x) = -\frac{87}{x-88}$$

Answer

An input of x = 88 would cause division by zero, so 88 is not in the domain. All other possible inputs are valid. The domain, in set-builder notation, is $\{x : x \neq 88\}$..

Exercise 16.5E.78

$$f(x) = -\frac{30}{x-52}$$

Use set-builder and interval notation to describe the domain of the functions defined in Exercises 16.5E.79-16.5E.82

Exercise 16.5E.79

$$f(x) = \sqrt{x+69}$$

Answer

The square root of a negative number is not defined as a real number. Thus, x + 69 must be greater than or equal to zero. Then $x+69geq0$ implies that $x \geq -69$, so the domain is the interval $[-69, \infty)$, or in set-builder notation, $\{x : x \geq -69\}$.

Exercise 16.5E.80

$$f(x) = \sqrt{x+62}$$

Exercise 16.5E.81

$$f(x) = \sqrt{x-81}$$

Answer

The square root of a negative number is not defined as a real number. Thus, x − 81 must be greater than or equal to zero. Then $x - 81 \geq 0$ implies that $x \geq 81$, so the domain is the interval $[81, \infty)$, or in set-builder notation, $\{x : x \geq 81\}$.

Exercise 16.5E.82

$f(x) = \sqrt{x - 98}$

Two integers are said to be relatively prime if their greatest common divisor is 1. For example, the greatest common divisor of 6 and 35 is 1, so 6 and 35 are relatively prime. On the other hand, the greatest common divisor of 14 and 21 is not 1 (it is 7), so 14 and 21 are not relatively prime. The Euler ϕ-function is defined as follows:

• If n = 1, then $\phi(n) = 1$.

• If n > 1, then $\phi(n)$ is the number of positive integers less than n that are relatively prime to n. In Exercises $16.5E.83$- $16.5E.84$, evaluate the Euler ϕ-function at the given input.

Exercise 16.5E.83

$\phi(12)$

Answer

1, 5, 7, and 11 are less than 12 and are each relatively prime to 12. Therefore, $\phi(12) = 4$.

Exercise 16.5E.84

$\phi(36)$

2.2 Exercises

Perform each of the following tasks for the functions defined by the equations in Exercises $16.5E.1$-$16.5E.8$.

i. Set up a table of points that satisfy the given equation. Please place this table of points next to your graph on your graph paper.

ii. Set up a coordinate system on a sheet of graph paper. Label and scale each axis, then plot each of the points from your table on your coordinate system.

iii. If you are confident that you "see" the shape of the graph, make a "leap of faith" and plot all pairs that satisfy the given equation by drawing a smooth curve (free-hand) on your coordinate system that contains all previously plotted points (use a ruler only if the graph of the equation is a line). If you are not confident that you "see" the shape of the graph, then add more points to your table, plot them on your coordinate system, and see if this helps. Continue this process until you "see" the shape of the graph and can fill in the rest of the points that satisfy the equation by drawing a smooth curve (or line) on your coordinate system.

Exercise 16.5E.1

$f(x) = 2x + 1$

Answer

Evaluate the function $f(x) = 2x + 1$ at −2, −1, 0, and 1.

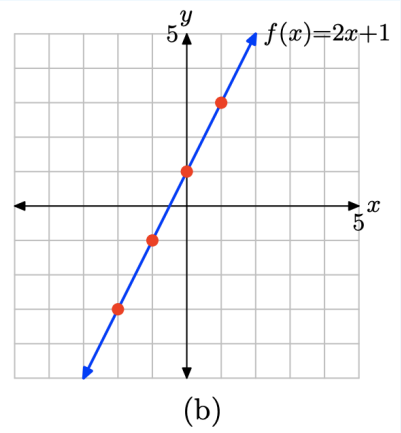
$$\begin{aligned} f(-2) &= 2(-2)+1 &&= -3 \\ f(-1) &= 2(-1)+1 &&= -1 \\ f(0) &= 2(0)+1 &&= 1 \\ f(1) &= 2(1)+1 &&= 3 \end{aligned}$$

Place these results in table (a) and plot them as shown in (b). There is enough evidence here to intuit that the graph of f is the line shown in (b).

x	$f(x) = 2x + 1$	(x, f(x))
-2	-3	(−2, −3)
-1	-1	(−1, −1)

x	$f(x)=2x+1$	(x, f(x))
0	1	(0,1)
1	3	(1,3)

(a)



(b)

? Exercise $16.5E.2$

$f(x)=1-x$

? Exercise $16.5E.3$

$f(x)=3-\frac{1}{2}x$

Answer

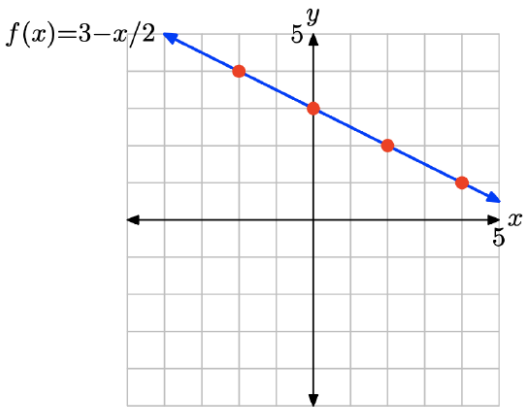
Evaluate the function f(x) = 3 − (1/2)x at x = −2, 0, 2, and 4.

$$f(-2)=3-(1/2)(-2)=4$$
$$f(0)=3-(1/2)(0)=3$$
$$f(2)=3-(1/2)(2)=2$$
$$f(4)=3-(1/2)(4)=1$$

Place these results in table (a) and plot them as shown in (b). There is enough evidence here to intuit that the graph of f is the line shown in (b).

x	$f(x)=3-x/2$	(x, f(x))
-2	4	(−2, 4)
0	3	(0,3)
2	2	(2,2)
4	1	(4,1)

(a)



(b)

Exercise 16.5E.4

$f(x) = -1 + \frac{1}{2}x$

Exercise 16.5E.5

$f(x) = x^2 - 2$

Answer

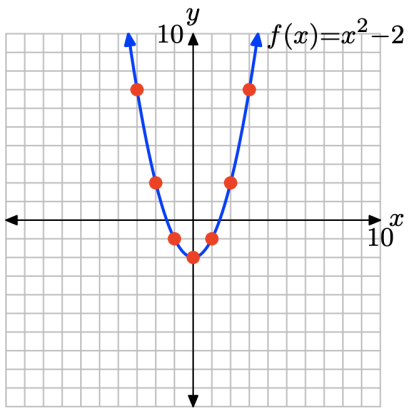
Evaluate $f(x) = x^2 - 2$ at x = −3, −2, −1, 0, 1, 2, and 3.

$$f(-3) = (-3)^2 - 2 = 7$$
$$f(-2) = (-2)^2 - 2 = 2$$
$$f(-1) = (-1)^2 - 2 = -1$$
$$f(0) = (0)^2 - 2 = -2$$
$$f(1) = (1)^2 - 2 = -1$$
$$f(2) = (2)^2 - 2 = 2$$
$$f(3) = (3)^2 - 2 = 7$$

Place these results in table (a) and plot them as shown in (b). There is enough evidence here to intuit that the graph of f is the curve shown in (b).

x	$f(x) = x^2 - 2$	(x, f(x))
-3	7	(−3, 7)
-2	2	(-2,2)
-1	-1	(-1,-1)
0	-2	(0,-2)
1	-1	(1,-1)
2	2	(2,2)
3	7	(3,7)

(a)



(b)

Exercise 16.5E.6

$f(x) = 4 - x^2$

Exercise 16.5E.7

$f(x) = \frac{1}{2}x^2 - 6$

Answer

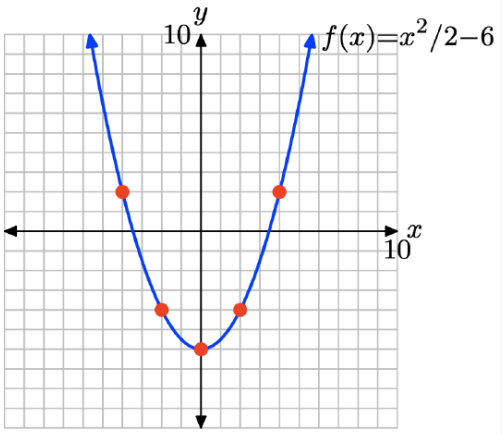
Evaluate $f(x) = x^2/2 - 6$ at x = −4, −2, 0, 2, and 4.

$$f(-4) = (-4)^2/2 - 6 = 2$$
$$f(-2) = (-2)^2/2 - 6 = -4$$
$$f(0) = (0)^2/2 - 6 = -6$$
$$f(2) = (2)^2/2 - 6 = -4$$
$$f(4) = (4)^2/2 - 6 = 2$$

Place these results in table (a) and plot them as shown in (b). There is enough evidence here to intuit that the graph of f is the curve shown in (b).

x	$f(x) = x^2 - 2$	(x, f(x))
-4	2	(−4, 2)
-2	-4	(-2,-4)
0	-6	(0,-6)
2	-4	(2,-4)
4	2	(4,2)

(a)



(b)

Exercise 16.5E. 8

$f(x) = 8 - \frac{1}{2}x^2$

Perform each of the following tasks for the functions Exercises 16.5E. 9-16.5E. 10.

i. Set up a coordinate system on a sheet of graph paper. Label and scale each axis.

ii. Use the table feature of your graphing calculator to evaluate the function at the given values of x. Record these results in a table next to your coordinate system on your graph paper.

iii. Plot the points in the table on your coordinate system then use them to draw the graph of the given function. Label the graph with its equation.

Exercise 16.5E. 9

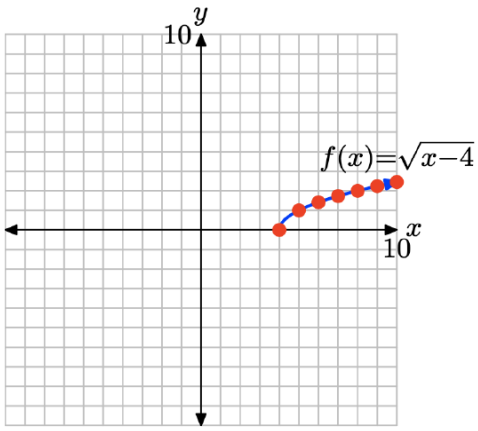
$f(x) = \sqrt{x-4}$ at x = 4, 5, 6, 7, 8, 9, and 10.

Answer

Load the function $f(x) = \sqrt{x-4}$ into Y1 as shown in (a). Select TBLSET, then highlight ASK for the independent variable and press ENTER (see (b)). It doesn't matter what is entered for TblStart or Δ Tbl. Select TABLE and enter the x-values 4, 5, 6, 7, 8, 9, and 10, as shown in (c).

(a) (b) (c)

Plot the points in table (c) in (d). This is enough to intuit that the graph of f is the curve shown in (d).



(d)

? Exercise 16.5E. 10

$f(x) = \sqrt{4-x}$ at x = −10, −8, −6, −4, −2, 0, 2, and 4.

In Exercises 16.5E. 11-16.5E. 14, the graph of the given function is a parabola, a graph that has a "U-shape." A parabola has only one turning point. For each exercise, perform the following tasks.

i. Load the equation into the Y= menu of your graphing calculator. Adjust the WINDOW parameters so that the "turning point" (actually called the vertex) is visible in the viewing window.

ii. Make a reasonable copy of the image in the viewing window on your homework paper. Draw all lines with a ruler (including the axes), but draw curves freehand. Label and scale each axis with xmin, xmax, ymin, and ymax. Label the graph with its equation.

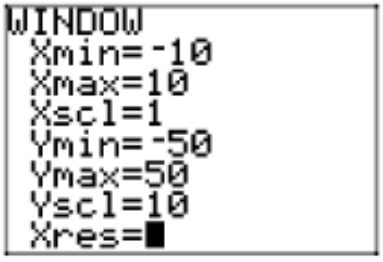
? Exercise 16.5E. 11

$f(x) = x^2 - x - 30$

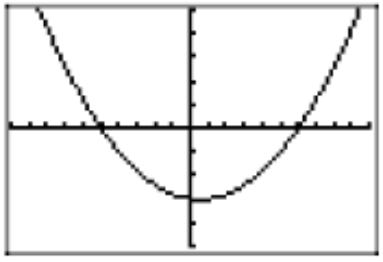
Answer

Load the function $f(x) = x^2 - x - 30$ into Y1 as shown in (a). Adjust the WINDOW parameters as shown in (b). Push the GRAPH button to obtain the graph of f in (c).

(a)

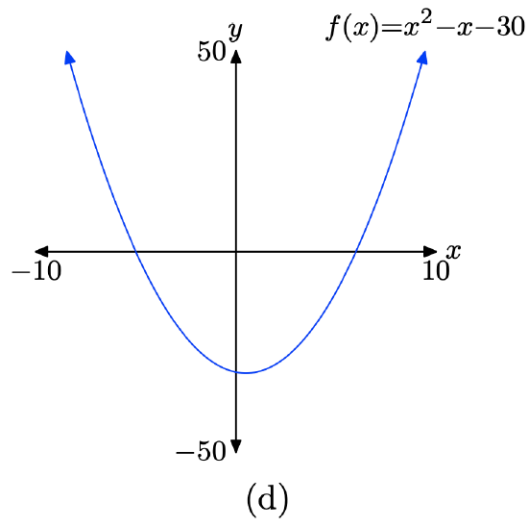


(b)



(c)

Copy the image onto your homework as shown in (d).



(d)

Exercise 16.5E.12

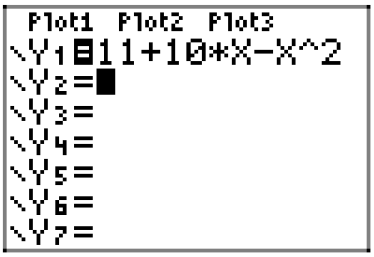
$f(x) = 24 - 2x - x^2$

Exercise 16.5E.13

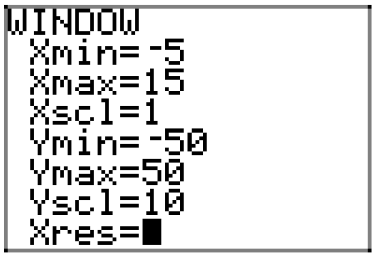
$f(x) = 11 + 10x - x^2$

Answer

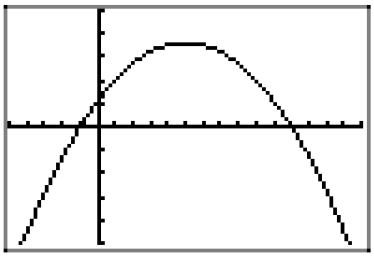
Load the function $f(x) = 11 + 10x - x^2$ into Y1 as shown in (a). Adjust the WINDOW parameters as shown in (b). Push the GRAPH button to obtain the graph of f in (c).



(a)

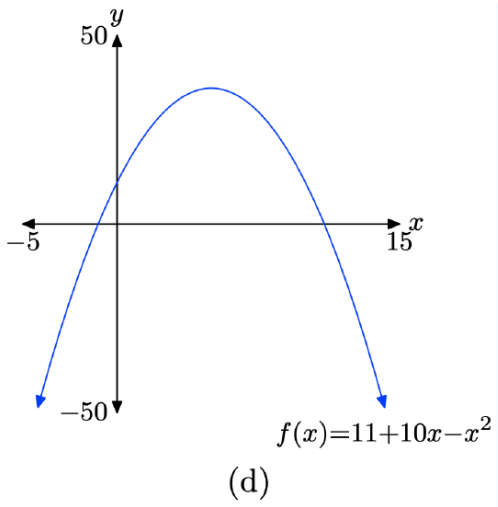


(b)



(c)

Copy the image onto your homework as shown in (d).



(d)

Exercise 16.5E. 14

$f(x) = x^2 + 11x - 12$

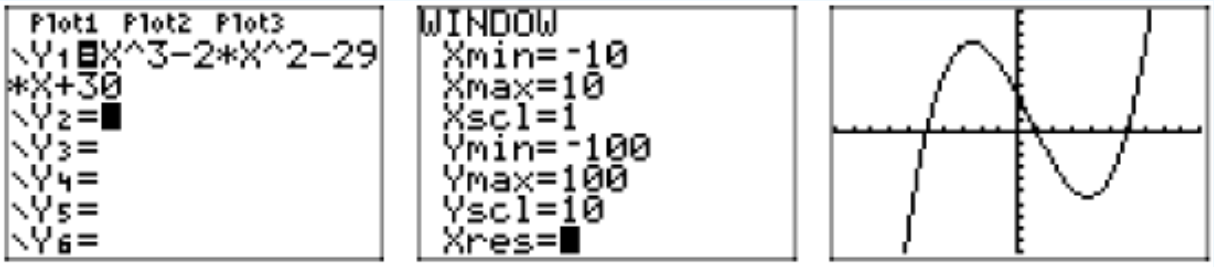
Each of the equations in Exercises $16.5E.15$ - $16.5E.18$ are called “cubic polynomials.” Each equation has been carefully chosen so that its graph has exactly two “turning points.” For each exercise, perform each of the following tasks. i. Load the equation into the Y= menu of your graphing calculator and adjust the WINDOW parameters so that both “turning points” are visible in the viewing window. ii. Make a reasonable copy of the graph in the viewing window on your homework paper. Label and scale each axis with xmin, xmax, ymin, and ymax, then label the graph with its equation. Remember to draw all lines with a ruler.

Exercise 16.5E. 15

$f(x) = x^3 - 2x^2 - 29x + 30$

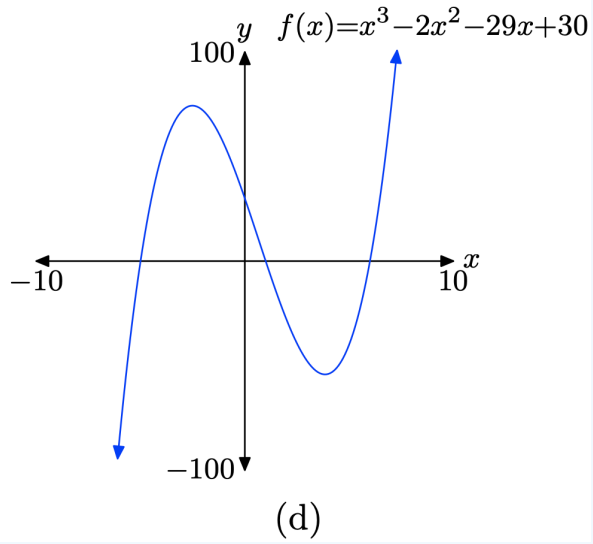
Answer

Load the function $f(x) = x^3 - 2x^2 - 29x + 30$ into Y1 as shown in (a). Adjust the WINDOW parameters as shown in (b). Push the GRAPH button to obtain the graph of f in (c).



(a) (b) (c)

Copy the image onto your homework as shown in (d).



(d)

Exercise 16.5E. 16

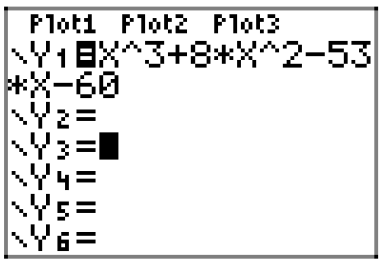
$f(x) = -x^3 + 2x^2 + 19x - 20$

Exercise 16.5E. 17

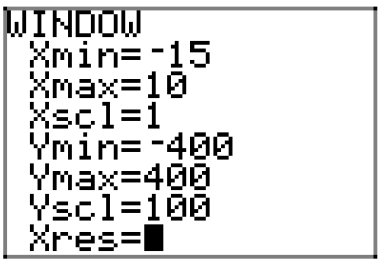
$f(x) = x^3 + 8x^2 - 53x - 60$

Answer

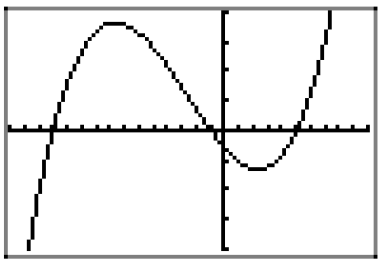
Load the function $f(x) = x^3 + 8x^2 - 53x - 60$ into Y1 as shown in (a). Adjust the WINDOW parameters as shown in (b). Push the GRAPH button to obtain the graph of f in (c).



(a)

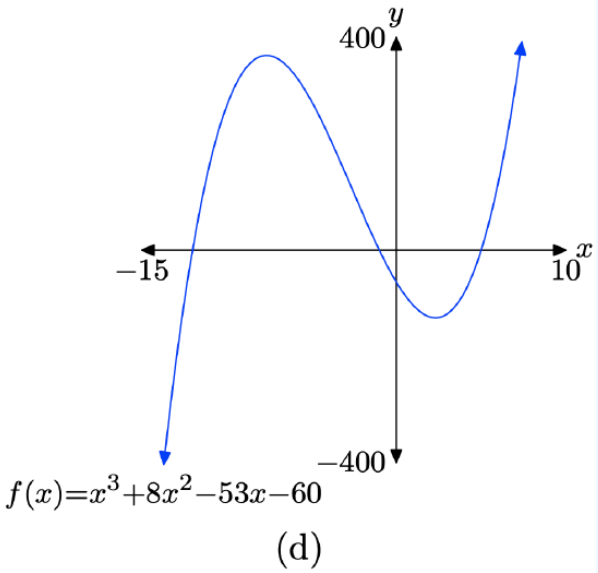


(b)



(c)

Copy the image onto your homework as shown in (d).



(d)

? Exercise 16.5E. 18

$f(x) = -x^3 + 16x^2 - 43x - 60$

Perform each of the following tasks for the equations in Exercises 16.5E. 19-16.5E. 22

i. Load the equation into the Y= menu. Adjust the WINDOW parameters until you think all important behavior ("turning points," etc.) is visible in the viewing window. Note: This is more difficult than it sounds, particularly when we have no advance notion of what the graph might look like. However, experiment with several settings until you "discover" the settings that exhibit the most important behavior.

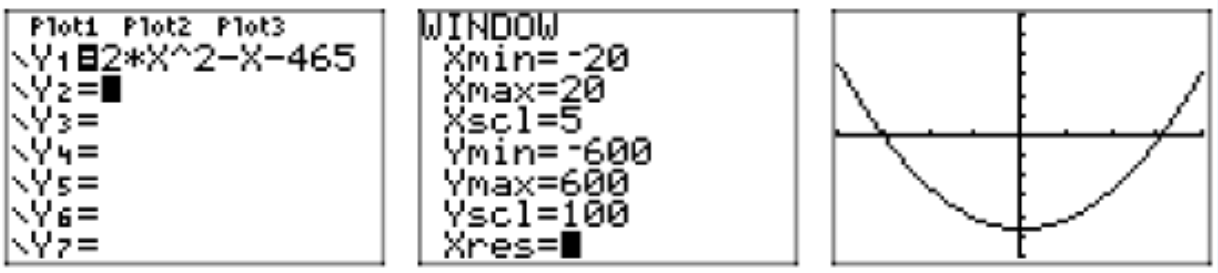
ii. Copy the image on the screen onto your homework paper. Label and scale each axis with xmin, xmax, ymin, and ymax. Label the graph with its equation.

? Exercise 16.5E. 19

$f(x) = 2x^2 - x - 465$

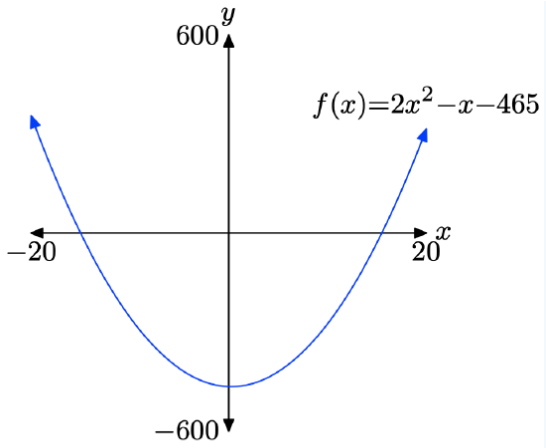
Answer

Load the function $f(x) = 2x^2 - x - 465$ into Y1 as shown in (a). Adjust the WINDOW parameters as shown in (b). Push the GRAPH button to obtain the graph of f in (c).



(a) (b) (c)

Copy the image onto your homework as shown in (d).



(d)

Exercise 16.5E.20

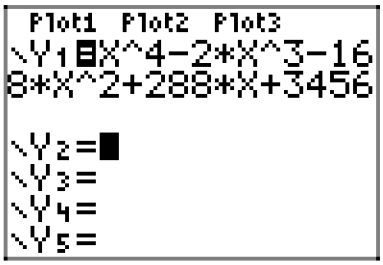
$f(x) = x^3 - 24x^2 + 65x + 1050$

Exercise 16.5E.21

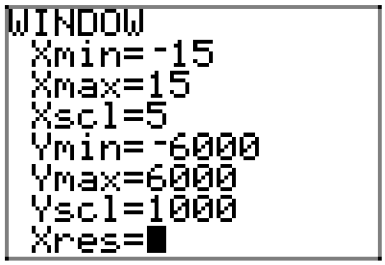
$f(x) = x^4 - 2x^3 - 168x^2 + 288x + 3456$

Answer

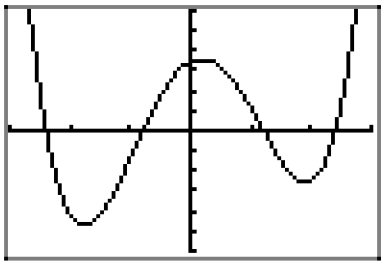
Load the function $f(x) = x^4 - 2x^3 - 168x^2 + 288x + 3456$ into Y1 as shown in (a). Adjust the WINDOW parameters as shown in (b). Push the GRAPH button to obtain the graph of f in (c).



(a)

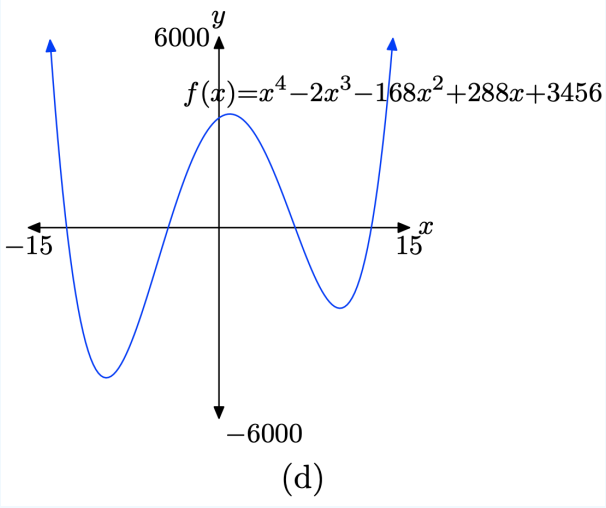


(b)



(c)

Copy the image onto your homework as shown in (d)



(d)

Exercise 16.5E. 22

$f(x) = -x^4 - 3x^3 + 141x^2 + 523x - 660$

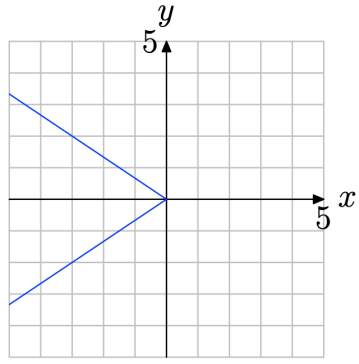
2.3 Exercises

For Exercises 16.5E. 1-16.5E. 6, perform each of the following tasks.

i. Make a copy of the graph on a sheet of graph paper and apply the vertical line test.

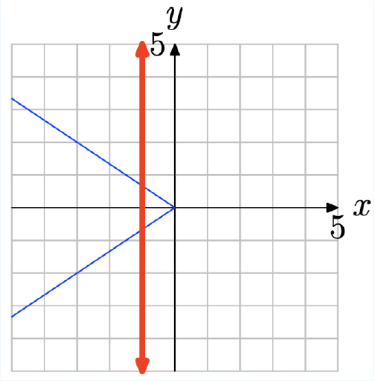
ii. Write a complete sentence stating whether or not the graph represents a function. Explain the reason for your response.

Exercise 16.5E. 1

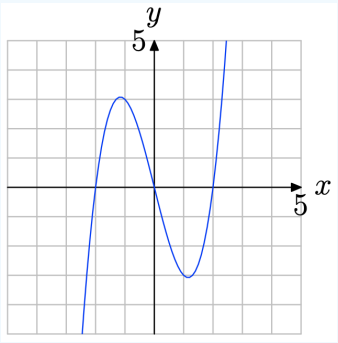


Answer

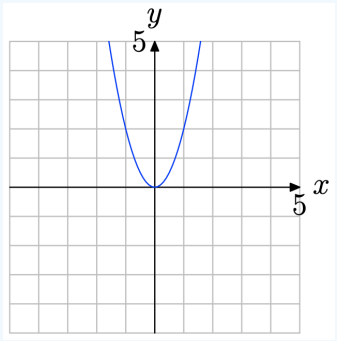
Note that in the figure below a vertical line cuts the graph more than once. Therefore, the graph does not represent the graph of a function.



? Exercise 16.5E. 2

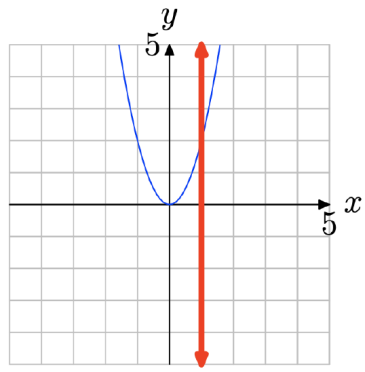


? Exercise 16.5E. 3

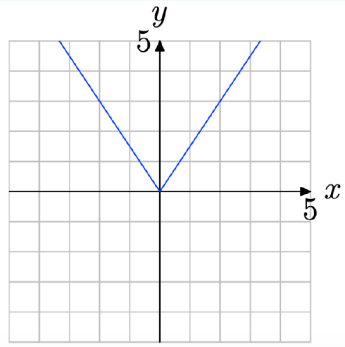


Answer

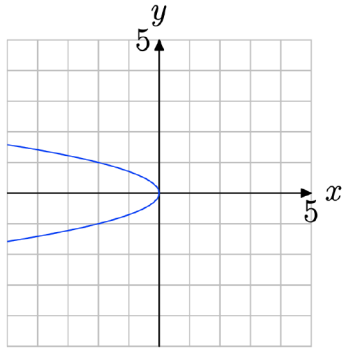
No vertical line cuts the graph more than once (see figure below). Therefore, the graph represents a function.



Exercise 16.5E.4

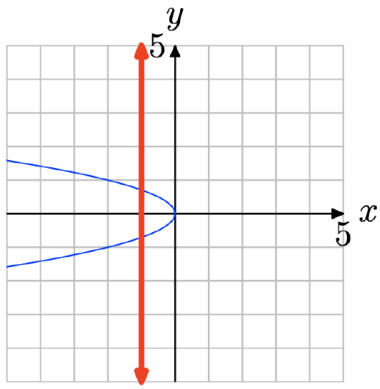


Exercise 16.5E.5

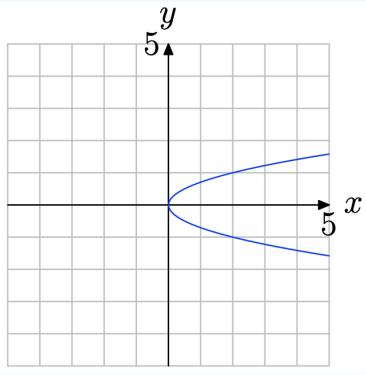


Answer

Note that in the figure below a vertical line cuts the graph more than once. Therefore, the graph does not represent the graph of a function.



Exercise 16.5E.6



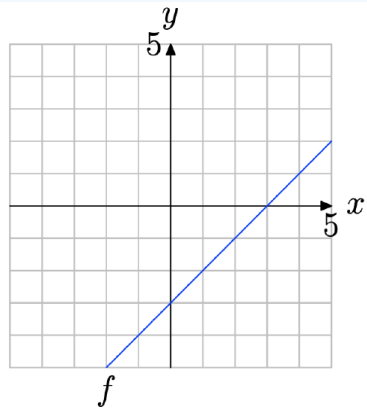
In Exercises 16.5E.7-16.5E.12, perform each of the following tasks.

i. Make an exact copy of the graph of the function f on a sheet of graph paper. Label and scale each axis. Remember to draw all lines with a ruler.

ii. Use the technique of Examples 3 and 4 in the narrative to evaluate the function at the given value. Draw and label the arrows as shown in Figures 4 and 5 in the narrative.

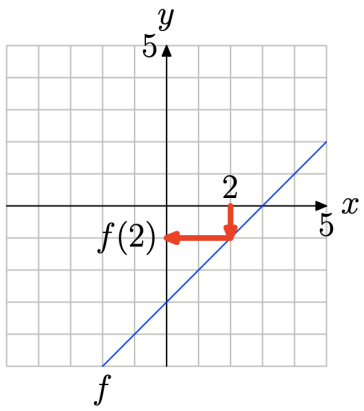
Exercise 16.5E.7

Use the graph of f to determine f(2).



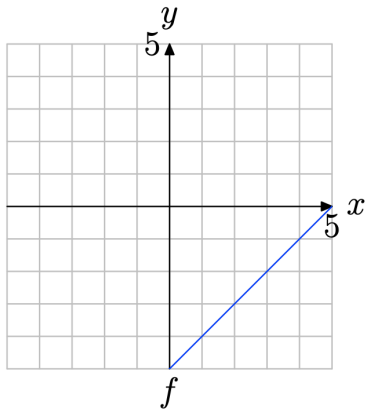
Answer

Locate x = 2 on the x-axis (see figure below), draw a vertical arrow to the graph of f, then a horizontal arrow to the y-axis. Thus, f(2) = −1.



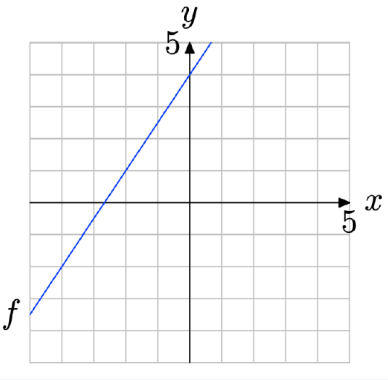
? Exercise 16.5E. 8

Use the graph of f to determine f(3).



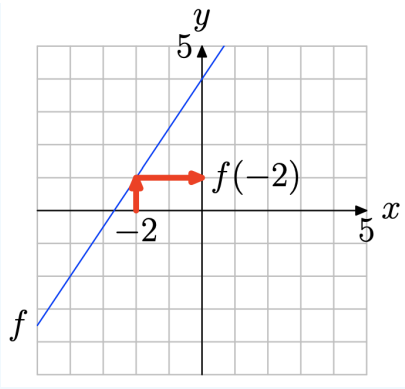
? Exercise 16.5E. 9

Use the graph of f to determine f(−2).



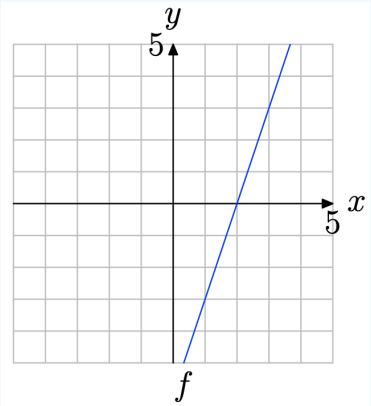
Answer

Locate x = −2 on the x-axis (see figure below), draw a vertical arrow to the graph of f, then a horizontal arrow to the y-axis. Thus, f(−2) = 1.



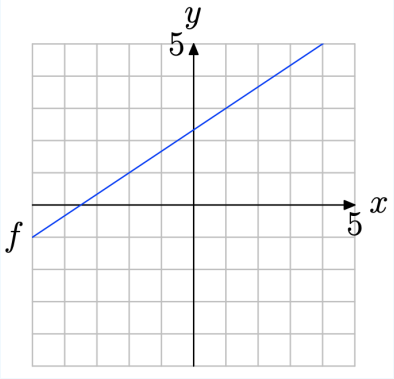
Exercise 16.5E.10

Use the graph of f to determine f(1).



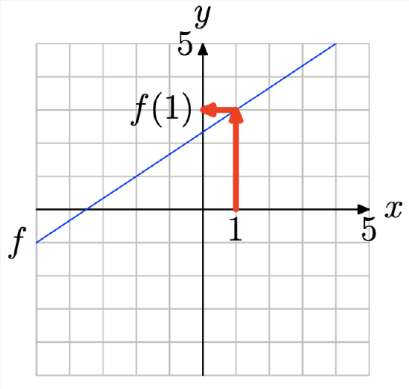
Exercise 16.5E.11

Use the graph of f to determine f(1).



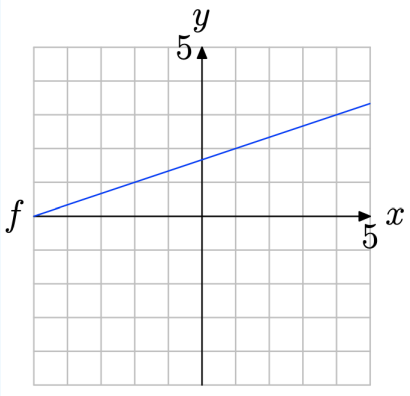
Answer

Locate x = 1 on the x-axis (see figure below), draw a vertical arrow to the graph of f, then a horizontal arrow to the y-axis. Thus, f(1) = 3.



Exercise 16.5E.12

Use the graph of f to determine f(−2).



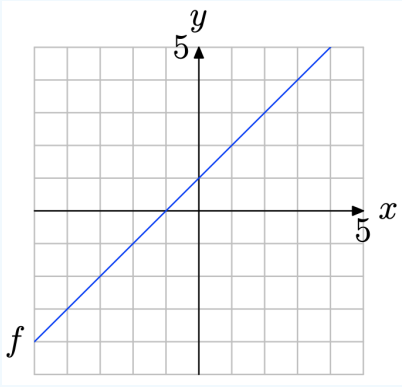
In Exercises 16.5E.13-16.5E.18, perform each of the following tasks.

i. Make an exact copy of the graph of the function f on a sheet of graph paper. Label and scale each axis. Remember to draw all lines with a ruler.

ii. Use the technique of Example 5 in the narrative to find the value of x that maps onto the given value. Draw and label the arrows as shown in Figure 6 in the narrative.

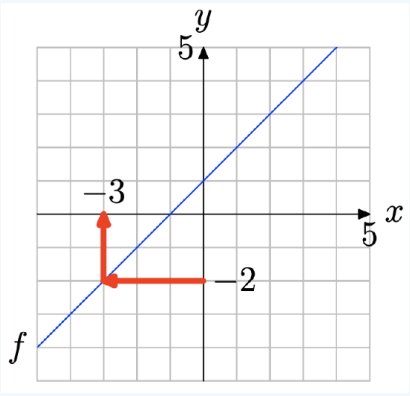
Exercise 16.5E.13

Use the graph of f to solve the equation f(x) = −2.



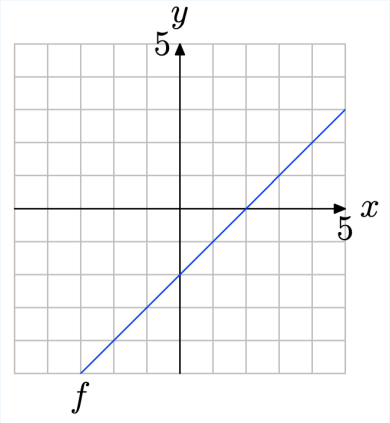
Answer

Locate y = −2 on the y-axis (see figure below), draw a horizontal arrow to the graph of f, then a vertical arrow to the y-axis. Thus, the solution of f(x) = −2 is x = −3.



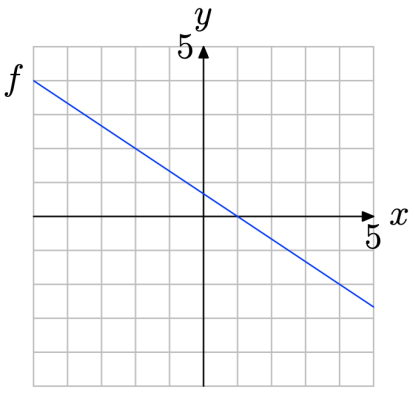
? Exercise 16.5E. 14

Use the graph of f to solve the equation f(x) = 1.



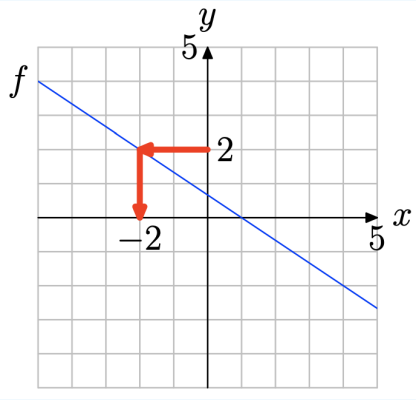
? Exercise 16.5E. 15

Use the graph of f to solve the equation f(x) = 2



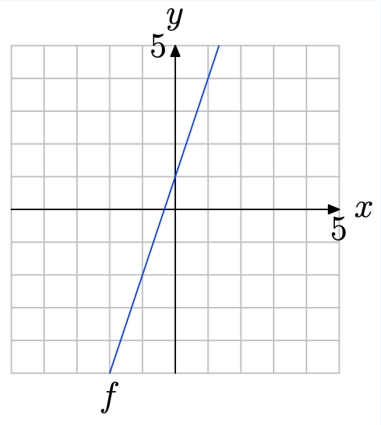
Answer

Locate y = 2 on the y-axis (see figure below), draw a horizontal arrow to the graph of f, then a vertical arrow to the y-axis. Thus, the solution of f(x) = 2 is x = −2.



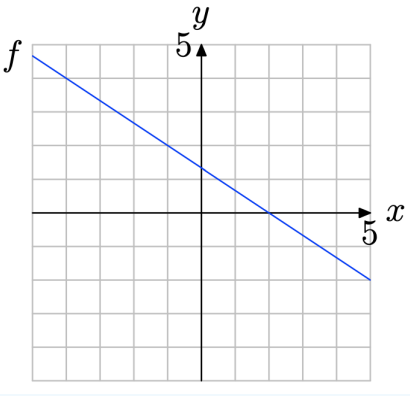
Exercise 16.5E.16

Use the graph of f to solve the equation f(x) = −2.



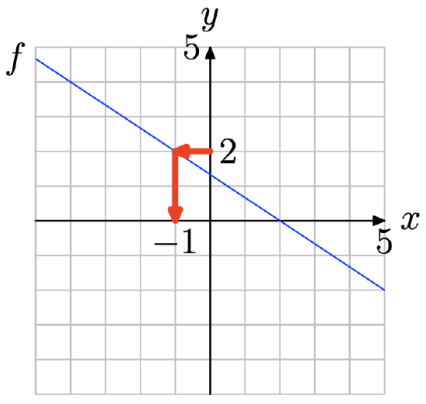
Exercise 16.5E.17

Use the graph of f to solve the equation f(x) = 2.



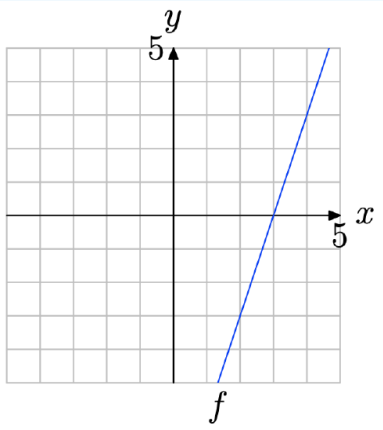
Answer

Locate y = 2 on the y-axis (see figure below), draw a horizontal arrow to the graph of f, then a vertical arrow to the y-axis. Thus, the solution of f(x) = 2 is x = −1.



Exercise 16.5E.18

Use the graph of f to solve the equation f(x) = −3.



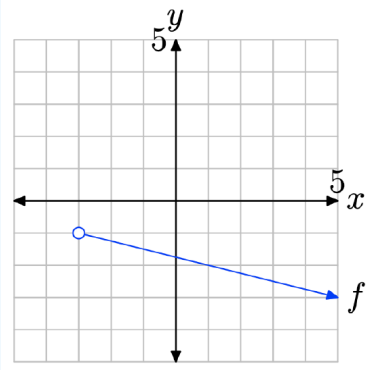
In the Exercises 16.5E.19-16.5E.22, perform each of the following tasks.

i. Make a copy of the graph of f on a sheet of graph paper. Label and scale each axis.

ii. Using a different colored pen or pencil, project each point on the graph of f onto the x-axis. Shade the resulting domain on the x-axis.

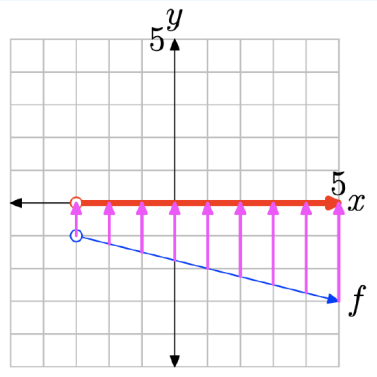
iii. Use both set-builder and interval notation to describe the domain.

Exercise 16.5E.19

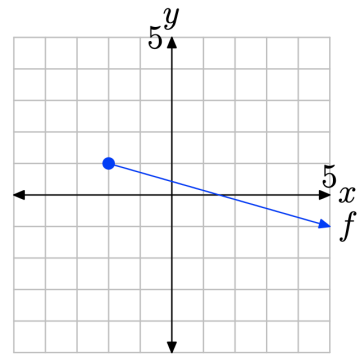


Answer

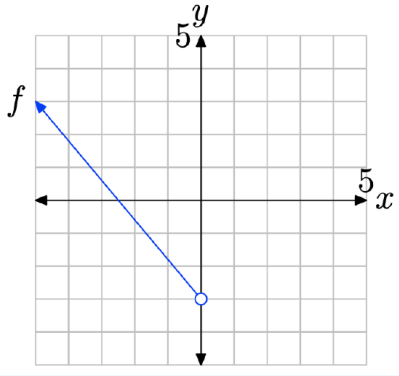
To find the domain of the function, project the graph of f onto the x-axis. Note that all values of x that lie to the right of -3 lie in shadow and are hence in the domain of f. Therefore, the domain is best described with the notation $\{x : x > -3\} = (-3, \infty)$.



Exercise $16.5E.20$

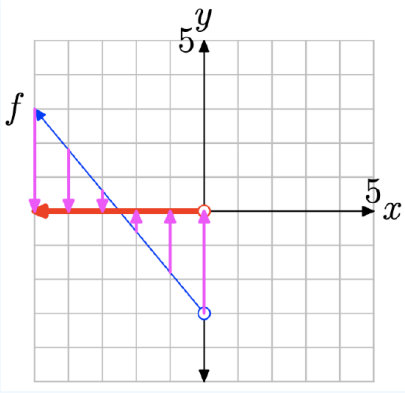


Exercise $16.5E.21$

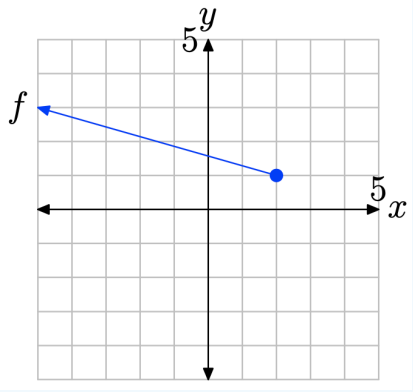


Answer

To find the domain of the function, project the graph of f onto the x-axis. Note that all values of x that lie to the left of 0 lie in shadow and are hence in the domain of f. Therefore, the domain is best described with the interval notation $\{x : x < 0\} = (-\infty, 0)$.



? Exercise 16.5E. 22

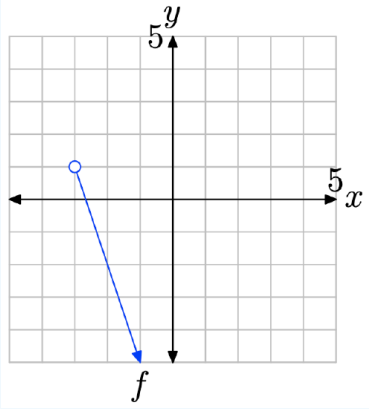


In Exercises 16.5E. 23-16.5E. 26, perform each of the following tasks.

i. Make a copy of the graph of f on a sheet of graph paper. Label and scale each axis.

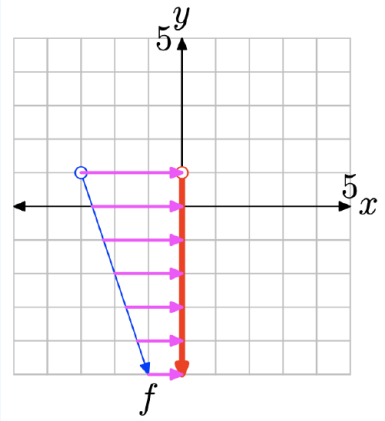
ii. Using a different colored pen or pencil, project each point on the graph of f onto the y-axis. Shade the resulting range on the y-axis. iii. Use both set-builder and interval notation to describe the range.

? Exercise 16.5E. 23

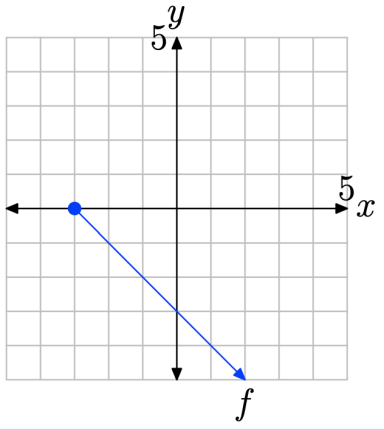


Answer

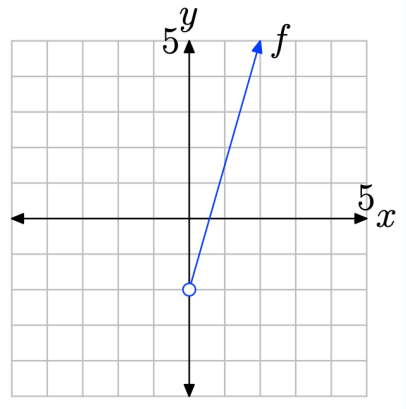
To find the range of the function, project the graph of f onto the y-axis. Note that all values of y that lie below 1 lie in shadow and are hence in the range of f. Therefore, the range is best described with the interval notation $\{y : y < 1\} = (-\infty, 1)$.



Exercise 16.5E.24

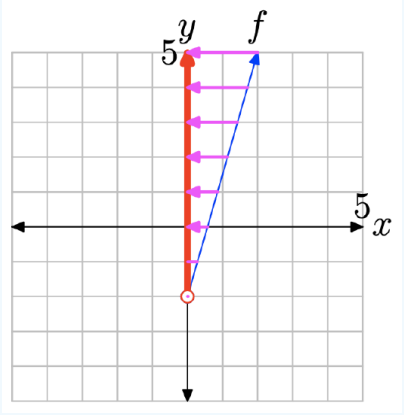


Exercise 16.5E.25

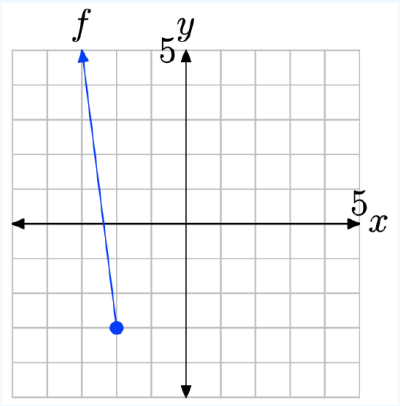


Answer

To find the range of the function, project the graph of f onto the y-axis. Note that all values of y that lie above −2 lie in shadow and are hence in the range of f. Therefore, the range is best described with the interval notation $\{y : y > -2\} = (-2, \infty)$.



Exercise 16.5E.26



In Exercises 16.5E.27-16.5E.30, perform each of the following tasks.

i. Use your graphing calculator to draw the graph of the given function. Make a reasonably accurate copy of the image in your viewing screen on your homework paper. Label and scale each axis with the WINDOW parameters xmin, xmax, ymin, and ymax. Label the graph with its equation.

ii. Using a colored pencil, project each point on the graph onto the x-axis; i.e., shade the domain on the x-axis. Use interval and set-builder notation to describe the domain.

iii. Use a purely algebraic technique, as demonstrated in Example 8 in the narrative, to find the domain. Compare this result with that found in part (ii).

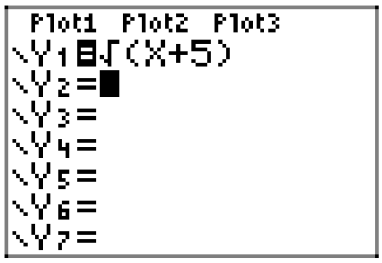
iv. Using a different colored pencil, project each point on the graph onto the y-axis; i.e., shade the range on the y-axis. Use interval and set-builder notation to describe the range.

Exercise 16.5E.27

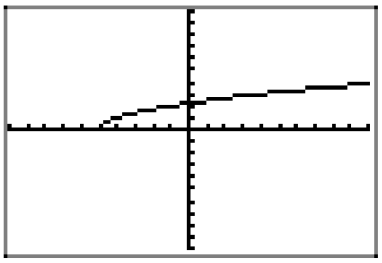
$f(x) = \sqrt{x+5}$.

Answer

Load the function $f(x) = \sqrt{x+5}$ into Y1 as shown in (a). Select 6:ZStandrd from the ZOOM menu to produce the graph in (b).

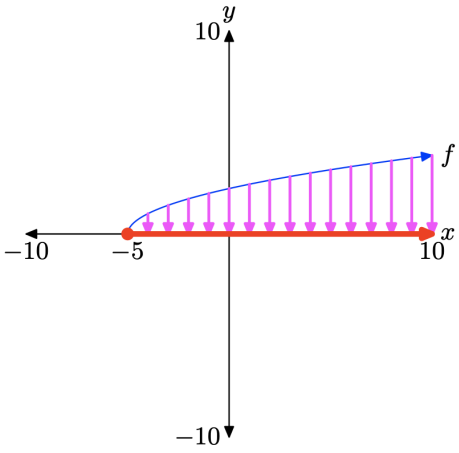


(a)

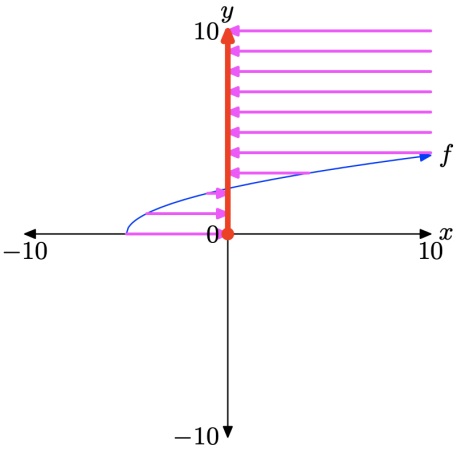


(b)

Copy the image in (b) onto your homework paper, then project the domain and range onto the x- and y-axes, as shown in (c) and (d), respectively.



(c) $\mathrm{D} = [-5, \infty) = \{x : x \geq -5\}$



(d) $\mathrm{R} = [0, \infty) = \{y : y \geq 0\}$

To find the domain algebraically, note that you cannot take the square root of a negative number, so the expression under the radical in $f(x) = \sqrt{x+5}$, namely x+5, must either be positive or zero (nonnegative). That is,

$$x + 5 \geq 0$$

or equivalently,

$$x \geq -5$$

Thus, the domain of f is Domain = $[-5, \infty)$, or in set-builder notation, Domain = $x : x \geq -5$.

? Exercise 16.5E. 28

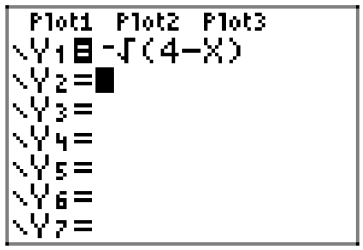
$f(x) = \sqrt{5 - x}$

? Exercise 16.5E. 29

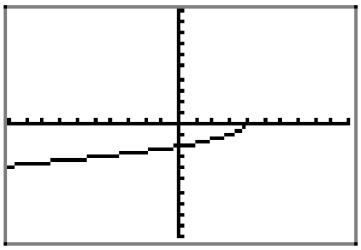
$f(x) = -\sqrt{4 - x}$.

Answer

Load the function $f(x) = -\sqrt{4 - x}$. into Y1 as shown in (a). Select 6:ZStandrd from the ZOOM menu to produce the graph in (b).

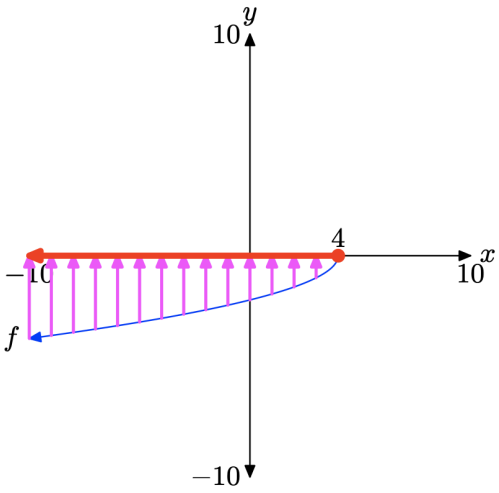


(a)

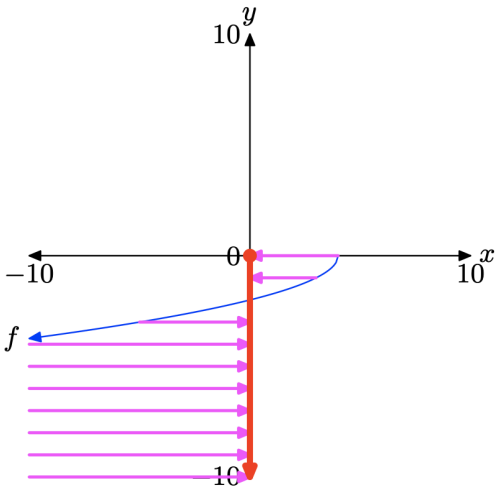


(b)

Copy the image in (b) onto your homework paper, then project the domain and range onto the x- and y-axes, as shown in (c) and (d), respectively.



(c) $\mathrm{D} = (-\infty, 4] = \{x : x \leq 4\}$



(d) $\mathrm{R} = (-\infty, 0] = \{y : y \leq 0\}$

To find the domain algebraically, note that you cannot take the square root of a negative number, so the expression under the radical in $f(x) = -\sqrt{4-x}$, namely 4−x, must either be positive or zero (nonnegative). That is,

$$4 - x \geq 0$$

or equivalently,

$$-x \geq -4$$
$$x \leq 4$$

Thus, the domain of f is Domain = $(\infty, 4]$, or in set-builder notation, Domain = $\{x : x \leq 4\}$.

? Exercise $16.5E.30$

$f(x) = -\sqrt{x+4}$

2.4 Exercises

In Exercises $16.5E.1$-$16.5E.6$, you are given the definition of two functions f and g. Compare the functions, as in Example 1 of the narrative, at the given values of x.

? Exercise $16.5E.1$

f(x) = x+2, g(x) = 4−x at x = −3, 1, and 2.

Answer

We're given that f(x) = x + 2 and g(x) = 4 − x. At x = −3,

$$f(-3) = -3 + 2 = -1$$
$$g(-3) = 4 - (-3) = 7$$

Therefore, f(−3) < g(−3). At x = 1,

$$f(1) = 1 + 2 = 3$$
$$g(1) = 4 - 1 = 3.$$

Therefore, f(1) = g(1). At x = 2,

$$f(2) = 2 + 2 = 4$$
$$g(2) = 4 - 2 = 2.$$

Therefore, f(2) > g(2).

? Exercise 16.5E. 2

f(x) = 2x − 3, g(x) = 3 − x at x = −4, 2, and 5.

? Exercise 16.5E. 3

f(x) = 3−x, g(x) = x+9 at x = −4, −3, and −2.

Answer

We're given that f(x) = 3 − x and g(x) = x + 9. At x = −4,

$$f(-4) = 3 - (-4) = 7$$
$$g(-4) = -4 + 9 = 5$$

Therefore, f(−4) > g(−4). At x = −3,

$$f(-3) = 3 - (-3) = 6$$
$$g(-3) = -3 + 9 = 6$$

Therefore, f(−3) = g(−3). At x = −2,

$$f(-2) = 3 - (-2) = 5$$
$$g(-2) = -2 + 9 = 7$$

Therefore, f(−2) < g(−2).

? Exercise 16.5E. 4

$f(x) = x^2$, g(x) = 4x + 5 at x = −2, 1, and 6.

? Exercise 16.5E. 5

$f(x) = x^2$, g(x) = −3x − 2 at x = −3, −1, and 0.

Answer

We're given that $f(x) = x^2$ and g(x) = −3x − 2. At x = −3,

$$f(-3) = (-3)2 = 9$$
$$g(-3) = -3(-3) - 2 = 7$$

Therefore, f(−3) > g(−3). At x = −1,

$$f(-1) = (-1)2 = 1$$
$$g(-1) = -3(-1) - 2 = 1$$

Therefore, f(−1) = g(−1). At x = 0,

$$f(0) = (0)2 = 0$$
$$g(0) = -3(0) - 2 = -2$$

Therefore, f(0) > g(0).

? Exercise $16.5E.6$

f(x) = |x|, g(x) = 4 − x at x = 1, 2, and 3.

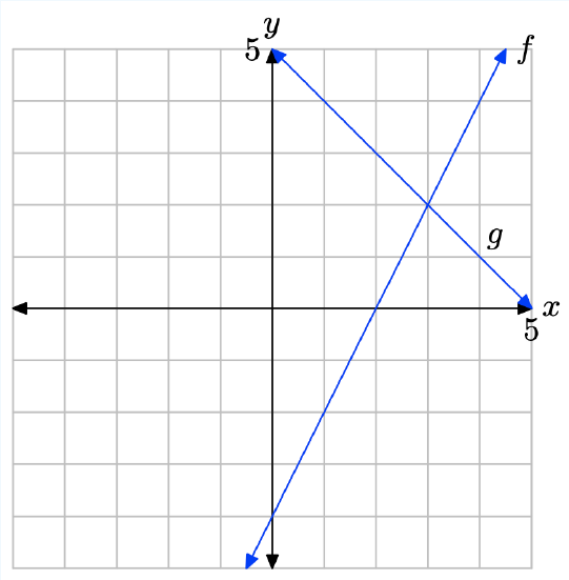
In Exercises $16.5E.7$-$16.5E.12$, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Make an accurate copy of the image on graph paper (label each equation, label and scale each axis), drop a dashed vertical line through the point of intersection, then label and shade the solution of f(x) = g(x) on the x-axis.

ii. Make a second copy of the image on graph paper, drop a dashed, vertical line through the point of intersection, then label and shade the solution of f(x) > g(x) on the x-axis. Use set-builder and interval notation to describe your solution set.

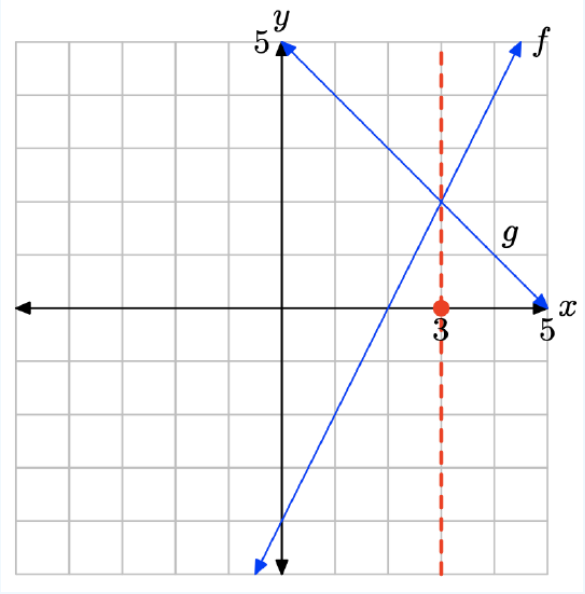
iii. Make a third copy of the image on graph paper, drop a dashed, vertical line through the point of intersection, then label and shade the solution of f(x) < g(x) on the x-axis. Use setbuilder and interval notation to describe your solution set.

? Exercise $16.5E.7$

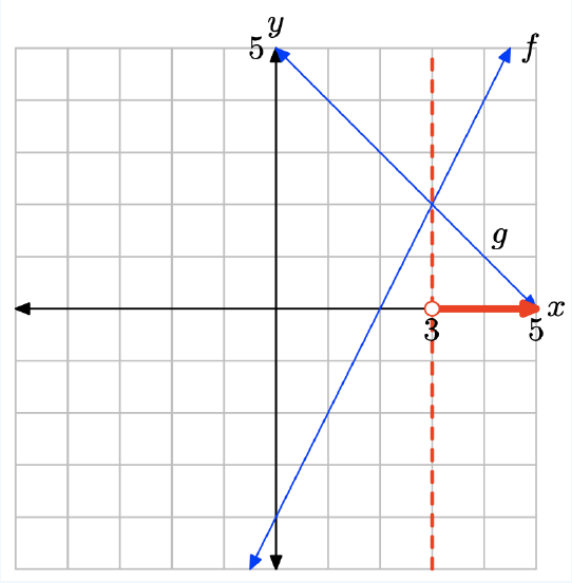


Answer

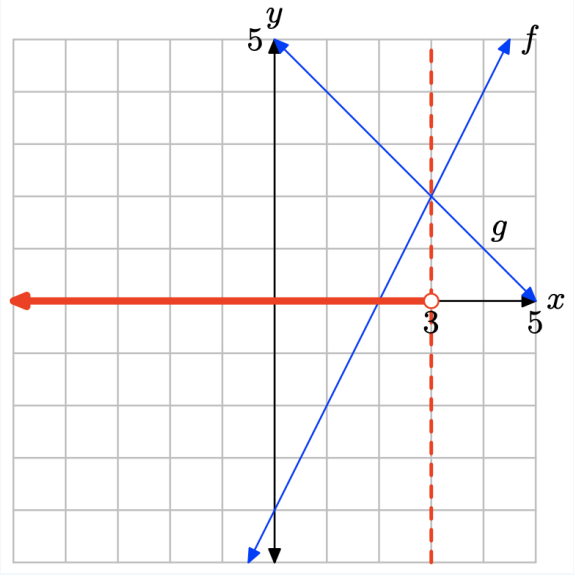
The graph of f intersects the graph of g at x = 3. The solution of f(x) = g(x) is x = 3.



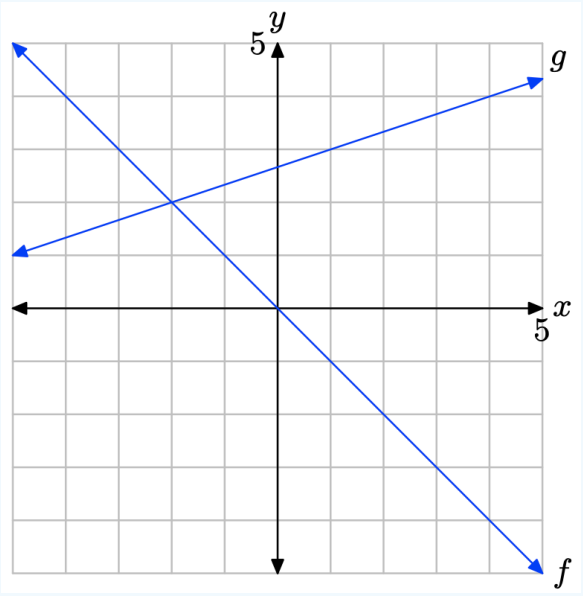
The graph of f lies above the graph of g to the right of x = 3. The solution of f(x) > g(x) is $(3, \infty) = \{x : x > 3\}$.



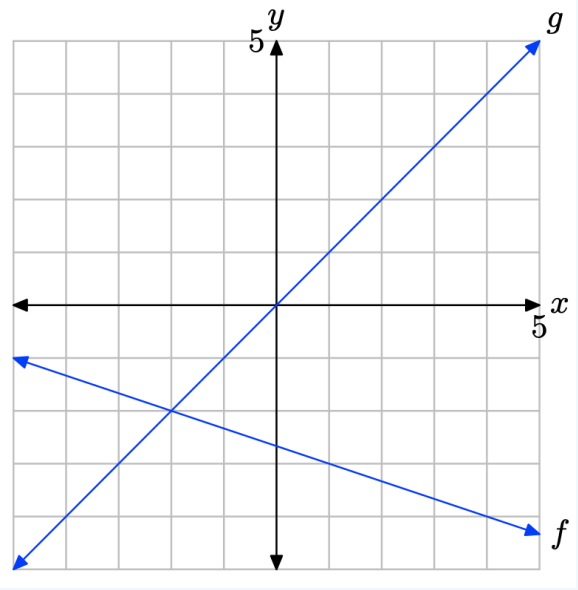
The graph of f lies below the graph of g to the left of x = 3. The solution of f(x) < g(x) is $(-\infty, 3) = \{x : x < 3\}$.



Exercise 16.5E.8

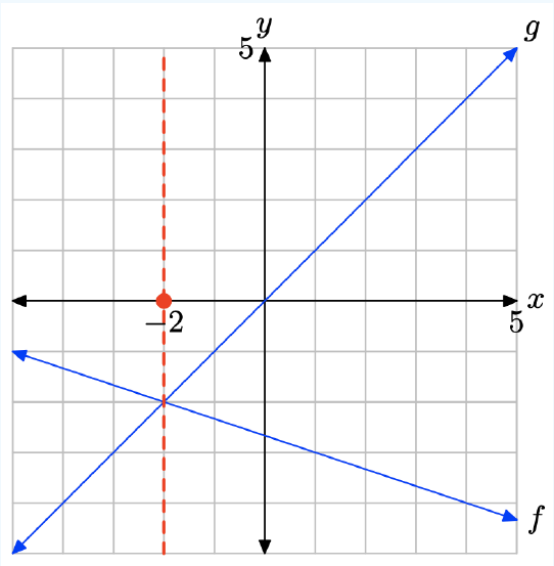


Exercise 16.5E.9

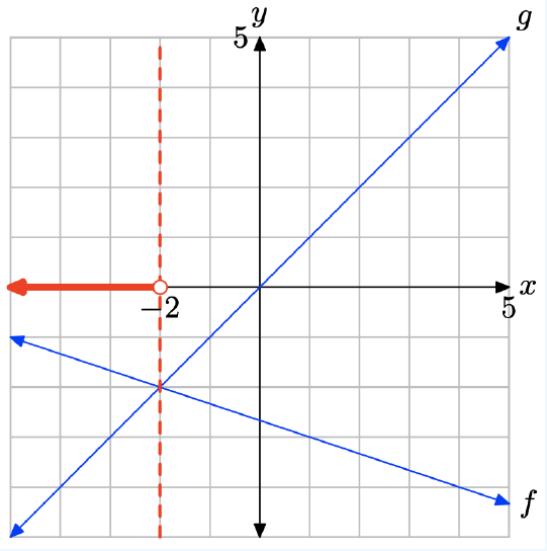


Answer

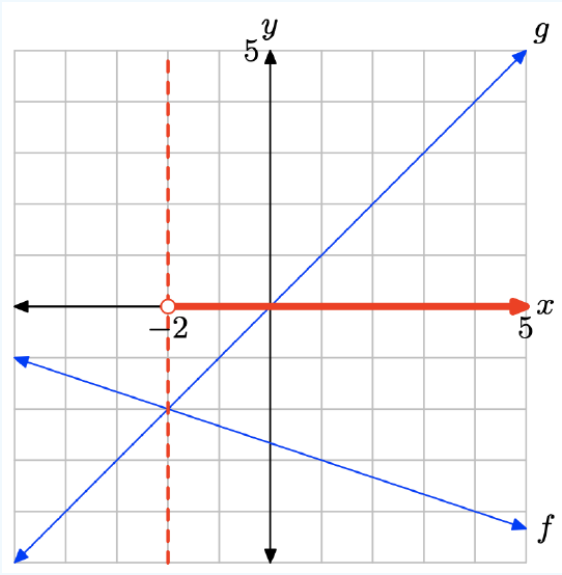
The graph of f intersects the graph of g at x = −2. The solution of f(x) = g(x) is x = −2.



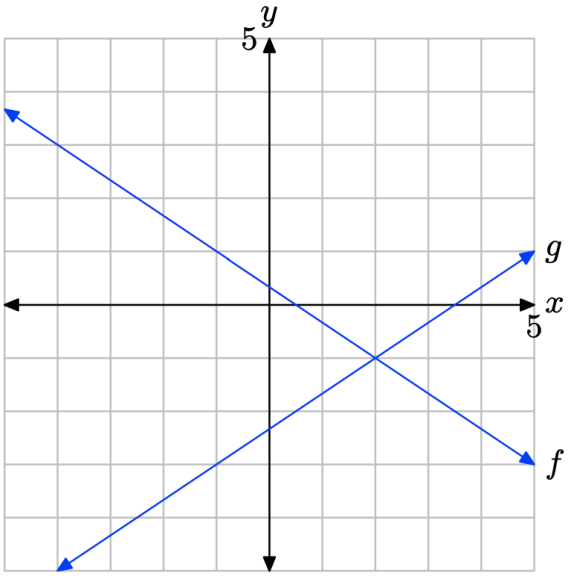
The graph of f lies above the graph of g to the left of x = −2. The solution of f(x) > g(x) is $(-\infty, -2) = \{x : x < -2\}$.



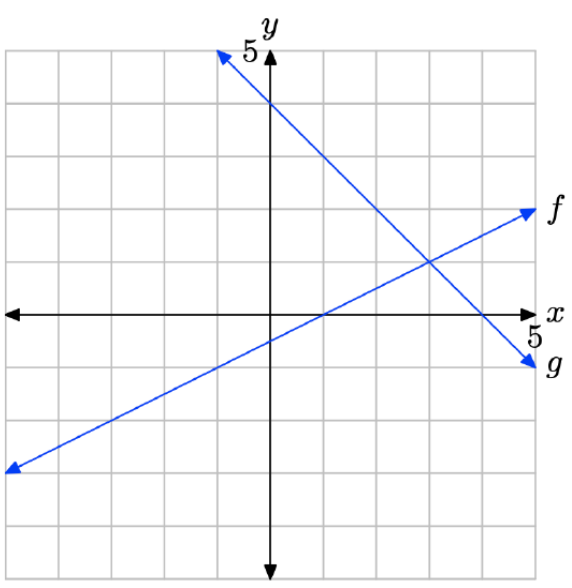
The graph of f lies below the graph of g to the right of x = −2. The solution of f(x) < g(x) is \((−2,\infty) = {\x : x > −2\}\).



? Exercise 16.5E. 10

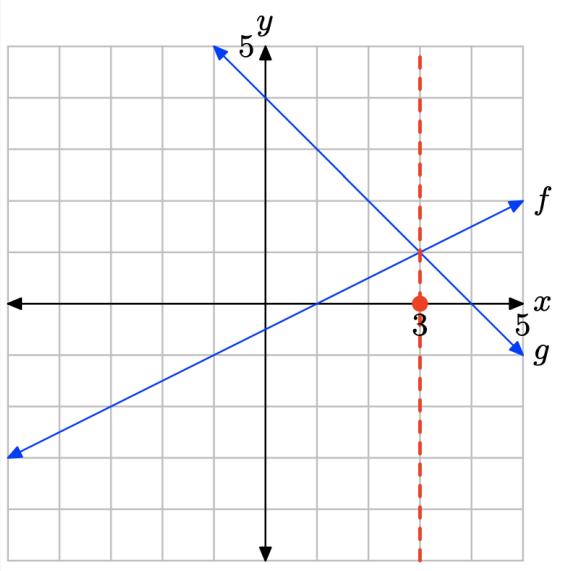


Exercise 16.5E.11

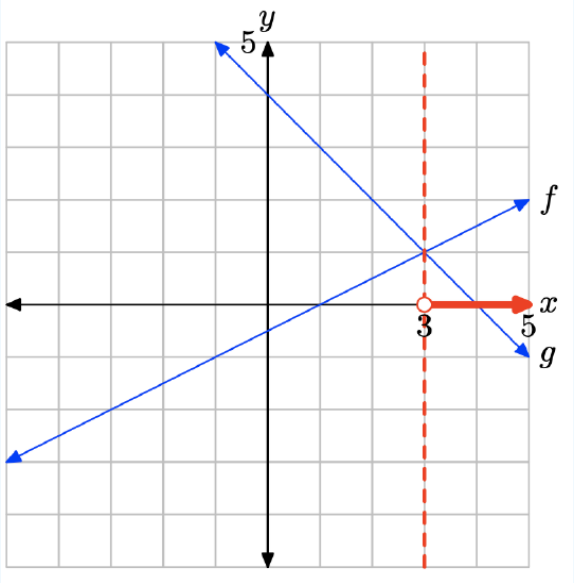


Answer

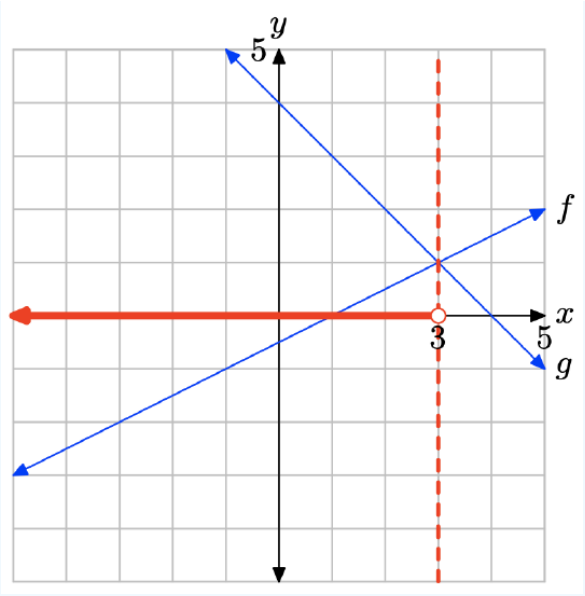
The graph of f intersects the graph of g at x = 3. The solution of f(x) = g(x) is x = 3.



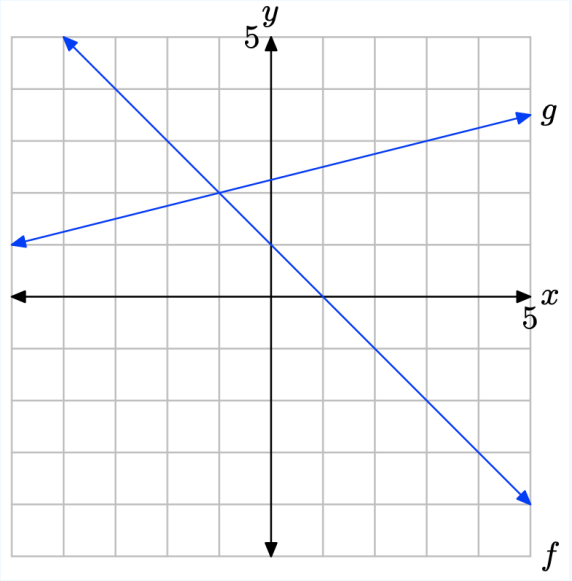
The graph of f is above the graph of g to the right of x = 3. The solution of f(x) > g(x) is $(3, \infty) = \{x : x > 3\}$.



The graph of f is below the graph of g to the left of x = 3. The solution of f(x) < g(x) is $(-\infty, 3) = \{x : x < 3\}$.



Exercise $16.5E.12$

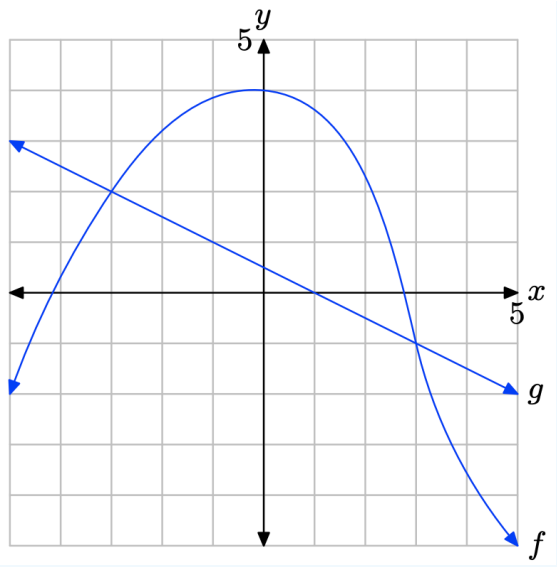


In Exercises $16.5E.13$-$16.5E.16$, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Make an accurate copy of the image on graph paper, drop dashed, vertical lines through the points of intersection, then label and shade the solution of $f(x) \geq g(x)$ on the x-axis. Use set-builder and interval notation to describe your solution set.

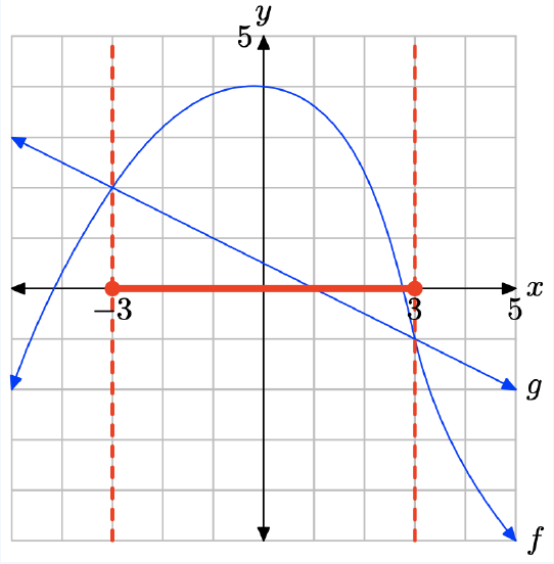
ii. Make a second copy of the image on graph paper, drop dashed, vertical lines through the points of intersection, then label and shade the solution of f(x) < g(x) on the x-axis. Use set-builder and interval notation to describe your solution set.

Exercise $16.5E.13$

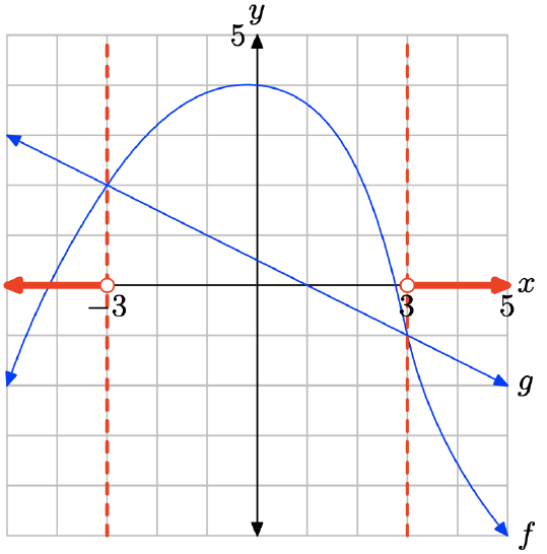


Answer

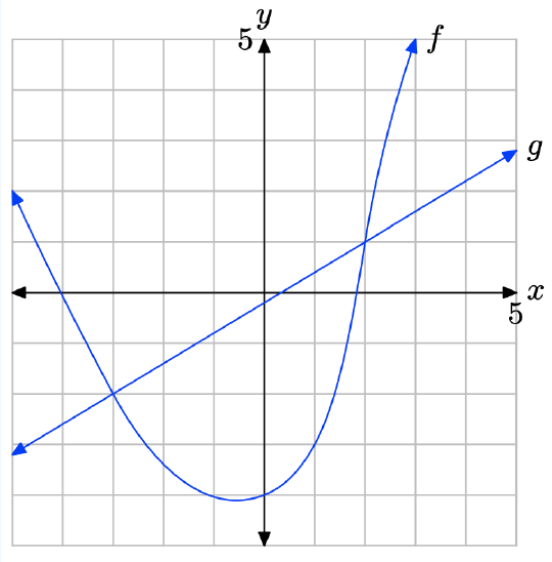
The graph of f intersects the graph of g at x = −3 and x = 3. The graph of f lies above the graph of g for values of x that lie between −3 and 3. Therefore, the solution of $f(x) \geq g(x)$ is $[-3, 3] = \{x : -3 \leq x \leq 3\}$.



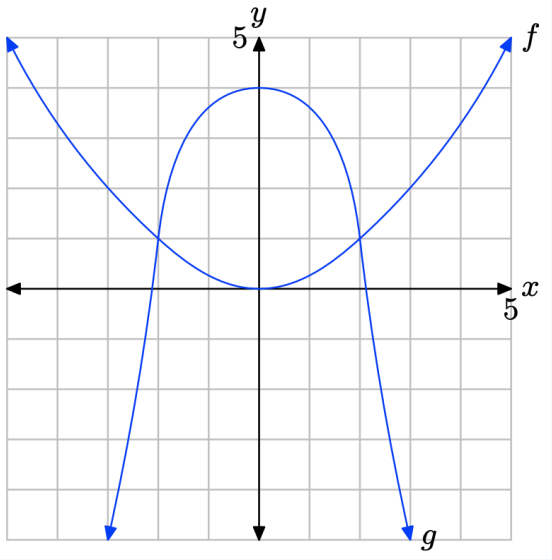
The graph of f is below the graph of g for values of x that lie to the left of −3 or to the right of 3. Therefore, the solution of f(x) < g(x) is $(-\infty, -3) \cup (3, \infty)$ or $\{x : x < -3 or x > 3\}$.



Exercise 16.5E.14

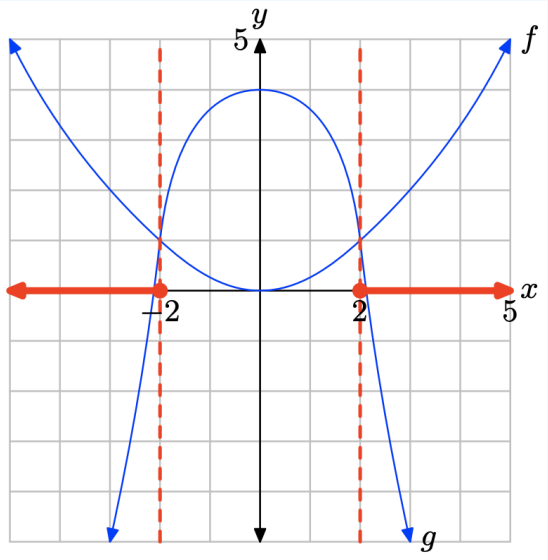


Exercise 16.5E.15

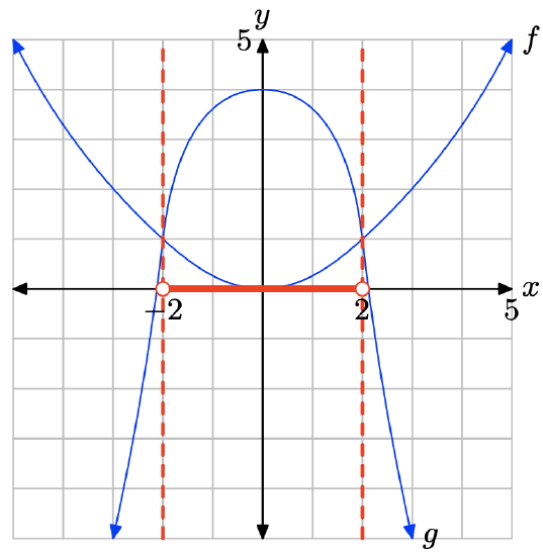


Answer

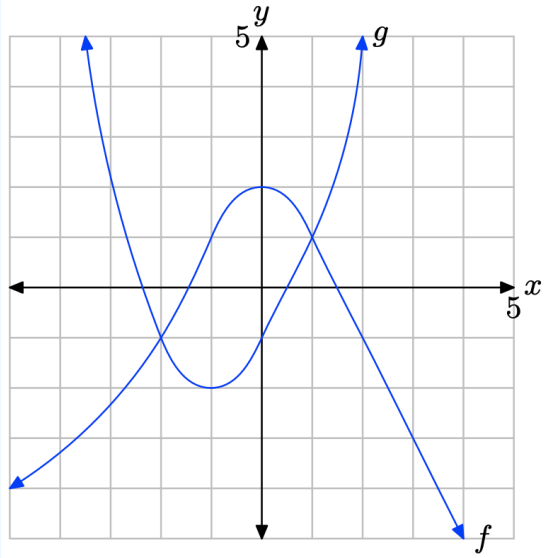
The graph of f intersects the graph of g at x = −2 and at x = 2. The graph of f lies above the graph of g for all values of x that lie to the left of −2 or to the right of 2. Therefore, the solution of $f(x) \geq g(x)$ is $(-\infty, -2] \cup [2, \infty)$ or $\{x : x \leq -2 or x \geq 2\}$.



The graph of f lies below the graph of g for values of x that lie between −2 and 2. Therefore, the solution of f(x) < g(x) is $(-2, 2) = \{x : -2 < x < 2\}$.



Exercise 16.5E. 16



In Exercises 16.5E. 17-16.5E. 20, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Load each side of the equation into the Y= menu of your calculator. Adjust the WINDOW parameters so that the point of intersection of the graphs is visible in the viewing window. Use the intersect utility in the CALC menu of your calculator to determine the x-coordinate of the point of intersection.

ii. Make an accurate copy of the image in your viewing window on your homework paper. Label and scale each axis with xmin, xmax, ymin, and ymax, and label each graph with its equation.

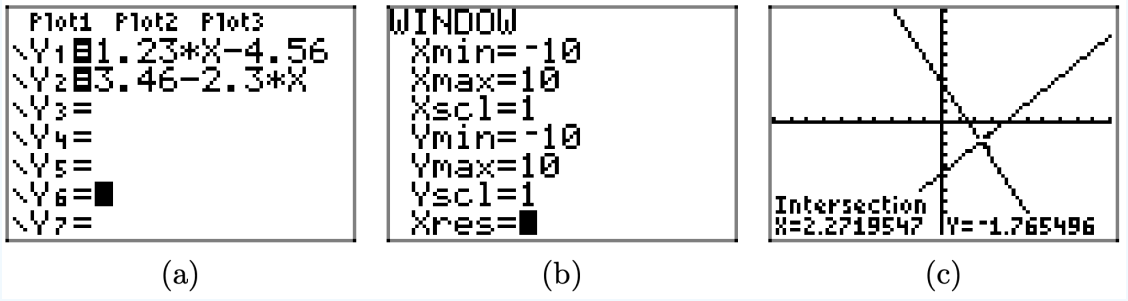
iii. Draw a dashed, vertical line through the point of intersection. Shade and label the solution of the equation on the x-axis.

Exercise 16.5E. 17

1.23x − 4.56 = 3.46 − 2.3x

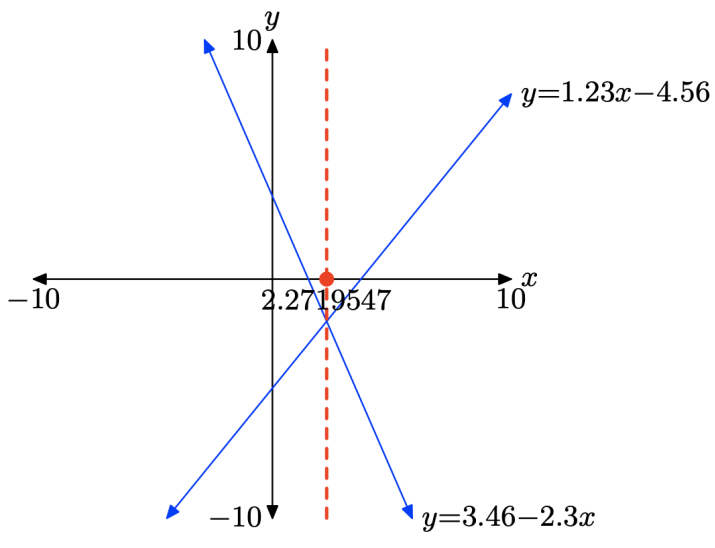
Answer

To solve the equation 1.23x − 4.56 = 3.46 − 2.3x graphically, start by loading the left- and right-hand sides of the equation into Y1 and Y2, respectively, as shown in (a). Use the intersect utility in the CALC menu to determine the point of intersection, as shown in (c).



(a) (b) (c)

Therefore, the solution of the equation is x = 2.2719547, which is shaded on the x-axis in the image that follows. Answers may vary due to roundoff error.



? Exercise 16.5E. 18

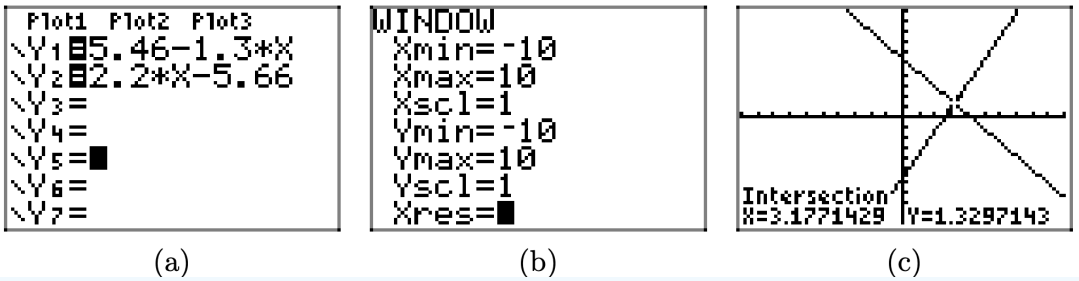
2.23x − 1.56 = 5.46 − 3.3x

? Exercise 16.5E. 19

5.46 − 1.3x = 2.2x − 5.66

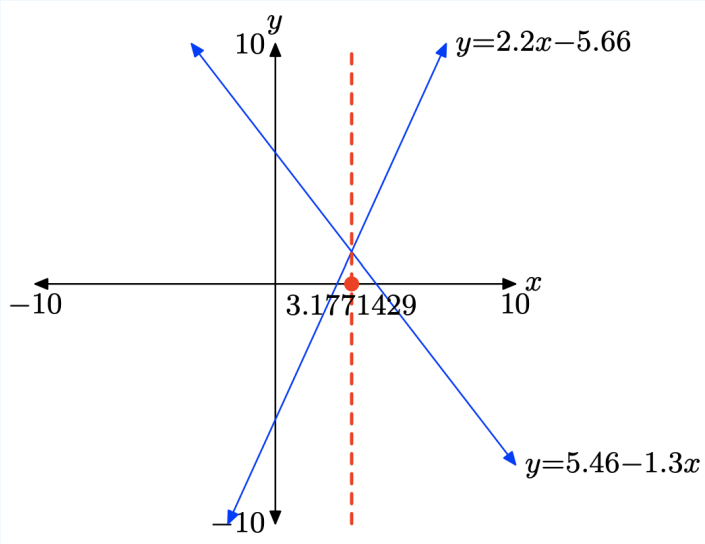
Answer

To solve the equation 5.46 − 1.3x = 2.2x − 5.66 graphically, start by loading the left- and right-hand sides of the equation into Y1 and Y2, respectively, as shown in (a). Use the intersect utility in the CALC menu to determine the point of intersection, as shown in (c).



(a) (b) (c)

Therefore, the solution of the equation is x = 3.1771429, which is shaded on the x-axis in the image that follows. Answers may vary due to roundoff error.



? Exercise 16.5E. 20

2.46 − 1.4x = 1.2x − 2.66

In Exercises 16.5E. 21-16.5E. 26, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Load each side of the inequality into the Y= menu of your calculator. Adjust the WINDOW parameters so that the point(s) of intersection of the graphs is visible in the viewing window. Use the intersect utility in the CALC menu of your calculator to determine the coordinates of the point(s) of intersection.

ii. Make an accurate copy of the image in your viewing window on your homework paper. Label and scale each axis with xmin, xmax, ymin, and ymax, and label each graph with its equation.

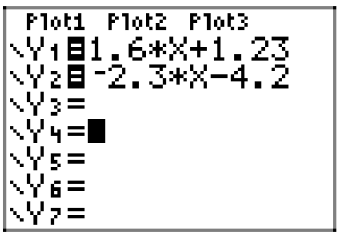
iii. Draw a dashed, vertical line through the point(s) of intersection. Shade and label the solution of the inequality on the x-axis. Use both set-builder and interval notation to describe the solution set.

? Exercise 16.5E. 21

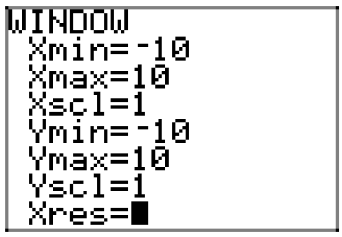
$1.6x + 1.23 \geq -2.3x - 4.2$

Answer

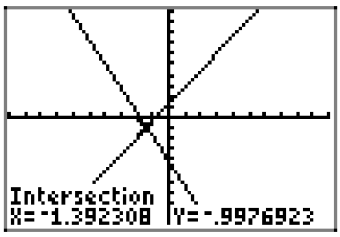
To solve the inequality $1.6x + 1.23 \geq -2.3x - 4.2$ graphically, start by loading the left- and right-hand sides of the inequality into Y1 and Y2, respectively, as shown in (a). Use the intersect utility in the CALC menu to determine the point of intersection, as shown in (c).



(a)

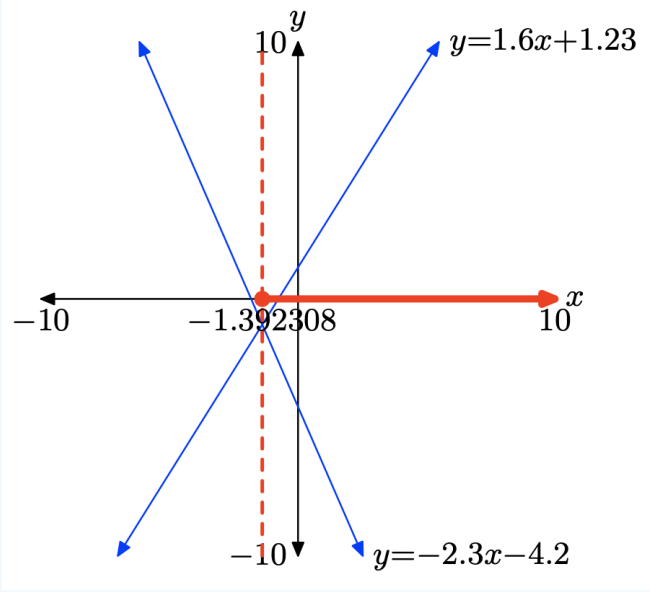


(b)



(c)

The two graphs intersect at x = −1.392308. The graph of y = 1.6x + 1.23 is above the graph of y = −2.3x−4.2 for all values of x that lie to the right of −1.392308. Therefore, the solution of $1.6x+1.23 \geq -2.3x-4.2$ is $[-1.392308, \infty) = \{x : x \geq -1.392308\}$



? Exercise $16.5E.22$

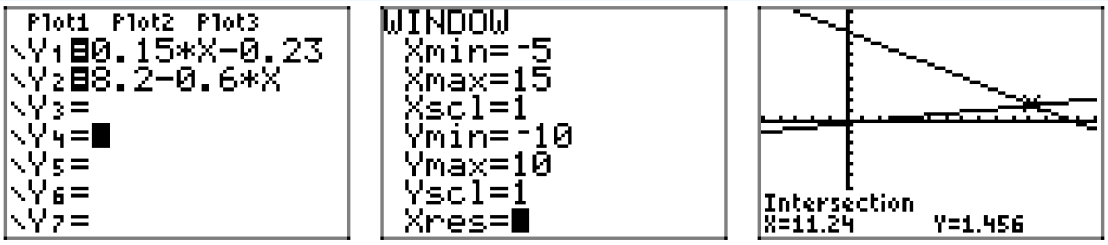
1.24x + 5.6 < 1.2 − 0.52x

? Exercise $16.5E.23$

0.15x − 0.23 > 8.2 − 0.6x

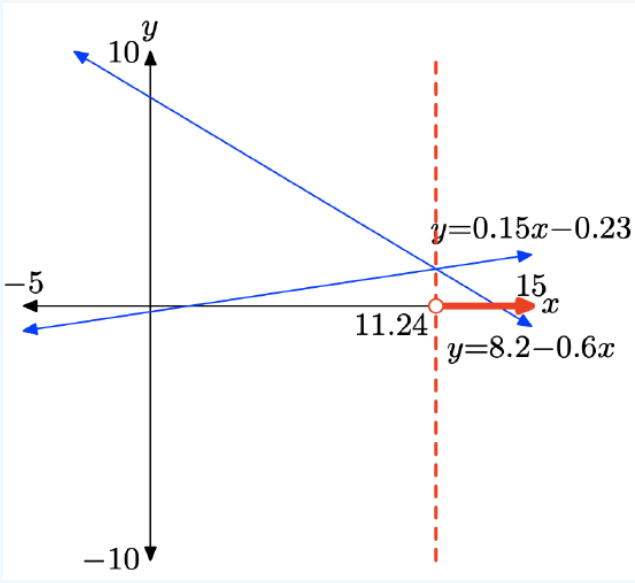
Answer

To solve the inequality 0.15x − 0.23 > 8.2 − 0.6x graphically, start by loading the left- and right-hand sides of the inequality into Y1 and Y2, respectively, as shown in (a). Adjust the viewing window as shown in (b). Use the intersect utility in the CALC menu to determine the point of intersection, as shown in (c).



(a) (b) (c)

The graph of y = 0.15x − 0.23 is above the graph of y = 8.2 − 0.6x for all values of x that lie to the right of 11.24. Therefore, the solution of 0.15x − 0.23 > 8.2 − 0.6x is $(11.24, \infty) = \{x : x > 11.24\}$



Exercise 16.5E. 24

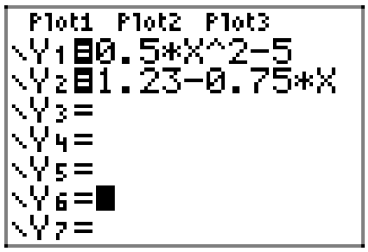
$-1.23x - 9.76 \leq 1.44x + 22.8$

Exercise 16.5E. 25

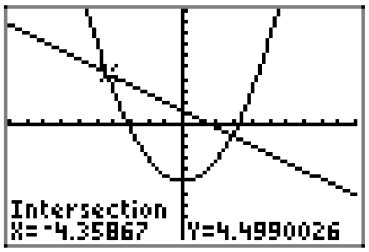
$0.5x^2 - 5 < 1.23 - 0.75x$

Answer

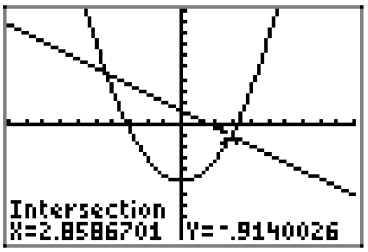
To solve the inequality $0.5x^2 - 5 < 1.23 - 0.75x$ graphically, start by loading the left- and right-hand sides of the inequality into Y1 and Y2, respectively, as shown in (a). Use the intersect utility in the CALC menu to determine the points of intersection, as shown in (b) and (c).



(a)

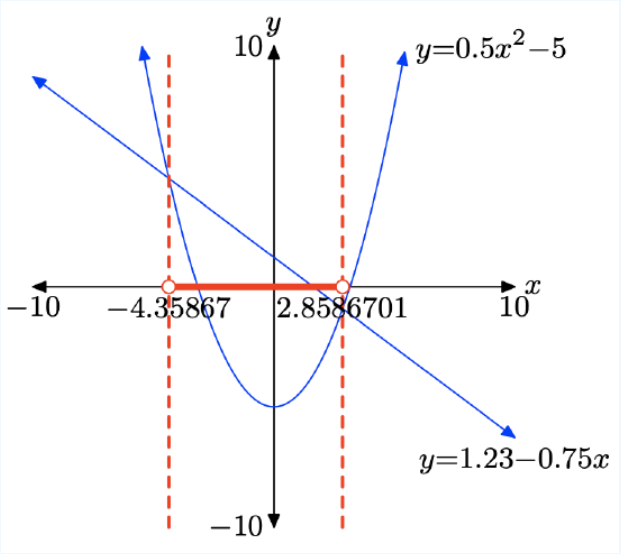


(b)



(c)

The graph of y = 0.5x2−5 is below the graph of y = 1.23−0.75x for all values of x that lie between −4.35867 and 2.8586701. Therefore, the solution of $0.5x^2 - 5 < 1.23 - 0.75x$ is (−4.35867, 2.8586701) or {x : −4.35867 < x < 2.8586701}.



? Exercise 16.5E. 26

$4 - 0.5x^2 \leq 0.72x - 1.34$

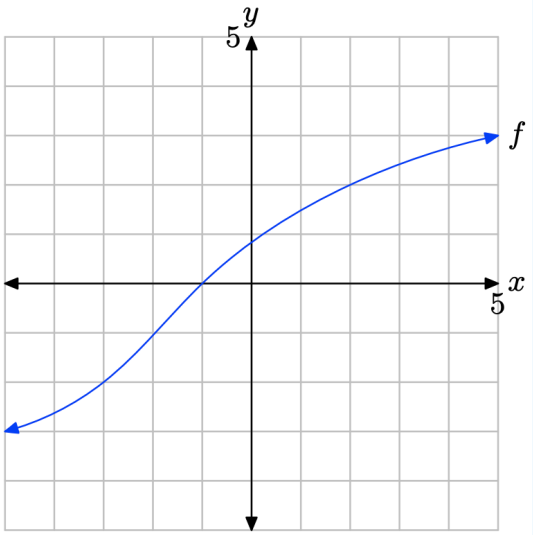
In Exercises 16.5E. 27-16.5E. 30, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Make an accurate copy of the image on graph paper (label the graph with the letter f and label and scale each axis), drop a dashed vertical line through the x-intercept of the graph of f, then label and shade the solution of f(x) = 0 on the x-axis. Use set-builder notation to describe your solution.

ii. Make a second copy of the image on graph paper, drop a dashed, vertical line through the x-intercept of the graph of f, then label and shade the solution of f(x) > 0 on the x-axis. Use set-builder and interval notation to describe your solution set.

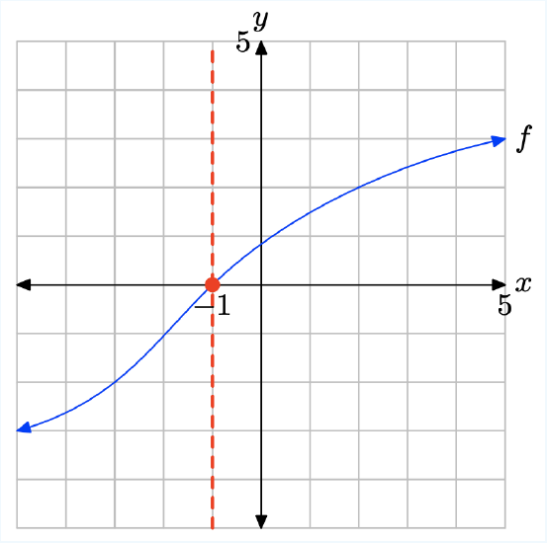
iii. Make a third copy of the image on graph paper, drop a dashed, vertical line through the x-intercept of the graph of f, then label and shade the solution of f(x) < 0 on the x-axis. Use set-builder and interval notation to describe your solution set.

? Exercise 16.5E. 27

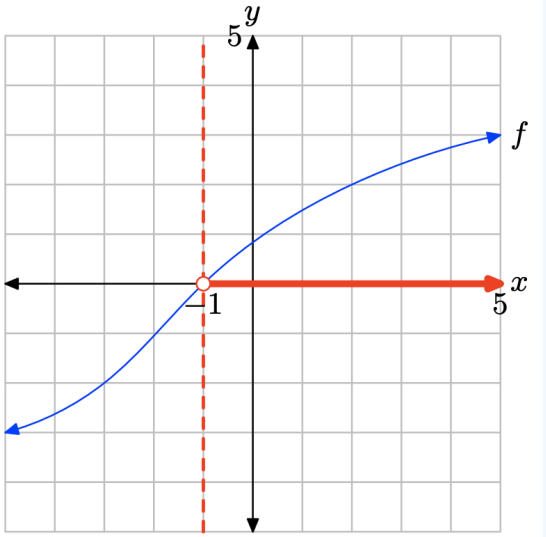


Answer

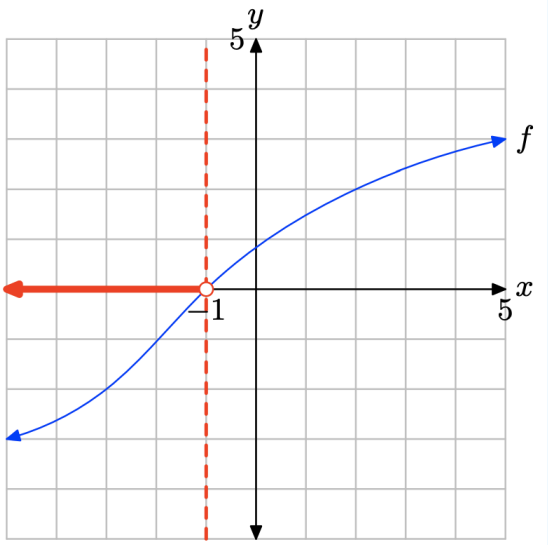
The graph of f intercepts the x-axis at x = −1. Therefore, the solution of f(x) = 0 is x = −1.



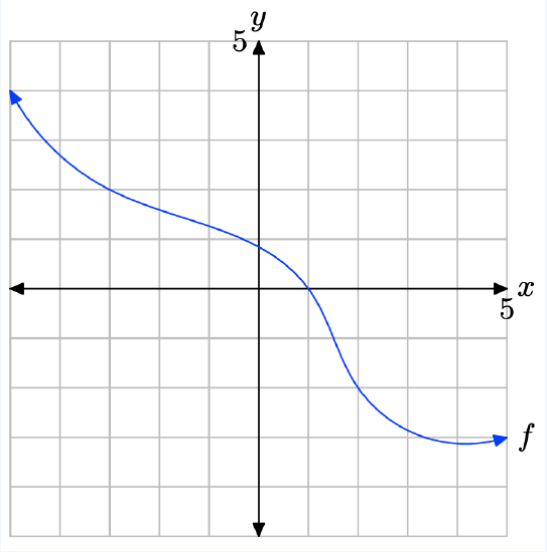
The graph of f lies above the x-axis for all values of x that lie to the right of −1. Therefore, the solution of f(x) > 0 is $(-1, \infty) = \{x : x > -1\}$.



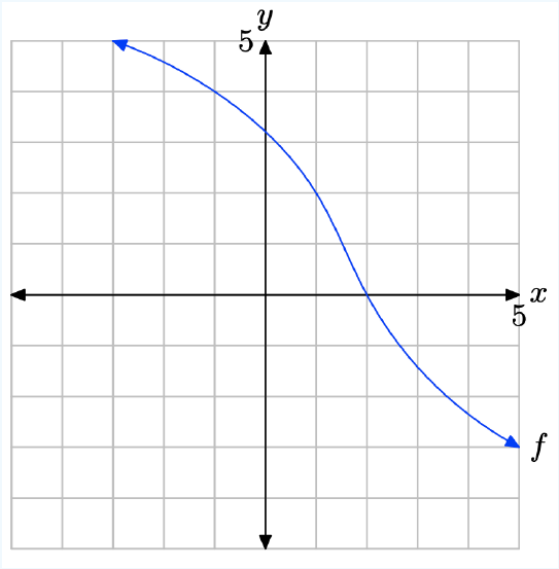
The graph of f lies below the x-axis for all values of x that lie to the left of −1. Therefore, the solution of f(x) < 0 is $(-\infty, -1) = \{x : x < -1\}$



? Exercise $16.5E.28$

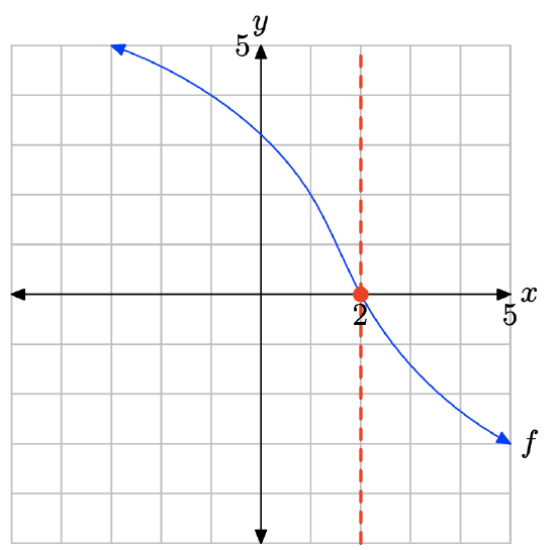


Exercise $16.5E.29$

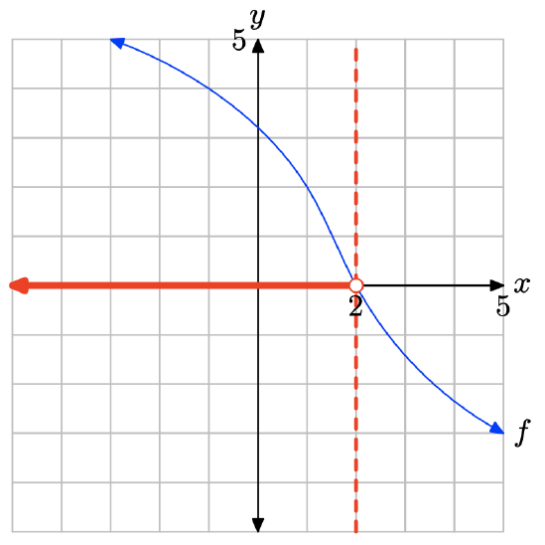


Answer

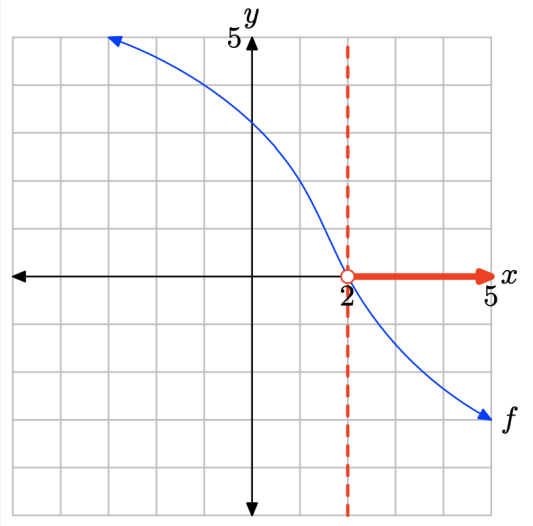
The graph of f intercepts the x-axis at x = 2. Therefore, the solution of f(x) = 0 is x = 2.



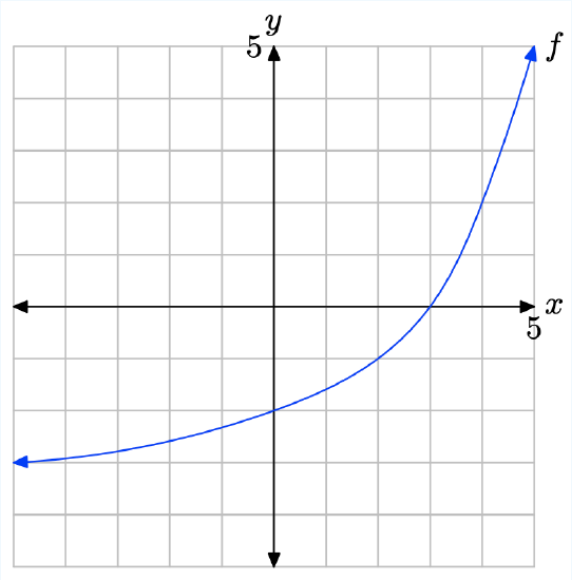
The graph of f lies above the x-axis for all values of x that lie to the left of x = 2. Therefore, the solution of f(x) > 0 is $(-\infty, 2) = \{x : x < 2\}$.



The graph of f lies below the x-axis for all values of x that lie to the right of x = 2. Therefore, the solution of f(x) < 0 is $(2, \infty) = \{x : x > 2\}$



Exercise $16.5E.30$

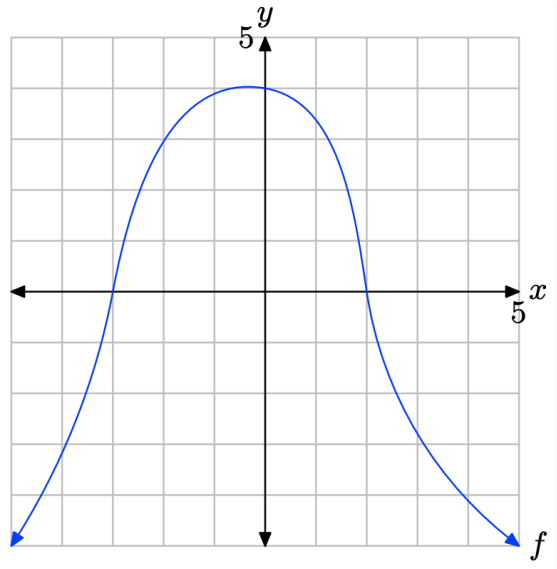


In Exercises $16.5E.31$-$16.5E.34$, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Make an accurate copy of the image on graph paper, drop dashed, vertical lines through the x-intercepts, then label and shade the solution of $f(x) \geq 0$ on the x-axis. Use set-builder and interval notation to describe your solution set.

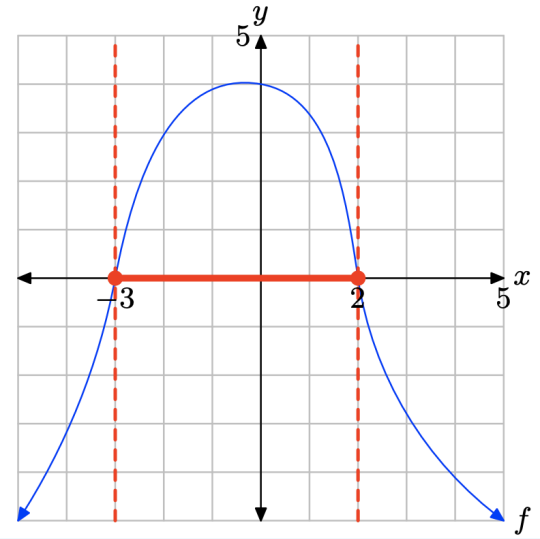
ii. Make a second copy of the image on graph paper, drop dashed, vertical lines through the x-intercepts, then label and shade the solution of f(x) < 0 on the x-axis. Use set-builder and interval notation to describe your solution set.

Exercise $16.5E.31$

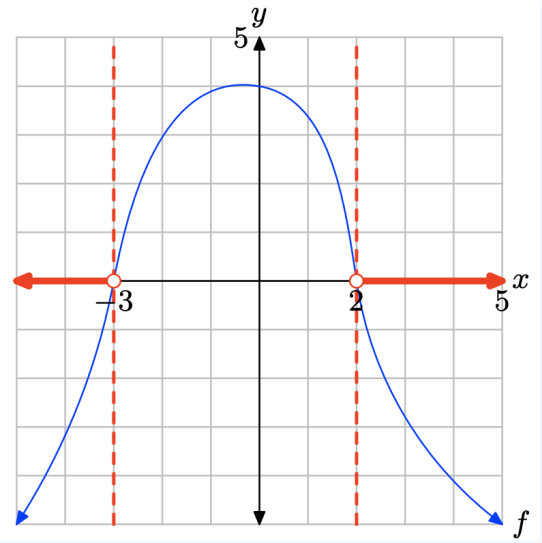


Answer

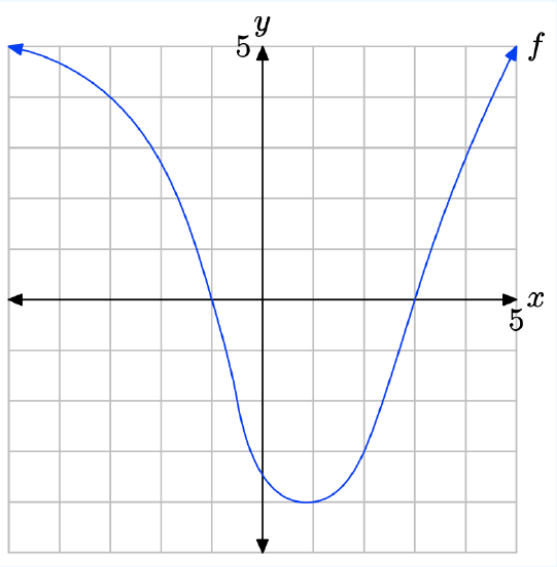
The graph of f intercepts the x-axis at x = −3 and x = 2. The graph of f lies above the x-axis for all values of x that lie between x = −3 and x = 2. Therefore, the solution of $f(x) \geq 0$ is $[-3, 2] = \{x : -3 \leq x \leq 2\}$.



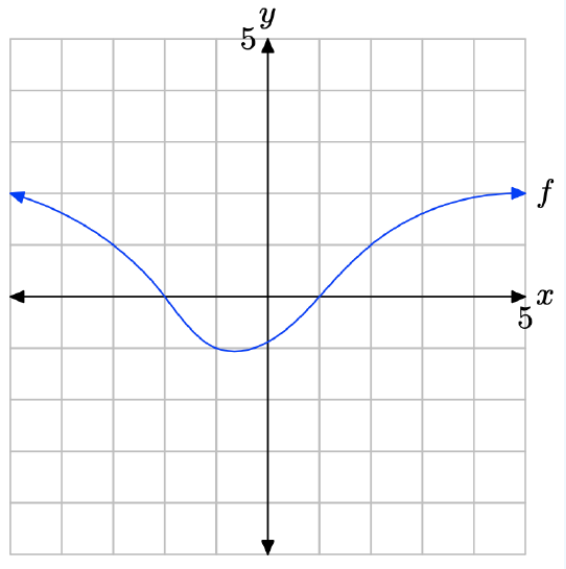
The graph of f lies below the x-axis for all values of x that lie to the left of x = −3 or to the right of x = 2. Therefore, the solution of f(x) < 0 is $(-\infty, -3) \cup (2, \infty) = \{x : x < -3 or x > 2\}$.



Exercise 16.5E.32

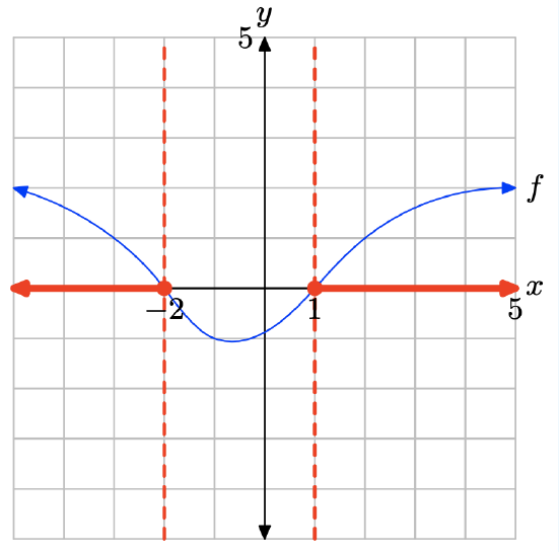


Exercise 16.5E.33

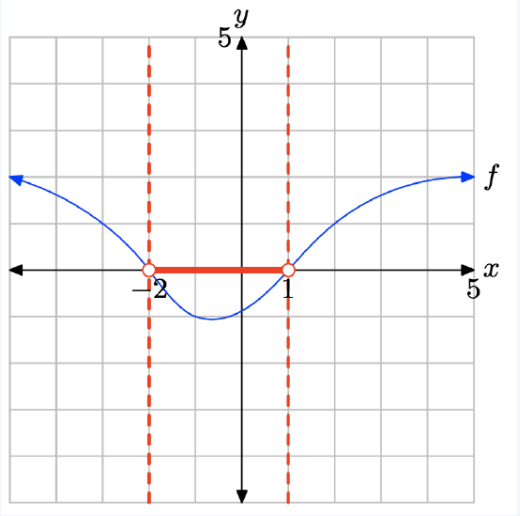


Answer

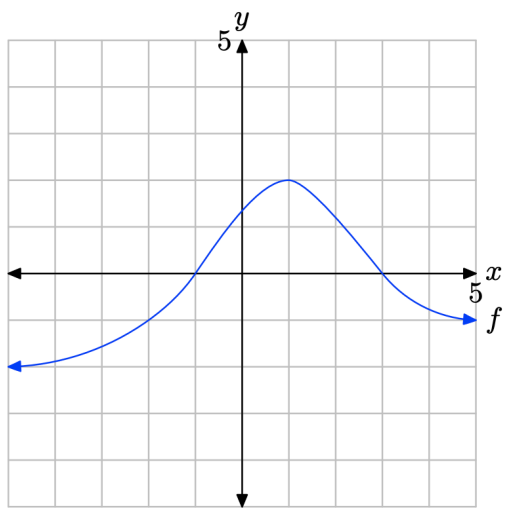
The graph of f intercepts the x-axis at x = −2 and x = 1. The graph of f lies above the x-axis for all values of x that lie to the left x = −2 or to the right of x = 1. Therefore, the solution of $f(x) \geq 0$ is $(-\infty, -2] \cup [1, \infty) = \{x : x \leq -2 or x \geq 1\}$.



The graph of f lies below the x-axis for all values of x that lie between x = −2 and x = 1. Therefore, the solution of f(x) < 0 is $(-2, 1) = \{x : -2 < x < 1\}$.



Exercise 16.5E.34



In Exercises 16.5E.35-16.5E.38, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Load the given function f into the Y= menu of your calculator. Adjust the WINDOW parameters so that the x-intercept(s) of the graph of f is visible in the viewing window. Use the zero utility in the CALC menu of your calculator to determine the coordinates of the x-intercept(s) of the graph of f.

ii. Make an accurate copy of the image in your viewing window on your homework paper. Label and scale each axis with xmin, xmax, ymin, and ymax, and label the graph with its equation.

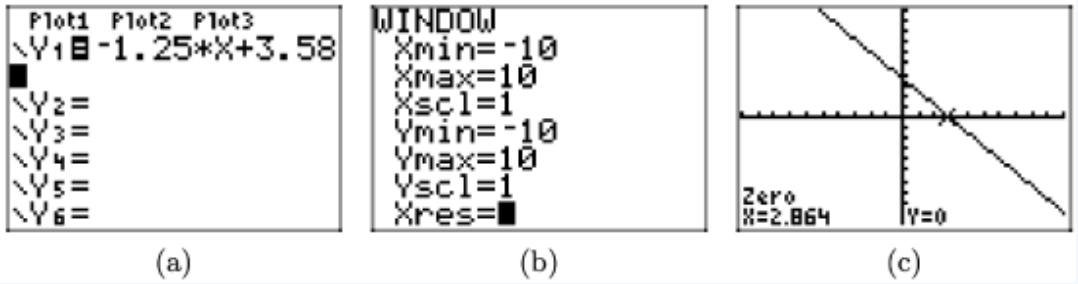
iii. Draw a dashed, vertical line through the x-intercept(s). Shade and label the solution of the inequality f(x) > 0 on the x-axis. Use both set-builder and interval notation to describe the solution set.

Exercise 16.5E.35

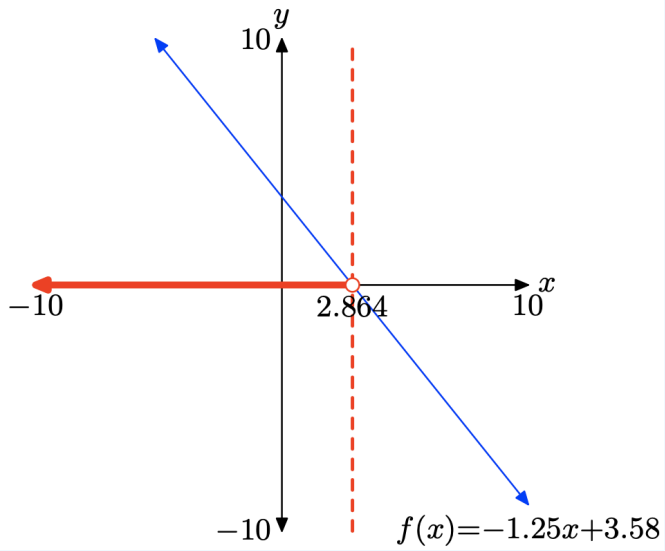
f(x) = −1.25x + 3.58

Answer

To solve the inequality f(x) > 0 graphically, start by loading f(x) = −1.25x+3.58 into Y1. Use the zero utility in the CALC menu to determine the zero of f, as shown in (c).



The graph of f lies above the x-axis for all values of x that lie to the left of x = 2.864. Therefore, the solution of f(x) > 0 is $(-\infty, 2.864) = \{x : x < 2.864\}$. Answers may vary due to round-off error.



Exercise 16.5E. 36

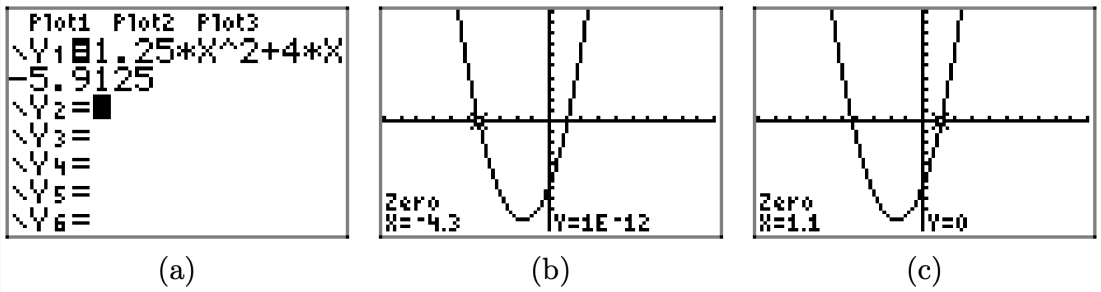
f(x) = 1.34x − 4.52

Exercise 16.5E. 37

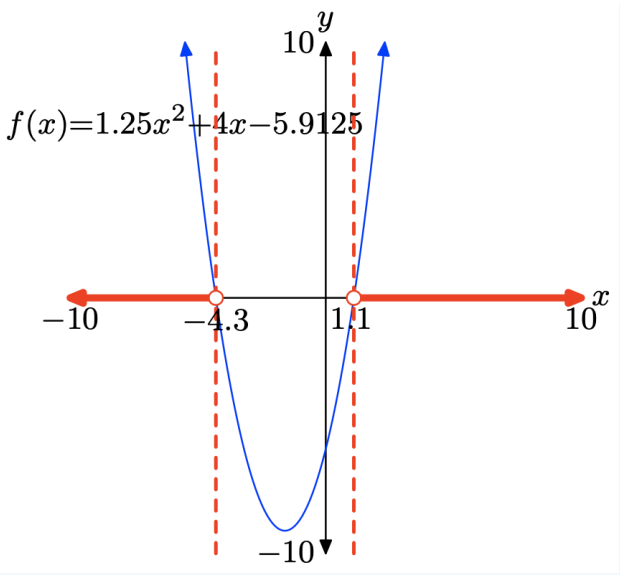
$f(x) = 1.25x^2 + 4x - 5.9125$

Answer

To solve the inequality f(x) > 0 graphically, start by loading $f(x) = 1.25x^2 + 4x - 5.9125$ into Y1. Use the zero utility in the CALC menu to determine the zeros of f, as shown in (b) and (c).



The graph of f lies above the x-axis for all values of x that lie to the left of x = −4.3 or to the right of x = 1.1. Therefore, the solution of f(x) > 0 is $(-\infty, -4.3) \cup (1.1, \infty)$ or $\{x : x < -4.3 or x > 1.1\}$. Answers may vary due to round-off error.



Exercise 16.5E. 38

$f(x) = -1.32x^2 - 3.96x + 5.9532$

In Exercises 16.5E. 39-16.5E. 42, perform each of the following tasks. Remember to use a ruler to draw all lines.

i. Load the given function f into the Y= menu of your calculator. Adjust the WINDOW parameters so that the x-intercept(s) of the graph of f is visible in the viewing window. Use the zero utility in the CALC menu of your calculator to determine the coordinates of the x-intercept(s) of the graph of f.

ii. Make an accurate copy of the image in your viewing window on your homework paper. Label and scale each axis with xmin, xmax, ymin, and ymax, and label the graph with its equation.

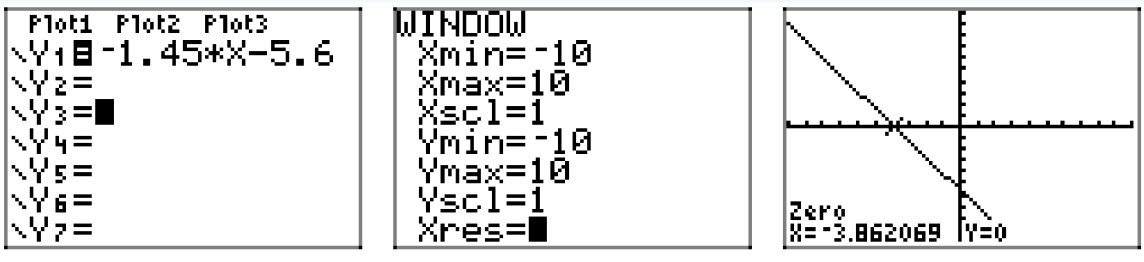
iii. Draw a dashed, vertical line through the x-intercept(s). Shade and label the solution of the inequality $f(x) \leq 0$ on the x-axis. Use both set-builder and interval notation to describe the solution set.

Exercise 16.5E. 39

f(x) = −1.45x − 5.6

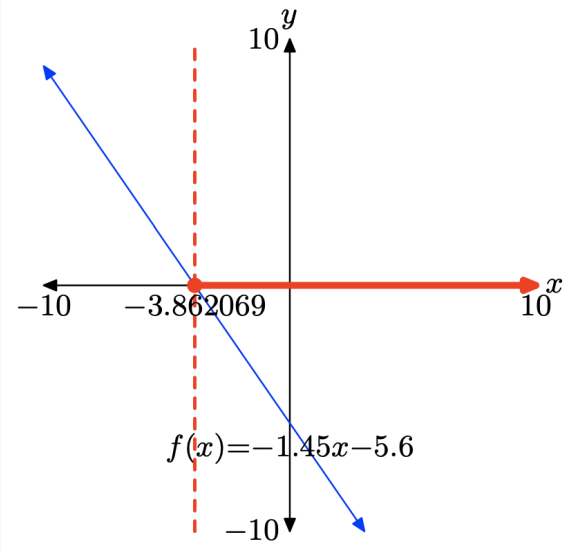
Answer

To solve the inequality $f(x) \leq 0$ graphically, start by loading f(x) = −1.45x−5.6 into Y1. Use the zero utility in the CALC menu to determine the zero of f, as shown in (c).



(a) (b) (c)

The graph of f intercepts the x-axis at x = −3.862069. The graph of f lies below the x-axis for all values of x that lie to the right of x = −3.862069. Therefore, the solution of $f(x) \leq 0$ is $[-3.862069, \infty) = \{x : x \geq -3.862069\}$ Answers may vary due to roundoff error.



Exercise 16.5E. 40

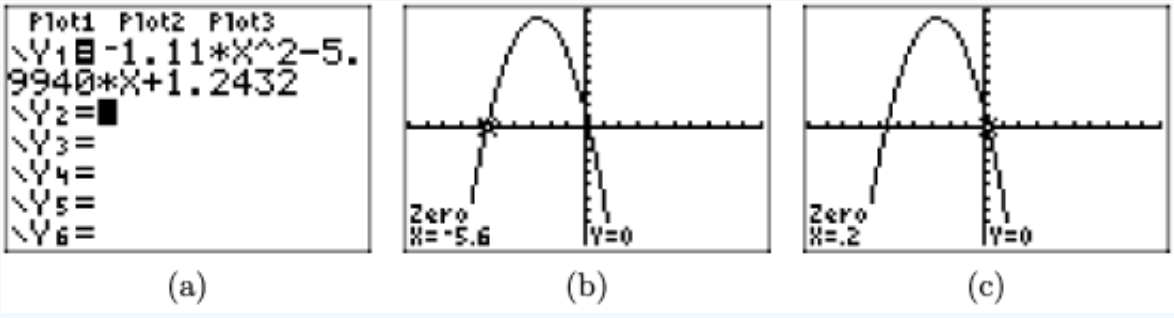
f(x) = 1.35x + 8.6

Exercise 16.5E. 41

$f(x) = -1.11x^2 - 5.9940x + 1.2432$

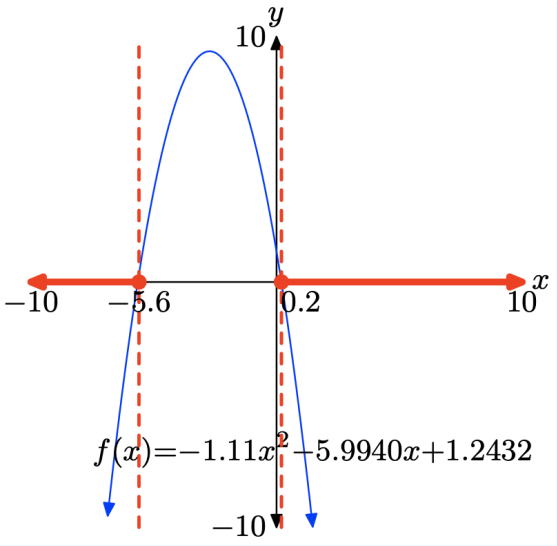
Answer

To solve the inequality $f(x) \leq 0$ graphically, start by loading $f(x) = -1.11x^2 - 5.9940x + 1.2432$into Y1. Use the zero utility in the CALC menu to determine the zeros of f, as shown in (b) and (c).



(a) (b) (c)

The graph of f intercepts the x-axis at x = −5.6 and x = 0.2. The graph of f lies below the x-axis for all values of x that lie to the left of x = −5.6 or to the right of x = 0.2. Therefore, the solution of $f(x) \leq 0$ is $(-\infty, -5.6] \cup [0.2, \infty)$ or $\{x : x \leq -5.6 or x \geq 0.2\}$. Answers may vary due to roundoff error.

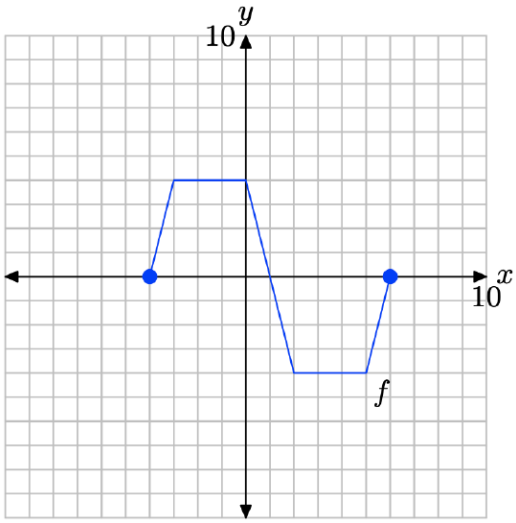


Exercise $16.5E.42$

$f(x) = 1.22x^2 - 6.3440x + 1.3176$

2.5 Exercises

Pictured below is the graph of a function f.



The table that follows evaluates the function f in the plot at key values of x. Notice the horizontal format, where the first point in the table is the ordered pair (−4, 0).

x	-4	-3	0	2	5	6
f(x)	0	4	4	-4	-4	0

Use the graph and the table to complete each of following tasks for Exercises $16.5E.1$ - $16.5E.10$.

i. Set up a coordinate system on graph paper. Label and scale each axis, then copy and label the original graph of f onto your coordinate system. Remember to draw all lines with a ruler.

ii. Use the original table to help complete the table for the given function in the exercise.

iii. Using a different colored pencil, plot the data from your completed table on the same coordinate system as the original graph of f. Use these points to help complete the graph of the given function in the exercise, then label this graph with its equation given in the exercise.

Exercise 16.5E.1

y= 2f(x).

x	-4	-3	0	2	5	6
y						

Answer

The original function table.

x	-4	-3	0	2	5	6
f(x)	0	4	4	-4	-4	0

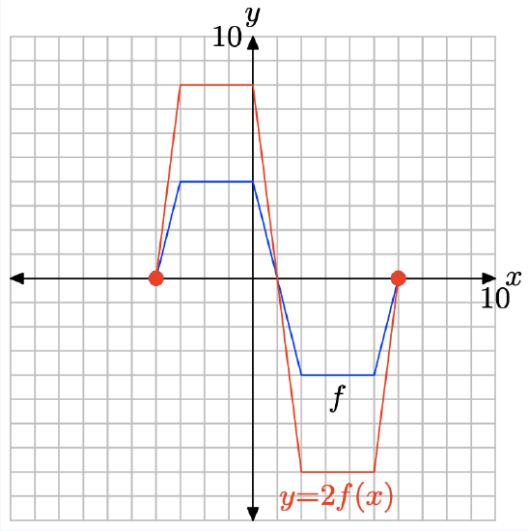
Evaluate the function y = 2f(x) at x = −4, −3, 0, 2, 5, and 6.

$$y = 2f(-4) = 2(0) = 0$$
$$y = 2f(-3) = 2(4) = 8$$
$$y = 2f(0) = 2(4) = 8$$
$$y = 2f(2) = 2(-4) = -8$$
$$y = 2f(5) = 2(-4) = -8$$
$$y = 2f(6) = 2(0) = 0$$

Points satisfying y = 2f(x).

x	-4	-3	0	2	5	6
y	0	8	8	-8	-8	0

Plot the points in the table to get the graph of y = 2f(x).



Note that multiplying by 2, as in y = 2f(x), stretches the graph of y = f(x) vertically by a factor of 2.

Exercise $16.5E.2$

y = (1/2)f(x).

x	-4	-3	0	2	5	6
y						

Exercise $16.5E.3$

y = −f(x).

x	-4	-3	0	2	5	6
y						

Answer

The original function table.

x	-4	-3	0	2	5	6
f(x)	0	4	4	-4	-4	0

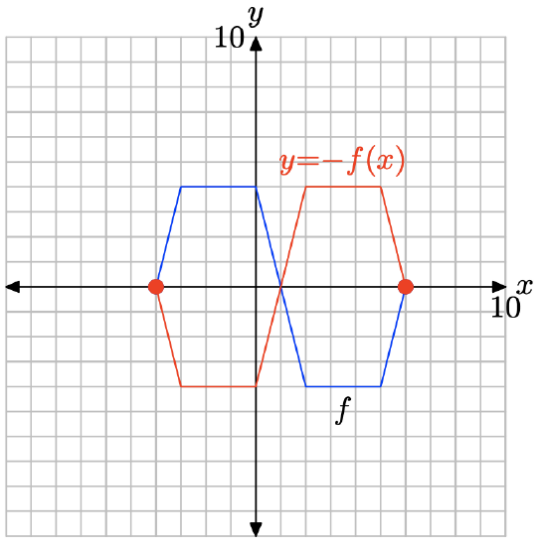
Evaluate the function y = −f(x) at x = −4, −3, 0, 2, 5, and 6.

$$y = -f(-4) = -(0) = 0$$
$$y = -f(-3) = -(4) = -4$$
$$y = -f(0) = -(4) = -4$$
$$y = -f(2) = -(-4) = 4$$
$$y = -f(5) = -(-4) = 4$$
$$y = -f(6) = -(0) = 0$$

Points satisfying y = −f(x).

x	-4	-3	0	2	5	6
y	0	-4	-4	4	4	0

Plot the points in the table to get the graph of y = −f(x).



Note that negating the function, as in y = −f(x), reflects the graph of y = f(x) across the x-axis.

Exercise 16.5E.4

y = f(x) − 2.

x	-4	-3	0	2	5	6
y						

Exercise 16.5E.5

y = f(x) + 4.

x	-4	-3	0	2	5	6
y						

Answer

The original function table.

x	-4	-3	0	2	5	6
f(x)	0	4	4	-4	-4	0

Evaluate the function y = f(x) + 4 at x = −4, −3, 0, 2, 5, and 6.

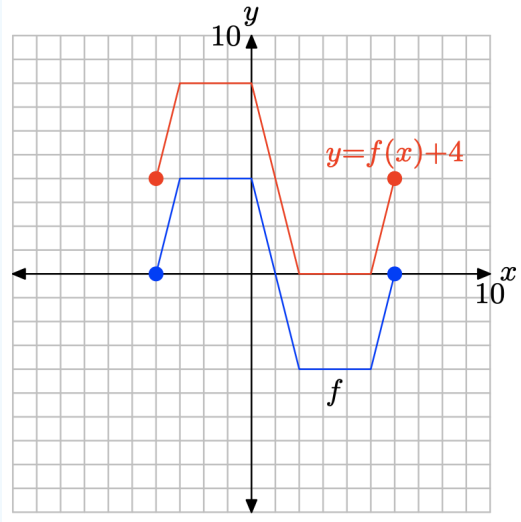
$$y = f(-4) + 4 = (0) + 4 = 4$$
$$y = f(-3) + 4 = (4) + 4 = 8$$
$$y = f(0) + 4 = (4) + 4 = 8$$
$$y = f(2) + 4 = (-4) + 4 = 0$$
$$y = f(5) + 4 = (-4) + 4 = 0$$
$$y = f(6) + 4 = (0) + 4 = 4$$

Points satisfying y = f(x) + 4.

x	-4	-3	0	2	5	6

y	4	8	8	0	0	4

Plot the points in the table to get the graph of y = f(x) + 4.



Note that adding 4, as in y = f(x) + 4, translates the graph of y = f(x) upwards 4 units.

Exercise 16.5E.6

y = −2f(x)

x	-4	-3	0	2	5	6
y						

Exercise 16.5E.7

y = (−1/2)f(x)

x	-4	-3	0	2	5	6
y						

Answer

The original function table.

x	-4	-3	0	2	5	6
f(x)	0	4	4	-4	-4	0

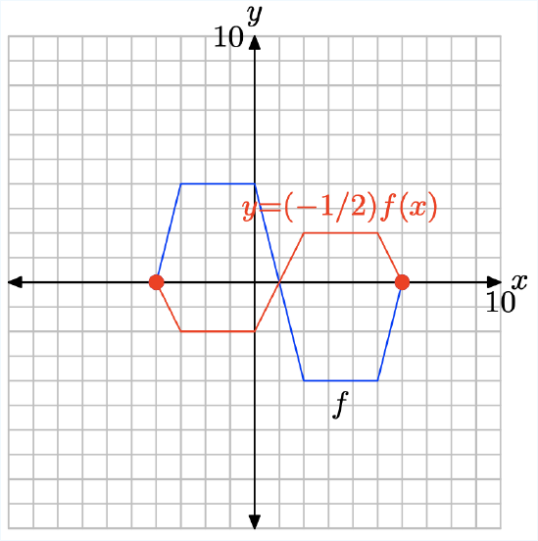
Evaluate the function y = (−1/2)f(x) at x = −4, −3, 0, 2, 5, and 6.

$$y = (-1/2)f(-4) = (-1/2)(0) = 0$$
$$y = (-1/2)f(-3) = (-1/2)(4) = -2$$
$$y = (-1/2)f(0) = (-1/2)(4) = -2$$
$$y = (-1/2)f(2) = (-1/2)(-4) = 2$$
$$y = (-1/2)f(5) = (-1/2)(-4) = 2$$
$$y = (-1/2)f(6) = (-1/2)(0) = 0$$

Points satisfying y = (−1/2)f(x).

x	-4	-3	0	2	5	6
y	0	-2	-2	2	2	0

Plot the points in the table to get the graph of y = (−1/2)f(x).



Note that multiplying by −1/2, as in y = (−1/2)f(x), compresses the graph of y = f(x) vertically by a factor of 2, then reflects the result across the x-axis.

Exercise 16.5E.8

y = −f(x) + 3.

x	-4	-3	0	2	5	6
y						

Exercise 16.5E.9

y = −f(x) − 2

x	-4	-3	0	2	5	6
y						

Answer

The original function table.

x	-4	-3	0	2	5	6
f(x)	0	4	4	-4	-4	0

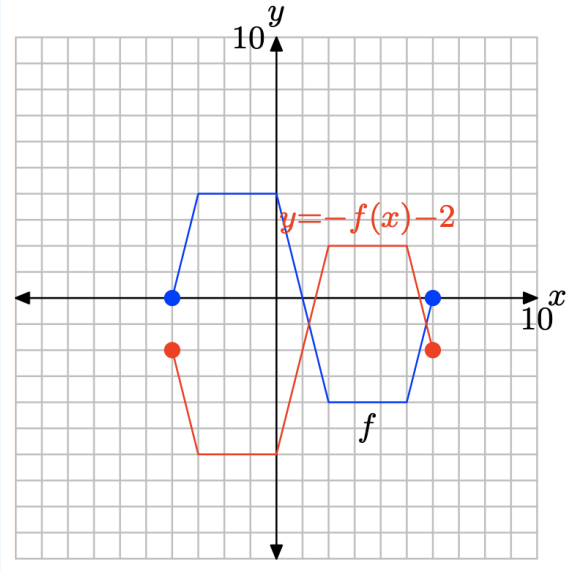
Evaluate the function y = −f(x) − 2 at x = −4, −3, 0, 2, 5, and 6.

$$y = -f(-4) - 2 = -(0) - 2 = -2$$
$$y = -f(-3) - 2 = -(4) - 2 = -6$$
$$y = -f(0) - 2 = -(4) - 2 = -6$$
$$y = -f(2) - 2 = -(-4) - 2 = 2$$
$$y = -f(5) - 2 = -(-4) - 2 = 2$$
$$y = -f(6) - 2 = -(0) - 2 = -2$$

Points satisfying y = −f(x) − 2.

x	-4	-3	0	2	5	6
y	-2	-6	-6	2	2	-2

Plot the points in the table to get the graph of y = −f(x) − 2.



Note that negating then subtracting 2, as in y = −f(x) − 2, first reflects the graph of y = f(x) across the x-axis, then translates the resulting reflection 2 units downward.

Exercise 16.5E.10

y = (−1/2)f(x) + 3

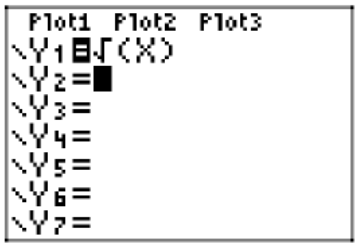
x	-4	-3	0	2	5	6
y						

Exercise 16.5E.11

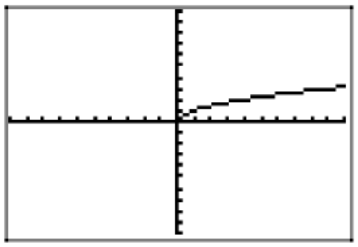
Use your graphing calculator to draw the graph of $y = \sqrt{x}$. Then, draw the graph of $y = \sqrt{x}$. In your own words, explain what you learned from this exercise.

Answer

First, draw the graph of $y = \sqrt{x}$.

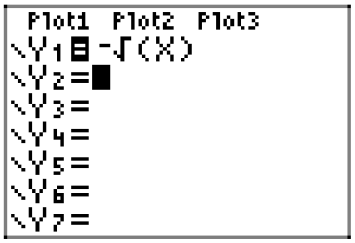


(a)

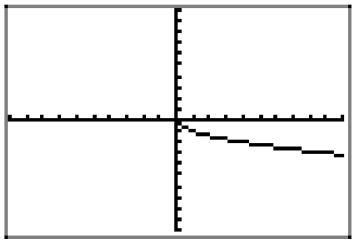


(b)

The graph of $y = -\sqrt{x}$ is a reflection of the graph of $y = \sqrt{x}$ across the x-axis.



(c)



(d)

Negating a function appears to reflect the graph of the function across the x-axis.

? Exercise 16.5E. 12

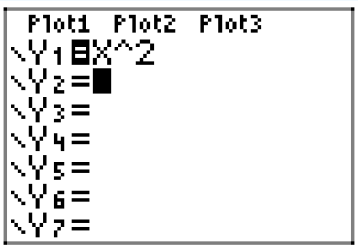
Use your graphing calculator to draw the graph of y = |x|. Then, draw the graph of y = −|x|. In your own words, explain what you learned from this exercise.

? Exercise 16.5E. 13

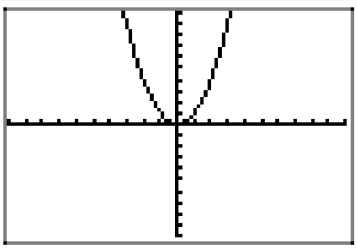
Use your graphing calculator to draw the graph of $y = x^2$. Then, in succession, draw the graphs of $y = x^2 - 2$, $y = x^2 - 4$, and $y = x^2 - 6$. In your own words, explain what you learned from this exercise.

Answer

First, draw the graph of $y = x^2$.

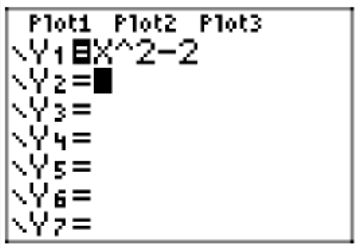


(a)

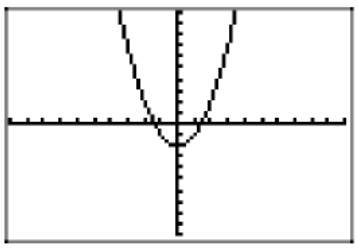


(b)

Subtracting 2 (as in $y = x^2 - 2$) translates the graph of $y = x^2$ two units downward in the y-direction.

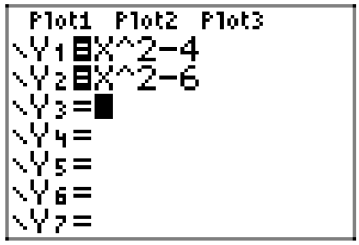


(c)

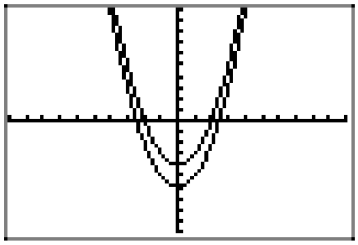


(d)

Similarly, subtracting 4 and 6 translates the graph of $y = x^2$ four units and 6 units downward, respectively



(e)



(f)

In general, if c is positive, then the graph of y = f(x) − c is obtained by translating the graph of y = f(x) downward c units.

Exercise 16.5E. 14

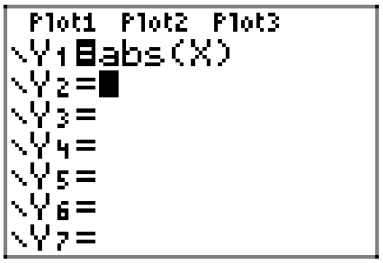
Use your graphing calculator to draw the graph of $y = x^2$. Then, in succession, draw the graphs of $y = x^2 + 2$, $y = x^2 + 4$, and $y = x^2 + 6$. In your own words, explain what you learned from this exercise.

Exercise 16.5E. 15

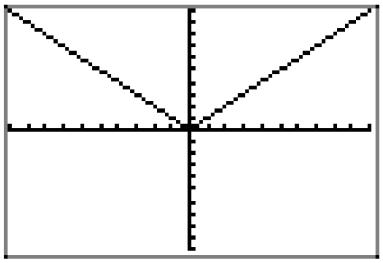
Use your graphing calculator to draw the graph of y = |x|. Then, in succession, draw the graphs of y = 2|x|, y = 3|x|, and y = 4|x|. In your own words, explain what you learned from this exercise.

Answer

First, draw the graph of y = |x|.

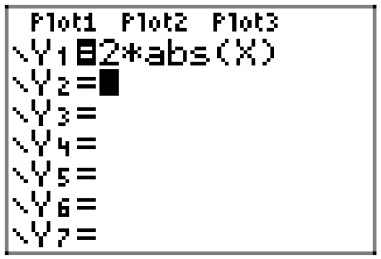


(a)

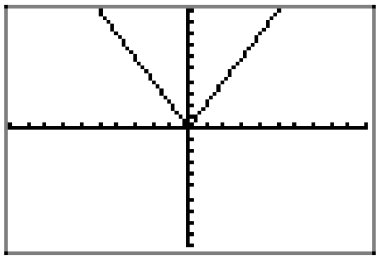


(b)

Multiplying by 2, as in y = 2|x|, stretches the graph of y = |x| vertically by a factor of 2.

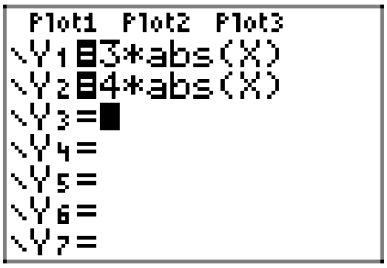


(c)

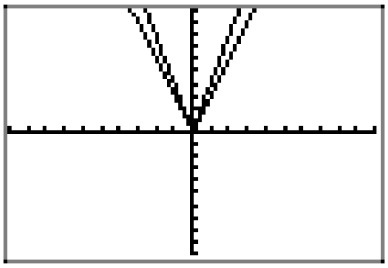


(d)

Similarly, multiplying by 3 and 4, as in y = 3|x| and y = 4|x|, stretches the graph of y = |x| vertically by factors of 3 and 4, respectively.



(e)



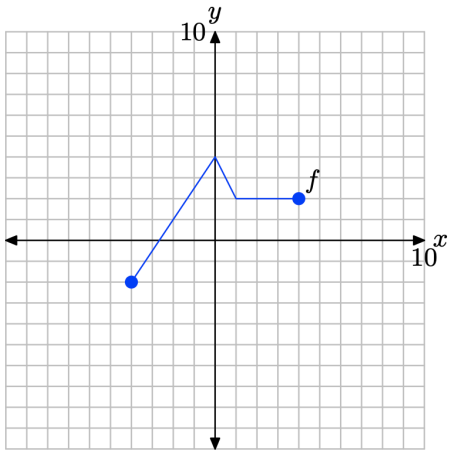
(f)

In general, if a > 1, then the graph of y = af(x) is obtained by stretching the graph of y = f(x) vertically by a factor of a.

? Exercise 16.5E. 16

Use your graphing calculator to draw the graph of y = |x|. Then, in succession, draw the graphs of y = (1/2)|x|, y = (1/3)|x|, and y = (1/4)|x|. In your own words, explain what you learned from this exercise.

Pictured below is the graph of a function f. In Exercises 16.5E. 17-16.5E. 22, use this graph to perform each of the following tasks.



i. Set up a coordinate system on a sheet of graph paper. Label and scale each axis. Make an exact copy of the graph of f on your coordinate system. Remember to draw all lines with a ruler.

ii. In the narrative, a shadow box at the end of the section summarizes the concepts and technique of vertical scaling, vertical reflection, and vertical translation. Use the shortcut ideas presented in this summary shadow box to draw the graphs of the functions that follow without using tables.

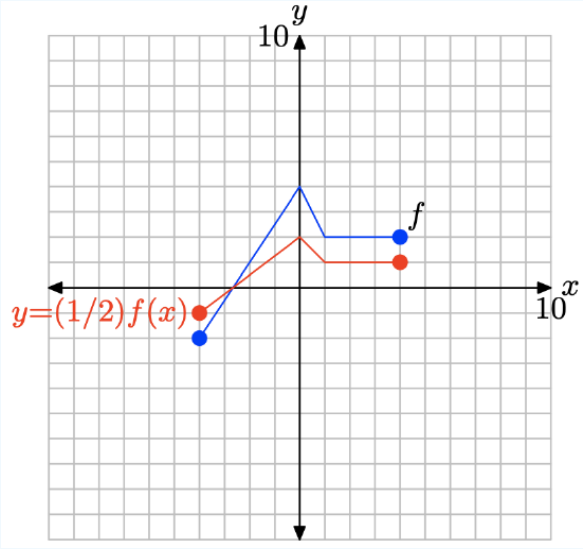
iii. Use a different colored pencil to draw the graph of the function given in the exercise. Label this graph with its equation. Be sure that key points are accurately plotted. In each exercise, please plot exactly two plots per coordinate system, the graph of original function f and the graph of the function in the exercise.

Exercise 16.5E.17

y = (1/2)f(x).

Answer

To obtain the plot of y = (1/2)f(x), simply multiply the y-value of each point on the graph of y = f(x) by 1/2, keeping the x-value the same.



Note that multiplying by 1/2, as in y = (1/2)f(x), compresses the graph of y = f(x) vertically by a factor of 2.

Exercise 16.5E.18

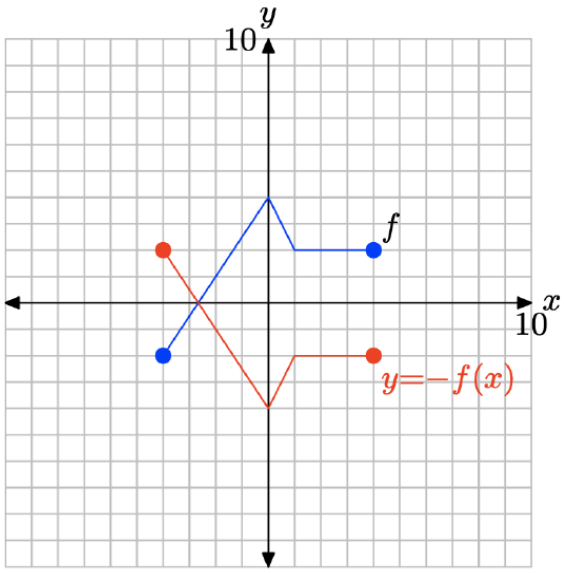
y = 2f(x).

Exercise 16.5E.19

y= −f(x).

Answer

To obtain the plot of y = −f(x), simply negate the y-value of each point on the graph of y = f(x).



Note that negating, as in y = −f(x), reflects the graph of y = f(x) across the x-axis.

Exercise 16.5E.20

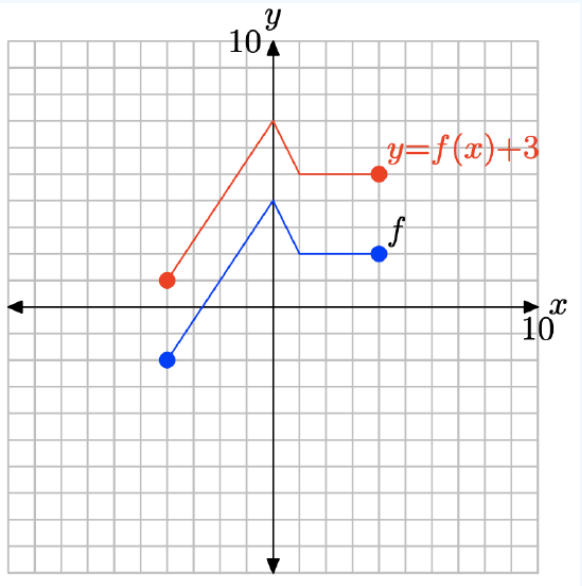
y = f(x) − 1

Exercise 16.5E.21

y = f(x) + 3.

Answer

To obtain the plot of y = f(x) + 3, simply add 3 to the y-value of each point on the graph of y = f(x).

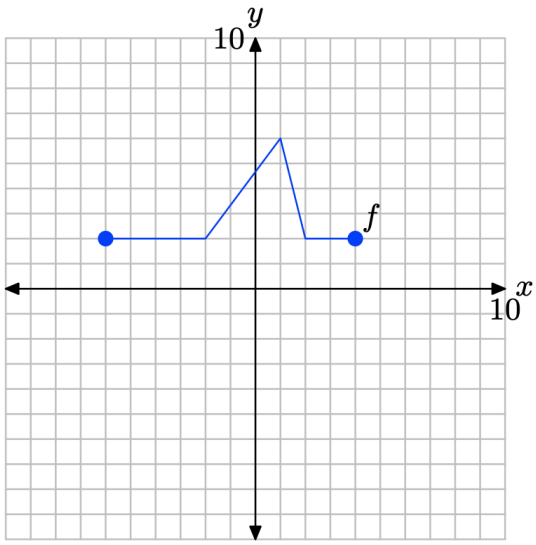


Note that adding 3, as in y = f(x) + 3, translates the graph of y = f(x) upwards 3 units.

Exercise 16.5E.22

y = f(x) − 4

Pictured below is the graph of a function f. In Exercises 16.5E.23-16.5E.28, use this graph to perform each of the following tasks.



i. Set up a coordinate system on a sheet of graph paper. Label and scale each axis. Make an exact copy of the graph of f on your coordinate system. Remember to draw all lines with a ruler.

ii. In the narrative, a shadow box at the end of the section summarizes the concepts and technique of vertical scaling, vertical reflection, and vertical translation. Use the shortcut ideas presented in this summary shadow box to draw the graphs of the functions that follow without using tables.

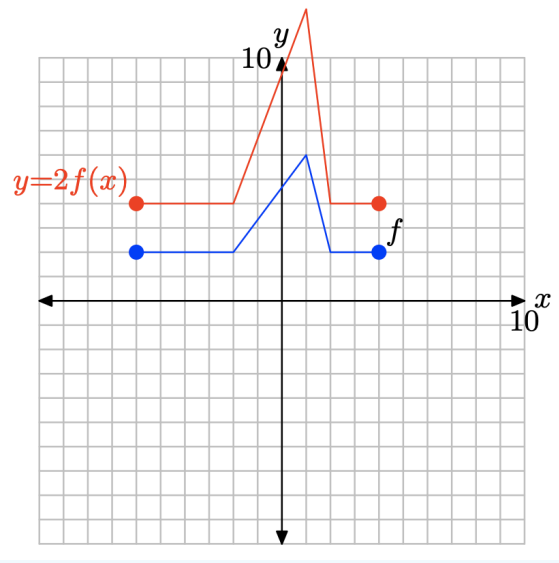
iii. Use a different colored pencil to draw the graph of the function given in the exercise. Label this graph with its equation. Be sure that key points are accurately plotted. In each exercise, please plot exactly two plots per coordinate system, the graph of original function f and the graph of the function in the exercise.

Exercise 16.5E.23

y = 2f(x)

Answer

To obtain the plot of y = 2f(x), simply multiply the y-value of each point of y = f(x) by 2.



Note that multiplying by 2, as in y = 2f(x), stretches the graph of y = f(x) vertically by a factor of 2.

Exercise 16.5E.24

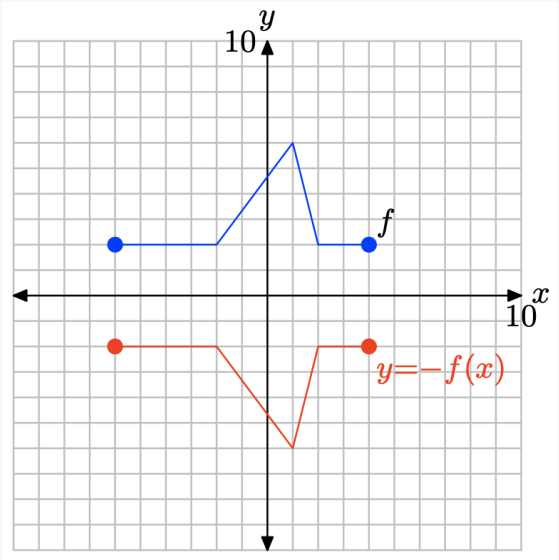
y = (1/2)f(x)

Exercise 16.5E.25

y = −f(x).

Answer

To obtain the plot of y = −f(x), simply negate the y-value of each point on the graph of y = f(x).



Note that negating a function, as in y = −f(x), reflects the graph of y = f(x) across the x-axis.

Exercise 16.5E.26

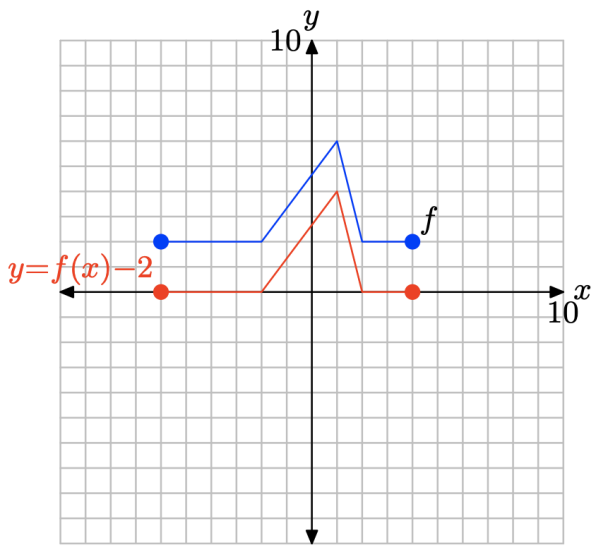
y = f(x) + 3

Exercise 16.5E.27

y = f(x) − 2

Answer

To obtain the plot of y = f(x) − 2, simply subtract 2 from the y-value of each point on the graph of y = f(x).

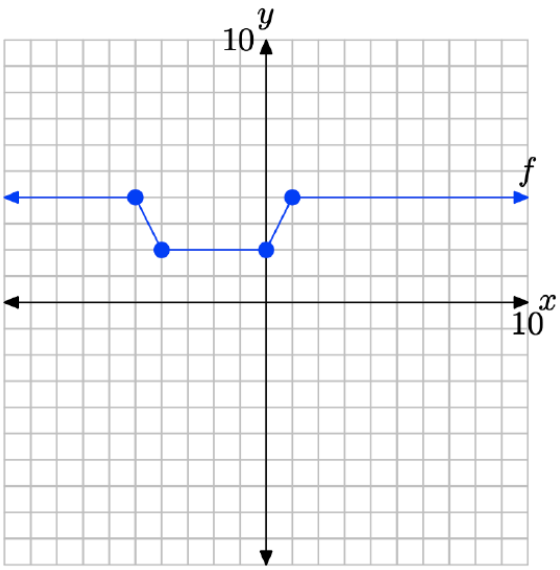


Note that subtracting 2, as in y = f(x)−2, translates the graph of y = f(x) downwards 2 units.

Exercise 16.5E.28

y = f(x) − 1

Pictured below is the graph of a function f. In Exercises 16.5E.29-16.5E.34, use this graph to perform each of the following tasks.



i. Set up a coordinate system on a sheet of graph paper. Label and scale each axis. Make an exact copy of the graph of f on your coordinate system. Remember to draw all lines with a ruler.

ii. In the narrative, a shadow box at the end of the section summarizes the concepts and technique of vertical scaling, vertical reflection, and vertical translation. Use the shortcut ideas presented in this summary shadow box to draw the graphs of the functions that follow without using tables.

iii. Use a different colored pencil to draw the graph of the function given in the exercise. Label this graph with its equation. Be sure that key points are accurately plotted. In each exercise, please plot exactly two plots per coordinate system, the graph of original function f and the graph of the function in the exercise.

Exercise 16.5E.29

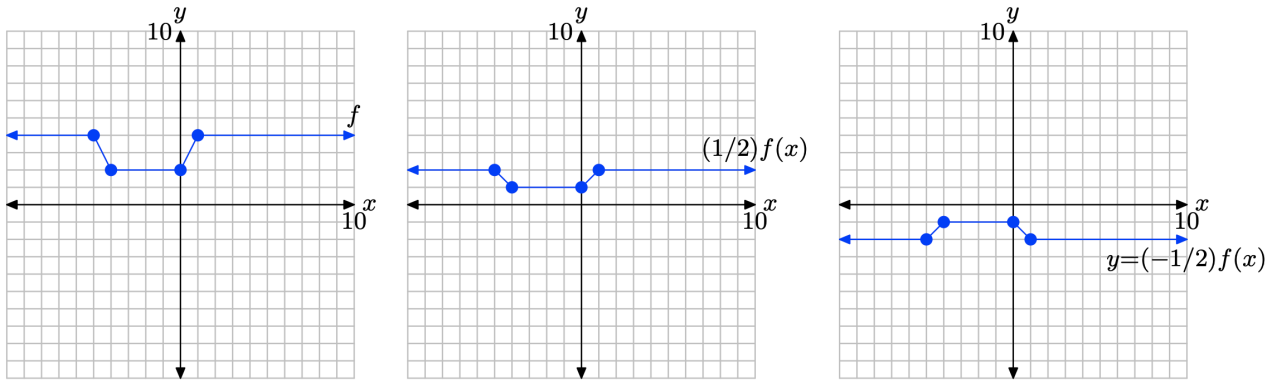
y = (−1/2)f(x)

Answer

We proceed in two steps:

1. First, multiply the y-value of each point on the graph of y = f(x) by 1/2 to produce the graph of y = (1/2)f(x) in (b). This compresses the graph of y = f(x) by a factor of 2.

2. Secondly, multiply the y-value of each point on the graph of y = (1/2)f(x) by −1 to produce the graph of y = (−1/2)f(x) in (c). This reflects the graph of y = (1/2)f(x) across the x-axis.



Exercise 16.5E.30

y = −2f(x).

Exercise 16.5E.31

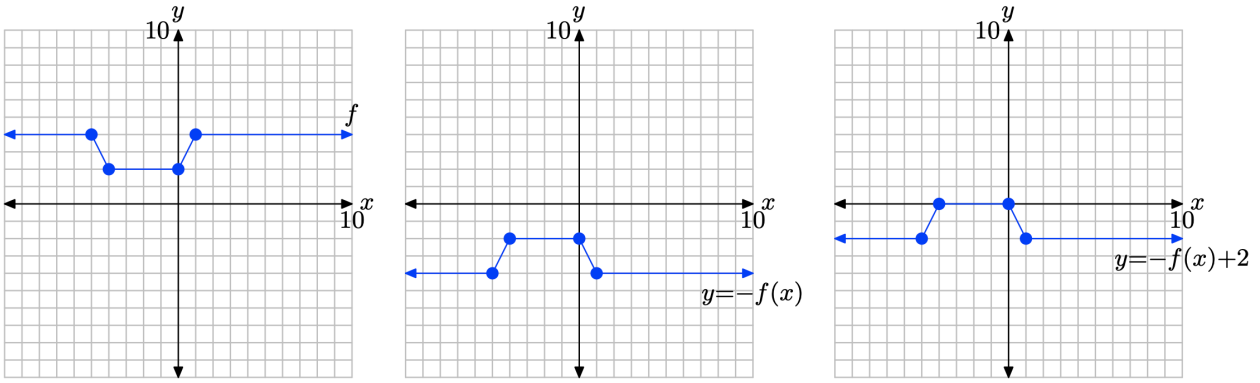
y = −f(x) + 2

Answer

We proceed in two steps:

1. First, multiply the y-value of each point on the graph of y = f(x) by −1 to produce the graph of y = −f(x) in (b). This reflects the graph of y = f(x) across the x-axis.

2. Secondly, add 2 to the y-value of each point on the graph of y = −f(x) to produce the graph of y = −f(x) + 2 in (c). This shifts the graph of y = −f(x) upward 2 units.



(a) $y = f(x)$ (b) $y = -f(x)$ (c) $y = -f(x) + 2$

Exercise 16.5E. 32

y = −f(x) − 3

Exercise 16.5E. 33

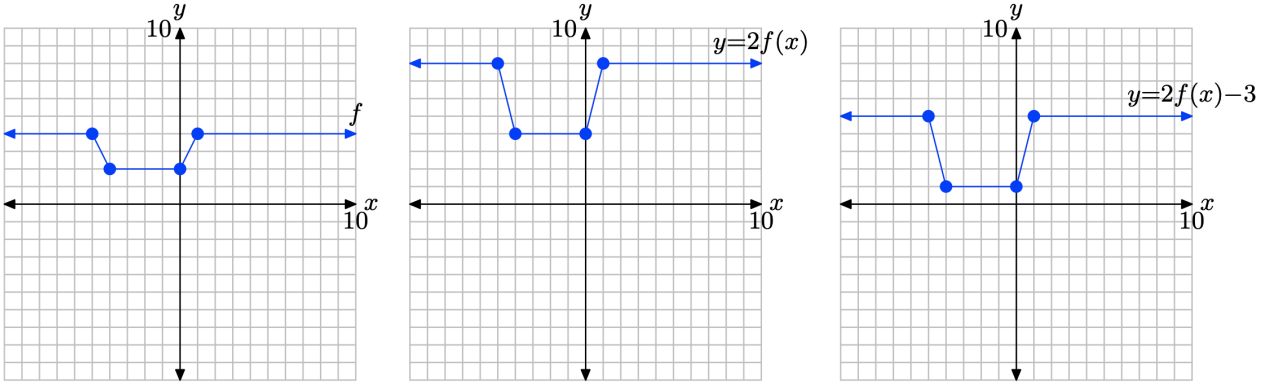
y = 2f(x) − 3.

Answer

We proceed in two steps:

1. First, multiply the y-value of each point on the graph of y = f(x) by 2 to produce the graph of y = 2f(x) in (b). This stretches the graph of y = f(x) vertically by a factor of 2.

2. Secondly, subtract 3 from the y-value of each point on the graph of y = 2f(x) to produce the graph of y = 2f(x) − 3 in (c). This shifts the graph of y = 2f(x) downward 3 units.



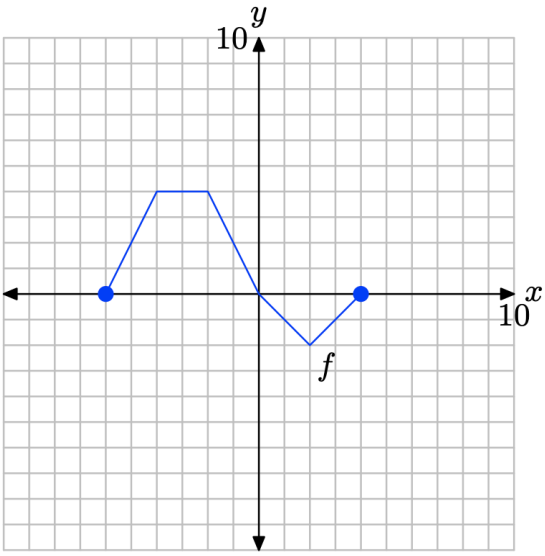
(a) $y = f(x)$ (b) $y = 2f(x)$ (c) $y = 2f(x) - 3$

Exercise 16.5E. 34

y = (−1/2)f(x) + 1

2.6 Exercises

Pictured below is the graph of a function f.



The table that follows evaluates the function f in the plot at key values of x. Notice the horizontal format, where the first point in the table is the ordered pair (−6, 0).

x	-6	-4	-2	0	2	4
f(x)	0	4	4	0	-2	0

Use the graph and the table to complete each of following tasks for Exercises $16.5E.1$ - $16.5E.10$.

i. Set up a coordinate system on graph paper. Label and scale each axis, then copy and label the original graph of f onto your coordinate system. Remember to draw all lines with a ruler.

ii. Use the original table to help complete the table for the given function in the exercise.

iii. Using a different colored pencil, plot the data from your completed table on the same coordinate system as the original graph of f. Use these points to help complete the graph of the given function in the exercise, then label this graph with its equation given in the exercise.

? Exercise $16.5E.1$

y = f(2x).

x	-3	-2	-1	0	1	2
y						

Answer

The original function table.

x	-6	-4	-2	0	2	4
f(x)	0	4	4	0	-2	0

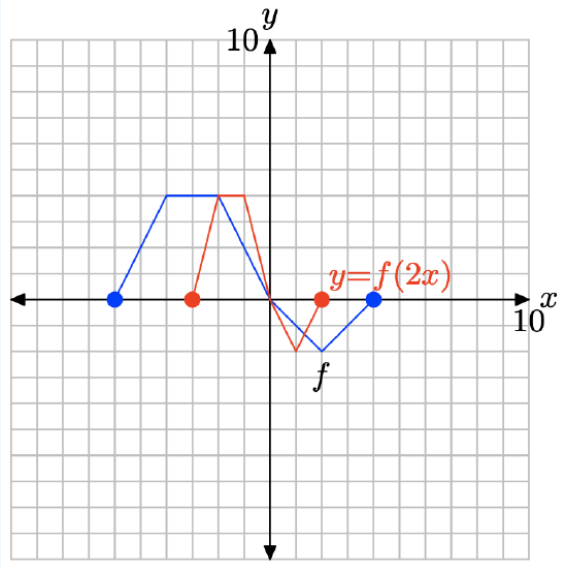
Evaluate the function y = f(2x) at x = −3, −2, −1, 0, 1, and 2.

$$y = f(2(-3)) = f(-6) = 0$$
$$y = f(2(-2)) = f(-4) = 4$$
$$y = f(2(-1)) = f(-2) = 4$$
$$y = f(2(0)) = f(0) = 0$$
$$y = f(2(1)) = f(2) = -2$$
$$y = f(2(2)) = f(4) = 0$$

Points satisfying y = f(2x).

x	-3	-2	-1	0	1	2
y	0	4	4	0	-2	0

Plot the points in the table to get the graph of y = f(2x).



Note that replacing x with 2x, as in y = f(2x), compresses the graph of y = f(x) horizontally by a factor of 2.

Exercise 16.5E.2

y = f((1/2)x).

x	-12	-8	-4	0	4	8
y						

Exercise 16.5E.3

y = f(−x).

x	-4	-2	0	2	4	6
y						

Answer

The original function table.

x	-6	-4	-2	0	2	4

f(x)	0	4	4	0	-2	0

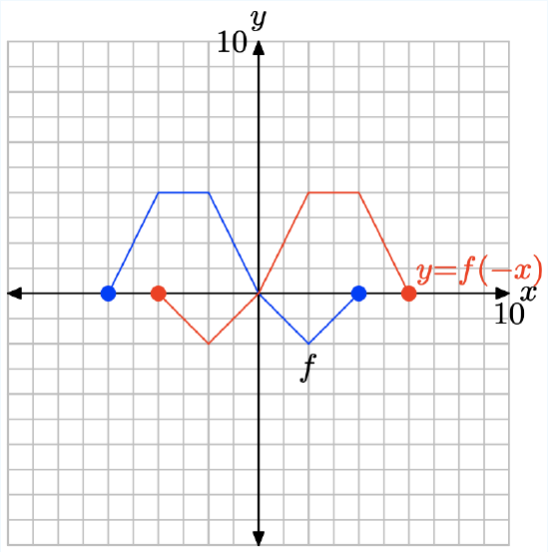
Evaluate the function y = f(−x) at x = −4, −2, 0, 2, 4, and 6.

$$y = f(-(-4)) = f(4) = 0$$
$$y = f(-(-2)) = f(2) = -2$$
$$y = f(-(0)) = f(0) = 0$$
$$y = f(-(2)) = f(-2) = 4$$
$$y = f(-(4)) = f(-4) = 4$$
$$y = f(-(6)) = f(-6) = 0$$

Points satisfying y = f(−x).

x	-4	-2	0	2	4	6
y	0	-2	0	4	4	0

Plot the points in the table to get the graph of y = f(−x).



Note that replacing x with −x, as in y = f(−x), reflects the graph of y = f(x) across the y-axis.

Exercise 16.5E.4

y = f(x + 3).

x	-9	-7	-5	-3	-1	1
y						

Exercise 16.5E.5

y = f(x − 1).

x	-5	-3	-1	1	3	5
y						

Answer

The original function table.

x	-6	-4	-2	0	2	4
f(x)	0	4	4	0	-2	0

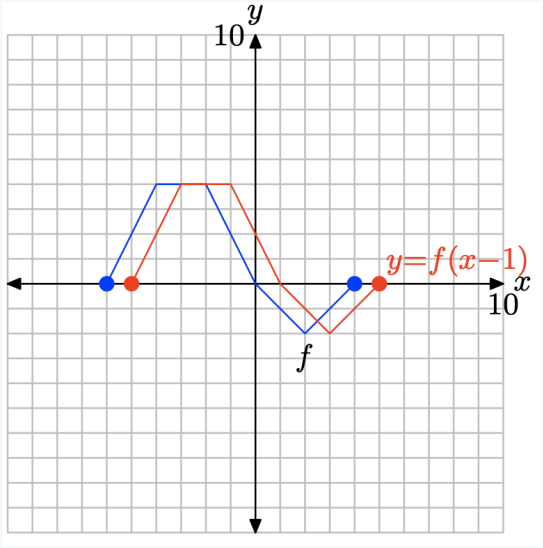
Evaluate the function y = f(x − 1) at x = −5, −3, −1, 1, 3, and 5.

$$y = f((-5) - 1) = f(-6) = 0$$
$$y = f((-3) - 1) = f(-4) = 4$$
$$y = f((-1) - 1) = f(-2) = 4$$
$$y = f((1) - 1) = f(0) = 0$$
$$y = f((3) - 1) = f(2) = -2$$
$$y = f((5) - 1) = f(4) = 0$$

Points satisfying y = f(x − 1).

x	-5	-3	-1	1	3	5
y	0	4	4	0	-2	0

Plot the points in the table to get the graph of y = f(x − 1).



Note that replacing x with x − 1, as in y = f(x − 1), translates the graph of y = f(x) horizontally 1 unit to the right.

Exercise 16.5E.6

y = f(−2x).

x	-2	-1	0	1	2	3
y						

Exercise 16.5E.7

y = f((−1/2)x).

x	-8	-4	0	4	8	12

y						

Answer

The original function table.

x	-6	-4	-2	0	2	4
f(x)	0	4	4	0	-2	0

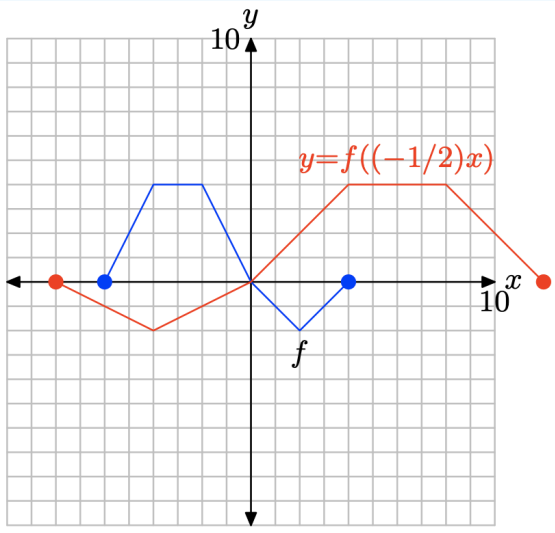
Evaluate the function y = f((−1/2)x) at x = −8, −4, 0, 4, 8, and 12.

$$y = f((-1/2)(-8)) = f(4) = 0$$
$$y = f((-1/2)(-4)) = f(2) = -2$$
$$y = f((-1/2)(0)) = f(0) = 0$$
$$y = f((-1/2)(4)) = f(-2) = 4$$
$$y = f((-1/2)(8)) = f(-4) = 4$$
$$y = f((-1/2)(12)) = f(-6) = 0$$

Points satisfying y = f((−1/2)x).

x	-8	-4	0	4	8	12
y	0	-2	0	4	4	0

Plot the points in the table to get the graph of y = f((−1/2)x).



Note that replacing x with (−1/2)x, as in y = f((−1/2)x), stretches the graph by a factor of 2, then reflects the result across the y-axis.

Exercise 16.5E. 8

y= f(−x − 2)

x	-6	-4	-2	0	2	4
y						

Exercise $16.5E.9$

y= f(−x + 1).

x	-3	-1	1	3	5	7
y						

Answer

The original function table.

x	-6	-4	-2	0	2	4
f(x)	0	4	4	0	-2	0

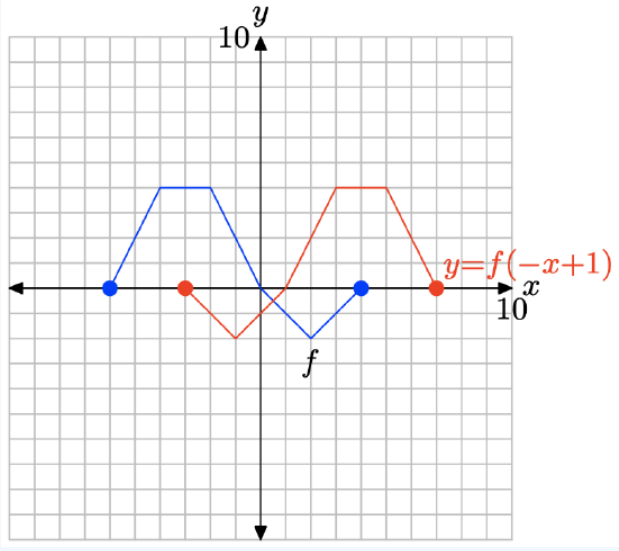
Evaluate the function y = f(−x + 1) at x = −3, −1, 1, 3, 5, and 7.

$$y = f(-(-3)+1) = f(4) = 0$$
$$y = f(-(-1)+1) = f(2) = -2$$
$$y = f(-(1)+1) = f(0) = 0$$
$$y = f(-(3)+1) = f(-2) = 4$$
$$y = f(-(5)+1) = f(-4) = 4$$
$$y = f(-(7)+1) = f(-6) = 0$$

Points satisfying y = f(−x + 1).

x	-3	-1	1	3	5	7
y	0	-2	0	4	4	0

Plot the points in the table to get the graph of y = f(−x + 1).



Note that y = f(−x + 1) is the same as y = f(−(x − 1)). If we replace x with −x to get y = f(−x), then x in this last result with x − 1 to get y = f(−(x − 1)), this has the effect of first reflecting the graph of y = f(x) across the y-axis, then shifting the result to the right 1 unit.

Exercise 16.5E. 10

y = f(−x/4).

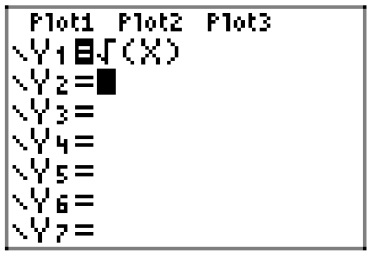
x	-16	-8	0	8	16	24
y						

Exercise 16.5E. 11

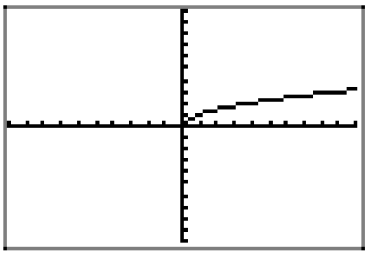
Use your graphing calculator to draw the graph of $y = \sqrt{x}$. Then, draw the graph of $y = \sqrt{-x}$. In your own words, explain what you learned from this exercise.

Answer

First, draw the graph of $y = \sqrt{x}$.

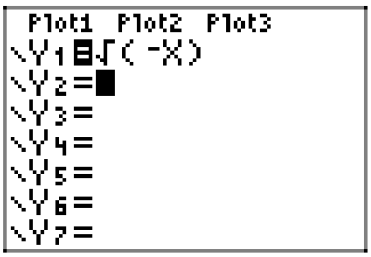


(a)

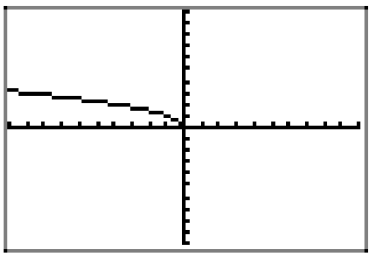


(b)

The graph of $y = \sqrt{-x}$ is a reflection of the graph of $y = \sqrt{x}$ across the y-axis.



(c)



(d)

Replacing x with −x, as in y = f(−x), reflects the graph of y = f(x) across the y-axis.

Exercise 16.5E. 12

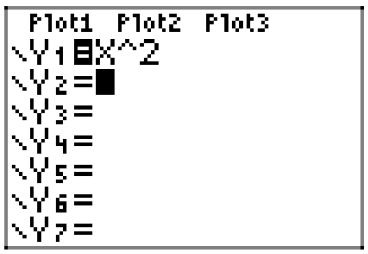
Use your graphing calculator to draw the graph of y = |x|. Then, draw the graph of y = | − x|. In your own words, explain what you learned from this exercise.

Exercise 16.5E. 13

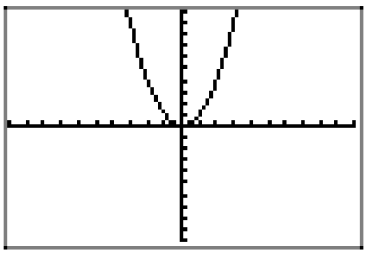
Use your graphing calculator to draw the graph of $y = x^2$. Then, in succession, draw the graphs of $y = (x-2)^2, y = (x-4)^2$, and $y = (x-6)^2$. In your own words, explain what you learned from this exercise.

Answer

First, draw the graph of $y = x^2$.

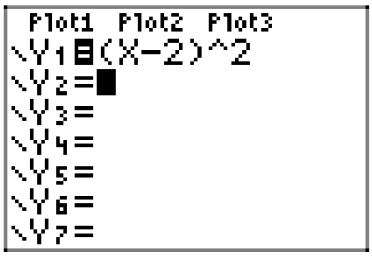


(a)

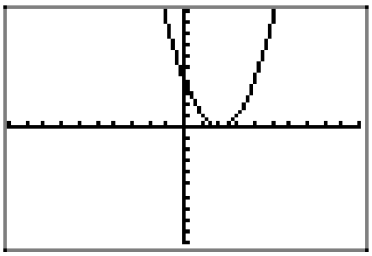


(b)

Replacing x with x − 2 translates the graph of $y = x^2$ two units to the right in the horizontal direction.

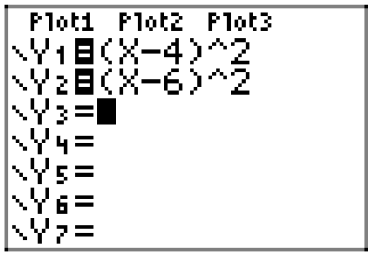


(c)

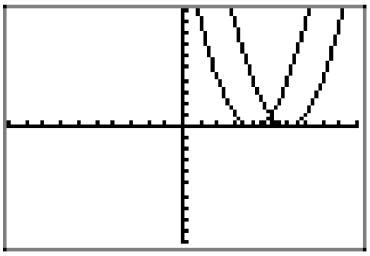


(d)

Similarly, replacing x with x − 4 and x − 6 translates the graph of $y = x^2$ four units and 6 units to the right, respectively.



(e)



(f)

In general, if c is positive, then the graph of y = f(x − c) is obtained by translating the graph of y = f(x) to the right c units.

Exercise 16.5E. 14

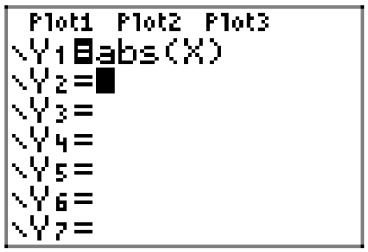
Use your graphing calculator to draw the graph of $y = x^2$. Then, in succession, draw the graphs of $y = (x+2)^2, y = (x+4)^2$, and $y = (x+6)^2$. In your own words, explain what you learned from this exercise.

Exercise 16.5E. 15

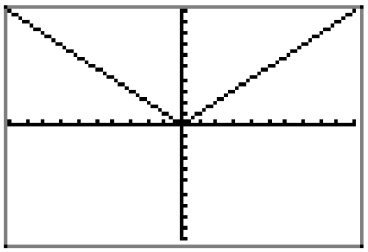
Use your graphing calculator to draw the graph of y = |x|. Then, in succession, draw the graphs of y = |2x|, y = |3x|, and y = |4x|. In your own words, explain what you learned from this exercise.

Answer

First, draw the graph of y = |x|.

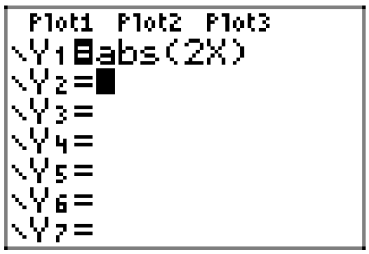


(a)

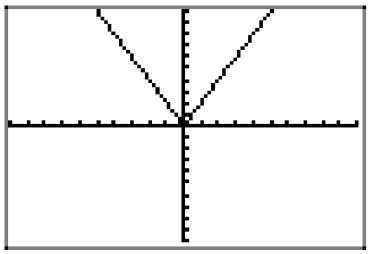


(b)

Replacing x with 2x compresses the graph of y = |x| by a factor of 2 in the horizontal direction.

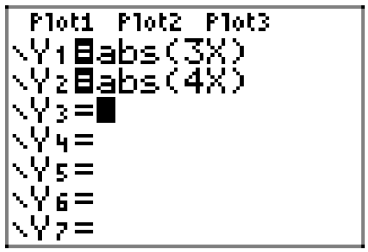


(c)

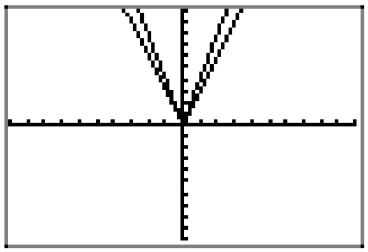


(d)

Similarly, replacing x with 3x and 4x by a factor of 3 and 4 in the horizontal direction, respectively.



(e)



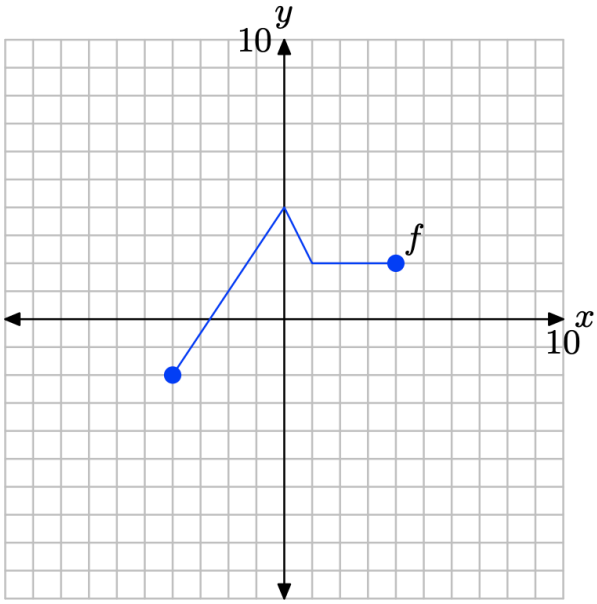
(f)

In general, if a > 1, then the graph of y = f(ax) is obtained by compressing the graph of y = f(x) by a factor of a in the horizontal direction.

? Exercise 16.5E. 16

Use your graphing calculator to draw the graph of y = |x|. Then, in succession, draw the graphs of y = |(1/2)x|, y = |(1/3)x|, and y = |(1/4)x|. In your own words, explain what you learned from this exercise.

Pictured below is the graph of a function f. In Exercises 16.5E. 17-16.5E. 22, use this graph to perform each of the following tasks.



i. Set up a coordinate system on a sheet of graph paper. Label and scale each axis. Make an exact copy of the graph of f on your coordinate system. Remember to draw all lines with a ruler.

ii. In the narrative, a shadow box at the end of the section summarizes the concepts and technique of horizontal scaling, horizontal reflection, and horizontal translation. Use the shortcut ideas presented in this summary shadow box to draw the graphs of the functions that follow without using tables.

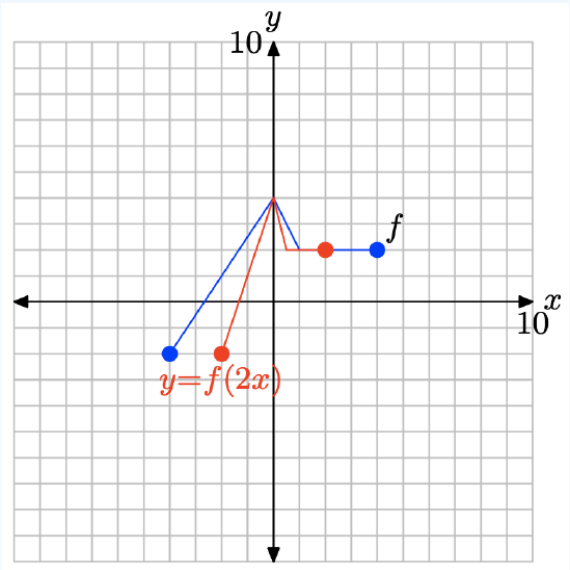
iii. Use a different colored pencil to draw the graph of the function given in the exercise. Label this graph with its equation. Be sure that key points are accurately plotted. In each exercise, please plot exactly two plots per coordinate system, the graph of original function f and the graph of the function in the exercise.

? Exercise 16.5E. 17

y = f(2x).

Answer

To obtain a plot for y = f(2x), take each point on the graph of y = f(x) and divide its x-value by 2, keeping the y-value the same.



Note that replacing x with 2x, as in y = f(2x), compresses the graph of y = f(x) in the horizontal direction by a factor of 2.

Exercise 16.5E.18

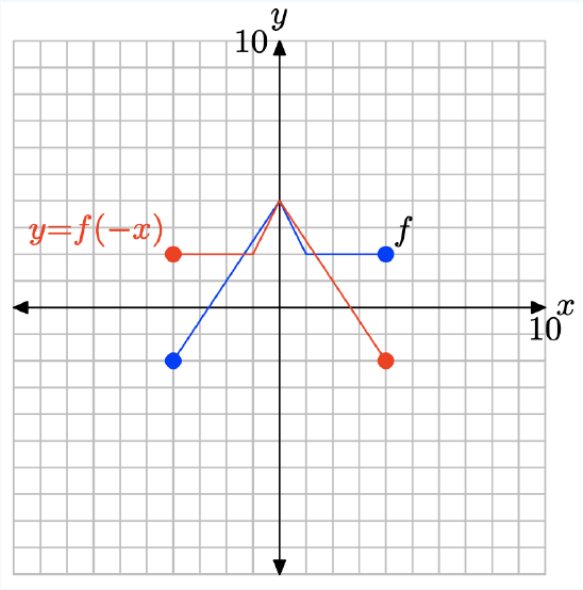
y = f((1/2)x).

Exercise 16.5E.19

y = f(−x).

Answer

To obtain a plot of y = f(−x), take each point on the graph of y = f(x) and negate its x-value, keeping the y-value the same.



Note that replacing x with −x, as in y = f(−x), reflects the graph of f across the y-axis.

Exercise 16.5E.20

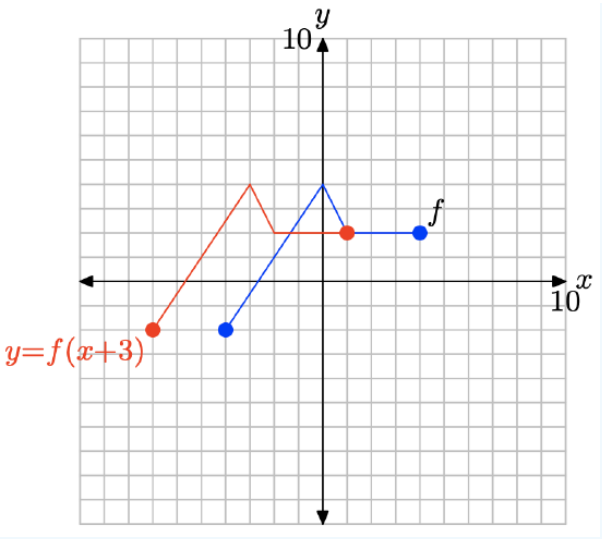
y = f(x − 1).

Exercise 16.5E.21

y = f(x + 3).

Answer

To obtain a plot of y = f(x + 3), take each point on the graph of y = f(x) and subtract 3 from its x-value, keeping the y-value the same.

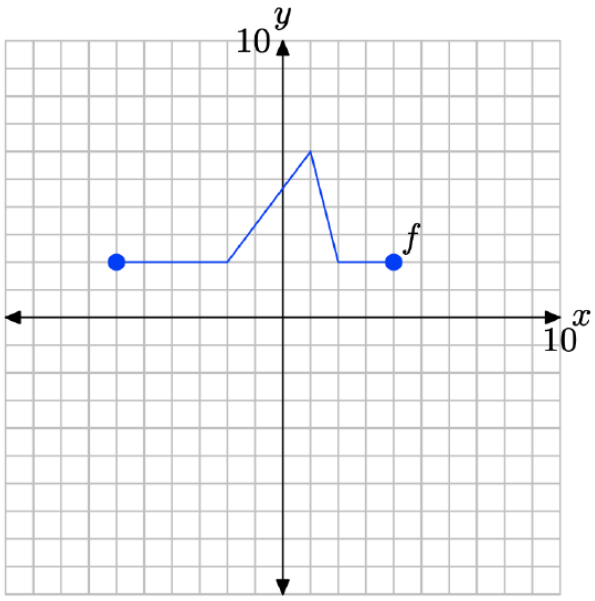


Note that replacing x with x + 3, as in y = f(x + 3), translates the graph of y = f(x) to the left 3 units.

? Exercise 16.5E.22

y = f(x − 2).

Pictured below is the graph of a function f. In Exercises 16.5E.23-16.5E.28, use this graph to perform each of the following tasks.



i. Set up a coordinate system on a sheet of graph paper. Label and scale each axis. Make an exact copy of the graph of f on your coordinate system. Remember to draw all lines with a ruler.

ii. In the narrative, a shadow box at the end of the section summarizes the concepts and technique of horizontal scaling, horizontal reflection, and horizontal translation. Use the shortcut ideas presented in this summary shadow box to draw the graphs of the functions that follow without using tables.

iii. Use a different colored pencil to draw the graph of the function given in the exercise. Label this graph with its equation. Be sure that key points are accurately plotted. In each exercise, please plot exactly two plots per coordinate system, the graph of original

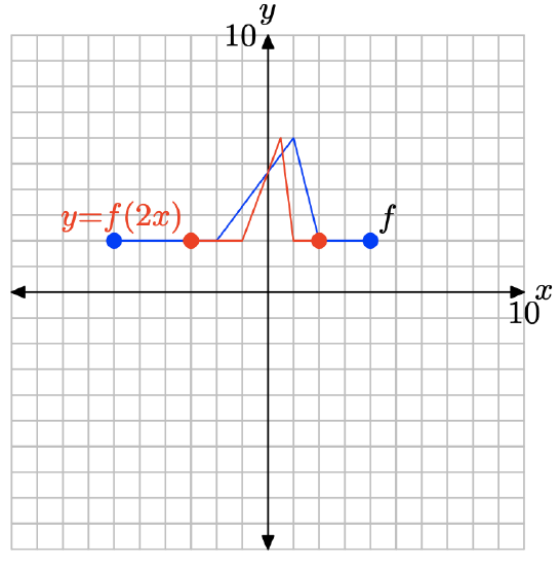
function f and the graph of the function in the exercise.

Exercise 16.5E.23

y = f(2x).

Answer

To obtain a plot of y = f(2x), take each point on the graph of y = f(x) and divide its x-value by 2, keeping the y-value the same.



Replacing x with 2x, as in y = f(2x), compresses the graph of y = f(x) horizontally by a factor of 2.

Exercise 16.5E.24

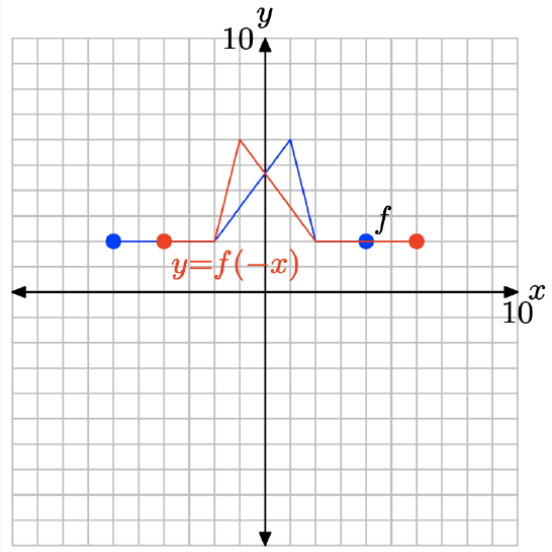
y = f((1/2)x).

Exercise 16.5E.25

y = f(−x).

Answer

To obtain a plot of y = f(−x), take each point on the graph of y = f(x) and negate its x-value, keeping the same y-value.



Replacing x with −x, as in y = f(−x), reflects the graph of y = f(x) across the y-axis.

Exercise 16.5E.26

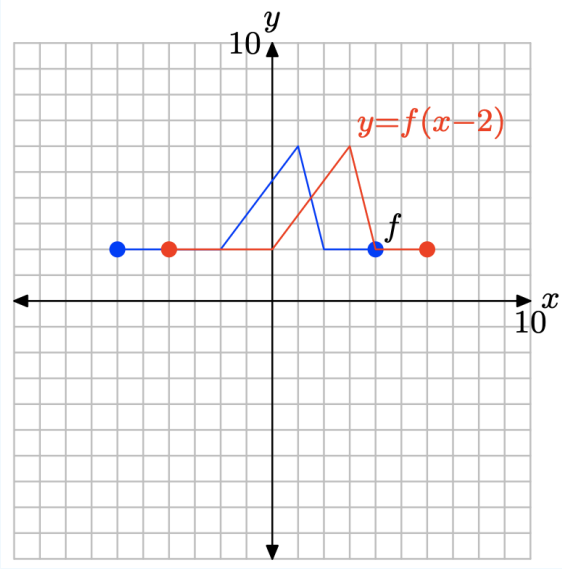
y = f(x + 3)

Exercise 16.5E.27

y= f(x − 2).

Answer

To obtain a plot of y = f(x − 2), take each point on the graph of y = f(x) and add 2 to its x-value, keeping its y-value the same.



Replacing x with x − 2, as in y = f(x − 2), shifts the graph of y = f(x) to the right 2 units.

Exercise $16.5E.28$

y = f(x + 1).

16.6: The Algebra of Functions

Learning Objectives

- Combine functions using algebraic operations.
- Create a new function by composition of functions.
- Evaluate composite functions.
- Find the domain of a composite function.
- Decompose a composite function into its component functions.

Suppose we want to calculate how much it costs to heat a house on a particular day of the year. The cost to heat a house will depend on the average daily temperature, and in turn, the average daily temperature depends on the particular day of the year. Notice how we have just defined two relationships: The cost depends on the temperature, and the temperature depends on the day.

Using descriptive variables, we can notate these two functions. The function $C(T)$ gives the cost C of heating a house for a given average daily temperature in T degrees Celsius. The function $T(d)$ gives the average daily temperature on day d of the year. For any given day, $Cost = C(T(d))$ means that the cost depends on the temperature, which in turns depends on the day of the year. Thus, we can evaluate the cost function at the temperature $T(d)$. For example, we could evaluate $T(5)$ to determine the average daily temperature on the 5th day of the year. Then, we could evaluate the **cost function** at that temperature. We would write $C(T(5))$.

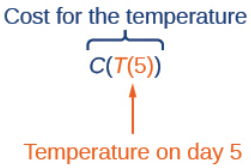

Figure 16.6.1: Explanation of $C(T(5))$, which is the cost for the temperature and $T(5)$ is the temperature on day 5.

By combining these two relationships into one function, we have performed function composition, which is the focus of this section.

Combining Functions Using Algebraic Operations

Function composition is only one way to combine existing functions. Another way is to carry out the usual algebraic operations on functions, such as addition, subtraction, multiplication and division. We do this by performing the operations with the function outputs, defining the result as the output of our new function.

Suppose we need to add two columns of numbers that represent a husband and wife's separate annual incomes over a period of years, with the result being their total household income. We want to do this for every year, adding only that year's incomes and then collecting all the data in a new column. If $w(y)$ is the wife's income and $h(y)$ is the husband's income in year y, and we want T to represent the total income, then we can define a new function.

$$T(y) = h(y) + w(y) \tag{16.6.1}$$

If this holds true for every year, then we can focus on the relation between the functions without reference to a year and write

$$T = h + w \tag{16.6.2}$$

Just as for this sum of two functions, we can define difference, product, and ratio functions for any pair of functions that have the same kinds of inputs (not necessarily numbers) and also the same kinds of outputs (which do have to be numbers so that the usual operations of algebra can apply to them, and which also must have the same units or no units when we add and subtract). In this way, we can think of adding, subtracting, multiplying, and dividing functions.

For two functions $f(x)$ and $g(x)$ with real number outputs, we define new functions $f+g$, $f-g$, fg, and $\frac{f}{g}$ by the relations.

$$(f+g)(x) = f(x)+g(x)$$
$$(f-g)(x) = f(x)-g(x)$$
$$(fg)(x) = f(x)g(x)$$
$$\left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$$

Example 16.6.1: Performing Algebraic Operations on Functions

Find and simplify the functions $(g-f)(x)$ and $\left(\frac{g}{f}\right)(x)$, given $f(x)=x-1$ and $g(x)=x^2-1$. Are they the same function?

Solution

Begin by writing the general form, and then substitute the given functions.

$$\begin{aligned}(g-f)(x) &= g(x)-f(x)\\ (g-f)(x) &= x^2-1-(x-1)\\ &= x^2-x\\ &= x(x-1)\end{aligned}$$

$$\left(\frac{g}{f}\right)(x) = g(x)f(x)$$

$$\begin{aligned}\left(\frac{g}{f}\right)(x) &= \frac{x^2-1}{x-1}\\ &= \frac{(x+1)(x-1)}{x-1}\\ &= x+1\end{aligned}$$

No, the functions are not the same.

Note: For $\left(\frac{g}{f}\right)(x)$, the condition $x \neq 1$ is necessary because when $x=1$, the denominator is equal to 0, which makes the function undefined.

16.6.1

Find and simplify the functions $(fg)(x)$ and $(f-g)(x)$.

$$f(x) = x-1$$

and

$$g(x) = x^2-1$$

Are they the same function?

Answer

$(fg)(x) = f(x)g(x) = (x-1)(x2-1) = x^3-x^2-x+1$

$(f-g)(x) = f(x)-g(x) = (x-1)-(x^2-1) = x-x^2$

No, the functions are not the same.

Create a Function by Composition of Functions

Performing algebraic operations on functions combines them into a new function, but we can also create functions by composing functions. When we wanted to compute a heating cost from a day of the year, we created a new function that takes a day as input and yields a cost as output. The process of **combining functions** so that the output of one function becomes the input of another is known as a **composition of functions**. The resulting function is known as a **composite function**. We represent this combination by the following notation:

$$f \circ g(x) = f(g(x)) \tag{16.6.3}$$

We read the left-hand side as"f composed with g at x," and the right-hand side as"f of g of x."The two sides of the equation have the same mathematical meaning and are equal. The open circle symbol $\circ$ is called the composition operator. We use this operator mainly when we wish to emphasize the relationship between the functions themselves without referring to any particular input value. Composition is a binary operation that takes two functions and forms a new function, much as addition or multiplication takes two numbers and gives a new number. However, it is important not to confuse function composition with multiplication because, as we learned above, in most cases $f(g(x)) \neq f(x)g(x)$.

It is also important to understand the order of operations in evaluating a composite function. We follow the usual convention with parentheses by starting with the innermost parentheses first, and then working to the outside. In the equation above, the function g takes the input x first and yields an output $g(x)$. Then the function f takes $g(x)$ as an input and yields an output $f(g(x))$.

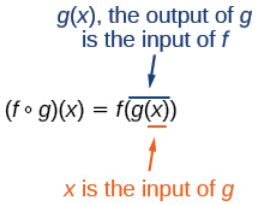

Figure 16.6.2: Explanation of the composite function.

In general, $f \circ g$ and $g \circ f$ are different functions. In other words, in many cases $f(g(x)) \neq g(f(x))$ for all x. We will also see that sometimes two functions can be composed only in one specific order.

For example, if $f(x) = x^2$ and $g(x) = x + 2$, then

$$\begin{aligned} f(g(x)) &= f(x+2) \\ &= (x+2)^2 \\ &= x^2 + 4x + 4 \end{aligned}$$

but

$$\begin{aligned} g(f(x)) &= g(x^2) \\ &= x^2 + 2 \end{aligned}$$

These expressions are not equal for all values of x, so the two functions are not equal. It is irrelevant that the expressions happen to be equal for the single input value $x = -\frac{1}{2}$.

Note that the range of the inside function (the first function to be evaluated) needs to be within the domain of the outside function. Less formally, the composition has to make sense in terms of inputs and outputs.

Composition of Functions

When the output of one function is used as the input of another, we call the entire operation a composition of functions. For any input x and functions f and g, this action defines a **composite function**, which we write as $f \circ g$ such that

$$(f \circ g)(x) = f(g(x)) \tag{16.6.4}$$

The domain of the composite function $f \circ g$ is all x such that x is in the domain of g and $g(x)$ is in the domain of f.

It is important to realize that the product of functions fg is not the same as the function composition $f(g(x))$, because, in general, $f(x)g(x) \neq f(g(x))$.

Example 16.6.2: Determining whether Composition of Functions is Commutative

Using the functions provided, find $f(g(x))$ and $g(f(x))$. Determine whether the composition of the functions is **commutative**.

$$f(x)=2x+1 \quad g(x)=3-x$$

Solution

Let's begin by substituting $g(x)$ into $f(x)$.

$$\begin{aligned} f(g(x)) &= 2(3-x)+1 \\ &= 6-2x+1 \\ &= 7-2x \end{aligned}$$

Now we can substitute $f(x)$ into $g(x)$.

$$\begin{aligned} g(f(x)) &= 3-(2x+1) \\ &= 3-2x-1 \\ &= 2-2x \end{aligned}$$

We find that $g(f(x))\neq f(g(x))$, so the operation of function composition is not commutative.

Example 16.6.3: Interpreting Composite Functions

The function $c(s)$ gives the number of calories burned completing s sit-ups, and $s(t)$ gives the number of sit-ups a person can complete in t minutes. Interpret $c(s(3))$.

Solution

The inside expression in the composition is $s(3)$. Because the input to the s-function is time, $t=3$ represents 3 minutes, and $s(3)$ is the number of sit-ups completed in 3 minutes.

Using $s(3)$ as the input to the function $c(s)$ gives us the number of calories burned during the number of sit-ups that can be completed in 3 minutes, or simply the number of calories burned in 3 minutes (by doing sit-ups).

Example 16.6.4: Investigating the Order of Function Composition

Suppose $f(x)$ gives miles that can be driven in x hours and $g(y)$ gives the gallons of gas used in driving y miles. Which of these expressions is meaningful: $f(g(y))$ or $g(f(x))$?

Solution

The function $y=f(x)$ is a function whose output is the number of miles driven corresponding to the number of hours driven.

$$\text{number of miles } = f(\text{number of hours})$$

The function $g(y)$ is a function whose output is the number of gallons used corresponding to the number of miles driven. This means:

$$\text{number of gallons } = g(\text{number of miles})$$

The expression $g(y)$ takes miles as the input and a number of gallons as the output. The function $f(x)$ requires a number of hours as the input. Trying to input a number of gallons does not make sense. The expression $f(g(y))$ is meaningless.

The expression $f(x)$ takes hours as input and a number of miles driven as the output. The function $g(y)$ requires a number of miles as the input. Using $f(x)$ (miles driven) as an input value for $g(y)$, where gallons of gas depends on miles driven, does make sense. The expression $g(f(x))$ makes sense, and will yield the number of gallons of gas used, g, driving a certain number of miles, $f(x)$, in x hours.

Question/Answer

Are there any situations where $f(g(y))$ and $g(f(x))$ would both be meaningful or useful expressions?

Yes. For many pure mathematical functions, both compositions make sense, even though they usually produce different new functions. In real-world problems, functions whose inputs and outputs have the same units also may give compositions that are meaningful in either order

16.6.2

The gravitational force on a planet a distance r from the sun is given by the function $G(r)$. The acceleration of a planet subjected to any force F is given by the function $a(F)$. Form a meaningful composition of these two functions, and explain what it means.

Answer

A gravitational force is still a force, so $a(G(r))$ makes sense as the acceleration of a planet at a distance r from the Sun (due to gravity), but $G(a(F))$ does not make sense.

Evaluating Composite Functions

Once we compose a new function from two existing functions, we need to be able to evaluate it for any input in its domain. We will do this with specific numerical inputs for functions expressed as tables, graphs, and formulas and with variables as inputs to functions expressed as formulas. In each case, we evaluate the inner function using the starting input and then use the inner function's output as the input for the outer function.

Evaluating Composite Functions Using Tables

When working with functions given as tables, we read input and output values from the table entries and always work from the inside to the outside. We evaluate the inside function first and then use the output of the inside function as the input to the outside function.

Example16.6.5: Using a Table to Evaluate a Composite Function

Using Table 16.6.1, evaluate $f(g(3))$ and $g(f(3))$.

Table 16.6.1

x	$f(g(3))$	$g(f(3))$
1	6	3
2	8	5
3	3	2
4	1	7

Solution

To evaluate $f(g(3))$, we start from the inside with the input value 3. We then evaluate the inside expression $g(3)$ using the table that defines the function g : $g(3) = 2$. We can then use that result as the input to the function f, so $g(3)$ is replaced by 2 and we get $f(2)$. Then, using the table that defines the function f, we find that $f(2) = 8$.

$$g(3) = 2 \tag{16.6.5}$$

$$f(g(3)) = f(2) = 8 \tag{16.6.6}$$

To evaluate $g(f(3))$, we first evaluate the inside expression $f(3)$ using the first table: $f(3) = 3$. Then, using the table for g, we can evaluate

$$g(f(3)) = g(3) = 2 \tag{16.6.7}$$

Table 16.6.2 shows the composite functions $f \circ g$ and $g \circ f$ as tables.

Table 16.6.2

x	$g(x)$	$f(g(x))$	$f(x)$	$g(f(x))$
3	2	8	3	2

Exercise 16.6.3

Using Table 16.6.1, evaluate $f(g(1))$ and $g(f(4))$.

Answer

$f(g(1)) = f(3) = 3$ and $g(f(4)) = g(1) = 3$

Evaluating Composite Functions Using Graphs

When we are given individual functions as graphs, the procedure for evaluating composite functions is similar to the process we use for evaluating tables. We read the input and output values, but this time, from the x- and y-axes of the graphs.

HowTO: Given a composite function and graphs of its individual functions, evaluate it using the information provided by the graphs

1. Locate the given input to the inner function on the x-axis of its graph.
2. Read off the output of the inner function from the y-axis of its graph.
3. Locate the inner function output on the x-axis of the graph of the outer function.
4. Read the output of the outer function from the y-axis of its graph. This is the output of the composite function.

Example 16.6.6: Using a Graph to Evaluate a Composite Function

Using Figure 16.6.3, evaluate $f(g(1))$.

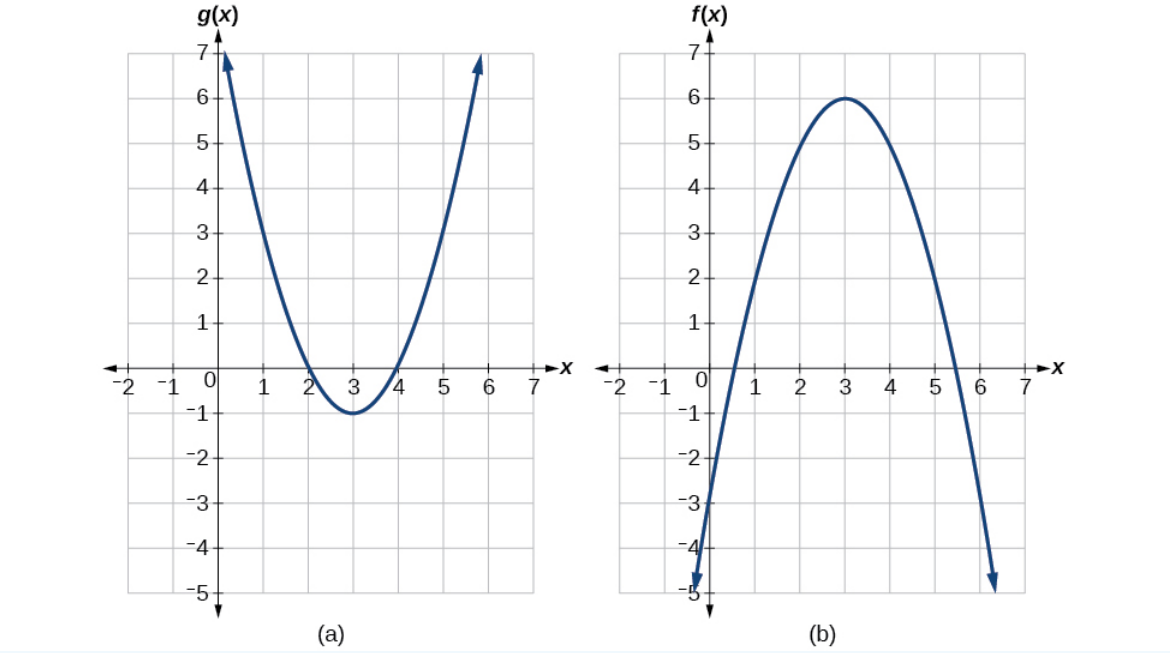

Figure 16.6.3: Two graphs of a positive and negative parabola.

Solution

To evaluate $f(g(1))$, we start with the inside evaluation. See Figure 16.6.4

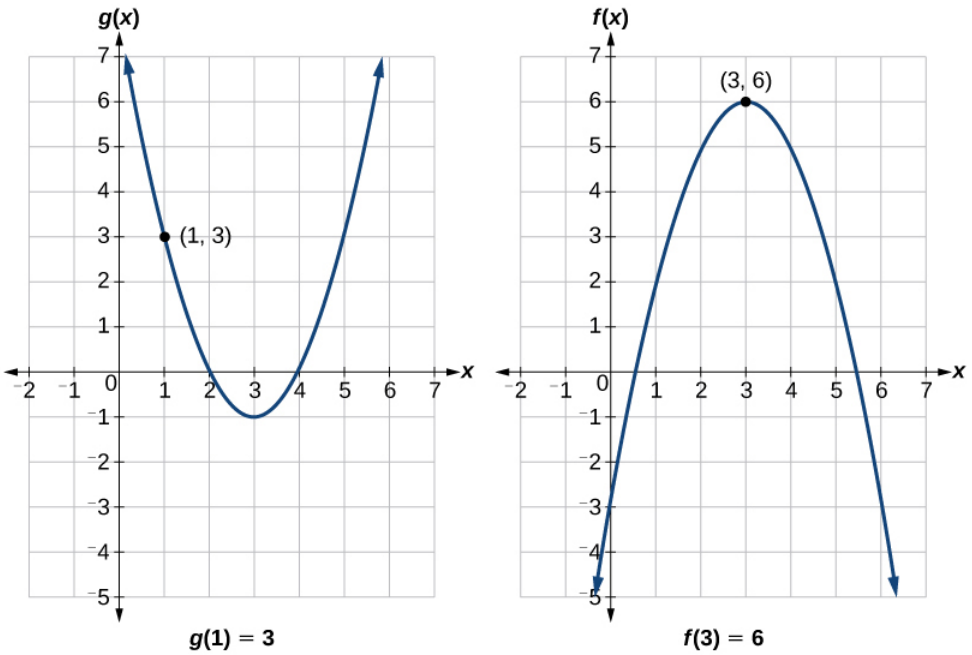

Figure 16.6.4: Two graphs of a positive parabola $g(x)$ and a negative parabola $f(x)$. The following points are plotted: $g(1) = 3$ and $f(3) = 6$.

We evaluate $g(1)$ using the graph of $g(x)$, finding the input of 1 on the x-axis and finding the output value of the graph at that input. Here, $g(1) = 3$. We use this value as the input to the function f.

$$f(g(1)) = f(3) \tag{16.6.8}$$

We can then evaluate the composite function by looking to the graph of $f(x)$, finding the input of 3 on the x-axis and reading the output value of the graph at this input. Here, $f(3) = 6$, so $f(g(1)) = 6$.

Analysis

Figure 16.6.5 shows how we can mark the graphs with arrows to trace the path from the input value to the output value.

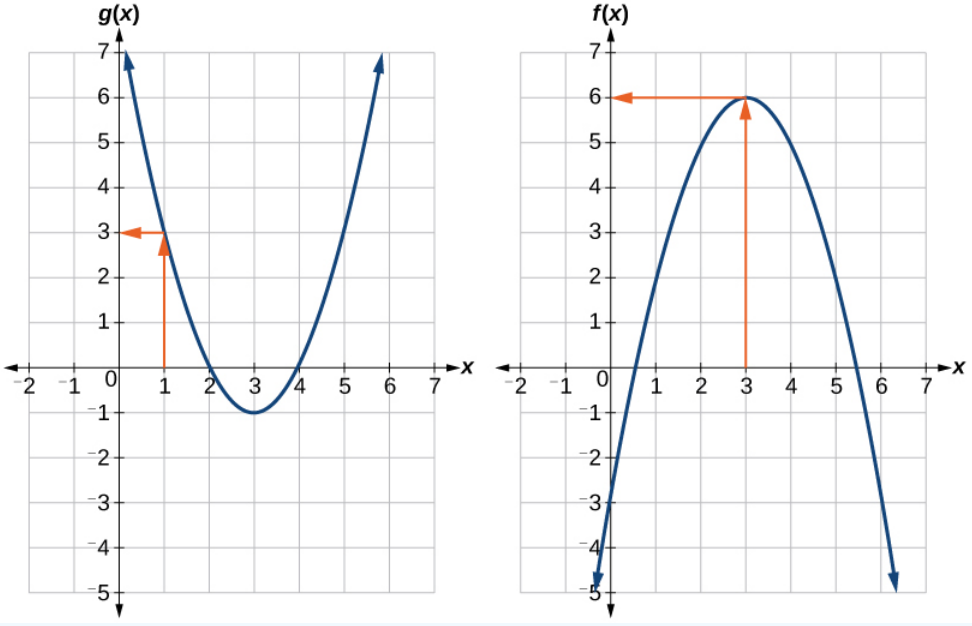

Figure 16.6.5: Two graphs of a positive and negative parabola.

Exercise 16.6.4

Using Figure 16.6.3, evaluate $g(f(2))$.

Answer

$g(f(2)) = g(5) = 3$

Evaluating Composite Functions Using Formulas

When evaluating a composite function where we have either created or been given formulas, the rule of working from the inside out remains the same. The input value to the outer function will be the output of the inner function, which may be a numerical value, a variable name, or a more complicated expression.

While we can compose the functions for each individual input value, it is sometimes helpful to find a single formula that will calculate the result of a composition $f(g(x))$. To do this, we will extend our idea of function evaluation. Recall that, when we evaluate a function like $f(t) = t^2 - t$, we substitute the value inside the parentheses into the formula wherever we see the input variable.

HowTo: Given a formula for a composite function, evaluate the function.

1. Evaluate the inside function using the input value or variable provided.
2. Use the resulting output as the input to the outside function.

Example 16.6.7: Evaluating a Composition of Functions Expressed as Formulas with a Numerical Input

Given $f(t) = t^2 - t$ and $h(x) = 3x + 2$, evaluate $f(h(1))$.

Solution

Because the inside expression is $h(1)$, we start by evaluating $h(x)$ at 1.

$$h(1) = 3(1) + 2$$
$$h(1) = 5$$

Then $f(h(1)) = f(5)$, so we evaluate $f(t)$ at an input of 5.

$$f(h(1)) = f(5)$$
$$f(h(1)) = 5^2 - 5$$
$$f(h(1)) = 20$$

Analysis

It makes no difference what the input variables t and x were called in this problem because we evaluated for specific numerical values.

Exercise 16.6.5

Given $f(t) = t^2 - t$ and $h(x) = 3x + 2$, evaluate

a. $h(f(2))$
b. $h(f(-2))$

Answer a

8

Answer b

20

Finding the Domain of a Composite Function

As we discussed previously, the **domain of a composite function** such as $f \circ g$ is dependent on the domain of g and the domain of f. It is important to know when we can apply a composite function and when we cannot, that is, to know the domain of a function such as $f \circ g$. Let us assume we know the domains of the functions f and g separately. If we write the composite function for an input x as $f(g(x))$, we can see right away that x must be a member of the domain of g in order for the expression to be meaningful, because otherwise we cannot complete the inner function evaluation. However, we also see that $g(x)$ must be a member of the domain of f, otherwise the second function evaluation in $f(g(x))$ cannot be completed, and the expression is still undefined. Thus the domain of $f \circ g$ consists of only those inputs in the domain of g that produce outputs from g belonging to the domain of f. Note that the domain of f composed with g is the set of all x such that x is in the domain of $gandg(x)$ is in the domain of f.

Definition: Domain of a Composite Function

The *domain of a composite function* $f(g(x))$ is the set of those inputs x in the domain of g for which $g(x)$ is in the domain of f.

HOWTO: Given a function composition f(g(x)),determine its domain.

1. Find the domain of g.
2. Find the domain of f.
3. Find those inputs x in the domain of g for which $g(x)$ is in the domain of f. That is, exclude those inputs x from the domain of g for which $g(x)$ is not in the domain of f. The resulting set is the domain of $f \circ g$.

Example 16.6.8A: Finding the Domain of a Composite Function

Find the domain of

$$(f \circ g)(x) \text{ where } f(x) = 5x - 1 \text{ and } g(x) = \frac{4}{3x-2} \tag{16.6.9}$$

Solution

The domain of $g(x)$ consists of all real numbers except $x = \frac{2}{3}$, since that input value would cause us to divide by 0. Likewise, the domain of f consists of all real numbers except 1. So we need to exclude from the domain of $g(x)$ that value of x for which $g(x) = 1$.

$$\begin{aligned} \frac{4}{3x-2} &= 1 \\ 4 &= 3x - 2 \\ 6 &= 3x \\ x &= 2 \end{aligned}$$

So the domain of $f \circ g$ is the set of all real numbers except $\frac{2}{3}$ and 2. This means that

$$x \neq \frac{2}{3} \text{ or } x \neq 2 \tag{16.6.10}$$

We can write this in interval notation as

$$(-\infty, \frac{2}{3}) \cup (\frac{2}{3}, 2) \cup (2, \infty) \tag{16.6.11}$$

Example 16.6.8B: Finding the Domain of a Composite Function Involving Radicals

Find the domain of

$$(f \circ g)(x) \text{ where } f(x) = \sqrt{x+2} \text{ and } g(x) = \sqrt{3-x} \tag{16.6.12}$$

Because we cannot take the square root of a negative number, the domain of g is $(-\infty, 3]$. Now we check the domain of the composite function

$$(f\circ g)(x) = \sqrt{\sqrt{3-x}+2} \tag{16.6.13}$$

For $(f \circ g)(x) = \sqrt{\sqrt{3-x}+2}$, $\sqrt{3-x}+2 \geq 0$, since the radicand of a square root must be positive. Since square roots are positive, $\sqrt{3-x} \geq 0$,or, $3-x \geq 0$, which gives a domain of $(-\infty, 3]$.

Analysis

This example shows that knowledge of the range of functions (specifically the inner function) can also be helpful in finding the domain of a composite function. It also shows that the domain of $f\circ g$ can contain values that are not in the domain of f, though they must be in the domain of g.

Exercise 16.6.6

Find the domain of

$$(f\circ g)(x) \text{ where } f(x) = \frac{1}{x-2} \text{ and } g(x) = \sqrt{x+4} \tag{16.6.14}$$

Answer

$[-4, 0)\cup(0, \infty)$

Decomposing a Composite Function into its Component Functions

In some cases, it is necessary to decompose a complicated function. In other words, we can write it as a composition of two simpler functions. There may be more than one way to **decompose a composite function**, so we may choose the decomposition that appears to be most expedient.

Example 16.6.9: Decomposing a Function

Write $f(x) = \sqrt{5-x^2}$ as the composition of two functions.

Solution

We are looking for two functions, g and h, so $f(x) = g(h(x))$. To do this, we look for a function inside a function in the formula for $f(x)$. As one possibility, we might notice that the expression $5-x^2$ is the inside of the square root. We could then decompose the function as

$$h(x) = 5-x^2 \text{ and } g(x) = \sqrt{x} \tag{16.6.15}$$

We can check our answer by recomposing the functions.

$$g(h(x)) = g(5-x^2) = \sqrt{5-x^2} \tag{16.6.16}$$

Exercise 16.6.7

Write $f(x) = \dfrac{4}{3-\sqrt{4+x^2}}$ as the composition of two functions.

Answer

Possible answers:

$g(x) = \sqrt{4+x^2}$

$h(x) = \dfrac{4}{3-x}$

$f = h\circ g$

Access these online resources for additional instruction and practice with composite functions.

- Composite Functions (http://openstaxcollege.org/l/compfunction)
- Composite Function Notation Application (http://openstaxcollege.org/l/compfuncnot)
- Composite Functions Using Graphs (http://openstaxcollege.org/l/compfuncgraph)
- Decompose Functions (http://openstaxcollege.org/l/decompfunction)
- Composite Function Values (http://openstaxcollege.org/l/compfuncvalue)

Key Equation

- Composite function $(f \circ g)(x) = f(g(x))$

Key Concepts

- We can perform algebraic operations on functions. See Example.
- When functions are combined, the output of the first (inner) function becomes the input of the second (outer) function.
- The function produced by combining two functions is a composite function. See Example and Example.
- The order of function composition must be considered when interpreting the meaning of composite functions. See Example.
- A composite function can be evaluated by evaluating the inner function using the given input value and then evaluating the outer function taking as its input the output of the inner function.
- A composite function can be evaluated from a table. See Example.
- A composite function can be evaluated from a graph. See Example.
- A composite function can be evaluated from a formula. See Example.
- The domain of a composite function consists of those inputs in the domain of the inner function that correspond to outputs of the inner function that are in the domain of the outer function. See Example and Example.
- Just as functions can be combined to form a composite function, composite functions can be decomposed into simpler functions.
- Functions can often be decomposed in more than one way. See Example.

Glossary

composite function

the new function formed by function composition, when the output of one function is used as the input of another

16.E: Review Exercises 1

Chapter Review Exercises

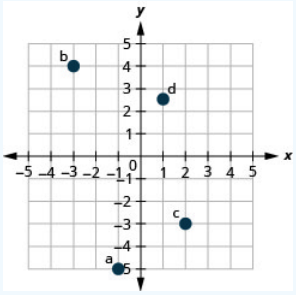
Graph Linear Equations in Two Variables

Plot Points in a Rectangular Coordinate System

In the following exercises, plot each point in a rectangular coordinate system.

1. ⓐ $(-1,-5)$
ⓑ $(-3,4)$
ⓒ $(2,-3)$
ⓓ $(1,\frac{5}{2})$

Answer



2. ⓐ $(-2,0)$
ⓑ $(0,-4)$
ⓒ $(0,5)$
ⓓ $(3,0)$

In the following exercises, determine which ordered pairs are solutions to the given equations.

3. $5x+y=10$;

ⓐ $(5,1)$
ⓑ $(2,0)$
ⓒ $(4,-10)$

Answer

ⓑ, ⓒ

4. $y=6x-2$;

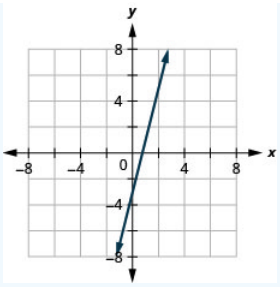
ⓐ $(1,4)$
ⓑ $(13,0)$
ⓒ $(6,-2)$

Graph a Linear Equation by Plotting Points

In the following exercises, graph by plotting points.

5. $y=4x-3$

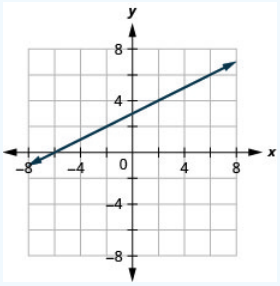
Answer



6. $y = -3x$

7. $y = \frac{1}{2}x + 3$

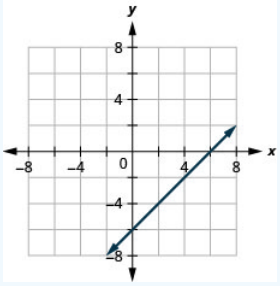
Answer



8. $y = -\frac{4}{5}|x - 1$

9. $x - y = 6$

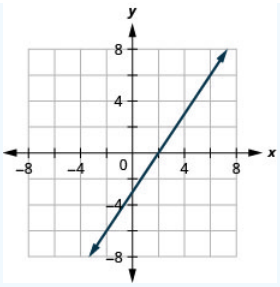
Answer



10. $2x + y = 7$

11. $3x - 2y = 6$

Answer



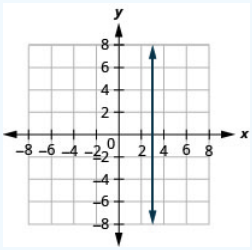
Graph Vertical and Horizontal lines

In the following exercises, graph each equation.

12. $y = -2$

13. $x = 3$

Answer

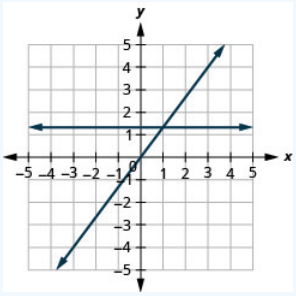


In the following exercises, graph each pair of equations in the same rectangular coordinate system.

14. $y = -2x$ and $y = -2$

15. $y = \frac{4}{3}x$ and $y = \frac{4}{3}$

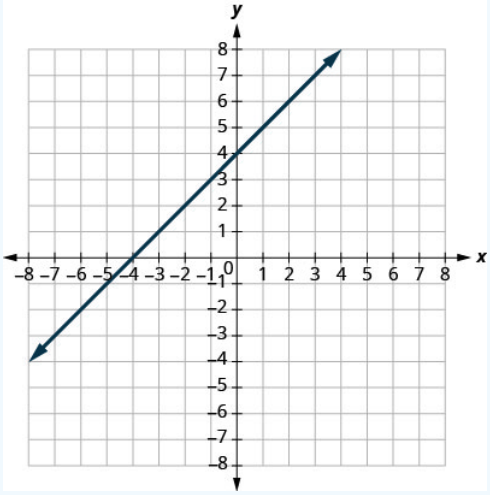
Answer



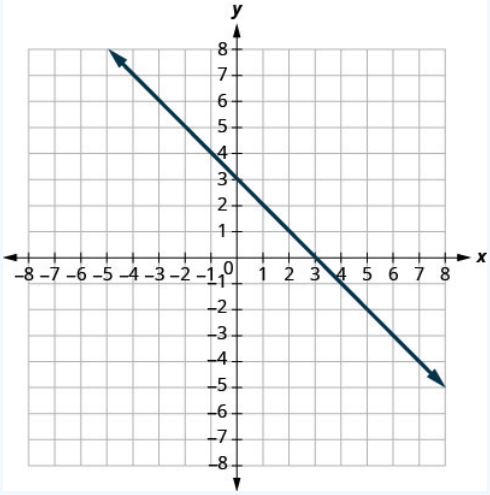
Find *x*- and *y*-Intercepts

In the following exercises, find the *x*- and *y*-intercepts.

16.



17.



Answer

$(0,3)(3,0)$

In the following exercises, find the intercepts of each equation.

18. $x-y=-1$

19. $x+2y=6$

Answer

$(6,0),\ (0,3)$

20. $2x+3y=12$

21. $y=\frac{3}{4}x-12$

Answer

$(16,0),\ (0,-12)$

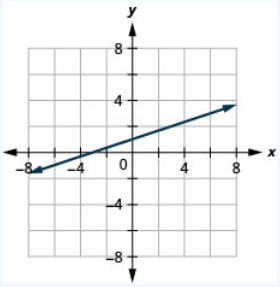
22. $y = 3x$

Graph a Line Using the Intercepts

In the following exercises, graph using the intercepts.

23. $-x + 3y = 3$

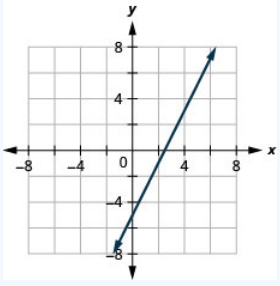
Answer



24. $x - y = 4$

25. $2x - y = 5$

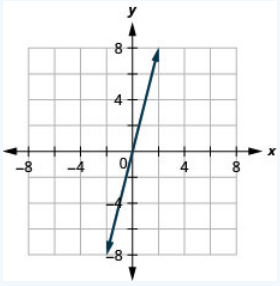
Answer



26. $2x - 4y = 8$

27. $y = 4x$

Answer

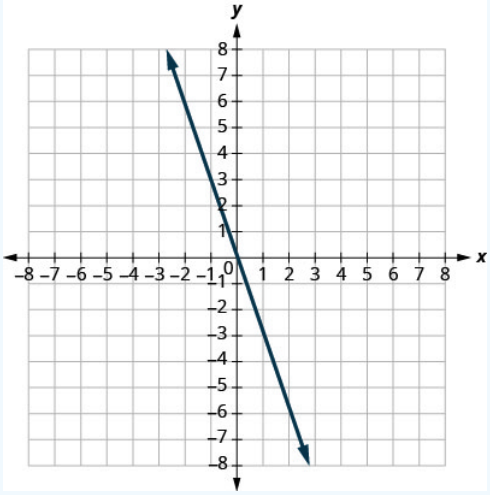


Slope of a Line

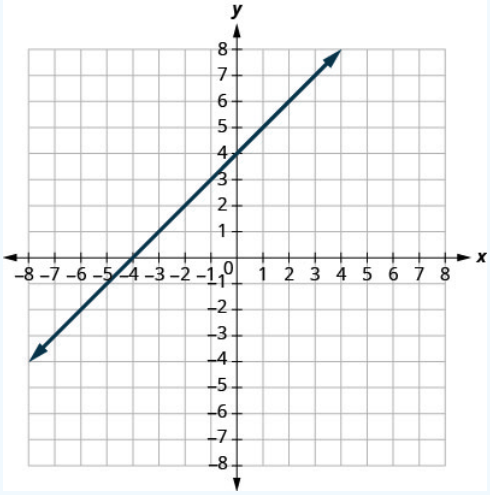
Find the Slope of a Line

In the following exercises, find the slope of each line shown.

28.



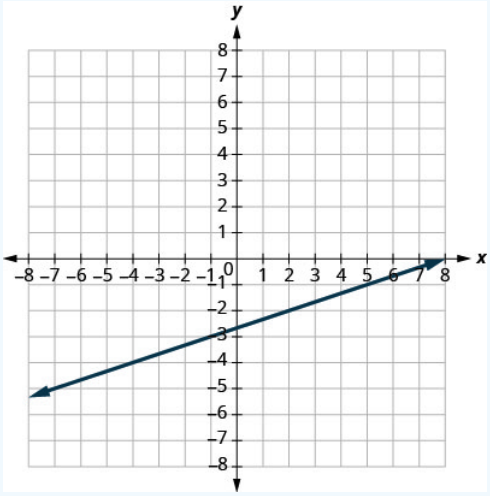
29.



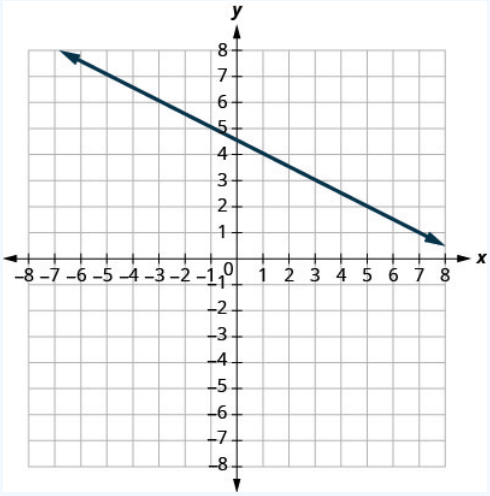
Answer

1

30.



31.



Answer

-12

In the following exercises, find the slope of each line.

32. $y = 2$

33. $x = 5$

Answer

undefined

34. $x = -3$

35. $y = -1$

Answer

0

Use the Slope Formula to find the Slope of a Line between Two Points

In the following exercises, use the slope formula to find the slope of the line between each pair of points.

36. $(-1, -1), (0, 5)$

37. $(3.5), (4, -1)$

Answer

-6

38. $(-5, -2), (3, 2)$

39. $(2, 1), (4, 6)$

Answer

52

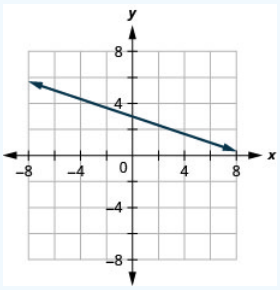
Graph a Line Given a Point and the Slope

In the following exercises, graph each line with the given point and slope.

40. $(2,-2);\ m=52$

41. $(-3,4);\ m=-13$

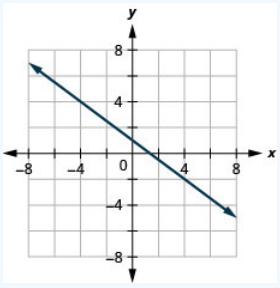
Answer



42. x-intercept $-4; m=3$

43. y-intercept $1; m=-34$

Answer



Graph a Line Using Its Slope and Intercept

In the following exercises, identify the slope and y-intercept of each line.

44. $y=-4x+9$

45. $y=53x-6$

Answer

$m=53;\ (0,-6)$

46. $5x+y=10$

47. $4x-5y=8$

Answer

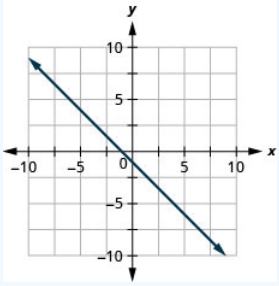
$m=\frac{4}{5};\ (0,-\frac{8}{5})$

In the following exercises, graph the line of each equation using its slope and y-intercept.

48. $y = 2x + 3$

49. $y = -x - 1$

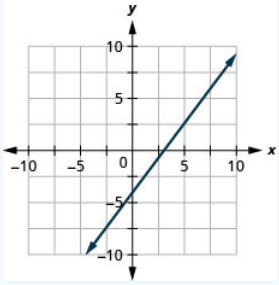
Answer



50. $y = -25x + 3$

51. $4x - 3y = 12$

Answer



In the following exercises, determine the most convenient method to graph each line.

52. $x = 5$

53. $y = -3$

Answer

horizontal line

54. $2x + y = 5$

55. $x - y = 2$

Answer

intercepts

56. $y = 22x + 2$

57. $y = 34x - 1$

Answer

plotting points

Graph and Interpret Applications of Slope-Intercept

58. Katherine is a private chef. The equation $C = 6.5m + 42$ models the relation between her weekly cost, C, in dollars and the number of meals, m, that she serves.

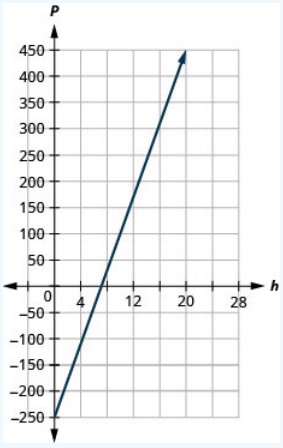
ⓐ Find Katherine's cost for a week when she serves no meals.
ⓑ Find the cost for a week when she serves 14 meals.
ⓒ Interpret the slope and C-intercept of the equation.
ⓓ Graph the equation.

59. Marjorie teaches piano. The equation $P = 35h - 250$ models the relation between her weekly profit, P, in dollars and the number of student lessons, s, that she teaches.

ⓐ Find Marjorie's profit for a week when she teaches no student lessons.
ⓑ Find the profit for a week when she teaches 20 student lessons.
ⓒ Interpret the slope and P-intercept of the equation.
ⓓ Graph the equation.

Answer

ⓐ $-\$250$
ⓑ $\$450$
ⓒ The slope, 35, means that Marjorie's weekly profit, P, increases by \$35 for each additional student lesson she teaches. The P-intercept means that when the number of lessons is 0, Marjorie loses \$250.
ⓓ



Use Slopes to Identify Parallel and Perpendicular Lines

In the following exercises, use slopes and y-intercepts to determine if the lines are parallel, perpendicular, or neither.

60. $4x - 3y = -1; \quad y = 43x - 3$

61. $y = 5x - 1; \quad 10x + 2y = 0$

Answer

neither

62. $3x - 2y = 5; \quad 2x + 3y = 6$

63. $2x - y = 8; \quad x - 2y = 4$

Answer

not parallel

Find the Equation of a Line

Find an Equation of the Line Given the Slope and *y*-Intercept

In the following exercises, find the equation of a line with given slope and y-intercept. Write the equation in slope–intercept form.

64. Slope $\frac{1}{3}$ and y-intercept $(0, -6)$

65. Slope -5 and y-intercept $(0, -3)$

Answer

$y = -5x - 3$

66. Slope 0 and y-intercept $(0, 4)$

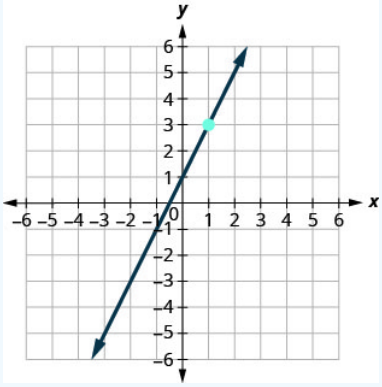
67. Slope -2 and y-intercept $(0, 0)$

Answer

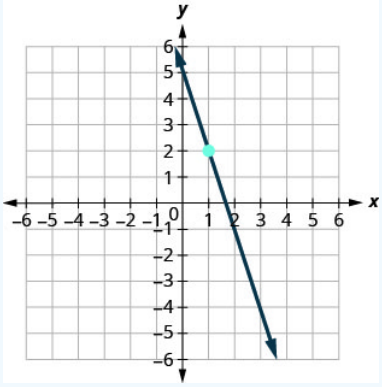
$y = -2x$

In the following exercises, find the equation of the line shown in each graph. Write the equation in slope–intercept form.

68.



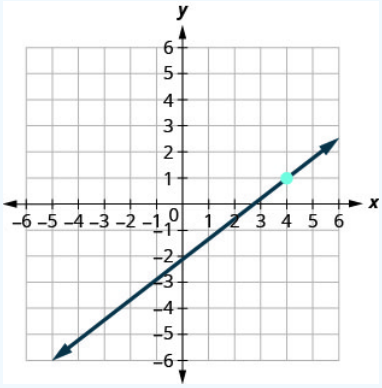
69.



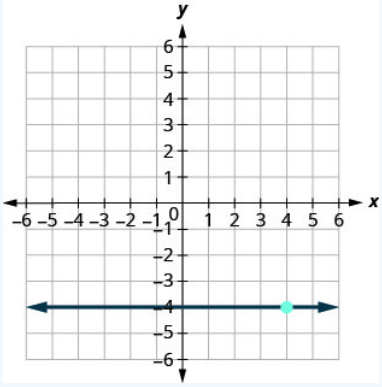
Answer

$y = -3x + 5$

70.



71.



Answer

$y = -4$

Find an Equation of the Line Given the Slope and a Point

In the following exercises, find the equation of a line with given slope and containing the given point. Write the equation in slope–intercept form.

72. $m = -\frac{1}{4}$, point $(-8, 3)$

73. $m = \frac{3}{5}$, point $(10, 6)$

Answer

$y = \frac{3}{5}x$

74. Horizontal line containing $(-2, 7)$

75. $m = -2$, point $(-1, -3)$

Answer

$y = -2x - 5$

Find an Equation of the Line Given Two Points

In the following exercises, find the equation of a line containing the given points. Write the equation in slope–intercept form.

76. $(2, 10)$ and $(-2, -2)$

77. $(7, 1)$ and $(5, 0)$

Answer

$y = \frac{1}{2}x - \frac{5}{2}$

78. $(3, 8)$ and $(3, -4)$

79. $(5, 2)$ and $(-1, 2)$

Answer

$y = 2$

Find an Equation of a Line Parallel to a Given Line

In the following exercises, find an equation of a line parallel to the given line and contains the given point. Write the equation in slope–intercept form.

80. line $y = -3x + 6$, point $(1, -5)$

81. line $2x + 5y = -10$, point $(10, 4)$

Answer

$y = -\frac{2}{5}x + 8$

82. line $x = 4$, point $(-2, -1)$

83. line $y = -5$, point $(-4, 3)$

Answer

$y = 3$

Find an Equation of a Line Perpendicular to a Given Line

In the following exercises, find an equation of a line perpendicular to the given line and contains the given point. Write the equation in slope–intercept form.

84. line $y = -\frac{4}{5}x + 2$, point $(8, 9)$

85. line $2x - 3y = 9$, point $(-4, 0)$

Answer

$y = -\frac{3}{2}x - 6$

86. line $y = 3$, point $(-1, -3)$

87. line $x = -5$ point $(2, 1)$

Answer

$y = 1$

Graph Linear Inequalities in Two Variables

Verify Solutions to an Inequality in Two Variables

In the following exercises, determine whether each ordered pair is a solution to the given inequality.

88. Determine whether each ordered pair is a solution to the inequality $y < x - 3$:

ⓐ $(0, 1)$ ⓑ $(-2, -4)$ ⓒ $(5, 2)$ ⓓ $(3, -1)$
ⓔ $(-1, -5)$

89. Determine whether each ordered pair is a solution to the inequality $x + y > 4$:

ⓐ $(6, 1)$ ⓑ $(-3, 6)$ ⓒ $(3, 2)$ ⓓ $(-5, 10)$ ⓔ $(0, 0)$

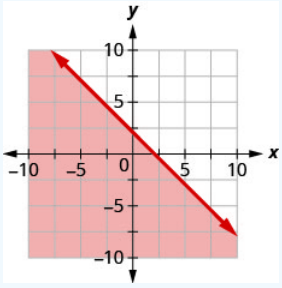
Answer

ⓐ yes ⓑ no ⓒ yes ⓓ yes; ⓔ nom

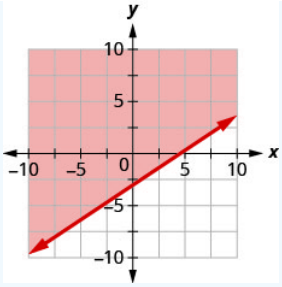
Recognize the Relation Between the Solutions of an Inequality and its Graph

In the following exercises, write the inequality shown by the shaded region.

90. Write the inequality shown by the graph with the boundary line $y = -x + 2$.



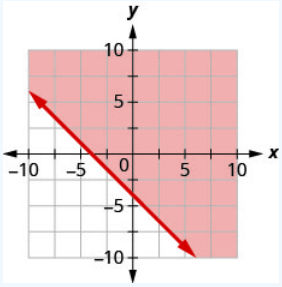
91. Write the inequality shown by the graph with the boundary line $y = \frac{2}{3}x - 3$.



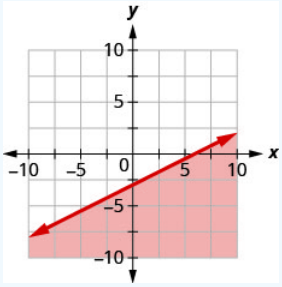
Answer

$y > \frac{2}{3}x - 3$

92. Write the inequality shown by the shaded region in the graph with the boundary line $x + y = -4$.



93. Write the inequality shown by the shaded region in the graph with the boundary line $x - 2y = 6$.



Answer

$x - 2y \geq 6$

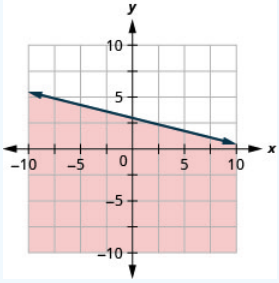
Graph Linear Inequalities in Two Variables

In the following exercises, graph each linear inequality.

94. Graph the linear inequality $y > \frac{2}{5}x - 4$.

95. Graph the linear inequality $y \leq -\frac{1}{4}x + 3$.

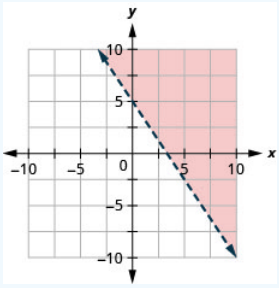
Answer



96. Graph the linear inequality $x - y \leq 5$.

97. Graph the linear inequality $3x + 2y > 10$.

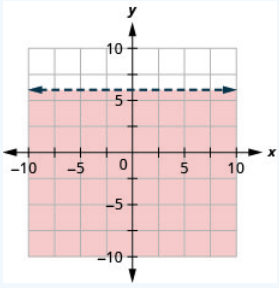
Answer



98. Graph the linear inequality $y \leq -3x$.

99. Graph the linear inequality $y < 6$.

Answer



Solve Applications using Linear Inequalities in Two Variables

100. Shanthie needs to earn at least $500 a week during her summer break to pay for college. She works two jobs. One as a swimming instructor that pays $10 an hour and the other as an intern in a law office for $25 hour. How many hours does Shanthie need to work at each job to earn at least $500 per week?

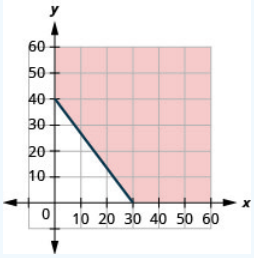
ⓐ Let *x* be the number of hours she works teaching swimming and let *y* be the number of hours she works as an intern. Write an inequality that would model this situation.
ⓑ Graph the inequality.
ⓒ Find three ordered pairs (x, y) that would be solutions to the inequality. Then, explain what that means for Shanthie.

101. Atsushi he needs to exercise enough to burn 600 calories each day. He prefers to either run or bike and burns 20 calories per minute while running and 15 calories a minute while biking.

ⓐ If x is the number of minutes that Atsushi runs and y is the number minutes he bikes, find the inequality that models the situation.
ⓑ Graph the inequality.
ⓒ List three solutions to the inequality. What options do the solutions provide Atsushi?

Answer

ⓐ $20x+15y\geq 60020x+15y\geq 600$
ⓑ



ⓒ Answers will vary.

Relations and Functions

Find the Domain and Range of a Relation

In the following exercises, for each relation, ⓐ find the domain of the relation ⓑ find the range of the relation.

102. $\{(5,-2),\ (5,-4),\ (7,-6),\ (8,-8),\ (9,-10)\}$

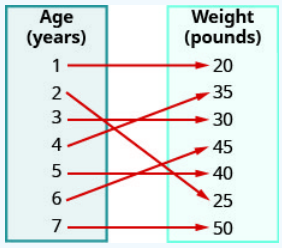
103. $\{(-3,7),\ (-2,3),\ (-1,9),\ (0,-3),\ (-1,8)\}$

Answer

ⓐ $D:-3,-2,-1,0$
ⓑ $R:7,3,9,-3,8$

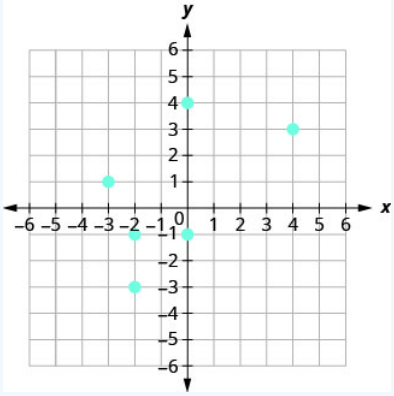
In the following exercise, use the mapping of the relation to ⓐ list the ordered pairs of the relation ⓑ find the domain of the relation ⓒ find the range of the relation.

104. The mapping below shows the average weight of a child according to age.



In the following exercise, use the graph of the relation to ⓐ list the ordered pairs of the relation ⓑ find the domain of the relation ⓒ find the range of the relation.

105.



Answer

ⓐ $(4,3),\ (-2,-3),\ (-2,-1),\ (-3,1),\ (0,-1),\ (0,4)$
ⓑ $D: -3,-2,0,4$
ⓒ $R: -3,-1,1,3,4$

Determine if a Relation is a Function

In the following exercises, use the set of ordered pairs to ⓐ determine whether the relation is a function ⓑ find the domain of the relation ⓒ find the range of the relation.

106. $\{(9,-5),\ (4,-3),\ (1,-1),\ (0,0),\ (1,1),\ (4,3),\ (9,5)\}$

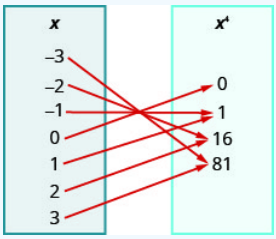
107. $\{(-3,27),\ (-2,8),\ (-1,1),\ (0,0),\ (1,1),\ (2,8),\ (3,27)\}$

Answer

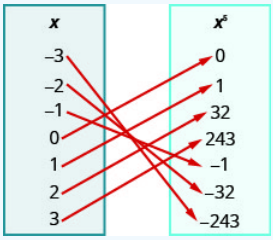
ⓐ yes ⓑ $-3,-2,-1,0,1,2,3$
ⓒ $0,1,8,27$

In the following exercises, use the mapping to ⓐ determine whether the relation is a function ⓑ find the domain of the function ⓒfind the range of the function.

108.



109.



Answer

ⓐ $-3, -2, -1, 0, 1, 2, 3$
ⓑ $-3, -2, -1, 0, 1, 2, 3$
ⓒ $-243, -32, -1, 0, 1, 32, 243$

In the following exercises, determine whether each equation is a function.

110. $2x + y = -3$

111. $y = x^2$

Answer

yes

112. $y = 3x - 5$

113. $y = x^3$

Answer

yes

114. $2x + y2 = 4$

Find the Value of a Function

In the following exercises, evaluate the function:

ⓐ $f(-2)$ ⓑ $f(3)$ ⓒ $f(a)$.

115. $f(x) = 3x - 4$

Answer

ⓐ $f(-2) = -10$ ⓑ $f(3) = 5$ ⓒ $f(a) = 3a - 4$

116. $f(x) = -2x + 5$

117. $f(x) = x^2 - 5x + 6$

Answer

ⓐ $f(-2) = 20$ ⓑ $f(3) = 0$ ⓒ $f(a) = a^2 - 5a + 6$

118. $f(x) = 3x^2 - 2x + 1$

In the following exercises, evaluate the function.

119. $g(x) = 3x2 - 5x;\ g(2)$

Answer

2

120. $F(x) = 2x2 - 3x + 1;\ F(-1)$

121. $h(t) = 4|t-1|+2;\ h(t) = 4$

Answer

18

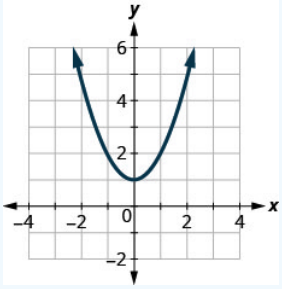
122. $f(x) = x + 2x - 1;\ f(3)$

Graphs of Functions

Use the Vertical line Test

In the following exercises, determine whether each graph is the graph of a function.

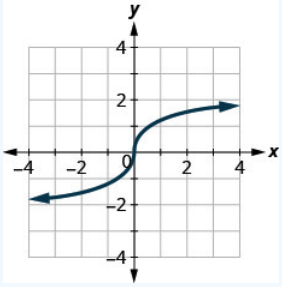
123.



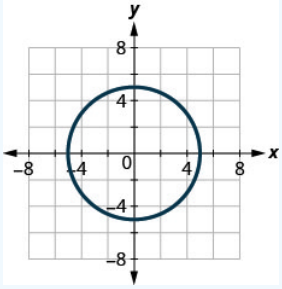
Answer

yes

124.



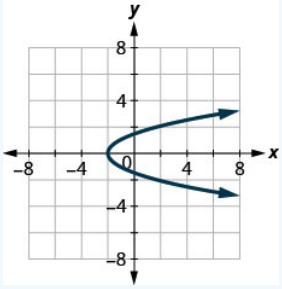
125.



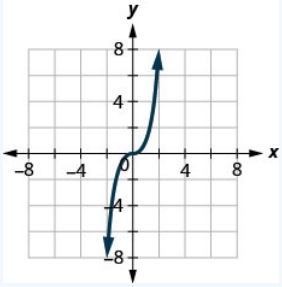
Answer

no

126.



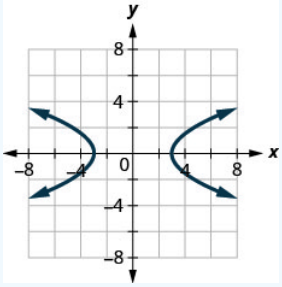
127.



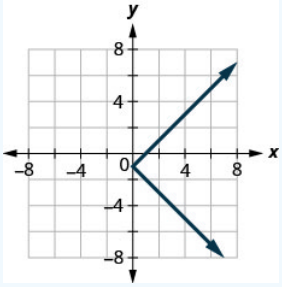
Answer

yes

128.



129.



Answer

no

Identify Graphs of Basic Functions

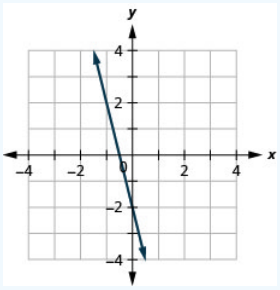
In the following exercises, ⓐ graph each function ⓑ state its domain and range. Write the domain and range in interval notation.

130. $f(x) = 5x + 1$

131. $f(x) = -4x - 2$

Answer

ⓐ



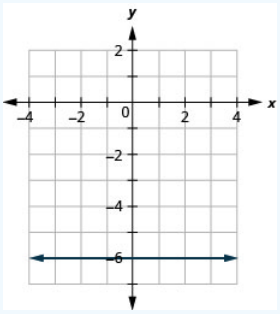
ⓑ $D : (-\text{inf}, \text{inf}), R : (-\text{inf}, \text{inf})$

132. $f(x) = \frac{2}{3}x - 1$

133. $f(x) = -6$

Answer

ⓐ



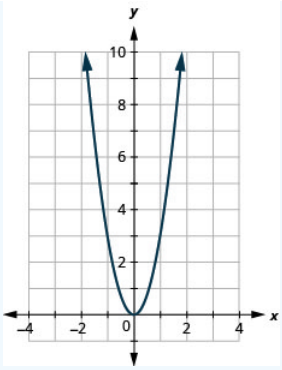
ⓑ $D : (-\text{inf}, \text{inf}), R : (-\text{inf}, \text{inf})$

134. $f(x) = 2x$

135. $f(x) = 3x^2$

Answer

ⓐ



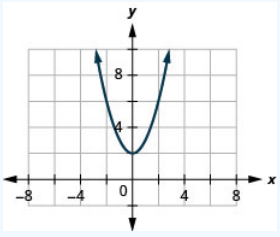
ⓑ $D: (-\text{inf}, \text{inf}), R: (-\text{inf}, 0]$

136. $f(x) = -12x^2$

137. $f(x) = x^2 + 2$

Answer

ⓐ



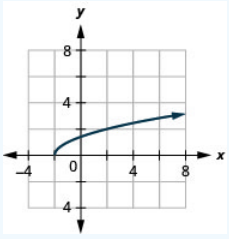
ⓑ $D: (-\text{inf}, \text{inf}), R: (-\text{inf}, \text{inf})$

138. $f(x) = x^3 - 2$

139. $f(x) = \sqrt{x+2}$

Answer

ⓐ



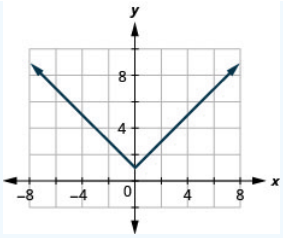
ⓑ $D: [-2, -2, \text{inf}),\ R: [0, \text{inf})$

140. $f(x) = -|x|$

141. $f(x) = |x| + 1$

Answer

ⓐ

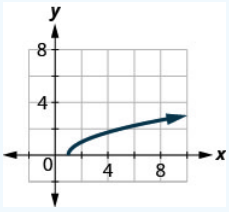


ⓑ $D : (-\text{inf}, \text{inf}),\ R : [1, \text{inf})$

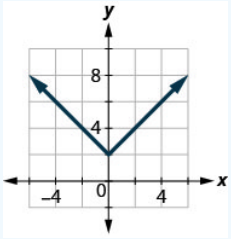
Read Information from a Graph of a Function

In the following exercises, use the graph of the function to find its domain and range. Write the domain and range in interval notation

142.



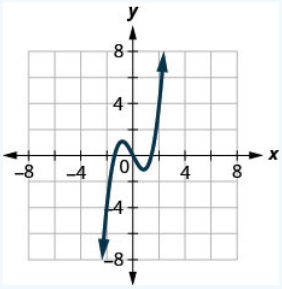
143.



Answer

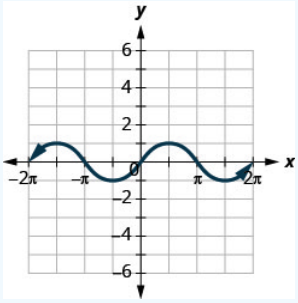
$D : (-\text{inf}, \text{inf}), R : [2, \text{inf})$

144.



In the following exercises, use the graph of the function to find the indicated values.

145.

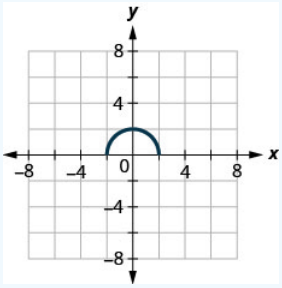


ⓐ Find $f(0)$.
ⓑ Find $f(12\pi)$.
ⓒ Find $f(-32\pi)$.
ⓓ Find the values for x when $f(x) = 0$.
ⓔ Find the x-intercepts.
ⓕ Find the y-intercept(s).
ⓖ Find the domain. Write it in interval notation.
ⓗ Find the range. Write it in interval notation.

Answer

ⓐ $f(x) = 0$ ⓑ $f(\pi/2) = 1$
ⓒ $f(-3\pi/2) = 1$ ⓓ $f(x) = 0$ for $x = -2\pi, -\pi, 0, \pi, 2\pi$
ⓔ $(-2\pi, 0), (-\pi, 0), (0, 0), (\pi, 0), (2\pi, 0)$ ⓕ $(0, 0)$
ⓖ $[-2\pi, 2\pi]$ ⓗ $[-1, 1]$

146.



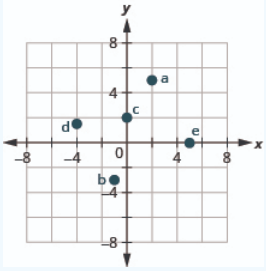
ⓐ Find $f(0)$.
ⓑ Find the values for x when $f(x) = 0$.
ⓒ Find the x-intercepts.
ⓓ Find the y-intercept(s).
ⓔ Find the domain. Write it in interval notation.
ⓕ Find the range. Write it in interval notation.

Practice Test

1. Plot each point in a rectangular coordinate system.

ⓐ $(2, 5)$
ⓑ $(-1, -3)$
ⓒ $(0, 2)$
ⓓ $(-4, 32)$
ⓔ $(5, 0)$

Answer

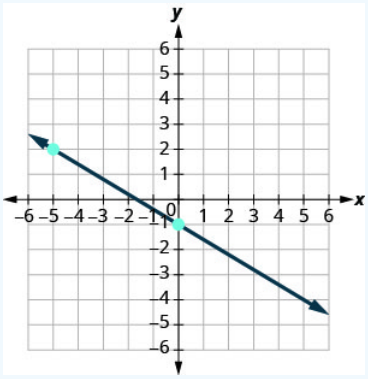


2. Which of the given ordered pairs are solutions to the equation $3x - y = 6$?

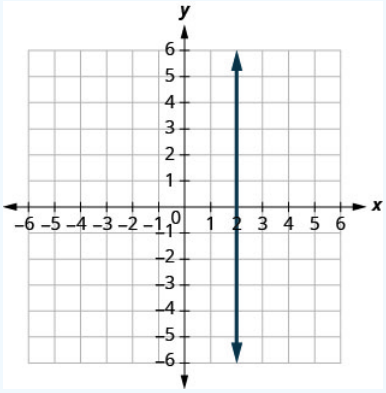
ⓐ $(3, 3)$ ⓑ $(2, 0)$ ⓒ $(4, -6)$

3. Find the slope of each line shown.

ⓐ



ⓑ



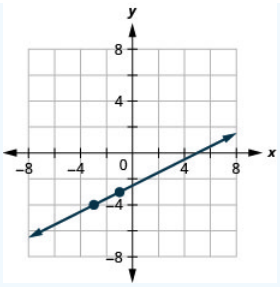
Answer

ⓐ $-\frac{3}{5}$ ⓑ undefined

4. Find the slope of the line between the points $(5, 2)$ and $(-1, -4)$.

5. Graph the line with slope $\frac{1}{2}$ containing the point $(-3, -4)$.

Answer

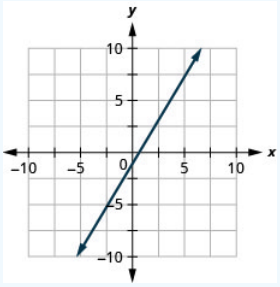


6. Find the intercepts of $4x + 2y = -8$ and graph.

Graph the line for each of the following equations.

7. $y = \frac{5}{3}x - 1$

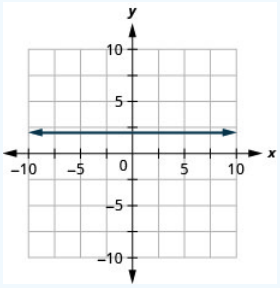
Answer



8. $y = -x$

9. $y = 2$

Answer



Find the equation of each line. Write the equation in slope-intercept form.

10. slope $-\frac{3}{4}$ and y-intercept $(0, -2)$

11. $m = 2$, point $(-3, -1)$

Answer

$y = 2x + 5$

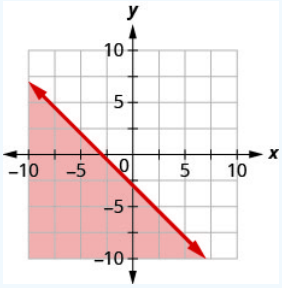
12. containing $(10, 1)$ and $(6, -1)$

13. perpendicular to the line $y = \frac{5}{4}x + 2$, containing the point $(-10, 3)$

Answer

$y = -\frac{4}{5}x - 5$

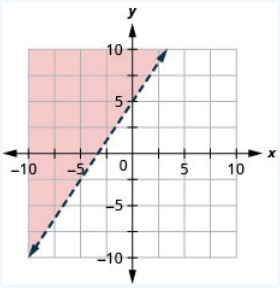
14. Write the inequality shown by the graph with the boundary line $y = -x - 3$.



Graph each linear inequality.

15. $y > \frac{3}{2}x + 5$

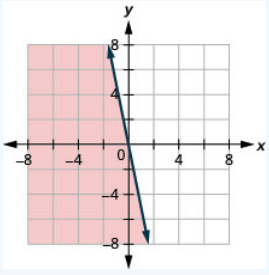
Answer



16. $x - y \geq -4$

17. $y \leq -5x$

Answer



18. Hiro works two part time jobs in order to earn enough money to meet her obligations of at least $450 a week. Her job at the mall pays $10 an hour and her administrative assistant job on campus pays $15 an hour. How many hours does Hiro need to work at each job to earn at least $450?

ⓐ Let *x* be the number of hours she works at the mall and let *y* be the number of hours she works as administrative assistant. Write an inequality that would model this situation.

ⓑ Graph the inequality .
ⓒ Find three ordered pairs (x, y) that would be solutions to the inequality. Then explain what that means for Hiro.

19. Use the set of ordered pairs to ⓐ determine whether the relation is a function, ⓑ find the domain of the relation, and ⓒfind the range of the relation.

$\{(-3, 27), (-2, 8), (-1, 1), (0, 0), (1, 1), (2, 8), (3, 27)\}$

Answer

ⓐ yes ⓑ $\{-3, -2, -1, 0, 1, 2, 3\}$ⓒ $\{0, 1, 8, 27\}$

20. Evaluate the function: ⓐ $f(-1)$ ⓑ $f(2)$ ⓒ $f(c)$.

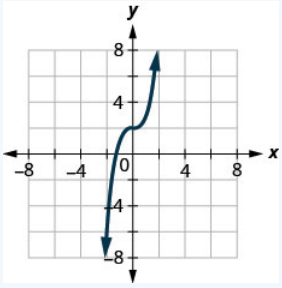
$f(x) = 4x^2 - 2x - 3$

21. For $h(y) = 3|y - 1| - 3$, evaluate $h(-4)$.

Answer

12

22. Determine whether the graph is the graph of a function. Explain your answer.

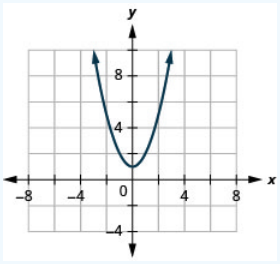


In the following exercises, ⓐ graph each function ⓑ state its domain and range.
Write the domain and range in interval notation.

23. $f(x) = x^2 + 1$

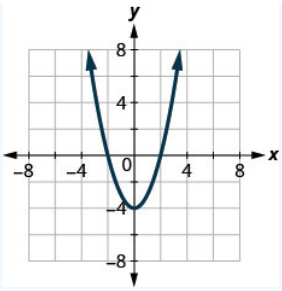
Answer

ⓐ



ⓑ $D : (-\text{inf}, \text{inf}), R : [1, \text{inf})$

24. $f(x) = \sqrt{x + 1}$



ⓑ Find the y-intercepts.
ⓒ Find $f(-1)$.
ⓓ Find $f(1)$.
ⓔ Find the domain. Write it in interval notation.
ⓕ Find the range. Write it in interval notation.

Answer

ⓐ $x = -2, 2$ ⓑ $y = -4$
ⓒ $f(-1) = -3$ ⓓ $f(1) = -3$
ⓔ $D : (-\text{inf}, \text{inf})$ ⓕ $R : [-4, \text{inf})$

16.E: Review Exercises 2

Chapter Review Exercises

Solve Quadratic Equations Using the Square Root Property

Exercise 16.E.1 Solve Quadratic Equations of the Form $ax^2 = k$ Using the Square Root Property

In the following exercises, solve using the Square Root Property.

1. $y^2 = 144$
2. $n^2 - 80 = 0$
3. $4a^2 = 100$
4. $2b^2 = 72$
5. $r^2 + 32 = 0$
6. $t^2 + 18 = 0$
7. $\frac{2}{3}w^2 - 20 = 30$
8. $5c^2 + 3 = 19$

Answer

1. $y = \pm 12$
3. $a = \pm 5$
5. $r = \pm 4\sqrt{2}i$
7. $w = \pm 5\sqrt{3}$

Exercise 16.E.2 Solve Quadratic Equations of the Form $a(x-h)^2 = k$ Using the Square Root Property

In the following exercises, solve using the Square Root Property.

1. $(p-5)^2 + 3 = 19$
2. $(u+1)^2 = 45$
3. $\left(x - \frac{1}{4}\right)^2 = \frac{3}{16}$
4. $\left(y - \frac{2}{3}\right)^2 = \frac{2}{9}$
5. $(n-4)^2 - 50 = 150$
6. $(4c-1)^2 = -18$
7. $n^2 + 10n + 25 = 12$
8. $64a^2 + 48a + 9 = 81$

Answer

1. $p = -1, 9$
3. $x = \frac{1}{4} \pm \frac{\sqrt{3}}{4}$
5. $n = 4 \pm 10\sqrt{2}$
7. $n = -5 \pm 2\sqrt{3}$

Solve Quadratic Equations by Completing the Square

Exercise 16.E.3 Solve Quadratic Equations Using Completing the Square

In the following exercises, complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

1. $x^2 + 22x$

2. $m^2 - 8m$
3. $a^2 - 3a$
4. $b^2 + 13b$

Answer

1. $(x+11)^2$
3. $\left(a - \frac{3}{2}\right)^2$

Exercise $16.E.4$ Solve Quadratic Equations Using Completing the Square

In the following exercises, solve by completing the square.

1. $d^2 + 14d = -13$
2. $y^2 - 6y = 36$
3. $m^2 + 6m = -109$
4. $t^2 - 12t = -40$
5. $v^2 - 14v = -31$
6. $w^2 - 20w = 100$
7. $m^2 + 10m - 4 = -13$
8. $n^2 - 6n + 11 = 34$
9. $a^2 = 3a + 8$
10. $b^2 = 11b - 5$
11. $(u+8)(u+4) = 14$
12. $(z-10)(z+2) = 28$

Answer

1. $d = -13, -1$
3. $m = -3 \pm 10i$
5. $v = 7 \pm 3\sqrt{2}$
7. $m = -9, -1$
9. $a = \frac{3}{2} \pm \frac{\sqrt{41}}{2}$
11. $u = -6 \pm 2\sqrt{2}$

Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

Exercise $16.E.5$ Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

In the following exercises, solve by completing the square.

1. $3p^2 - 18p + 15 = 15$
2. $5q^2 + 70q + 20 = 0$
3. $4y^2 - 6y = 4$
4. $2x^2 + 2x = 4$
5. $3c^2 + 2c = 9$
6. $4d^2 - 2d = 8$
7. $2x^2 + 6x = -5$
8. $2x^2 + 4x = -5$

Answer

1. $p = 0, 6$

3. $y = -\frac{1}{2}, 2$

5. $c = -\frac{1}{3} \pm \frac{2\sqrt{7}}{3}$

7. $x = \frac{3}{2} \pm \frac{1}{2}i$

Exercise 16.E.6 Solve Quadratic Equations Using the Quadratic Formula

In the following exercises, solve by using the Quadratic Formula.

1. $4x^2 - 5x + 1 = 0$
2. $7y^2 + 4y - 3 = 0$
3. $r^2 - r - 42 = 0$
4. $t^2 + 13t + 22 = 0$
5. $4v^2 + v - 5 = 0$
6. $2w^2 + 9w + 2 = 0$
7. $3m^2 + 8m + 2 = 0$
8. $5n^2 + 2n - 1 = 0$
9. $6a^2 - 5a + 2 = 0$
10. $4b^2 - b + 8 = 0$
11. $u(u - 10) + 3 = 0$
12. $5z(z - 2) = 3$
13. $\frac{1}{8}p^2 - \frac{1}{5}p = -\frac{1}{20}$
14. $\frac{2}{5}q^2 + \frac{3}{10}q = \frac{1}{10}$
15. $4c^2 + 4c + 1 = 0$
16. $9d^2 - 12d = -4$

Answer

1. $x = \frac{1}{4}, 1$

3. $r = -6, 7$

5. $v = \frac{-1 \pm \sqrt{21}}{8}$

7. $m = \frac{-4 \pm \sqrt{10}}{3}$

9. $a = \frac{5}{12} \pm \frac{\sqrt{23}}{12}i$

11. $u = 5 \pm \sqrt{21}$

13. $p = \frac{4 \pm \sqrt{5}}{5}$

15. $c = -\frac{1}{2}$

Exercise 16.E.7 Use the Discriminant to Predict the Number of Solutions of a Quadratic Equation

In the following exercises, determine the number of solutions for each quadratic equation.

1. a. $9x^2 - 6x + 1 = 0$
   b. $3y^2 - 8y + 1 = 0$
   c. $7m^2 + 12m + 4 = 0$
   d. $5n^2 - n + 1 = 0$
2. a. $5x^2 - 7x - 8 = 0$
   b. $7x^2 - 10x + 5 = 0$
   c. $25x^2 - 90x + 81 = 0$
   d. $15x^2 - 8x + 4 = 0$

Answer

1.

a. 1
b. 2
c. 2
d. 2

Exercise 16.E.8 Identify the Most Appropriate Method to Use to Solve a Quadratic Equation

In the following exercises, identify the most appropriate method (Factoring, Square Root, or Quadratic Formula) to use to solve each quadratic equation. Do not solve.

1. a. $16r^2-8r+1=0$
   b. $5t^2-8t+3=9$
   c. $3(c+2)^2=15$
2. a. $4d^2+10d-5=21$
   b. $25x^2-60x+36=0$
   c. $6(5v-7)^2=150$

Answer

1.

a. Factor
b. Quadratic Formula
c. Square Root

Solve Equations in Quadratic Form

Exercise 16.E.9 Solve Equations in Quadratic Form

In the following exercises, solve.

1. $x^4-14x^2+24=0$
2. $x^4+4x^2-32=0$
3. $4x^4-5x^2+1=0$
4. $(2y+3)^2+3(2y+3)-28=0$
5. $x+3\sqrt{x}-28=0$
6. $6x+5\sqrt{x}-6=0$
7. $x^{\frac{2}{3}}-10x^{\frac{1}{3}}+24=0$
8. $x+7x^{\frac{1}{2}}+6=0$
9. $8x^{-2}-2x^{-1}-3=0$

Answer

1. $x=\pm\sqrt{2}, x=\pm 2\sqrt{3}$
3. $x=\pm 1, x=\pm\frac{1}{2}$
5. $x=16$
7. $x=64, x=216$
9. $x=-2, x=\frac{4}{3}$

https://math.libretexts.org/@go/page/46420

Exercise 16.E.10 Solve Applications Modeled by Quadratic Equations

In the following exercises, solve by using the method of factoring, the square root principle, or the Quadratic Formula. Round your answers to the nearest tenth, if needed.

1. Find two consecutive odd numbers whose product is 323.
2. Find two consecutive even numbers whose product is 624.
3. A triangular banner has an area of 351 square centimeters. The length of the base is two centimeters longer than four times the height. Find the height and length of the base.
4. Julius built a triangular display case for his coin collection. The height of the display case is six inches less than twice the width of the base. The area of the of the back of the case is 70 square inches. Find the height and width of the case.
5. A tile mosaic in the shape of a right triangle is used as the corner of a rectangular pathway. The hypotenuse of the mosaic is 5 feet. One side of the mosaic is twice as long as the other side. What are the lengths of the sides? Round to the nearest tenth.

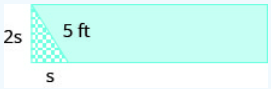

Figure 9.E.1

6. A rectangular piece of plywood has a diagonal which measures two feet more than the width. The length of the plywood is twice the width. What is the length of the plywood's diagonal? Round to the nearest tenth.

7. The front walk from the street to Pam's house has an area of 250 square feet. Its length is two less than four times its width. Find the length and width of the sidewalk. Round to the nearest tenth.

8. For Sophia's graduation party, several tables of the same width will be arranged end to end to give serving table with a total area of 75 square feet. The total length of the tables will be two more than three times the width. Find the length and width of the serving table so Sophia can purchase the correct size tablecloth . Round answer to the nearest tenth.

9. A ball is thrown vertically in the air with a velocity of 160 ft/sec. Use the formula $h = -16t^2 + v_0 t$ to determine when the ball will be 384 feet from the ground. Round to the nearest tenth.

10. The couple took a small airplane for a quick flight up to the wine country for a romantic dinner and then returned home. The plane flew a total of 5 hours and each way the trip was 360 miles. If the plane was flying at 150 mph, what was the speed of the wind that affected the plane?

11. Ezra kayaked up the river and then back in a total time of 6 hours. The trip was 4 miles each way and the current was difficult. If Roy kayaked at a speed of 5 mph, what was the speed of the current?

12. Two handymen can do a home repair in 2 hours if they work together. One of the men takes 3 hours more than the other man to finish the job by himself. How long does it take for each handyman to do the home repair individually?

Answer

2. Two consecutive even numbers whose product is 624 are 24 and 26, and -24 and -26.

4. The height is 14 inches and the width is 10 inches.

6. The length of the diagonal is 3.6 feet.

8. The width of the serving table is 4.7 feet and the length is 16.1 feet.

Figure 9.E.2

10. The speed of the wind was 30 mph.

12. One man takes 3 hours and the other man 6 hours to finish the repair alone.

https://math.libretexts.org/@go/page/46420

Graph Quadratic Functions Using Properties

Exercise 16.E.11 Recognize the Graph of a Quadratic Function

In the following exercises, graph by plotting point.

1. Graph $y = x^2 - 2$
2. Graph $y = -x^2 + 3$

Answer

2.

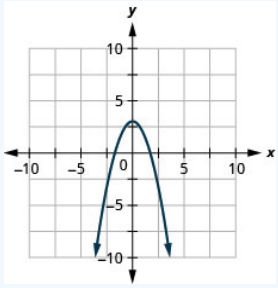

Figure 9.E.3

Exercise 16.E.12 Recognize the Graph of a Quadratic Function

In the following exercises, determine if the following parabolas open up or down.

1. a. $y = -3x^2 + 3x - 1$
   b. $y = 5x^2 + 6x + 3$
2. a. $y = x^2 + 8x - 1$
   b. $y = -4x^2 - 7x + 1$

Answer

2.

a. Up
b. Down

Exercise 16.E.13 Find the Axis of Symmetry and Vertex of a Parabola

In the following exercises, find

a. The equation of the axis of symmetry
b. The vertex

1. $y = -x^2 + 6x + 8$
2. $y = 2x^2 - 8x + 1$

Answer

2. $x = 2$; $(2, -7)$

Exercise 16.E.14 Find the Intercepts of a Parabola

In the following exercises, find the x- and y-intercepts.

1. $y = x^2 - 4x + 5$

https://math.libretexts.org/@go/page/46420

2. $y = x^2 - 8x + 15$
3. $y = x^2 - 4x + 10$
4. $y = -5x^2 - 30x - 46$
5. $y = 16x^2 - 8x + 1$
6. $y = x^2 + 16x + 64$

Answer

2. $y : (0, 15)$
   $x : (3, 0), (5, 0)$
4. $y : (0, -46)$
   $x :$ none
6. $y : (0, -64)$
   $x : (-8, 0)$

Graph Quadratic Functions Using Properties

Exercise $16.E.15$ Graph Quadratic Functions Using Properties

In the following exercises, graph by using its properties.

1. $y = x^2 + 8x + 15$
2. $y = x^2 - 2x - 3$
3. $y = -x^2 + 8x - 16$
4. $y = 4x^2 - 4x + 1$
5. $y = x^2 + 6x + 13$
6. $y = -2x^2 - 8x - 12$

Answer

2.

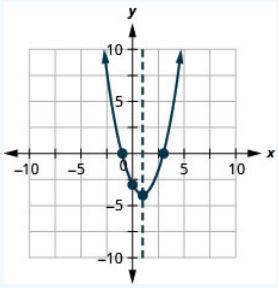

Figure 9.E.4

4.

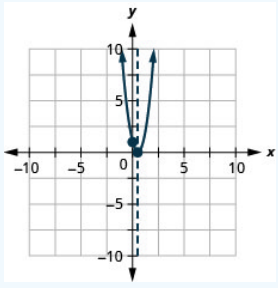

Figure 9.E.5

6.

https://math.libretexts.org/@go/page/46420

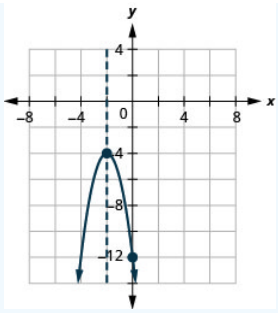

Figure 9.E.6

Exercise 16.E.16 Solve Maximum and Minimum Applications

In the following exercises, find the minimum or maximum value.

1. $y = 7x^2 + 14x + 6$
2. $y = -3x^2 + 12x - 10$

Answer

2. The maximum value is 2 when $x = 2$.

Exercise 16.E.17 Solve Maximum and Minimum Applications

In the following exercises, solve. Rounding answers to the nearest tenth.

1. A ball is thrown upward from the ground with an initial velocity of 112 ft/sec. Use the quadratic equation $h = -16t^2 + 112t$ to find how long it will take the ball to reach maximum height, and then find the maximum height.
2. A daycare facility is enclosing a rectangular area along the side of their building for the children to play outdoors. They need to maximize the area using 180 feet of fencing on three sides of the yard. The quadratic equation $A = -2x^2 + 180x$ gives the area, A, of the yard for the length, x, of the building that will border the yard. Find the length of the building that should border the yard to maximize the area, and then find the maximum area.

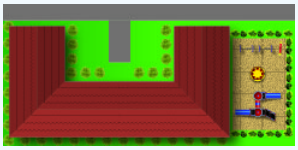

Figure 9.E.7

Answer

2. The length adjacent to the building is 90 feet giving a maximum area of $4,050$ square feet.

Graph Quadratic Functions Using Transformations

Exercise 16.E.18 Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using a vertical shift.

1. $g(x) = x^2 + 4$
2. $h(x) = x^2 - 3$

Answer

2.

https://math.libretexts.org/@go/page/46420

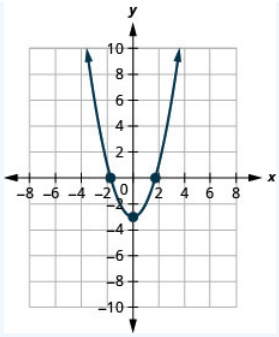

Figure 9.E.8

Exercise $16.E.19$ Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using a horizontal shift.

1. $f(x) = (x+1)^2$
2. $g(x) = (x-3)^2$

Answer

2.

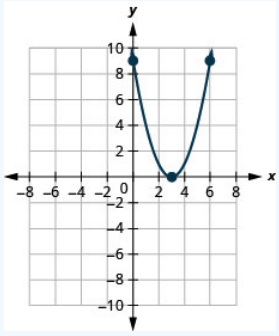

Figure 9.E.9

Exercise $16.E.20$ Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using transformations.

1. $f(x) = (x+2)^2 + 3$
2. $f(x) = (x+3)^2 - 2$
3. $f(x) = (x-1)^2 + 4$
4. $f(x) = (x-4)^2 - 3$

Answer

2.

https://math.libretexts.org/@go/page/46420

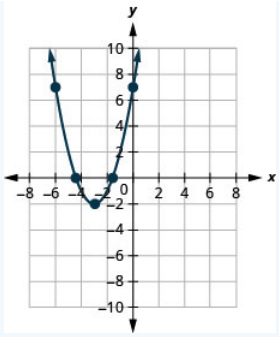

Figure 9.E.10

4.

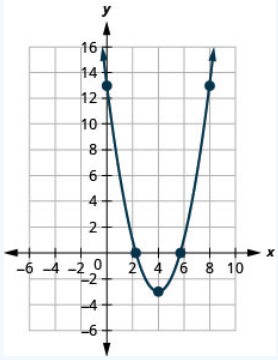

Figure 9.E.11

Exercise 16.E. 21 Graph Quadratic Functions of the Form $f(x) = ax^2$

In the following exercises, graph each function.

1. $f(x) = 2x^2$
2. $f(x) = -x^2$
3. $f(x) = \frac{1}{2}x^2$

Answer

2.

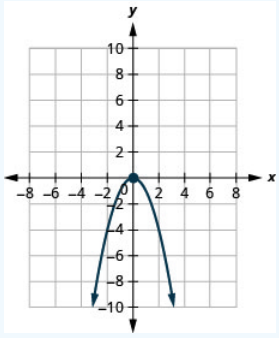

Figure 9.E.12

Exercise 16.E. 22 Graph Quadratic Functions Using Transformations

In the following exercises, rewrite each function in the $f(x) = a(x-h)^2 + k$ form by completing the square.

1. $f(x) = 2x^2 - 4x - 4$

2. $f(x) = 3x^2 + 12x + 8$

Answer

1. $f(x) = 2(x-1)^2 - 6$

Exercise $16.E.23$ Graph Quadratic Functions Using Transformations

In the following exercises,

a. Rewrite each function in $f(x) = a(x-h)^2 + k$ form
b. Graph it by using transformations

1. $f(x) = 3x^2 - 6x - 1$
2. $f(x) = -2x^2 - 12x - 5$
3. $f(x) = 2x^2 + 4x + 6$
4. $f(x) = 3x^2 - 12x + 7$

Answer

1.

a. $f(x) = 3(x-1)^2 - 4$
b.

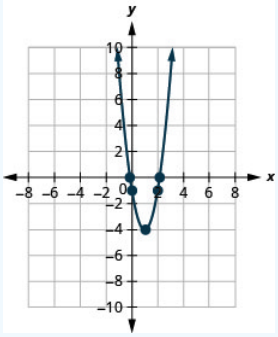

Figure 9.E.13

3.

a. $f(x) = 2(x+1)^2 + 4$
b.

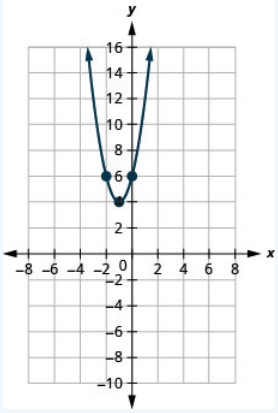

Figure 9.E.14

https://math.libretexts.org/@go/page/46420

Exercise 16.E.24 Graph Quadratic Functions Using Transformations

In the following exercises,

a. Rewrite each function in $f(x)=a(x-h)^2+k$ form
b. Graph it using properties

1. $f(x)=-3x^2-12x-5$
2. $f(x)=2x^2-12x+7$

Answer

1.

a. $f(x)=-3(x+2)^2+7$
b.

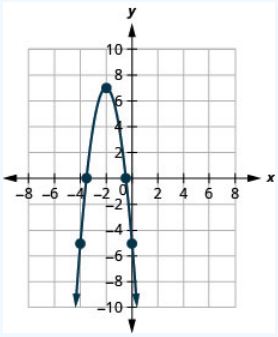

Figure 9.E.15

Exercise 16.E.25 Find a Quadratic Function From its Graph

In the following exercises, write the quadratic function in $f(x)=a(x-h)^2+k$ form.

1.

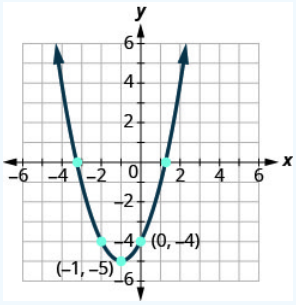

Figure 9.E.16

2.

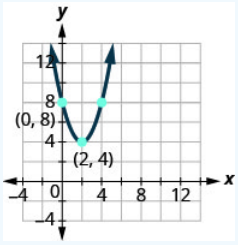

Figure 9.E.17

Answer

1. $f(x)=(x+1)^2-5$

https://math.libretexts.org/@go/page/46420

Exercise $16.E.26$ Solve Quadratic Inequalities Graphically

In the following exercises, solve graphically and write the solution in interval notation.

1. $x^2 - x - 6 > 0$
2. $x^2 + 4x + 3 \leq 0$
3. $-x^2 - x + 2 \geq 0$
4. $-x^2 + 2x + 3 < 0$

Answer

1.

a.

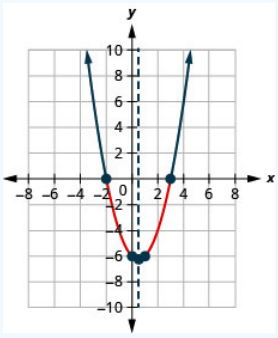

Figure 9.E.18

b. $(-\infty, -2) \cup (3, \infty)$

3.

a.

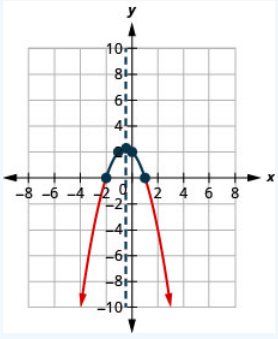

Figure 9.E.19

b. $[-2, 1]$

Exercise $16.E.27$ Solve Quadratic Inequalities Graphically

In the following exercises, solve each inequality algebraically and write any solution in interval notation.

1. $x^2 - 6x + 8 < 0$
2. $x^2 + x > 12$
3. $x^2 - 6x + 4 \leq 0$
4. $2x^2 + 7x - 4 > 0$
5. $-x^2 + x - 6 > 0$
6. $x^2 - 2x + 4 \geq 0$

Answer

1. $(2, 4)$
3. $[3-\sqrt{5}, 3+\sqrt{5}]$
5. no solution

Practice Test

Exercise 16.E.28

1. Use the Square Root Property to solve the quadratic equation $3(w+5)^2 = 27$.
2. Use Completing the Square to solve the quadratic equation $a^2 - 8a + 7 = 23$.
3. Use the Quadratic Formula to solve the quadratic equation $2m^2 - 5m + 3 = 0$.

Answer

1. $w = -2, w = -8$
3. $m = 1, m = \frac{3}{2}$

Exercise 16.E.29

Solve the following quadratic equations. Use any method.

1. $2x(3x-2) - 1 = 0$
2. $\frac{9}{4}y^2 - 3y + 1 = 0$

Answer

2. $y = \frac{2}{3}$

Exercise 16.E.30

Use the discriminant to determine the number and type of solutions of each quadratic equation.

1. $6p^2 - 13p + 7 = 0$
2. $3q^2 - 10q + 12 = 0$

Answer

2. 2 complex

Exercise 16.E.31

Solve each equation.

1. $4x^4 - 17x^2 + 4 = 0$
2. $y^{\frac{2}{3}} + 2y^{\frac{1}{3}} - 3 = 0$

Answer

2. $y = 1, y = -27$

Exercise 16.E.32

For each parabola, find

a. Which direction it opens
b. The equation of the axis of symmetry

c. The vertex
d. The x-and y-intercepts
e. The maximum or minimum value

1. $y = 3x^2 + 6x + 8$
2. $y = -x^2 - 8x + 16$

Answer

2.

a. down
b. $x = -4$
c. $(-4, 0)$
d. $y : (0, 16); x : (-4, 0)$
e. minimum value of -4 when $x = 0$

Exercise $16.E.33$

Graph each quadratic function using intercepts, the vertex, and the equation of the axis of symmetry.

1. $f(x) = x^2 + 6x + 9$
2. $f(x) = -2x^2 + 8x + 4$

Answer

2.

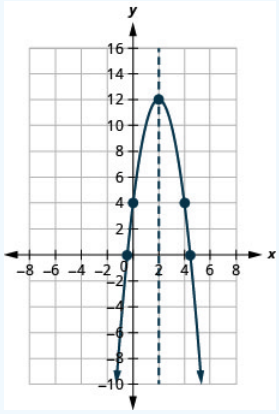

Figure 9.E.20

Exercise $16.E.34$

In the following exercises, graph each function using transformations.

1. $f(x) = (x + 3)^2 + 2$
2. $f(x) = x^2 - 4x - 1$

Answer

2.

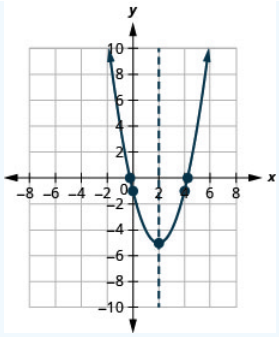

Figure 9.E.21

Exercise $16.E.35$

In the following exercises, solve each inequality algebraically and write any solution in interval notation.

1. $x^2 - 6x - 8 \leq 0$
2. $2x^2 + x - 10 > 0$

Answer

2. $\left(-\infty, -\frac{5}{2}\right) \cup (2, \infty)$

Exercise $16.E.36$

Model the situation with a quadratic equation and solve by any method.

1. Find two consecutive even numbers whose product is 360.
2. The length of a diagonal of a rectangle is three more than the width. The length of the rectangle is three times the width. Find the length of the diagonal. (Round to the nearest tenth.)

Answer

2. A water balloon is launched upward at the rate of 86 ft/sec. Using the formula $h = -16t^2 + 86t$ find how long it will take the balloon to reach the maximum height, and then find the maximum height. Round to the nearest tenth.

17.1: Prelude to Roots and Radicals

Imagine charging your cell phone is less than five seconds. Consider cleaning radioactive waste from contaminated water. Think about filtering salt from ocean water to make an endless supply of drinking water. Ponder the idea of bionic devices that can repair spinal injuries. These are just of few of the many possible uses of a material called graphene. Materials scientists are developing a material made up of a single layer of carbon atoms that is stronger than any other material, completely flexible, and conducts electricity better than most metals. Research into this type of material requires a solid background in mathematics, including understanding roots and radicals. In this chapter, you will learn to simplify expressions containing roots and radicals, perform operations on radical expressions and equations, and evaluate radical functions.

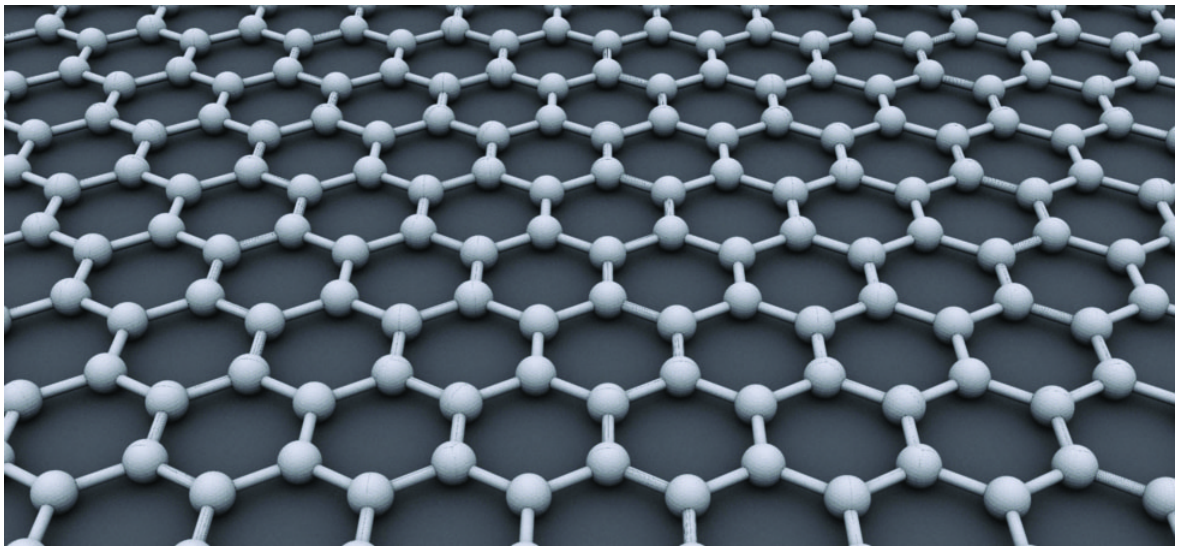

Figure 17.1.1 : Graphene is an incredible strong and flexible material made from carbon. It can also conduct electricity. Notice the hexagonal grid pattern. (credit: "AlexanderAIUS" / Wikimedia Commons)

17.2: Simplify Expressions with Roots

Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with roots
- Estimate and approximate roots
- Simplify variable expressions with roots

Before you get started, take this readiness quiz.

1. Simplify: a. $(-9)^2$ b. -9^2 c. $(-9)^3$
   If you missed this problem, review Example 2.21.
2. Round 3.846 to the nearest hundredth.
   If you missed this problem, review Example 1.34.
3. Simplify: a. $x^3 \cdot x^3$ b. $y^2 \cdot y^2 \cdot y^2$ c. $z^3 \cdot z^3 \cdot z^3 \cdot z^3$
   If you missed this problem, review Example 5.12.

Simplify Expressions with Roots

In Foundations, we briefly looked at square roots. Remember that when a real number n is multiplied by itself, we write n^2 and read it 'n^2 squared'. This number is called the **square** of n, and n is called the **square root**. For example,

13^2 is read "13 squared"

169 is called the square of 13, since $13^2 = 169$

13 is a square root of 169

Definition 17.2.1: Square and Square Root of a Number

Square

If $n^2 = m$, then m is the **square** of n.

Square Root

If $n^2 = m$, then n is a **square root** of m.

Notice $(-13)^2 = 169$ also, so -13 is also a square root of 169. Therefore, both 13 and -13 are square roots of 169.

So, every positive number has two square roots—one positive and one negative. What if we only wanted the positive square root of a positive number? We use a *radical sign*, and write, $\sqrt{m}$, which denotes the positive square root of m. The positive square root is also called the **principal square root**.

We also use the radical sign for the square root of zero. Because $0^2 = 0$, $\sqrt{0} = 0$. Notice that zero has only one square root.

Definition 17.2.2: Square Root Notation

$\sqrt{m}$ is read "the square root of m."

If $n^2 = m$, then $n = \sqrt{m}$, for $n \geq 0$.

radical sign $\longrightarrow \sqrt{m} \longleftarrow$ radicand

Figure 8.1.1

We know that every positive number has two square roots and the radical sign indicates the positive one. We write $\sqrt{169} = 13$. If we want to find the negative square root of a number, we place a negative in front of the radical sign. For example, $-\sqrt{169} = -13$.

Example 17.2.1

Simplify:

a. $\sqrt{144}$
b. $-\sqrt{289}$

Solution:

a.

$$\sqrt{144}$$

Since $12^2 = 144$.

$$12$$

b.

$$-\sqrt{289}$$

Since $17^2 = 289$ and the negative is in front of the radical sign.

$$-17$$

Exercise 17.2.1

Simplify:

a. $-\sqrt{64}$
b. $\sqrt{225}$

Answer

a. -8
b. 15

Exercise 17.2.2

Simplify:

a. $\sqrt{100}$
b. $-\sqrt{121}$

Answer

a. 10
b. -11

Can we simplify $-\sqrt{49}$? Is there a number whose square is -49?

$$(___)^2 = -49$$

Any positive number squared is positive. Any negative number squared is positive. There is no real number equal to $\sqrt{-49}$. The square root of a negative number is not a real number.

Example 17.2.2

Simplify:

a. $\sqrt{-196}$
b. $-\sqrt{64}$

Solution:

a.

$$\sqrt{-196}$$

There is no real number whose square is -196.

$\sqrt{-196}$ is not a real number.

b.

$$-\sqrt{64}$$

The negative is in front of the radical.

$$-8$$

Exercise 17.2.3

Simplify:

a. $\sqrt{-169}$
b. $-\sqrt{81}$

Answer

a. not a real number
b. -9

Exercise 17.2.4

Simplify:

a. $-\sqrt{49}$
b. $\sqrt{-121}$

Answer

a. -7
b. not a real number

So far we have only talked about squares and square roots. Let's now extend our work to include higher powers and higher roots.

Let's review some vocabulary first.

We write:	We say:
n^2	n squared
n^3	n cubed
n^4	n to the fourth power
n^5	n to the fifth power

The terms 'squared' and 'cubed' come from the formulas for area of a square and volume of a cube.

It will be helpful to have a table of the powers of the integers from -5 to 5. See *Figure 8.1.2*

Number	Square	Cube	Fourth power	Fifth power
n	n^2	n^3	n^4	n^5
1	1	1	1	1
2	4	8	16	32
3	9	27	81	243
4	16	64	256	1024
5	25	125	625	3125
x	x^2	x^3	x^4	x^5
x^2	x^4	x^6	x^8	x^{10}

Number	Square	Cube	Fourth power	Fifth power
n	n^2	n^3	n^4	n^5
–1	1	–1	1	–1
–2	4	–8	16	–32
–3	9	–27	81	–243
–4	16	–64	256	–1024
–5	25	–125	625	–3125

Figure 8.1.2

Notice the signs in the table. All powers of positive numbers are positive, of course. But when we have a negative number, the *even* powers are positive and the *odd* powers are negative. We'll copy the row with the powers of -2 to help you see this.

n	n^2	n^3	n^4	n^5
–2	4	–8	16	–32

Even power
Positive result

Odd power
Negative result

Figure 8.1.3

We will now extend the square root definition to higher roots.

Definition 17.2.3: Nth Root of a Number

If $b^n = a$, then b is an n^{th} root of a.

The principal n^{th} root of a is written $\sqrt[n]{a}$.

The n is called the **index** of the radical.

Just like we use the word 'cubed' for b^3, we use the term 'cube root' for $\sqrt[3]{a}$.

We can refer to *Figure 8.1.2* to help find higher roots.

$$4^3 = 64 \qquad \sqrt[3]{64} = 4$$
$$3^4 = 81 \qquad \sqrt[4]{81} = 3$$
$$(-2)^5 = -32 \qquad \sqrt[5]{-32} = -2$$

Could we have an even root of a negative number? We know that the square root of a negative number is not a real number. The same is true for any even root. *Even* roots of negative numbers are not real numbers. *Odd* roots of negative numbers are real numbers.

Properties of $\sqrt[n]{a}$

When n is an even number and

- $a \geq 0$, then $\sqrt[n]{a}$ is a real number.
- $a < 0$, then $\sqrt[n]{a}$ is not a real number.

When n is an odd number, $\sqrt[n]{a}$ is a real number for all the values of a.

We will apply these properties in the next two examples.

Example 17.2.3

Simplify:

a. $\sqrt[3]{64}$
b. $\sqrt[4]{81}$
c. $\sqrt[5]{32}$

Solution:

a.

$$\sqrt[3]{64}$$

Since $4^3 = 64$.

$$4$$

b.

$$\sqrt[4]{81}$$

Since $(3)^4 = 81$.

$$3$$

https://math.libretexts.org/@go/page/46423

c.

$$\sqrt[5]{32}$$

Since $(2)^5 = 32$.

$$2$$

Exercise 17.2.5

Simplify:

a. $\sqrt[3]{27}$
b. $\sqrt[4]{256}$
c. $\sqrt[5]{243}$

Answer

a. 3
b. 4
c. 3

Exercise 17.2.6

Simplify:

a. $\sqrt[3]{1000}$
b. $\sqrt[4]{16}$
c. $\sqrt[5]{243}$

Answer

a. 10
b. 2
c. 3

In this example be alert for the negative signs as well as even and odd powers.

Example 17.2.4

Simplify:

a. $\sqrt[3]{-125}$
b. $\sqrt[4]{16}$
c. $\sqrt[5]{-243}$

Solution:

a.

$$\sqrt[3]{-125}$$

Since $(-5)^3 = -125$.

$$-5$$

b.

$$\sqrt[4]{16}$$

Think, $(?)^4 = -16$. No real number raised to the fourth power is negative.

Not a real number.

c.

$$\sqrt[5]{-243}$$

Since $(-3)^5 = -243$.

$$-3$$

Exercise 17.2.7

Simplify:

a. $\sqrt[3]{-27}$
b. $\sqrt[4]{-256}$
c. $\sqrt[5]{-32}$

Answer

a. -3
b. not real
c. -2

Exercise 17.2.8

Simplify:

a. $\sqrt[3]{-216}$
b. $\sqrt[4]{-81}$
c. $\sqrt[5]{-1024}$

Answer

a. -6
b. not real
c. -4

Estimate and Approximate Roots

When we see a number with a radical sign, we often don't think about its numerical value. While we probably know that the $\sqrt{4} = 2$, what is the value of $\sqrt{21}$ or $\sqrt[3]{50}$? In some situations a quick estimate is meaningful and in others it is convenient to have a decimal approximation.

To get a numerical estimate of a square root, we look for **perfect square** numbers closest to the radicand. To find an estimate of $\sqrt{11}$, we see 11 is between perfect square numbers 9 and 16, *closer* to 9. Its square root then will be between 3 and 4, but closer to 3.

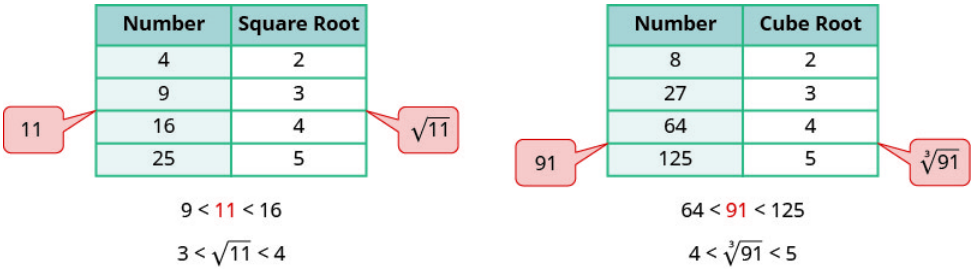

Figure 8.1.4

Similarly, to estimate $\sqrt[3]{91}$, we see 91 is between perfect cube numbers 64 and 125. The cube root then will be between 4 and 5.

Example 17.2.5

Estimate each root between two consecutive whole numbers:

a. $\sqrt{105}$
b. $\sqrt[3]{43}$

Solution:

a. Think of the perfect square numbers closest to 105. Make a small table of these perfect squares and their squares roots.

Table 8.1.1

	$\sqrt{105}$
	Locate 105 between two consecutive perfect squares.	$100 < 105 < 121$
$\sqrt{105}$ is between their square roots.	$10 < \sqrt{105} < 11$

b. Similarly we locate 43 between two perfect cube numbers.

Table 8.1.2

	$\sqrt[3]{43}$
	Locate 43 between two consecutive perfect cubes.	$27 < 43 < 64$
$\sqrt[3]{43}$ is between their cube roots.	$3 < \sqrt[3]{43} < 4$

Exercise 17.2.9

Estimate each root between two consecutive whole numbers:

a. $\sqrt{38}$
b. $\sqrt[3]{93}$

Answer

a. $6 < \sqrt{38} < 7$
b. $4 < \sqrt[3]{93} < 5$

Exercise 17.2.10

Estimate each root between two consecutive whole numbers:

a. $\sqrt{84}$
b. $\sqrt[3]{152}$

Answer

a. $9 < \sqrt{84} < 10$
b. $5 < \sqrt[3]{152} < 6$

There are mathematical methods to approximate square roots, but nowadays most people use a calculator to find square roots. To find a square root you will use the $\sqrt{x}$ key on your calculator. To find a cube root, or any root with higher index, you will use the $\sqrt[y]{x}$ key.

When you use these keys, you get an approximate value. It is an approximation, accurate to the number of digits shown on your calculator's display. The symbol for an approximation is $\approx$ and it is read 'approximately'.

Suppose your calculator has a 10 digit display. You would see that

$$\sqrt{5} \approx 2.236067978 \text{rounded to two decimal places is } \sqrt{5} \approx 2.24$$

$$\sqrt[4]{93} \approx 3.105422799 \text{rounded to two decimal places is } \sqrt[4]{93} \approx 3.11$$

How do we know these values are approximations and not the exact values? Look at what happens when we square them:

$$(2.236067978)^2 = 5.000000002 \qquad (3.105422799)^4 = 92.999999991$$
$$(2.24)^2 = 5.0176 \qquad (3.11)^4 = 93.54951841$$

Their squares are close to 5, but are not exactly equal to 5. The fourth powers are close to 93, but not equal to 93.

Example 17.2.6

Round to two decimal places:

a. $\sqrt{17}$
b. $\sqrt[3]{49}$
c. $\sqrt[4]{51}$

Solution:

a.

$$\sqrt{17}$$

Use the calculator square root key.

$$4.123105626\ldots$$

Round to two decimal places.

$$4.12$$

$$\sqrt{17} \approx 4.12$$

b.

$$\sqrt[3]{49}$$

Use the calculator $\sqrt[y]{x}$ key.

$$3.659305710\ldots$$

Round to two decimal places.

$$3.66$$

$$\sqrt[3]{49} \approx 3.66$$

c.

$$\sqrt[4]{51}$$

Use the calculator $\sqrt[y]{x}$ key.

$$2.6723451177\ldots$$

Round to two decimal places.

$$2.67$$

$$\sqrt[4]{51} \approx 2.67$$

Exercise 17.2.11

Round to two decimal places:

1. $\sqrt{11}$
2. $\sqrt[3]{71}$
3. $\sqrt[4]{127}$

Answer

a. ≈ 3.32
b. ≈ 4.14
c. ≈ 3.36

Exercise 17.2.12

Round to two decimal places:

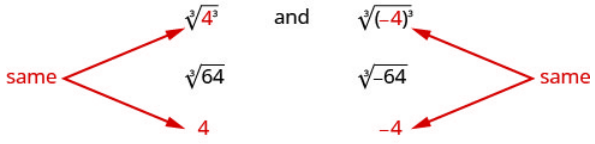
1. $\sqrt{13}$
2. $\sqrt[3]{84}$
3. $\sqrt[4]{98}$

Answer

a. ≈ 3.61
b. ≈ 4.38
c. ≈ 3.15

Simplify Variable Expressions with Roots

The odd root of a number can be either positive or negative. For example,

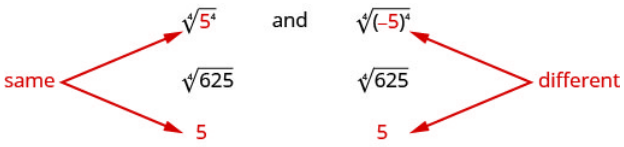


In either case, when n is odd, $\sqrt[n]{a^n} = a$.

Figure 8.1.13

But what about an even root? We want the principal root, so $\sqrt[4]{625} = 5$.

But notice,



Here we see that sometimes when n is even, $\sqrt[n]{a^n} \neq a$.

Figure 8.1.14

How can we make sure the fourth root of -5 raised to the fourth power is 5? We can use the absolute value. $|-5| = 5$. So we say that when n is even $\sqrt[n]{a^n} = |a|$. This guarantees the principal root is positive.

Definition 17.2.4: Simplifying Odd and Even Roots

For any integer $n \geq 2$,

$$\text{when the index } n \text{ is odd } \sqrt[n]{a^n} = a$$

$$\text{when the index } n \text{ is even } \sqrt[n]{a^n} = |a|$$

We must use the **absolute value** signs when we take an even root of an expression with a variable in the radical.

Example 17.2.7

Simplify:

a. $\sqrt{x^2}$
b. $\sqrt[3]{n^3}$
c. $\sqrt[4]{p^4}$
d. $\sqrt[5]{y^5}$

Solution:

a. We use the absolute value to be sure to get the positive root.

$$\sqrt{x^2}$$

Since the index n is even, $\sqrt[n]{a^n} = |a|$.

b. This is an odd indexed root so there is no need for an absolute value sign.

$$\sqrt[3]{m^3}$$

Since the index is n is odd, $\sqrt[n]{a^n} = a$.

$$m$$

c.

$$\sqrt[4]{p^4}$$

Since the index n is even $\sqrt[n]{a^n} = |a|$.

$$|p|$$

d.

$$\sqrt[5]{y^5}$$

Since the index n is odd, $\sqrt[n]{a^n} = a$.

$$y$$

Exercise 17.2.13

Simplify:

a. $\sqrt{b^2}$
b. $\sqrt[3]{w^3}$
c. $\sqrt[4]{m^4}$
d. $\sqrt[5]{q^5}$

Answer

a. $|b|$
b. w
c. $|m|$
d. q

Exercise 17.2.14

Simplify:

a. $\sqrt{y^2}$
b. $\sqrt[3]{p^3}$
c. $\sqrt[4]{z^4}$
d. $\sqrt[5]{q^5}$

Answer

a. $|y|$
b. p
c. $|z|$
d. q

What about square roots of higher powers of variables? The Power Property of Exponents says $(a^m)^n = a^{m \cdot n}$. So if we square a^m, the exponent will become $2m$.

$$(a^m)^2 = a^{2m}$$

Looking now at the square root.

$$\sqrt{a^{2m}}$$

Since $(a^m)^2 = a^{2m}$.

$$\sqrt{(a^m)^2}$$

Since n is even $\sqrt[n]{a^n} = |a|$.

$$|a^m|$$

So $\sqrt{a^{2m}} = |a^m|$.

We apply this concept in the next example.

Example 17.2.8

Simplify:

a. $\sqrt{x^6}$
b. $\sqrt{y^{16}}$

Solution:

a.

$$\sqrt{x^6}$$

Since $\left(x^3\right)^2 = x^6$.

$$\sqrt{(x^3)^2}$$

Since the index n is even $\sqrt{a^n} = |a|$.

$$|x^3|$$

b.

$$\sqrt{y^{16}}$$

Since $\left(y^8\right)^2 = y^{16}$.

$$\sqrt{(y^8)^2}$$

Since the index n is even $\sqrt[n]{a^n} = |a|$.

$$y^8$$

In this case the absolute value sign is not needed as y^8 is positive.

Exercise 17.2.15

Simplify:

a. $\sqrt{y^{18}}$
b. $\sqrt{z^{12}}$

Answer

a. $|y^9|$
b. z^6

Exercise 17.2.16

Simplify:

a. $\sqrt{m^4}$
b. $\sqrt{b^{10}}$

Answer

a. m^2
b. $|b^5|$

The next example uses the same idea for higher roots.

Example 17.2.9

Simplify:

a. $\sqrt[3]{y^{18}}$
b. $\sqrt[4]{z^8}$

Solution:

a.

$$\sqrt[3]{y^{18}}$$

Since $\left(y^6\right)^3 = y^{18}$.

$$\sqrt[3]{\left(y^6\right)^3}$$

Since n is odd, $\sqrt[n]{a^n} = a$.

$$y^6$$

b.

$$\sqrt[4]{z^8}$$

Since $\left(z^2\right)^4 = z^8$.

$$\sqrt[4]{\left(z^2\right)^4}$$

Since z^2 is positive, we do not need an absolute value sign.

$$z^2$$

Exercise 17.2.17

Simplify:

a. $\sqrt[4]{u^{12}}$
b. $\sqrt[3]{v^{15}}$

Answer

a. $|u^3|$
b. v^5

Exercise 17.2.18

Simplify:

a. $\sqrt[5]{c^{20}}$
b. $\sqrt[6]{d^{24}}$

Answer

a. c^4
b. d^4

In the next example, we now have a coefficient in front of the variable. The concept $\sqrt{a^{2m}} = |a^m|$ works in much the same way.

$$\sqrt{16r^{22}} = 4\left|r^{11}\right| \text{ because } \left(4r^{11}\right)^2 = 16r^{22}.$$

But notice $\sqrt{25u^8} = 5u^4$ and no absolute value sign is needed as u^4 is always positive.

Example 17.2.10

Simplify:

a. $\sqrt{16n^2}$
b. $-\sqrt{81c^2}$

Solution:

a.

$$\sqrt{16n^2}$$

Since $(4n)^2 = 16n^2$.

$$\sqrt{(4n)^2}$$

Since the index n is even $\sqrt[n]{a^n} = |a|$.

$$4|n|$$

b.

$$-\sqrt{81c^2}$$

Since $(9c)^2 = 81c^2$.

$$-\sqrt{(9c)^2}$$

Since the index n is even $\sqrt[n]{a^n} = |a|$.

$$-9|c|$$

Exercise 17.2.19

Simplify:

a. $\sqrt{64x^2}$
b. $-\sqrt{100p^2}$

Answer

a. $8|x|$
b. $-10|p|$

Exercise 17.2.20

Simplify:

a. $\sqrt{169y^2}$
b. $-\sqrt{121y^2}$

Answer

a. $13|y|$
b. $-11|y|$

This example just takes the idea farther as it has roots of higher index.

Example 17.2.11

Simplify:

a. $\sqrt[3]{64p^6}$
b. $\sqrt[4]{16q^{12}}$

Solution:

a.

$$\sqrt[3]{64p^6}$$

Rewrite $64p^6$ as $\left(4p^2\right)^3$.

$$\sqrt[3]{\left(4p^2\right)^3}$$

Take the cube root.

$$4p^2$$

b.

$$\sqrt[4]{16q^{12}}$$

Rewrite the radicand as a fourth power.

$$\sqrt[4]{\left(2q^3\right)^4}$$

Take the fourth root.

$$2|q^3|$$

Exercise 17.2.21

Simplify:

a. $\sqrt[3]{27x^{27}}$
b. $\sqrt[4]{81q^{28}}$

Answer

a. $3x^9$
b. $3|q^7|$

Exercise 17.2.22

Simplify:

a. $\sqrt[3]{125q^9}$
b. $\sqrt[5]{243q^{25}}$

Answer

a. $5p^3$
b. $3q^5$

The next examples have two variables.

Example 17.2.12

Simplify:

a. $\sqrt{36x^2y^2}$
b. $\sqrt{121a^6b^8}$
c. $\sqrt[3]{64p^{63}q^9}$

Solution:

a.

$$\sqrt{36x^2y^2}$$

Since $(6xy)^2 = 36x^2y^2$

$$\sqrt{(6xy)^2}$$

Take the square root.

$$6|xy|$$

b.

$$\sqrt{121a^6b^8}$$

Since $\left(11a^3b^4\right)^2 = 121a^6b^8$

$$\sqrt{\left(11a^3b^4\right)^2}$$

Take the square root.

$$11\left|a^3\right|b^4$$

c.

$$\sqrt[3]{64p^{63}q^9}$$

Since $\left(4p^{21}q^3\right)^3 = 64p^{63}q^9$

$$\sqrt[3]{(4p^{21}q^3)^3}$$

Take the cube root.

$$4p^{21}q^3$$

Exercise 17.2.23

Simplify:

a. $\sqrt{100a^2b^2}$
b. $\sqrt{144p^{12}q^{20}}$
c. $\sqrt[3]{8x^{30}y^{12}}$

Answer

a. $10|ab|$
b. $12p^6q^{10}$
c. $2x^{10}y^4$

Exercise 17.2.24

Simplify:

a. $\sqrt{225m^2n^2}$
b. $\sqrt{169x^{10}y^{14}}$
c. $\sqrt[3]{27w^{36}z^{15}}$

Answer

a. $15|mn|$
b. $13\,|x^5y^7|$
c. $3w^{12}z^5$

Access this online resource for additional instruction and practice with simplifying expressions with roots.

- Simplifying Variables Exponents with Roots using Absolute Values

Key Concepts

- **Square Root Notation**
  - $\sqrt{m}$ is read 'the square root of m'
  - If $n^2 = m$, then $n = \sqrt{m}$, for $n \geq 0$.

    Figure 8.1.1
  - The square root of m, $\sqrt{m}$, is a positive number whose square is m.
- **n^{th} Root of a Number**
  - If $b^n = a$, then b is an n^{th} root of a.
  - The principal n^{th} root of a is written $\sqrt[n]{a}$.
  - n is called the *index* of the radical.
- **Properties of $\sqrt[n]{a}$**
  - When n is an even number and
    - $a \geq 0$, then $\sqrt[n]{a}$ is a real number
    - $a < 0$, then $\sqrt[n]{a}$ is not a real number
  - When n is an odd number, $\sqrt[n]{a}$ is a real number for all values of a.
- **Simplifying Odd and Even Roots**

- For any integer $n \geq 2$,
  - when n is odd $\sqrt[n]{a^n} = a$
  - when n is even $\sqrt[n]{a^n} = |a|$
- We must use the absolute value signs when we take an even root of an expression with a variable in the radical.

Glossary

square of a number

If $n^2 = m$, then m is the square of n.

square root of a number

If $n^2 = m$, then n is a square root of m.

17.2E: Exercises

Simplifying Expressions with Roots

In the following exercises, simplify.

1. a. $\sqrt{64}$ b. $-\sqrt{81}$

Answer

a. 8 b. -9

2. a. $\sqrt{169}$ b. $-\sqrt{100}$

3. a. $\sqrt{196}$ b. $-\sqrt{1}$

Answer

a. 14 b. -1

4. a. $\sqrt{144}$ b. $-\sqrt{121}$

5. a. $\sqrt{\frac{4}{9}}$ b. $-\sqrt{0.01}$

Answer

a. $\frac{2}{3}$ b. -0.1

6. a. $\sqrt{\frac{64}{121}}$ b. $-\sqrt{0.16}$

7. a. $\sqrt{-121}$ b. $-\sqrt{289}$

Answer

a. not a real number b. -17

8. a. $-\sqrt{400}$ b. $\sqrt{-36}$

9. a. $-\sqrt{225}$ b. $\sqrt{-9}$

Answer

a. -15 b. not a real number

10. a. $\sqrt{-49}$ b. $-\sqrt{256}$

11. a. $\sqrt[3]{216}$ b. $\sqrt[4]{256}$

Answer

a. 6 b. 4

12. a. $\sqrt[3]{27}$ b. $\sqrt[4]{16}$ c. $\sqrt[5]{243}$

13. a. $\sqrt[3]{512}$ b. $\sqrt[4]{81}$ c. $\sqrt[5]{1}$

Answer

a. 8 b. 3 b. 1

14. a. $\sqrt[3]{125}$ b. $\sqrt[4]{1296}$ c. $\sqrt[5]{1024}$

15. a. $\sqrt[3]{-8}$ b. $\sqrt[4]{-81}$ c. $\sqrt[5]{-32}$

Answer

a. -2 b. not a real number c. -2

16. a. $\sqrt[3]{-64}$ b. $\sqrt[4]{-16}$ c. $\sqrt[5]{-243}$

17. a. $\sqrt[3]{-125}$ b. $\sqrt[4]{-1296}$ c. $\sqrt[5]{-1024}$

Answer

a. -5 b. not a real number c. -4

18. a. $\sqrt[3]{-512}$ b. $\sqrt[4]{-81}$ c. $\sqrt[5]{-1}$

In the following exercises, estimate each root by giving the interval of two consecutive whole numbers in which the root lies.

19. a. $\sqrt{70}$ b. $\sqrt[3]{71}$

Answer

a. $8 < \sqrt{70} < 9$ b. $4 < \sqrt[3]{71} < 5$

20. a. $\sqrt{55}$ b. $\sqrt[3]{119}$

21. a. $\sqrt{200}$ b. $\sqrt[3]{137}$

Answer

a. $14 < \sqrt{200} < 15$ b. $5 < \sqrt[3]{137} < 6$

22. a. $\sqrt{172}$ b. $\sqrt[3]{200}$

In the following exercises, approximate each root and round to two decimal places.

23. a. $\sqrt{19}$ b. $\sqrt[3]{89}$ c. $\sqrt[4]{97}$

Answer

a. ≈ 4.36 b. ≈ 4.46 c. ≈ 3.14

24. a. $\sqrt{21}$ b. $\sqrt[3]{93}$ c. $\sqrt[4]{101}$

25. a. $\sqrt{53}$ b. $\sqrt[3]{147}$ c. $\sqrt[4]{452}$

Answer

a. ≈ 7.28 b. ≈ 5.28 c. ≈ 4.61

26. a. $\sqrt{47}$ b. $\sqrt[3]{163}$ c. $\sqrt[4]{527}$

Simplify Variable Expressions with Roots

In the following exercises, simplify using absolute values as necessary.

27. a. $\sqrt[5]{u^5}$ b. $\sqrt[8]{v^8}$

Answer

a. u b. $|v|$

28. a. $\sqrt[3]{a^3}$ b. $\sqrt[9]{b^9}$

29. a. $\sqrt[4]{y^4}$ b. $\sqrt[7]{m^7}$

Answer

a. $|y|$ b. m

30. a. $\sqrt[8]{k^8}$ b. $\sqrt[6]{p^6}$

31. a. $\sqrt{x^6}$ b. $\sqrt{y^{16}}$

Answer

a. $|x^3|$ b. y^8

32. a. $\sqrt{a^{14}}$ b. $\sqrt{w^{24}}$

33. a. $\sqrt{x^{24}}$ b. $\sqrt{y^{22}}$

Answer

a. x^{12} b. $|y^{11}|$

34. a. $\sqrt{a^{12}}$ b. $\sqrt{b^{26}}$

35. a. $\sqrt[3]{x^9}$ b. $\sqrt[4]{y^{12}}$

Answer

a. x^3 b. $|y^3|$

36. a. $\sqrt[5]{a^{10}}$ b. $\sqrt[3]{b^{27}}$

37. a. $\sqrt[4]{m^8}$ b. $\sqrt[5]{n^{20}}$

Answer

a. m^2 b. n^4

38. a. $\sqrt[6]{r^{12}}$ b. $\sqrt[3]{s^{30}}$

39. a. $\sqrt{49x^2}$ b. $-\sqrt{81x^{18}}$

Answer

a. $7|x|$ b. $-9|x^9|$

40. a. $\sqrt{100y^2}$ b. $-\sqrt{100m^{32}}$

41. a. $\sqrt{121m^{20}}$ b. $-\sqrt{64a^2}$

Answer

a. $11m^{10}$ b. $-8|a|$

42. a. $\sqrt{81x^{36}}$ b. $-\sqrt{25x^2}$

43. a. $\sqrt[4]{16x^8}$ b. $\sqrt[6]{64y^{12}}$

Answer

a. $2x^2$ b. $2y^2$

44. a. $\sqrt[3]{-8c^9}$ b. $\sqrt[3]{125d^{15}}$

45. a. $\sqrt[3]{216a^6}$ b. $\sqrt[5]{32b^{20}}$

Answer

a. $6a^2$ b. $2b^4$

46. a. $\sqrt[7]{128r^{14}}$ b. $\sqrt[4]{81s^{24}}$

47. a. $\sqrt{144x^2y^2}$ b. $\sqrt{169w^8y^{10}}$ c. $\sqrt[3]{8a^{51}b^6}$

Answer

a. $12|xy|$ b. $13w^4\,|y^5|$ c. $2a^{17}b^2$

48. a. $\sqrt{196a^2b^2}$ b. $\sqrt{81p^{24}q^6}$ c. $\sqrt[3]{27p^{45}q^9}$

49. a. $\sqrt{121a^2b^2}$ b. $\sqrt{9c^8d^{12}}$ c. $\sqrt[3]{64x^{15}y^{66}}$

Answer

a. $11|ab|$ b. $3c^4d^6$ c. $4x^5y^{22}$

50. a. $\sqrt{225x^2y^2z^2}$ b. $\sqrt{36r^6s^{20}}$ c. $\sqrt[3]{125y^{18}z^{27}}$

Writing Exercises

51. Why is there no real number equal to $\sqrt{-64}$?

Answer

Since the square of any real number is positive, it's not possible for a real number to square to -64.

52. What is the difference between 9^2 and $\sqrt{9}$?

53. Explain what is meant by the n^{th} root of a number.

Answer

If you raise this root to the n^{th} power, it will give you back the original number (under the radical).

54. Explain the difference of finding the n^{th} root of a number when the index is even compared to when the index is odd.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with roots.			
estimate and approximate roots.			
simplify variable expressions with roots.			

b. If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

17.3: Simplify Radical Expressions

Learning Objectives

By the end of this section, you will be able to:

- Use the Product Property to simplify radical expressions
- Use the Quotient Property to simplify radical expressions

Before you get started, take this readiness quiz.

1. Simplify: $\frac{x^9}{x^4}$.
   If you missed this problem, review Example 5.13.
2. Simplify: $\frac{y^3}{y^{11}}$.
   If you missed this problem, review Example 5.13.
3. Simplify: $\left(n^2\right)^6$.
   If you missed this problem, review Example 5.17.

Use the Product Property to Simplify Radical Expressions

We will simplify radical expressions in a way similar to how we simplified fractions. A fraction is simplified if there are no common factors in the numerator and denominator. To simplify a fraction, we look for any common factors in the numerator and denominator.

A **radical expression**, $\sqrt[n]{a}$, is considered simplified if it has no factors of m^n. So, to simplify a radical expression, we look for any factors in the radicand that are powers of the index.

Definition 17.3.1: Simplified Radical Expression

For real numbers a and m, and $n \geq 2$,

$\sqrt[n]{a}$ is considered simplified if a has no factors of m^n

For example, $\sqrt{5}$ is considered simplified because there are no perfect square factors in 5. But $\sqrt{12}$ is not simplified because 12 has a perfect square factor of 4.

Similarly, $\sqrt[3]{4}$ is simplified because there are no perfect cube factors in 4. But $\sqrt[3]{24}$ is not simplified because 24 has a perfect cube factor of 8.

To simplify radical expressions, we will also use some properties of roots. The properties we will use to simplify radical expressions are similar to the properties of exponents. We know that

$$(ab)^n = a^n b^n. \tag{17.3.1}$$

The corresponding of **Product Property of Roots** says that

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}. \tag{17.3.2}$$

Definition 17.3.2: Product Property of n^{th} Roots

If $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers, and $n \geq 2$ is an integer, then

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b} \quad \text{and} \quad \sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$$

We use the Product Property of Roots to remove all perfect square factors from a square root.

Example 17.3.1: Simplify square roots using the product property of roots

Simplify: $\sqrt{98}$.

Solution:

Step 1: Find the largest factor in the radicand that is a perfect power of the index.	We see that 49 is the largest factor of 98 that has a power of 2.	$\sqrt{98}$
Rewrite the radicand as a product of two factors, using that factor.	In other words 49 is the largest perfect square factor of 98. $98 = 49 \cdot 2$ Always write the perfect square factor first.	$\sqrt{49 \cdot 2}$
Step 2: Use the product rule to rewrite the radical as the product of two radicals.		$\sqrt{49} \cdot \sqrt{2}$
Step 3: Simplify the root of the perfect power.		$7\sqrt{2}$

Try It 17.3.1

Simplify: $\sqrt{48}$

Answer

$4\sqrt{3}$

Try It 17.3.2

Simplify: $\sqrt{45}$.

Answer

$3\sqrt{5}$

Notice in the previous example that the simplified form of $\sqrt{98}$ is $7\sqrt{2}$, which is the product of an integer and a square root. We always write the integer in front of the square root.

Be careful to write your integer so that it is not confused with the index. The expression $7\sqrt{2}$ is very different from $\sqrt[7]{2}$.

Simplify a Radical Expression Using the Product Property

1. Find the largest factor in the radicand that is a perfect power of the index. Rewrite the radicand as a product of two factors, using that factor.
2. Use the product rule to rewrite the radical as the product of two radicals.
3. Simplify the root of the perfect power.

We will apply this method in the next example. It may be helpful to have a table of perfect squares, cubes, and fourth powers.

Example 17.3.2

Simplify:

a. $\sqrt{500}$
b. $\sqrt[3]{16}$

c. $\sqrt[4]{243}$

Solution:

a.

$$\sqrt{500}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$\sqrt{100 \cdot 5}$$

Rewrite the radical as the product of two radicals.

$$\sqrt{100} \cdot \sqrt{5}$$

Simplify.

$$10\sqrt{5}$$

b.

$$\sqrt[3]{16}$$

Rewrite the radicand as a product using the greatest perfect cube factor. $2^3 = 8$

$$\sqrt[3]{8 \cdot 2}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[3]{8} \cdot \sqrt[3]{2}$$

Simplify.

$$2\sqrt[3]{2}$$

c.

$$\sqrt[4]{243}$$

Rewrite the radicand as a product using the greatest perfect fourth power factor. $3^4 = 81$

$$\sqrt[4]{81 \cdot 3}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[4]{81} \cdot \sqrt[4]{3}$$

Simplify.

$$3\sqrt[4]{3}$$

? Try It 17.3.3

Simplify: a. $\sqrt{288}$ b. $\sqrt[3]{81}$ c. $\sqrt[4]{64}$

Answer

a. $12\sqrt{2}$ b. $3\sqrt[3]{3}$ c. $2\sqrt[4]{4}$

? Try It 17.3.4

Simplify: a. $\sqrt{432}$ b. $\sqrt[3]{625}$ c. $\sqrt[4]{729}$

Answer

a. $12\sqrt{3}$ b. $5\sqrt[3]{5}$ c. $3\sqrt[4]{9}$

The next example is much like the previous examples, but with variables. Don't forget to use the absolute value signs when taking an even root of an expression with a variable in the radical.

Example 17.3.3

Simplify:

a. $\sqrt{x^3}$
b. $\sqrt[3]{x^4}$
c. $\sqrt[4]{x^7}$

Solution:

a.

$$\sqrt{x^3}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$\sqrt{x^2 \cdot x}$$

Rewrite the radical as the product of two radicals.

$$\sqrt{x^2} \cdot \sqrt{x}$$

Simplify.

$$|x|\sqrt{x}$$

b.

$$\sqrt[3]{x^4}$$

Rewrite the radicand as a product using the largest perfect cube factor.

$$\sqrt[3]{x^3 \cdot x}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[3]{x^3} \cdot \sqrt[3]{x}$$

Simplify.

$$x\sqrt[3]{x}$$

c.

$$\sqrt[4]{x^7}$$

Rewrite the radicand as a product using the greatest perfect fourth power factor.

$$\sqrt[4]{x^4 \cdot x^3}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[4]{x^4} \cdot \sqrt[4]{x^3}$$

Simplify.

$$|x|\sqrt[4]{x^3}$$

Try It 17.3.5

Simplify: a. $\sqrt{b^5}$ b. $\sqrt[4]{y^6}$ c. $\sqrt[3]{z^5}$

Answer

a. $b^2\sqrt{b}$ b. $|y|\sqrt[4]{y^2}$ c. $z\sqrt[3]{z^2}$

Try It 17.3.6

Simplify: a. $\sqrt{p^9}$ b. $\sqrt[5]{y^8}$ c. $\sqrt[6]{q^{13}}$

Answer

a. $p^4\sqrt{p}$ b. $p\sqrt[5]{p^3}$ c. $q^2\sqrt[6]{q}$

We follow the same procedure when there is a coefficient in the radicand. In the next example, both the constant and the variable have perfect square factors.

Example 17.3.4

Simplify:

a. $\sqrt{72n^7}$
b. $\sqrt[3]{24x^7}$
c. $\sqrt[4]{80y^{14}}$

Solution:

a.

$$\sqrt{72n^7}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$\sqrt{36n^6 \cdot 2n}$$

Rewrite the radical as the product of two radicals.

$$\sqrt{36n^6} \cdot \sqrt{2n}$$

Simplify.

$$6\left|n^3\right|\sqrt{2n}$$

b.

$$\sqrt[3]{24x^7}$$

Rewrite the radicand as a product using perfect cube factors.

$$\sqrt[3]{8x^6 \cdot 3x}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[3]{8x^6} \cdot \sqrt[3]{3x}$$

Rewrite the first radicand as $\left(2x^2\right)^3$.

$$\sqrt[3]{\left(2x^2\right)^3} \cdot \sqrt[3]{3x}$$

Simplify.

$$2x^2\sqrt[3]{3x}$$

c.

$$\sqrt[4]{80y^{14}}$$

Rewrite the radicand as a product using perfect fourth power factors.

$$\sqrt[4]{16y^{12} \cdot 5y^2}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[4]{16y^{12}} \cdot \sqrt[4]{5y^2}$$

Rewrite the first radicand as $\left(2y^3\right)^4$.

$$\sqrt[4]{(2y^3)^4}\cdot\sqrt[4]{5y^2}$$

Simplify.

$$2\left|y^3\right|\sqrt[4]{5y^2}$$

Try It 17.3.7

Simplify: a. $\sqrt{32y^5}$ b. $\sqrt[3]{54p^{10}}$ c. $\sqrt[4]{64q^{10}}$

Answer

a. $4y^2\sqrt{2y}$ b. $3p^3\sqrt[3]{2p}$ c. $2q^2\sqrt[4]{4q^2}$

Try It 17.3.8

Simplify: a. $\sqrt{75a^9}$ b. $\sqrt[3]{128m^{11}}$ c. $\sqrt[4]{162n^7}$

Answer

a. $5a^4\sqrt{3a}$ b. $4m^3\sqrt[3]{2m^2}$ c. $3|n|\sqrt[4]{2n^3}$

In the next example, we continue to use the same methods even though there are more than one variable under the radical.

Example 17.3.5

Simplify:

a. $\sqrt{63u^3v^5}$
b. $\sqrt[3]{40x^4y^5}$
c. $\sqrt[4]{48x^4y^7}$

Solution:

a.

$$\sqrt{63u^3v^5}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$\sqrt{9u^2v^4\cdot 7uv}$$

Rewrite the radical as the product of two radicals.

$$\sqrt{9u^2v^4}\cdot\sqrt{7uv}$$

Rewrite the first radicand as $\left(3uv^2\right)^2$.

$$\sqrt{(3uv^2)^2}\cdot\sqrt{7uv}$$

Simplify.

$$3|u|v^2\sqrt{7uv}$$

b.

$$\sqrt[3]{40x^4y^5}$$

Rewrite the radicand as a product using the largest perfect cube factor.

$$\sqrt[3]{8x^3y^3\cdot 5xy^2}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[3]{8x^3y^3} \cdot \sqrt[3]{5xy^2}$$

Rewrite the first radicand as $(2xy)^3$.

$$\sqrt[3]{(2xy)^3} \cdot \sqrt[3]{5xy^2}$$

Simplify.

$$2xy\sqrt[3]{5xy^2}$$

c.

$$\sqrt[4]{48x^4y^7}$$

Rewrite the radicand as a product using the largest perfect fourth power factor.

$$\sqrt[4]{16x^4y^4 \cdot 3y^3}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[4]{16x^4y^4} \cdot \sqrt[4]{3y^3}$$

Rewrite the first radicand as $(2xy)^4$.

$$\sqrt[4]{(2xy)^4} \cdot \sqrt[4]{3y^3}$$

Simplify.

$$2|xy|\sqrt[4]{3y^3}$$

Try It 17.3.9

Simplify:

a. $\sqrt{98a^7b^5}$
b. $\sqrt[3]{56x^5y^4}$
c. $\sqrt[4]{32x^5y^8}$

Answer

a. $7|a^3|b^2\sqrt{2ab}$
b. $2xy\sqrt[3]{7x^2y}$
c. $2|x|y^2\sqrt[4]{2x}$

Try It 17.3.10

Simplify:

a. $\sqrt{180m^9n^{11}}$
b. $\sqrt[3]{72x^6y^5}$
c. $\sqrt[4]{80x^7y^4}$

Answer

a. $6m^4|n^5|\sqrt{5mn}$
b. $2x^2y\sqrt[3]{9y^2}$
c. $2|xy|\sqrt[4]{5x^3}$

Example 17.3.6

Simplify:

a. $\sqrt[3]{-27}$
b. $\sqrt[4]{-16}$

Solution:

a.

$$\sqrt[3]{-27}$$

Rewrite the radicand as a product using perfect cube factors.

$$\sqrt[3]{(-3)^3}$$

Take the cube root.

$$-3$$

b.

$$\sqrt[4]{-16}$$

There is no real number n where $n^4 = -16$.

Not a real number

Try It 17.3.11

Simplify:

a. $\sqrt[3]{-64}$
b. $\sqrt[4]{-81}$

Answer

a. -4
b. no real number

Try It 17.3.12

Simplify:

a. $\sqrt[3]{-625}$
b. $\sqrt[4]{-324}$

Answer

a. $-5\sqrt[3]{5}$
b. no real number

We have seen how to use the **order of operations** to simplify some expressions with radicals. In the next example, we have the sum of an integer and a square root. We simplify the square root but cannot add the resulting expression to the integer since one term contains a radical and the other does not. The next example also includes a fraction with a radical in the numerator. Remember that in order to simplify a fraction you need a common factor in the numerator and denominator.

Example 17.3.7

Simplify:

a. $3+\sqrt{32}$
b. $\dfrac{4-\sqrt{48}}{2}$

Solution:

a.

$$3+\sqrt{32}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$3+\sqrt{16\cdot 2}$$

Rewrite the radical as the product of two radicals.

$$3+\sqrt{16}\cdot\sqrt{2}$$

Simplify.

$$3+4\sqrt{2}$$

The terms cannot be added as one has a radical and the other does not. Trying to add an integer and a radical is like trying to add an integer and a variable. They are not like terms!

b.

$$\frac{4-\sqrt{48}}{2}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$\frac{4-\sqrt{16\cdot 3}}{2}$$

Rewrite the radical as the product of two radicals.

$$\frac{4-\sqrt{16}\cdot\sqrt{3}}{2}$$

Simplify.

$$\frac{4-4\sqrt{3}}{2}$$

Factor the common factor from the numerator.

$$\frac{4(1-\sqrt{3})}{2}$$

Remove the common factor, 2, from the numerator and denominator.

$$\frac{\cancel{2}\cdot 2(1-\sqrt{3})}{\cancel{2}}$$

Simplify.

$$2(1-\sqrt{3})$$

? Try It 17.3.13

Simplify:

a. $5+\sqrt{75}$

b. $\dfrac{10-\sqrt{75}}{5}$

Answer

a. $5+5\sqrt{3}$

b. $2-\sqrt{3}$

? Try It 17.3.14

Simplify:

a. $2+\sqrt{98}$

b. $\dfrac{6-\sqrt{45}}{3}$

Answer

a. $2+7\sqrt{2}$
b. $2-\sqrt{5}$

Use the Quotient Property to Simplify Radical Expressions

Whenever you have to simplify a radical expression, the first step you should take is to determine whether the radicand is a perfect power of the index. If not, check the numerator and denominator for any common factors, and remove them. You may find a fraction in which both the numerator and the denominator are perfect powers of the index.

Example 17.3.8

Simplify:

a. $\sqrt{\dfrac{45}{80}}$
b. $\sqrt[3]{\dfrac{16}{54}}$
c. $\sqrt[4]{\dfrac{5}{80}}$

Solution:

a.

$$\sqrt{\frac{45}{80}}$$

Simplify inside the radical first. Rewrite showing the common factors of the numerator and denominator.

$$\sqrt{\frac{5\cdot 9}{5\cdot 16}}$$

Simplify the fraction by removing common factors.

$$\sqrt{\frac{9}{16}}$$

Simplify. Note $\left(\dfrac{3}{4}\right)^2=\dfrac{9}{16}$.

$$\frac{3}{4}$$

b.

$$\sqrt[3]{\frac{16}{54}}$$

Simplify inside the radical first. Rewrite showing the common factors of the numerator and denominator.

$$\sqrt[3]{\frac{2\cdot 8}{2\cdot 27}}$$

Simplify the fraction by removing common factors.

$$\sqrt[3]{\frac{8}{27}}$$

Simplify. Note $\left(\dfrac{2}{3}\right)^3=\dfrac{8}{27}$.

$$\frac{2}{3}$$

c.

$$\sqrt[4]{\frac{5}{80}}$$

Simplify inside the radical first. Rewrite showing the common factors of the numerator and denominator.

$$\sqrt[4]{\frac{5 \cdot 1}{5 \cdot 16}}$$

Simplify the fraction by removing common factors.

$$\sqrt[4]{\frac{1}{16}}$$

Simplify. Note $\left(\frac{1}{2}\right)^4 = \frac{1}{16}$.

$$\frac{1}{2}$$

? Try It 17.3.15

Simplify:

a. $\sqrt{\frac{75}{48}}$

b. $\sqrt[3]{\frac{54}{250}}$

c. $\sqrt[4]{\frac{32}{162}}$

Answer

a. $\frac{5}{4}$

b. $\frac{3}{5}$

c. $\frac{2}{3}$

? Try It 17.3.16

Simplify:

a. $\sqrt{\frac{98}{162}}$

b. $\sqrt[3]{\frac{24}{375}}$

c. $\sqrt[4]{\frac{4}{324}}$

Answer

a. $\frac{7}{9}$

b. $\frac{2}{5}$

c. $\frac{1}{3}$

In the last example, our first step was to simplify the fraction under the radical by removing common factors. In the next example we will use the **Quotient Property** to simplify under the radical. We divide the like bases by subtracting their exponents,

$$\frac{a^m}{a^n} = a^{m-n}, \quad a \neq 0$$

Example 17.3.9

Simplify:

a. $\sqrt{\frac{m^6}{m^4}}$

b. $\sqrt[3]{\frac{a^8}{a^5}}$

c. $\sqrt[4]{\frac{a^{10}}{a^2}}$

Solution:

a.

$$\sqrt{\frac{m^6}{m^4}}$$

Simplify the fraction inside the radical first. Divide the like bases by subtracting the exponents.

$$\sqrt{m^2}$$

Simplify.

$$|m|$$

b.

$$\sqrt[3]{\frac{a^8}{a^5}}$$

Use the Quotient Property of exponents to simplify the fraction under the radical first.

$$\sqrt[3]{a^3}$$

Simplify.

$$a$$

c.

$$\sqrt[4]{\frac{a^{10}}{a^2}}$$

Use the Quotient Property of exponents to simplify the fraction under the radical first.

$$\sqrt[4]{a^8}$$

Rewrite the radicand using perfect fourth power factors.

$$\sqrt[4]{(a^2)^4}$$

Simplify.

$$a^2$$

Try It 17.3.17

Simplify:

a. $\sqrt{\frac{a^8}{a^6}}$
b. $\sqrt[4]{\frac{x^7}{x^3}}$
c. $\sqrt[4]{\frac{y^{17}}{y^5}}$

Answer

a. $|a|$
b. $|x|$
c. y^3

Try It 17.3.18

Simplify:

a. $\sqrt{\frac{x^{14}}{x^{10}}}$
b. $\sqrt[3]{\frac{m^{13}}{m^7}}$
c. $\sqrt[5]{\frac{n^{12}}{n^2}}$

Answer

a. x^2
b. m^2
c. n^2

Remember the **Quotient to a Power Property**? It said we could raise a fraction to a power by raising the numerator and denominator to the power separately.

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$$

Definition 17.3.3

Quotient Property of Radical Expressions

If $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers, $b \neq 0$, and for any integer $n \geq 2$ then,

$$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}} \text{ and } \frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$$

Example 17.3.10 how to simplify the quotient of radical expressions

Simplify: $\sqrt{\frac{27m^3}{196}}$

Solution:

Step 1: Simplify the fraction in the radicand, if possible.

$\frac{27m^3}{196}$ cannot be simplified.

$$\sqrt{\frac{27m^3}{196}}$$

Step 2: Use the Quotient Property to rewrite the radical as the quotient of two radicals.

We rewrite $\sqrt{\frac{27m^3}{196}}$ as the quotient of $\sqrt{27m^3}$ and $\sqrt{196}$.

$$\frac{\sqrt{27m^3}}{\sqrt{196}}$$

Step 3: Simplify the radicals in the numerator and the denominator.

$9m^2$ and 196 are perfect squares.

$$\frac{\sqrt{9m^2}\cdot\sqrt{3m}}{\sqrt{196}}$$

$$\frac{3m\sqrt{3m}}{14}$$

? Try It 17.3.19

Simplify: $\sqrt{\frac{24p^3}{49}}$.

Answer

$$\frac{2|p|\sqrt{6p}}{7}$$

? Try It 17.3.20

Simplify: $\sqrt{\frac{48x^5}{100}}$.

Answer

$$\frac{2x^2\sqrt{3x}}{5}$$

Simplify a Square Root Using the Quotient Property

1. Simplify the fraction in the radicand, if possible.
2. Use the Quotient Property to rewrite the radical as the quotient of two radicals.
3. Simplify the radicals in the numerator and the denominator.

✓ Example 17.3.11

Simplify:

a. $\sqrt{\frac{45x^5}{y^4}}$

b. $\sqrt[3]{\frac{24x^7}{y^3}}$

c. $\sqrt[4]{\frac{48x^{10}}{y^8}}$

Solution:

a.

$$\sqrt{\frac{45x^5}{y^4}}$$

We cannot simplify the fraction in the radicand. Rewrite using the Quotient Property.

$$\frac{\sqrt{45x^5}}{\sqrt{y^4}}$$

Simplify the radicals in the numerator and the denominator.

$$\frac{\sqrt{9x^4}\cdot\sqrt{5x}}{y^2}$$

Simplify.

$$\frac{3x^2\sqrt{5x}}{y^2}$$

b.

$$\sqrt[3]{\frac{24x^7}{y^3}}$$

The fraction in the radicand cannot be simplified. Use the Quotient Property to write as two radicals.

$$\frac{\sqrt[3]{24x^7}}{\sqrt[3]{y^3}}$$

Rewrite each radicand as a product using perfect cube factors.

$$\frac{\sqrt[3]{8x^6\cdot 3x}}{\sqrt[3]{y^3}}$$

Rewrite the numerator as the product of two radicals.

$$\frac{\sqrt[3]{(2x^2)^3}\cdot\sqrt[3]{3x}}{\sqrt[3]{y^3}}$$

Simplify.

$$\frac{2x^2\sqrt[3]{3x}}{y}$$

c.

$$\sqrt[4]{\frac{48x^{10}}{y^8}}$$

The fraction in the radicand cannot be simplified.

$$\frac{\sqrt[4]{48x^{10}}}{\sqrt[4]{y^8}}$$

Use the Quotient Property to write as two radicals. Rewrite each radicand as a product using perfect fourth power factors.

$$\frac{\sqrt[4]{16x^8\cdot 3x^2}}{\sqrt[4]{y^8}}$$

Rewrite the numerator as the product of two radicals.

$$\frac{\sqrt[4]{(2x^2)^4}\cdot\sqrt[4]{3x^2}}{\sqrt[4]{(y^2)^4}}$$

Simplify.

$$\frac{2x^2\sqrt[4]{3x^2}}{y^2}$$

Try It 17.3.21

Simplify:

a. $\sqrt{\frac{80m^3}{n^6}}$

b. $\sqrt[3]{\frac{108c^{10}}{d^6}}$

c. $\sqrt[4]{\frac{80x^{10}}{y^4}}$

Answer

a. $\frac{4|m|\sqrt{5m}}{|n^3|}$

b. $\frac{3c^3\sqrt[3]{4c}}{d^2}$

c. $\frac{2x^2\sqrt[4]{5x^2}}{|y|}$

Try It 17.3.22

Simplify:

a. $\sqrt{\frac{54u^7}{v^8}}$

b. $\sqrt[3]{\frac{40r^3}{s^6}}$

c. $\sqrt[4]{\frac{162m^{14}}{n^{12}}}$

Answer

a. $\frac{3u^3\sqrt{6u}}{v^4}$

b. $\frac{2r\sqrt[3]{5}}{s^2}$

c. $\frac{3\left|m^3\right|\sqrt[4]{2m^2}}{|n^3|}$

Be sure to simplify the fraction in the radicand first, if possible.

Example 17.3.12

Simplify:

a. $\sqrt{\frac{18p^5q^7}{32pq^2}}$

b. $\sqrt[3]{\frac{16x^5y^7}{54x^2y^2}}$

c. $\sqrt[4]{\frac{5a^8b^6}{80a^3b^2}}$

Solution:

a.

$$\sqrt{\frac{18p^5q^7}{32pq^2}}$$

Simplify the fraction in the radicand, if possible.

$$\sqrt{\frac{9p^4q^5}{16}}$$

Rewrite using the Quotient Property.

$$\frac{\sqrt{9p^4q^5}}{\sqrt{16}}$$

Simplify the radicals in the numerator and the denominator.

$$\frac{\sqrt{9p^4q^4}\cdot\sqrt{q}}{4}$$

Simplify.

$$\frac{3p^2q^2\sqrt{q}}{4}$$

b.

$$\sqrt[3]{\frac{16x^5y^7}{54x^2y^2}}$$

Simplify the fraction in the radicand, if possible.

$$\sqrt[3]{\frac{8x^3y^5}{27}}$$

Rewrite using the Quotient Property.

$$\frac{\sqrt[3]{8x^3y^5}}{\sqrt[3]{27}}$$

Simplify the radicals in the numerator and the denominator.

$$\frac{\sqrt[3]{8x^3y^3}\cdot\sqrt[3]{y^2}}{\sqrt[3]{27}}$$

Simplify.

$$\frac{2xy\sqrt[3]{y^2}}{3}$$

c.

$$\sqrt[4]{\frac{5a^8b^6}{80a^3b^2}}$$

Simplify the fraction in the radicand, if possible.

$$\sqrt[4]{\frac{a^5b^4}{16}}$$

Rewrite using the Quotient Property.

$$\frac{\sqrt[4]{a^5b^4}}{\sqrt[4]{16}}$$

Simplify the radicals in the numerator and the denominator.

$$\frac{\sqrt[4]{a^4b^4}\cdot\sqrt[4]{a}}{\sqrt[4]{16}}$$

Simplify.

$$\frac{|ab|\sqrt[4]{a}}{2}$$

? Try It 17.3.23

Simplify:

a. $\sqrt{\frac{50x^5y^3}{72x^4y}}$

b. $\sqrt[3]{\frac{16x^5y^7}{54x^2y^2}}$

c. $\sqrt[4]{\frac{5a^8b^6}{80a^3b^2}}$

Answer

a. $\frac{5|y|\sqrt{x}}{6}$

b. $\frac{2xy\sqrt[3]{y^2}}{3}$

c. $\frac{|ab|\sqrt[4]{a}}{2}$

? Try It 17.3.24

Simplify:

a. $\sqrt{\frac{48m^7n^2}{100m^5n^8}}$

b. $\sqrt[3]{\frac{54x^7y^5}{250x^2y^2}}$

c. $\sqrt[4]{\frac{32a^9b^7}{162a^3b^3}}$

Answer

a. $\frac{2|m|\sqrt{3}}{5\,|n^3|}$

b. $\frac{3xy\sqrt[3]{x^2}}{5}$

c. $\frac{2|ab|\sqrt[4]{a^2}}{3}$

In the next example, there is nothing to simplify in the denominators. Since the index on the radicals is the same, we can use the **Quotient Property** again, to combine them into one radical. We will then look to see if we can simplify the expression.

Example 17.3.13

Simplify:

a. $\dfrac{\sqrt{48a^7}}{\sqrt{3a}}$

b. $\dfrac{\sqrt[3]{-108}}{\sqrt[3]{2}}$

c. $\dfrac{\sqrt[4]{96x^7}}{\sqrt[4]{3x^2}}$

Solution:

a.

$$\frac{\sqrt{48a^7}}{\sqrt{3a}}$$

The denominator cannot be simplified, so use the Quotient Property to write as one radical.

$$\sqrt{\frac{48a^7}{3a}}$$

Simplify the fraction under the radical.

$$\sqrt{16a^6}$$

Simplify.

$$4\left|a^3\right|$$

b.

$$\frac{\sqrt[3]{-108}}{\sqrt[3]{2}}$$

The denominator cannot be simplified, so use the Quotient Property to write as one radical.

$$\sqrt[3]{\frac{-108}{2}}$$

Simplify the fraction under the radical.

$$\sqrt[3]{-54}$$

Rewrite the radicand as a product using perfect cube factors.

$$\sqrt[3]{(-3)^3\cdot 2}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[3]{(-3)^3}\cdot\sqrt[3]{2}$$

Simplify.

$$-3\sqrt[3]{2}$$

c.

$$\frac{\sqrt[4]{96x^7}}{\sqrt[4]{3x^2}}$$

The denominator cannot be simplified, so use the Quotient Property to write as one radical.

$$\sqrt[4]{\frac{96x^7}{3x^2}}$$

Simplify the fraction under the radical.

$$\sqrt[4]{32x^5}$$

Rewrite the radicand as a product using perfect fourth power factors.

$$\sqrt[4]{16x^4}\cdot\sqrt[4]{2x}$$

Rewrite the radical as the product of two radicals.

$$\sqrt[4]{(2x)^4}\cdot\sqrt[4]{2x}$$

Simplify.

$$2|x|\sqrt[4]{2x}$$

? Try It 17.3.25

Simplify:

a. $\dfrac{\sqrt{98z^5}}{\sqrt{2z}}$

b. $\dfrac{\sqrt[3]{-500}}{\sqrt[3]{2}}$

c. $\dfrac{\sqrt[4]{486m^{11}}}{\sqrt[4]{3m^5}}$

Answer

a. $7z^2$

b. $-5\sqrt[3]{2}$

c. $3|m|\sqrt[4]{2m^2}$

? Try It 17.3.26

Simplify:

a. $\dfrac{\sqrt{128m^9}}{\sqrt{2m}}$

b. $\dfrac{\sqrt[3]{-192}}{\sqrt[3]{3}}$

c. $\dfrac{\sqrt[4]{324n^7}}{\sqrt[4]{2n^3}}$

Answer

a. $8m^4$

b. -4

c. $3|n|\sqrt[4]{2}$

Access these online resources for additional instruction and practice with simplifying radical expressions.

- Simplifying Square Root and Cube Root with Variables
- Express a Radical in Simplified Form-Square and Cube Roots with Variables and Exponents
- Simplifying Cube Roots

Key Concepts

- **Simplified Radical Expression**
  - For real numbers a, m and $n \geq 2$
    $\sqrt[n]{a}$ is considered simplified if a has no factors of m^n
- **Product Property of n^{th} Roots**

- For any real numbers, $\sqrt[n]{a}$ and $\sqrt[n]{b}$, and for any integer $n \geq 2$
  $\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}$ and $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$

- **How to simplify a radical expression using the Product Property**
  1. Find the largest factor in the radicand that is a perfect power of the index.
     Rewrite the radicand as a product of two factors, using that factor.
  2. Use the product rule to rewrite the radical as the product of two radicals.
  3. Simplify the root of the perfect power.

- **Quotient Property of Radical Expressions**
  - If $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers, $b \neq 0$, and for any integer $n \geq 2$ then, $\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}$ and $\frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$

- **How to simplify a radical expression using the Quotient Property.**
  1. Simplify the fraction in the radicand, if possible.
  2. Use the Quotient Property to rewrite the radical as the quotient of two radicals.
  3. Simplify the radicals in the numerator and the denominator.

17.3E: Exercises

Practice Makes Perfect

Exercise SET A: use the product property to simplify radical expressions

In the following exercises, use the Product Property to simplify radical expressions.

1. $\sqrt{27}$
2. $\sqrt{80}$
3. $\sqrt{125}$
4. $\sqrt{96}$
5. $\sqrt{147}$
6. $\sqrt{450}$
7. $\sqrt{800}$
8. $\sqrt{675}$
9. a. $\sqrt[4]{32}$
   b. $\sqrt[5]{64}$
10. a. $\sqrt[3]{625}$
    b. $\sqrt[6]{128}$
11. a. $\sqrt[5]{64}$
    b. $\sqrt[3]{256}$
12. a. $\sqrt[4]{3125}$
    b. $\sqrt[3]{81}$

Answer

1. $3\sqrt{3}$
3. $5\sqrt{5}$
5. $7\sqrt{3}$
7. $20\sqrt{2}$
9. a. $2\sqrt[4]{2}$
   b. $2\sqrt[5]{2}$
11. a. $2\sqrt[5]{2}$
    b. $4\sqrt[3]{4}$

Exercise SET B: use the product property to simplify radical expressions

In the following exercises, simplify using absolute value signs as needed.

1. a. $\sqrt{y^{11}}$
   b. $\sqrt[3]{r^5}$
   c. $\sqrt[4]{s^{10}}$
2. a. $\sqrt{m^{13}}$
   b. $\sqrt[5]{u^7}$
   c. $\sqrt[6]{v^{11}}$
3. a. $\sqrt{n^{21}}$
   b. $\sqrt[3]{q^8}$

c. $\sqrt[8]{n^{10}}$

4. a. $\sqrt{r^{25}}$
   b. $\sqrt[5]{p^8}$
   c. $\sqrt[4]{m^5}$
5. a. $\sqrt{125r^{13}}$
   b. $\sqrt[3]{108x^5}$
   c. $\sqrt[4]{48y^6}$
6. a. $\sqrt{80s^{15}}$
   b. $\sqrt[5]{96a^7}$
   c. $\sqrt[6]{128b^7}$
7. a. $\sqrt{242m^{23}}$
   b. $\sqrt[4]{405m10}$
   c. $\sqrt[5]{160n^8}$
8. a. $\sqrt{175n^{13}}$
   b. $\sqrt[5]{512p^5}$
   c. $\sqrt[4]{324q^7}$
9. a. $\sqrt{147m^7n^{11}}$
   b. $\sqrt[3]{48x^6y^7}$
   c. $\sqrt[4]{32x^5y^4}$
10. a. $\sqrt{96r^3s^3}$
    b. $\sqrt[3]{80x^7y^6}$
    c. $\sqrt[4]{80x^8y^9}$
11. a. $\sqrt{192q^3r^7}$
    b. $\sqrt[3]{54m^9n^{10}}$
    c. $\sqrt[4]{81a^9b^8}$
12. a. $\sqrt{150m^9n^3}$
    b. $\sqrt[3]{81p^7q^8}$
    c. $\sqrt[4]{162c^{11}d^{12}}$
13. a. $\sqrt[3]{-864}$
    b. $\sqrt[4]{-256}$
14. a. $\sqrt[5]{-486}$
    b. $\sqrt[6]{-64}$
15. a. $\sqrt[5]{-32}$
    b. $\sqrt[8]{-1}$
16. a. $\sqrt[3]{-8}$
    b. $\sqrt[4]{-16}$
17. a. $5+\sqrt{12}$
    b. $\dfrac{10-\sqrt{24}}{2}$
18. a. $8+\sqrt{96}$
    b. $\dfrac{8-\sqrt{80}}{4}$
19. a. $1+\sqrt{45}$
    b. $\dfrac{3+\sqrt{90}}{3}$
20. a. $3+\sqrt{125}$
    b. $\dfrac{15+\sqrt{75}}{5}$

Answer

1.

a. $|y^5|\sqrt{y}$
b. $r\sqrt[3]{r^2}$
c. $s^2\sqrt[4]{s^2}$

3.

a. $n^{10}\sqrt{n}$
b. $q^2\sqrt[3]{q^2}$
c. $|n|\sqrt[8]{n^2}$

5.

a. $5r^6\sqrt{5r}$
b. $3x\sqrt[3]{4x^2}$
c. $2|y|\sqrt[4]{3y^2}$

7.

a. $11\,|m^{11}|\sqrt{2m}$
b. $3m^2\sqrt[4]{5m^2}$
c. $2n\sqrt[5]{5n^3}$

9.

a. $7\,|m^3n^5|\sqrt{3mn}$
b. $2x^2y^2\sqrt[3]{6y}$
c. $2|xy|\sqrt[4]{2x}$

11.

a. $8\,|qr^3|\sqrt{3qr}$
b. $3m^3n^3\sqrt[3]{2n}$
c. $3a^2b^2\sqrt[4]{a}$

13.

a. $-6\sqrt[3]{4}$
b. not real

15.

a. -2
b. not real

17.

a. $5+2\sqrt{3}$
b. $5-\sqrt{6}$

19.

a. $1+3\sqrt{5}$
b. $1+\sqrt{10}$

Exercise Set C: use the quotient property to simplify radical expressions

In the following exercises, use the Quotient Property to simplify square roots.

1. a. $\sqrt{\frac{45}{80}}$

https://math.libretexts.org/@go/page/46426

b. $\sqrt[3]{\frac{8}{27}}$

c. $\sqrt[4]{\frac{1}{81}}$

2. a. $\sqrt{\frac{72}{98}}$

b. $\sqrt[3]{\frac{24}{81}}$

c. $\sqrt[4]{\frac{6}{96}}$

3. a. $\sqrt{\frac{100}{36}}$

b. $\sqrt[3]{\frac{81}{375}}$

c. $\sqrt[4]{\frac{1}{256}}$

4. a. $\sqrt{\frac{121}{16}}$

b. $\sqrt[3]{\frac{16}{250}}$

c. $\sqrt[4]{\frac{32}{162}}$

5. a. $\sqrt{\frac{x^{10}}{x^6}}$

b. $\sqrt[3]{\frac{p^{11}}{p^2}}$

c. $\sqrt[4]{\frac{q^{17}}{q^{13}}}$

6. a. $\sqrt{\frac{p^{20}}{p^{10}}}$

b. $\sqrt[5]{\frac{d^{12}}{d^7}}$

c. $\sqrt[8]{\frac{m^{12}}{m^4}}$

c. $\sqrt[4]{\frac{81m^2n^8}{256m^1n^2}}$

25. a. $\frac{\sqrt{45p^9}}{\sqrt{5q^2}}$

b. $\frac{\sqrt[4]{64}}{\sqrt[4]{2}}$

c. $\frac{\sqrt[5]{128x^8}}{\sqrt[5]{2x^2}}$

26. a. $\frac{\sqrt{80q^5}}{\sqrt{5q}}$

b. $\frac{\sqrt[3]{-625}}{\sqrt[3]{5}}$

c. $\frac{\sqrt[4]{80m^7}}{\sqrt[4]{5m}}$

27. a. $\frac{\sqrt{50m^7}}{\sqrt{2m}}$

b. $\sqrt[3]{\frac{1250}{2}}$

c. $\sqrt[4]{\frac{486y^9}{2y^3}}$

28. a. $\frac{\sqrt{72n^{11}}}{\sqrt{2n}}$

b. $\sqrt[3]{\frac{162}{6}}$

c. $\sqrt[4]{\frac{160r^{10}}{5r^3}}$

Answer

1.

a. $\frac{3}{4}$

b. $\frac{2}{3}$

c. $\frac{1}{3}$

3.

https://math.libretexts.org/@go/page/46426

a. $\frac{5}{3}$
b. $\frac{3}{5}$
c. $\frac{1}{4}$

5.

a. x^2
b. p^3
c. $|q|$

7.

a. $\frac{1}{y^2}$
b. u^2
c. $|v^3|$

9. $\frac{4\left|x^3\right|\sqrt{6x}}{11}$

11. $\frac{10m^2\sqrt{3m}}{8}$

13. $\frac{7r^2\sqrt{2r}}{10}$

15. $\frac{2\left|q^3\right|\sqrt{7}}{15}$

17.

a. $\frac{5r^4\sqrt{3r}}{s^4}$
b. $\frac{3a^2\sqrt[3]{2a^2}}{|b|}$
c. $\frac{2|c|\sqrt[4]{4c}}{|d|}$

19.

a. $\frac{2\left|p^3\right|\sqrt{7p}}{|q|}$
b. $\frac{3s^2\sqrt[3]{3s^2}}{t}$
c. $\frac{2\left|p^3\right|\sqrt[4]{4p^3}}{|q^3|}$

21.

a. $\frac{4|xy|}{3}$
b. $\frac{y^2\sqrt[3]{x}}{2}$
c. $\frac{|ab|\sqrt[4]{a}}{4}$

23.

a. $\frac{1}{2|pq|}$

https://math.libretexts.org/@go/page/46426

b. $\frac{2cd\sqrt[5]{2d^2}}{5}$

c. $\frac{|mn|\sqrt[6]{2}}{2}$

25.

a. $\frac{3p^4\sqrt{p}}{|q|}$

b. $2\sqrt[4]{2}$

c. $2x\sqrt[5]{2x}$

27.

a. $5\left|m^3\right|$

b. $5\sqrt[3]{5}$

c. $3|y|\sqrt[4]{3y^2}$

Exercise SET D: writing exercises

1. Explain why $\sqrt{x^4}=x^2$. Then explain why $\sqrt{x^{16}}=x^8$.
2. Explain why $7+\sqrt{9}$ is not equal to $\sqrt{7+9}$.
3. Explain how you know that $\sqrt[5]{x^{10}}=x^2$.
4. Explain why $\sqrt[4]{-64}$ is not a real number but $\sqrt[3]{-64}$ is.

Answer

1. Answers may vary

3. Answers may vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the Product Property to simplify radical expressions.			
use the Quotient Property to simplify radical expressions.			

Figure 8.2.1

b. After reviewing this checklist, what will you do to become confident for all objectives?

17.4: Simplify Rational Exponents

Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with $a^{\frac{1}{n}}$
- Simplify expressions with $a^{\frac{m}{n}}$
- Use the properties of exponents to simplify expressions with rational exponents

Before you get started, take this readiness quiz.

1. Add: $\frac{7}{15}+\frac{5}{12}$.
   If you missed this problem, review Example 1.28.
2. Simplify: $(4x^2y^5)^3$.
   If you missed this problem, review Example 5.18.
3. Simplify: 5^{-3}.
   If you missed this problem, review Example 5.14.

Simplify Expressions with $a^{\frac{1}{n}}$

Rational exponents are another way of writing expressions with radicals. When we use rational exponents, we can apply the properties of exponents to simplify expressions.

The Power Property for Exponents says that $(a^m)^n=a^{m\cdot n}$ when m and n are whole numbers. Let's assume we are now not limited to whole numbers.

Suppose we want to find a number p such that $(8^p)^3=8$. We will use the Power Property of Exponents to find the value of p.

$$(8^p)^3=8$$

Multiple the exponents on the left.

$$8^{3p}=8$$

Write the exponent 1 on the right.

$$8^{3p}=8^1$$

Since the bases are the same, the exponents must be equal.

$$3p=1$$

Solve for p.

$$p=\frac{1}{3}$$

So $\left(8^{\frac{1}{3}}\right)^3=8$. But we know also $(\sqrt[3]{8})^3=8$. Then it must be that $8^{\frac{1}{3}}=\sqrt[3]{8}$.

This same logic can be used for any positive integer exponent n to show that $a^{\frac{1}{n}}=\sqrt[n]{a}$.

Definition 17.4.1: Rational Exponent $a^{\frac{1}{n}}$

If $\sqrt[n]{a}$ is a real number and $n\geq 2$, then

$$a^{\frac{1}{n}}=\sqrt[n]{a}$$

The denominator of the rational exponent is the index of the radical.

There will be times when working with expressions will be easier if you use rational exponents and times when it will be easier if you use radicals. In the first few examples, you'll practice converting expressions between these two notations.

Example 17.4.1

Write as a radical expression:

a. $x^{\frac{1}{2}}$
b. $y^{\frac{1}{3}}$
c. $z^{\frac{1}{4}}$

Solution:

We want to write each expression in the form $\sqrt[n]{a}$.

a.

$$x^{\frac{1}{2}}$$

The denominator of the rational exponent is 2, so the index of the radical is 2. We do not show the index when it is 2.

$$\sqrt{x}$$

b.

$$y^{\frac{1}{3}}$$

The denominator of the exponent is 3, so the index is 3.

$$\sqrt[3]{y}$$

c.

$$z^{\frac{1}{4}}$$

The denominator of the exponent is \4, so the index is 4.

$$\sqrt[4]{z}$$

Exercise 17.4.1

Write as a radical expression:

a. $t^{\frac{1}{2}}$
b. $m^{\frac{1}{3}}$
c. $r^{\frac{1}{4}}$

Answer

a. $\sqrt{t}$
b. $\sqrt[3]{m}$
c. $\sqrt[4]{r}$

Exercise 17.4.2

Write as a radical expression:

a. $b^{\frac{1}{6}}$
b. $z^{\frac{1}{5}}$
c. $p^{\frac{1}{4}}$

Answer

a. $\sqrt[6]{b}$
b. $\sqrt[5]{z}$
c. $\sqrt[4]{p}$

In the next example, we will write each radical using a rational exponent. It is important to use parentheses around the entire expression in the radicand since the entire expression is raised to the rational power.

Example 17.4.2

Write with a rational exponent:

a. $\sqrt{5y}$
b. $\sqrt[3]{4x}$
c. $3\sqrt[4]{5z}$

Solution:

We want to write each radical in the form $a^{\frac{1}{n}}$

a.

$$\sqrt{5y}$$

No index is shown, so it is 2.

The denominator of the exponent will be 2.

Put parentheses around the entire expression $5y$.

$$(5y)^{\frac{1}{2}}$$

b.

$$\sqrt[3]{4x}$$

The index is 3, so the denominator of the exponent is 3. Include parentheses $(4x)$.

$$(4x)^{\frac{1}{3}}$$

c.

$$3\sqrt[4]{5z}$$

The index is 4, so the denominator of the exponent is 4. Put parentheses only around the $5z$ since 3 is not under the radical sign.

$$3(5z)^{\frac{1}{4}}$$

Exercise 17.4.3

Write with a rational exponent:

a. $\sqrt{10m}$
b. $\sqrt[5]{3n}$
c. $3\sqrt[4]{6y}$

Answer

a. $(10m)^{\frac{1}{2}}$
b. $(3n)^{\frac{1}{5}}$
c. $3(6y)^{\frac{1}{4}}$

Exercise 17.4.4

Write with a rational exponent:

a. $\sqrt[7]{3k}$
b. $\sqrt[4]{5j}$
c. $8\sqrt[3]{2a}$

Answer

a. $(3k)^{\frac{1}{7}}$
b. $(5j)^{\frac{1}{4}}$
c. $8(2a)^{\frac{1}{3}}$

In the next example, you may find it easier to simplify the expressions if you rewrite them as radicals first.

Example 17.4.3

Simplify:

a. $25^{\frac{1}{2}}$
b. $64^{\frac{1}{3}}$
c. $256^{\frac{1}{4}}$

Solution:

a.

$$25^{\frac{1}{2}}$$

Rewrite as a square root.

$$\sqrt{25}$$

Simplify.

$$5$$

b.

$$64^{\frac{1}{3}}$$

Rewrite as a cube root.

$$\sqrt[3]{64}$$

Recognize 64 is a perfect cube.

$$\sqrt[3]{4^3}$$

Simplify.

$$4$$

c.

$$256^{\frac{1}{4}}$$

Rewrite as a fourth root.

$$\sqrt[4]{256}$$

Recognize 256 is a perfect fourth power.

$$\sqrt[4]{4^4}$$

Simplify.

4

Exercise 17.4.5

Simplify:

a. $36^{\frac{1}{2}}$
b. $8^{\frac{1}{3}}$
c. $16^{\frac{1}{4}}$

Answer

a. 6
b. 2
c. 2

Exercise 17.4.6

Simplify:

a. $100^{\frac{1}{2}}$
b. $27^{\frac{1}{3}}$
c. $81^{\frac{1}{4}}$

Answer

a. 10
b. 3
c. 3

Be careful of the placement of the negative signs in the next example. We will need to use the property $a^{-n} = \frac{1}{a^n}$ in one case.

Example 17.4.4

Simplify:

a. $(-16)^{\frac{1}{4}}$
b. $-16^{\frac{1}{4}}$
c. $(16)^{-\frac{1}{4}}$

Solution:

a.

$$(-16)^{\frac{1}{4}}$$

Rewrite as a fourth root.

$$\sqrt[4]{-16}$$

$$\sqrt[4]{(-2)^4}$$

Simplify.

No real solution

b.

$$-16^{\frac{1}{4}}$$

The exponent only applies to the 16. Rewrite as a fourth root.

$$-\sqrt[4]{16}$$

Rewrite 16 as 2^4

$$-\sqrt[4]{2^4}$$

Simplify.

$$-2$$

c.

$$(16)^{-\frac{1}{4}}$$

Rewrite using the property $a^{-n}=\frac{1}{a^n}$.

$$\frac{1}{(16)^{\frac{1}{4}}}$$

Rewrite as a fourth root.

$$\frac{1}{\sqrt[4]{16}}$$

Rewrite 16 as 2^4.

$$\frac{1}{\sqrt[4]{2^4}}$$

Simplify.

$$\frac{1}{2}$$

Exercise 17.4.7

Simplify:

a. $(-64)^{-\frac{1}{2}}$
b. $-64^{\frac{1}{2}}$
c. $(64)^{-\frac{1}{2}}$

Answer

a. No real solution
b. -8
c. $\frac{1}{8}$

Exercise 17.4.8

Simplify:

a. $(-256)^{\frac{1}{4}}$
b. $-256^{\frac{1}{4}}$
c. $(256)^{-\frac{1}{4}}$

Answer

a. No real solution
b. -4
c. $\frac{1}{4}$

Simplify Expressions with $a^{\frac{m}{n}}$

We can look at $a^{\frac{m}{n}}$ in two ways. Remember the Power Property tells us to multiply the exponents and so $\left(a^{\frac{1}{n}}\right)^m$ and $(a^m)^{\frac{1}{n}}$ both equal $a^{\frac{m}{n}}$. If we write these expressions in radical form, we get

$$a^{\frac{m}{n}} = \left(a^{\frac{1}{n}}\right)^m = (\sqrt[n]{a})^m \quad \text{and} \quad a^{\frac{m}{n}} = (a^m)^{\frac{1}{n}} = \sqrt[n]{a^m}$$

This leads us to the following defintion.

Definition 17.4.2: Rational Exponent $a^{\frac{m}{n}}$

For any positive integers m and n,

$$a^{\frac{m}{n}} = (\sqrt[n]{a})^m \quad \text{and} \quad a^{\frac{m}{n}} = \sqrt[n]{a^m}$$

Which form do we use to simplify an expression? We usually take the root first—that way we keep the numbers in the radicand smaller, before raising it to the power indicated.

Example 17.4.5

Write with a rational exponent:

a. $\sqrt{y^3}$
b. $(\sqrt[3]{2x})^4$
c. $\sqrt{\left(\frac{3a}{4b}\right)^3}$

Solution:

We want to use $a^{\frac{m}{n}} = \sqrt[n]{a^m}$ to write each radical in the form $a^{\frac{m}{n}}$

a.

Let

$$\sqrt[2]{y^3} \tag{17.4.1}$$

The numerator of the exponent is the exponent 3.
The denominator of the exponent is the index of the radical, 2.

$$y^{\frac{3}{2}} \tag{17.4.2}$$

b.

Let

$$(\sqrt[3]{2x})^4 \tag{17.4.3}$$

The numerator of the exponent is the exponent 4.
The denominator of the exponent is the index of the radical, 3.

$$(2x)^{\frac{4}{3}} \tag{17.4.4}$$

c.

Let

$$\sqrt{\left(\frac{3a}{4b}\right)^3} \tag{17.4.5}$$

The numerator of the exponent is the exponent 3.
The denominator of the exponent is the index of the radical, 2.

$$\left(\frac{3a}{4b}\right)^{\frac{3}{2}} \tag{17.4.6}$$

Exercise 17.4.9

Write with a rational exponent:

a. $\sqrt{x^5}$
b. $(\sqrt[4]{3y})^3$
c. $\sqrt{\left(\frac{2m}{3n}\right)^5}$

Answer

a. $x^{\frac{5}{2}}$
b. $(3y)^{\frac{3}{4}}$
c. $\left(\frac{2m}{3n}\right)^{\frac{5}{2}}$

Exercise 17.4.10

Write with a rational exponent:

a. $\sqrt[5]{a^2}$
b. $(\sqrt[3]{5ab})^5$
c. $\sqrt{\left(\frac{7xy}{z}\right)^3}$

Answer

a. $a^{\frac{2}{5}}$
b. $(5ab)^{\frac{5}{3}}$
c. $\left(\frac{7xy}{z}\right)^{\frac{3}{2}}$

Remember that $a^{-n} = \frac{1}{a^n}$. The negative sign in the exponent does not change the sign of the expression.

Example 17.4.6

Simplify:

a. $125^{\frac{2}{3}}$
b. $16^{-\frac{3}{2}}$
c. $32^{-\frac{2}{5}}$

Solution:

We will rewrite the expression as a radical first using the defintion, $a^{\frac{m}{n}} = (\sqrt[n]{a})^m$. This form lets us take the root first and so we keep the numbers in the radicand smaller than if we used the other form.

a.

$$125^{\frac{2}{3}}$$

The power of the radical is the numerator of the exponent, 2. The index of the radical is the denominator of the exponent, 3.

$$(\sqrt[3]{125})^2$$

Simplify.

$$(5)^2$$

$$25$$

b. We will rewrite each expression first using $a^{-n} = \frac{1}{a^n}$ and then change to radical form.

$$16^{-\frac{3}{2}}$$

Rewrite using $a^{-n} = \frac{1}{a^n}$

$$\frac{1}{16^{\frac{3}{2}}}$$

Change to radical form. The power of the radical is the numerator of the exponent, 3. The index is the denominator of the exponent, 2.

$$\frac{1}{(\sqrt{16})^3}$$

Simplify.

$$\frac{1}{4^3}$$

$$\frac{1}{64}$$

c.

$$32^{-\frac{2}{5}}$$

Rewrite using $a^{-n} = \frac{1}{a^n}$

$$\frac{1}{32^{\frac{2}{5}}}$$

Change to radical form.

$$\frac{1}{(\sqrt[5]{32})^2}$$

Rewrite the radicand as a power.

$$\frac{1}{\left(\sqrt[5]{2^5}\right)^2}$$

Simplify.

$$\frac{1}{2^2}$$

$$\frac{1}{4}$$

? Exercise 17.4.11

Simplify:

a. $27^{\frac{2}{3}}$
b. $81^{-\frac{3}{2}}$
c. $16^{-\frac{3}{4}}$

Answer

a. 9
b. $\frac{1}{729}$
c. $\frac{1}{8}$

Exercise 17.4.12

Simplify:

a. $4^{\frac{3}{2}}$

b. $27^{-\frac{2}{3}}$

c. $625^{-\frac{3}{4}}$

Answer

a. 8

b. $\frac{1}{9}$

c. $\frac{1}{125}$

Example 17.4.7

Simplify:

a. $-25^{\frac{3}{2}}$

b. $-25^{-\frac{3}{2}}$

c. $(-25)^{\frac{3}{2}}$

Solution:

a.

$$-25^{\frac{3}{2}}$$

Rewrite in radical form.

$$-(\sqrt{25})^3$$

Simplify the radical.

$$-(5)^3$$

Simplify.

$$-125$$

b.

$$-25^{-\frac{3}{2}}$$

Rewrite using $a^{-n} = \frac{1}{a^n}$.

$$-\left(\frac{1}{25^{\frac{3}{2}}}\right)$$

Rewrite in radical form.

$$-\left(\frac{1}{(\sqrt{25})^3}\right)$$

Simplify the radical.

$$-\left(\frac{1}{(5)^3}\right)$$

Simplify.

$$-\frac{1}{125}$$

c.

$$(-25)^{\frac{3}{2}}$$

Rewrite in radical form.

$$(\sqrt{-25})^3$$

There is no real number whose square root is -25.

Not a real number.

Exercise 17.4.13

Simplify:

a. $-16^{\frac{3}{2}}$
b. $-16^{-\frac{3}{2}}$
c. $(-16)^{-\frac{3}{2}}$

Answer

a. -64
b. $-\frac{1}{64}$
c. Not a real number

Exercise 17.4.14

Simplify:

a. $-81^{\frac{3}{2}}$
b. $-81^{-\frac{3}{2}}$
c. $(-81)^{-\frac{3}{2}}$

Answer

a. -729
b. $-\frac{1}{729}$
c. Not a real number

Use the Properties of Exponents to Simplify Expressions with Rational Exponents

The same properties of exponents that we have already used also apply to rational exponents. We will list the Properties of Exponents here to have them for reference as we simplify expressions.

Properties of Exponents

If a and b are real numbers and m and n are rational numbers, then

Product Property

$$a^m \cdot a^n = a^{m+n}$$

Power Property

$$(a^m)^n = a^{m \cdot n}$$

Product to a Power

$$(ab)^m = a^m b^m$$

Quotient Property

$$\frac{a^m}{a^n} = a^{m-n}, a \neq 0$$

Zero Exponent Definition

$$a^0 = 1, a \neq 0$$

Quotient to a Power Property

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$$

Negative Exponent Property

$$a^{-n} = \frac{1}{a^n}, a \neq 0$$

We will apply these properties in the next example.

Example 17.4.8

Simplify:

a. $x^{\frac{1}{2}} \cdot x^{\frac{5}{6}}$

b. $\left(z^9\right)^{\frac{2}{3}}$

c. $\frac{x^{\frac{1}{3}}}{x^{\frac{5}{3}}}$

Solution

a. The Product Property tells us that when we multiple the same base, we add the exponents.

$$x^{\frac{1}{2}} \cdot x^{\frac{5}{6}}$$

The bases are the same, so we add the exponents.

$$x^{\frac{1}{2}+\frac{5}{6}}$$

Add the fractions.

$$x^{\frac{8}{6}}$$

Simplify the exponent.

$$x^{\frac{4}{3}}$$

b. The Power Property tells us that when we raise a power to a power, we multiple the exponents.

$$\left(z^9\right)^{\frac{2}{3}}$$

To raise a power to a power, we multiple the exponents.

$$z^{9 \cdot \frac{2}{3}}$$

Simplify.

$$z^6$$

c. The Quotient Property tells us that when we divide with the same base, we subtract the exponents.

$$\frac{x^{\frac{1}{3}}}{x^{\frac{5}{3}}}$$

To divide with the same base, we subtract the exponents.

$$\frac{1}{x^{\frac{5}{3}-\frac{1}{3}}}$$

Simplify.

$$\frac{1}{x^{\frac{4}{3}}}$$

Exercise 17.4.15

Simplify:

a. $x^{\frac{1}{6}} \cdot x^{\frac{4}{3}}$

b. $\left(x^{6}\right)^{\frac{4}{3}}$

c. $\frac{x^{\frac{2}{3}}}{x^{\frac{5}{3}}}$

Answer

a. $x^{\frac{3}{2}}$

b. x^{8}

c. $\frac{1}{x}$

Exercise 17.4.16

Simplify:

a. $y^{\frac{3}{4}} \cdot y^{\frac{5}{8}}$

b. $\left(m^{9}\right)^{\frac{2}{9}}$

c. $\frac{d^{\frac{1}{5}}}{d^{\frac{6}{5}}}$

Answer

a. $y^{\frac{11}{8}}$

b. m^{2}

c. $\frac{1}{d}$

Sometimes we need to use more than one property. In the next example, we will use both the **Product to a Power Property** and then the **Power Property**.

Example 17.4.9

Simplify:

a. $\left(27u^{\frac{1}{2}}\right)^{\frac{2}{3}}$

b. $\left(m^{\frac{2}{3}}n^{\frac{1}{2}}\right)^{\frac{3}{2}}$

Solution:

a.

$$\left(27u^{\frac{1}{2}}\right)^{\frac{2}{3}}$$

First we use the Product to a Power Property.

$$(27)^{\frac{2}{3}}\left(u^{\frac{1}{2}}\right)^{\frac{2}{3}}$$

Rewrite 27 as a power of 3.

$$\left(3^{3}\right)^{\frac{2}{3}}\left(u^{\frac{1}{2}}\right)^{\frac{2}{3}}$$

To raise a power to a power, we multiple the exponents.

$$\left(3^2\right)\left(u^{\frac{1}{3}}\right)$$

Simplify.

$$9u^{\frac{1}{3}}$$

b.

$$\left(m^{\frac{2}{3}}n^{\frac{1}{2}}\right)^{\frac{3}{2}}$$

First we use the Product to a Power Property.

$$\left(m^{\frac{2}{3}}\right)^{\frac{3}{2}}\left(n^{\frac{1}{2}}\right)^{\frac{3}{2}}$$

To raise a power to a power, we multiply the exponents.

$$mn^{\frac{3}{4}}$$

? Exercise 17.4.17

Simplify:

a. $\left(32x^{\frac{1}{3}}\right)^{\frac{3}{5}}$

b. $\left(x^{\frac{3}{4}}y^{\frac{1}{2}}\right)^{\frac{2}{3}}$

Answer

a. $8x^{\frac{1}{5}}$

b. $x^{\frac{1}{2}}y^{\frac{1}{3}}$

? Exercise 17.4.18

Simplify:

a. $\left(81n^{\frac{2}{5}}\right)^{\frac{3}{2}}$

b. $\left(a^{\frac{3}{2}}b^{\frac{1}{2}}\right)^{\frac{4}{3}}$

Answer

a. $729n^{\frac{3}{5}}$

b. $a^2b^{\frac{2}{3}}$

We will use both the **Product Property** and the **Quotient Property** in the next example.

✓ Example 17.4.10

Simplify:

a. $\frac{x^{\frac{3}{4}}\cdot x^{-\frac{1}{4}}}{x^{-\frac{6}{4}}}$

b. $\left(\frac{16x^{\frac{4}{3}}y^{-\frac{5}{6}}}{x^{-\frac{2}{3}}y^{\frac{1}{6}}}\right)^{\frac{1}{2}}$

Solution:

a.

$$\frac{x^{\frac{3}{4}} \cdot x^{-\frac{1}{4}}}{x^{-\frac{6}{4}}}$$

Use the Product Property in the numerator, add the exponents.

$$\frac{x^{\frac{2}{4}}}{x^{-\frac{6}{4}}}$$

Use the Quotient Property, subtract the exponents.

$$x^{\frac{8}{4}}$$

Simplify.

$$x^2$$

b.

$$\left(\frac{16x^{\frac{4}{3}}y^{-\frac{5}{6}}}{x^{-\frac{2}{3}}y^{\frac{1}{6}}}\right)^{\frac{1}{2}}$$

Use the Quotient Property, subtract the exponents.

$$\left(\frac{16x^{\frac{6}{3}}}{y^{\frac{6}{6}}}\right)^{\frac{1}{2}}$$

Simplify.

$$\left(\frac{16x^2}{y}\right)^{\frac{1}{2}}$$

Use the Product to a Power Property, multiply the exponents.

$$\frac{4x}{y^{\frac{1}{2}}}$$

Exercise 17.4.19

Simplify:

a. $\frac{m^{\frac{2}{3}} \cdot m^{-\frac{1}{3}}}{m^{-\frac{5}{3}}}$

b. $\left(\frac{25m^{\frac{1}{6}}n^{\frac{11}{6}}}{m^{\frac{2}{3}}n^{-\frac{1}{6}}}\right)^{\frac{1}{2}}$

Answer

a. m^2

b. $\frac{5n}{m^{\frac{1}{4}}}$

Exercise 17.4.20

Simplify:

a. $\frac{u^{\frac{4}{5}} \cdot u^{-\frac{2}{5}}}{u^{-\frac{13}{5}}}$

b. $\left(\frac{27x^{\frac{4}{5}}y^{\frac{1}{6}}}{x^{\frac{1}{5}}y^{-\frac{5}{6}}}\right)^{\frac{1}{3}}$

Answer

a. u^3

b. $3x^{\frac{1}{5}}y^{\frac{1}{3}}$

  - If a, b are real numbers and m, n are rational numbers, then
    - **Product Property** $a^m \cdot a^n = a^{m+n}$
    - **Power Property** $(a^m)^n = a^{m \cdot n}$
    - **Product to a Power** $(ab)^m = a^m b^m$
    - **Quotient Property** $\frac{a^m}{a^n} = a^{m-n}, a \neq 0$
    - **Zero Exponent Definition** $a^0 = 1, a \neq 0$
    - **Quotient to a Power Property** $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$
    - **Negative Exponent Property** $a^{-n} = \frac{1}{a^n}, a \neq 0$

17.4E: Exercises

Practice Makes Perfect

Exercise SET A: simplify expressions with $a^{\frac{1}{n}}$

In the following exercises, write as a radical expression.

1. a. $x^{\frac{1}{2}}$ b. $y^{\frac{1}{3}}$ c. $z^{\frac{1}{4}}$
2. a. $r^{\frac{1}{2}}$ b. $s^{\frac{1}{3}}$ c. $t^{\frac{1}{4}}$
3. a. $u^{\frac{1}{5}}$ b. $v^{\frac{1}{9}}$ c. $w^{\frac{1}{20}}$
4. a. $g^{\frac{1}{7}}$ b. $h^{\frac{1}{5}}$ c. $j^{\frac{1}{25}}$

Answer

1. a. $\sqrt{x}$ b. $\sqrt[3]{y}$ c. $\sqrt[4]{z}$
3. a. $\sqrt[5]{u}$ b. $\sqrt[9]{v}$ c. $\sqrt[20]{w}$

Exercise Set B: simplify expressions with $a^{\frac{1}{n}}$

In the following exercises, write with a rational exponent.

1. a. $\sqrt[7]{x}$ b. $\sqrt[9]{y}$ c. $\sqrt[5]{f}$
2. a. $\sqrt[8]{4}$ b. $\sqrt[10]{s}$ c. $\sqrt[4]{t}$
3. a. $\sqrt[3]{7c}$ b. $\sqrt[7]{12d}$ c. $2\sqrt[4]{6b}$
4. a. $\sqrt[4]{5x}$ b. $\sqrt[8]{9y}$ c. $7\sqrt[5]{3z}$
5. a. $\sqrt{21p}$ b. $\sqrt[4]{8q}$ c. $4\sqrt[6]{36r}$
6. a. $\sqrt[3]{25a}$ b. $\sqrt{3b}$ c. $\sqrt[8]{40c}$

Answer

1. a. $x^{\frac{1}{7}}$ b. $y^{\frac{1}{9}}$ c. $f^{\frac{1}{5}}$
3. a. $(7c)^{\frac{1}{4}}$ b. $(12d)^{\frac{1}{7}}$ c. $2(6b)^{\frac{1}{4}}$
5. a. $(21p)^{\frac{1}{2}}$ b. $(8q)^{\frac{1}{4}}$ c. $4(36r)^{\frac{1}{6}}$

Exercise SET C: simplify expressions with $a^{\frac{1}{n}}$

In the following exercises, simplify.

1. a. $81^{\frac{1}{2}}$ b. $125^{\frac{1}{3}}$ c. $64^{\frac{1}{2}}$
2. a. $625^{\frac{1}{4}}$ b. $243^{\frac{1}{5}}$ c. $32^{\frac{1}{5}}$
3. a. $16^{\frac{1}{4}}$ b. $16^{\frac{1}{2}}$ c. $625^{\frac{1}{4}}$
4. a. $64^{\frac{1}{3}}$ b. $32^{\frac{1}{5}}$ c. $81^{\frac{1}{4}}$
5. a. $(-216)^{\frac{1}{3}}$ b. $-216^{\frac{1}{3}}$ c. $(216)^{-\frac{1}{3}}$
6. a. $(-1000)^{\frac{1}{3}}$ b. $-1000^{\frac{1}{3}}$ c. $(1000)^{-\frac{1}{3}}$
7. a. $(-81)^{\frac{1}{4}}$ b. $-81^{\frac{1}{4}}$ c. $(81)^{-\frac{1}{4}}$
8. a. $(-49)^{\frac{1}{2}}$ b. $-49^{\frac{1}{2}}$ c. $(49)^{-\frac{1}{2}}$
9. a. $(-36)^{\frac{1}{2}}$ b. $-36^{\frac{1}{2}}$ c. $(36)^{-\frac{1}{2}}$
10. a. $(-16)^{\frac{1}{4}}$ b. $-16^{\frac{1}{4}}$ c. $16^{-\frac{1}{4}}$
11. a. $(-100)^{\frac{1}{2}}$ b. $-100^{\frac{1}{2}}$ c. $(100)^{-\frac{1}{2}}$

12. a. $(-32)^{\frac{1}{5}}$ b. $(243)^{-\frac{1}{5}}$ c. $-125^{\frac{1}{3}}$

Answer

1. a. 9 b. 5 c. 8
3. a. 2 b. 4 c. 5
5. a. -6 b. -6 c. $\frac{1}{6}$
7. a. not real b. -3 c. $\frac{1}{3}$
9. a. not real b. -6 c. $\frac{1}{6}$
11. a. not real b. -10 c. $\frac{1}{10}$

Exercise SET D: simplify expressions with $a^{\frac{m}{n}}$

In the following exercises, write with a rational exponent.

1. a. $\sqrt{m^5}$ b. $(\sqrt[3]{3y})^7$ c. $\sqrt[5]{\left(\frac{4x}{5y}\right)^3}$
2. a. $\sqrt[4]{r^7}$ b. $(\sqrt[5]{2pq})^3$ c. $\sqrt[4]{\left(\frac{12m}{7n}\right)^3}$
3. a. $\sqrt[5]{u^2}$ b. $(\sqrt[3]{6x})^5$ c. $\sqrt[4]{\left(\frac{18a}{5b}\right)^7}$
4. a. $\sqrt[3]{a}$ b. $(\sqrt[4]{21v})^3$ c. $\sqrt[4]{\left(\frac{2xy}{5z}\right)^2}$

Answer

1. a. $m^{\frac{5}{2}}$ b. $(3y)^{\frac{7}{3}}$ c. $\left(\frac{4x}{5y}\right)^{\frac{3}{5}}$
3. a. $u^{\frac{2}{5}}$ b. $(6x)^{\frac{5}{3}}$ c. $\left(\frac{18a}{5b}\right)^{\frac{7}{4}}$

Exercise SET E: simplify expressions with $a^{\frac{m}{n}}$

In the following exercises, simplify.

1. a. $64^{\frac{5}{2}}$ b. $81^{\frac{-3}{2}}$ c. $(-27)^{\frac{2}{3}}$
2. a. $25^{\frac{3}{2}}$ b. $9^{-\frac{3}{2}}$ c. $(-64)^{\frac{2}{3}}$
3. a. $32^{\frac{2}{5}}$ b. $27^{-\frac{2}{3}}$ c. $(-25)^{\frac{1}{2}}$
4. a. $100^{\frac{3}{2}}$ b. $49^{-\frac{5}{2}}$ c. $(-100)^{\frac{3}{2}}$
5. a. $-9^{\frac{3}{2}}$ b. $-9^{-\frac{3}{2}}$ c. $(-9)^{\frac{3}{2}}$
6. a. $-64^{\frac{3}{2}}$ b. $-64^{-\frac{3}{2}}$ c. $(-64)^{\frac{3}{2}}$

Answer

1. a. $32,768$ b. $\frac{1}{729}$ c. 9
3. a. 4 b. $\frac{1}{9}$ c. not real
5. a. -27 b. $-\frac{1}{27}$ c. not real

Exercise SET F: use the laws of exponents to simplify expressions with rational exponents

In the following exercises, simplify. Assume all variables are positive.

1. a. $c^{\frac{1}{4}} \cdot c^{\frac{5}{8}}$ b. $\left(p^{12}\right)^{\frac{3}{4}}$ c. $\dfrac{r^{\frac{4}{5}}}{r^{\frac{9}{5}}}$
2. a. $6^{\frac{5}{2}} \cdot 6^{\frac{1}{2}}$ b. $\left(b^{15}\right)^{\frac{3}{5}}$ c. $\dfrac{w^{\frac{2}{7}}}{w^{\frac{9}{7}}}$
3. a. $y^{\frac{1}{2}} \cdot y^{\frac{3}{4}}$ b. $\left(x^{12}\right)^{\frac{2}{3}}$ c. $\dfrac{m^{\frac{5}{8}}}{m^{\frac{13}{8}}}$
4. a. $q^{\frac{2}{3}} \cdot q^{\frac{5}{6}}$ b. $\left(h^{6}\right)^{\frac{4}{3}}$ c. $\dfrac{n^{\frac{3}{5}}}{n^{\frac{8}{5}}}$
5. a. $\left(27q^{\frac{3}{2}}\right)^{\frac{4}{3}}$ b. $\left(a^{\frac{1}{3}}b^{\frac{2}{3}}\right)^{\frac{3}{2}}$
6. a. $\left(64s^{\frac{3}{7}}\right)^{\frac{1}{6}}$ b. $\left(m^{\frac{4}{3}}n^{\frac{1}{2}}\right)^{\frac{3}{4}}$
7. a. $\left(16u^{\frac{1}{3}}\right)^{\frac{3}{4}}$ b. $\left(4p^{\frac{1}{3}}q^{\frac{1}{2}}\right)^{\frac{3}{2}}$
8. a. $\left(625n^{\frac{8}{3}}\right)^{\frac{3}{4}}$ b. $\left(9x^{\frac{2}{5}}y^{\frac{3}{5}}\right)^{\frac{5}{2}}$
9. a. $\dfrac{r^{\frac{5}{2}} \cdot r^{-\frac{1}{2}}}{r^{-\frac{3}{2}}}$ b. $\left(\dfrac{36s^{\frac{1}{5}}t^{-\frac{3}{2}}}{s^{-\frac{9}{5}}t^{\frac{1}{2}}}\right)^{\frac{1}{2}}$
10. a. $\dfrac{a^{\frac{3}{4}} \cdot a^{-\frac{1}{4}}}{a^{-\frac{10}{4}}}$ b. $\left(\dfrac{27b^{\frac{2}{3}}c^{-\frac{5}{2}}}{b^{-\frac{7}{3}}c^{\frac{1}{2}}}\right)^{\frac{1}{3}}$
11. a. $\dfrac{c^{\frac{5}{3}} \cdot c^{-\frac{1}{3}}}{c^{-\frac{2}{3}}}$ b. $\left(\dfrac{8x^{\frac{5}{3}}y^{-\frac{1}{2}}}{27x^{-\frac{4}{3}}y^{\frac{5}{2}}}\right)^{\frac{1}{3}}$
12. a. $\dfrac{m^{\frac{7}{4}} \cdot m^{-\frac{5}{4}}}{m^{-\frac{2}{4}}}$ b. $\left(\dfrac{16m^{\frac{1}{5}}n^{\frac{3}{2}}}{81m^{\frac{9}{5}}n^{-\frac{1}{2}}}\right)^{\frac{1}{4}}$

Answer

1. a. $c^{\frac{7}{8}}$ b. p^9 c. $\frac{1}{r}$
3. a. $y^{\frac{5}{4}}$ b. x^8 c. $\dfrac{1}{m}$
5. a. $81q^2$ b. $a^{\frac{1}{2}}b$
7. a. $8u^{\frac{1}{4}}$ b. $8p^{\frac{1}{2}}q^{\frac{3}{4}}$
9. a. $r^{\frac{7}{2}}$ b. $\dfrac{6s}{t}$
11. a. c^2 b. $\dfrac{2x}{3y}$

Exercise SET G: writing exercises

1. Show two different algebraic methods to simplify $4^{\frac{3}{2}}$. Explain all your steps.
2. Explain why the expression $(-16)^{\frac{3}{2}}$ cannot be evaluated.

Answer

1. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with $a^{\frac{1}{n}}$.			
simplify expressions with $a^{\frac{m}{n}}$.			
use the Laws of Exponents to simply expressions with rational exponents.			

Figure 8.3.4

b. What does this checklist tell you about your mastery of this section? What steps will you take to improve?

17.5: Add, Subtract, and Multiply Radical Expressions

Learning Objectives

By the end of this section, you will be able to:

- Add and subtract radical expressions
- Multiply radical expressions
- Use polynomial multiplication to multiply radical expressions

Before you get started, take this readiness quiz.

1. Add: $3x^2+9x-5-(x^2-2x+3)$.
   If you missed this problem, review Example 5.5.
2. Simplify: $(2+a)(4-a)$.
   If you missed this problem, review Example 5.28.
3. Simplify: $(9-5y)^2$.
   If you missed this problem, review Example 5.31.

Add and Subtract Radical Expressions

Adding radical expressions with the same index and the same radicand is just like adding like terms. We call radicals with the same index and the same radicand **like radicals** to remind us they work the same as like terms.

Definition 17.5.1: Like Radicals

Like radicals are radical expressions with the same index and the same radicand.

We add and subtract like radicals in the same way we add and subtract like terms. We know that $3x+8x$ is $11x$.Similarly we add $3\sqrt{x}+8\sqrt{x}$ and the result is $11\sqrt{x}$.

Think about adding like terms with variables as you do the next few examples. When you have like radicals, you just add or subtract the coefficients. When the radicals are not like, you cannot combine the terms.

Example 17.5.1

Simplify:

a. $2\sqrt{2}-7\sqrt{2}$
b. $5\sqrt[3]{y}+4\sqrt[3]{y}$
c. $7\sqrt[4]{x}-2\sqrt[4]{y}$

Solution:

a.

$$2\sqrt{2}-7\sqrt{2}$$

Since the radicals are like, we subtract the coefficients.

$$-5\sqrt{2}$$

b.

$$5\sqrt[3]{y}+4\sqrt[3]{y}$$

Since the radicals are like, we add the coefficients.

$$9\sqrt[3]{y}$$

c.

$$7\sqrt[4]{x}-2\sqrt[4]{y}$$

The indices are the same but the radicals are different. These are not like radicals. Since the radicals are not like, we cannot subtract them.

Exercise 17.5.1

Simplify:

a. $8\sqrt{2}-9\sqrt{2}$
b. $4\sqrt[3]{x}+7\sqrt[3]{x}$
c. $3\sqrt[4]{x}-5\sqrt[4]{y}$

Answer

a. $-\sqrt{2}$
b. $11\sqrt[3]{x}$
c. $3\sqrt[4]{x}-5\sqrt[4]{y}$

Exercise 17.5.2

Simplify:

a. $5\sqrt{3}-9\sqrt{3}$
b. $5\sqrt[3]{y}+3\sqrt[3]{y}$
c. $5\sqrt[4]{m}-2\sqrt[3]{m}$

Answer

a. $-4\sqrt{3}$
b. $8\sqrt[3]{y}$
c. $5\sqrt[4]{m}-2\sqrt[3]{m}$

For radicals to be like, they must have the same index and radicand. When the radicands contain more than one variable, as long as all the variables and their exponents are identical, the radicands are the same.

Example 17.5.2

Simplify:

a. $2\sqrt{5n}-6\sqrt{5n}+4\sqrt{5n}$
b. $\sqrt[4]{3xy}+5\sqrt[4]{3xy}-4\sqrt[4]{3xy}$

Solution:

a.

$$2\sqrt{5n}-6\sqrt{5n}+4\sqrt{5n}$$

Since the radicals are like, we combine them.

$$0\sqrt{5n}$$

Simplify.

$$0$$

b.

$$\sqrt[4]{3xy}+5\sqrt[4]{3xy}-4\sqrt[4]{3xy}$$

Since the radicals are like, we combine them.

$$2\sqrt[4]{3xy}$$

Exercise 17.5.3

Simplify:

a. $\sqrt{7x}-7\sqrt{7x}+4\sqrt{7x}$
b. $4\sqrt[4]{5xy}+2\sqrt[4]{5xy}-7\sqrt[4]{5xy}$

Answer

a. $-2\sqrt{7x}$
b. $-\sqrt[4]{5xy}$

Exercise 17.5.4

Simplify:

a. $4\sqrt{3y}-7\sqrt{3y}+2\sqrt{3y}$
b. $6\sqrt[3]{7mn}+\sqrt[3]{7mn}-4\sqrt[3]{7mn}$

Answer

a. $-\sqrt{3y}$
b. $3\sqrt[3]{7mn}$

Remember that we always simplify radicals by removing the largest factor from the radicand that is a power of the index. Once each radical is simplified, we can then decide if they are like radicals.

Example 17.5.3

Simplify:

a. $\sqrt{20}+3\sqrt{5}$
b. $\sqrt[3]{24}-\sqrt[3]{375}$
c. $\frac{1}{2}\sqrt[4]{48}-\frac{2}{3}\sqrt[4]{243}$

Solution:

a.

$$\sqrt{20}+3\sqrt{5}$$

Simplify the radicals, when possible.

$$\sqrt{4}\cdot\sqrt{5}+3\sqrt{5}$$
$$2\sqrt{5}+3\sqrt{5}$$

Combine the like radicals.

$$5\sqrt{5}$$

b.

$$\sqrt[3]{24}-\sqrt[3]{375}$$

Simplify the radicals.

$$\sqrt[3]{8}\cdot\sqrt[3]{3}-\sqrt[3]{125}\cdot\sqrt[3]{3}$$
$$2\sqrt[3]{3}-5\sqrt[3]{3}$$

Combine the like radicals.

$$-3\sqrt[3]{3}$$

c.

$$\frac{1}{2}\sqrt[4]{48}-\frac{2}{3}\sqrt[4]{243}$$

Simplify the radicals.

$$\frac{1}{2}\sqrt[4]{16}\cdot\sqrt[4]{3}-\frac{2}{3}\sqrt[4]{81}\cdot\sqrt[4]{3}$$
$$\frac{1}{2}\cdot 2\cdot\sqrt[4]{3}-\frac{2}{3}\cdot 3\cdot\sqrt[4]{3}$$
$$\sqrt[4]{3}-2\sqrt[4]{3}$$

Combine the like radicals.

$$-\sqrt[4]{3}$$

Exercise 17.5.5

Simplify:

a. $\sqrt{18}+6\sqrt{2}$
b. $6\sqrt[3]{16}-2\sqrt[3]{250}$
c. $\frac{2}{3}\sqrt[3]{81}-\frac{1}{2}\sqrt[3]{24}$

Answer

a. $9\sqrt{2}$
b. $2\sqrt[3]{2}$
c. $\sqrt[3]{3}$

Exercise 17.5.6

Simplify:

a. $\sqrt{27}+4\sqrt{3}$
b. $4\sqrt[3]{5}-7\sqrt[3]{40}$
c. $\frac{1}{2}\sqrt[3]{128}-\frac{5}{3}\sqrt[3]{54}$

Answer

a. $7\sqrt{3}$
b. $-10\sqrt[3]{5}$
c. $-3\sqrt[3]{2}$

In the next example, we will remove both constant and variable factors from the radicals. Now that we have practiced taking both the even and odd roots of variables, it is common practice at this point for us to assume all variables are greater than or equal to zero so that absolute values are not needed. We will use this assumption thoughout the rest of this chapter.

Example 17.5.4

Simplify:

a. $9\sqrt{50m^2}-6\sqrt{48m^2}$
b. $\sqrt[3]{54n^5}-\sqrt[3]{16n^5}$

Solution:

a.

$$9\sqrt{50m^2}-6\sqrt{48m^2}$$

Simplify the radicals.

$$9\sqrt{25m^2}\cdot\sqrt{2}-6\sqrt{16m^2}\cdot\sqrt{3}$$

$$9 \cdot 5m \cdot \sqrt{2} - 6 \cdot 4m \cdot \sqrt{3}$$

$$45m\sqrt{2} - 24m\sqrt{3}$$

The radicals are not like and so cannot be combined.

b.

$$\sqrt[3]{54n^5} - \sqrt[3]{16n^5}$$

Simplify the radicals.

$$\sqrt[3]{27n^3} \cdot \sqrt[3]{2n^2} - \sqrt[3]{8n^3} \cdot \sqrt[3]{2n^2}$$

$$3n\sqrt[3]{2n^2} - 2n\sqrt[3]{2n^2}$$

Combine the like radicals.

$$n\sqrt[3]{2n^2}$$

? Exercise 17.5.7

Simplify:

a. $\sqrt{32m^7} - \sqrt{50m^7}$
b. $\sqrt[3]{135x^7} - \sqrt[3]{40x^7}$

Answer

a. $-m^3\sqrt{2m}$
b. $x^2\sqrt[3]{5x}$

? Exercise 17.5.8

Simplify:

a. $\sqrt{27p^3} - \sqrt{48p^3}$
b. $\sqrt[3]{256y^5} - \sqrt[3]{32n^5}$

Answer

a. $-p\sqrt{3p}$
b. $4y\sqrt[3]{4y^2} - 2n\sqrt[3]{4n^2}$

Multiply Radical Expressions

We have used the **Product Property of Roots** to simplify square roots by removing the perfect square factors. We can use the Product Property of Roots 'in reverse' to multiply square roots. Remember, we assume all variables are greater than or equal to zero.

We will rewrite the Product Property of Roots so we see both ways together.

Definition 17.5.2: Product Property of Roots

For any real numbers, $\sqrt[n]{a}$ and $\sqrt[b]{n}$, and for any integer $n \geq 2$

$$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b} \quad \text{and} \quad \sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$$

When we multiply two radicals they must have the same index. Once we multiply the radicals, we then look for factors that are a power of the index and simplify the radical whenever possible.

Multiplying radicals with coefficients is much like multiplying variables with coefficients. To multiply $4x \cdot 3y$ we multiply the coefficients together and then the variables. The result is $12xy$. Keep this in mind as you do these examples.

Example 17.5.5

Simplify:

a. $(6\sqrt{2})(3\sqrt{10})$
b. $(-5\sqrt[3]{4})(-4\sqrt[3]{6})$

Solution:

a.

$$(6\sqrt{2})(3\sqrt{10})$$

Multiply using the Product Property.

$$18\sqrt{20}$$

Simplify the radical.

$$18\sqrt{4}\cdot\sqrt{5}$$

Simplify.

$$18\cdot 2\cdot\sqrt{5}$$
$$36\sqrt{5}$$

b.

$$(-5\sqrt[3]{4})(-4\sqrt[3]{6})$$

Multiply using the Product Property.

$$20\sqrt[3]{24}$$

Simplify the radical.

$$20\sqrt[3]{8}\cdot\sqrt[3]{3}$$

Simplify.

$$20\cdot 2\cdot\sqrt[3]{3}$$
$$40\sqrt[3]{3}$$

Exercise 17.5.9

Simplify:

a. $(3\sqrt{2})(2\sqrt{30})$
b. $(2\sqrt[3]{18})(-3\sqrt[3]{6})$

Answer

a. $12\sqrt{15}$
b. $-18\sqrt[3]{2}$

Exercise 17.5.10

Simplify:

a. $(3\sqrt{3})(3\sqrt{6})$
b. $(-4\sqrt[3]{9})(3\sqrt[3]{6})$

Answer

a. $27\sqrt{2}$
b. $-36\sqrt[3]{2}$

We follow the same procedures when there are variables in the radicands.

Example 17.5.6

Simplify:

a. $\left(10\sqrt{6p^3}\right)\left(4\sqrt{3p}\right)$
b. $\left(2\sqrt[4]{20y^2}\right)\left(3\sqrt[4]{28y^3}\right)$

Solution:

a.

$$\left(10\sqrt{6p^3}\right)\left(4\sqrt{3p}\right)$$

Multiply.

$$40\sqrt{18p^4}$$

Simplify the radical.

$$40\sqrt{9p^4}\cdot\sqrt{2}$$

Simplify.

$$40\cdot 3p^2\cdot\sqrt{3}$$
$$120p^2\sqrt{3}$$

b. When the radicands involve large numbers, it is often advantageous to factor them in order to find the perfect powers.

$$\left(2\sqrt[4]{20y^2}\right)\left(3\sqrt[4]{28y^3}\right)$$

Multiply.

$$6\sqrt[4]{4\cdot 5\cdot 4\cdot 7y^5}$$

Simplify the radical.

$$6\sqrt[4]{16y^4}\cdot\sqrt[4]{35y}$$

Simplify.

$$6\cdot 2y\sqrt[4]{35y}$$

Multiply.

$$12y\sqrt[4]{35y}$$

Exercise 17.5.11

Simplify:

a. $\left(6\sqrt{6x^2}\right)\left(8\sqrt{30x^4}\right)$
b. $\left(-4\sqrt[4]{12y^3}\right)\left(-\sqrt[4]{8y^3}\right)$

Answer

a. $36x^3\sqrt{5}$
b. $8y\sqrt[4]{3y^2}$

Exercise 17.5.12

Simplify:

a. $\left(2\sqrt{6y^4}\right)\left(12\sqrt{30y}\right)$
b. $\left(-4\sqrt[4]{9a^3}\right)\left(3\sqrt[4]{27a^2}\right)$

Answer

a. $144y^2\sqrt{5y}$
b. $-36\sqrt[4]{3a}$

Use Polynomial Multiplication to Multiply Radical Expressions

In the next a few examples, we will use the **Distributive Property** to multiply expressions with radicals. First we will distribute and then simplify the radicals when possible.

Example 17.5.7

Simplify:

a. $\sqrt{6}(\sqrt{2}+\sqrt{18})$
b. $\sqrt[3]{9}(5-\sqrt[3]{18})$

Solution:

a.

$$\sqrt{6}(\sqrt{2}+\sqrt{18})$$

Multiply.

$$\sqrt{12}+\sqrt{108}$$

Simplify.

$$\sqrt{4}\cdot\sqrt{3}+\sqrt{36}\cdot\sqrt{3}$$

Simplify.

$$2\sqrt{3}+6\sqrt{3}$$

Combine like radicals.

$$8\sqrt{3}$$

b.

$$\sqrt[3]{9}(5-\sqrt[3]{18})$$

Distribute.

$$5\sqrt[3]{9}-\sqrt[3]{162}$$

Simplify.

$$5\sqrt[3]{9}-\sqrt[3]{27}\cdot\sqrt[3]{6}$$

Simplify.

$$5\sqrt[3]{9}-3\sqrt[3]{6}$$

Exercise 17.5.13

Simplify:

a. $\sqrt{6}(1+3\sqrt{6})$
b. $\sqrt[3]{4}(-2-\sqrt[3]{6})$

Answer

a. $18+\sqrt{6}$
b. $-2\sqrt[3]{4}-2\sqrt[3]{3}$

https://math.libretexts.org/@go/page/46429

Exercise 17.5.14

Simplify:

a. $\sqrt{8}(2-5\sqrt{8})$
b. $\sqrt[3]{3}(-\sqrt[3]{9}-\sqrt[3]{6})$

Answer

a. $-40+4\sqrt{2}$
b. $-3-\sqrt[3]{18}$

When we worked with polynomials, we multiplied binomials by binomials. Remember, this gave us four products before we combined any like terms. To be sure to get all four products, we organized our work—usually by the FOIL method.

Example 17.5.8

Simplify:

a. $(3-2\sqrt{7})(4-2\sqrt{7})$
b. $(\sqrt[3]{x}-2)(\sqrt[3]{x}+4)$

Solution:

a.

$$(3-2\sqrt{7})(4-2\sqrt{7})$$

Multiply.

$$12-6\sqrt{7}-8\sqrt{7}+4\cdot 7$$

Simplify.

$$12-6\sqrt{7}-8\sqrt{7}+28$$

Combine like terms.

$$40-14\sqrt{7}$$

b.

$$(\sqrt[3]{x}-2)(\sqrt[3]{x}+4)$$

Multiply.

$$\sqrt[3]{x^2}+4\sqrt[3]{x}-2\sqrt[3]{x}-8$$

Combine like terms.

$$\sqrt[3]{x^2}+2\sqrt[3]{x}-8$$

Exercise 17.5.15

Simplify:

a. $(6-3\sqrt{7})(3+4\sqrt{7})$
b. $(\sqrt[3]{x}-2)(\sqrt[3]{x}-3)$

Answer

a. $-66+15\sqrt{7}$
b. $\sqrt[3]{x^2}-5\sqrt[3]{x}+6$

Exercise 17.5.16

Simplify:

a. $(2-3\sqrt{11})(4-\sqrt{11})$
b. $(\sqrt[3]{x}+1)(\sqrt[3]{x}+3)$

Answer

a. $41-14\sqrt{11}$
b. $\sqrt[3]{x^2}+4\sqrt[3]{x}+3$

Example 17.5.9

Simplify: $(3\sqrt{2}-\sqrt{5})(\sqrt{2}+4\sqrt{5})$

Solution:

$$(3\sqrt{2}-\sqrt{5})(\sqrt{2}+4\sqrt{5})$$

Multiply.

$$3\cdot 2+12\sqrt{10}-\sqrt{10}-4\cdot 5$$

Simplify.

$$6+12\sqrt{10}-\sqrt{10}-20$$

Combine like terms.

$$-14+11\sqrt{10}$$

Exercise 17.5.17

Simplify: $(5\sqrt{3}-\sqrt{7})(\sqrt{3}+2\sqrt{7})$

Answer

$1+9\sqrt{21}$

Exercise 17.5.18

Simplify: $(\sqrt{6}-3\sqrt{8})(2\sqrt{6}+\sqrt{8})$

Answer

$-12-20\sqrt{3}$

Recognizing some special products made our work easier when we multiplied binomials earlier. This is true when we multiply radicals, too. The special product formulas we used are shown here.

Special Products

Binomial Squares

$$(a+b)^2=a^2+2ab+b^2$$
$$(a-b)^2=a^2-2ab+b^2$$

Product of Conjugates

$$(a+b)(a-b)=a^2-b^2$$

We will use the special product formulas in the next few examples. We will start with the **Product of Binomial Squares Pattern**.

Example 17.5.10

Simplify:

a. $(2+\sqrt{3})^2$
b. $(4-2\sqrt{5})^2$

Solution:

a.

Table 8.4.1

	$(a+b)^2$ $(2+\sqrt{3})^2$
Multiply using the Product of Binomial Squares Pattern.	$a^2+2ab+b^2$ $2^2+2\cdot 2\cdot\sqrt{3}+(\sqrt{3})^2$
Simplify.	$4+4\sqrt{3}+3$
Combine like terms.	$7+4\sqrt{3}$

b.

Table 8.4.2

	$(a-b)^2$ $(4-2\sqrt{5})^2$
Multiple, using the Product of Binomial Squares Pattern.	$a^2-2ab+b^2$ $4^2-2\cdot 4\cdot 2\sqrt{5}+(2\sqrt{5})^2$
Simplify.	$16-16\sqrt{5}+4\cdot 5$
	$16-16\sqrt{5}+20$
Combine like terms.	$36-16\sqrt{5}$

Exercise 17.5.19

Simplify:

a. $(10+\sqrt{2})^2$
b. $(1+3\sqrt{6})^2$

Answer

a. $102+20\sqrt{2}$
b. $55+6\sqrt{6}$

Exercise 17.5.20

Simplify:

a. $(6-\sqrt{5})^2$
b. $(9-2\sqrt{10})^2$

Answer

a. $41-12\sqrt{5}$
b. $121-36\sqrt{10}$

In the next example, we will use the Product of Conjugates Pattern. Notice that the final product has no radical.

Example 17.5.11

Simplify: $(5-2\sqrt{3})(5+2\sqrt{3})$

Solution:

Table 8.4.3

	$(a-b)(a+b)$ $(5-2\sqrt{3})(5+2\sqrt{3})$
Multiply using the Product of Conjugates Pattern.	a^2-b^2 $5^2-(2\sqrt{3})^2$
Simplify.	$25-4\cdot 3$
	13

Exercise 17.5.21

Simplify: $(3-2\sqrt{5})(3+2\sqrt{5})$

Answer

-11

Exercise 17.5.22

Simplify: $(4+5\sqrt{7})(4-5\sqrt{7})$

Answer

-159

- Multiplying Conjugates

Key Concepts

- **Product Property of Roots**
  - For any real numbers, $\sqrt[n]{a}$ and $\sqrt[n]{b}$, and for any integer $n \geq 2$ $\sqrt[n]{ab}=\sqrt[n]{a}\cdot\sqrt[n]{b}$ and $\sqrt[n]{a}\cdot\sqrt[n]{b}=\sqrt[n]{ab}$
- **Special Products**

Binomial Squares	Product of Conjugates
$(a+b)^2=a^2+2ab+b^2$	$(a+b)(a-b)=a^2-b^2$
$(a-b)^2=a^2-2ab+b^2$	

Glossary

like radicals

Like radicals are radical expressions with the same index and the same radicand.

This page titled 17.5: Add, Subtract, and Multiply Radical Expressions is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

17.5E: Exercises

Practice Makes Perfect

Exercise A: add and subtract radical expressions

In the following exercises, simplify. Assume all variables are greater than or equal to zero so that absolute values are not needed.

1. a. $8\sqrt{2}-5\sqrt{2}$ b. $5\sqrt[3]{m}+2\sqrt[3]{m}$ c. $8\sqrt[4]{m}-2\sqrt[4]{n}$
2. a. $7\sqrt{2}-3\sqrt{2}$ b. $7\sqrt[3]{p}+2\sqrt[3]{p}$ c. $5\sqrt[3]{x}-3\sqrt[3]{x}$
3. a. $3\sqrt{5}+6\sqrt{5}$ b. $9\sqrt[3]{a}+3\sqrt[3]{a}$ c. $5\sqrt[4]{2z}+\sqrt[4]{2z}$
4. a. $4\sqrt{5}+8\sqrt{5}$ b. $\sqrt[3]{m}-4\sqrt[3]{m}$ c. $\sqrt{n}+3\sqrt{n}$
5. a. $3\sqrt{2a}-4\sqrt{2a}+5\sqrt{2a}$ b. $5\sqrt[4]{3ab}-3\sqrt[4]{3ab}-2\sqrt[4]{3ab}$
6. a. $\sqrt{11b}-5\sqrt{11b}+3\sqrt{11b}$ b. $8\sqrt[4]{11cd}+5\sqrt[4]{11cd}-9\sqrt[4]{11cd}$
7. a. $8\sqrt{3c}+2\sqrt{3c}-9\sqrt{3c}$ b. $2\sqrt[3]{4pq}-5\sqrt[3]{4pq}+4\sqrt[3]{4pq}$
8. a. $3\sqrt{5d}+8\sqrt{5d}-11\sqrt{5d}$ b. $11\sqrt[3]{2rs}-9\sqrt[3]{2rs}+3\sqrt[3]{2rs}$
9. a. $\sqrt{27}-\sqrt{75}$ b. $\sqrt[3]{40}-\sqrt[3]{320}$ c. $\frac{1}{2}\sqrt[4]{32}+\frac{2}{3}\sqrt[4]{162}$
10. a. $\sqrt{72}-\sqrt{98}$ b. $\sqrt[3]{24}+\sqrt[3]{81}$ c. $\frac{1}{2}\sqrt[4]{80}-\frac{2}{3}\sqrt[4]{405}$
11. a. $\sqrt{48}+\sqrt{27}$ b. $\sqrt[3]{54}+\sqrt[3]{128}$ c. $6\sqrt[4]{5}-\frac{3}{2}\sqrt[4]{320}$
12. a. $\sqrt{45}+\sqrt{80}$ b. $\sqrt[3]{81}-\sqrt[3]{192}$ c. $\frac{5}{2}\sqrt[4]{80}+\frac{7}{3}\sqrt[4]{405}$
13. a. $\sqrt{72a^5}-\sqrt{50a^5}$ b. $9\sqrt[4]{80p^4}-6\sqrt[4]{405p^4}$
14. a. $\sqrt{48b^5}-\sqrt{75b^5}$ b. $8\sqrt[3]{64q^6}-3\sqrt[3]{125q^6}$
15. a. $\sqrt{80c^7}-\sqrt{20c^7}$ b. $2\sqrt[4]{162r^{10}}+4\sqrt[4]{32r^{10}}$
16. a. $\sqrt{96d^9}-\sqrt{24d^9}$ b. $5\sqrt[4]{243s^6}+2\sqrt[4]{3s^6}$
17. $3\sqrt{128y^2}+4y\sqrt{162}-8\sqrt{98y^2}$
18. $3\sqrt{75y^2}+8y\sqrt{48}-\sqrt{300y^2}$

Answer

1. a. $3\sqrt{2}$ b. $7\sqrt[3]{m}$ c. $6\sqrt[4]{m}$
3. a. $9\sqrt{5}$ b. $12\sqrt[3]{a}$ c. $6\sqrt[4]{2z}$
5. a. $4\sqrt{2a}$ b. 0
7. a. $\sqrt{3c}$ b. $\sqrt[3]{4pq}$
9. a. $-2\sqrt{3}$ b. $-2\sqrt[3]{5}$ c. $3\sqrt[4]{2}$

11. a. $7\sqrt{3}$ b. $7\sqrt[3]{2}$ c. $3\sqrt[4]{5}$

13. a. $a^2\sqrt{2a}$ b. 0

15. a. $2c^3\sqrt{5c}$ b. $14r^2\sqrt[4]{2r^2}$

17. $4y\sqrt{2}$

Exercise B: multiply radical expressions

In the following exercises, simplify.

1. a. $(-2\sqrt{3})(3\sqrt{18})$

   b. $(8\sqrt[3]{4})(-4\sqrt[3]{18})$

   c.

2. a. $(-4\sqrt{5})(5\sqrt{10})$

   b. $(-2\sqrt[3]{9})(7\sqrt[3]{9})$

   c.

3. a. $(5\sqrt{6})(-\sqrt{12})$

   b. $(-2\sqrt[4]{18})(-\sqrt[4]{9})$

   c.

4. a. $(-2\sqrt{7})(-2\sqrt{14})$

   b. $(-3\sqrt[4]{8})(-5\sqrt[4]{6})$

   c.

5. a. $\left(4\sqrt{12z^3}\right)\left(3\sqrt{9z}\right)$

   b. $\left(5\sqrt[3]{3x^3}\right)\left(3\sqrt[3]{18x^3}\right)$

c.

6. a. $\left(3\sqrt{2x^3}\right)\left(7\sqrt{18x^2}\right)$

   b. $\left(-6\sqrt[3]{20a^2}\right)\left(-2\sqrt[3]{16a^3}\right)$

   c.

7. a. $\left(-2\sqrt{7z^3}\right)\left(3\sqrt{14z^8}\right)$

   b. $\left(2\sqrt[4]{8y^2}\right)\left(-2\sqrt[4]{12y^3}\right)$

   c.

8. a. $\left(4\sqrt{2k^5}\right)\left(-3\sqrt{32k^6}\right)$

   b. $\left(-\sqrt[4]{6b^3}\right)\left(3\sqrt[4]{8b^3}\right)$

   c.

Answer

1.

   a. $-18\sqrt{6}$

   b. $-64\sqrt[3]{9}$

   c.

3.

   a. $-30\sqrt{2}$

   b. $6\sqrt[4]{2}$

c.

5.

a. $72z^2\sqrt{3}$

b. $45x^2\sqrt[3]{2}$

c.

7.

a. $-42z^5\sqrt{2z}$

b. $-8y\sqrt[4]{6y}$

Exercise C: use polynomial multiplication to multiply radical expressions

In the following exercises, multiply.

1. a. $\sqrt{7}(5+2\sqrt{7})$

   b. $\sqrt[3]{6}(4+\sqrt[3]{18})$

   c.

2. a. $\sqrt{11}(8+4\sqrt{11})$

   b. $\sqrt[3]{3}(\sqrt[3]{9}+\sqrt[3]{18})$

   c.

3. a. $\sqrt{11}(-3+4\sqrt{11})$

   b. $\sqrt[4]{3}(\sqrt[4]{54}+\sqrt[4]{18})$

   c.

4. a. $\sqrt{2}(-5+9\sqrt{2})$

   b. $\sqrt[4]{2}(\sqrt[4]{12}+\sqrt[4]{24})$

https://math.libretexts.org/@go/page/46430

c.

5. $(7+\sqrt{3})(9-\sqrt{3})$

6. $(8-\sqrt{2})(3+\sqrt{2})$

7. a. $(9-3\sqrt{2})(6+4\sqrt{2})$

   b. $(\sqrt[3]{x}-3)(\sqrt[3]{x}+1)$

   c.

8. a. $(3-2\sqrt{7})(5-4\sqrt{7})$

   b. $(\sqrt[3]{x}-5)(\sqrt[3]{x}-3)$

   c.

9. a. $(1+3\sqrt{10})(5-2\sqrt{10})$

   b. $(2\sqrt[3]{x}+6)(\sqrt[3]{x}+1)$

   c.

10. a. $(7-2\sqrt{5})(4+9\sqrt{5})$

    b. $(3\sqrt[3]{x}+2)(\sqrt[3]{x}-2)$

    c.

11. $(\sqrt{3}+\sqrt{10})(\sqrt{3}+2\sqrt{10})$

12. $(\sqrt{11}+\sqrt{5})(\sqrt{11}+6\sqrt{5})$

13. $(2\sqrt{7}-5\sqrt{11})(4\sqrt{7}+9\sqrt{11})$

14. $(4\sqrt{6}+7\sqrt{13})(8\sqrt{6}-3\sqrt{13})$

15. a. $(3+\sqrt{5})^2$

    b. $(2-5\sqrt{3})^2$

    c.

16. a. $(4+\sqrt{11})^2$

    b. $(3-2\sqrt{5})^2$

    c.

17. a. $(9-\sqrt{6})^2$

    b. $(10+3\sqrt{7})^2$

    c.

18. a. $(5-\sqrt{10})^2$

    b. $(8+3\sqrt{2})^2$

    c.

19. $(4+\sqrt{2})(4-\sqrt{2})$

20. $(7+\sqrt{10})(7-\sqrt{10})$

21. $(4+9\sqrt{3})(4-9\sqrt{3})$

22. $(1+8\sqrt{2})(1-8\sqrt{2})$

23. $(12-5\sqrt{5})(12+5\sqrt{5})$

24. $(9-4\sqrt{3})(9+4\sqrt{3})$

25. $(\sqrt[3]{3x}+2)(\sqrt[3]{3x}-2)$

26. $(\sqrt[3]{4x}+3)(\sqrt[3]{4x}-3)$

Answer

1.

a. $14+5\sqrt{7}$

b. $4\sqrt[3]{6}+3\sqrt[3]{4}$

c.

3.

a. $44-3\sqrt{11}$

b. $3\sqrt[4]{2}+\sqrt[4]{54}$

c.

5. $60+2\sqrt{3}$

7.

a. $30+18\sqrt{2}$

b. $\sqrt[3]{x^2}-2\sqrt[3]{x}-3$

c.

9.

a. $-54+13\sqrt{10}$

b. $2\sqrt[3]{x^2}+8\sqrt[3]{x}+6$

c.

11. $23+3\sqrt{30}$

13. $-439-2\sqrt{77}$

15.

a. $14+6\sqrt{5}$

b. $79-20\sqrt{3}$

17.

a. $87-18\sqrt{6}$

b. $163+60\sqrt{7}$

19. 14

21. -227

23. 19

25. $\sqrt[3]{9x^2}-4$

Exercise D: mixed practice

1. $\frac{2}{3}\sqrt{27}+\frac{3}{4}\sqrt{48}$
2. $\sqrt{175k^4}-\sqrt{63k^4}$
3. $\frac{5}{6}\sqrt{162}+\frac{3}{16}\sqrt{128}$
4. $\sqrt[3]{24}+\sqrt[3]{81}$
5. $\frac{1}{2}\sqrt[4]{80}-\frac{2}{3}\sqrt[4]{405}$
6. $8\sqrt[4]{13}-4\sqrt[4]{13}-3\sqrt[4]{13}$
7. $5\sqrt{12c^4}-3\sqrt{27c^6}$
8. $\sqrt{80a^5}-\sqrt{45a^5}$
9. $\frac{3}{5}\sqrt{75}-\frac{1}{4}\sqrt{48}$
10. $21\sqrt[3]{9}-2\sqrt[3]{9}$
11. $8\sqrt[3]{64q^6}-3\sqrt[3]{125q^6}$
12. $11\sqrt{11}-10\sqrt{11}$
13. $\sqrt{3}\cdot\sqrt{21}$
14. $(4\sqrt{6})(-\sqrt{18})$
15. $(7\sqrt[3]{4})(-3\sqrt[3]{18})$
16. $\left(4\sqrt{12x^5}\right)\left(2\sqrt{6x^3}\right)$
17. $(\sqrt{29})^2$
18. $(-4\sqrt{17})(-3\sqrt{17})$
19. $(-4+\sqrt{17})(-3+\sqrt{17})$
20. $\left(3\sqrt[4]{8a^2}\right)\left(\sqrt[4]{12a^3}\right)$

21. $(6-3\sqrt{2})^2$

22. $\sqrt{3}(4-3\sqrt{3})$

23. $\sqrt[3]{3}(2\sqrt[3]{9}+\sqrt[3]{18})$

24. $(\sqrt{6}+\sqrt{3})(\sqrt{6}+6\sqrt{3})$

Answer

1. $5\sqrt{3}$
3. $9\sqrt{2}$
5. $-\sqrt[4]{5}$
7. $10c^2\sqrt{3}-9c^3\sqrt{3}$
9. $2\sqrt{3}$
11. $17q^2$
13. $3\sqrt{7}$
15. $-42\sqrt[3]{9}$
17. 29
19. $29-7\sqrt{17}$
21. $72-36\sqrt{2}$
23. $6+3\sqrt[3]{2}$

Exercise E: writing exercises

1. Explain when a radical expression is in simplest form.
2. Explain the process for determining whether two radicals are like or unlike. Make sure your answer makes sense for radicals containing both numbers and variables.
3. a. Explain why $(-\sqrt{n})^2$ is always non-negative, for $n \geq 0$.
   b. Explain why $-(\sqrt{n})^2$ is always non-positive, for $n \geq 0$.
4. Use the binomial square pattern to simplify $(3+\sqrt{2})^2$. Explain all your steps.

Answer

1. Answers will vary
3. Answers will vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add and subtract radical expressions.			
multiply radical expressions.			
use polynomial multiplication to multiply radical expressions.			

Figure 8.4.14

b. On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

This page titled 17.5E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

17.6: Divide Radical Expressions

Learning Objectives

By the end of this section, you will be able to:

- Divide radical expressions
- Rationalize a one term denominator
- Rationalize a two term denominator

Before you get started, take this readiness quiz.

1. Simplify: $\frac{30}{48}$.
   If you missed this problem, review Example 1.24.
2. Simplify: $x^2 \cdot x^4$.
   If you missed this problem, review Example 5.12.
3. Multiply: $(7+3x)(7-3x)$.
   If you missed this problem, review Example 5.32.

Divide Radical Expressions

We have used the **Quotient Property of Radical Expressions** to simplify roots of fractions. We will need to use this property 'in reverse' to simplify a fraction with radicals. We give the Quotient Property of Radical Expressions again for easy reference. Remember, we assume all variables are greater than or equal to zero so that no absolute value bars re needed.

Definition 17.6.1: Quotient Property of Radical Expressions

If $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers, $b \neq 0$, and for any integer $n \geq 2$ then,

$$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}} \quad \text{and} \quad \frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$$

We will use the Quotient Property of Radical Expressions when the fraction we start with is the quotient of two radicals, and neither radicand is a perfect power of the index. When we write the fraction in a single radical, we may find common factors in the numerator and denominator.

Example 17.6.1

Simplify:

a. $\frac{\sqrt{72x^3}}{\sqrt{162x}}$

b. $\frac{\sqrt[3]{32x^2}}{\sqrt[3]{4x^5}}$

Solution:

a.

$$\frac{\sqrt{72x^3}}{\sqrt{162x}}$$

Rewrite using the quotient property,

$$\sqrt{\frac{72x^3}{162x}}$$

Remove common factors.

$$\sqrt{\frac{\cancel{18}\cdot 4\cdot x^2\cdot \cancel{x}}{\cancel{18}\cdot 9\cdot \cancel{x}}}$$

Simplify.

$$\sqrt{\frac{4x^2}{9}}$$

Simplify the radical.

$$\frac{2x}{3}$$

b.

$$\frac{\sqrt[3]{32x^2}}{\sqrt[3]{4x^5}}$$

Rewrite using the quotient property, $\frac{\sqrt[n]{a}}{\sqrt[n]{b}}=\sqrt[n]{\frac{a}{b}}$.

$$\sqrt[3]{\frac{32x^2}{4x^5}}$$

Simplify the fraction under the radical.

$$\sqrt[3]{\frac{8}{x^3}}$$

Simplify the radical.

$$\frac{2}{x}$$

Exercise 17.6.1

Simplify:

a. $\frac{\sqrt{50s^3}}{\sqrt{128s}}$

b. $\frac{\sqrt[3]{56a}}{\sqrt[3]{7a^4}}$

Answer

a. $\frac{5s}{8}$

b. $\frac{2}{a}$

Exercise 17.6.2

Simplify:

a. $\frac{\sqrt{75q^5}}{\sqrt{108q}}$

b. $\frac{\sqrt[3]{72b^2}}{\sqrt[3]{9b^5}}$

Answer

a. $\frac{5q^2}{6}$

b. $\frac{2}{b}$

Example 17.6.2

Simplify:

a. $\frac{\sqrt{147ab^8}}{\sqrt{3a^3b^4}}$

b. $\frac{\sqrt[3]{-250mn^{-2}}}{\sqrt[3]{2m^{-2}n^4}}$

Solution:

a.

$$\frac{\sqrt{147ab^8}}{\sqrt{3a^3b^4}}$$

Rewrite using the quotient property.

$$\sqrt{\frac{147ab^8}{3a^3b^4}}$$

Remove common factors in the fraction.

$$\sqrt{\frac{49b^4}{a^2}}$$

Simplify the radical.

$$\frac{7b^2}{a}$$

b.

$$\frac{\sqrt[3]{-250mn^{-2}}}{\sqrt[3]{2m^{-2}n^4}}$$

Rewrite using the quotient property.

$$\sqrt[3]{\frac{-250mn^{-2}}{2m^{-2}n^4}}$$

Simplify the fraction under the radical.

$$\sqrt[3]{\frac{-125m^3}{n^6}}$$

Simplify the radical.

$$-\frac{5m}{n^2}$$

Exercise 17.6.3

Simplify:

a. $\frac{\sqrt{162x^{10}y^2}}{\sqrt{2x^6y^6}}$

b. $\frac{\sqrt[3]{-128x^2y^{-1}}}{\sqrt[3]{2x^{-1}y^2}}$

Answer

a. $\frac{9x^2}{y^2}$
b. $\frac{-4x}{y}$

Exercise 17.6.4

Simplify:

a. $\frac{\sqrt{300m^3n^7}}{\sqrt{3m^5n}}$
b. $\frac{\sqrt[3]{-81pq^{-1}}}{\sqrt[3]{3p^{-2}q^5}}$

Answer

a. $\frac{10n^3}{m}$
b. $\frac{-3p}{q^2}$

Example 17.6.3

Simplify: $\frac{\sqrt{54x^5y^3}}{\sqrt{3x^2y}}$

Solution:

$$\frac{\sqrt{54x^5y^3}}{\sqrt{3x^2y}}$$

Rewrite using the quotient property.

$$\sqrt{\frac{54x^5y^3}{3x^2y}}$$

Remove common factors in the fraction.

$$\sqrt{18x^3y^2}$$

Rewrite the radicand as a product using the largest perfect square factor.

$$\sqrt{9x^2y^2\cdot 2x}$$

Rewrite the radical as the product of two radicals.

$$\sqrt{9x^2y^2}\cdot\sqrt{2x}$$

Simplify.

$$3xy\sqrt{2x}$$

Exercise 17.6.5

Simplify: $\frac{\sqrt{64x^4y^5}}{\sqrt{2xy^3}}$

Answer

$4xy\sqrt{2x}$

Exercise 17.6.6

Simplify: $\frac{\sqrt{96a^5b^4}}{\sqrt{2a^3b}}$

Answer

$4ab\sqrt{3b}$

Rationalize a One Term Denominator

Before the calculator became a tool of everyday life, approximating the value of a fraction with a radical in the denominator was a very cumbersome process!

For this reason, a process called **rationalizing the denominator** was developed. A fraction with a radical in the denominator is converted to an equivalent fraction whose denominator is an integer. Square roots of numbers that are not perfect squares are irrational numbers. When we rationalize the denominator, we write an equivalent fraction with a rational number in the denominator. This process is still used today, and is useful in other areas of mathematics, too.

Definition 17.6.2: Rationalizing the Denominator

Rationalizing the denominator is the process of converting a fraction with a radical in the denominator to an equivalent fraction whose denominator is an integer.

Even though we have calculators available nearly everywhere, a fraction with a radical in the denominator still must be rationalized. It is not considered simplified if the denominator contains a radical.

Similarly, a **radical expression** is not considered simplified if the radicand contains a fraction.

Simplified Radical Expressions

A radical expression is considered simplified if there are

- no factors in the radicand have perfect powers of the index
- no fractions in the radicand
- no radicals in the denominator of a fraction

To rationalize a denominator with a square root, we use the property that $(\sqrt{a})^2 = a$. If we square an irrational square root, we get a rational number.

We will use this property to rationalize the denominator in the next example.

Example 17.6.4

Simplify:

a. $\frac{4}{\sqrt{3}}$

b. $\sqrt{\frac{3}{20}}$

c. $\frac{3}{\sqrt{6x}}$

Solution:

To rationalize a denominator with one term, we can multiply a square root by itself. To keep the fraction equivalent, we multiply both the numerator and denominator by the same factor.

a.

Table 8.5.1

	$\frac{4}{\sqrt{3}}$
Multiply both the numerator and denominator by $\sqrt{3}$.	$\frac{4 \cdot \sqrt{3}}{\sqrt{3} \cdot \sqrt{3}}$
Simplify.	$\frac{4\sqrt{3}}{3}$

b. We always simplify the radical in the denominator first, before we rationalize it. This way the numbers stay smaller and easier to work with.

Table 8.5.2

	$\sqrt{\frac{3}{20}}$
The fraction is not a perfect square, so rewrite using the Quotient Property.	$\frac{\sqrt{3}}{\sqrt{20}}$
Simplify the denominator.	$\frac{\sqrt{3}}{2\sqrt{5}}$
Multiply the numerator and denominator by $\sqrt{5}$.	$\frac{\sqrt{3} \cdot \sqrt{5}}{2\sqrt{5} \cdot \sqrt{5}}$
Simplify.	$\frac{\sqrt{15}}{2 \cdot 5}$
Simplify.	$\frac{\sqrt{15}}{10}$

c.

Table 8.5.3

	$\frac{3}{\sqrt{6x}}$
Multiply the numerator and denominator by $\sqrt{6x}$.	$\frac{3 \cdot \sqrt{6x}}{\sqrt{6x} \cdot \sqrt{6x}}$
Simplify.	$\frac{3\sqrt{6x}}{6x}$
Simplify.	$\frac{\sqrt{6x}}{2x}$

? Exercise 17.6.7

Simplify:

a. $\frac{5}{\sqrt{3}}$

b. $\sqrt{\frac{3}{32}}$

c. $\frac{2}{\sqrt{2x}}$

Answer

a. $\frac{5\sqrt{3}}{3}$

b. $\frac{\sqrt{6}}{8}$

c. $\dfrac{\sqrt{2x}}{x}$

Exercise 17.6.8

Simplify:

a. $\dfrac{6}{\sqrt{5}}$

b. $\sqrt{\dfrac{7}{18}}$

c. $\dfrac{5}{\sqrt{5x}}$

Answer

a. $\dfrac{6\sqrt{5}}{5}$

b. $\dfrac{\sqrt{14}}{6}$

c. $\dfrac{\sqrt{5x}}{x}$

When we rationalized a square root, we multiplied the numerator and denominator by a square root that would give us a perfect square under the radical in the denominator. When we took the square root, the denominator no longer had a radical.

We will follow a similar process to rationalize higher roots. To rationalize a denominator with a higher index radical, we multiply the numerator and denominator by a radical that would give us a radicand that is a perfect power of the index. When we simplify the new radical, the denominator will no longer have a radical.

For example,

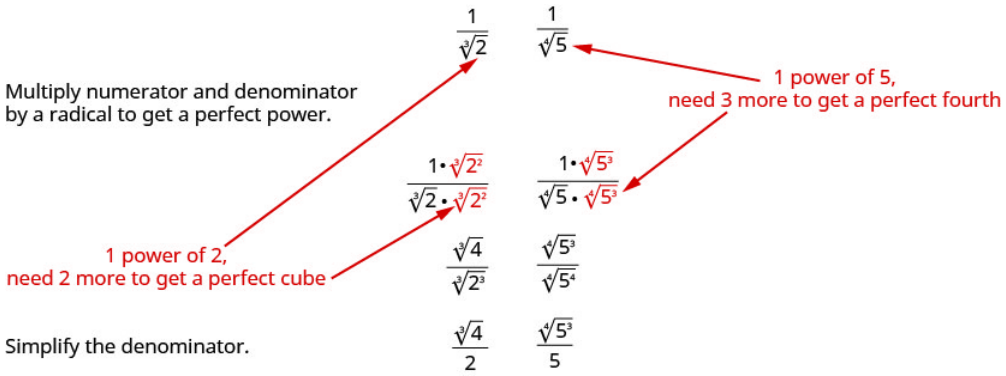

Figure 8.5.14

We will use this technique in the next examples.

Example 17.6.5

Simplify:

a. $\dfrac{1}{\sqrt[3]{6}}$

b. $\sqrt[3]{\dfrac{7}{24}}$

c. $\dfrac{3}{\sqrt[3]{4x}}$

Solution:

To rationalize a denominator with a cube root, we can multiply by a cube root that will give us a perfect cube in the radicand in the denominator. To keep the fraction equivalent, we multiply both the numerator and denominator by the same factor.

a.

Table 8.5.4

	$\frac{1}{\sqrt[3]{6}}$
The radical in the denominator has one factor of 6. Multiply both the numerator and denominator by $\sqrt[3]{6^2}$, which gives us 2 more factors of 6.	$\frac{1 \cdot \sqrt[3]{6^2}}{\sqrt[3]{6} \cdot \sqrt[3]{6^2}}$
Multiply. Notice the radicand in the denominator has 3 powers of 6.	$\frac{\sqrt[3]{6^2}}{\sqrt[3]{6^3}}$
Simplify the cube root in the denominator.	$\frac{\sqrt[3]{36}}{6}$

b. We always simplify the radical in the denominator first, before we rationalize it. This way the numbers stay smaller and easier to work with.

Table 8.5.5

	$\sqrt[3]{\frac{7}{24}}$
The fraction is not a perfect cube, so rewrite using the Quotient Property.	$\frac{\sqrt[3]{7}}{\sqrt[3]{24}}$
Simplify the denominator.	$\frac{\sqrt[3]{7}}{2\sqrt[3]{3}}$
Multiply the numerator and denominator by $\sqrt[3]{3^2}$. This will give us 3 factors of 3.	$\frac{\sqrt[3]{7} \cdot \sqrt[3]{3^2}}{2\sqrt[3]{3} \cdot \sqrt[3]{3^2}}$
Simplify.	$\frac{\sqrt[3]{63}}{2\sqrt[3]{3^3}}$
Remember, $\sqrt[3]{3^3} = 3$.	$\frac{\sqrt[3]{63}}{2 \cdot 3}$
Simplify.	$\frac{\sqrt[3]{63}}{6}$

c.

Table 8.5.6

	$\frac{3}{\sqrt[3]{4x}}$
Rewrite the radicand to show the factors.	$\frac{3}{\sqrt[3]{2^2 \cdot x}}$
Multiple the numerator and denominator by $\sqrt[3]{2 \cdot x^2}$. This will get us 3 factors of 2 and 3 factors of x.	$\frac{3 \cdot \sqrt[3]{2 \cdot x^2}}{\sqrt[3]{2^2 x} \cdot \sqrt[3]{2 \cdot x^2}}$
Simplify.	$\frac{3\sqrt[3]{2x^2}}{\sqrt[3]{2^3 x^3}}$
Simplify the radical in the denominator.	$\frac{3\sqrt[3]{2x^2}}{2x}$

Exercise 17.6.9

Simplify:

a. $\frac{1}{\sqrt[3]{7}}$

b. $\sqrt[3]{\frac{5}{12}}$

c. $\frac{5}{\sqrt[3]{9y}}$

Answer

a. $\frac{\sqrt[3]{49}}{7}$

b. $\frac{\sqrt[3]{90}}{6}$

c. $\frac{5\sqrt[3]{3y^2}}{3y}$

Exercise 17.6.10

Simplify:

a. $\frac{1}{\sqrt[3]{2}}$

b. $\sqrt[3]{\frac{3}{20}}$

c. $\frac{2}{\sqrt[3]{25n}}$

Answer

a. $\frac{\sqrt[3]{4}}{2}$

b. $\frac{\sqrt[3]{150}}{10}$

c. $\frac{2\sqrt[3]{5n^2}}{5n}$

Example 17.6.6

Simplify:

a. $\frac{1}{\sqrt[4]{2}}$

b. $\sqrt[4]{\frac{5}{64}}$

c. $\frac{2}{\sqrt[4]{8x}}$

Solution:

To rationalize a denominator with a fourth root, we can multiply by a fourth root that will give us a perfect fourth power in the radicand in the denominator. To keep the fraction equivalent, we multiply both the numerator and denominator by the same factor.

a.

Table 8.5.7

	$\frac{1}{\sqrt[4]{2}}$
The radical in the denominator has one factor of 2. Multiply both the numerator and denominator by $\sqrt[4]{2^3}$, which gives us 3 more factors of 2.	$\frac{1 \cdot \sqrt[4]{2^3}}{\sqrt[4]{2} \cdot \sqrt[4]{2^3}}$
Multiply. Notice the radicand in the denominator has 4 powers of 2.	$\frac{\sqrt[4]{8}}{\sqrt[4]{2^4}}$
Simplify the fourth root in the denominator.	$\frac{\sqrt[4]{8}}{2}$

b. We always simplify the radical in the denominator first, before we rationalize it. This way the numbers stay smaller and easier to work with.

Table 8.5.8

	$\sqrt[4]{\frac{5}{64}}$
The fraction is not a perfect fourth power, so rewrite using the Quotient Property.	$\frac{\sqrt[4]{5}}{\sqrt[4]{64}}$
Rewrite the radicand in the denominator to show the factors.	$\frac{\sqrt[4]{5}}{\sqrt[4]{2^6}}$
Simplify the denominator.	$\frac{\sqrt[4]{5}}{2\sqrt[4]{2^2}}$
Multiply the numerator and denominator by $\sqrt[4]{2^2}$. This will give us 4 factors of 2.	$\frac{\sqrt[4]{5} \cdot \sqrt[4]{2^2}}{2\sqrt[4]{2^2} \cdot \sqrt[4]{2^2}}$
Simplify.	$\frac{\sqrt[4]{5} \cdot \sqrt[4]{4}}{2\sqrt[4]{2^4}}$
Remember, $\sqrt[4]{2^4} = 2$.	$\frac{\sqrt[4]{20}}{2 \cdot 2}$
Simplify.	$\frac{\sqrt[4]{20}}{4}$

c.

Table 8.5.9

	$\frac{2}{\sqrt[4]{8x}}$
Rewrite the radicand to show the factors.	$\frac{2}{\sqrt[4]{2^3 \cdot x}}$
Multiply the numerator and denominator by $\sqrt[4]{2 \cdot x^3}$. This will get us 4 factors of 2 and 4 factors of x.	$\frac{2 \cdot \sqrt[4]{2 \cdot x^3}}{\sqrt[4]{2^3 x} \cdot \sqrt[4]{2 \cdot x^3}}$
Simplify.	$\frac{2\sqrt[4]{2x^3}}{\sqrt[4]{2^4 x^4}}$
Simplify the radical in the denominator.	$\frac{2\sqrt[4]{2x^3}}{2x}$
Simplify the fraction.	$\frac{\sqrt[4]{2x^3}}{x}$

Exercise 17.6.11

Simplify:

a. $\frac{1}{\sqrt[4]{3}}$

b. $\sqrt[4]{\frac{3}{64}}$

c. $\frac{3}{\sqrt[4]{125x}}$

Answer

a. $\frac{\sqrt[4]{27}}{3}$

b. $\frac{\sqrt[4]{12}}{4}$

c. $\frac{3\sqrt[4]{5x^3}}{5x}$

Exercise 17.6.12

Simplify:

a. $\frac{1}{\sqrt[4]{5}}$

b. $\sqrt[4]{\frac{7}{128}}$

c. $\frac{4}{\sqrt[4]{4x}}$

Answer

a. $\frac{\sqrt[4]{125}}{5}$

b. $\frac{\sqrt[4]{224}}{8}$

c. $\frac{\sqrt[4]{64x^3}}{x}$

Rationalize a Two Term Denominator

When the denominator of a fraction is a sum or difference with square roots, we use the **Product of Conjugates Pattern** to **rationalize the denominator**.

$$(a-b)(a+b) \qquad (2-\sqrt{5})(2+\sqrt{5})$$
$$a^2-b^2 \qquad 2^2-(\sqrt{5})^2$$
$$4-5$$
$$-1$$

When we multiple a binomial that includes a square root by its conjugate, the product has no square roots.

Example 17.6.7

Simplify: $\frac{5}{2-\sqrt{3}}$

Solution:

Table 8.5.10

	$\frac{5}{2-\sqrt{3}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{5(2+\sqrt{3})}{(2-\sqrt{3})(2+\sqrt{3})}$
Multiply the conjugates in the denominator.	$\frac{5(2+\sqrt{3})}{2^2-(\sqrt{3})^2}$
Simplify the denominator.	$\frac{5(2+\sqrt{3})}{4-3}$
Simplify the denominator.	$\frac{5(2+\sqrt{3})}{1}$
Simplify.	$5(2+\sqrt{3})$

? Exercise 17.6.13

Simplify: $\frac{3}{1-\sqrt{5}}$.

Answer

$-\frac{3(1+\sqrt{5})}{4}$

? Exercise 17.6.14

Simplify: $\frac{2}{4-\sqrt{6}}$.

Answer

$\frac{4+\sqrt{6}}{5}$

Notice we did not distribute the 5 in the answer of the last example. By leaving the result factored we can see if there are any factors that may be common to both the numerator and denominator.

✓ Example 17.6.8

Simplify: $\frac{\sqrt{3}}{\sqrt{u}-\sqrt{6}}$.

Solution:

Table 8.5.11

	$\frac{\sqrt{3}}{\sqrt{u}-\sqrt{6}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{\sqrt{3}(\sqrt{u}+\sqrt{6})}{(\sqrt{u}-\sqrt{6})(\sqrt{u}+\sqrt{6})}$
Multiply the conjugates in the denominator.	$\frac{\sqrt{3}(\sqrt{u}+\sqrt{6})}{(\sqrt{u})^2-(\sqrt{6})^2}$
Simplify the denominator.	$\frac{\sqrt{3}(\sqrt{u}+\sqrt{6})}{u-6}$

Exercise 17.6.15

Simplify: $\dfrac{\sqrt{5}}{\sqrt{x}+\sqrt{2}}$.

Answer

$$\frac{\sqrt{5}(\sqrt{x}-\sqrt{2})}{x-2}$$

Exercise 17.6.16

Simplify: $\dfrac{\sqrt{10}}{\sqrt{y}-\sqrt{3}}$

Answer

$$\frac{\sqrt{10}(\sqrt{y}+\sqrt{3})}{y-3}$$

Be careful of the signs when multiplying. The numerator and denominator look very similar when you multiply by the conjugate.

Example 17.6.9

Simplify: $\dfrac{\sqrt{x}+\sqrt{7}}{\sqrt{x}-\sqrt{7}}$.

Solution:

Table 8.5.12

	$\frac{\sqrt{x}+\sqrt{7}}{\sqrt{x}-\sqrt{7}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{(\sqrt{x}+\sqrt{7})(\sqrt{x}+\sqrt{7})}{(\sqrt{x}-\sqrt{7})(\sqrt{x}+\sqrt{7})}$
Multiply the conjugates in the denominator.	$\frac{(\sqrt{x}+\sqrt{7})(\sqrt{x}+\sqrt{7})}{(\sqrt{x})^2-(\sqrt{7})^2}$
Simplify the denominator.	$\frac{(\sqrt{x}+\sqrt{7})^2}{x-7}$

We do not square the numerator. Leaving it in factored form, we can see there are no common factors to remove from the numerator and denominator.

Exercise 17.6.17

Simplify: $\dfrac{\sqrt{p}+\sqrt{2}}{\sqrt{p}-\sqrt{2}}$.

Answer

$$\frac{(\sqrt{p}+\sqrt{2})^2}{p-2}$$

Exercise 17.6.18

Simplify: $\dfrac{\sqrt{q}-\sqrt{10}}{\sqrt{q}+\sqrt{10}}$

Answer

$$\frac{(\sqrt{q}-\sqrt{10})^2}{q-10}$$

Key Concepts

- **Quotient Property of Radical Expressions**
  - If $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers, $b \neq 0$, and for any integer $n \geq 2$ then, $\sqrt[n]{\dfrac{a}{b}} = \dfrac{\sqrt[n]{a}}{\sqrt[n]{b}}$ and $\dfrac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\dfrac{a}{b}}$
- **Simplified Radical Expressions**
  - A radical expression is considered simplified if there are:
    - no factors in the radicand that have perfect powers of the index
    - no fractions in the radicand
    - no radicals in the denominator of a fraction

Glossary

rationalizing the denominator

Rationalizing the denominator is the process of converting a fraction with a radical in the denominator to an equivalent fraction whose denominator is an integer.

17.6E: Exercises

Practice Makes Perfect

Exercise SET A: divide square roots

In the following exercises, simplify.

1. a. $\frac{\sqrt{128}}{\sqrt{72}}$ b. $\frac{\sqrt[3]{128}}{\sqrt[3]{54}}$
2. a. $\frac{\sqrt{48}}{\sqrt{75}}$ b. $\frac{\sqrt[3]{81}}{\sqrt[3]{24}}$
3. a. $\frac{\sqrt{200m^5}}{\sqrt{98m}}$ b. $\frac{\sqrt[3]{54y^2}}{\sqrt[3]{2y^5}}$
4. a. $\frac{\sqrt{108n^7}}{\sqrt{243n^3}}$ b. $\frac{\sqrt[3]{54y}}{\sqrt[3]{16y^4}}$
5. a. $\frac{\sqrt{75r^3}}{\sqrt{108r^7}}$ b. $\frac{\sqrt[3]{24x^7}}{\sqrt[3]{81x^4}}$
6. a. $\frac{\sqrt{196q}}{\sqrt{484q^5}}$ b. $\frac{\sqrt[3]{16m^4}}{\sqrt[3]{54m}}$
7. a. $\frac{\sqrt{108p^5q^2}}{\sqrt{3p^3q^6}}$ b. $\frac{\sqrt[3]{-16a^4b^{-2}}}{\sqrt[3]{2a^{-2}b}}$
8. a. $\frac{\sqrt{98rs^{10}}}{\sqrt{2r^3s^4}}$ b. $\frac{\sqrt[3]{-375y^4z^2}}{\sqrt[3]{3y^{-2}z^4}}$
9. a. $\frac{\sqrt{320mn^{-5}}}{\sqrt{45m^{-7}n^3}}$ b. $\frac{\sqrt[3]{16x^4y^{-2}}}{\sqrt[3]{-54x^{-2}y^4}}$
10. a. $\frac{\sqrt{810c^{-3}d^7}}{\sqrt{1000cd}}$ b. $\frac{\sqrt[3]{24a^7b^{-1}}}{\sqrt[3]{-81a^{-2}b^2}}$
11. $\frac{\sqrt{56x^5y^4}}{\sqrt{2xy^3}}$
12. $\frac{\sqrt{72a^3b^6}}{\sqrt{3ab^3}}$
13. $\frac{\sqrt[3]{48a^3b^6}}{\sqrt[3]{3a^{-1}b^3}}$
14. $\frac{\sqrt[3]{162x^{-3}y^6}}{\sqrt[3]{2x^3y^{-2}}}$

Answer

1. a. $\frac{4}{3}$ b. $\frac{4}{3}$
3. a. $\frac{10m^2}{7}$ b. $\frac{3}{y}$
5. a. $\frac{5}{6r^2}$ b. $\frac{2x}{3}$

7. a. $\frac{6p}{q^2}$ b. $-\frac{2a^2}{b}$

9. a. $\frac{8m^4}{3n^4}$ b. $-\frac{2x^2}{3y^2}$

11. $4x^4\sqrt{7y}$

13. $2ab\sqrt[3]{2a}$

Exercise SET B: Rationalize a One Term Denominator

In the following exercises, rationalize the denominator.

15. a. $\frac{10}{\sqrt{6}}$ b. $\sqrt{\frac{4}{27}}$ c. $\frac{10}{\sqrt{5x}}$

16. a. $\frac{8}{\sqrt{3}}$ b. $\sqrt{\frac{7}{40}}$ c. $\frac{8}{\sqrt{2y}}$

17. a. $\frac{6}{\sqrt{7}}$ b. $\sqrt{\frac{8}{45}}$ c. $\frac{12}{\sqrt{3p}}$

18. a. $\frac{4}{\sqrt{5}}$ b. $\sqrt{\frac{27}{80}}$ c. $\frac{18}{\sqrt{6q}}$

19. a. $\frac{1}{\sqrt[3]{5}}$ b. $\sqrt[3]{\frac{5}{24}}$ c. $\frac{4}{\sqrt[3]{36a}}$

20. a. $\frac{1}{\sqrt[3]{3}}$ b. $\sqrt[3]{\frac{5}{32}}$ c. $\frac{7}{\sqrt[3]{49b}}$

21. a. $\frac{1}{\sqrt[3]{11}}$ b. $\sqrt[3]{\frac{7}{54}}$ c. $\frac{3}{\sqrt[3]{3x^2}}$

22. a. $\frac{1}{\sqrt[3]{13}}$ b. $\sqrt[3]{\frac{3}{128}}$ c. $\frac{3}{\sqrt[3]{6y^2}}$

23. a. $\frac{1}{\sqrt[4]{7}}$ b. $\sqrt[4]{\frac{5}{32}}$ c. $\frac{4}{\sqrt[4]{4x^2}}$

24. a. $\frac{1}{\sqrt[4]{4}}$ b. $\sqrt[4]{\frac{9}{32}}$ c. $\frac{6}{\sqrt[4]{9x^3}}$

25. a. $\frac{1}{\sqrt[4]{9}}$ b. $\sqrt[4]{\frac{25}{128}}$ c. $\frac{6}{\sqrt[4]{27a}}$

26. a. $\frac{1}{\sqrt[4]{8}}$ b. $\sqrt[4]{\frac{27}{128}}$ c. $\frac{16}{\sqrt[4]{64b^2}}$

Answer

15. a. $\frac{5\sqrt{6}}{3}$ b. $\frac{2\sqrt{3}}{9}$ c. $\frac{2\sqrt{5x}}{x}$

17. a. $\frac{6\sqrt{7}}{7}$ b. $\frac{2\sqrt{10}}{15}$ c. $\frac{4\sqrt{3p}}{p}$

19. a. $\frac{\sqrt[3]{25}}{5}$ b. $\frac{\sqrt[3]{45}}{6}$ c. $\frac{2\sqrt[3]{6a^2}}{3a}$

21. a. $\frac{\sqrt[3]{121}}{11}$ b. $\frac{\sqrt[3]{28}}{6}$ c. $\frac{\sqrt[3]{9x}}{x}$

23. a. $\frac{\sqrt[4]{343}}{7}$ b. $\frac{\sqrt[4]{40}}{4}$ c. $\frac{2\sqrt[4]{4x^2}}{x}$

25. a. $\frac{\sqrt[4]{9}}{3}$ b. $\frac{\sqrt[4]{50}}{4}$ c. $\frac{2\sqrt[4]{3a^2}}{a}$

Exercise SET C: Rationalize a Two Term Denominator

In the following exercises, simplify.

27. $\frac{8}{1-\sqrt{5}}$

28. $\frac{7}{2-\sqrt{6}}$

29. $\frac{6}{3-\sqrt{7}}$

30. $\frac{5}{4-\sqrt{11}}$

31. $\frac{\sqrt{3}}{\sqrt{m}-\sqrt{5}}$

32. $\frac{\sqrt{5}}{\sqrt{n}-\sqrt{7}}$

33. $\frac{\sqrt{2}}{\sqrt{x}-\sqrt{6}}$

34. $\frac{\sqrt{7}}{\sqrt{y}+\sqrt{3}}$

35. $\frac{\sqrt{r}+\sqrt{5}}{\sqrt{r}-\sqrt{5}}$

36. $\frac{\sqrt{s}-\sqrt{6}}{\sqrt{s}+\sqrt{6}}$

37. $\frac{\sqrt{x}+\sqrt{8}}{\sqrt{x}-\sqrt{8}}$

38. $\frac{\sqrt{m}-\sqrt{3}}{\sqrt{m}+\sqrt{3}}$

Answer

27. $-2(1+\sqrt{5})$

29. $3(3+\sqrt{7})$

31. $\frac{\sqrt{3}(\sqrt{m}+\sqrt{5})}{m-5}$

33. $\frac{\sqrt{2}(\sqrt{x}+\sqrt{6})}{x-6}$

35. $\frac{(\sqrt{r}+\sqrt{5})^2}{r-5}$

37. $\frac{(\sqrt{x}+2\sqrt{2})^2}{x-8}$

Exercise SET D: writing exercises

1. a. Simplify $\sqrt{\frac{27}{3}}$ and explain all your steps.

   b. Simplify $\sqrt{\frac{27}{5}}$ and explain all your steps.

   c. Why are the two methods of simplifying square roots different?

2. Explain what is meant by the word rationalize in the phrase, "rationalize a denominator."
3. Explain why multiplying $\sqrt{2x}-3$ by its conjugate results in an epxression with no radicals.
4. Explain why multiplying $\frac{7}{\sqrt[3]{x}}$ by $\frac{\sqrt[3]{x}}{\sqrt[3]{x}}$ does not rationalize the denominator.

Answer

1. Answers will vary
3. Answers will vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
divide radical expressions.			
rationalize a one-term denominator.			
rationalize a two-term denominator.			

Figure 8.5.63

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

17.7: Solve Radical Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve radical equations
- Solve radical equations with two radicals
- Use radicals in applications

Before you get started, take this readiness quiz.

1. Simplify: $(y-3)^2$.
   If you missed this problem, review Example 5.31.
2. Solve: $2x-5=0$.
   If you missed this problem, review Example 2.2.
3. Solve $n^2-6n+8=0$.
   If you missed this problem, review Example 6.45.

Solve Radical Equations

In this section we will solve equations that have a variable in the radicand of a radical expression. An equation of this type is called a **radical equation**.

Definition: Radical Equation

An equation in which a variable is in the radicand of a radical expression is called a **radical equation**.

As usual, when solving these equations, what we do to one side of an equation we must do to the other side as well. Once we isolate the radical, our strategy will be to raise both sides of the equation to the power of the index. This will eliminate the radical.

Solving radical equations containing an even index by raising both sides to the power of the index may introduce an algebraic solution that would not be a solution to the original radical equation. Again, we call this an extraneous solution as we did when we solved rational equations.

In the next example, we will see how to solve a radical equation. Our strategy is based on raising a radical with index n to the n^{th} power. This will eliminate the radical.

$$\text{For } a \geq 0, (\sqrt[n]{a})^n = a \text{ .}$$

Example 17.7.1 how to solve a radical equation

Solve: $\sqrt{5n-4}-9=0$.

Solution:

Table 8.6.1

Step 1: Isolate the radical on one side of the equation.	To isolate the radical, add 9 to both sides. Simplify.	$\sqrt{5n-4}-9=0$ $\sqrt{5n-4}-9+9=0+9$ $\sqrt{5n-4}=9$
Step 2: Raise both sides of the equation to the power of the index.	Since the index of a square root is 2, we square both sides.	$(\sqrt{5n-4})^2=(9)^2$
Step 3: Solve the new equation.	Remember, $(\sqrt{a})^2=a$.	$5n-4=81$ $5n=85$ $n=17$

Step 4: Check the answer in the original equation.		Check the answer. $\sqrt{5n-4}-9=0$ $\sqrt{5(17)-4}-9\stackrel{?}{=}0$ $\sqrt{85-4}-9\stackrel{?}{=}0$ $\sqrt{81}-9\stackrel{?}{=}0$ $9-9=0$ $0=0$ The solution is $n=17$.

Exercise 17.7.1

Solve: $\sqrt{3m+2}-5=0$.

Answer

$m=\frac{23}{3}$

Exercise 17.7.2

Solve: $\sqrt{10z+1}-2=0$.

Answer

$z=\frac{3}{10}$

Solve a Radical Equation With One Radical

1. Isolate the radical on one side of the equation.
2. Raise both sides of the equation to the power of the index.
3. Solve the new equation.
4. Check the answer in the original equation.

When we use a radical sign, it indicates the principal or positive root. If an equation has a radical with an even index equal to a negative number, that equation will have no solution.

Example 17.7.2

Solve: $\sqrt{9k-2}+1=0$.

Solution:

Table 8.6.2

	$\sqrt{9k-2}+1=0$
To isolate the radical, subtract 1 to both sides.	$\sqrt{9k-2}+1-1=0-1$
Simplify.	$\sqrt{9k-2}=-1$

Because the square root is equal to a negative number, the equation has no solution.

Exercise 17.7.3

Solve: $\sqrt{2r-3}+5=0$.

Answer

no solution

Exercise 17.7.4

Solve: $\sqrt{7s-3}+2=0$.

Answer

no solution

If one side of an equation with a square root is a binomial, we use the Product of Binomial Squares Pattern when we square it.

Definition: Binomial Squares

$(a+b)^2=a^2+2ab+b^2$
$(a-b)^2=a^2-2ab+b^2$

Don't forget the middle term!

Example 17.7.3

Solve: $\sqrt{p-1}+1=p$.

Solution:

Table 8.6.3

	$\sqrt{p-1}+1=p$
To isolate the radical, subtract 1 from both sides.	$\sqrt{p-1}+1-1=p-1$
Simplify.	$\sqrt{p-1}=p-1$
Square both sides of the equation.	$\left(\sqrt{p-1}\right)^2=(p-1)^2$
Simplify, using the Product of Binomial Squares Pattern on the right, Then solve the new equation.	$p-1=p^2-2p+1$
It is a quadratic equation, so get zero on one side.	$0=p^2-3p+2$
Factor the right side.	$0=(p-1)(p-2)$
Use the Zero Product Property.	$0=p-1 \quad 0=p-2$
Solve each equation.	$p=1 \quad p=2$
Check the answers.	
$p=1$ $\sqrt{p-1}+1=p$ $\sqrt{1-1}+1\stackrel{?}{=}1$ $\sqrt{0}+1\stackrel{?}{=}1$ $1=1$ ✓ $p=2$ $\sqrt{p-1}+1=p$ $\sqrt{2-1}+1\stackrel{?}{=}2$ $\sqrt{1}+1\stackrel{?}{=}2$ $2=2$ ✓	

The solutions are $p=1, p=2$.

Exercise 17.7.5

Solve: $\sqrt{x-2}+2=x$.

Answer

$x = 2, x = 3$

Exercise 17.7.6

Solve: $\sqrt{y-5}+5=y$.

Answer

$y = 5, y = 6$

When the index of the radical is 3, we cube both sides to remove the radical.

$$(\sqrt[3]{a})^3 = a$$

Example 17.7.4

Solve: $\sqrt[3]{5x+1}+8=4$.

Solution:

Table 8.6.4

	$\sqrt[3]{5x+1}+8=4$
To isolate the radical, subtract 8 from both sides.	$\sqrt[3]{5x+1}=-4$
Cube both sides of the equation.	$(\sqrt[3]{5x+1})^3=(-4)^3$
Simplify.	$5x+1=-64$
Solve the equation.	$5x=-65$
	$x=-13$
Check the answer.	
$x=-13$ $\quad \sqrt[3]{5x+1}+8=4$ $\sqrt[3]{5(-13)+1}+8\stackrel{?}{=}4$ $\sqrt[3]{-64}+8\stackrel{?}{=}4$ $-4+8\stackrel{?}{=}4$ $4=4\checkmark$	
	The solution is $x=-13$.

Exercise 17.7.7

Solve: $\sqrt[3]{4x-3}+8=5$

Answer

$x = -6$

Exercise 17.7.8

Solve: $\sqrt[3]{6x-10}+1=-3$

Answer

$x = -9$

Sometimes an equation will contain rational exponents instead of a radical. We use the same techniques to solve the equation as when we have a radical. We raise each side of the equation to the power of the denominator of the rational exponent. Since $(a^m)^n = a^{m \cdot n}$, we have for example,

$$\left(x^{\frac{1}{2}}\right)^2 = x, \left(x^{\frac{1}{3}}\right)^3 = x$$

Remember, $x^{\frac{1}{2}} = \sqrt{x}$ and $x^{\frac{1}{3}} = \sqrt[3]{x}$.

Example 17.7.5

Solve: $(3x-2)^{\frac{1}{4}} + 3 = 5$.

Solution:

Table 8.6.5

	$(3x-2)^{\frac{1}{4}} + 3 = 5$
To isolate the term with the rational exponent, subtract 3 from both sides.	$(3x-2)^{\frac{1}{4}} = 2$
Raise each side of the equation to the fourth power.	$\left((3x-2)^{\frac{1}{4}}\right)^4 = (2)^4$
Simplify.	$3x-2 = 16$
Solve the equation.	$3x = 18$
	$x = 6$
Check the answer.	
$x=6 \quad (3x-2)^{\frac{1}{4}}+3=5$ $(3\cdot 6-2)^{\frac{1}{4}}+3 \stackrel{?}{=} 5$ $(16)^{\frac{1}{4}}+3 \stackrel{?}{=} 5$ $2+3 \stackrel{?}{=} 5$ $5=5$ ✓	
	The solution is $x = 6$.

Exercise 17.7.9

Solve: $(9x+9)^{\frac{1}{4}} - 2 = 1$

Answer

$x = 8$

Exercise 17.7.10

Solve: $(4x-8)^{\frac{1}{4}} + 5 = 7$

Answer

$x = 6$

Sometimes the solution of a radical equation results in two algebraic solutions, but one of them may be an **extraneous solution**!

Example 17.7.6

Solve: $\sqrt{r+4}-r+2=0$.

Solution:

Table 8.6.6

	$\sqrt{r+4}-r+2=0$
Isolate the radical.	$\sqrt{r+4}=r-2$
Square both sides of the equation.	$(\sqrt{r+4})^2=(r-2)^2$
Simplify and then solve the equation.	$r+4=r^2-4r+4$
If it is a quadratic equation, so get zero on one side.	$0=r^2-5r$
Factor the right side.	$0=r(r-5)$
Use the Zero Product Property.	$0=r \quad 0=r-5$
Solve the equation.	$r=0 \quad r=5$
Check your answer.	
$r=0$, $\sqrt{r+4}-r+2=0$ $\sqrt{0+4}-0+2\stackrel{?}{=}0$ $\sqrt{4}+2\stackrel{?}{=}0$ $4\neq 0$ $r=5$, $\sqrt{r+4}-r+2=0$ $\sqrt{5+4}-5+2\stackrel{?}{=}0$ $\sqrt{9}-3\stackrel{?}{=}0$ $0=0$ ✓	The solution is $r=5$.
	$r=0$ is an extreneous solution.

Exercise 17.7.11

Solve: $\sqrt{m+9}-m+3=0$

Answer

$m=7$

Exercise 17.7.12

Solve: $\sqrt{n+1}-n+1=0$.

Answer

$n=3$

When there is a coefficient in front of the radical, we must raise it to the power of the index, too.

Example 17.7.7

Solve: $3\sqrt{3x-5}-8=4$.

Solution:

Table 8.6.7

	$3\sqrt{3x-5}-8=4$
Isolate the radical term.	$3\sqrt{3x-5}=12$

Isolate the radical by dividing both sides by 3.	$\sqrt{3x-5}=4$
Square both sides of the equation.	$(\sqrt{3x-5})^2=(4)^2$
Simplify, then solve the new equation.	$3x-5=16$
	$3x=21$
Solve the equation.	$x=7$
Check the answer.	
$x=7$ $3\sqrt{3x-5}-8=4$ $3\sqrt{3(7)-5}-8\stackrel{?}{=}4$ $3\sqrt{21-5}-8\stackrel{?}{=}4$ $3\sqrt{16}-8\stackrel{?}{=}4$ $3(4)-8\stackrel{?}{=}4$ $4=4$ ✓	
	The solution is $x=7$.

Exercise 17.7.13

Solve: $2\sqrt{4a+4}-16=16$.

Answer

$a=63$

Exercise 17.7.14

Solve: $3\sqrt{2b+3}-25=50$

Answer

$b=311$

Solve Radical Equations with Two Radicals

If the radical equation has two radicals, we start out by isolating one of them. It often works out easiest to isolate the more complicated radical first.

In the next example, when one radical is isolated, the second radical is also isolated.

Example 17.7.8

Solve: $\sqrt[3]{4x-3}=\sqrt[3]{3x+2}$.

Solution:

The radical terms are isolated.

$$\sqrt[3]{4x-3}=\sqrt[3]{3x+2}$$

Since the index is 3, cube both sides of the equation.

$$(\sqrt[3]{4x-3})^3=(\sqrt[3]{3x+2})^3$$

Simplify, then solve the new equation.

$$\begin{aligned} 4x-3 &= 3x+2 \\ x-3 &= 2 \\ x &= 5 \end{aligned}$$

The solution is $x=5$.

Check the answer.

We leave it to you to show that 5 checks!

? Exercise 17.7.15

Solve: $\sqrt[3]{5x-4} = \sqrt[3]{2x+5}$.

Answer

$x=3$

? Exercise 17.7.16

Solve: $\sqrt[3]{7x+1} = \sqrt[3]{2x-5}$.

Answer

$x=-\frac{6}{5}$

Sometimes after raising both sides of an equation to a power, we still have a variable inside a radical. When that happens, we repeat Step 1 and Step 2 of our procedure. We isolate the radical and raise both sides of the equation to the power of the index again.

✓ Example 17.7.9 how to solve a radical equation

Solve: $\sqrt{m}+1 = \sqrt{m+9}$.

Solution:

Table 8.6.8

Step 1: Isolate one of the radical terms on one side of the equation.	The radical on the right is isolated.	$\sqrt{m}+1=\sqrt{m+9}$
Step 2: Raise both sides of the equation to the power of the index.	We square both sides. Simplify--be very careful as you multiply!	$(\sqrt{m}+1)^2=(\sqrt{m+9})^2$
Step 3: Are there any more radicals? If yes, repeat Step 1 and Step 2 again. If no, solve the new equation.	There is still a radical in the equation. So we must repeat the previous steps. Isolate the radical term. Here, we can easily isolate the radical by dividing both sides by 2. Square both sides.	$\begin{aligned} m+2\sqrt{m}+1 &= m+9 \\ 2\sqrt{m} &= 8 \\ \sqrt{m} &= 4 \\ (\sqrt{m})^2 &= (4)^2 \\ m &= 16 \end{aligned}$
Step 4: Check the answer in the original equation.		$\begin{aligned} \sqrt{m}+1 &= \sqrt{m+9} \\ \sqrt{16}+1 &\stackrel{?}{=} \sqrt{16+9} \\ 4+1 &\stackrel{?}{=} 5 \\ 5 &= 5 \end{aligned}$ The solution is $m=16$.

Exercise 17.7.17

Solve: $3-\sqrt{x}=\sqrt{x-3}$.

Answer

$x=4$

Exercise 17.7.18

Solve: $\sqrt{x}+2=\sqrt{x+16}$.

Answer

$x=9$

We summarize the steps here. We have adjusted our previous steps to include more than one radical in the equation This procedure will now work for any radical equations.

Solve a Radical Equation

1. Isolate one of the radical terms on one side of the equation.
2. Raise both sides of the equation to the power of the index.
3. Are there any more radicals?
   If yes, repeat Step 1 and Step 2 again.
   If no, solve the new equation.
4. Check the answer in the original equation.

Be careful as you square binomials in the next example. Remember the pattern in $(a+b)^2=a^2+2ab+b^2$ or $(a-b)^2=a^2-2ab+b^2$.

Example 17.7.10

Solve: $\sqrt{q-2}+3=\sqrt{4q+1}$.

Solution:

Table 8.6.9

	$\sqrt{q-2}+3=\sqrt{4q+1}$
The radical on the right is isolated. Square both sides.	$(\sqrt{q-2}+3)^2=(\sqrt{4q+1})^2$
Simplify.	$q-2+6\sqrt{q-2}+9=4q+1$
There is still a radical in the equation so we must repeat the previous steps. Isolate the radical.	$6\sqrt{q-2}=3q-6$
Square both sides. It would not help to divide both sides by 6. Remember to square both the 6 and the $\sqrt{q-2}$.	$(6\sqrt{q-2})^2=\left(\begin{matrix}a-b\\3q-6\end{matrix}\right)^2$ $\begin{matrix}a^2 & - & 2ab & + b^2\end{matrix}$ $6^2(\sqrt{q-2})^2=(3q)^2-2\cdot 3q\cdot 6+6^2$
Simplify, then solve the new equation.	$36(q-2)=9q^2-36q+36$
Distribute.	$36q-72=9q^2-36q+36$
It is a quadratic equation, so get zero on one side.	$0=9q^2-72q+108$
Factor the right side.	$0=9(q^2-8q+12)$ $0=9(q-6)(q-2)$

Use the Zero Product Property.	$q-6=0 \quad q-2=0$ $q=6 \quad q=2$
The checks are left to you.	The solutions are $q=6$ and $q=2$.

Exercise 17.7.19

Solve: $\sqrt{x-1}+2=\sqrt{2x+6}$

Answer

$x=5$

Exercise 17.7.20

Solve: $\sqrt{x}+2=\sqrt{3x+4}$

Answer

$x=0x=4$

Use Radicals in Applications

As you progress through your college courses, you'll encounter formulas that include radicals in many disciplines. We will modify our Problem Solving Strategy for Geometry Applications slightly to give us a plan for solving applications with formulas from any discipline.

Use a Problem Solving Strategy for Applications With Formulas

1. **Read** the problem and make sure all the words and ideas are understood. When appropriate, draw a figure and label it with the given information.
2. **Identify** what we are looking for.
3. **Name** what we are looking for by choosing a variable to represent it.
4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. **Solve the equation** using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

One application of radicals has to do with the effect of **gravity** on falling objects. The formula allows us to determine how long it will take a fallen object to hit the gound.

Definition: Falling Objects

On Earth, if an object is dropped from a height of h feet, the time in seconds it will take to reach the ground is found by using the formula

$$t=\frac{\sqrt{h}}{4}$$

For example, if an object is dropped from a height of 64 feet, we can find the time it takes to reach the ground by substituting $h=64$ into the formula.

Table 8.6.10

	$t=\frac{\sqrt{h}}{4}$
	$t=\frac{\sqrt{64}}{4}$

Take the square root of 64.	$t=\frac{8}{4}$
Simplify the fraction.	$t=2$

It would take 2 seconds for an object dropped from a height of 64 feet to reach the ground.

Example 17.7.11

Marissa dropped her sunglasses from a bridge 400 feet above a river. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the sunglasses to reach the river.

Solution:

Table 8.6.11

Step 1: **Read** the problem.	
Step 2: **Identify** what we are looking.	The time it takes for the sunglasses to reach the river.
Step 3: **Name** what we are looking.	Let (t=\) time.
Step 4: **Translate** into an equation by writing the appropriate formula. Substitute in the given information.	$t=\frac{\sqrt{h}}{4}$, and $h=400$ $t=\frac{\sqrt{400}}{4}$
Step 5: **Solve the equation**.	$t=\frac{20}{4}$
	$t=5$
Step 6: **Check** the answer in the problem and make sure it makes sense.	$5\stackrel{?}{=}\frac{\sqrt{400}}{4}$ $5\stackrel{?}{=}\frac{20}{4}$ $5=5\checkmark$
Does 5 seconds seem like a reasonable length of time?	Yes.
Step 7: **Answer** the equation.	It will take 5 seconds for the sunglasses to reach the river.

Exercise 17.7.21

A helicopter dropped a rescue package from a height of $1,296$ feet. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the package to reach the ground.

Answer

9 seconds

Exercise 17.7.22

A window washer dropped a squeegee from a platform 196 feet above the sidewalk. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the squeegee to reach the sidewalk.

Answer

3.5 seconds

Police officers investigating car accidents measure the length of the skid marks on the pavement. Then they use square roots to determine the **speed**, in miles per hour, a car was going before applying the brakes.

Definition: Skid Marks and Speed of a Car

If the length of the skid marks is d feet, then the speed, s, of the car before the brakes were applied can be found by using the formula

$$s = \sqrt{24d}$$

Example 17.7.12

After a car accident, the skid marks for one car measured 190 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.

Solution:

Table 8.6.12

Step 1: **Read** the problem.	
Step 2: **Identify** what we are looking for.	The speed of a car.
Step 3: **Name** what we are looking for.	Let $s =$ the speed.
Step 4: **Translate** into an equation by writing the appropriate formula. Substitute in the given information.	$s = \sqrt{24d}$, and $d = 190$ $s = \sqrt{24(190)}$
Step 5: **Solve the equation**.	$s = \sqrt{4{,}560}$
	$s = 67.52777...$
Round to 1 decimal place.	$s \approx 67.5$
	$67.5 \stackrel{?}{\approx} \sqrt{24(190)}$ $67.5 \stackrel{?}{\approx} \sqrt{4560}$ $67.5 \approx 67.5277...$ ✓
	The speed of the car before the brakes were applied was 67.5 miles per hour.

Exercise 17.7.23

An accident investigator measured the skid marks of the car. The length of the skid marks was 76 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.

Answer

42.7mph

Exercise 17.7.24

The skid marks of a vehicle involved in an accident were 122 feet long. Use the formula $s = \sqrt{24d}$ to find the speed of the vehicle before the brakes were applied. Round your answer to the nearest tenth.

Answer

54.1mph

17.7E: Exercises

Practice Makes Perfect

Exercise SET A: Solve Radical Equations

In the following exercises, solve.

1. $\sqrt{5x-6}=8$
2. $\sqrt{4x-3}=7$
3. $\sqrt{5x+1}=-3$
4. $\sqrt{3y-4}=-2$
5. $\sqrt[3]{2x}=-2$
6. $\sqrt[3]{4x-1}=3$
7. $\sqrt{2m-3}-5=0$
8. $\sqrt{2n-1}-3=0$
9. $\sqrt{6v-2}-10=0$
10. $\sqrt{12u+1}-11=0$
11. $\sqrt{4m+2}+2=6$
12. $\sqrt{6n+1}+4=8$
13. $\sqrt{2u-3}+2=0$
14. $\sqrt{5v-2}+5=0$
15. $\sqrt{u-3}+3=u$
16. $\sqrt{v-10}+10=v$
17. $\sqrt{r-1}=r-1$
18. $\sqrt{s-8}=s-8$
19. $\sqrt[3]{6x+4}=4$
20. $\sqrt[3]{11x+4}=5$
21. $\sqrt[3]{4x+5}-2=-5$
22. $\sqrt[3]{9x-1}-1=-5$
23. $(6x+1)^{\frac{1}{2}}-3=4$
24. $(3x-2)^{\frac{1}{2}}+1=6$
25. $(8x+5)^{\frac{1}{3}}+2=-1$
26. $(12x-5)^{\frac{1}{3}}+8=3$
27. $(12x-3)^{\frac{1}{4}}-5=-2$
28. $(5x-4)^{\frac{1}{4}}+7=9$
29. $\sqrt{x+1}-x+1=0$
30. $\sqrt{y+4}-y+2=0$
31. $\sqrt{z+100}-z=-10$
32. $\sqrt{w+25}-w=-5$

33. $3\sqrt{2x-3}-20=7$

34. $2\sqrt{5x+1}-8=0$

35. $2\sqrt{8r+1}-8=2$

36. $3\sqrt{7y+1}-10=8$

Answer

1. $m=14$
3. no solution
5. $x=-4$
7. $m=14$
9. $v=17$
11. $m=\frac{7}{2}$
13. no solution
15. $u=3, u=4$
17. $r=1, r=2$
19. $x=10$
21. $x=-8$
23. $x=8$
25. $x=-4$
27. $x=7$
29. $x=3$
31. $z=21$
33. $x=42$
35. $r=3$

Exercise SET B: Solve Radical Equations with Two Radicals

In the following exercises, solve.

37. $\sqrt{3u+7}=\sqrt{5u+1}$

38. $\sqrt{4v+1}=\sqrt{3v+3}$

39. $\sqrt{8+2r}=\sqrt{3r+10}$

40. $\sqrt{10+2c}=\sqrt{4c+16}$

41. $\sqrt[3]{5x-1}=\sqrt[3]{x+3}$

42. $\sqrt[3]{8x-5}=\sqrt[3]{3x+5}$

43. $\sqrt[3]{2x^2+9x-18}=\sqrt[3]{x^2+3x-2}$

44. $\sqrt[3]{x^2-x+18}=\sqrt[3]{2x^2-3x-6}$

45. $\sqrt{a}+2=\sqrt{a+4}$

46. $\sqrt{r}+6=\sqrt{r+8}$

47. $\sqrt{u}+1=\sqrt{u+4}$

48. $\sqrt{x}+1=\sqrt{x+2}$

49. $\sqrt{a+5}-\sqrt{a}=1$
50. $-2=\sqrt{d-20}-\sqrt{d}$
51. $\sqrt{2x+1}=1+\sqrt{x}$
52. $\sqrt{3x+1}=1+\sqrt{2x-1}$
53. $\sqrt{2x-1}-\sqrt{x-1}=1$
54. $\sqrt{x+1}-\sqrt{x-2}=1$
55. $\sqrt{x+7}-\sqrt{x-5}=2$
56. $\sqrt{x+5}-\sqrt{x-3}=2$

Answer

37. $u=3$
39. $r=-2$
41. $x=1$
43. $x=-8, x=2$
45. $a=0$
47. $u=\frac{9}{4}$
49. $a=4$
51. $x=0\ x=4$
53. $x=1\ x=5$
55. $x=9$

Exercise SET C: Use Radicals in Applications

In the following exercises, solve. Round approximations to one decimal place.

57. **Landscaping** Reed wants to have a square garden plot in his backyard. He has enough compost to cover an area of 75 square feet. Use the formula $s=\sqrt{A}$ to find the length of each side of his garden. Round your answer to the nearest tenth of a foot.
58. **Landscaping** Vince wants to make a square patio in his yard. He has enough concrete to pave an area of 130 square feet. Use the formula $s=\sqrt{A}$ to find the length of each side of his patio. Round your answer to the nearest tenth of a foot.
59. **Gravity** A hang glider dropped his cell phone from a height of 350 feet. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the cell phone to reach the ground.
60. **Gravity** A construction worker dropped a hammer while building the Grand Canyon skywalk, 4000 feet above the Colorado River. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the hammer to reach the river.
61. **Accident investigation** The skid marks for a car involved in an accident measured 216 feet. Use the formula $s=\sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.
62. **Accident investigation** An accident investigator measured the skid marks of one of the vehicles involved in an accident. The length of the skid marks was 175 feet. Use the formula $s=\sqrt{24d}$ to find the speed of the vehicle before the brakes were applied. Round your answer to the nearest tenth.

Answer

57. 8.7 feet
59. 4.7 seconds
61. 72 feet

Exercise SET D: Writing Exercises

63. Explain why an equation of the form $\sqrt{x}+1=0$ has no solution.

64. a. Solve the equations $\sqrt{r+4}-r+2=0$.
    b. Explain why one of the "solutions" that was found was not actually a solution to the equation.

Answer

63. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve radical equations.			
solve radical equations with two radicals.			
use radicals in applications.

17.8: Use Radicals in Functions

Learning Objectives

By the end of this section, you will be able to:

- Evaluate a radical function
- Find the domain of a radical function
- Graph radical functions

Before you get started, take this readiness quiz.

1. Solve: $1-2x \geq 0$.
   If you missed this problem, review Example 2.50.
2. For $f(x)=3x-4$, evaluate $f(2), f(-1), f(0)$
   If you missed this problem, review Example 3.48.
3. Graph $f(x)=\sqrt{x}$. State the domain and range of the function in interval notation.
   If you missed this problem, review Example 3.56.

Evaluate a Radical Function

In this section we will extend our previous work with functions to include radicals. If a function is defined by a radical expression, we call it a **radical function**.

- The square root function is $f(x)=\sqrt{x}$.
- The cube root function is $f(x)=\sqrt[3]{x}$.

Definition 17.8.1: radical function

A **radical function** is a function that is defined by a radical expression.

To evaluate a radical function, we find the value of $f(x)$ for a given value of x just as we did in our previous work with functions.

Example 17.8.1

For the function $f(x)=\sqrt{2x-1}$, find

a. $f(5)$
b. $f(-2)$

Solution:

a.

$$f(x)=\sqrt{2x-1}$$

To evaluate $f(5)$, substitute 5 for x.

$$f(5)=\sqrt{2\cdot 5-1}$$

Simplify.

$$f(5)=\sqrt{9}$$

Take the square root.

$$f(5)=3$$

b.

$$f(x)=\sqrt{2x-1}$$

To evaluate $f(-2)$, substitute -2 for x.

$$f(-2)=\sqrt{2(-2)-1}$$

Simplify.

$$f(-2)=\sqrt{-5}$$

Since the square root of a negative number is not a real number, the function does not have a value at $x=-2$.

Exercise 17.8.1

For the function $f(x)=\sqrt{3x-2}$, find

a. $f(6)$
b. $f(0)$

Answer

a. $f(6)=4$
b. no value at $x=0$

Exercise 17.8.2

For the function $g(x)=\sqrt{5x+5}$, find

a. $g(4)$
b. $g(-3)$

Answer

a. $g(4)=5$
b. no value at $f(-3)$

We follow the same procedure to evaluate cube roots.

Example 17.8.2

For the function $g(x)=\sqrt[3]{x-6}$, find

a. $g(14)$
b. $g(-2)$

Solution:

a.

$$g(x)=\sqrt[3]{x-6}$$

To evaluate $g(14)$, substitute 14 for x.

$$g(14)=\sqrt[3]{14-6}$$

Simplify.

$$g(14)=\sqrt[3]{8}$$

Take the cube root.

$$g(14)=2$$

b.

$$g(x)=\sqrt[3]{x-6}$$

To evaluate $g(-2)$, substitute -2 for x.

$$g(-2)=\sqrt[3]{-2-6}$$

Simplify.

$$g(-2) = \sqrt[3]{-8}$$

Take the cube root.

$$g(-2) = -2$$

Exercise 17.8.3

For the function $g(x) = \sqrt[3]{3x-4}$, find

a. $g(4)$
b. $g(1)$

Answer

a. $g(4) = 2$
b. $g(1) = -1$

Exercise 17.8.4

For the function $h(x) = \sqrt[3]{5x-2}$, find

a. $h(2)$
b. $h(-5)$

Answer

a. $h(2) = 2$
b. $h(-5) = -3$

The next example has fourth roots.

Example 17.8.3

For the function $f(x) = \sqrt[4]{5x-4}$, find

a. $f(4)$
b. $f(-12)$

Solution:

a.

$$f(x) = \sqrt[4]{5x-4}$$

To evaluate $f(4)$, substitute 4 for x.

$$f(4) = \sqrt[4]{5 \cdot 4 - 4}$$

Simplify.

$$f(4) = \sqrt[4]{16}$$

Take the fourth root.

$$f(4) = 2$$

b.

$$f(x) = \sqrt[4]{5x-4}$$

To evaluate $f(-12)$, substitute -12 for x.

$$f(-12) = \sqrt[4]{5(-12)-4}$$

Simplify.

$$f(-12) = \sqrt[4]{-64}$$

Since the fourth root of a negative number is not a real number, the function does not have a value at $x = -12$.

Exercise 17.8.5

For the function $f(x) = \sqrt[4]{3x+4}$, find

a. $f(4)$
b. $f(-1)$

Answer

a. $f(4) = 2$
b. $f(-1) = 1$

Exercise 17.8.6

For the function $g(x) = \sqrt[4]{5x+1}$, find

a. $g(16)$
b. $g(3)$

Answer

a. $g(16) = 3$
b. $g(3) = 2$

Find the Domain of a Radical Function

To find the **domain** and **range** of radical functions, we use our properties of radicals. For a radical with an even index, we said the radicand had to be greater than or equal to zero as even roots of negative numbers are not real numbers. For an odd index, the radicand can be any real number. We restate the properties here for reference.

Properties of $\sqrt[n]{a}$

When n is an **even** number and:

- $a \geq 0$, then $\sqrt[n]{a}$ is a real number.
- $a < 0$, then $\sqrt[n]{a}$ is not a real number.

When n is an **odd** number, $\sqrt[n]{a}$ is a real number for all values of a.

So, to find the domain of a radical function with even index, we set the radicand to be greater than or equal to zero. For an odd index radical, the radicand can be any real number.

Domain of a Radical Function

When the **index** of the radical is **even**, the radicand must be greater than or equal to zero.

When the **index** of the radical is **odd**, the radicand can be any real number.

Example 17.8.4

Find the domain of the function, $f(x) = \sqrt{3x-4}$. Write the domain in interval notation.

Solution:

Since the function, $f(x) = \sqrt{3x-4}$ has a radical with an index of 2, which is even, we know the radicand must be greater than or equal to 0. We set the radicand to be greater than or equal to 0 and then solve to find the domain.

Solve.

$$\begin{aligned} 3x-4 &\geq 0 \\ 3x &\geq 4 \\ x &\geq \frac{4}{3} \end{aligned}$$

The domain of $f(x)=\sqrt{3x-4}$ is all values $x \geq \frac{4}{3}$ and we write it in interval notation as $\left[\frac{4}{3}, \infty\right)$.

Exercise 17.8.7

Find the domain of the function, $f(x)=\sqrt{6x-5}$. Write the domain in interval notation.

Answer

$\left[\frac{5}{6}, \infty\right)$

Exercise 17.8.8

Find the domain of the function, $f(x)=\sqrt{4-5x}$. Write the domain in interval notation.

Answer

$\left(-\infty, \frac{4}{5}\right]$

Example 17.8.5

Find the domain of the function, $g(x)=\sqrt{\frac{6}{x-1}}$. Write the domain in interval notation.

Solution:

Solve the function, $g(x)=\sqrt{\frac{6}{x-1}}$ has a radical with an index of 2, which is even, we know the radicand must be greater than or equal to 0.

The radicand cannot be zero since the numerator is not zero.

For $\frac{6}{x-1}$ to be greater than zero, the denominator must be positive since the numerator is positive. We know a positive divided by a positive is positive.

We set $x-1>0$ and solve.

$$x-1>0$$

Solve.

$$x>1$$

Also, since the radicand is a fraction, we must realize that the denominator cannot be zero.

We solve $x-1=0$ to find the value that must be eliminated from the domain.

$$x-1=0$$

Solve.

$$x=1 \text{ so } x/neq1 \text{ in the domain.}$$

Putting this together we get the domain is $x>1$ and we write it as $(1, \infty)$.

Exercise 17.8.9

Find the domain of the function, $f(x)=\sqrt{\frac{4}{x+3}}$. Write the domain in interval notation.

Answer

$(-3,\infty)$

Exercise 17.8.10

Find the domain of the function, $h(x)=\sqrt{\frac{9}{x-5}}$. Write the domain in interval notation.

Answer

$(5,\infty)$

The next example involves a cube root and so will require different thinking.

Example 17.8.6

Find the domain of the function, $f(x)=\sqrt[3]{2x^2+3}$. Write the domain in interval notation.

Solution:

Since the function, $f(x)=\sqrt[3]{2x^2+3}$ has a radical with an index of 3, which is odd, we know the radicand can be any real number. This tells us the domain is any real number. In interval notation, we write $(-\infty,\infty)$.

The domain of $f(x)=\sqrt[3]{2x^2+3}$ is all real numbers and we write it in interval notation as $(-\infty,\infty)$.

Exercise 17.8.11

Find the domain of the function, $f(x)=\sqrt[3]{3x^2-1}$. Write the domain in interval notation.

Answer

$(-\infty,\infty)$

Exercise 17.8.12

Find the domain of the function, $g(x)=\sqrt[3]{5x-4}$. Write the domain in interval notation.

Answer

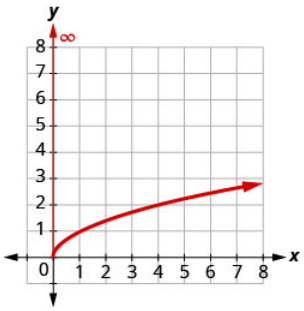
$(-\infty,\infty)$

Graph Radical Functions

Before we graph any radical function, we first find the **domain** of the function. For the function, $f(x)=\sqrt{x}$, the index is even, and so the radicand must be greater than or equal to 0.

This tells us the domain is $x\geq 0$ and we write this in interval notation as $[0,\infty)$.

Previously we used point plotting to graph the function, $f(x)=\sqrt{x}$. We chose x-values, substituted them in and then created a chart. Notice we chose points that are perfect squares in order to make taking the square root easier.



x	$f(x)=\sqrt{x}$	$(x, f(x))$
0	0	(0, 0)
1	1	(1, 1)
4	2	(4, 2)
9	3	(9, 3)

Figure 8.7.1

Once we see the graph, we can find the range of the function. The y-values of the function are greater than or equal to zero. The range then is $[0, \infty)$.

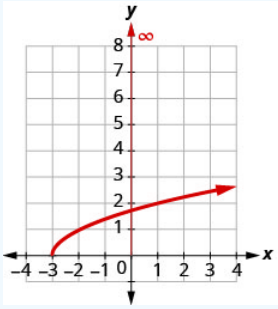
Example 17.8.7

For the function $f(x)=\sqrt{x+3}$,

a. find the domain
b. graph the function
c. use the graph to determine the range

Solution:

a. Since the radical has index 2, we know the radicand must be greater than or equal to zero. If $x+3 \geq 0$, then $x \geq -3$. This tells us the domain is all values $x \geq -3$ and written in interval notation as $[-3, \infty)$.
b. To graph the function, we choose points in the interval $[-3, \infty)$ that will also give us a radicand which will be easy to take the square root.



x	$f(x)=\sqrt{x+3}$	$(x, f(x))$
–3	0	(–3, 0)
–2	1	(–2, 1)
1	2	(1, 2)
6	3	(6, 3)

Figure 8.7.2

c. Looking at the graph, we see the y-values of the function are greater than or equal to zero. The range then is $[0, \infty)$.

Exercise 17.8.13

For the function $f(x)=\sqrt{x+2}$,

a. find the domain
b. graph the function
c. use the graph to determine the range

Answer

a. domain: $[-2, \infty)$

b.

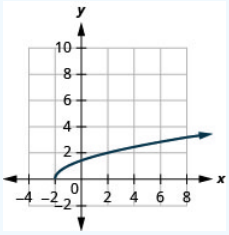


Figure 8.7.3

c. range: $[0, \infty)$

Exercise 17.8.14

For the function $f(x) = \sqrt{x-2}$,

a. find the domain
b. graph the function
c. use the graph to determine the range

Answer

a. domain: $[2, \infty)$
b.

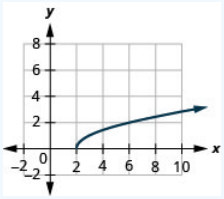

Figure 8.7.4

c. range: $[0, \infty)$

In our previous work graphing functions, we graphed $f(x) = x^3$ but we did not graph the function $f(x) = \sqrt[3]{x}$. We will do this now in the next example.

Example 17.8.8

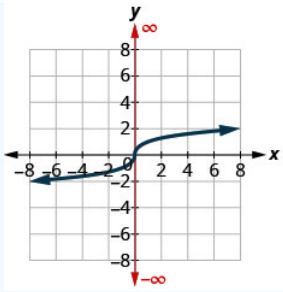
For the function, $f(x) = \sqrt[3]{x}$,

a. find the domain
b. graph the function
c. use the graph to determine the range

Solution:

a. Since the radical has index 3, we know the radicand can be any real number. This tells us the domain is all real numbers and written in interval notation as $(-\infty, \infty)$

b. To graph the function, we choose points in the interval $(-\infty, \infty)$ that will also give us a radicand which will be easy to take the cube root.



x	$f(x)=\sqrt[3]{x}$	$(x, f(x))$
–8	–2	(–8, –2)
–1	–1	(–1, –1)
0	0	(0, 0)
1	1	(1, 1)
8	2	(8, 2)

Figure 8.7.5

c. Looking at the graph, we see the y-values of the function are all real numbers. The range then is $(-\infty, \infty)$.

Exercise 17.8.15

For the function $f(x)=-\sqrt[3]{x}$,

a. find the domain
b. graph the function
c. use the graph to determine the range

Answer

a. domain: $(-\infty, \infty)$
b.

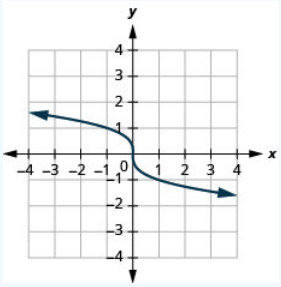


Figure 8.7.6

c. range: $(-\infty, \infty)$

Exercise 17.8.16

For the function $f(x)=\sqrt[3]{x-2}$,

a. find the domain
b. graph the function
c. use the graph to determine the range

Answer

a. domain: $(-\infty, \infty)$
b.

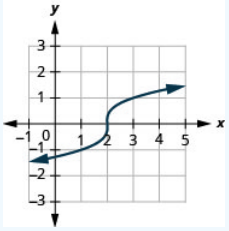

Figure 8.7.7

c. range: $(-\infty, \infty)$

Key Concepts

- **Properties of $\sqrt[n]{a}$**
  - When n is an **even** number and:
    $a \geq 0$, then $\sqrt[n]{a}$ is a real number.
    $a < 0$, then $\sqrt[n]{a}$ is not a real number.
  - When n is an **odd** number, $\sqrt[n]{a}$ is a real number for all values of a.
- **Domain of a Radical Function**
  - When the **index** of the radical is **even**, the radicand must be greater than or equal to zero.
  - When the **index** of the radical is **odd**, the radicand can be any real number.

Glossary

radical function

A radical function is a function that is defined by a radical expression.

17.8: Use Radicals in Functions is shared under a not declared license and was authored, remixed, and/or curated by LibreTexts.

17.8E: Exercises

Practice Makes Perfect

Exercise $17.8E.17$ Evaluate a Radical Function

In the following exercises, evaluate each function.

1. $f(x)=\sqrt{4x-4}$, find
   a. $f(5)$
   b. $f(0)$
2. $f(x)=\sqrt{6x-5}$, find
   a. $f(5)$
   b. $f(-1)$
3. $g(x)=\sqrt{6x+1}$, find
   a. $g(4)$
   b. $g(8)$
4. $g(x)=\sqrt{3x+1}$, find
   a. $g(8)$
   b. $g(5)$
5. $F(x)=\sqrt{3-2x}$, find
   a. $F(1)$
   b. $F(-11)$
6. $F(x)=\sqrt{8-4x}$, find
   a. $F(1)$
   b. $F(-2)$
7. $G(x)=\sqrt{5x-1}$, find
   a. $G(5)$
   b. $G(2)$
8. $G(x)=\sqrt{4x+1}$, find
   a. $G(11)$
   b. $G(2)$
9. $g(x)=\sqrt[3]{2x-4}$, find
   a. $g(6)$
   b. $g(-2)$
10. $g(x)=\sqrt[3]{7x-1}$, find
    a. $g(4)$
    b. $g(-1)$
11. $h(x)=\sqrt[3]{x^2-4}$, find
    a. $h(-2)$
    b. $h(6)$
12. $h(x)=\sqrt[3]{x^2+4}$, find
    a. $h(-2)$
    b. $h(6)$
13. For the function $f(x)=\sqrt[4]{2x^3}$, find
    a. $f(0)$
    b. $f(2)$
14. For the function $f(x)=\sqrt[4]{3x^3}$, find

a. $f(0)$
b. $f(3)$

15. For the function $g(x)=\sqrt[4]{4-4x}$, find
    a. $g(1)$
    b. $g(-3)$
16. For the function $g(x)=\sqrt[4]{8-4x}$, find
    a. $g(-6)$
    b. $g(2)$

Answer

1.
    a. $f(5)=4$
    b. no value at $x=0$
3.
    a. $g(4)=5$
    b. $g(8)=7$
5.
    a. $F(1)=1$
    b. $F(-11)=5$
7.
    a. $G(5)=2\sqrt{6}$
    b. $G(2)=3$
9.
    a. $g(6)=2$
    b. $g(-2)=-2$
11.
    a. $h(-2)=0$
    b. $h(6)=2\sqrt[3]{4}$
13.
    a. $f(0)=0$
    b. $f(2)=2$
15.
    a. $g(1)=0$
    b. $g(-3)=2$

? Exercise $17.8E.18$ Find the Domain of a Radical Function

In the following exercises, find the domain of the function and write the domain in interval notation.

1. $f(x)=\sqrt{3x-1}$
2. $f(x)=\sqrt{4x-2}$
3. $g(x)=\sqrt{2-3x}$
4. $g(x)=\sqrt{8-x}$
5. $h(x)=\sqrt{\frac{5}{x-2}}$
6. $h(x)=\sqrt{\frac{6}{x+3}}$

7. $f(x)=\sqrt{\frac{x+3}{x-2}}$
8. $f(x)=\sqrt{\frac{x-1}{x+4}}$
9. $g(x)=\sqrt[3]{8x-1}$
10. $g(x)=\sqrt[3]{6x+5}$
11. $f(x)=\sqrt[3]{4x^2-16}$
12. $f(x)=\sqrt[3]{6x^2-25}$
13. $F(x)=\sqrt[4]{8x+3}$
14. $F(x)=\sqrt[4]{10-7x}$
15. $G(x)=\sqrt[5]{2x-1}$
16. $G(x)=\sqrt[5]{6x-3}$

Answer

1. $\left[\frac{1}{3},\infty\right)$
3. $\left(-\infty,\frac{2}{3}\right]$
5. $(2,\infty)$
7. $(-\infty,-3]\cup(2,\infty)$
9. $(-\infty,\infty)$
11. $(-\infty,\infty)$
13. $\left[-\frac{3}{8},\infty\right)$
15. $(-\infty,\infty)$

? Exercise $17.8E.19$ graph radical functions

In the following exercises,

a. find the domain of the function
b. graph the function
c. use the graph to determine the range

1. $f(x)=\sqrt{x+1}$
2. $f(x)=\sqrt{x-1}$
3. $g(x)=\sqrt{x+4}$
4. $g(x)=\sqrt{x-4}$
5. $f(x)=\sqrt{x}+2$
6. $f(x)=\sqrt{x}-2$
7. $g(x)=2\sqrt{x}$
8. $g(x)=3\sqrt{x}$
9. $f(x)=\sqrt{3-x}$
10. $f(x)=\sqrt{4-x}$
11. $g(x)=-\sqrt{x}$
12. $g(x)=-\sqrt{x}+1$
13. $f(x)=\sqrt[3]{x+1}$
14. $f(x)=\sqrt[3]{x-1}$
15. $g(x)=\sqrt[3]{x+2}$
16. $g(x)=\sqrt[3]{x-2}$
17. $f(x)=\sqrt[3]{x}+3$
18. $f(x)=\sqrt[3]{x}-3$
19. $g(x)=\sqrt[3]{x}$
20. $g(x)=-\sqrt[3]{x}$

https://math.libretexts.org/@go/page/46436

21. $f(x) = 2\sqrt[3]{x}$
22. $f(x) = -2\sqrt[3]{x}$

Answer

17.9: Use the Complex Number System

Learning Objectives

By the end of this section, you will be able to:

- Evaluate the square root of a negative number
- Add and subtract complex numbers
- Multiply complex numbers
- Divide complex numbers
- Simplify powers of i

Before you get started, take this readiness quiz.

1. Given the numbers $-4, -\sqrt{7}, 0.\overline{5}, \frac{7}{3}, 3, \sqrt{81}$, list the
   a. rational numbers
   b. irrational numbers
   c. real numbers

   If you missed this problem, review Example 1.42.
2. Multiply: $(x-3)(2x+5)$.
   If you missed this problem, review Example 5.28.
3. Rationalize the denominator: $\frac{\sqrt{5}}{\sqrt{5}-\sqrt{3}}$
   If you missed this problem, review Example 5.32.

Evaluate the Square Root of a Negative Number

Whenever we have a situation where we have a square root of a negative number we say there is no real number that equals that square root. For example, to simplify $\sqrt{-1}$, we are looking for a real number x so that $x^2 = -1$. Since all real numbers squared are positive numbers, there is no real number that equals -1 when squared.

Mathematicians have often expanded their numbers systems as needed. They added 0 to the counting numbers to get the whole numbers. When they needed negative balances, they added negative numbers to get the integers. When they needed the idea of parts of a whole they added fractions and got the rational numbers. Adding the irrational numbers allowed numbers like $\sqrt{5}$. All of these together gave us the real numbers and so far in your study of mathematics, that has been sufficient.

But now we will expand the real numbers to include the square roots of negative numbers. We start by defining the **imaginary unit** i as the number whose square is -1.

Definition 17.9.1

The **imaginary unit** i is the number whose square is -1.

$$i^2 = -1 \text{ or } i = \sqrt{-1}$$

We will use the imaginary unit to simplify the square roots of negative numbers.

Definition 17.9.2

Square Root of a Negative Number

If b is a positive real number, then

$$\sqrt{-b} = \sqrt{b}i$$

We will use this definition in the next example. Be careful that it is clear that the i is not under the radical. Sometimes you will see this written as $\sqrt{-b} = i\sqrt{b}$ to emphasize the i is not under the radical. But the $\sqrt{-b} = \sqrt{b}i$ is considered standard form.

Example 17.9.1

Write each expression in terms of i and simplify is possible:

a. $\sqrt{-25}$
b. $\sqrt{-7}$
c. $\sqrt{-12}$

Solution:

a.

$$\sqrt{-25}$$

Use the definition of the square root of negative numbers.

$$\sqrt{25}i$$

Simplify.

$$5i$$

b.

$$\sqrt{-7}$$

Use the definition of the square root of negative numbers.

$$\sqrt{7}i$$

Simplify.

Be careful that it is clear that i is not under the radical sign.

c.

$$\sqrt{-12}$$

Use the definition of the square root of negative numbers.

$$\sqrt{12}i$$

Simplify $\sqrt{12}$.

$$2\sqrt{3}i$$

Exercise 17.9.1

Write each expression in terms of i and simplify if possible:

a. $\sqrt{-81}$
b. $\sqrt{-5}$
c. $\sqrt{-18}$

Answer

a. $9i$
b. $\sqrt{5}i$
c. $3\sqrt{2}i$

Exercise 17.9.2

Write each expression in terms of i and simplify if possible:

a. $\sqrt{-36}$
b. $\sqrt{-3}$
c. $\sqrt{-27}$

Answer

a. $6i$
b. $\sqrt{3}i$
c. $3\sqrt{3}i$

Now that we are familiar with the imaginary number i, we can expand the real numbers to include imaginary numbers. The **complex number system** includes the real numbers and the imaginary numbers. A **complex number** is of the form $a+bi$, where a, b are real numbers. We call a the real part and b the imaginary part.

Definition 17.9.3

A **complex number** is of the form $a+bi$, where a and b are real numbers.

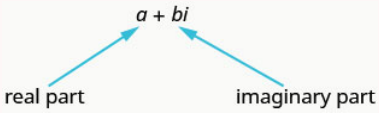

Figure 8.8.1

A complex number is in standard form when written as $a+bi$, where a and b are real numbers.

If $b=0$, then $a+bi$ becomes $a+0\cdot i=a$, and is a real number.

If $b\neq 0$, then $a+bi$ is an imaginary number.

If $a=0$, then $a+bi$ becomes $0+bi=bi$, and is called a pure imaginary number.

We summarize this here.

Table 8.8.1

	$a+bi$	
$b=0$	$a+0\cdot i$ a	Real number
$b\neq 0$	$a+bi$	Imaginary number
$a=0$R	$0+bi$ bi	Pure imaginary numbe4

The standard form of a complex number is $a+bi$, so this explains why the preferred form is $\sqrt{-b}=\sqrt{b}i$ when $b>0$.

The diagram helps us visualize the complex number system. It is made up of both the real numbers and the imaginary numbers.

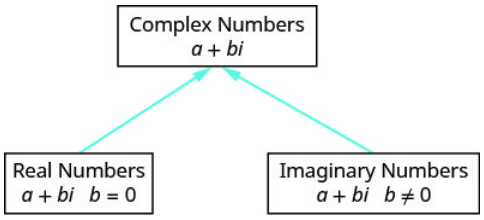

Figure 8.8.2

Add or Subtract Complex Numbers

We are now ready to perform the operations of addition, subtraction, multiplication and division on the complex numbers—just as we did with the real numbers.

Adding and subtracting complex numbers is much like adding or subtracting like terms. We add or subtract the real parts and then add or subtract the imaginary parts. Our final result should be in standard form.

Example 17.9.2

Add: $\sqrt{-12}+\sqrt{-27}$.

Solution:

$$\sqrt{-12}+\sqrt{-27}$$

Use the definition of the square root of negative numbers.

$$\sqrt{12}i+\sqrt{27}i$$

Simplify the square roots.

$$2\sqrt{3}i+3\sqrt{3}i$$

Add.

$$5\sqrt{3}i$$

Exercise 17.9.3

Add: $\sqrt{-8}+\sqrt{-32}$.

Answer

$6\sqrt{2}i$

Exercise 17.9.4

Add: $\sqrt{-27}+\sqrt{-48}$

Answer

$7\sqrt{3}i$

Remember to add both the real parts and the imaginary parts in this next example.

Example 17.9.3

Simplify:

a. $(4-3i)+(5+6i)$
b. $(2-5i)-(5-2i)$

Solution:

a.

$$(4-3i)+(5+6i)$$

Use the Associative Property to put the real parts and the imaginary parts together.

$$(4+5)+(-3i+6i)$$

Simplify.

$$9+3i$$

b.

$$(2-5i)-(5-2i)$$

Distribute.

$$2-5i-5+2i$$

Use the Associative Property to put the real parts and the imaginary parts together.

$$2-5-5i+2i$$

Simplify.

$$-3-3i$$

Exercise 17.9.5

Simplify:

a. $(2+7i)+(4-2i)$
b. $(8-4i)-(2-i)$

Answer

a. $6+5i$
b. $6-3i$

Exercise 17.9.6

Simplify:

a. $(3-2i)+(-5-4i)$
b. $(4+3i)-(2-6i)$

Answer

a. $-2-6i$
b. $2+9i$

Multiply Complex Numbers

Multiplying complex numbers is also much like multiplying expressions with coefficients and variables. There is only one special case we need to consider. We will look at that after we practice in the next two examples.

Example 17.9.4

Multiply: $2i(7-5i)$

Solution:

$$2i(7-5i)$$

Distribute.

$$14i-10i^2$$

Simplify i^2.

$$14i-10(-1)$$

Multiply.

$$14i+10$$

Write in standard form.

$$10+14i$$

Exercise 17.9.7

Multiply: $4i(5-3i)$.

Answer

$12+20i$

Exercise 17.9.8

Multiply: $-3i(2+4i)$.

Answer

$12-6i$

In the next example, we multiply the binomials using the **Distributive Property** or **FOIL**.

Example 17.9.5

Multiply: $(3+2i)(4-3i)$.

Solution:

$$(3+2i)(4-3i)$$

Use FOIL.

$$12-9i+8i-6i^2$$

Simplify i^2 and combine like terms.

$$12-i-6(-1)$$

Multiply.

$$12-i+6$$

Combine the real parts.

$$18-i$$

Exercise 17.9.9

Multiple: $(5-3i)(-1-2i)$.

Answer

$-11-7i$

Exercise 17.9.10

Multiple: $(-4-3i)(2+i)$.

Answer

$-5-10i$

In the next example, we could use FOIL or the **Product of Binomial Squares Pattern**.

Example 17.9.6

Multiply: $(3+2i)^2$

Solution:

Table 8.8.2

	$(a+b)^2$ $3+2i$
Use the Product of Binomial Squares Pattern, $(a+b)^2=a^2+2ab+b^2$.	$a^2+2 \quad a \quad b+ \quad b^2$ $3^2+2 \cdot 3 \cdot 2i+(2i)^2$
Simplify.	$9+12i+4i^2$
Simplify i^2.	$9+12i+4(-1)$
Simplify.	$5+12i$

Exercise 17.9.11

Multiply using the Binomial Squares pattern: $(-2-5i)^2$.

Answer

$-21+20i$

Exercise 17.9.12

Multiply using the Binomial Squares pattern: $(-5+4i)^2$.

Answer

$9-40i$

Since the square root of a negative number is not a real number, we cannot use the Product Property for Radicals. In order to multiply square roots of negative numbers we should first write them as complex numbers, using $\sqrt{-b}=\sqrt{b}i$.This is one place students tend to make errors, so be careful when you see multiplying with a negative square root.

Example 17.9.7

Multiply: $\sqrt{-36}\cdot\sqrt{-4}$.

Solution:

To multiply square roots of negative numbers, we first write them as complex numbers.

$$\sqrt{-36}\cdot\sqrt{-4}$$

Write as complex numbers using $\sqrt{-b}=\sqrt{b}i$.

$$\sqrt{36}i\cdot\sqrt{4}i$$

Simplify.

$$6i\cdot 2i$$

Multiply.

$$12i^2$$

Simplify i^2 and multiply.

$$-12$$

Exercise 17.9.13

Multiply: $\sqrt{-49} \cdot \sqrt{-4}$.

Answer

-14

Exercise 17.9.14

Multiply: $\sqrt{-36} \cdot \sqrt{-81}$.

Answer

-54

In the next example, each binomial has a square root of a negative number. Before multiplying, each square root of a negative number must be written as a complex number.

Example 17.9.8

Multiply: $(3-\sqrt{-12})(5+\sqrt{-27})$.

Solution:

To multiply square roots of negative numbers, we first write them as complex numbers.

$$(3-\sqrt{-12})(5+\sqrt{-27})$$

Write as complex numbers using $\sqrt{-b}=\sqrt{b}i$.

$$(3-2\sqrt{3}i)(5+3\sqrt{3}i)$$

Use FOIL.

$$15+9\sqrt{3}i-10\sqrt{3}i-6\cdot 3i^2$$

Combine like terms and simplify i^2.

$$15-\sqrt{3}i-6\cdot(-3)$$

Multiply and combine like terms.

$$33-\sqrt{3}i$$

Exercise 17.9.15

Multiply: $(4-\sqrt{-12})(3-\sqrt{-48})$.

Answer

$-12-22\sqrt{3}i$

Exercise 17.9.16

Multiply: $(-2+\sqrt{-8})(3-\sqrt{-18})$.

Answer

$6+12\sqrt{2}i$

We first looked at conjugate pairs when we studied polynomials. We said that a pair of binomials that each have the same first term and the same last term, but one is a sum and one is a difference is called a *conjugate pair* and is of the form $(a-b),(a+b)$.

A **complex conjugate pair** is very similar. For a complex number of the form $a+bi$, its conjugate is $a-bi$. Notice they have the same first term and the same last term, but one is a sum and one is a difference.

Definition 17.9.4

A **complex conjugate pair** is of the form $a+bi, a-bi$.

We will multiply a complex conjugate pair in the next example.

Example 17.9.9

Multiply: $(3-2i)(3+2i)$.

Solution:

$$(3-2i)(3+2i)$$

Use FOIL

$$9+6i-6i-4i^2$$

Combine like terms and simplify i^2.

$$9-4(-1)$$

Multiply and combine like terms.

$$13$$

Exercise 17.9.17

Multiply: $(4-3i)\cdot(4+3i)$.

Answer

25

Exercise 17.9.18

Multiply: $(-2+5i)\cdot(-2-5i)$.

Answer

29

From our study of polynomials, we know the product of conjugates is always of the form $(a-b)(a+b)=a^2-b^2$ .The result is called a **difference of squares**. We can multiply a complex conjugate pair using this pattern.

The last example we used FOIL. Now we will use the **Product of Conjugates Pattern**.

$$(a-b)(a+b)$$

$$(3-2i)(3+2i)$$

$$a^2-b^2$$

$$(3)^2-(2i)^2$$

$$9-4i^2$$

$$9-4(-1)$$

$$13$$

Figure 8.8.8

Notice this is the same result we found in Example 8.8.9.

When we multiply complex conjugates, the product of the last terms will always have an i^2 which simplifies to -1.

$$(a-bi)(a+bi)$$
$$a^2-(bi)^2$$
$$a^2-b^2i^2$$
$$a^2-b^2(-1)$$
$$a^2+b^2$$

This leads us to the Product of Complex Conjugates Pattern: $(a-bi)(a+bi)=a^2+b^2$

Definition 17.9.5

Product of Complex Conjugates

If a and b are real numbers, then

$$(a-bi)(a+bi)=a^2+b^2$$

Example 17.9.10

Multiply using the Product of Complex Conjugates Pattern: $(8-2i)(8+2i)$.

Solution:

Table 8.8.3

	$(a-b)(a+b)$ $(8-2i)(8+2i)$
Use the Product of Complex Conjugates Pattern, $(a-bi)(a+bi)=a^2+b^2$.	a^2+b^2 8^2+2^2
Simplify the squares.	$64+4$
Add.	68

Exercise 17.9.19

Multiply using the Product of Complex Conjugates Pattern: $(3-10i)(3+10i)$.

Answer

109

Exercise 17.9.20

Multiply using the Product of Complex Conjugates Pattern: $(-5+4i)(-5-4i)$.

Answer

41

Divide Complex Numbers

Dividing complex numbers is much like rationalizing a denominator. We want our result to be in standard form with no imaginary numbers in the denominator.

Example 17.9.11 how to divide complex numbers

Divide: $\frac{4+3i}{3-4i}$.

Solution:

Table 8.8.4

Step 1: Write both the numerator and denominator in standard form.	They are both in standard form.	$\frac{4+3i}{3-4i}$
Step 2: Multiply the numerator and denominator by the complex conjugate of the denominator.	The complex conjugate of $3-4i$ is $3+4i$.	$\frac{(4+3i)(3+4i)}{(3-4i)(3+4i)}$
Step 3: Simplify and write the result in standard form.	Use the pattern $(a-bi)(a+bi)=a^2+b^2$ in the denominator. Combine like terms. Simplify. Write the result in standard form.	$\frac{12+16i+9i+12i^2}{9+16}$ $\frac{12+25i-12}{25}$ $\frac{25i}{25}$ i

Exercise 17.9.21

Divide: $\frac{2+5i}{5-2i}$.

Answer

i

Exercise 17.9.22

Divide: $\frac{1+6i}{6-i}$.

Answer

i

We summarize the steps here.

How to Divide Complex Numbers

1. Write both the numerator and denominator in standard form.
2. Multiply both the numerator and denominator by the complex conjugate of the denominator.
3. Simplify and write the result in standard form.

Example 17.9.12

Divide, writing the answers in standard form: $\frac{-3}{5+2i}$.

Solution:

$$\frac{-3}{5+2i}$$

Multiply the numerator and denominator by the complex conjugate of the denominator.

$$\frac{-3(5-2i)}{(5+2i)(5-2i)}$$

Multiply in the numerator and use the Product of Complex Conjugates Pattern in the denominator.

$$\frac{-15+6i}{5^2+2^2}$$

Simplify.

$$\frac{-15+6i}{29}$$

Write in standard form.

$$-\frac{15}{29}+\frac{6}{29}i$$

Exercise 17.9.23

Divide, writing the answer in standard form: $\frac{4}{1-4i}$.

Answer

$\frac{4}{17}+\frac{16}{17}i$

Exercise 17.9.24

Divide, writing the answer in standard form: $\frac{-2}{-1+2i}$.

Answer

$\frac{2}{5}+\frac{4}{5}i$

Be careful as you find the conjugate of the denominator.

Example 17.9.13

Divide: $\frac{5+3i}{4i}$.

Solution:

$$\frac{5+3i}{4i}$$

Write the denominator in standard form.

$$\frac{5+3i}{0+4i}$$

Multiply the numerator and denominator by the complex conjugate of the denominator.

$$\frac{(5+3i)(0-4i)}{(0+4i)(0-4i)}$$

Simplify.

$$\frac{(5+3i)(-4i)}{(4i)(-4i)}$$

Multiply.

$$\frac{-20i-12i^2}{-16i^2}.$$

Simplify the i^2.

$$\frac{-20i+12}{16}$$

Rewrite in standard form.

$$\frac{12}{16}-\frac{20}{16}i$$

Simplify the fractions.

$$\frac{3}{4}-\frac{5}{4}i$$

Exercise 17.9.25

Divide: $\frac{3+3i}{2i}$.

Answer

$\frac{3}{2}-\frac{3}{2}i$

Exercise 17.9.26

Divide: $\frac{2+4i}{5i}$.

Answer

$\frac{4}{5}-\frac{2}{5}i$

Simplify Powers of i

The powers of i make an interesting pattern that will help us simplify higher powers of i. Let's evaluate the powers of i to see the pattern.

$$\begin{array}{cccc} i^1 & i^2 & i^3 & i^4 \\ i & -1 & i^2\cdot i & i^2\cdot i^2 \\ & & -1\cdot i & (-1)(-1) \\ & & -i & 1 \end{array}$$

$$\begin{array}{cccc} i^5 & i^6 & i^7 & i^8 \\ i^4\cdot i & i^4\cdot i^2 & i^4\cdot i^3 & i^4\cdot i^4 \\ 1\cdot i & 1\cdot i^2 & 1\cdot i^3 & 1\cdot 1 \\ i & i^2 & i^3 & 1 \\ & -1 & -i & \end{array}$$

We summarize this now.

$$\begin{array}{ll} i^1=i & i^5=i \\ i^2=-1 & i^6=-1 \\ i^3=-i & i^7=-i \\ i^4=1 & i^8=1 \end{array}$$

If we continued, the pattern would keep repeating in blocks of four. We can use this pattern to help us simplify powers of i. Since $i^4=1$, we rewrite each power, i^n, as a product using i^4 to a power and another power of i.

We rewrite it in the form $i^n=\left(i^4\right)^q\cdot i^r$, where the exponent, q, is the quotient of n divided by 4 and the exponent, r, is the remainder from this division. For example, to simplify i^{57}, we divide 57 by 4 and we get 14 with a remainder of 1. In other words, $57=4\cdot 14+1$. So we write $i^{57}=\left(1^4\right)^{14}\cdot i^1$ and then simplify from there.

$$\begin{array}{r} 14 \\ 4\overline{)57} \\ \underline{4} \\ 17 \\ \underline{16} \\ 1 \end{array} \qquad \begin{array}{l} i^{57} \\ \left(1^4\right)^{14}\cdot i^1 \\ 1\cdot i \\ i \end{array}$$

Figure 8.8.13

Example 17.9.14

Simplify: i^{86}.

Solution:

$$i^{86}$$

Divide 86 by 4 and rewrite i^{86} in the $i^n=\left(i^4\right)^q\cdot i^r$ form.

$$\left(1^4\right)^{21}\cdot i^2$$

$$\begin{array}{rl} 21 & \text{(divide the exponent by the number of repeats in the imaginary number i)} \\ 4\overline{)86} & \\ \underline{8} & \text{(four goes into eight twice with zero remainders)} \\ 06 & \\ \underline{4} & \text{(four goes into 6 one time with 2 remainders)} \\ 2 & \text{(remainder is 2 so calculate the imaginary number with an exponent of two)} \end{array} \tag{17.9.1}$$

Simplify.

$$(1)^{21} \cdot (-1)$$

Simplify.

$$-1$$

? Exercise 17.9.27

Simplify: i^{74}.

Answer

-1

? Exercise 17.9.28

Simplify: i^{92}.

Answer

1

- Rewriting Powers of i

Key Concepts

- **Square Root of a Negative Number**
  - If b is a positive real number, then \(\sqrt{-b}=\sqrt{b} i\

Table 8.8.1

	$a+bi$	
$b=0$	$a+0\cdot i$ a	Real number
$b\neq 0$	$a+bi$	Imaginary number
$a=0$	$0+bi$ bi	Pure imaginary number

- A complex number is in **standard form** when written as $a + bi$, where a, b are real numbers.

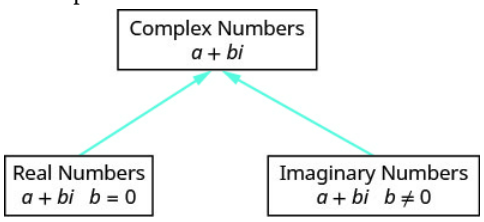

Figure 8.8.2

- **Product of Complex Conjugates**
  - If a, b are real numbers, then $(a-bi)(a+bi) = a^2+b^2$
- **How to Divide Complex Numbers**
  1. Write both the numerator and denominator in standard form.
  2. Multiply the numerator and denominator by the complex conjugate of the denominator.
  3. Simplify and write the result in standard form.

Glossary

complex conjugate pair

A complex conjugate pair is of the form $a+bi, a-bi$.

complex number

A complex number is of the form $a+bi$, where a and b are real numbers. We call a the real part and b the imaginary part.

complex number system

The complex number system is made up of both the real numbers and the imaginary numbers.

imaginary unit

The imaginary unit i is the number whose square is -1. $i^2 = -1$ or $i = \sqrt{-1}$.

standard form

A complex number is in standard form when written as $a+bi$, where a, b are real numbers.

17.9E: Exercises

Practice Makes Perfect

Exercises 1 - 4: Evaluate a Square Root of a Negative Number

In the following exercises, write each expression in terms of i and simplify if possible.

1. a. $\sqrt{-16}$ b. $\sqrt{-11}$ c. $\sqrt{-8}$
2. a. $\sqrt{-121}$ b. $\sqrt{-1}$ c. $\sqrt{-20}$
3. a. $\sqrt{-100}$ b. $\sqrt{-13}$ c. $\sqrt{-45}$
4. a. $\sqrt{-49}$ b. $\sqrt{-15}$ c. $\sqrt{-75}$

Answer

1. a. $4i$ b. $i\sqrt{11}$ c. $2i\sqrt{2}$
3. a. $10i$ b. $i\sqrt{13}$ c. $3i\sqrt{5}$

ExerciseS 5 - 21: Add or Subtract Complex Numbers

In the following exercises, add or subtract, putting the answer in $a+bi$ form.

5. $\sqrt{-75}+\sqrt{-48}$
6. $\sqrt{-12}+\sqrt{-75}$
7. $\sqrt{-50}+\sqrt{-18}$
8. $\sqrt{-72}+\sqrt{-8}$
9. $(1+3i)+(7+4i)$
10. $(6+2i)+(3-4i)$
11. $(8-i)+(6+3i)$
12. $(7-4i)+(-2-6i)$
13. $(1-4i)-(3-6i)$
14. $(8-4i)-(3+7i)$
15. $(6+i)-(-2-4i)$
16. $(-2+5i)-(-5+6i)$
17. $(5-\sqrt{-36})+(2-\sqrt{-49})$
18. $(-3+\sqrt{-64})+(5-\sqrt{-16})$
19. $(-7-\sqrt{-50})-(-32-\sqrt{-18})$
20. $(-5+\sqrt{-27})-(-4-\sqrt{-48})$

Answer

5. $0+\left(9\sqrt{3}\right)i$
7. $0+\left(8\sqrt{2}\right)i$
9. $8+7i$
11. $14+2i$
13. $-2+2i$
15. $8+5i$

17. $7-13i$

19. $25-\left(2\sqrt{2}\right)i$

? ExerciseS 21 - 28: Multiply Complex Numbers

In the following exercises, multiply, putting the answer in $a+bi$ form.

21. $4i(5-3i)$

22. $2i(-3+4i)$

23. $-6i(-3-2i)$

24. $-i(6+5i)$

25. $(4+3i)(-5+6i)$

26. $(-2-5i)(-4+3i)$

27. $(-3+3i)(-2-7i)$

28. $(-6-2i)(-3-5i)$

Answer

21. $12+20i$

23. $-12+18i$

25. $-38+9i$

27. $27+15i$

? ExerciseS 29 - 32: Multiply Complex Numbers

In the following exercises, multiply using the Product of Binomial Squares Pattern, putting the answer in $a+bi$ form.

29. $(3+4i)^2$

30. $(-1+5i)^2$

31. $(-2-3i)^2$

32. $(-6-5i)^2$

Answer

29. $-7+24i$

31. $-5-12i$

? Exercises 33 - 46: Multiply Complex Numbers

In the following exercises, multiply, putting the answer in $a+bi$ form.

33. $\sqrt{-25}\cdot\sqrt{-36}$

34. $\sqrt{-4}\cdot\sqrt{-16}$

35. $\sqrt{-9}\cdot\sqrt{-100}$

36. $\sqrt{-64}\cdot\sqrt{-9}$

37. $(-2-\sqrt{-27})(4-\sqrt{-48})$

38. $(5-\sqrt{-12})(-3+\sqrt{-75})$

39. $(2+\sqrt{-8})(-4+\sqrt{-18})$

40. $(5+\sqrt{-18})(-2-\sqrt{-50})$

41. $(2-i)(2+i)$

42. $(4-5i)(4+5i)$

43. $(7-2i)(7+2i)$

44. $(-3-8i)(-3+8i)$

Answer

33. $30i = 0+30i$

35. $-30 = -30+0i$

37. $-44+\left(4\sqrt{3}\right)i$

39. $-20-\left(2\sqrt{2}\right)i$

41. $5 = 5+0i$

43. $53 = 53+0i$

? ExerciseS 45 - 49: Multiply Complex Numbers

In the following exercises, multiply using the Product of Complex Conjugates Pattern.

45. $(7-i)(7+i)$

46. $(6-5i)(6+5i)$

47. $(9-2i)(9+2i)$

48. $(-3-4i)(-3+4i)$

Answer

45. 50

47. 85

? ExerciseS 49 - 60: Divide Complex Numbers

In the following exercises, divide, putting the answer in $a+bi$ form.

49. $\dfrac{3+4i}{4-3i}$

50. $\dfrac{5-2i}{2+5i}$

51. $\dfrac{2+i}{3-4i}$

52. $\dfrac{3-2i}{6+i}$

53. $\dfrac{3}{2-3i}$

54. $\dfrac{2}{4-5i}$

55. $\dfrac{-4}{3-2i}$

56. $\dfrac{-1}{3+2i}$

57. $\dfrac{1+4i}{3i}$

58. $\dfrac{4+3i}{7i}$

59. $\dfrac{-2-3i}{4i}$

60. $\dfrac{-3-5i}{2i}$

Answer

49. $i=0+i$

51. $\frac{2}{25}+\frac{11}{25}i$

53. $\frac{6}{13}+\frac{9}{13}i$

55. $-\frac{12}{13}-\frac{8}{13}i$

57. $\frac{4}{3}-\frac{1}{3}i$

59. $-\frac{3}{4}+\frac{1}{2}i$

ExerciseS 61 - 68: Simplify Powers of i

In the following exercises, simplify.

61. i^{41}

62. i^{39}

63. i^{66}

64. i^{48}

65. i^{128}

66. i^{162}

67. i^{137}

68. i^{255}

Answer

61. $i^{41}=i^{40}\cdot i=\left(i^4\right)^{10}\cdot i=i$

63. $i^{66}=i^{64}\cdot i^2=\left(i^4\right)^{16}\cdot(-1)=-1$

65. $i^{128}=\left(i^4\right)^{32}=1$

67. $i^{137}=i^{136}\cdot i=\left(i^4\right)^{34}\cdot i=1\cdot i=i$

ExerciseS 69 - 72: Writing Exercises

69. Explain the relationship between real numbers and complex numbers.

70. Aniket multiplied as follows and he got the wrong answer. What is wrong with his reasoning?

$\sqrt{-7}\cdot\sqrt{-7}$

$\sqrt{49}$

7

71. Why is $\sqrt{-64} = 8i$ but $\sqrt[3]{-64} = -4$.

72. Explain how dividing complex numbers is similar to rationalizing a denominator.

Answer

69. Answers may vary

71. Answers may vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
evaluate the square root of a negative number.			
add or subtract complex numbers.			
multiply complex numbers.			
divide complex numbers.			
simplify powers of *i*.			

Figure 8.8.15

b. On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

17.10: Review Exercises

Chapter Review Exercises

Simplify Expressions with Roots

Exercise 17.10.1 Simplify Expressions with Roots

In the following exercises, simplify.

1. a. $\sqrt{225}$
   b. $-\sqrt{16}$
2. a. $-\sqrt{169}$
   b. $\sqrt{-8}$
3. a. $\sqrt[3]{8}$
   b. $\sqrt[4]{81}$
   c. $\sqrt[5]{243}$
4. a. $\sqrt[3]{-512}$
   b. $\sqrt[4]{-81}$
   c. $\sqrt[5]{-1}$

Answer

1.
   a. 15
   b. -4
3.
   a. 2
   b. 3
   c. 3

Exercise 17.10.2 Estimate and Approximate Roots

In the following exercises, estimate each root between two consecutive whole numbers.

1. a. $\sqrt{68}$
   b. $\sqrt[3]{84}$

Answer

1.
   a. $8 < \sqrt{68} < 9$
   b. $4 < \sqrt[3]{84} < 5$

Exercise 17.10.3 Estimate and Approximate Roots

In the following exercises, approximate each root and round to two decimal places.

1. a. $\sqrt{37}$
   b. $\sqrt[3]{84}$
   c. $\sqrt[4]{125}$

Answer

1. Solve for yourself

Exercise 17.10.4 Simplify Variable Expressions with Roots

In the following exercises, simplify using absolute values as necessary.

1. a. $\sqrt[3]{a^3}$
   b. $\sqrt[7]{b^7}$
2. a. $\sqrt{a^{14}}$
   b. $\sqrt{w^{24}}$
3. a. $\sqrt[4]{m^8}$
   b. $\sqrt[5]{n^{20}}$
4. a. $\sqrt{121m^{20}}$
   b. $-\sqrt{64a^2}$
5. a. $\sqrt[3]{216a^6}$
   b. $\sqrt[5]{32b^{20}}$
6. a. $\sqrt{144x^2y^2}$
   b. $\sqrt{169w^8y^{10}}$
   c. $\sqrt[3]{8a^{51}b^6}$

Answer

1.
   a. a
   b. $|b|$
3.
   a. m^2
   b. n^4
5.
   a. $6a^2$
   b. $2b^4$

Simplify Radical Expressions

Exercise 17.10.5 Use the Product Property to Simplify Radical Expressions

In the following exercises, use the Product Property to simplify radical expressions.

1. $\sqrt{125}$
2. $\sqrt{675}$
3. a. $\sqrt[3]{625}$
   b. $\sqrt[6]{128}$

Answer

1. $5\sqrt{5}$
3.
   a. $5\sqrt[3]{5}$
   b. $2\sqrt[6]{2}$

Exercise 17.10.6 Use the Product Property to Simplify Radical Expressions

In the following exercises, simplify using absolute value signs as needed.

1. a. $\sqrt{a^{23}}$
   b. $\sqrt[3]{b^8}$
   c. $\sqrt[8]{c^{13}}$
2. a. $\sqrt{80s^{15}}$
   b. $\sqrt[5]{96a^7}$
   c. $\sqrt[6]{128b^7}$
3. a. $\sqrt{96r^3s^3}$
   b. $\sqrt[3]{80x^7y^6}$
   c. $\sqrt[4]{80x^8y^9}$
4. a. $\sqrt[5]{-32}$
   b. $\sqrt[8]{-1}$
5. a. $8+\sqrt{96}$
   b. $\frac{2+\sqrt{40}}{2}$

Answer

2.

a. $4\left|s^7\right|\sqrt{5s}$
b. $2a\sqrt[5]{3a^2}$
c. $2|b|\sqrt[6]{2b}$

4.

a. -2
b. not real

Exercise 17.10.7 Use the Quotient Property to Simplify Radical Expressions

In the following exercises, use the Quotient Property to simplify square roots.

1. a. $\sqrt{\frac{72}{98}}$
   b. $\sqrt[3]{\frac{24}{81}}$
   c. $\sqrt[4]{\frac{6}{96}}$
2. a. $\sqrt{\frac{y^4}{y^8}}$
   b. $\sqrt[5]{\frac{u^{21}}{u^{11}}}$
   c. $\sqrt[6]{\frac{v^{30}}{v^{12}}}$
3. $\sqrt{\frac{300m^5}{64}}$
4. a. $\sqrt{\frac{28p^7}{q^2}}$
   b. $\sqrt[3]{\frac{81s^8}{t^3}}$
   c. $\sqrt[4]{\frac{64p^{15}}{q^{12}}}$
5. a. $\sqrt{\frac{27p^2q}{108p^4q^3}}$

b. $\sqrt[3]{\frac{16c^5d^7}{250c^2d^2}}$

c. $\sqrt[6]{\frac{2m^9n^7}{128m^3n}}$

6. a. $\frac{\sqrt{80q^5}}{\sqrt{5q}}$

b. $\frac{\sqrt[3]{-625}}{\sqrt[3]{5}}$

c. $\frac{\sqrt[4]{80m^7}}{\sqrt[4]{5m}}$

Answer

1.

a. $\frac{6}{7}$

b. $\frac{2}{3}$

c. $\frac{1}{2}$

3. $\frac{10m^2\sqrt{3m}}{8}$

5.

a. $\frac{1}{2|pq|}$

b. $\frac{2cd\sqrt[5]{2d^2}}{5}$

c. $\frac{|mn|\sqrt[6]{2}}{2}$

Simplify Rational Exponents

Exercise 17.10.8 Simplify Expressions with $a^{\frac{1}{n}}$

In the following exercises, write as a radical expression.

1. a. $r^{\frac{1}{2}}$

b. $s^{\frac{1}{3}}$

c. $t^{\frac{1}{4}}$

Answer

1.

a. $\sqrt{r}$

b. $\sqrt[3]{s}$

c. $\sqrt[4]{t}$

Exercise 17.10.9 Simplify Expressions with $a^{\frac{1}{n}}$

In the following exercises, write with a rational exponent.

1. a. $\sqrt{21p}$

b. $\sqrt[4]{8q}$

c. $4\sqrt[6]{36r}$

Answer

1. Solve for yourself

Exercise 17.10.10 Simplify Expressions with $a^{\frac{1}{n}}$

In the following exercises, simplify.

1. a. $625^{\frac{1}{4}}$
   b. $243^{\frac{1}{5}}$
   c. $32^{\frac{1}{5}}$
2. a. $(-1,000)^{\frac{1}{3}}$
   b. $-1,000^{\frac{1}{3}}$
   c. $(1,000)^{-\frac{1}{3}}$
3. a. $(-32)^{\frac{1}{5}}$
   b. $(243)^{-\frac{1}{5}}$
   c. $-125^{\frac{1}{3}}$

Answer

1.
   a. 5
   b. 3
   c. 2
3.
   a. -2
   b. $\frac{1}{3}$
   c. -5

Exercise 17.10.11 Simplify Expressions with $a^{\frac{m}{n}}$

In the following exercises, write with a rational exponent.

1. a. $\sqrt[4]{r^7}$
   b. $(\sqrt[5]{2pq})^3$
   c. $\sqrt[4]{\left(\frac{12m}{7n}\right)^3}$

Answer

1. Solve for yourself

Exercise 17.10.12 Simplify Expressions with $a^{\frac{m}{n}}$

In the following exercises, simplify.

1. a. $25^{\frac{3}{2}}$
   b. $9^{-\frac{3}{2}}$
   c. $(-64)^{\frac{2}{3}}$
2. a. $-64^{\frac{3}{2}}$
   b. $-64^{-\frac{3}{2}}$
   c. $(-64)^{\frac{3}{2}}$

Answer

1.

a. 125
b. $\frac{1}{27}$
c. 16

Exercise 17.10.13 Use the Laws of Exponents to Simplify Expressions with Rational Exponents

In the following exercises, simplify.

1. a. $6^{\frac{5}{2}} \cdot 6^{\frac{1}{2}}$
   b. $\left(b^{15}\right)^{\frac{3}{5}}$
   c. $\frac{w^{\frac{2}{7}}}{w^{\frac{9}{7}}}$
2. a. $\frac{a^{\frac{3}{4}} \cdot a^{-\frac{1}{4}}}{a^{-\frac{10}{4}}}$
   b. $\left(\frac{27b^{\frac{2}{3}}c^{-\frac{5}{2}}}{b^{-\frac{7}{3}}c^{\frac{1}{2}}}\right)^{\frac{1}{3}}$

Answer

1.
a. 6^3
b. b^9
c. $\frac{1}{w}$

Add, Subtract and Multiply Radical Expressions

Exercise 17.10.14 add and Subtract Radical Expressions

In the following exercises, simplify.

1. a. $7\sqrt{2}-3\sqrt{2}$
   b. $7\sqrt[3]{p}+2\sqrt[3]{p}$
   c. $5\sqrt[3]{x}-3\sqrt[3]{x}$
2. a. $\sqrt{11b}-5\sqrt{11b}+3\sqrt{11b}$
   b. $8\sqrt[4]{11cd}+5\sqrt[4]{11cd}-9\sqrt[4]{11cd}$
3. a. $\sqrt{48}+\sqrt{27}$
   b. $\sqrt[3]{54}+\sqrt[3]{128}$
   c. $6\sqrt[4]{5}-\frac{3}{2}\sqrt[4]{320}$
4. a. $\sqrt{80c^7}-\sqrt{20c^7}$
   b. $2\sqrt[4]{162r^{10}}+4\sqrt[4]{32r^{10}}$
5. $3\sqrt{75y^2}+8y\sqrt{48}-\sqrt{300y^2}$

Answer

1.
a. $4\sqrt{2}$
b. $9\sqrt[3]{p}$
c. $2\sqrt[3]{x}$

3.
a. $7\sqrt{3}$
b. $7\sqrt[3]{2}$

c. $3\sqrt[4]{5}$

5. $37y\sqrt{3}$

Exercise 17.10.15 Multiply Radical Expressions

In the following exercises, simplify.

1. a. $(5\sqrt{6})(-\sqrt{12})$
   b. $(-2\sqrt[4]{18})(-\sqrt[4]{9})$
2. a. $\left(3\sqrt{2x^3}\right)\left(7\sqrt{18x^2}\right)$
   b. $\left(-6\sqrt[3]{20a^2}\right)\left(-2\sqrt[3]{16a^3}\right)$

Answer

2.

a. $126x^2\sqrt{2}$
b. $48a\sqrt[3]{a^2}$

Exercise 17.10.16 Use Polynomial Multiplication to Multiply Radical Expressions

In the following exercises, multiply.

1. a. $\sqrt{11}(8+4\sqrt{11})$
   b. $\sqrt[3]{3}(\sqrt[3]{9}+\sqrt[3]{18})$
2. a. $(3-2\sqrt{7})(5-4\sqrt{7})$
   b. $(\sqrt[3]{x}-5)(\sqrt[3]{x}-3)$
3. $(2\sqrt{7}-5\sqrt{11})(4\sqrt{7}+9\sqrt{11})$
4. a. $(4+\sqrt{11})^2$
   b. $(3-2\sqrt{5})^2$
5. $(7+\sqrt{10})(7-\sqrt{10})$
6. $(\sqrt[3]{3x}+2)(\sqrt[3]{3x}-2)$

Answer

2.

a. $71-22\sqrt{7}$
b. $\sqrt[3]{x^2}-8\sqrt[3]{x}+15$

4.

a. $27+8\sqrt{11}$
b. $29-12\sqrt{5}$

6. $\sqrt[3]{9x^2}-4$

Divide Radical Expressions

Exercise 17.10.17 Divide Square Roots

In the following exercises, simplify.

1. a. $\frac{\sqrt{48}}{\sqrt{75}}$
   b. $\frac{\sqrt[3]{81}}{\sqrt[3]{24}}$
2. a. $\frac{\sqrt{320mn^{-5}}}{\sqrt{45m^{-7}n^3}}$

b. $\frac{\sqrt[3]{16x^4y^{-2}}}{\sqrt[3]{-54x^{-2}y^4}}$

Answer

2.

a. $\frac{8m^4}{3n^4}$

b. $-\frac{x^2}{2y^2}$

Exercise 17.10.18 rationalize a One Term Denominator

In the following exercises, rationalize the denominator.

1. a. $\frac{8}{\sqrt{3}}$
   b. $\sqrt{\frac{7}{40}}$
   c. $\frac{8}{\sqrt{2y}}$
2. a. $\frac{1}{\sqrt[3]{11}}$
   b. $\sqrt[3]{\frac{7}{54}}$
   c. $\frac{3}{\sqrt[3]{3x^2}}$
3. a. $\frac{1}{\sqrt[4]{4}}$
   b. $\sqrt[4]{\frac{9}{32}}$
   c. $\frac{6}{\sqrt[4]{9x^3}}$

Answer

2.

a. $\frac{\sqrt[3]{121}}{11}$

b. $\frac{\sqrt[3]{28}}{6}$

c. $\frac{\sqrt[3]{9x}}{x}$

Exercise 17.10.19 Rationalize a Two Term Denominator

In the following exercises, simplify.

1. $\frac{7}{2-\sqrt{6}}$
2. $\frac{\sqrt{5}}{\sqrt{n}-\sqrt{7}}$
3. $\frac{\sqrt{x}+\sqrt{8}}{\sqrt{x}-\sqrt{8}}$

Answer

1. $-\frac{7(2+\sqrt{6})}{2}$
3. $\frac{(\sqrt{x}+2\sqrt{2})^2}{x-8}$

Solve Radical Equations

Exercise 17.10.20 Solve Radical Equations

In the following exercises, solve.

1. $\sqrt{4x-3}=7$
2. $\sqrt{5x+1}=-3$
3. $\sqrt[3]{4x-1}=3$
4. $\sqrt{u-3}+3=u$
5. $\sqrt[3]{4x+5}-2=-5$
6. $(8x+5)^{\frac{1}{3}}+2=-1$
7. $\sqrt{y+4}-y+2=0$
8. $2\sqrt{8r+1}-8=2$

Answer

2. no solution

4. $u=3, u=4$

6. $x=-4$

8. $r=3$

Exercise 17.10.21 Solve Radical Equations with Two Radicals

In the following exercises, solve.

1. $\sqrt{10+2c}=\sqrt{4c+16}$
2. $\sqrt[3]{2x^2+9x-18}=\sqrt[3]{x^2+3x-2}$
3. $\sqrt{r}+6=\sqrt{r+8}$
4. $\sqrt{x+1}-\sqrt{x-2}=1$

Answer

2. $x=-8, x=2$

4. $x=3$

Exercise 17.10.22 Use Radicals in Applications

In the following exercises, solve. Round approximations to one decimal place.

1. **Landscaping** Reed wants to have a square garden plot in his backyard. He has enough compost to cover an area of 75 square feet. Use the formula $s=\sqrt{A}$ to find the length of each side of his garden. Round your answers to th nearest tenth of a foot.
2. **Accident investigation** An accident investigator measured the skid marks of one of the vehicles involved in an accident. The length of the skid marks was 175 feet. Use the formula $s=\sqrt{24d}$ to find the speed of the vehicle before the brakes were applied. Round your answer to the nearest tenth.

Answer

2. 64.8 feet

Use Radicals in Functions

Exercise 17.10.23 Evaluate a Radical Function

In the following exercises, evaluate each function.

1. $g(x) = \sqrt{6x+1}$, find
   a. $g(4)$
   b. $g(8)$
2. $G(x) = \sqrt{5x-1}$, find
   a. $G(5)$
   b. $G(2)$
3. $h(x) = \sqrt[3]{x^2-4}$, find
   a. $h(-2)$
   b. $h(6)$
4. For the function $g(x) = \sqrt[4]{4-4x}$, find
   a. $g(1)$
   b. $g(-3)$

Answer

2.

a. $G(5) = 2\sqrt{6}$
b. $G(2) = 3$

4.

a. $g(1) = 0$
b. $g(-3) = 2$

Exercise 17.10.24 Find the Domain of a Radical Function

In the following exercises, find the domain of the function and write the domain in interval notation.

1. $g(x) = \sqrt{2-3x}$
2. $F(x) = \sqrt{\frac{x+3}{x-2}}$
3. $f(x) = \sqrt[3]{4x^2-16}$
4. $F(x) = \sqrt[4]{10-7x}$

Answer

2. $(2, \infty)$
4. $\left[\frac{7}{10}, \infty\right)$

Exercise 17.10.25 graph Radical Functions

In the following exercises,

a. find the domain of the function
b. graph the function
c. use the graph to determine the range

1. $g(x) = \sqrt{x+4}$
2. $g(x) = 2\sqrt{x}$
3. $f(x) = \sqrt[3]{x-1}$
4. $f(x) = \sqrt[3]{x}+3$

Answer

2.

a. domain: $[0, \infty)$

b.

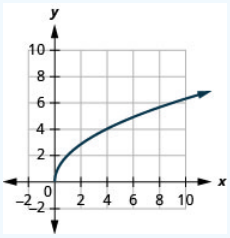

Figure 8.E.1

c. range: $[0, \infty)$

4.

a. domain: $(-\infty, \infty)$

b.

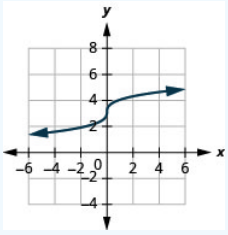

Figure 8.E.2

c. range: $(-\infty, \infty)$

Use the Complex Number System

Exercise 17.10.26 evaluate the Square Root of a Negative Number

In the following exercises, write each expression in terms of i and simplify if possible.

1. a. $\sqrt{-100}$
   b. $\sqrt{-13}$
   c. $\sqrt{-45}$

Answer

Solve for yourself

Exercise 17.10.27 Add or Subtract Complex Numbers

In the following exercises, add or subtract.

1. $\sqrt{-50} + \sqrt{-18}$
2. $(8 - i) + (6 + 3i)$
3. $(6 + i) - (-2 - 4i)$
4. $(-7 - \sqrt{-50}) - (-32 - \sqrt{-18})$

Answer

1. $8\sqrt{2}i$
3. $8 + 5i$

Exercise 17.10.28 Multiply Complex Numbers

In the following exercises, multiply.

1. $(-2-5i)(-4+3i)$
2. $-6i(-3-2i)$
3. $\sqrt{-4}\cdot\sqrt{-16}$
4. $(5-\sqrt{-12})(-3+\sqrt{-75})$

Answer

1. $23+14i$
3. -6

Exercise 17.10.29 Multiply Complex Numbers

In the following exercises, multiply using the Product of Binomial Squares Pattern.

1. $(-2-3i)^2$

Answer

1. $-5-12i$

Exercise 17.10.30 Multiply Complex Numbers

In the following exercises, multiply using the Product of Complex Conjugates Pattern.

1. $(9-2i)(9+2i)$

Answer

Solve for yourself

Exercise 17.10.31 divide Complex Numbers

In the following exercises, divide.

1. $\frac{2+i}{3-4i}$
2. $\frac{-4}{3-2i}$

Answer

1. $\frac{2}{25}+\frac{11}{25}i$

Exercise 17.10.32 Simplify Powers of i

In the following exercises, simplify.

1. i^{48}
2. i^{255}

Answer

1. 1

Exercise 17.10.33

In the following exercises, simplify using absolute values as necessary.

1. $\sqrt[3]{125x^9}$
2. $\sqrt{169x^8y^6}$
3. $\sqrt[3]{72x^8y^4}$
4. $\sqrt{\frac{45x^3y^4}{180x^5y^2}}$

Answer

1. $5x^3$
3. $2x^2y\sqrt[3]{9x^2y}$

Exercise 17.10.34

In the following exercises, simplify. Assume all variables are positive.

1. a. $216^{-\frac{1}{4}}$
   b. $-49^{\frac{3}{2}}$
2. $\sqrt{-45}$
3. $\frac{x^{-\frac{1}{4}}\cdot x^{\frac{5}{4}}}{x^{-\frac{3}{4}}}$
4. $\left(\frac{8x^{\frac{2}{3}}y^{-\frac{5}{2}}}{x^{-\frac{7}{3}}y^{\frac{1}{2}}}\right)^{\frac{1}{3}}$
5. $\sqrt{48x^5}-\sqrt{75x^5}$
6. $\sqrt{27x^2}-4x\sqrt{12}+\sqrt{108x^2}$
7. $2\sqrt{12x^5}\cdot 3\sqrt{6x^3}$
8. $\sqrt[3]{4}(\sqrt[3]{16}-\sqrt[3]{6})$
9. $(4-3\sqrt{3})(5+2\sqrt{3})$
10. $\frac{\sqrt[3]{128}}{\sqrt[3]{54}}$
11. $\frac{\sqrt{245xy^{-4}}}{\sqrt{45x^4y^3}}$
12. $\frac{1}{\sqrt[3]{5}}$
13. $\frac{3}{2+\sqrt{3}}$
14. $\sqrt{-4}\cdot\sqrt{-9}$
15. $-4i(-2-3i)$
16. $\frac{4+i}{3-2i}$
17. i^{172}

Answer

1.
   a. $\frac{1}{4}$
   b. -343
3. $x^{\frac{7}{4}}$
5. $-x^2\sqrt{3x}$
7. $36x^4\sqrt{2}$

9. $2-7\sqrt{3}$

11. $\frac{7x^5}{3y^7}$

13. $3(2-\sqrt{3})$

15. $-12+8i$

17. $-i$

Exercise 17.10.35

In the following exercises, solve.

1. $\sqrt{2x+5}+8=6$
2. $\sqrt{x+5}+1=x$
3. $\sqrt[3]{2x^2-6x-23}=\sqrt[3]{x^2-3x+5}$

Answer

2. $x=4$

Exercise 17.10.36

In the following exercise,

a. find the domain of the function
b. graph the function
c. use the graph to determine the range

1. $g(x)=\sqrt{x+2}$

Answer

1.

a. domain: $[-2,\infty)$
b.

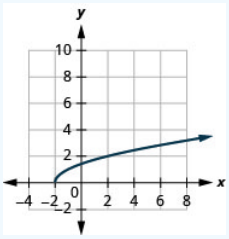

Figure 8.E.3

c. range: $[0,\infty)$

18.1: Prelude to Quadratic Equations and Functions

Blink your eyes. You've taken a photo. That's what will happen if you are wearing a contact lens with a built-in camera. Some of the same technology used to help doctors see inside the eye may someday be used to make cameras and other devices. These technologies are being developed by biomedical engineers using many mathematical principles, including an understanding of quadratic equations and functions. In this chapter, you will explore these kinds of equations and learn to solve them in different ways. Then you will solve applications modeled by quadratics, graph them, and extend your understanding to quadratic inequalities.

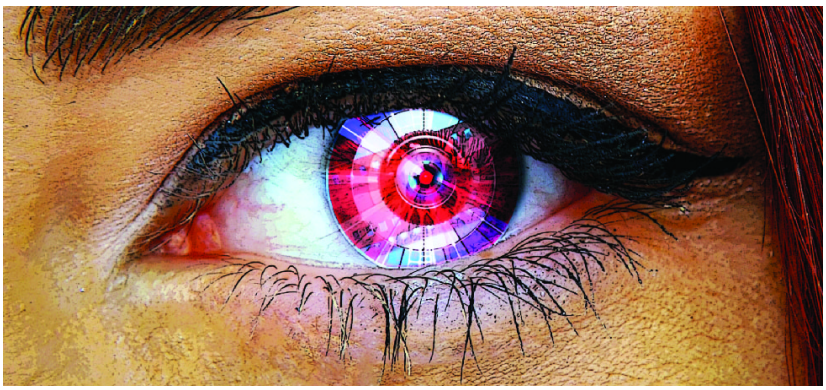

Figure 9.0.1: Several companies have patented contact lenses equipped with cameras, suggesting that they may be the future of wearable camera technology. (credit: "intographics"/Pixabay)

18.2: Solve Quadratic Equations Using the Square Root Property

Learning Objectives

By the end of this section, you will be able to:

- Solve quadratic equations of the form $ax^2 = k$ using the Square Root Property
- Solve quadratic equations of the form $a(x-h)^2 = k$ using the Square Root Property

Before you get started, take this readiness quiz.

1. Simplify: $\sqrt{128}$.
   If you missed this problem, review Example 8.13.
2. Simplify: $\sqrt{\frac{32}{5}}$.
   If you missed this problem, review Example 8.50.
3. Factor: $9x^2 - 12x + 4$.
   If you missed this problem, review Example 6.23.

A quadratic equation is an equation of the form $ax^2 + bx + c = 0$, where $a \neq 0$. Quadratic equations differ from linear equations by including a quadratic term with the variable raised to the second power of the form ax^2. We use different methods to solve quadratic equations than linear equations, because just adding, subtracting, multiplying, and dividing terms will not isolate the variable.

We have seen that some quadratic equations can be solved by factoring. In this chapter, we will learn three other methods to use in case a quadratic equation cannot be factored.

Solve Quadratic Equations of the Form $ax^2 = k$ using the Square Root Property

We have already solved some quadratic equations by factoring. Let's review how we used factoring to solve the quadratic equation $x^2 = 9$.

$$x^2 = 9$$

Put the equation in standard form.

$$x^2 - 9 = 0$$

Factor the difference of squares.

$$(x-3)(x+3) = 0$$

Use the Zero Produce Property.

$$x - 3 = 0 \quad x - 3 = 0$$

Solve each equation.

$$x = 3 \quad x = -3$$

We can easily use factoring to find the solutions of similar equations, like $x^2 = 16$ and $x^2 = 25$, because 16 and 25 are perfect squares. In each case, we would get two solutions, $x = 4, x = -4$ and $x = 5, x = -5$

But what happens when we have an equation like $x^2 = 7$? Since 7 is not a perfect square, we cannot solve the equation by factoring.

Previously we learned that since 169 is the square of 13, we can also say that 13 is a *square root* of 169. Also, $(-13)^2 = 169$, so -13 is also a square root of 169. Therefore, both 13 and -13 are square roots of 169. So, every positive number has two square roots—one positive and one negative. We earlier defined the square root of a number in this way:

If $n^2 = m$, then n is a square root of m.

Since these equations are all of the form $x^2 = k$, the square root definition tells us the solutions are the two square roots of k. This leads to the **Square Root Property**.

Definition 18.2.1

Square Root Property

If $x^2 = k$, then

$$x = \sqrt{k} \quad \text{or} \quad x = -\sqrt{k} \quad \text{or} \quad x = \pm\sqrt{k}$$

Notice that the Square Root Property gives two solutions to an equation of the form $x^2 = k$, the principal square root of k and its opposite. We could also write the solution as $x = \pm\sqrt{k}$. We read this as x equals positive or negative the square root of k.

Now we will solve the equation $x^2 = 9$ again, this time using the Square Root Property.

$$\begin{aligned} & & x^2 &= 9 \\ &\text{Use the Square Root Property.} & x &= \pm\sqrt{9} \\ & & x &= \pm 3 \end{aligned}$$

So $x = 3$ or $x = -3$

What happens when the constant is not a perfect square? Let's use the Square Root Property to solve the equation $x^2 = 7$.

$$x^2 = 7$$

Use the Square Root Property. $x = \sqrt{7}, \quad x = -\sqrt{7}$

We cannot simplify $\sqrt{7}$, so we leave the answer as a radical.

Example 18.2.1 How to Solve a Quadratic Equation of the form $ax^2 - k$ Using the Square Root Property

Solve: $x^2 - 50 = 0$.

Solution:

Table 9.1.1

Step 1: Isolate the quadratic term and make its coefficient one.	Add 50 to both sides to get x^2 by itself.	$x^2 - 50 = 0$ $x^2 = 50$
Step 2: Use the Square Root Property.	Remember to write the $\pm$ symbol.	$x = \pm\sqrt{50}$
Step 3: Simplify the radical.	Rewrite to show two solutions.	$x = \pm\sqrt{25}\cdot\sqrt{2}$ $x = \pm 5\sqrt{2}$ $x = 5\sqrt{2},\ x = -5\sqrt{2}$
Step 4: Check the solutions.	Substitute in $x = 5\sqrt{2}$ and $x = -5\sqrt{2}$	$x^2 - 50 = 0$ $(5\sqrt{2})^2 - 50 \stackrel{?}{=} 0$ $25\cdot 2 - 50 \stackrel{?}{=} 0$ $0 = 0$ $x^2 - 50 = 0$ $(-5\sqrt{2})^2 - 50 \stackrel{?}{=} 0$ $25\cdot 2 - 50 \stackrel{?}{=} 0$ $0 = 0$

Exercise 18.2.1

Solve: $x^2 - 48 = 0$.

Answer

$x = 4\sqrt{3}, x = -4\sqrt{3}$

Exercise 18.2.2

Solve: $y^2 - 27 = 0$.

Answer

$y = 3\sqrt{3}, y = -3\sqrt{3}$

The steps to take to use the **Square Root Property** to solve a quadratic equation are listed here.

Solve a Quadratic Equation Using the Square Root Property

1. Isolate the quadratic term and make its coefficient one.
2. Use Square Root Property.
3. Simplify the radical.
4. Check the solutions.

In order to use the Square Root Property, the coefficient of the variable term must equal one. In the next example, we must divide both sides of the equation by the coefficient 3 before using the Square Root Property.

Example 18.2.2

Solve: $3z^2 = 108$.

Solution:

Table 9.1.2

	$3z^2 = 108$
The quadratic term is isolated. Divide by 3 to make its coefficient 1.	$\frac{3z^2}{3} = \frac{108}{3}$
Simplify.	$z^2 = 36$
Use the Square Root Property.	$z = \pm\sqrt{36}$
Simplify the radical.	$z = \pm 6$
Rewrite to show two solutions.	$z = 6, \quad z = -6$
Check the solutions: $3z^2 = 108$ $\quad$ $3z^2 = 108$ $3(6)^2 \stackrel{?}{=} 108$ $\quad$ $3(-6)^2 \stackrel{?}{=} 108$ $3(36) \stackrel{?}{=} 108$ $\quad$ $3(36) \stackrel{?}{=} 108$ $108 = 108$ ✓ $\quad$ $108 = 108$ ✓ Figure 9.1.1	

Exercise 18.2.3

Solve: $2x^2 = 98$.

Answer

$x = 7, x = -7$

Exercise 18.2.4

Solve: $5m^2 = 80$.

Answer

$m = 4, m = -4$

The Square Root Property states 'If $x^2 = k$,' What will happen if $k < 0$? This will be the case in the next example.

Example 18.2.3

Solve: $x^2 + 72 = 0$.

Solution:

Table 9.1.3

	$x^2 + 72 = 0$
Isolate the quadratic term.	$x^2 = -72$
Use the Square Root Property.	$x = \pm\sqrt{-72}$
Simplify using complex numbers.	$x = \pm\sqrt{72}i$
Simplify the radical.	$x = \pm 6\sqrt{2}i$
Rewrite to show two solutions	$x = 6\sqrt{2}i, x = -6\sqrt{2}i$
Check the solutions: $x^2 + 72 = 0$ $(6\sqrt{2}i)^2 + 72 \stackrel{?}{=} 0$ $(6)^2 \cdot (\sqrt{2})^2 \cdot i^2 + 72 \stackrel{?}{=} 0$ $36 \cdot 2 \cdot (-1) + 72 \stackrel{?}{=} 0$ $0 = 0$ ✓	$x^2 + 72 = 0$ $(-6\sqrt{2}i)^2 + 72 \stackrel{?}{=} 0$ $(-6)^2 \cdot (\sqrt{2})^2 \cdot i^2 + 72 \stackrel{?}{=} 0$ $36 \cdot 2 \cdot (-1) + 72 \stackrel{?}{=} 0$ $0 = 0$ ✓

Exercise 18.2.5

Solve: $c^2 + 12 = 0$.

Answer

$c = 2\sqrt{3}i, \quad c = -2\sqrt{3}i$

Exercise 18.2.6

Solve: $q^2 + 24 = 0$.

Answer

$c = 2\sqrt{6}i, \quad c = -2\sqrt{6}i$

Our method also works when fractions occur in the equation, we solve as any equation with fractions. In the next example, we first isolate the quadratic term, and then make the coefficient equal to one.

Example 18.2.4

Solve: $\frac{2}{3}u^2 + 5 = 17$.

Solution:

Table 9.1.4

	$\frac{2}{3}u^2+5=17$
Isolate the quadratic term.	$\frac{2}{3}u^2=12$
Multiply by $\frac{3}{2}$ to make the coefficient 1.	$\frac{3}{2}\cdot\frac{2}{3}u^2=\frac{3}{2}\cdot 12$
Simplify.	$u^2=18$
Use the Square Root Property.	$u=\pm\sqrt{18}$
Simplify the radical.	$u=\pm\sqrt{9\cdot 2}$
Simplify.	$u=\pm 3\sqrt{2}$
Rewrite to show two solutions.	$u=3\sqrt{2},\quad u=-3\sqrt{2}$
Check: $\frac{2}{3}u^2+5=17$ $\frac{2}{3}(3\sqrt{2})^2+5\stackrel{?}{=}17$ $\frac{2}{3}\cdot 18+5\stackrel{?}{=}17$ $12+5\stackrel{?}{=}17$ $17=17\checkmark$	$\frac{2}{3}u^2+5=17$ $\frac{2}{3}(-3\sqrt{2})^2+5\stackrel{?}{=}17$ $\frac{2}{3}\cdot 18+5\stackrel{?}{=}17$ $12+5\stackrel{?}{=}17$ $17=17\checkmark$

? Exercise 18.2.7

Solve: $\frac{1}{2}x^2+4=24$.

Answer

$x=2\sqrt{10}, x=-2\sqrt{10}$

? Exercise 18.2.8

Solve: $\frac{3}{4}y^2-3=18$.

Answer

$y=2\sqrt{7}, y=-2\sqrt{7}$

The solutions to some equations may have fractions inside the radicals. When this happens, we must **rationalize the denominator**.

✓ Example 18.2.5

Solve: $2x^2-8=41$.

Solution:

Table 9.1.5

	$2x^2-8=41$
Isolate the quadratic term.	$2x^2=49$
Divide by 2 to make the coefficient 1.	$\frac{2x^2}{2}=\frac{49}{2}$
Simplify.	$x^2=\frac{49}{2}$

Use the Square Root Property.	$x = \pm\sqrt{\frac{49}{2}}$
Rewrite the radical as a fraction of square roots.	$x = \pm\frac{\sqrt{49}}{\sqrt{2}}$
Rationalize the denominator.	$x = \pm\frac{\sqrt{49}\cdot\sqrt{2}}{\sqrt{2}\cdot\sqrt{2}}$
Simplify.	$x = \pm\frac{7\sqrt{2}}{2}$
Rewrite to show two solutions.	$x = \frac{7\sqrt{2}}{2}, \quad x = -\frac{7\sqrt{2}}{2}$
Check: We leave te check for you.	

? Exercise 18.2.9

Solve: $5r^2 - 2 = 34$.

Answer

$r = \frac{6\sqrt{5}}{5}, \quad r = -\frac{6\sqrt{5}}{5}$

? Exercise 18.2.10

Solve: $3t^2 + 6 = 70$.

Answer

$t = \frac{8\sqrt{3}}{3}, \quad t = -\frac{8\sqrt{3}}{3}$

Solve Quadratic Equation of the Form $a(x-h)^2 = k$ Using the Square Root Property

We can use the **Square Root Property** to solve an equation of the form $a(x-h)^2 = k$ as well. Notice that the quadratic term, x, in the original form $ax^2 = k$ is replaced with $(x-h)$.

$ax^2 = k \qquad a(x-h)^2 = k$

Figure 9.1.20

The first step, like before, is to isolate the term that has the variable squared. In this case, a binomial is being squared. Once the binomial is isolated, by dividing each side by the coefficient of a, then the Square Root Property can be used on $(x-h)^2$.

✓ Example 18.2.6

Solve: $4(y-7)^2 = 48$.

Solution:

Table 9.1.6

	$4(y-7)^2 = 48$
Divide both sides by the coefficient 4.	$(y-7)^2 = 12$
Use the Square Root Property on the binomial.	$y-7 = \pm\sqrt{12}$
Simplify the radical.	$y-7 = \pm 2\sqrt{3}$
Solve for y.	$y = 7 \pm 2\sqrt{3}$

Rewrite to show two solutions.	$y = 7 + 2\sqrt{3}$ $y = 7 - 2\sqrt{3}$

Check:

$4(y-7)^2 = 48$ | $4(y-7)^2 = 48$

$4(7+2\sqrt{3}-7)^2 \stackrel{?}{=} 48$ | $4(7-2\sqrt{3}-7)^2 \stackrel{?}{=} 48$

$4(2\sqrt{3})^2 \stackrel{?}{=} 48$ | $4(-2\sqrt{3})^2 \stackrel{?}{=} 48$

$4(12) \stackrel{?}{=} 48$ | $4(12) \stackrel{?}{=} 48$

$48 = 48$ ✓ | $48 = 48$ ✓

Figure 9.1.21

? Exercise 18.2.11

Solve: $3(a-3)^2 = 54$.

Answer

$a = 3 + 3\sqrt{2}, \quad a = 3 - 3\sqrt{2}$

? Exercise 18.2.12

Solve: $2(b+2)^2 = 80$.

Answer

$b = -2 + 2\sqrt{10}, \quad b = -2 - 2\sqrt{10}$

Remember when we take the square root of a fraction, we can take the square root of the numerator and denominator separately.

✓ Example 18.2.7

Solve: $\left(x - \frac{1}{3}\right)^2 = \frac{5}{9}$.

Solution:

$$\left(x - \tfrac{1}{3}\right)^2 = \tfrac{5}{9}$$

Use the Square Root Property.

$$x - \tfrac{1}{3} = \pm\sqrt{\tfrac{5}{9}}$$

Rewrite the radical as a fraction of square roots.

$$x - \tfrac{1}{3} = \pm\tfrac{\sqrt{5}}{\sqrt{9}}$$

Simplify the radical.

$$x - \tfrac{1}{3} = \pm\tfrac{\sqrt{5}}{3}$$

Solve for x.

$$x = \tfrac{1}{3} \pm \tfrac{\sqrt{5}}{3}$$

Rewrite to show two solutions.

$$x = \tfrac{1}{3} + \tfrac{\sqrt{5}}{3}, x = \tfrac{1}{3} - \tfrac{\sqrt{5}}{3}$$

Check:

We leave the check for you.

Exercise 18.2.13

Solve: $\left(x-\frac{1}{2}\right)^2=\frac{5}{4}$.

Answer

$x=\frac{1}{2}+\frac{\sqrt{5}}{2}, x=\frac{1}{2}-\frac{\sqrt{5}}{2}$

Exercise 18.2.14

Solve: $\left(y+\frac{3}{4}\right)^2=\frac{7}{16}$.

Answer

$y=-\frac{3}{4}+\frac{\sqrt{7}}{4}, y=-\frac{3}{4}-\frac{\sqrt{7}}{4}$

We will start the solution to the next example by isolating the binomial term.

Example 18.2.8

Solve: $2(x-2)^2+3=57$.

Solution:

$$2(x-2)^2+3=57$$

Subtract 3 from both sides to isolate the binomial term.

$$2(x-2)^2=54$$

Divide both sides by 2.

$$(x-2)^2=27$$

Use the Square Root Property.

$$x-2=\pm\sqrt{27}$$

Simplify the radical.

$$x-2=\pm 3\sqrt{3}$$

Solve for x.

$$x=2\pm 3\sqrt{3}$$

Rewrite to show two solutions.

$$x=2+3\sqrt{3}, x=2-3\sqrt{3}$$

Check:

We leave the check for you.

Exercise 18.2.15

Solve: $5(a-5)^2+4=104$.

Answer

$a=5+2\sqrt{5}, a=5-2\sqrt{5}$

Exercise 18.2.16

Solve: $3(b+3)^2-8=88$.

Answer

$b=-3+4\sqrt{2}, \quad b=-3-4\sqrt{2}$

Sometimes the solutions are complex numbers.

Example 18.2.9

Solve: $(2x-3)^2=-12$.

Solution:

$$(2x-3)^2=-12$$

Use the Square Root Property.

$$2x-3=\pm\sqrt{-12}$$

Simplify the radical.

$$2x-3=\pm 2\sqrt{3}i$$

Add 3 to both sides.

$$2x=3\pm 2\sqrt{3}i$$

Divide both sides by 2.

$$x=\frac{3\pm 2\sqrt{3}i}{2}$$

Rewrite in standard form.

$$x=\frac{3}{2}\pm\frac{2\sqrt{3}i}{2}$$

Simplify.

$$x=\frac{3}{2}\pm\sqrt{3}i$$

Rewrite to show two solutions.

$$x=\frac{3}{2}+\sqrt{3}i, x=\frac{3}{2}-\sqrt{3}i$$

Check:

We leave the check for you.

Exercise 18.2.17

Solve: $(3r+4)^2=-8$.

Answer

$r=-\frac{4}{3}+\frac{2\sqrt{2}i}{3}, r=-\frac{4}{3}-\frac{2\sqrt{2}i}{3}$

Exercise 18.2.18

Solve: $(2t-8)^2=-10$.

Answer

$t=4+\frac{\sqrt{10}i}{2}, t=4-\frac{\sqrt{10}i}{2}$

The left sides of the equations in the next two examples do not seem to be of the form $a(x-h)^2$. But they are perfect square trinomials, so we will factor to put them in the form we need.

Example 18.2.10

Solve: $4n^2+4n+1=16$.

Solution:

We notice the left side of the equation is a perfect square trinomial. We will factor it first.

Table 9.1.7

	$4n^2+4n+1=16$
Factor the perfect square trinomial.	$(2n+1)^2=16$
Use the Square Root Property.	$2n+1=\pm\sqrt{16}$
Simplify the radical.	$2n+1=\pm 4$
Solve for n.	$2n=-1\pm 4$
Divide each side by 2.	$\frac{2n}{2}=\frac{-1\pm 4}{2}$ $n=\frac{-1\pm 4}{2}$
Rewrite to show two solutions.	$n=\frac{-1+4}{2}, n=\frac{-1-4}{2}$
Simplify each equation.	$n=\frac{3}{2}, \quad n=-\frac{5}{2}$
Check: $4n^2+4n+1=16$ $4\left(\frac{3}{2}\right)^2+4\left(\frac{3}{2}\right)+1\stackrel{?}{=}16$ $4\left(\frac{9}{4}\right)+4\left(\frac{3}{2}\right)+1\stackrel{?}{=}16$ $9+6+1\stackrel{?}{=}16$ $16=16$ ✓ $4n^2+4n+1=16$ $4\left(-\frac{5}{2}\right)^2+4\left(-\frac{5}{2}\right)+1\stackrel{?}{=}16$ $4\left(\frac{25}{4}\right)+4\left(-\frac{5}{2}\right)+1\stackrel{?}{=}16$ $25-10+1\stackrel{?}{=}16$ $16=16$ ✓	

Figure 9.1.22

Exercise 18.2.19

Solve: $9m^2-12m+4=25$.

Answer

$m=\frac{7}{3}, \quad m=-1$

Exercise 18.2.20

Solve: $16n^2+40n+25=4$.

Answer

$n=-\frac{3}{4}, \quad n=-\frac{7}{4}$

18.2E: Exercises

Practice Makes Perfect

ExerciseS 1 - 22: Solve Quadratic Equations of the Form $ax^2 = k$ Using the Square Root Property

In the following exercises, solve each equation.

1. $a^2 = 49$
2. $b^2 = 144$
3. $r^2 - 24 = 0$
4. $t^2 - 75 = 0$
5. $u^2 - 300 = 0$
6. $v^2 - 80 = 0$
7. $4m^2 = 36$
8. $3n^2 = 48$
9. $\frac{4}{3}x^2 = 48$
10. $\frac{5}{3}y^2 = 60$
11. $x^2 + 25 = 0$
12. $y^2 + 64 = 0$
13. $x^2 + 63 = 0$
14. $y^2 + 45 = 0$
15. $\frac{4}{3}x^2 + 2 = 110$
16. $\frac{2}{3}y^2 - 8 = -2$
17. $\frac{2}{5}a^2 + 3 = 11$
18. $\frac{3}{2}b^2 - 7 = 41$
19. $7p^2 + 10 = 26$
20. $2q^2 + 5 = 30$
21. $5y^2 - 7 = 25$
22. $3x^2 - 8 = 46$

Answer

1. $a = \pm 7$
3. $r = \pm 2\sqrt{6}$
5. $u = \pm 10\sqrt{3}$
7. $m = \pm 3$
9. $x = \pm 6$
11. $x = \pm 5i$
13. $x = \pm 3\sqrt{7}i$
15. $x = \pm 9$
17. $a = \pm 2\sqrt{5}$

19. $p = \pm\frac{4\sqrt{7}}{7}$

21. $y = \pm\frac{4\sqrt{10}}{5}$

? ExerciseS 23 - 46: Solve Quadratic Equations of the Form $a(x-h)^2 = k$ Using the Square Root Property

In the following exercises, solve each equation.

23. $(u-6)^2 = 64$

24. $(v+10)^2 = 121$

25. $(m-6)^2 = 20$

26. $(n+5)^2 = 32$

27. $\left(r-\frac{1}{2}\right)^2 = \frac{3}{4}$

28. $\left(x+\frac{1}{5}\right)^2 = \frac{7}{25}$

29. $\left(y+\frac{2}{3}\right)^2 = \frac{8}{81}$

30. $\left(t-\frac{5}{6}\right)^2 = \frac{11}{25}$

31. $(a-7)^2+5 = 55$

32. $(b-1)^2-9 = 39$

33. $4(x+3)^2-5 = 27$

34. $5(x+3)^2-7 = 68$

35. $(5c+1)^2 = -27$

36. $(8d-6)^2 = -24$

37. $(4x-3)^2+11 = -17$

38. $(2y+1)^2-5 = -23$

39. $m^2-4m+4 = 8$

40. $n^2+8n+16 = 27$

41. $x^2-6x+9 = 12$

42. $y^2+12y+36 = 32$

43. $25x^2-30x+9 = 36$

44. $9y^2+12y+4 = 9$

45. $36x^2-24x+4 = 81$

46. $64x^2+144x+81 = 25$

Answer

23. $u = 14, u = -2$

25. $m = 6 \pm 2\sqrt{5}$

27. $r = \frac{1}{2} \pm \frac{\sqrt{3}}{2}$

29. $y = -\frac{2}{3} \pm \frac{2\sqrt{2}}{9}$

31. $a = 7 \pm 5\sqrt{2}$

33. $x = -3 \pm 2\sqrt{2}$

35. $c = -\frac{1}{5} \pm \frac{3\sqrt{3}}{5}i$

37. $x = \frac{3}{4} \pm \frac{\sqrt{7}}{2}i$

39. $m = 2 \pm 2\sqrt{2}$

41. $x = 3 + 2\sqrt{3}, x = 3 - 2\sqrt{3}$

43. $x = -\frac{3}{5}, x = \frac{9}{5}$

45. $x = -\frac{7}{6}, x = \frac{11}{6}$

ExerciseS 47 - 68: Mixed Practice

In the following exercises, solve using the Square Root Property.

47. $2r^2 = 32$

48. $4t^2 = 16$

49. $(a-4)^2 = 28$

50. $(b+7)^2 = 8$

51. $9w^2 - 24w + 16 = 1$

52. $4z^2 + 4z + 1 = 49$

53. $a^2 - 18 = 0$

54. $b^2 - 108 = 0$

55. $\left(p - \frac{1}{3}\right)^2 = \frac{7}{9}$

56. $\left(q - \frac{3}{5}\right)^2 = \frac{3}{4}$

57. $m^2 + 12 = 0$

58. $n^2 + 48 = 0$

59. $u^2 - 14u + 49 = 72$

60. $v^2 + 18v + 81 = 50$

61. $(m-4)^2 + 3 = 15$

62. $(n-7)^2 - 8 = 64$

63. $(x+5)^2 = 4$

64. $(y-4)^2 = 64$

65. $6c^2 + 4 = 29$

66. $2d^2 - 4 = 77$

67. $(x-6)^2 + 7 = 3$

68. $(y-4)^2 + 10 = 9$

Answer

47. $r = \pm 4$

49. $a = 4 \pm 2\sqrt{7}$

51. $w = 1, w = \frac{5}{3}$

53. $a = \pm 3\sqrt{2}$

https://math.libretexts.org/@go/page/46443

55. $p = \frac{1}{3} \pm \frac{\sqrt{7}}{3}$

57. $m = \pm 2\sqrt{2i}$

59. $u = 7 \pm 6\sqrt{2}$

61. $m = 4 \pm 2\sqrt{3}$

63. $x = -3, x = -7$

65. $c = \pm \frac{5\sqrt{6}}{6}$

67. $x = 6 \pm 2i$

? ExerciseS 69 - 70: Writing exercises

69. In your own words, explain the Square Root Property.

70. In your own words, explain how to use the Square Root Property to solve the quadratic equation $(x+2)^2 = 16$.

Answer

69. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve quadratic equations of the form $ax^2 = k$ using the square root property.			
solve quadratic equations of the form $a(x-h)^2 = k$ using the square root property.			

Figure 9.1.23

Choose how would you respond to the statement "I can solve quadratic equations of the form a times the square of x minus h equals k using the Square Root Property." "Confidently," "with some help," or "No, I don't get it."

b. If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

18.3: Solve Quadratic Equations by Completing the Square

Learning Objectives

By the end of this section, you will be able to:

- Complete the square of a binomial expression
- Solve quadratic equations of the form $x^2+bx+c=0$ by completing the square
- Solve quadratic equations of the form $ax^2+bx+c=0$ by completing the square

Before you get started, take this readiness quiz.

1. Expand: $(x+9)^2$.
   If you missed this problem, review Example 5.32.
2. Factor $y^2-14y+49$.
   If you missed this problem, review Example 6.9.
3. Factor $5n^2+40n+80$.
   If you missed this problem, review Example 6.14.

So far we have solved quadratic equations by factoring and using the Square Root Property. In this section, we will solve quadratic equations by a process called **completing the square**, which is important for our work on conics later.

Complete the Square of a Binomial Expression

In the last section, we were able to use the Square Root Property to solve the equation $(y-7)^2=12$ because the left side was a perfect square.

$$\begin{aligned}(y-7)^2&=12\\ y-7&=\pm\sqrt{12}\\ y-7&=\pm 2\sqrt{3}\\ y&=7\pm 2\sqrt{3}\end{aligned}$$

We also solved an equation in which the left side was a perfect square trinomial, but we had to rewrite it the form $(x-k)^2$ in order to use the Square Root Property.

$$\begin{aligned}x^2-10x+25&=18\\ (x-5)^2&=18\end{aligned}$$

What happens if the variable is not part of a perfect square? Can we use algebra to make a perfect square?

Let's look at two examples to help us recognize the patterns.

$$\begin{array}{cc}(x+9)^2 & (y-7)^2\\ (x+9)(x+9) & (y-7)(y-7)\\ x^2+9x+9x+81 & y^2-7y-7y+49\\ x^2+18x+81 & y^2-14y+49\end{array}$$

We restate the patterns here for reference.

Definition 18.3.1: Binomial Squares Pattern

If a and b are real numbers,

$$(a+b)^2=a^2+2ab+b^2$$

$$\underbrace{(a+b)^2}_{\text{(binomial)}^2}=\underbrace{a^2}_{\text{(first term)}^2}+\underbrace{2ab}_{2\cdot\text{(product of terms)}}+\underbrace{b^2}_{\text{(second term)}^2}$$

$$(a-b)^2=a^2-2ab+b^2$$

$$\underbrace{(a-b)^2}_{\text{(binomial)}^2}=\underbrace{a^2}_{\text{(first term)}^2}-\underbrace{2ab}_{2\cdot\text{(product of terms)}}+\underbrace{b^2}_{\text{(second term)}^2}$$

We can use this pattern to “make” a perfect square.

We will start with the expression x^2+6x. Since there is a plus sign between the two terms, we will use the $(a+b)^2$ pattern, $a^2+2ab+b^2=(a+b)^2$.

$$\underset{a^2+2ab+b^2}{x^2+6x+_}$$

We ultimately need to find the last term of this trinomial that will make it a perfect square trinomial. To do that we will need to find b. But first we start with determining a. Notice that the first term of x^2+6x is a square, x^2. This tells us that $a=x$.

$$\underset{a^2+\quad 2ab\quad +\ b^2}{x^2+2\cdot x\cdot b+b^2}$$

What number, b, when multiplied with $2x$ gives $6x$? It would have to be 3, which is $\frac{1}{2}(6)$. So $b=3$.

$$\underset{a^2+\quad 2ab\quad +\ b^2}{x^2+2\cdot 3\cdot x+_}$$

Now to complete the perfect square trinomial, we will find the last term by squaring b, which is $3^2=9$.

$$\underset{a^2+2ab+b^2}{x^2+6x+9}$$

We can now factor.

$$\underset{(a+b)^2}{(x+3)^2}$$

So we found that adding 9 to x^2+6x ‘completes the square’, and we write it as $(x+3)^2$.

Howto: Complete a Square of x^2+bx

1. Identify b, the coefficient of x.
2. Find $\left(\frac{1}{2}b\right)^2$, the number to complete the square.
3. Add the $\left(\frac{1}{2}b\right)^2$ to x^2+bx.
4. Factor the perfect square trinomial, writing it as a binomial squared.

Example 18.3.1

Complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

a. x^2-26x
b. y^2-9y
c. $n^2+\frac{1}{2}n$

Solution:

a.

	$\underset{x^2-\ bx}{x^2-26x}$
The coefficient of x is -26.	
Find $\left(\frac{1}{2}b\right)^2$. $\left(\frac{1}{2}\cdot(-26)\right)^2$ $(13)^2$ 169	
Add 169 to the binomial to complete the square.	$x^2-26x+169$
Factor the perfect square trinomial, writing it as a binomial squared.	$(x-13)^2$

b.

	$x^2 - bx$ $y^2 - 9y$
The coefficient of y is -9.	
Find $\left(\frac{1}{2}b\right)^2$. $\left(\frac{1}{2}\cdot(-9)\right)^2$ $\left(-\frac{9}{2}\right)^2$ $\frac{81}{4}$	
Add $\frac{81}{4}$ to the binomial to complete the square.	$y^2 - 9y + \frac{81}{4}$
Factor the perfect square trinomial, writing it as a binomial squared.	$\left(y - \frac{9}{2}\right)^2$

c.

	$x^2 + bx$ $n^2 + \frac{1}{2}n$
The coefficient of n is $\frac{1}{2}$.	
Find $\left(\frac{1}{2}b\right)^2$. $\left(\frac{1}{2}\cdot\frac{1}{2}\right)^2$ $\left(\frac{1}{4}\right)^2$ $\frac{1}{16}$	
Add $\frac{1}{16}$ to the binomial to complete the square.	$n^2 + \frac{1}{2}n + \frac{1}{16}$
Rewrite as a binomial square.	$\left(n + \frac{1}{4}\right)^2$

Exercise 18.3.1

Complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

a. $a^2 - 20a$
b. $m^2 - 5m$
c. $p^2 + \frac{1}{4}p$

Answer

a. $(a-10)^2$
b. $\left(b - \frac{5}{2}\right)^2$
c. $\left(p + \frac{1}{8}\right)^2$

Exercise 18.3.2

Complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

a. $b^2 - 4b$
b. $n^2 + 13n$
c. $q^2 - \frac{2}{3}q$

Answer

a. $(b-2)^2$

b. $\left(n+\frac{13}{2}\right)^2$

c. $\left(q-\frac{1}{3}\right)^2$

Solve Quadratic Equations of the Form $x^2+bx+c=0$ by Completing the Square

In solving equations, we must always do the same thing to both sides of the equation. This is true, of course, when we solve a **quadratic equation** by **completing the square** too. When we add a term to one side of the equation to make a perfect square trinomial, we must also add the same term to the other side of the equation.

For example, if we start with the equation $x^2+6x=40$, and we want to complete the square on the left, we will add 9 to both sides of the equation.

	$x^2+6x=40$
	$x^2+6x+__=40+__$
	$x^2+6x+9=40+9$
Add 9 to both sides to complete the square.	$(x+3)^2=49$

Now the equation is in the form to solve using the **Square Root Property**! Completing the square is a way to transform an equation into the form we need to be able to use the Square Root Property.

Example 18.3.2 How to Solve a Quadratic Equation of the Form $x^2+bx+x=0$ by Completing the Square

Solve by completing the square: $x^2+8x=48$.

Solution:

Step 1: Isolate the variable terms on one side and the constant terms on the other.	This equation has all the variables on the left.	$x^2+bx \quad c$ $x^2+8x=48$
Step 2: Find $\left(\frac{1}{2}\cdot b\right)^2$, the number to complete the square. Add it to both sides of the equation.	Take half of 8 and square it. $4^2=16$ Add 16 to BOTH sides of the equation.	$x^2+8x+\underline{\quad\quad}=48$ $\left(\frac{1}{2}\cdot 8\right)^2$ $x^2+8x+16=48+16$
Step 3: Factor the perfect square trinomial as a binomial square.	$x^2+8x+16=(x+4)^2$ Add the terms on the right.	$(x+4)^2=64$
Step 4: Use the Square Root Property.		$x+4=\pm\sqrt{64}$
Step 5: Simplify the radical and then solve the two resulting equations.		$x+4=\pm 8$ $x+4=8 \quad x+4=-8$ $x=4 \quad\quad x=-12$
Step 6: Check the solutions.	Put each answer in the original equation to check. Substitute $x=4$ and $x=-12$.	$x^2+8x=48$ $(4)^2+8(4)\stackrel{?}{=}48$ $16+32\stackrel{?}{=}48$ $48=48$ $x^2+8x=48$ $(-12)^2+8(-12)\stackrel{?}{=}48$ $144-96\stackrel{?}{=}48$ $48=48$

Exercise 18.3.3

Solve by completing the square: $x^2+4x=5$.

Answer

$x=-5, x=-1$

Exercise 18.3.4

Solve by completing the square: $y^2-10y=-9$.

Answer

$y=1, y=9$

The steps to solve a quadratic equation by completing the square are listed here.

Solve a Quadratic Equation of the Form $x^2+bx+c=0$ by Completing the Square

1. Isolate the variable terms on one side and the constant terms on the other.
2. Find $\left(\frac{1}{2}\cdot b\right)^2$, the number needed to complete the square. Add it to both sides of the equation.
3. Factor the perfect square trinomial, writing it as a binomial squared on the left and simplify by adding the terms on the right
4. Use the Square Root Property.
5. Simplify the radical and then solve the two resulting equations.
6. Check the solutions.

When we solve an equation by completing the square, the answers will not always be integers.

Example 18.3.3

Solve by completing the square: $x^2+4x=-21$.

Solution:

	$\underset{x^2}{}+\underset{bx}{4x}=\underset{c}{-21}$
The variable terms are on the left side. Take half of 4 and square it.	$x^2+4x+\underset{\left(\frac{1}{2}\cdot 4\right)^2}{____}=-21$
$\left(\frac{1}{2}(4)\right)^2=4$	
Add 4 to both sides.	$x^2+4x+4=-21+4$
Factor the perfect square trinomial, writing it as a binomial squared.	$(x+2)^2=-17$
Use the Square Root Property.	$x+2=\pm\sqrt{-17}$
Simplifying using complex numbers.	$x+2=\pm\sqrt{17}\,i$
Subtract 2 from each side.	$x=-2\pm\sqrt{17}\,i$
Rewrite to show two solutions.	$x=-2+\sqrt{17}\,i, \quad x=-2-\sqrt{17}\,i$
We leave the check to you.	

Exercise 18.3.5

Solve by completing the square: $y^2 - 10y = -35$.

Answer

$y = 5 + \sqrt{15}i, y = 5 - \sqrt{15}i$

Exercise 18.3.6

Solve by completing the square: $z^2 + 8z = -19$.

Answer

$z = -4 + \sqrt{3}i, z = -4 - \sqrt{3}i$

In the previous example, our solutions were complex numbers. In the next example, the solutions will be irrational numbers.

Example 18.3.4

Solve by completing the square: $y^2 - 18y = -6$.

Solution:

	$\underset{x^2}{y^2} - \underset{bx}{18y} = \underset{c}{-6}$
The variable terms are on the left side. Take half of -18 and square it.	
$\left(\frac{1}{2}(-18)\right)^2 = 81$	$y^2 - 18y + \underset{\left(\frac{1}{2}\cdot(-18)\right)^2}{____} = -6$
Add 81 to both sides.	$y^2 - 18y + 81 = -6 + 81$
Factor the perfect square trinomial, writing it as a binomial squared.	$(y-9)^2 = 75$
Use the Square Root Property.	$y - 9 = \pm\sqrt{75}$
Simplify the radical.	$y - 9 = \pm 5\sqrt{3}$
Solve for y.	$y = 9 \pm 5\sqrt{3}$
Check. $y^2 - 18y = -6$ $(9+5\sqrt{3})^2 - 18(9+5\sqrt{3}) \stackrel{?}{=} -6$ $81 + 90\sqrt{3} + 75 - 162 + 90\sqrt{3} \stackrel{?}{=} -6$ $-6 = -6$ ✓ $y^2 - 18y = -6$ $(9-5\sqrt{3})^2 - 18(9-5\sqrt{3}) \stackrel{?}{=} -6$ $81 + 90\sqrt{3} + 75 - 162 + 90\sqrt{3} \stackrel{?}{=} -6$ $-6 = -6$ ✓ Figure 9.2.35	$y^2 - 18y = -6$ $(9+5\sqrt{3})^2 - 18(9+5\sqrt{3}) \stackrel{?}{=} -6$ $81 + 90\sqrt{3} + 75 - 162 + 90\sqrt{3} \stackrel{?}{=} -6$ $-6 = -6$ ✓ $y^2 - 18y = -6$ $(9-5\sqrt{3})^2 - 18(9-5\sqrt{3}) \stackrel{?}{=} -6$ $81 + 90\sqrt{3} + 75 - 162 + 90\sqrt{3} \stackrel{?}{=} -6$ $-6 = -6$ ✓

Another way to check this would be to use a calculator. Evaluate $y^2 - 18y$ for both of the solutions. The answer should be -6.

Exercise 18.3.7

Solve by completing the square: $x^2 - 16x = -16$.

Answer

$x = 8 + 4\sqrt{3}, x = 8 - 4\sqrt{3}$

Exercise 18.3.8

Solve by completing the square: $y^2+8y=11$.

Answer

$y=-4+3\sqrt{3}, y=-4-3\sqrt{3}$

We will start the next example by isolating the variable terms on the left side of the equation.

Example 18.3.5

Solve by completing the square: $x^2+10x+4=15$.

Solution:

	$x^2+10x+4=15$
Isolate the variable terms on the left side. Subtract 4 to get the constant terms on the right side.	$x^2+10x=11$
Take half of 10 and square it.	
$\left(\frac{1}{2}(10)\right)^2=25$	$x^2-10x+\underset{\left(\frac{1}{2}\cdot(10)\right)^2}{_____}=11$
Add 25 to both sides.	$x^2+10x+25=11+25$
Factor the perfect square trinomial, writing it as a binomial squared.	$(x+5)^2=36$
Use the Square Root Property.	$x+5=\pm\sqrt{36}$
Simplify the radical.	$x+5=\pm 6$
Solve for x.	$x=-5\pm 6$
Rewrite to show two solutions.	$x=-5+6, \quad x=-5-6$
Solve the equations.	$x=1, \quad x=-11$
Check: $x^2+10x+4=15$ $(1)^2+10(1)+4\stackrel{?}{=}15$ $1+10+4\stackrel{?}{=}15$ $15=15$ ✓ $x^2+10x+4=15$ $(-11)^2+10(-11)+4\stackrel{?}{=}15$ $121+110+4\stackrel{?}{=}15$ $15=15$ ✓ Figure 9.2.47	

Exercise 18.3.9

Solve by completing the square: $a^2+4a+9=30$.

Answer

$a=-7, a=3$

Exercise 18.3.10

Solve by completing the square: $b^2+8b-4=16$.

Answer

$b=-10, b=2$

To solve the next equation, we must first collect all the variable terms on the left side of the equation. Then we proceed as we did in the previous examples.

Example 18.3.6

Solve by completing the square: $n^2=3n+11$.

Solution:

	$n^2=3n+11$
Subtract $3n$ to get the variable terms on the left side.	$n^2-3n=11$
Take half of -3 and square it.	
$\left(\frac{1}{2}(-3)\right)^2=\frac{9}{4}$	$n^2-3n+\underset{\left(\frac{1}{2}\cdot(-3)\right)^2}{____}=11$
Add $\frac{9}{4}$ to both sides.	$n^2-3n+\frac{9}{4}=11+\frac{9}{4}$
Factor the perfect square trinomial, writing it as a binomial squared.	$\left(n-\frac{3}{2}\right)^2=\frac{44}{4}+\frac{9}{4}$
Add the fractions on the right side.	$\left(n-\frac{3}{2}\right)^2=\frac{53}{4}$
Use the Square Root Property.	$n-\frac{3}{2}=\pm\sqrt{\frac{53}{4}}$
Simplify the radical.	$n-\frac{3}{2}=\pm\frac{\sqrt{53}}{2}$
Solve for n.	$n=\frac{3}{2}\pm\frac{\sqrt{53}}{2}$
Rewrite to show two solutions.	$n=\frac{3}{2}+\frac{\sqrt{53}}{2}, \quad n=\frac{3}{2}-\frac{\sqrt{53}}{2}$
Check: We leave the check for you!	

Exercise 18.3.11

Solve by completing the square: $p^2=5p+9$.

Answer

$p=\frac{5}{2}+\frac{\sqrt{61}}{2}, p=\frac{5}{2}-\frac{\sqrt{61}}{2}$

Exercise 18.3.12

Solve by completing the square: $q^2=7q-3$.

Answer

$q = \frac{7}{2} + \frac{\sqrt{37}}{2}, q = \frac{7}{2} - \frac{\sqrt{37}}{2}$

Notice that the left side of the next equation is in factored form. But the right side is not zero. So, we cannot use the **Zero Product Property** since it says "If $a \cdot b = 0$, then $a = 0$ or $b = 0$." Instead, we multiply the factors and then put the equation into standard form to solve by completing the square.

Example 18.3.7

Solve by completing the square: $(x-3)(x+5) = 9$.

Solution:

	$(x-3)(x+5) = 9$
We multiple the binomials on the left.	$x^2 + 2x - 15 = 9$
Add 15 to isolate the constant terms on the right.	$x^2 + 2x \quad = 24$
Take half of 2 and square it.	
$\left(\frac{1}{2} \cdot (2)\right)^2 = 1$	$x^2 + 2x + \underset{\left(\frac{1}{2} \cdot (2)\right)^2}{____} = 24$
Add 1 to both sides.	$x^2 + 2x + 1 = 24 + 1$
Factor the perfect square trinomial, writing it as a binomial squared.	$(x+1)^2 = 25$
Use the Square Root Property.	$x + 1 = \pm\sqrt{25}$
Solve for x.	$x = -1 \pm 5$
Rewrite to show two solutions.	$x = -1 + 5, x = -1 - 5$
Simplify.	$x = 4, \quad x = -6$
Check: We leave the check for you!	

Exercise 18.3.13

Solve by completing the square: $(c-2)(c+8) = 11$.

Answer

$c = -9, c = 3$

Exercise 18.3.14

Solve by completing the square: $(d-7)(d+3) = 56$.

Answer

$d = 11, d = -7$

Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

The process of **completing the square** works best when the coefficient of x^2 is 1, so the left side of the equation is of the form $x^2 + bx + c$. If the x^2 term has a coefficient other than 1, we take some preliminary steps to make the coefficient equal to 1.

Sometimes the coefficient can be factored from all three terms of the trinomial. This will be our strategy in the next example.

Example 18.3.8

Solve by completing the square: $3x^2 - 12x - 15 = 0$.

Solution:

To complete the square, we need the coefficient of x^2 to be one. If we factor out the coefficient of x^2 as a common factor, we can continue with solving the equation by completing the square.

	$3x^2 - 12x - 15 = 0$
Factor out the greatest common factor.	$3(x^2 - 4x - 5) = 0$
Divide both sides by 3 to isolate the trinomial with coefficient 1.	$\frac{3(x^2 - 4x - 5)}{3} = \frac{0}{3}$
Simplify.	$x^2 - 4x - 5 = 0$
Add 5 to get the constant terms on the right side.	$x^2 - 4x = 5$
Take half of 4 and square it.	
$\left(\frac{1}{2}(-4)\right)^2 = 4$	$x^2 - 4x + \underset{\left(\frac{1}{2}\cdot(4)\right)^2}{____} = 5$
Add 4 to both sides.	$x^2 - 4x + 4 = 5 + 4$
Factor the perfect square trinomial, writing it as a binomial squared.	$(x-2)^2 = 9$
Use the Square Root Property.	$x - 2 = \pm\sqrt{9}$
Solve for x.	$x - 2 = \pm 3$
Rewrite to show two solutions.	$x = 2 + 3,\ x = 2 - 3$
Simplify.	$x = 5, \quad x = -1$
Check: $x = 5$: $3x^2 - 12x - 15 = 0$; $3(5)^2 - 12(5) - 15 \stackrel{?}{=} 0$; $75 - 60 - 15 \stackrel{?}{=} 0$; $0 = 0$ ✓ — $x = -1$: $3x^2 - 12x - 15 = 0$; $3(-1)^2 - 12(-1) - 15 \stackrel{?}{=} 0$; $3 + 12 - 15 \stackrel{?}{=} 0$; $0 = 0$ ✓	

Figure 9.2.80

Exercise 18.3.15

Solve by completing the square: $2m^2 + 16m + 14 = 0$.

Answer

$m = -7, m = -1$

Exercise 18.3.16

Solve by completing the square: $4n^2 - 24n - 56 = 8$.

Answer

$n = -2, n = 8$

To complete the square, the coefficient of the x^2 must be 1. When the **leading coefficient** is not a factor of all the terms, we will divide both sides of the equation by the leading coefficient! This will give us a fraction for the second coefficient. We have already seen how to complete the square with fractions in this section.

Example 18.3.9

Solve by completing the square: $2x^2 - 3x = 20$.

Solution:

To complete the square we need the coefficient of x^2 to be one. We will divide both sides of the equation by the coefficient of x^2. Then we can continue with solving the equation by completing the square.

	$2x^2 - 3x = 20$
Divide both sides by 2 to get the coefficient of x^2 to be 1.	$\frac{2x^2 - 3x}{2} = \frac{20}{2}$
Simplify.	$x^2 - \frac{3}{2}x = 10$
Take half of $-\frac{3}{2}$ and square it.	
$\left(\frac{1}{2}\left(-\frac{3}{2}\right)\right)^2 = \frac{9}{16}$	$x^2 - \frac{3}{2}x + \underline{\quad} = 10$ $\left(\frac{1}{2}\cdot\left(-\frac{3}{2}\right)\right)^2$
Add $\frac{9}{16}$ to both sides.	$x^2 - \frac{3}{2}x + \frac{9}{16} = 10 + \frac{9}{16}$
Factor the perfect square trinomial, writing it as a binomial squared.	$\left(x - \frac{3}{4}\right)^2 = \frac{160}{16} + \frac{9}{16}$
Add the fractions on the right side.	$\left(x - \frac{3}{4}\right)^2 = \frac{169}{16}$
Use the Square Root Property.	$x - \frac{3}{4} = \pm\sqrt{\frac{169}{16}}$
Simplify the radical.	$x - \frac{3}{4} = \pm\frac{13}{4}$
Solve for x.	$x = \frac{3}{4} \pm \frac{13}{4}$
Rewrite to show two solutions.	$x = \frac{3}{4} + \frac{13}{4}, \quad x = \frac{3}{4} - \frac{13}{4}$
Simplify.	$x = 4, \qquad x = -\frac{5}{2}$
Check: We leave the check for you!	

Exercise 18.3.17

Solve by completing the square: $3r^2 - 2r = 21$.

Answer

$r = -\frac{7}{3}, r = 3$

Exercise 18.3.18

Solve by completing the square: $4t^2+2t=20$.

Answer

$t=-\frac{5}{2}, t=2$

Now that we have seen that the coefficient of x^2 must be 1 for us to complete the square, we update our procedure for solving a **quadratic equation** by completing the square to include equations of the form $ax^2+bx+c=0$.

Howto: Solve a Quadratic Equation of the Form $ax^2+bx+c=0$ by Completing the Square

1. Divide by aa to make the coefficient of x^2 term 1.
2. Isolate the variable terms on one side and the constant terms on the other.
3. Find $\left(\frac{1}{2}\cdot b\right)^2$, the number needed to complete the square. Add it to both sides of the equation.
4. Factor the perfect square trinomial, writing it as a binomial squared on the left and simplify by adding the terms on the right
5. Use the Square Root Property.
6. Simplify the radical and then solve the two resulting equations.
7. Check the solutions.

Example 18.3.10

Solve by completing the square: $3x^2+2x=4$.

Solution:

Again, our first step will be to make the coefficient of x^2 one. By dividing both sides of the equation by the coefficient of x^2, we can then continue with solving the equation by completing the square.

	$3x^2+2x=4$
Divide both sides by 3 to make the coefficient of x^2 equal 1.	$\frac{3x^2+2x}{3}=\frac{4}{3}$
Simplify.	$x^2+\frac{2}{3}x=\frac{4}{3}$
Take half of $\frac{2}{3}$ and square it.	
$\left(\frac{1}{2}\cdot\frac{2}{3}\right)^2=\frac{1}{9}$	$x^2+\frac{2}{3}x+\underset{\left(\frac{1}{2}\cdot\frac{2}{3}\right)^2}{____}=\frac{4}{3}$
Add $\frac{1}{9}$ to both sides.	$x^2+\frac{2}{3}x+\frac{1}{9}=\frac{4}{3}+\frac{1}{9}$
Factor the perfect square trinomial, writing it as a binomial squared.	$\left(x+\frac{1}{3}\right)^2=\frac{12}{9}+\frac{1}{9}$
Use the Square Root Property.	$x+\frac{1}{3}=\pm\sqrt{\frac{13}{9}}$
Simplify the radical.	$x+\frac{1}{3}=\pm\frac{\sqrt{13}}{3}$
Solve for x.	$x=-\frac{1}{3}\pm\frac{\sqrt{13}}{3}$
Rewrite to show two solutions.	$x=-\frac{1}{3}+\frac{\sqrt{13}}{3},\quad x=-\frac{1}{3}-\frac{\sqrt{13}}{3}$
Check: We leave the check for you!	

Exercise 18.3.19

Solve by completing the square: $4x^2+3x=2$.

Answer

$x=-\frac{3}{8}+\frac{\sqrt{41}}{8}, x=-\frac{3}{8}-\frac{\sqrt{41}}{8}$

Exercise 18.3.20

Solve by completing the square: $3y^2-10y=-5$.

Answer

$y=\frac{5}{3}+\frac{\sqrt{10}}{3}, y=\frac{5}{3}-\frac{\sqrt{10}}{3}$

Key Concepts

- Binomial Squares Pattern
  If a and b are real numbers,

$$(a+b)^2=a^2+2ab+b^2 \qquad \underbrace{(a+b)^2}_{(\text{binomial})^2} = \underbrace{a^2}_{(\text{first term})^2} + \underbrace{2ab}_{2\cdot(\text{product of terms})} + \underbrace{b^2}_{(\text{second term})^2}$$

$$(a-b)^2=a^2-2ab+b^2 \qquad \underbrace{(a-b)^2}_{(\text{binomial})^2} = \underbrace{a^2}_{(\text{first term})^2} - \underbrace{2ab}_{2\cdot(\text{product of terms})} + \underbrace{b^2}_{(\text{second term})^2}$$

- How to Complete a Square
  1. Identify b, the coefficient of x.
  2. Find $\left(\frac{1}{2}b\right)^2$, the number to complete the square.
  3. Add the $\left(\frac{1}{2}b\right)^2$ to x^2+bx
  4. Rewrite the trinomial as a binomial square
- How to solve a quadratic equation of the form $ax^2+bx+c=0$ by completing the square.
  1. Divide by a to make the coefficient of x^2 term 1.
  2. Isolate the variable terms on one side and the constant terms on the other.
  3. Find $\left(\frac{1}{2}\cdot b\right)^2$, the number needed to complete the square. Add it to both sides of the equation.
  4. Factor the perfect square trinomial, writing it as a binomial squared on the left and simplify by adding the terms on the right.
  5. Use the Square Root Property.
  6. Simplify the radical and then solve the two resulting equations.
  7. Check the solutions.

18.3E: Exercises

Practice Makes Perfect

? ExerciseS 1 - 4: Complete the Square of a Binomial Expression

In the following exercises, complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

1. a. m^2-24m
   b. x^2-11x
   c. $p^2-\frac{1}{3}p$
2. a. n^2-16n
   b. y^2+15y
   c. $q^2+\frac{3}{4}q$
3. a. p^2-22p
   b. y^2+5y
   c. $m^2+\frac{2}{5}m$
4. a. q^2-6q
   b. x^2-7x
   c. $n^2-\frac{2}{3}n$

Answer

1. a. $(m-12)^2$ b. $\left(x-\frac{11}{2}\right)^2$ c. $\left(p-\frac{1}{6}\right)^2$

3. a. $(p-11)^2$ b. $\left(y+\frac{5}{2}\right)^2$ c. $\left(m+\frac{1}{5}\right)^2$

? ExerciseS 5 - 28: Solve Quadratic Equations of the Form $x^2+bx+c=0$ by Completing the Square

In the following exercises, solve by completing the square.

5. $u^2+2u=3$
6. $z^2+12z=-11$
7. $x^2-20x=21$
8. $y^2-2y=8$
9. $m^2+4m=-44$
10. $n^2-2n=-3$
11. $r^2+6r=-11$
12. $t^2-14t=-50$
13. $a^2-10a=-5$
14. $b^2+6b=41$
15. $x^2+5x=2$
16. $y^2-3y=2$
17. $u^2-14u+12=-1$
18. $z^2+2z-5=2$
19. $r^2-4r-3=9$
20. $t^2-10t-6=5$

21. $v^2 = 9v + 2$

22. $w^2 = 5w - 1$

23. $x^2 - 5 = 10x$

24. $y^2 - 14 = 6y$

25. $(x + 6)(x - 2) = 9$

26. $(y + 9)(y + 7) = 80$

27. $(x + 2)(x + 4) = 3$

28. $(x - 2)(x - 6) = 5$

Answer

5. $u = -3, u = 1$

7. $x = -1, x = 21$

9. $m = -2 \pm 2\sqrt{10}i$

11. $r = -3 \pm \sqrt{2}i$

13. $a = 5 \pm 2\sqrt{5}$

15. $x = -\frac{5}{2} \pm \frac{\sqrt{33}}{2}$

17. $u = 1, u = 13$

19. $r = -2, r = 6$

21. $v = \frac{9}{2} \pm \frac{\sqrt{89}}{2}$

23. $x = 5 \pm \sqrt{30}$

25. $x = -7, x = 3$

27. $x = -5, x = -1$

? ExerciseS 29 - 40: Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

In the following exercises, solve by completing the square.

29. $3m^2 + 30m - 27 = 6$

30. $2x^2 - 14x + 12 = 0$

31. $2n^2 + 4n = 26$

32. $5x^2 + 20x = 15$

33. $2c^2 + c = 6$

34. $3d^2 - 4d = 15$

35. $2x^2 + 7x - 15 = 0$

36. $3x^2 - 14x + 8 = 0$

37. $2p^2 + 7p = 14$

38. $3q^2 - 5q = 9$

39. $5x^2 - 3x = -10$

40. $7x^2 + 4x = -3$

Answer

29. $m = -11, m = 1$

31. $n = 1 \pm \sqrt{14}$

33. $c = -2, c = \frac{3}{2}$

35. $x = -5, x = \frac{3}{2}$

37. $p = -\frac{7}{4} \pm \frac{\sqrt{161}}{4}$

39. $x = \frac{3}{10} \pm \frac{\sqrt{191}}{10} i$

? ExerciseS 41 - 42: writing exercises

41. Solve the equation $x^2 + 10x = -25$

a. by using the Square Root Property
b. by Completing the Square
c. Which method do you prefer? Why?

42. Solve the equation $y^2 + 8y = 48$ by completing the square and explain all your steps.

Answer

41. Answers will vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
complete the square of a binomial expression.			
solve quadratic equations of the form $x^2 + bx + c = 0$ by completing the square.			
solve quadratic equations of the form $ax^2 + bx + c = 0$ by completing the square.			

Figure 9.2.103

b. After reviewing this checklist, what will you do to become confident for all objectives?

18.4: Solve Quadratic Equations Using the Quadratic Formula

Learning Objectives

By the end of this section, you will be able to:

- Solve quadratic equations using the Quadratic Formula
- Use the discriminant to predict the number and type of solutions of a quadratic equation
- Identify the most appropriate method to use to solve a quadratic equation

Before you get started, take this readiness quiz.

1. Evaluate b^2-4ab when $a=3$ and $b=-2$.
2. Simplify $\sqrt{108}$.
3. Simplify $\sqrt{50}$.

Solve Quadratic Equations Using the Quadratic Formula

When we solved quadratic equations in the last section by completing the square, we took the same steps every time. By the end of the exercise set, you may have been wondering 'isn't there an easier way to do this?' The answer is 'yes'. Mathematicians look for patterns when they do things over and over in order to make their work easier. In this section we will derive and use a formula to find the solution of a quadratic equation.

We have already seen how to solve a formula for a specific variable 'in general', so that we would do the algebraic steps only once, and then use the new formula to find the value of the specific variable. Now we will go through the steps of completing the square using the general form of a quadratic equation to solve a quadratic equation for x.

We start with the standard form of a quadratic equation and solve it for x by completing the square.

	$ax^2+bx+c=0, \quad a\neq 0$
Isolate the variable terms on one side.	$ax^2+bx \quad =-c$
Make the coefficient of x^2 equal to 1, by dividing by a.	$\frac{ax^2}{a}+\frac{b}{a}x \quad =-\frac{c}{a}$
Simplify.	$x^2+\frac{b}{a}x \quad =-\frac{c}{a}$
To complete the square, find $\left(\frac{1}{2}\cdot\frac{b}{a}\right)^2$ and add it to both sides of the equation.	
$\left(\frac{1}{2}\frac{b}{a}\right)^2=\frac{b^2}{4a^2}$	$x^2+\frac{b}{a}x+\frac{b^2}{4a^2}=-\frac{c}{a}+\frac{b^2}{4a^2}$
The left side is a perfect square, factor it.	$\left(x+\frac{b}{2a}\right)^2=-\frac{c}{a}+\frac{b^2}{4a^2}$
Find the common denominator of the right side and write equivalent fractions with the common denominator.	$\left(x+\frac{b}{2a}\right)^2=\frac{b^2}{4a^2}-\frac{c\cdot 4a}{a\cdot 4a}$
Simplify.	$\left(x+\frac{b}{2a}\right)^2=\frac{b^2}{4a^2}-\frac{4ac}{4a^2}$
Combine to one fraction.	$\left(x+\frac{b}{2a}\right)^2=\frac{b^2-4ac}{4a^2}$
Use the square root property.	$x+\frac{b}{2a}=\pm\sqrt{\frac{b^2-4ac}{4a^2}}$

Simplify the radical.	$x+\frac{b}{2a}=\pm\frac{\sqrt{b^2-4ac}}{2a}$
Add $-\frac{b}{2a}$ to both sides of the equation.	$x=-\frac{b}{2a}\pm\frac{\sqrt{b^2-4ac}}{2a}$
Combine the terms on the right side.	$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$

The final equation is called the "Quadratic Formula."

Definition 18.4.1: Quadratic Formula

The solutions to a **quadratic equation** of the form $ax^2+bx+c=0$, where $a\neq 0$ are given by the formula:

$$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a} \tag{18.4.1}$$

To use the **Quadratic Formula**, we substitute the values of a, b, and c from the standard form into the expression on the right side of the formula. Then we simplify the expression. The result is the pair of solutions to the quadratic equation.

Notice the Quadratic Formula (Equation 18.4.1) is an equation. Make sure you use both sides of the equation.

Example 18.4.1 How to Solve a Quadratic Equation Using the Quadratic Formula

Solve by using the Quadratic Formula: $2x^2+9x-5=0$.

Solution:

Step 1: Write the quadratic equation in standard form. Identify the a, b, c values.	This equation is in standard form.	$ax^2+bx+c=0$ $2x^2+9x-5=0$ $a=2, b=9, c=-5$
Step 2: Write the quadratic formula. Then substitute in the values of a, b, c.	Substitute in $a=2, b=9, c=-5$	$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$ $x=\frac{-9\pm\sqrt{9^2-4\cdot 2\cdot(-5)}}{2\cdot 2}$
Step 3: Simplify the fraction, and solve for x.		$x=\frac{-9\pm\sqrt{81-(-40)}}{4}$ $x=\frac{-9\pm\sqrt{121}}{4}$ $x=\frac{-9\pm 11}{4}$ $x=\frac{-9+11}{4}$ $x=\frac{-9-11}{4}$ $x=\frac{2}{4}$ $x=\frac{-20}{4}$ $x=\frac{1}{2}$ $x=-5$

Step 4: Check the solutions.	Put each answer in the original equation to check. Substitute $x=\frac{1}{2}$ and $x=-5$.	$2x^2+9x-5=0$ $2\left(\frac{1}{2}\right)^2+9\cdot\frac{1}{2}-5\stackrel{?}{=}0$ $2\cdot\frac{1}{4}+0\cdot\frac{1}{2}-5\stackrel{?}{=}0$ $2\cdot\frac{1}{4}+9\cdot\frac{1}{2}-5\stackrel{?}{=}0$ $\frac{1}{2}+\frac{9}{2}-5\stackrel{?}{=}0$ $\frac{10}{2}-5\stackrel{?}{=}0$ $5-5\stackrel{?}{=}0$ $0=0$ $2x^2+9x-5=0$ $2(-5)^2+9(-5)-5\stackrel{?}{=}0$ $2\cdot25-45-5\stackrel{?}{=}0$ $50-45-5\stackrel{?}{=}0$ $0=0$

Exercise 18.4.1

Solve by using the Quadratic Formula: $3y^2-5y+2=0$.

Answer

$y=1, y=\frac{2}{3}$

Exercise 18.4.2

Solve by using the Quadratic Formula: $4z^2+2z-6=0$.

Answer

$z=1, z=-\frac{3}{2}$

HowTo: Solve a Quadratic Equation Using the Quadratic Formula

1. Write the quadratic equation in standard form, $ax^2+bx+c=0$. Identify the values of a, b, and c.
2. Write the Quadratic Formula. Then substitute in the values of a, b, and c.
3. Simplify.
4. Check the solutions.

If you say the formula as you write it in each problem, you'll have it memorized in no time! And remember, the Quadratic Formula is an EQUATION. Be sure you start with "$x=$".

Example 18.4.2

Solve by using the Quadratic Formula: $x^2-6x=-5$.

Solution:

	$x^2-6x=-5$

Write the equation in standard form by adding 5 to each side.	$x^2-6x+5=0$
This equation is now in standard form.	$ax^2+bx+c=0$ $x^2-6x+5=0$
Identify the values of a, b, c.	$a=1, b=-6, c=5$
Write the Quadratic Formula.	$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$
Then substitute in the values of a, b, c.	$x=\frac{-(-6)\pm\sqrt{(-6)^2-4\cdot 1\cdot(5)}}{2\cdot 1}$
Simplify.	$x=\frac{6\pm\sqrt{36-20}}{2}$ $x=\frac{6\pm\sqrt{16}}{2}$ $x=\frac{6\pm 4}{2}$
Rewrite to show two solutions.	$x=\frac{6+4}{2}, \quad x=\frac{6-4}{2}$
Simplify.	$x=\frac{10}{2}, \quad x=\frac{2}{2}$
	$x=5, \quad x=1$
Check: $x^2-6x+5=0$ $\quad$ $x^2-6x+5=0$ $5^2-6\cdot 5+5\stackrel{?}{=}0$ $\quad$ $1^2-6\cdot 1+5\stackrel{?}{=}0$ $25-30+5\stackrel{?}{=}0$ $\quad$ $1-6+5\stackrel{?}{=}0$ $0=0$ ✓ $\quad$ $0=0$ ✓	

? Exercise 18.4.3

Solve by using the Quadratic Formula: $a^2-2a=15$.

Answer

$a=-3, a=5$

? Exercise 18.4.4

Solve by using the Quadratic Formula: $b^2+24=-10b$.

Answer

$b=-6, b=-4$

When we solved quadratic equations by using the Square Root Property, we sometimes got answers that had radicals. That can happen, too, when using the **Quadratic Formula**. If we get a **radical** as a solution, the final answer must have the radical in its simplified form.

✓ Example 18.4.3

Solve by using the Quadratic Formula: $2x^2+10x+11=0$.

Solution:

	$2x^2+10x+11=0$
This equation is in standard form.	$ax^2+bx+c=0$ $2x^2+10x+11=0$

Identify the values of a, b and c.	$a = 2,\ b = 10,\ c = 11$
Write the Quadratic Formula.	$x = \dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, and c.	$x = \dfrac{-(10) \pm \sqrt{(10)^2 - 4 \cdot 2 \cdot (11)}}{2 \cdot 2}$
Simplify.	$x = \dfrac{-10 \pm \sqrt{100 - 88}}{4}$
	$x = \dfrac{-10 \pm \sqrt{12}}{4}$
Simplify the radical.	$x = \dfrac{-10 \pm 2\sqrt{3}}{4}$
Factor out the common factor in the numerator.	$x = \dfrac{2(-5 \pm \sqrt{3})}{4}$ $x = \dfrac{2(-5 \pm \sqrt{3})}{4}$
Remove the common factors.	$x = \dfrac{-5 \pm \sqrt{3}}{2}$
Rewrite to show two solutions.	$x = \dfrac{-5 + \sqrt{3}}{2}, \quad x = \dfrac{-5 - \sqrt{3}}{2}$
Check: We leave the check for you!	

? Exercise 18.4.5

Solve by using the Quadratic Formula: $3m^2 + 12m + 7 = 0$.

Answer

$$m = \frac{-6 + \sqrt{15}}{3}, m = \frac{-6 - \sqrt{15}}{3}$$

? Exercise 18.4.6

Solve by using the Quadratic Formula: $5n^2 + 4n - 4 = 0$.

Answer

$$n = \frac{-2 + 2\sqrt{6}}{5}, n = \frac{-2 - 2\sqrt{6}}{5}$$

When we substitute a, b, and c into the Quadratic Formula and the **radicand** is negative, the quadratic equation will have imaginary or complex solutions. We will see this in the next example.

✓ Example 18.4.4

Solve by using the Quadratic Formula: $3p^2 + 2p + 9 = 0$.

Solution:

Table 9.3.5

	$3p^2 + 2p + 9 = 0$
This equation is in standard form.	$ax^2 + bx + c = 0$ $3p^2 + 2p + 9 = 0$

Identify the values of a, b, c.	$a = 3, b = 2, c = 9$
Write the Quadratic Formula.	$p = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, c.	$p = \frac{-(2) \pm \sqrt{(2)^2 - 4 \cdot 3 \cdot (9)}}{2 \cdot 3}$
Simplify.	$p = \frac{-2 \pm \sqrt{4 - 108}}{6}$
	$p = \frac{-2 \pm \sqrt{-104}}{6}$
Simplify the radical using complex numbers.	$p = \frac{-2 \pm \sqrt{104}\, i}{6}$
Simplify the radical.	$p = \frac{-2 \pm 2\sqrt{26}\, i}{6}$
Factor the common factor in the numerator.	$p = \frac{2(-1 \pm \sqrt{26}\, i)}{6}$
Remove the common factors.	$p = \frac{-1 \pm \sqrt{26}\, i}{3}$
Rewrite in standard $a + bi$ form.	$p = -\frac{1}{3} \pm \frac{\sqrt{26}\, i}{3}$
Write as two solutions.	$p = -\frac{1}{3} + \frac{\sqrt{26}\, i}{3}, \quad p = -\frac{1}{3} - \frac{\sqrt{26}\, i}{3}$

? Exercise 18.4.7

Solve by using the Quadratic Formula: $4a^2 - 2a + 8 = 0$.

Answer

$$a = \frac{1}{4} + \frac{\sqrt{31}}{4}i, \quad a = \frac{1}{4} - \frac{\sqrt{31}}{4}i$$

? Exercise 18.4.8

Solve by using the Quadratic Formula: $5b^2 + 2b + 4 = 0$.

Answer

$$b = -\frac{1}{5} + \frac{\sqrt{19}}{5}i, \quad b = -\frac{1}{5} - \frac{\sqrt{19}}{5}i$$

Remember, to use the Quadratic Formula, the equation must be written in standard form, $ax^2 + bx + c = 0$. Sometimes, we will need to do some algebra to get the equation into standard form before we can use the Quadratic Formula.

✓ Example 18.4.5

Solve by using the Quadratic Formula: $x(x + 6) + 4 = 0$.

Solution:

Our first step is to get the equation in standard form.

Table 9.3.6

	$x(x + 6) + 4 = 0$
Distribute to get the equation in standard form.	$x^2 + 6x + 4 = 0$

This equation is now in standard form.	$ax^2+bx+c=0$ $x^2+6x+4=0$
Identify the values of a, b, c.	$a=1,\ b=6,\ c=4$
Write the Quadratic Formula.	$x=\frac{-b\pm\sqrt{b^2-4ac}}{2a}$
Then substitute in the values of a, b, c.	$x=\frac{-(6)\pm\sqrt{(6)^2-4\cdot 1\cdot(4)}}{2\cdot 1}$
Simplify.	$x=\frac{-6\pm\sqrt{36-16}}{2}$
	$x=\frac{-6\pm\sqrt{20}}{2}$
Simplify the radical.	$x=\frac{-6\pm 2\sqrt{5}}{2}$
Factor the common factor in the numerator.	$x=\frac{2(-3\pm 2\sqrt{5})}{2}$
Remove the common factors.	$x=-3\pm 2\sqrt{5}$
Write as two solutions.	$x=-3+2\sqrt{5},\ x=-3-2\sqrt{5}$
Check: We leave the check for you!	

? Exercise 18.4.9

Solve by using the Quadratic Formula: $x(x+2)-5=0$.

Answer

$x=-1+\sqrt{6}, x=-1-\sqrt{6}$

? Exercise 18.4.10

Solve by using the Quadratic Formula: $3y(y-2)-3=0$.

Answer

$y=1+\sqrt{2}, y=1-\sqrt{2}$

When we solved linear equations, if an equation had too many fractions we cleared the fractions by multiplying both sides of the equation by the LCD. This gave us an equivalent equation—without fractions— to solve. We can use the same strategy with quadratic equations.

✓ Example 18.4.6

Solve by using the Quadratic Formula: $\frac{1}{2}u^2+\frac{2}{3}u=\frac{1}{3}$.

Solution:

Our first step is to clear the fractions.

Table 9.3.7

	$\frac{1}{2}u^2+\frac{2}{3}u=\frac{1}{3}$
Multiply both sides by the LCD, 6, to clear the fractions.	$6\left(\frac{1}{2}u^2+\frac{2}{3}u\right)=6\left(\frac{1}{3}\right)$

Multiply.	$3u^2 + 4u = 2$
Subtract 2 to get the equation in standard form.	$ax^2 + bx + c = 0$ $3u^2 + 4u - 2 = 0$
Identify the values of a, b, and c.	$a = 3,\ b = 4,\ c = -2$
Write the Quadratic Formula.	$u = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, and c.	$u = \frac{-(4) \pm \sqrt{(4)^2 - 4 \cdot 3 \cdot (-2)}}{2 \cdot 3}$
Simplify.	$u = \frac{-4 \pm \sqrt{16 + 24}}{6}$
	$u = \frac{-4 \pm \sqrt{40}}{6}$
Simplify the radical.	$u = \frac{-4 \pm 2\sqrt{10}}{6}$
Factor the common factor in the numerator.	$u = \frac{2(-2 \pm \sqrt{10})}{6}$
Remove the common factors.	$u = \frac{-2 \pm \sqrt{10}}{3}$
Rewrite to show two solutions.	$u = \frac{-2 + \sqrt{10}}{3}, \quad u = \frac{-2 - \sqrt{10}}{3}$
Check: We leave the check for you!	

Exercise 18.4.11

Solve by using the Quadratic Formula: $\frac{1}{4}c^2 - \frac{1}{3}c = \frac{1}{12}$.

Answer

$c = \frac{2+\sqrt{7}}{3}, \quad c = \frac{2-\sqrt{7}}{3}$

Exercise 18.4.12

Solve by using the Quadratic Formula: $\frac{1}{9}d^2 - \frac{1}{2}d = -\frac{1}{3}$.

Answer

$d = \frac{9+\sqrt{33}}{4}, d = \frac{9-\sqrt{33}}{4}$

Think about the equation $(x-3)^2 = 0$. We know from the **Zero Product Property** that this equation has only one solution, $x = 3$.

We will see in the next example how using the **Quadratic Formula** to solve an equation whose standard form is a perfect square **trinomial** equal to 0 gives just one solution. Notice that once the radicand is simplified it becomes 0, which leads to only one solution.

Example 18.4.7

Solve by using the Quadratic Formula: $4x^2 - 20x = -25$.

Solution:

Table 9.3.8

	$4x^2 - 20x = -25$
Add 25 to get the equation in standard form.	$ax^2 + bx + c = 0$ $4x^2 - 20x + 25 = 0$
Identify the values of a, b, and c.	$a = 4,\ b = -20,\ c = 25$
Write the quadratic formula.	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, and c.	$x = \frac{-(-20) \pm \sqrt{(-20)^2 - 4 \cdot 4 \cdot (25)}}{2 \cdot 4}$
Simplify.	$x = \frac{20 \pm \sqrt{400 - 400}}{8}$
	$x = \frac{20 \pm \sqrt{0}}{8}$
Simplify the radical.	$x = \frac{20}{8}$
Simplify the fraction.	$x = \frac{5}{2}$
Check: We leave the check for you!	

Did you recognize that $4x^2 - 20x + 25$ is a perfect square trinomial. It is equivalent to $(2x - 5)^2$? If you solve $4x^2 - 20x + 25 = 0$ by factoring and then using the Square Root Property, do you get the same result?

Exercise 18.4.13

Solve by using the Quadratic Formula: $r^2 + 10r + 25 = 0$.

Answer

$r = -5$

Exercise 18.4.14

Solve by using the Quadratic Formula: $25t^2 - 40t = -16$.

Answer

$t = \frac{4}{5}$

Use the Discriminant to Predict the Number and Type of Solutions of a Quadratic Equation

When we solved the quadratic equations in the previous examples, sometimes we got two real solutions, one real solution, and sometimes two complex solutions. Is there a way to predict the number and type of solutions to a quadratic equation without actually solving the equation?

Yes, the expression under the radical of the Quadratic Formula makes it easy for us to determine the number and type of solutions. This expression is called the **discriminant**.

Definition 18.4.2

Discriminant

In the Quadratic Formula, $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$, the quantity $b^2 - 4ac$ is called the discriminant.

Figure 9.3.85

Let's look at the discriminant of the equations in some of the examples and the number and type of solutions to those quadratic equations.

Table 9.3.9

Quadratic Equation (in standard form)	Discriminat $b^2 - 4ac$	Value of the Discriminant	Number and Type of Solutions
$2x^2 + 9x - 5 = 0$	$9^2 - 4 \cdot 2(-5)$ 121	$+$	2 real
$4x^2 - 20x + 25 = 0$	$(-20)^2 - 4 \cdot 4 \cdot 25$ 0	0	1 real
$3p^2 + 2p + 9 = 0$	$2^2 - 4 \cdot 3 \cdot 9$ -104	$-$	2 complex

When the discriminant is positive, the quadratic equation has **2 real solutions**. $x = \frac{-b \pm \sqrt{+}}{2a}$

When the discriminant is zero, the quadratic equation has **1 real solution**. $x = \frac{-b \pm \sqrt{0}}{2a}$

When the discriminant is negative, the quadratic equation has **2 complex solutions**. $x = \frac{-b \pm \sqrt{-}}{2a}$

Figure 9.3.86

Using the Discriminant $b^2 - 4ac$, to Determine the Number and Type of Solutions of a Quadratic Equation

For a quadratic equation of the form $ax^2 + bx + c = 0$, $a \neq 0$,

- If $b^2 - 4ac > 0$, the equation has 2 real solutions.
- if $b^2 - 4ac = 0$, the equation has 1 real solution.
- if $b^2 - 4ac < 0$, the equation has 2 complex solutions.

Example 18.4.8

Determine the number of solutions to each quadratic equation.

a. $3x^2 + 7x - 9 = 0$
b. $5n^2 + n + 4 = 0$
c. $9y^2 - 6y + 1 = 0$

Solution:

To determine the number of solutions of each quadratic equation, we will look at its discriminant.

a.

$$3x^2 + 7x - 9 = 0$$

The equation is in standard form, identify a, b, and c.

$$a = 3, \quad b = 7, \quad c = -9$$

Write the discriminant.

$$b^2-4ac$$

Substitute in the values of a, b, and c.

$$(7)^2-4\cdot 3\cdot(-9)$$

Simplify.

$$\begin{array}{c} 49+108 \\ 157 \end{array}$$

Since the discriminant is positive, there are 2 real solutions to the equation.

b.

$$5n^2+n+4=0$$

The equation is in standard form, identify a, b, and c.

$$a=5,\quad b=1,\quad c=4$$

Write the discriminant.

$$b^2-4ac$$

Substitute in the values of a, b, and c.

$$(1)^2-4\cdot 5\cdot 4$$

Simplify.

$$\begin{array}{c} 1-80 \\ -79 \end{array}$$

Since the discriminant is negative, there are 2 complex solutions to the equation.

c.

$$9y^2-6y+1=0$$

The equation is in standard form, identify a, b, and c.

$$a=9,\quad b=-6,\quad c=1$$

Write the discriminant.

$$b^2-4ac$$

Substitute in the values of a, b, and c.

$$(-6)^2-4\cdot 9\cdot 1$$

Simplify.

$$\begin{array}{c} 36-36 \\ 0 \end{array}$$

Since the discriminant is 0, there is 1 real solution to the equation.

? Exercise 18.4.15

Determine the number and type of solutions to each quadratic equation.

a. $8m^2-3m+6=0$
b. $5z^2+6z-2=0$
c. $9w^2+24w+16=0$

Answer

a. 2 complex solutions
b. 2 real solutions

c. 1 real solution

Exercise 18.4.16

Determine the number and type of solutions to each quadratic equation.

a. $b^2+7b-13=0$
b. $5a^2-6a+10=0$
c. $4r^2-20r+25=0$

Answer

a. 2 real solutions
b. 2 complex solutions
c. 1 real solution

Identify the Most Appropriate Method to Use to Solve a Quadratic Equation

We summarize the four methods that we have used to solve quadratic equations below.

Methods for Solving Quadratic Equations

1. Factoring
2. Square Root Property
3. Completing the Square
4. Quadratic Formula

Given that we have four methods to use to solve a quadratic equation, how do you decide which one to use? Factoring is often the quickest method and so we try it first. If the equation is $ax^2=k$ or $a(x-h)^2=k$ we use the Square Root Property. For any other equation, it is probably best to use the Quadratic Formula. Remember, you can solve any quadratic equation by using the Quadratic Formula, but that is not always the easiest method.

What about the method of Completing the Square? Most people find that method cumbersome and prefer not to use it. We needed to include it in the list of methods because we completed the square in general to derive the Quadratic Formula. You will also use the process of Completing the Square in other areas of algebra.

Identify the Most Appropriate Method to Solve a Quadratic Equation

1. Try **Factoring** first. If the quadratic factors easily, this method is very quick.
2. Try the **Square Root Property** next. If the equation fits the form $ax^2=k$ or $a(x-h)^2=k$, it can easily be solved by using the Square Root Property.
3. Use the **Quadratic Formula**. Any other quadratic equation is best solved by using the Quadratic Formula.

The next example uses this strategy to decide how to solve each quadratic equation.

Example 18.4.9

Identify the most appropriate method to use to solve each quadratic equation.

a. $5z^2=17$
b. $4x^2-12x+9=0$
c. $8u^2+6u=11$

Solution:

a.

$$5z^2=17$$

Since the equation is in the $ax^2=k$, the most appropriate method is to use the Square Root Property.

b.

$$4x^2 - 12x + 9 = 0$$

We recognize that the left side of the equation is a perfect square trinomial, and so factoring will be the most appropriate method.

c.

$$8u^2 + 6u = 11$$

Put the equation in standard form.

$$8u^2 + 6u - 11 = 0$$

While our first thought may be to try factoring, thinking about all the possibilities for trial and error method leads us to choose the Quadratic Formula as the most appropriate method.

Exercise 18.4.17

Identify the most appropriate method to use to solve each quadratic equation.

a. $x^2 + 6x + 8 = 0$
b. $(n-3)^2 = 16$
c. $5p^2 - 6p = 9$

Answer

a. Factoring
b. Square Root Property
c. Quadratic Formula

Exercise 18.4.18

Identify the most appropriate method to use to solve each quadratic equation.

a. $8a^2 + 3a - 9 = 0$
b. $4b^2 + 4b + 1 = 0$
c. $5c^2 = 125$

Answer

a. Quadratic Formula
b. Factoring or Square Root Property
c. Square Root Property

- Solve a Quadratic Equation Using the Quadratic Formula with Complex Solutions
- Discriminant in Quadratic Formula

Key Concepts

- Quadratic Formula
  - The solutions to a quadratic equation of the form $ax^2 + bx + c = 0, a \neq 0$ are given by the formula:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

- How to solve a quadratic equation using the Quadratic Formula.
  1. Write the quadratic equation in standard form, $ax^2 + bx + c = 0$. Identify the values of a, b, c.
  2. Write the Quadratic Formula. Then substitute in the values of a, b, c.
  3. Simplify.

4. Check the solutions.

- Using the Discriminant, b^2-4ac, to Determine the Number and Type of Solutions of a Quadratic Equation
  - For a quadratic equation of the form $ax^2+bx+c=0, a\neq 0$,
    - If $b^2-4ac>0$, the equation has 2 real solutions.
    - If $b^2-4ac=0$, the equation has 1 real solution.
    - If $b^2-4ac<0$, the equation has 2 complex solutions.
- Methods to Solve Quadratic Equations:
  - Factoring
  - Square Root Property
  - Completing the Square
  - Quadratic Formula
- How to identify the most appropriate method to solve a quadratic equation.
  1. Try Factoring first. If the quadratic factors easily, this method is very quick.
  2. Try the **Square Root Property** next. If the equation fits the form $ax^2=k$ or $a(x-h)^2=k$, it can easily be solved by using the Square Root Property.
  3. Use the **Quadratic Formula.** Any other quadratic equation is best solved by using the Quadratic Formula.

Glossary

discriminant

In the Quadratic Formula, $x=\dfrac{-b\pm\sqrt{b^2-4ac}}{2a}$, the quantity b^2-4ac is called the discriminant.

18.4E: Exercises

Practice Makes Perfect

? ExerciseS 1 - 32: Solve Quadratic Equations Using the Quadratic Formula

In the following exercises, solve by using the Quadratic Formula.

1. $4m^2+m-3=0$
2. $4n^2-9n+5=0$
3. $2p^2-7p+3=0$
4. $3q^2+8q-3=0$
5. $p^2+7p+12=0$
6. $q^2+3q-18=0$
7. $r^2-8r=33$
8. $t^2+13t=-40$
9. $3u^2+7u-2=0$
10. $2p^2+8p+5=0$
11. $2a^2-6a+3=0$
12. $5b^2+2b-4=0$
13. $x^2+8x-4=0$
14. $y^2+4y-4=0$
15. $3y^2+5y-2=0$
16. $6x^2+2x-20=0$
17. $2x^2+3x+3=0$
18. $2x^2-x+1=0$
19. $8x^2-6x+2=0$
20. $8x^2-4x+1=0$
21. $(v+1)(v-5)-4=0$
22. $(x+1)(x-3)=2$
23. $(y+4)(y-7)=18$
24. $(x+2)(x+6)=21$
25. $\frac{1}{4}m^2+\frac{1}{12}m=\frac{1}{3}$
26. $\frac{1}{3}n^2+n=-\frac{1}{2}$
27. $\frac{3}{4}b^2+\frac{1}{2}b=\frac{3}{8}$
28. $\frac{1}{9}c^2+\frac{2}{3}c=3$
29. $16c^2+24c+9=0$
30. $25d^2-60d+36=0$
31. $25q^2+30q+9=0$

32. $16y^2+8y+1=0$

Answer

1. $m=-1, m=\frac{3}{4}$
3. $p=\frac{1}{3}, p=2$
5. $p=-4, p=-3$
7. $r=-3, r=11$
9. $u=\frac{-7\pm\sqrt{73}}{6}$
11. $a=\frac{3\pm\sqrt{3}}{2}$
13. $x=-4\pm2\sqrt{5}$
15. $y=-\frac{2}{3}, y=-1$
17. $x=-\frac{3}{4}\pm\frac{\sqrt{15}}{4}i$
19. $x=\frac{3}{8}\pm\frac{\sqrt{7}}{8}i$
21. $v=2\pm2\sqrt{2}$
23. $y=-4, y=7$
25. $m=1, m=\frac{-4}{3}$
27. $b=\frac{-2\pm\sqrt{22}}{6}$
29. $c=-\frac{3}{4}$
31. $q=-\frac{3}{5}$

? ExerciseS 33 - 36 Use the Discriminant to Predict the Number of Real Solutions of a Quadratic Equation

In the following exercises, determine the number of real solutions for each quadratic equation.

33. a. $4x^2-5x+16=0$
    b. $36y^2+36y+9=0$
    c. $6m^2+3m-5=0$
34. a. $9v^2-15v+25=0$
    b. $100w^2+60w+9=0$
    c. $5c^2+7c-10=0$
35. a. $r^2+12r+36=0$
    b. $8t^2-11t+5=0$
    c. $3v^2-5v-1=0$
36. a. $25p^2+10p+1=0$
    b. $7q^2-3q-6=0$
    c. $7y^2+2y+8=0$

Answer

33. a. no real solutions b. 1 c. 2

35. a. 1 b. no real solutions c. 2

? ExerciseS 37 - 40: Identify the Most Appropriate Method to Use to Solve a Quadratic Equation

In the following exercises, identify the most appropriate method (Factoring, Square Root, or Quadratic Formula) to use to solve each quadratic equation. Do not solve.

37. a. $x^2-5x-24=0$
    b. $(y+5)^2=12$
    c. $14m^2+3m=11$
38. a. $(8v+3)^2=81$
    b. $w^2-9w-22=0$
    c. $4n^2-10=6$
39. a. $6a^2+14=20$
    b. $\left(x-\frac{1}{4}\right)^2=\frac{5}{16}$
    c. $y^2-2y=8$
40. a. $8b^2+15b=4$
    b. $\frac{5}{9}v^2-\frac{2}{3}v=1$
    c. $\left(w+\frac{4}{3}\right)^2=\frac{2}{9}$

Answer

37. a. Factor b. Square Root c. Quadratic Formula

39. a. Quadratic Formula b. Square Root c. Factor

? ExerciseS 41 - 42: Writing Exercises

41. Solve the equation $x^2+10x=120$
    a. by completing the square
    b. using the Quadratic Formula
    c. Which method do you prefer? Why?
42. Solve the equation $12y^2+23y=24$
    a. by completing the square
    b. using the Quadratic Formula
    c. Which method do you prefer? Why?

18.5: Solve Quadratic Equations in Quadratic Form

Learning Objectives

By the end of this section, you will be able to:

- Solve equations in quadratic form

Before you get started

... take this readiness quiz.

1. Factor by substitution: $y^4 - y^2 - 20$.
2. Factor by substitution: $(y-4)^2 + 8(y-4) + 15$.
3. Simplify
   a. $x^{\frac{1}{2}} \cdot x^{\frac{1}{4}}$
   b. $\left(x^{\frac{1}{3}}\right)^2$
   c. $\left(x^{-1}\right)^2$

Solve Equations in Quadratic Form

Sometimes when we factored trinomials, the trinomial did not appear to be in the $ax^2 + bx + c$ form. So we factored by substitution allowing us to make it fit the $ax^2 + bx + c$ form. We used the standard u for the substitution.

To factor the expression $x^4 - 4x^2 - 5$, we noticed the variable part of the middle term is x^2 and its square, x^4, is the variable part of the first term. (We know $\left(x^2\right)^2 = x^4$.) So we let $u = x^2$ and factored.

	$x^4 - 4x^2 - 5$
	$\left(x^2\right)^2 - 4\left(x^2\right) - 5$
Let $u = x^2$ and substitute.	$u^2 - 4u - 5$
Factor the trinomial.	$(u+1)(u-5)$
Replace u with x^2.	$\left(x^2+1\right)\left(x^2-5\right)$

Similarly, sometimes an equation is not in the $ax^2 + bx + c = 0$ form but looks much like a quadratic equation. Then, we can often make a thoughtful substitution that will allow us to make it fit the $ax^2 + bx + c = 0$ form. If we can make it fit the form, we can then use all of our methods to solve quadratic equations.

Notice that in the quadratic equation $ax^2 + bx + c = 0$, the middle term has a variable, x, and its square, x^2, is the variable part of the first term. Look for this relationship as you try to find a substitution.

Again, we will use the standard u to make a substitution that will put the equation in quadratic form. If the substitution gives us an equation of the form $ax^2 + bx + c = 0$, we say the original equation was of **quadratic form**.

The next example shows the steps for solving an equation in quadratic form.

Example 18.5.1 How to Solve Equations in Quadratic Form

Solve: $6x^4 - 7x^2 + 2 = 0$

Solution:

Step 1: Identify a substitution that will put the equation in quadratic form.	Since $\left(x^2\right)^2 = x^4$, we let $u = x^2$.	$6x^4 - 7x^2 + 2 = 0$

Step 2: Rewrite the equation with the substitution to put it in quadratic form.	Rewrite to prepare for the substitution. Substitute $u = x^2$.	$6\left(x^2\right)^2 - 7x^2 + 2 = 0$ $6u^2 - 7u + 2 = 0$
Step 3: Solve the quadratic equation for u.	We can solve by factoring. Use the Zero Product Property.	$(2u-1)(3u-2) = 0$ $2u - 1 = 0, 3u - 2 = 0$ $2u = 1, 3u = 2$ $u = \frac{1}{2} u = \frac{2}{3}$
Step 4: Substitute the original variable back into the results, using the substitution.	Replace u with x^2.	$x^2 = \frac{1}{2} \quad x^2 = \frac{2}{3}$
Step 5: Solve for the original variable.	Solve for x, using the Square Root Property.	$x = \pm\sqrt{\frac{1}{2}} \quad x = \pm\sqrt{\frac{2}{3}}$ $x = \pm\frac{\sqrt{2}}{2} \quad x = \pm\frac{\sqrt{6}}{3}$ There are four solutions. $x = \frac{\sqrt{2}}{2} \quad x = \frac{\sqrt{6}}{3}$ $x = -\frac{\sqrt{2}}{2} \quad x = -\frac{\sqrt{6}}{3}$
Step 6: Check the solutions.	Check all four solutions. We will show one check here.	$x = \frac{\sqrt{2}}{2}$ $6x^4 - 7x^2 + 2 = 0$ $6\left(\frac{\sqrt{2}}{2}\right)^4 - 7\left(\frac{\sqrt{2}}{2}\right)^2 + 2 \stackrel{?}{=} 0$ $6\left(\frac{4}{16}\right) - 7\left(\frac{2}{4}\right)^2 + 2 \stackrel{?}{=} 0$ $\frac{3}{2} - \frac{7}{2} + \frac{4}{2} \stackrel{?}{=} 0$ $0 = 0$ We leave the other checks to you!

? Exercise 18.5.1

Solve: $x^4 - 6x^2 + 8 = 0$.

Answer

$x = \sqrt{2}, x = -\sqrt{2}, x = 2, x = -2$

? Exercise 18.5.2

Solve: $x^4 - 11x^2 + 28 = 0$.

Answer

$x = \sqrt{7}, x = -\sqrt{7}, x = 2, x = -2$

We summarize the steps to solve an equation in quadratic form.

Solve Equations in Quadratic Form

1. Identify a substitution that will put the equation in quadratic form.
2. Rewrite the equation with the substitution to put it in quadratic form.
3. Solve the quadratic equation for u.
4. Substitute the original variable back into the results, using the substitution.

5. Solve for the original variable.
6. Check the solutions.

In the next example, the binomial in the middle term, $(x-2)$ is squared in the first term. If we let $u=x-2$ and substitute, our trinomial will be in ax^2+bx+c form.

Example 18.5.2

Solve: $(x-2)^2+7(x-2)+12=0$.

Solution:

	$(x-2)^2+7(x-2)+12=0$
Prepare for the substitution.	$(x-2)^2+7(x-2)+12=0$
Let $u=x-2$ and substitute.	$u^2+7u+12=0$
Solve by factoring.	$(u+3)(u+4)=0$ $u+3=0, \quad u+4=0$ $u=-3, \quad u=-4$
Replace u with $x-2$.	$x-2=-3, \quad x-2=-4$
Solve for x.	$x=-1, \quad x=-2$
Check: $x=-1$ $(x-2)^2+7(x-2)+12=0$ $(-1-2)^2+7(-1-2)+12 \stackrel{?}{=} 0$ $(-3)^2+7(-3)+12 \stackrel{?}{=} 0$ $9-21+12 \stackrel{?}{=} 0$ $0=0$ ✓ $x=-2$ $(x-2)^2+7(x-2)+12=0$ $(-2-2)^2+7(-2-2)+12 \stackrel{?}{=} 0$ $(-4)^2+7(-4)+12 \stackrel{?}{=} 0$ $16-28+12 \stackrel{?}{=} 0$ $0=0$ ✓	

Figure 9.4.14

Exercise 18.5.3

Solve: $(x-5)^2+6(x-5)+8=0$.

Answer

$x=3, x=1$

Exercise 18.5.4

Solve: $(y-4)^2+8(y-4)+15=0$.

Answer

$y=-1, y=1$

In the next example, we notice that $(\sqrt{x})^2=x$. Also, remember that when we square both sides of an equation, we may introduce extraneous roots. Be sure to check your answers!

Example 18.5.3

Solve: $x-3\sqrt{x}+2=0$.

Solution:

The $\sqrt{x}$ in the middle term, is squared in the first term $(\sqrt{x})^2=x$. If we let $u=\sqrt{x}$ and substitute, our trinomial will be in $ax^2+bx+c=0$ form.

	$x-3\sqrt{x}+2=0$
Rewrite the trinomial to prepare for the substitution.	$(\sqrt{x})^2-3\sqrt{x}+2=0$
Let $u=\sqrt{x}$ and substitute.	$u^2-3u+2=0$
Solve by factoring.	$(u-2)(u-1)=0$ $u-2=0, \quad u-1=0$ $u=2, \quad u=1$ \)
Replace u with $\sqrt{x}$.	$\sqrt{x}=2, \quad \sqrt{x}=1$
Solve for x, by squaring both sides.	$x=4, \quad x=1$
Check: $x=4$: $x-3\sqrt{x}+2=0$; $4-3\sqrt{4}+2\stackrel{?}{=}0$; $4-6+2\stackrel{?}{=}0$; $0=0$ ✓ $x=1$: $x-3\sqrt{x}+2=0$; $1-3\sqrt{1}+2\stackrel{?}{=}0$; $1-3+2\stackrel{?}{=}0$; $0=0$ ✓	

Exercise 18.5.5

Solve: $x-7\sqrt{x}+12=0$.

Answer

$x=9, x=16$

Exercise 18.5.6

Solve: $x-6\sqrt{x}+8=0$.

Answer

$x=4, x=16$

Substitutions for rational exponents can also help us solve an equation in quadratic form. Think of the properties of exponents as you begin the next example.

Example 18.5.4

Solve: $x^{\frac{2}{3}}-2x^{\frac{1}{3}}-24=0$.

Solution:

The $x^{\frac{1}{3}}$ in the middle term is squared in the first term $\left(x^{\frac{1}{3}}\right)^2=x^{\frac{2}{3}}$. If we let $u=x^{\frac{1}{3}}$ and substitute, our trinomial will be in $ax^2+bx+c=0$ form.

	$x^{\frac{2}{3}}-2x^{\frac{1}{3}}-24=0$

Rewrite the trinomial to prepare for the substitution.	$\left(x^{\frac{1}{3}}\right)^2 - 2\left(x^{\frac{1}{3}}\right) - 24 = 0$
Let $u = x^{\frac{1}{3}}$	$u^2 - 2u - 24 = 0$
Solve by factoring.	$(u-6)(u+4) = 0$ $u-6=0, \quad u+4=0$ $u=6, \quad u=-4$
Replace u with $x^{\frac{1}{3}}$.	$x^{\frac{1}{3}} = 6, \quad x^{\frac{1}{3}} = -4$
Solve for x by cubing both sides.	$\left(x^{\frac{1}{3}}\right)^3 = (6)^3, \quad \left(x^{\frac{1}{3}}\right)^3 = (-4)^3$ $x = 216, \quad x = -64$
Check: $x = 216$ $x^{\frac{2}{3}} - 2x^{\frac{1}{3}} - 24 = 0$ $(216)^{\frac{2}{3}} - 2(216)^{\frac{1}{3}} - 24 \stackrel{?}{=} 0$ $36 - 12 - 24 \stackrel{?}{=} 0$ $0 = 0$ ✓ $x = -64$ $x^{\frac{2}{3}} - 2x^{\frac{1}{3}} - 24 = 0$ $(-64)^{\frac{2}{3}} - 2(-64)^{\frac{1}{3}} - 24 \stackrel{?}{=} 0$ $16 + 8 - 24 \stackrel{?}{=} 0$ $0 = 0$ ✓ Figure 9.4.33	

? Exercise 18.5.7

Solve: $x^{\frac{2}{3}} - 5x^{\frac{1}{3}} - 14 = 0$.

Answer

$x = -8, x = 343$

? Exercise 18.5.8

Solve: $x^{\frac{1}{2}} + 8x^{\frac{1}{4}} + 15 = 0$.

Answer

$x = 81, x = 625$

In the next example, we need to keep in mind the definition of a negative exponent as well as the properties of exponents.

✓ Example 18.5.5

Solve: $3x^{-2} - 7x^{-1} + 2 = 0$.

Solution:

The x^{-1} in the middle term is squared in the first term $\left(x^{-1}\right)^2 = x^{-2}$. If we let $u = x^{-1}$ and substitute, our trinomial will be in $ax^2 + bx + c = 0$ form.

	$3x^{-2} - 7x^{-1} + 2 = 0$
Rewrite the trinomial to prepare for the substitution.	$3(x^{-1})^2 - 7(x^{-1}) + 2 = 0$
Let $u = x^{-1}$ and substitute.	$3u^2 - 7u + 2 = 0$
Solve by factoring.	$(3u-1)(u-2) = 0$
	$3u-1=0, \quad u-2=0$

	$u=\frac{1}{3}, \quad u=2$
Replace u with x^{-1}.	$x^{-1}=\frac{1}{3}, \quad x^{-1}=2$
Solve for x by taking the reciprocal since $x^{-1}=\frac{1}{x}$.	$x=3, \quad x=\frac{1}{2}$
Check: $x=3$ $3x^{-2}-7x^{-1}+2=0$ $3(3)^{-2}-7(3)^{-1}+2\stackrel{?}{=}0$ $3\left(\frac{1}{9}\right)-7\left(\frac{1}{3}\right)+2\stackrel{?}{=}0$ $\frac{1}{3}-\left(\frac{7}{3}\right)+\frac{6}{3}\stackrel{?}{=}0$ $0=0$ ✓ $x=\frac{1}{2}$ $3x^{-2}-7x^{-1}+2=0$ $3\left(\frac{1}{2}\right)^{-2}-7\left(\frac{1}{2}\right)^{-1}+2\stackrel{?}{=}0$ $3(4)-7(2)+2\stackrel{?}{=}0$ $12-14+2\stackrel{?}{=}0$ $0=0$ ✓ Figure 9.4.42	

? Exercise 18.5.9

Solve: $8x^{-2}-10x^{-1}+3=0$.

Answer

$x=\frac{4}{3}, x=2$

? Exercise 18.5.10

Solve: $6x^{-2}-23x^{-1}+20=0$.

Answer

$x=\frac{2}{5}, x=\frac{3}{4}$

Access this online video for additional instruction and practice with solving quadratic equations: https://www.youtube.com/watch?v=7X-CZMbpxuw

Key Concepts

- How to solve equations in quadratic form.
  1. Identify a substitution that will put the equation in quadratic form.
  2. Rewrite the equation with the substitution to put it in quadratic form.
  3. Solve the quadratic equation for u.
  4. Substitute the original variable back into the results, using the substitution.
  5. Solve for the original variable.
  6. Check the solutions.

18.5E: Exercises

Practice Makes Perfect

? Exercise 18.5E.11 Solve equations in quadratic form

In the following exercises, solve.

1. $x^4-7x^2+12=0$
2. $x^4-9x^2+18=0$
3. $x^4-13x^2-30=0$
4. $x^4+5x^2-36=0$
5. $2x^4-5x^2+3=0$
6. $4x^4-5x^2+1=0$
7. $2x^4-7x^2+3=0$
8. $3x^4-14x^2+8=0$
9. $(x-3)^2-5(x-3)-36=0$
10. $(x+2)^2-3(x+2)-54=0$
11. $(3y+2)^2+(3y+2)-6=0$
12. $(5y-1)^2+3(5y-1)-28=0$
13. $\left(x^2+1\right)^2-5\left(x^2+1\right)+4=0$
14. $\left(x^2-4\right)^2-4\left(x^2-4\right)+3=0$
15. $2\left(x^2-5\right)^2-5\left(x^2-5\right)+2=0$
16. $2\left(x^2-5\right)^2-7\left(x^2-5\right)+6=0$
17. $x-\sqrt{x}-20=0$
18. $x-8\sqrt{x}+15=0$
19. $x+6\sqrt{x}-16=0$
20. $x+4\sqrt{x}-21=0$
21. $6x+\sqrt{x}-2=0$
22. $6x+\sqrt{x}-1=0$
23. $10x-17\sqrt{x}+3=0$
24. $12x+5\sqrt{x}-3=0$
25. $x^{\frac{2}{3}}+9x^{\frac{1}{3}}+8=0$
26. $x^{\frac{2}{3}}-3x^{\frac{1}{3}}=28$
27. $x^{\frac{2}{3}}+4x^{\frac{1}{3}}=12$
28. $x^{\frac{2}{3}}-11x^{\frac{1}{3}}+30=0$
29. $6x^{\frac{2}{3}}-x^{\frac{1}{3}}=12$
30. $3x^{\frac{2}{3}}-10x^{\frac{1}{3}}=8$
31. $8x^{\frac{2}{3}}-43x^{\frac{1}{3}}+15=0$
32. $20x^{\frac{2}{3}}-23x^{\frac{1}{3}}+6=0$
33. $x-8x^{\frac{1}{2}}+7=0$
34. $2x-7x^{\frac{1}{2}}=15$
35. $6x^{-2}+13x^{-1}+5=0$
36. $15x^{-2}-26x^{-1}+8=0$
37. $8x^{-2}-2x^{-1}-3=0$
38. $15x^{-2}-4x^{-1}-4=0$

Answer

1. $x=\pm\sqrt{3}, x=\pm 2$
3. $x=\pm\sqrt{15}, x=\pm\sqrt{2}i$

5. $x = \pm 1, x = \frac{\pm\sqrt{6}}{2}$

7. $x = \pm\sqrt{3}, x = \pm\frac{\sqrt{2}}{2}$

9. $x = -1, x = 12$

11. $x = -\frac{5}{3}, x = 0$

13. $x = 0, x = \pm\sqrt{3}$

15. $x = \pm\frac{11}{2}, x = \pm\frac{\sqrt{22}}{2}$

17. $x = 25$

19. $x = 4$

21. $x = \frac{1}{4}$

23. $x = \frac{1}{25}, x = \frac{9}{4}$

25. $x = -1, x = -512$

27. $x = 8, x = -216$

29. $x = \frac{27}{8}, x = -\frac{64}{27}$

31. $x = 27, x = 64,000$

33. $x = 1, x = 49$

35. $x = -2, x = -\frac{3}{5}$

37. $x = -2, x = \frac{4}{3}$

Exercise $18.5E.12$ writing exercises

1. Explain how to recognize an equation in quadratic form.
2. Explain the procedure for solving an equation in quadratic form.

Answer

1. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve equations in quadratic form.			

Figure 9.4.43

b. On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

18.6: Solve Applications of Quadratic Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve applications modeled by quadratic equations

Before you get started, take this readiness quiz.

1. The sum of two consecutive odd numbers is -100. Find the numbers.
   If you missed this problem, review Example 2.18.
2. Solve: $\frac{2}{x+1}+\frac{1}{x-1}=\frac{1}{x^2-1}$.
   If you missed this problem, review Example 7.35.
3. Find the length of the hypotenuse of a right triangle with legs 5 inches and 12 inches.
   If you missed this problem, review Example 2.34.

Solve Applications Modeled by Quadratic Equations

We solved some applications that are modeled by quadratic equations earlier, when the only method we had to solve them was factoring. Now that we have more methods to solve quadratic equations, we will take another look at applications.

Let's first summarize the methods we now have to solve quadratic equations.

Methods to Solve Quadratic Equations

1. Factoring
2. Square Root Property
3. Completing the Square
4. Quadratic Formula

As you solve each equation, choose the method that is most convenient for you to work the problem. As a reminder, we will copy our usual Problem-Solving Strategy here so we can follow the steps.

Use a Problem-Solving Strategy

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. **Solve** the equation using algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

We have solved number applications that involved consecutive even and odd integers, by modeling the situation with linear equations. Remember, we noticed each even integer is 2 more than the number preceding it. If we call the first one n, then the next one is $n+2$. The next one would be $n+2+2$ or $n+4$. This is also true when we use odd integers. One set of even integers and one set of odd integers are shown below.

	Consecutive even integers
	$64, 66, 68$
n	1^{st} even integer
$n+2$	2^{nd} consecutive even integer
$n+4$	3^{rd} consecutive even integer

	Consecutive odd integers
	$77, 79, 81$
n	1^{st} odd integer
$n+2$	2^{nd} consecutive odd integer
$n+4$	3^{rd} consecutive odd integer

Some applications of odd or even consecutive integers are modeled by quadratic equations. The notation above will be helpful as you name the variables.

Example 18.6.1

The product of two consecutive odd integers is 195. Find the integers.

Solution:

Step 1: **Read** the problem

Step 2: **Identify** what we are looking for.

We are looking for two consecutive odd integers.

Step 3: **Name** what we are looking for.

Let $n =$ the first odd integer.

$n+2 =$ the next odd integer.

Step 4: **Translate** into an equation. State the problem in one sentence.

"The product of two consecutive odd integers is 195." The product of the first odd integer and the second odd integer is 195.

Translate into an equation.

$$n(n+2) = 195$$

Step 5: **Solve** the equation. Distribute.

$$n^2 + 2n = 195$$

Write the equation in standard form.

$$n^2 + 2n - 195 = 0$$

Factor.

$$(n+15)(n-13) = 0$$

Use the Zero Product Property.

$$n+15 = 0 \quad n-13 = 0$$

Solve each equation.

$$n = -15, \quad n = 13$$

There are two values of n that are solutions. This will give us two pairs of consecutive odd integers for our solution.

First odd integer $n = 13$	First odd integer $n = -15$
next odd integer $n+2$	next odd integer $n+2$
$13+2$	$-15+2$
15	-13

Step 6: **Check** the answer.

Do these pairs work? Are they consecutive odd integers?

$13, 15$ yes
$-13, -15$ yes

Is their product 195?

$13 \cdot 15 = 195$ yes
$-13(-15) = 195$ yes

Step 7: **Answer** the question.

Two consecutive odd integers whose product is 195 are $13, 15$ and $-13, -15$.

Exercise 18.6.1

The product of two consecutive odd integers is 99. Find the integers.

Answer

The two consecutive odd integers whose product is 99 are $9, 11$, and $-9, -11$.

Exercise 18.6.2

The product of two consecutive even integers is 168. Find the integers.

Answer

The two consecutive even integers whose product is 128 are $12, 14$ and $-12, -14$.

We will use the formula for the area of a triangle to solve the next example.

Definition 18.6.1

Area of a Triangle

For a triangle with base, b, and height, h, the area, A, is given by the formula $A = \frac{1}{2}bh$.

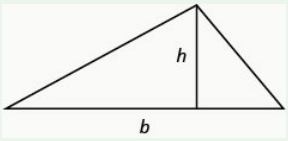

Figure 9.5.1

Recall that when we solve geometric applications, it is helpful to draw the figure.

Example 18.6.2

An architect is designing the entryway of a restaurant. She wants to put a triangular window above the doorway. Due to energy restrictions, the window can only have an area of 120 square feet and the architect wants the base to be 4 feet more than twice the height. Find the base and height of the window.

Solution:

Table 9.5.1

Step 1: **Read** the problem. Draw a picture.	Step 2: **Identify** what we are looking for.	We are looking for the base and height.
Step 3: **Name** what we are looking for.	Let $h =$ the height of the triangle. $2h + 4 =$ the base of the triangle.

Step 4: **Translate** into an equation. We know the area. Write the formula for the area of a triangle.	$A=\frac{1}{2}bh$
Step 5: **Solve** the equation. Substitute in the values.	$120=\frac{1}{2}(2h+4)h$
Distribute.	$120=h^2+2h$
This is a quadratic equation, rewrite it in standard form.	$h^2+2h-120=0$
Factor.	$(h-10)(h+12)=0$
Use the Zero Product Property.	$h-10=0 \quad h+12=0$
Simplify.	$h=10, \quad h=\cancel{-12}$
Since h is the height of a window, a value of $h=-12$ does not make sense.	
The height of the triangle $h=10$.	
The base of the triangle $2h+4$. $2\cdot 10+4$ 24	
Step 6: **Check** the answer. Does a triangle with height 10 and base 24 have area 120? Yes.	
Step 7: **Answer** the question.	The height of the triangular window is 10 feet and the base is 24 feet.

? Exercise 18.6.3

Find the base and height of a triangle whose base is four inches more than six times its height and has an area of 456 square inches.

Answer

The height of the triangle is 12 inches and the base is 76 inches.

? Exercise 18.6.4

If a triangle that has an area of 110 square feet has a base that is two feet less than twice the height, what is the length of its base and height?

Answer

The height of the triangle is 11 feet and the base is 20 feet.

In the two preceding examples, the number in the radical in the **Quadratic Formula** was a perfect square and so the solutions were rational numbers. If we get an irrational number as a solution to an application problem, we will use a calculator to get an approximate value.

We will use the formula for the area of a rectangle to solve the next example.

Definition 18.6.2

Area of a Rectangle

For a rectangle with length, L, and width, W, the area, A, is given by the formula $A=LW$.

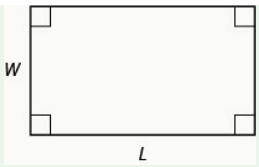

Figure 9.5.3

Example 18.6.3

Mike wants to put 150 square feet of artificial turf in his front yard. This is the maximum area of artificial turf allowed by his homeowners association. He wants to have a rectangular area of turf with length one foot less than 3 times the width. Find the length and width. Round to the nearest tenth of a foot.

Solution:

Table 9.5.2

Step 1: **Read** the problem. Draw a picture.	
Step 2: **Identify** what we are looking for.	We are looking for the length and width.
Step 3: **Name** what we are looking for.	Let $w =$ the width of the rectangle. $3w - 1 =$ the length of the rectangle
Step 4: **Translate** into an equation. We know the area. Write the formula for the area of a rectangle.	$A = L \cdot W$
Step 5: **Solve** the equation. Substitute in the values.	$150 = (3w - 1)w$
Distribute.	$150 = 3w^2 - w$
This is a quadratic equation; rewrite it in standard form. Solve the equation using the Quadratic Formula.	$ax^2 + bx + c = 0$ $3w^2 - w - 150 = 0$
Identify the a, b, c values.	$a = 3, b = -1, c = -150$
Write the Quadratic Formula.	$w = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, c.	$w = \frac{-(-1) \pm \sqrt{(-1)^2 - 4 \cdot 3 \cdot (-150)}}{2 \cdot 3}$
Simplify.	$w = \frac{1 \pm \sqrt{1 + 1800}}{6}$ $w = \frac{1 \pm \sqrt{1801}}{6}$ Figure 9.5.13
Rewrite to show two solutions.	$w = \frac{1 + \sqrt{1801}}{6}, \quad w = \frac{1 - \sqrt{1801}}{6}$
Approximate the answers using a calculator. We eliminate the negative solution for the width.	$w \approx 7.2, \quad$ ~~$w \approx -6.9$~~ Width $w \approx 7.2$ Length $\approx 3w - 1$ $\approx 3(7.2) - 1$ ≈ 20.6
Step 6: **Check** the answer. Make sure that the answers make sense. Since the answers are approximate, the area will not come out exactly to 150.	
Step 7: **Answer** the question.	The width of the rectangle is approximately 7.2 feet and the length is approximately 20.6 feet.

Exercise 18.6.5

The length of a 200 square foot rectangular vegetable garden is four feet less than twice the width. Find the length and width of the garden, to the nearest tenth of a foot.

Answer

The length of the garden is approximately 18 feet and the width 11 feet.

Exercise 18.6.6

A rectangular tablecloth has an area of 80 square feet. The width is 5 feet shorter than the length.What are the length and width of the tablecloth to the nearest tenth of a foot?

Answer

The length of the tablecloth is approximately 11.8 feet and the width 6.8 feet.

The **Pythagorean Theorem** gives the relation between the legs and hypotenuse of a right triangle. We will use the Pythagorean Theorem to solve the next example.

Definition 18.6.3

Pythagorean Theorem

In any right triangle, where a and b are the lengths of the legs, and c is the length of the hypotenuse, $a^2 + b^2 = c^2$.

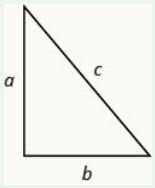

Figure 9.5.16

Example 18.6.4

Rene is setting up a holiday light display. He wants to make a 'tree' in the shape of two right triangles, as shown below, and has two 10-foot strings of lights to use for the sides. He will attach the lights to the top of a pole and to two stakes on the ground. He wants the height of the pole to be the same as the distance from the base of the pole to each stake. How tall should the pole be?

Solution:

Table 9.5.3

Step 1: **Read** the problem. Draw a picture.	Step 2: **Identify** what we are looking for.	We are looking for the height of the pole.

Step 3: **Name** what we are looking for.	The distance from the base of the pole to either stake is the same as the height of the pole. Let $x =$ the height of the pole. $x =$ the distance from pole to stake Each side is a right triangle. We draw a picture of one of them.  Figure 9.5.18
Step 4: **Translate** into an equation. We can use the Pythagorean Theorem to solve for x. Write the Pythagorean Theorem.	$a^2 + b^2 = c^2$
Step 5: **Solve** the equation. Substitute.	$x^2 + x^2 = 10^2$
Simplify.	$2x^2 = 100$
Divide by 2 to isolate the variable.	$\frac{2x^2}{2} = \frac{100}{2}$
Simplify.	$x^2 = 50$
Use the Square Root Property.	$x = \pm\sqrt{50}$
Simplify the radical.	$x = \pm 5\sqrt{2}$
Rewrite to show two solutions.	$x = 5\sqrt{2}, \quad x = -5\sqrt{2}$
	If we approximate this number to the nearest tenth with a calculator, we find $x \approx 7.1$.
Step 6: **Check** the answer. Check on your own in the Pythagorean Theorem.	
Step 7: **Answer** the question.	The pole should be about 7.1 feet tall.

? Exercise 18.6.7

The sun casts a shadow from a flag pole. The height of the flag pole is three times the length of its shadow. The distance between the end of the shadow and the top of the flag pole is 20 feet. Find the length of the shadow and the length of the flag pole. Round to the nearest tenth.

Answer

The length of the flag pole's shadow is approximately 6.3 feet and the height of the flag pole is 18.9 feet.

? Exercise 18.6.8

The distance between opposite corners of a rectangular field is four more than the width of the field. The length of the field is twice its width. Find the distance between the opposite corners. Round to the nearest tenth.

Answer

The distance between the opposite corners is approximately 7.2 feet.

The height of a projectile shot upward from the ground is modeled by a quadratic equation. The initial velocity, v_0, propels the object up until gravity causes the object to fall back down.

Definition 18.6.4

The height in feet, h, of an object shot upwards into the air with initial velocity, v_0, after t seconds is given by the formula

$$h = -16t^2 + v_0 t$$

We can use this formula to find how many seconds it will take for a firework to reach a specific height.

Example 18.6.5

A firework is shot upwards with initial velocity 130 feet per second. How many seconds will it take to reach a height of 260 feet? Round to the nearest tenth of a second.

Solution:

Table 9.5.4

Step 1: **Read** the problem.	
Step 2: **Identify** what we are looking for.	We are looking for the number of seconds, which is time.
Step 3: **Name** what we are looking for.	Let $t =$ the number of seconds.
Step 4: **Translate** into an equation. Use the formula.	$h = -16t^2 + v_0 t$
Step 5: **Solve** the equation. We know the velocity v_0 is 130 feet per second. The height is 260 feet. Substitute the values.	$260 = -16t^2 + 130t$
This is a quadratic equation, rewrite it in standard form. Solve the equation using the Quadratic Formula.	$\underset{a}{16t^2} \underset{b}{-130t} \underset{c}{+260} = 0$
Identify the values of a, b, c.	$a = 16,\ b = -130,\ c = 260$
Write the Quadratic Formula.	$t = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, c.	$t = \frac{-(-130) \pm \sqrt{(-130)^2 - 4 \cdot 16 \cdot (260)}}{2 \cdot 16}$
Simplify.	$t = \frac{130 \pm \sqrt{16{,}900 - 16{,}640}}{32}$ $t = \frac{130 \pm \sqrt{260}}{32}$ Figure 9.5.26
Rewrite to show two solutions.	$t = \frac{130 + \sqrt{260}}{32}, \quad t = \frac{130 - \sqrt{260}}{32}$
Approximate the answer with a calculator.	$t \approx 4.6$ seconds, $\quad t \approx 3.6$ seconds
Step 6: **Check** the answer. The check is left to you.	
Step 7: **Answer** the question.	The firework will go up and then fall back down. As the firework goes up, it will reach 260 feet after approximately 3.6 seconds. It will also pass that height on the way down at 4.6 seconds.

Exercise 18.6.9

An arrow is shot from the ground into the air at an initial speed of 108 ft/s. Use the formula $h = -16t^2 + v_0 t$ to determine when the arrow will be 180 feet from the ground. Round the nearest tenth.

Answer

The arrow will reach 180 feet on its way up after 3 seconds and again on its way down after approximately 3.8 seconds.

Exercise 18.6.10

A man throws a ball into the air with a velocity of 96 ft/s. Use the formula $h = -16t^2 + v_0 t$ to determine when the height of the ball will be 48 feet. Round to the nearest tenth.

Answer

The ball will reach 48 feet on its way up after approximately $.6$ second and again on its way down after approximately 5.4 seconds.

We have solved uniform motion problems using the formula $D = rt$ in previous chapters. We used a table like the one below to organize the information and lead us to the equation.

	Rate	•	Time	=	Distance

Figure 9.5.29

The formula $D = rt$ assumes we know r and t and use them to find D. If we know D and r and need to find t, we would solve the equation for t and get the formula $t = \frac{D}{r}$.

Some uniform motion problems are also modeled by quadratic equations.

Example 18.6.6

Professor Smith just returned from a conference that was $2,000$ miles east of his home. His total time in the airplane for the round trip was 9 hours. If the plane was flying at a rate of 450 miles per hour, what was the speed of the jet stream?

Solution:

This is a uniform motion situation. A diagram will help us visualize the situation.

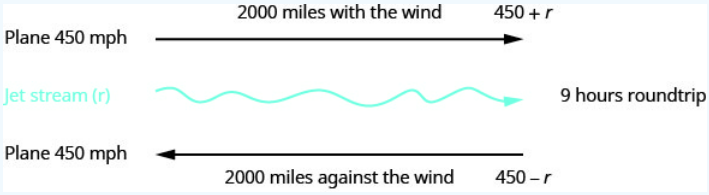

Figure 9.5.30

We fill in the chart to organize the information.

We are looking for the speed of the jet stream. Let $r =$ the speed of the jet stream.

When the plane flies with the wind, the wind increases its speed and so the rate is $450 + r$.

When the plane flies against the wind, the wind decreases its speed and the rate is $450 - r$.

Table 9.5.5

Write in the rates. Write in the distances. Since $D = r \cdot t$, we solve for t and get $t = \frac{D}{r}$. We divide the distance by the rate in each row, and place the expression in the time column.	<table><tr><th>Type</th><th>Rate</th><th>·</th><th>Time</th><th>=</th><th>Distance</th></tr><tr><td>Headwind</td><td>$450 - r$</td><td></td><td>$\frac{2000}{450-r}$</td><td></td><td>2000</td></tr><tr><td>Tailwind</td><td>$450 + r$</td><td></td><td>$\frac{2000}{450+r}$</td><td></td><td>2000</td></tr><tr><td></td><td></td><td></td><td>9</td><td></td><td></td></tr></table>
We know the times add to 9 and so we write our equation.	$\frac{2000}{450-r} + \frac{2000}{450+r} = 9$
We multiply both sides by the LCD.	$(450-r)(450+r)\left(\frac{2000}{450-r} + \frac{2000}{450+r}\right) = 9(450-r)(450+r)$
Simplify.	$2000(450+r) + 2000(450-r) = 9(450-r)(450+r)$
Factor the 2, 000.	$2000(450+r+450-r) = 9\left(450^2 - r^2\right)$
Solve.	$2000(900) = 9\left(450^2 - r^2\right)$
Divide by 9.	$2000(100) = 450^2 - r^2$
Simplify.	$200000 = 202500 - r^2$ $-2500 = -r^2$ \ $50 = r$ The speed of the jet stream is 50 mph.
Check: Is 50 mph a reasonable speed for the jet stream? Yes. If the plane is traveling 450 mph and the wind is 50 mph, Tailwind $450 + 50 = 500\text{mph} \quad \frac{2000}{500} = 4$ hours Headwind $450 - 50 = 400\text{mph} \quad \frac{2000}{400} = 5$ hours The times add to 9 hours, so it checks.	

The speed of the jet stream was 50 mph.

Exercise 18.6.11

MaryAnne just returned from a visit with her grandchildren back east. The trip was 2400 miles from her home and her total time in the airplane for the round trip was 10 hours. If the plane was flying at a rate of 500 miles per hour, what was the speed of the jet stream?

Answer

The speed of the jet stream was 100 mph.

Exercise 18.6.12

Gerry just returned from a cross country trip. The trip was 3000 miles from his home and his total time in the airplane for the round trip was 11 hours. If the plane was flying at a rate of 550 miles per hour, what was the speed of the jet stream?

Answer

The speed of the jet stream was 50 mph.

Work applications can also be modeled by quadratic equations. We will set them up using the same methods we used when we solved them with rational equations.We'll use a similar scenario now.

Example 18.6.7

The weekly gossip magazine has a big story about the presidential election and the editor wants the magazine to be printed as soon as possible. She has asked the printer to run an extra printing press to get the printing done more quickly. Press #1 takes 12 hours more than Press #2 to do the job and when both presses are running they can print the job in 8 hours. How long does it take for each press to print the job alone?

Solution:

This is a work problem. A chart will help us organize the information.

We are looking for how many hours it would take each press separately to complete the job.

Table 9.5.6

Let $x =$ the number of hours for Press #2 to complete the job. Enter the hours per job for Press #1, Press #2, and when they work together.	<table><tr><th></th><th>Number of hours needed to complete the job.</th><th>Part of job completed/hour</th></tr><tr><td>Press #1</td><td>$x+12$</td><td>$\frac{1}{x+12}$</td></tr><tr><td>Press #2</td><td>x</td><td>$\frac{1}{x}$</td></tr><tr><td>Together</td><td>8</td><td>$\frac{1}{8}$</td></tr></table>
The part completed by Press #1 plus the part completed by Press #2 equals the amount completed together. Translate to an equation.	Work completed by Press #1 + Press #2 = Together $\frac{1}{x+12} + \frac{1}{x} = \frac{1}{8}$
Solve.	$\frac{1}{x+12}+\frac{1}{x}=\frac{1}{8}$
Multiply by the LCD, $8x(x+12)$.	$8x(x+12)\left(\frac{1}{x+12}+\frac{1}{x}\right)=\left(\frac{1}{8}\right)8x(x+12)$
Simplify.	$8x+8(x+12)=x(x+12)$ $8x+8x+96=x^2+12x$ Figure 9.5.37 $0=x^2-4x-96$ Figure 9.5.38
Solve.	$0=(x-12)(x+8)$ $x-12=0, x+8=0$ Figure 9.5.40 $x=12, x=-8$ hours Figure 9.5.41
Since the idea of negative hours does not make sense, we use the values $x=12$.	$12+12$ 24 hours 12 12 hours Figure 9.5.43
Write our sentence answer.	Press #1 would take 24 hours and Press #2 would take 12 hours to do the job alone.

Exercise 18.6.13

The weekly news magazine has a big story naming the Person of the Year and the editor wants the magazine to be printed as soon as possible. She has asked the printer to run an extra printing press to get the printing done more quickly. Press #1 takes 6 hours more than Press #2 to do the job and when both presses are running they can print the job in 4 hours. How long does it take for each press to print the job alone?

Answer

Press #1 would take 12 hours, and Press #2 would take 6 hours to do the job alone.

Exercise 18.6.14

Erlinda is having a party and wants to fill her hot tub. If she only uses the red hose it takes 3 hours more than if she only uses the green hose. If she uses both hoses together, the hot tub fills in 2 hours. How long does it take for each hose to fill the hot tub?

Answer

The red hose take 6 hours and the green hose take 3 hours alone.

Access these online resources for additional instruction and practice with solving applications modeled by quadratic equations.

- Word Problems Involving Quadratic Equations
- Quadratic Equation Word Problems
- Applying the Quadratic Formula

Key Concepts

- Methods to Solve Quadratic Equations
  - Factoring
  - Square Root Property
  - Completing the Square
  - Quadratic Formula
- How to use a Problem-Solving Strategy.
  1. **Read** the problem. Make sure all the words and ideas are understood.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose a variable to represent that quantity.
  4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebra equation.
  5. **Solve** the equation using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.
- Area of a Triangle
  - For a triangle with base, b, and height, h, the area, A, is given by the formula $A = \frac{1}{2}bh$.

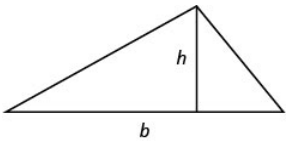

Figure 9.5.1

- Area of a Rectangle
  - For a rectangle with length,L, and width, W, the area, A, is given by the formula $A = LW$.

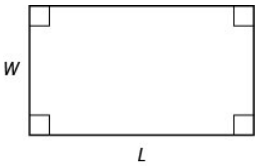

Figure 9.5.3

- Pythagorean Theorem
  - In any right triangle, where a and b are the lengths of the legs, and c is the length of the hypotenuse, $a^2 + b^2 = c^2$.

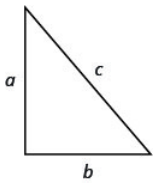

Figure 9.5.16

- Projectile motion
  - The height in feet, h, of an object shot upwards into the air with initial velocity, v_0, after t seconds is given by the formula $h = -16t^2 + v_0 t$.

18.6E: Exercises

Practice Makes Perfect

Exercise $18.6E.15$ Solve Applications Modeled by Quadratic Equations

In the following exercises, solve using any method.

1. The product of two consecutive odd numbers is 255. Find the numbers.
2. The product of two consecutive even numbers is 360. Find the numbers.
3. The product of two consecutive even numbers is 624. Find the numbers.
4. The product of two consecutive odd numbers is $1,023$. Find the numbers.
5. The product of two consecutive odd numbers is 483. Find the numbers.
6. The product of two consecutive even numbers is 528. Find the numbers.

Answer

1. Two consecutive odd numbers whose product is 255 are 15 and 17, and -15 and -17.

3. The first and second consecutive odd numbers are 24 and 26, and -26 and -24.

5. Two consecutive odd numbers whose product is 483 are 21 and 23, and -21 and -23.

Exercise $18.6E.16$ Solve Applications Modeled by Quadratic Equations

In the following exercises, solve using any method. Round your answers to the nearest tenth, if needed.

1. A triangle with area 45 square inches has a height that is two less than four times the base Find the base and height of the triangle.
2. The base of a triangle is six more than twice the height. The area of the triangle is 88 square yards. Find the base and height of the triangle.
3. The area of a triangular flower bed in the park has an area of 120 square feet. The base is 4 feet longer that twice the height. What are the base and height of the triangle?
4. A triangular banner for the basketball championship hangs in the gym. It has an area of 75 square feet. What is the length of the base and height , if the base is two-thirds of the height?
5. The length of a rectangular driveway is five feet more than three times the width. The area is 50 square feet. Find the length and width of the driveway.
6. A rectangular lawn has area 140 square yards. Its length is six yards less than twice its width. What are the length and width of the lawn?
7. A rectangular table for the dining room has a surface area of 24 square feet. The length is two more feet than twice the width of the table. Find the length and width of the table.
8. The new computer has a surface area of 168 square inches. If the the width is 5.5 inches less that the length, what are the dimensions of the computer?
9. The hypotenuse of a right triangle is twice the length of one of its legs. The length of the other leg is three feet. Find the lengths of the three sides of the triangle.
10. The hypotenuse of a right triangle is 10 cm long. One of the triangle's legs is three times as the length of the other leg . Round to the nearest tenth. Find the lengths of the three sides of the triangle.
11. A rectangular garden will be divided into two plots by fencing it on the diagonal. The diagonal distance from one corner of the garden to the opposite corner is five yards longer than the width of the garden. The length of the garden is three times the width. Find the length of the diagonal of the garden.

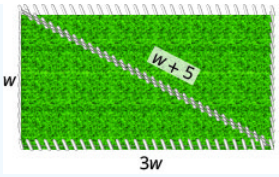

Figure 9.5.44

12. Nautical flags are used to represent letters of the alphabet. The flag for the letter, O consists of a yellow right triangle and a red right triangle which are sewn together along their hypotenuse to form a square. The hypotenuse of the two triangles is three inches longer than a side of the flag. Find the length of the side of the flag.

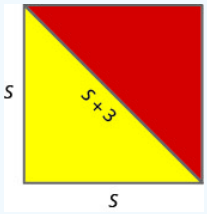

Figure 9.5.45

13. Gerry plans to place a 25-foot ladder against the side of his house to clean his gutters. The bottom of the ladder will be 5 feet from the house.How for up the side of the house will the ladder reach?

14. John has a 10-foot piece of rope that he wants to use to support his 8-foot tree. How far from the base of the tree should he secure the rope?

15. An arrow is shot vertically upward at a rate of $v_0 = 220$ feet per second. Use the projectile formula $h = -16t^2 + v_0 t$, to determine when the height of the arrow will be 400 feet.

16. A firework rocket is shot upward at a rate of 640 ft/sec. Use the projectile formula $h = -16t^2 + v_0 t$ to determine when the height of the firework rocket will be 1200 feet.

17. A bullet is fired straight up from a BB gun with initial velocity 1120 feet per second at an initial height of 8 feet. Use the formula $h = -16t^2 + v_0 t + 8$ to determine how many seconds it will take for the bullet to hit the ground. (That is, when will $h = 0$?)

18. A stone is dropped from a 196-foot platform. Use the formula $h = -16t^2 + v_0 t + 196$ to determine how many seconds it will take for the stone to hit the ground. (Since the stone is dropped, $v_0 = 0$.)

19. The businessman took a small airplane for a quick flight up the coast for a lunch meeting and then returned home. The plane flew a total of 4 hours and each way the trip was 200 miles. What was the speed of the wind that affected the plane which was flying at a speed of 120 mph?

20. The couple took a small airplane for a quick flight up to the wine country for a romantic dinner and then returned home. The plane flew a total of 5 hours and each way the trip was 300 miles. If the plane was flying at 125 mph, what was the speed of the wind that affected the plane?

21. Roy kayaked up the river and then back in a total time of 6 hours. The trip was 4 miles each way and the current was difficult. If Roy kayaked at a speed of 5 mph, what was the speed of the current?

22. Rick paddled up the river, spent the night camping, and then paddled back. He spent 10 hours paddling and the campground was 24 miles away. If Rick kayaked at a speed of 5 mph, what was the speed of the current?

23. Two painters can paint a room in 2 hours if they work together. The less experienced painter takes 3 hours more than the more experienced painter to finish the job. How long does it take for each painter to paint the room individually?

24. Two gardeners can do the weekly yard maintenance in 8 minutes if they work together. The older gardener takes 12 minutes more than the younger gardener to finish the job by himself. How long does it take for each gardener to do the weekly yard maintenance individually?

25. It takes two hours for two machines to manufacture $10,000$ parts. If Machine #1 can do the job alone in one hour less than Machine #2 can do the job, how long does it take for each machine to manufacture $10,000$ parts alone?

26. Sully is having a party and wants to fill his swimming pool. If he only uses his hose it takes 2 hours more than if he only uses his neighbor's hose. If he uses both hoses together, the pool fills in 4 hours. How long does it take for each hose to fill the pool?

Answer

1. The width of the triangle is 5 inches and the height is 18 inches.
3. The base is 24 feet and the height of the triangle is 10 feet.
5. The length of the driveway is 15.0 feet and the width is 3.3 feet.
7. The length of table is 8 feet and the width is 3 feet.
9. The length of the legs of the right triangle are 3.2 and 9.6 cm.
11. The length of the diagonal fencing is 7.3 yards.
13. The ladder will reach 24.5 feet on the side of the house.
15. The arrow will reach 400 feet on its way up in 2.2 seconds and on the way down in 11.6 seconds.
17. The bullet will take 70 seconds to hit the ground.
19. The speed of the wind was 49 mph.
21. The speed of the current was 4.3 mph.
23. The less experienced painter takes 6 hours and the experienced painter takes 3 hours to do the job alone.
25. Machine #1 takes 3.6 hours and Machine #2 takes 4.6 hours to do the job alone.

? Exercise 18.6E. 17 writing exercises

1. Make up a problem involving the product of two consecutive odd integers.
   a. Start by choosing two consecutive odd integers. What are your integers?
   b. What is the product of your integers?
   c. Solve the equation $n(n+2)=p$, where p is the product you found in part (b).
   d. Did you get the numbers you started with?
2. Make up a problem involving the product of two consecutive even integers.
   a. Start by choosing two consecutive even integers. What are your integers?
   b. What is the product of your integers?
   c. Solve the equation $n(n+2)=p$, where p is the product you found in part (b).
   d. Did you get the numbers you started with?

Answer

1. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve applications of the quadratic formula.			

Figure 9.5.46

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

18.7: Review Exercises

Chapter Review Exercises

Solve Quadratic Equations Using the Square Root Property

Exercise 18.7.1 Solve Quadratic Equations of the Form $ax^2 = k$ Using the Square Root Property

In the following exercises, solve using the Square Root Property.

1. $y^2 = 144$
2. $n^2 - 80 = 0$
3. $4a^2 = 100$
4. $2b^2 = 72$
5. $r^2 + 32 = 0$
6. $t^2 + 18 = 0$
7. $\frac{2}{3}w^2 - 20 = 30$
8. $5c^2 + 3 = 19$

Answer

1. $y = \pm 12$
3. $a = \pm 5$
5. $r = \pm 4\sqrt{2}i$
7. $w = \pm 5\sqrt{3}$

Exercise 18.7.2 Solve Quadratic Equations of the Form $a(x-h)^2 = k$ Using the Square Root Property

In the following exercises, solve using the Square Root Property.

1. $(p-5)^2 + 3 = 19$
2. $(u+1)^2 = 45$
3. $\left(x - \frac{1}{4}\right)^2 = \frac{3}{16}$
4. $\left(y - \frac{2}{3}\right)^2 = \frac{2}{9}$
5. $(n-4)^2 - 50 = 150$
6. $(4c-1)^2 = -18$
7. $n^2 + 10n + 25 = 12$
8. $64a^2 + 48a + 9 = 81$

Answer

1. $p = -1, 9$
3. $x = \frac{1}{4} \pm \frac{\sqrt{3}}{4}$
5. $n = 4 \pm 10\sqrt{2}$
7. $n = -5 \pm 2\sqrt{3}$

Solve Quadratic Equations by Completing the Square

Exercise 18.7.3 Solve Quadratic Equations Using Completing the Square

In the following exercises, complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

1. $x^2 + 22x$

2. $m^2 - 8m$
3. $a^2 - 3a$
4. $b^2 + 13b$

Answer

1. $(x+11)^2$
3. $\left(a - \frac{3}{2}\right)^2$

Exercise 18.7.4 Solve Quadratic Equations Using Completing the Square

In the following exercises, solve by completing the square.

1. $d^2 + 14d = -13$
2. $y^2 - 6y = 36$
3. $m^2 + 6m = -109$
4. $t^2 - 12t = -40$
5. $v^2 - 14v = -31$
6. $w^2 - 20w = 100$
7. $m^2 + 10m - 4 = -13$
8. $n^2 - 6n + 11 = 34$
9. $a^2 = 3a + 8$
10. $b^2 = 11b - 5$
11. $(u+8)(u+4) = 14$
12. $(z-10)(z+2) = 28$

Answer

1. $d = -13, -1$
3. $m = -3 \pm 10i$
5. $v = 7 \pm 3\sqrt{2}$
7. $m = -9, -1$
9. $a = \frac{3}{2} \pm \frac{\sqrt{41}}{2}$
11. $u = -6 \pm 2\sqrt{2}$

Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

Exercise 18.7.5 Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

In the following exercises, solve by completing the square.

1. $3p^2 - 18p + 15 = 15$
2. $5q^2 + 70q + 20 = 0$
3. $4y^2 - 6y = 4$
4. $2x^2 + 2x = 4$
5. $3c^2 + 2c = 9$
6. $4d^2 - 2d = 8$
7. $2x^2 + 6x = -5$
8. $2x^2 + 4x = -5$

Answer

1. $p = 0, 6$

3. $y = -\frac{1}{2}, 2$

5. $c = -\frac{1}{3} \pm \frac{2\sqrt{7}}{3}$

7. $x = \frac{3}{2} \pm \frac{1}{2}i$

Exercise 18.7.6 Solve Quadratic Equations Using the Quadratic Formula

In the following exercises, solve by using the Quadratic Formula.

1. $4x^2 - 5x + 1 = 0$
2. $7y^2 + 4y - 3 = 0$
3. $r^2 - r - 42 = 0$
4. $t^2 + 13t + 22 = 0$
5. $4v^2 + v - 5 = 0$
6. $2w^2 + 9w + 2 = 0$
7. $3m^2 + 8m + 2 = 0$
8. $5n^2 + 2n - 1 = 0$
9. $6a^2 - 5a + 2 = 0$
10. $4b^2 - b + 8 = 0$
11. $u(u - 10) + 3 = 0$
12. $5z(z - 2) = 3$
13. $\frac{1}{8}p^2 - \frac{1}{5}p = -\frac{1}{20}$
14. $\frac{2}{5}q^2 + \frac{3}{10}q = \frac{1}{10}$
15. $4c^2 + 4c + 1 = 0$
16. $9d^2 - 12d = -4$

Answer

1. $x = \frac{1}{4}, 1$

3. $r = -6, 7$

5. $v = \frac{-1 \pm \sqrt{21}}{8}$

7. $m = \frac{-4 \pm \sqrt{10}}{3}$

9. $a = \frac{5}{12} \pm \frac{\sqrt{23}}{12}i$

11. $u = 5 \pm \sqrt{21}$

13. $p = \frac{4 \pm \sqrt{5}}{5}$

15. $c = -\frac{1}{2}$

Exercise 18.7.7 Use the Discriminant to Predict the Number of Solutions of a Quadratic Equation

In the following exercises, determine the number of solutions for each quadratic equation.

1. a. $9x^2 - 6x + 1 = 0$
   b. $3y^2 - 8y + 1 = 0$
   c. $7m^2 + 12m + 4 = 0$
   d. $5n^2 - n + 1 = 0$
2. a. $5x^2 - 7x - 8 = 0$
   b. $7x^2 - 10x + 5 = 0$
   c. $25x^2 - 90x + 81 = 0$
   d. $15x^2 - 8x + 4 = 0$

Answer

1.

a. 1
b. 2
c. 2
d. 2

Exercise 18.7.8 Identify the Most Appropriate Method to Use to Solve a Quadratic Equation

In the following exercises, identify the most appropriate method (Factoring, Square Root, or Quadratic Formula) to use to solve each quadratic equation. Do not solve.

1. a. $16r^2-8r+1=0$
   b. $5t^2-8t+3=9$
   c. $3(c+2)^2=15$
2. a. $4d^2+10d-5=21$
   b. $25x^2-60x+36=0$
   c. $6(5v-7)^2=150$

Answer

1.

a. Factor
b. Quadratic Formula
c. Square Root

Solve Equations in Quadratic Form

Exercise 18.7.9 Solve Equations in Quadratic Form

In the following exercises, solve.

1. $x^4-14x^2+24=0$
2. $x^4+4x^2-32=0$
3. $4x^4-5x^2+1=0$
4. $(2y+3)^2+3(2y+3)-28=0$
5. $x+3\sqrt{x}-28=0$
6. $6x+5\sqrt{x}-6=0$
7. $x^{\frac{2}{3}}-10x^{\frac{1}{3}}+24=0$
8. $x+7x^{\frac{1}{2}}+6=0$
9. $8x^{-2}-2x^{-1}-3=0$

Answer

1. $x=\pm\sqrt{2}, x=\pm 2\sqrt{3}$
3. $x=\pm 1, x=\pm\frac{1}{2}$
5. $x=16$
7. $x=64, x=216$
9. $x=-2, x=\frac{4}{3}$

Exercise 18.7.10 Solve Applications Modeled by Quadratic Equations

In the following exercises, solve by using the method of factoring, the square root principle, or the Quadratic Formula. Round your answers to the nearest tenth, if needed.

1. Find two consecutive odd numbers whose product is 323.
2. Find two consecutive even numbers whose product is 624.
3. A triangular banner has an area of 351 square centimeters. The length of the base is two centimeters longer than four times the height. Find the height and length of the base.
4. Julius built a triangular display case for his coin collection. The height of the display case is six inches less than twice the width of the base. The area of the of the back of the case is 70 square inches. Find the height and width of the case.
5. A tile mosaic in the shape of a right triangle is used as the corner of a rectangular pathway. The hypotenuse of the mosaic is 5 feet. One side of the mosaic is twice as long as the other side. What are the lengths of the sides? Round to the nearest tenth.

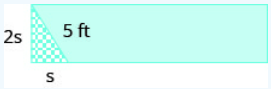

Figure 9.E.1

6. A rectangular piece of plywood has a diagonal which measures two feet more than the width. The length of the plywood is twice the width. What is the length of the plywood's diagonal? Round to the nearest tenth.

7. The front walk from the street to Pam's house has an area of 250 square feet. Its length is two less than four times its width. Find the length and width of the sidewalk. Round to the nearest tenth.

8. For Sophia's graduation party, several tables of the same width will be arranged end to end to give serving table with a total area of 75 square feet. The total length of the tables will be two more than three times the width. Find the length and width of the serving table so Sophia can purchase the correct size tablecloth . Round answer to the nearest tenth.

9. A ball is thrown vertically in the air with a velocity of 160 ft/sec. Use the formula $h = -16t^2 + v_0 t$ to determine when the ball will be 384 feet from the ground. Round to the nearest tenth.

10. The couple took a small airplane for a quick flight up to the wine country for a romantic dinner and then returned home. The plane flew a total of 5 hours and each way the trip was 360 miles. If the plane was flying at 150 mph, what was the speed of the wind that affected the plane?

11. Ezra kayaked up the river and then back in a total time of 6 hours. The trip was 4 miles each way and the current was difficult. If Roy kayaked at a speed of 5 mph, what was the speed of the current?

12. Two handymen can do a home repair in 2 hours if they work together. One of the men takes 3 hours more than the other man to finish the job by himself. How long does it take for each handyman to do the home repair individually?

Answer

2. Two consecutive even numbers whose product is 624 are 24 and 26, and -24 and -26.

4. The height is 14 inches and the width is 10 inches.

6. The length of the diagonal is 3.6 feet.

8. The width of the serving table is 4.7 feet and the length is 16.1 feet.

Figure 9.E.2

10. The speed of the wind was 30 mph.

12. One man takes 3 hours and the other man 6 hours to finish the repair alone.

Graph Quadratic Functions Using Properties

Exercise 18.7.11 Recognize the Graph of a Quadratic Function

In the following exercises, graph by plotting point.

1. Graph $y = x^2 - 2$
2. Graph $y = -x^2 + 3$

Answer

2.

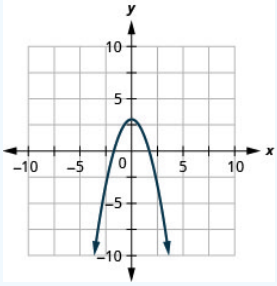

Figure 9.E.3

Exercise 18.7.12 Recognize the Graph of a Quadratic Function

In the following exercises, determine if the following parabolas open up or down.

1. a. $y = -3x^2 + 3x - 1$
   b. $y = 5x^2 + 6x + 3$
2. a. $y = x^2 + 8x - 1$
   b. $y = -4x^2 - 7x + 1$

Answer

2.

a. Up
b. Down

Exercise 18.7.13 Find the Axis of Symmetry and Vertex of a Parabola

In the following exercises, find

a. The equation of the axis of symmetry
b. The vertex

1. $y = -x^2 + 6x + 8$
2. $y = 2x^2 - 8x + 1$

Answer

2. $x = 2$; $(2, -7)$

Exercise 18.7.14 Find the Intercepts of a Parabola

In the following exercises, find the x- and y-intercepts.

1. $y = x^2 - 4x + 5$

2. $y = x^2 - 8x + 15$
3. $y = x^2 - 4x + 10$
4. $y = -5x^2 - 30x - 46$
5. $y = 16x^2 - 8x + 1$
6. $y = x^2 + 16x + 64$

Answer

2. $y : (0, 15)$
   $x : (3, 0), (5, 0)$
4. $y : (0, -46)$
   $x :$ none
6. $y : (0, -64)$
   $x : (-8, 0)$

Graph Quadratic Functions Using Properties

Exercise 18.7.15 Graph Quadratic Functions Using Properties

In the following exercises, graph by using its properties.

1. $y = x^2 + 8x + 15$
2. $y = x^2 - 2x - 3$
3. $y = -x^2 + 8x - 16$
4. $y = 4x^2 - 4x + 1$
5. $y = x^2 + 6x + 13$
6. $y = -2x^2 - 8x - 12$

Answer

2.

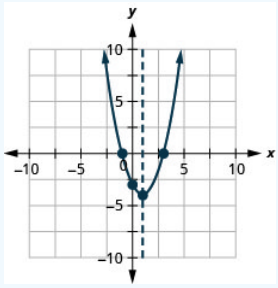

Figure 9.E.4

4.

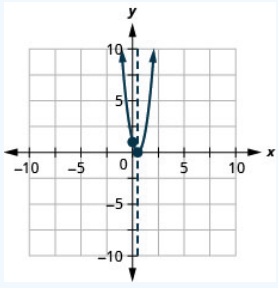

Figure 9.E.5

6.

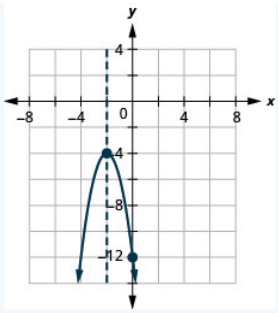

Figure 9.E.6

Exercise 18.7.16 Solve Maximum and Minimum Applications

In the following exercises, find the minimum or maximum value.

1. $y = 7x^2 + 14x + 6$
2. $y = -3x^2 + 12x - 10$

Answer

2. The maximum value is 2 when $x = 2$.

Exercise 18.7.17 Solve Maximum and Minimum Applications

In the following exercises, solve. Rounding answers to the nearest tenth.

1. A ball is thrown upward from the ground with an initial velocity of 112 ft/sec. Use the quadratic equation $h = -16t^2 + 112t$ to find how long it will take the ball to reach maximum height, and then find the maximum height.
2. A daycare facility is enclosing a rectangular area along the side of their building for the children to play outdoors. They need to maximize the area using 180 feet of fencing on three sides of the yard. The quadratic equation $A = -2x^2 + 180x$ gives the area, A, of the yard for the length, x, of the building that will border the yard. Find the length of the building that should border the yard to maximize the area, and then find the maximum area.

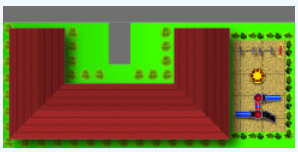

Figure 9.E.7

Answer

2. The length adjacent to the building is 90 feet giving a maximum area of $4,050$ square feet.

Graph Quadratic Functions Using Transformations

Exercise 18.7.18 Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using a vertical shift.

1. $g(x) = x^2 + 4$
2. $h(x) = x^2 - 3$

Answer

2.

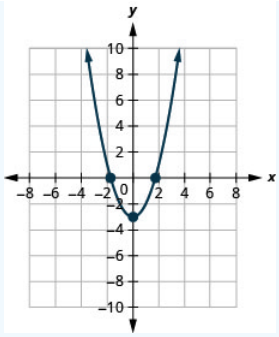

Figure 9.E.8

Exercise 18.7.19 Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using a horizontal shift.

1. $f(x) = (x+1)^2$
2. $g(x) = (x-3)^2$

Answer

2.

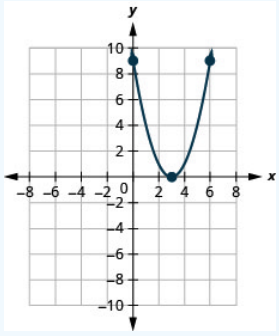

Figure 9.E.9

Exercise 18.7.20 Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using transformations.

1. $f(x) = (x+2)^2 + 3$
2. $f(x) = (x+3)^2 - 2$
3. $f(x) = (x-1)^2 + 4$
4. $f(x) = (x-4)^2 - 3$

Answer

2.

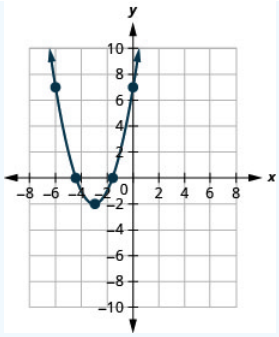

Figure 9.E.10

4.

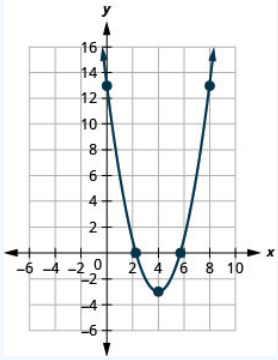

Figure 9.E.11

Exercise 18.7.21 Graph Quadratic Functions of the Form $f(x) = ax^2$

In the following exercises, graph each function.

1. $f(x) = 2x^2$
2. $f(x) = -x^2$
3. $f(x) = \frac{1}{2}x^2$

Answer

2.

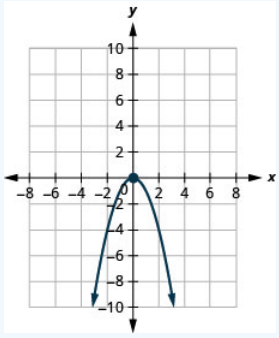

Figure 9.E.12

Exercise 18.7.22 Graph Quadratic Functions Using Transformations

In the following exercises, rewrite each function in the $f(x) = a(x-h)^2 + k$ form by completing the square.

1. $f(x) = 2x^2 - 4x - 4$

2. $f(x) = 3x^2 + 12x + 8$

Answer

1. $f(x) = 2(x-1)^2 - 6$

Exercise 18.7.23 Graph Quadratic Functions Using Transformations

In the following exercises,

a. Rewrite each function in $f(x) = a(x-h)^2 + k$ form
b. Graph it by using transformations

1. $f(x) = 3x^2 - 6x - 1$
2. $f(x) = -2x^2 - 12x - 5$
3. $f(x) = 2x^2 + 4x + 6$
4. $f(x) = 3x^2 - 12x + 7$

Answer

1.

a. $f(x) = 3(x-1)^2 - 4$
b.

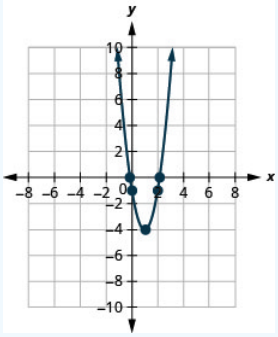

Figure 9.E.13

3.

a. $f(x) = 2(x+1)^2 + 4$
b.

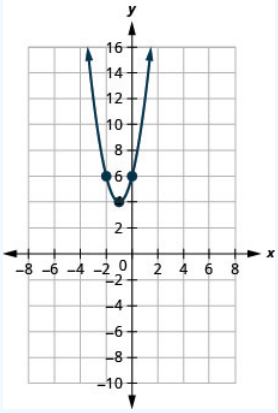

Figure 9.E.14

Exercise 18.7.24 Graph Quadratic Functions Using Transformations

In the following exercises,

a. Rewrite each function in $f(x) = a(x-h)^2 + k$ form
b. Graph it using properties
   1. $f(x) = -3x^2 - 12x - 5$
   2. $f(x) = 2x^2 - 12x + 7$

Answer

1.

a. $f(x) = -3(x+2)^2 + 7$
b.

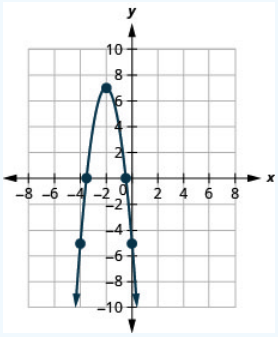

Figure 9.E.15

Exercise 18.7.25 Find a Quadratic Function From its Graph

In the following exercises, write the quadratic function in $f(x) = a(x-h)^2 + k$ form.

1.

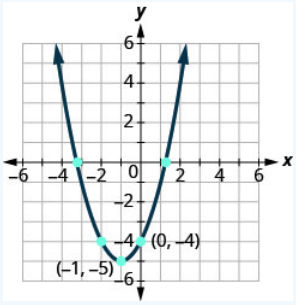

Figure 9.E.16

2.

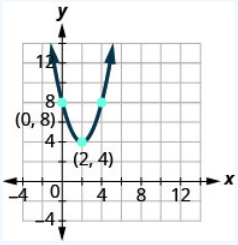

Figure 9.E.17

Answer

1. $f(x) = (x+1)^2 - 5$

Exercise 18.7.26 Solve Quadratic Inequalities Graphically

In the following exercises, solve graphically and write the solution in interval notation.

1. $x^2 - x - 6 > 0$
2. $x^2 + 4x + 3 \leq 0$
3. $-x^2 - x + 2 \geq 0$
4. $-x^2 + 2x + 3 < 0$

Answer

1.

a.

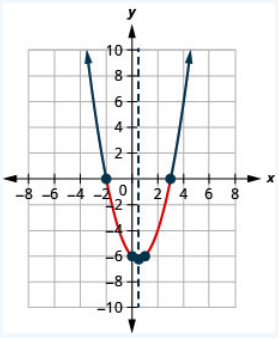

Figure 9.E.18

b. $(-\infty, -2) \cup (3, \infty)$

3.

a.

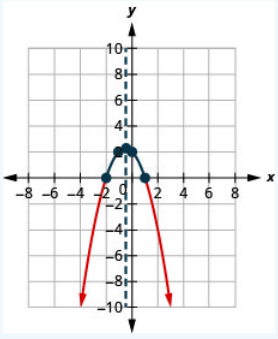

Figure 9.E.19

b. $[-2, 1]$

Exercise 18.7.27 Solve Quadratic Inequalities Graphically

In the following exercises, solve each inequality algebraically and write any solution in interval notation.

1. $x^2 - 6x + 8 < 0$
2. $x^2 + x > 12$
3. $x^2 - 6x + 4 \leq 0$
4. $2x^2 + 7x - 4 > 0$
5. $-x^2 + x - 6 > 0$
6. $x^2 - 2x + 4 \geq 0$

Answer

1. $(2, 4)$
3. $[3-\sqrt{5}, 3+\sqrt{5}]$
5. no solution

Practice Test

Exercise 18.7.28

1. Use the Square Root Property to solve the quadratic equation $3(w+5)^2 = 27$.
2. Use Completing the Square to solve the quadratic equation $a^2 - 8a + 7 = 23$.
3. Use the Quadratic Formula to solve the quadratic equation $2m^2 - 5m + 3 = 0$.

Answer

1. $w = -2, w = -8$
3. $m = 1, m = \frac{3}{2}$

Exercise 18.7.29

Solve the following quadratic equations. Use any method.

1. $2x(3x-2) - 1 = 0$
2. $\frac{9}{4}y^2 - 3y + 1 = 0$

Answer

2. $y = \frac{2}{3}$

Exercise 18.7.30

Use the discriminant to determine the number and type of solutions of each quadratic equation.

1. $6p^2 - 13p + 7 = 0$
2. $3q^2 - 10q + 12 = 0$

Answer

2. 2 complex

Exercise 18.7.31

Solve each equation.

1. $4x^4 - 17x^2 + 4 = 0$
2. $y^{\frac{2}{3}} + 2y^{\frac{1}{3}} - 3 = 0$

Answer

2. $y = 1, y = -27$

Exercise 18.7.32

For each parabola, find

a. Which direction it opens
b. The equation of the axis of symmetry

c. The vertex
d. The x-and y-intercepts
e. The maximum or minimum value

1. $y = 3x^2 + 6x + 8$
2. $y = -x^2 - 8x + 16$

Answer

2.

a. down
b. $x = -4$
c. $(-4, 0)$
d. $y : (0, 16); x : (-4, 0)$
e. minimum value of -4 when $x = 0$

Exercise 18.7.33

Graph each quadratic function using intercepts, the vertex, and the equation of the axis of symmetry.

1. $f(x) = x^2 + 6x + 9$
2. $f(x) = -2x^2 + 8x + 4$

Answer

2.

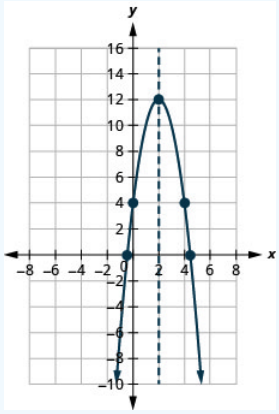

Figure 9.E.20

Exercise 18.7.34

In the following exercises, graph each function using transformations.

1. $f(x) = (x + 3)^2 + 2$
2. $f(x) = x^2 - 4x - 1$

Answer

2.

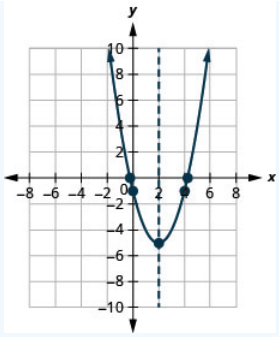

Figure 9.E.21

Exercise 18.7.35

In the following exercises, solve each inequality algebraically and write any solution in interval notation.

1. $x^2 - 6x - 8 \leq 0$
2. $2x^2 + x - 10 > 0$

Answer

2. $\left(-\infty, -\frac{5}{2}\right) \cup (2, \infty)$

Exercise 18.7.36

Model the situation with a quadratic equation and solve by any method.

1. Find two consecutive even numbers whose product is 360.
2. The length of a diagonal of a rectangle is three more than the width. The length of the rectangle is three times the width. Find the length of the diagonal. (Round to the nearest tenth.)

Answer

2. A water balloon is launched upward at the rate of 86 ft/sec. Using the formula $h = -16t^2 + 86t$ find how long it will take the balloon to reach the maximum height, and then find the maximum height. Round to the nearest tenth.

19.1: Review- Solve Linear Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Graph inequalities on the number line
- Solve linear inequalities
- Translate words to an inequality and solve
- Solve applications with linear inequalities

Before you get started, take this readiness quiz.

1. Translate from algebra to English: $15 > x$.
   If you missed this problem, review [link].
2. Translate to an algebraic expression: 15 is less than x.
   If you missed this problem, review [link].

Graph Inequalities on the Number Line

What number would make the inequality $x > 3$ true? Are you thinking, "x could be four"? That's correct, but x could be 6, too, or 37, or even 3.001. Any number greater than three is a solution to the inequality $x > 3$. We show all the solutions to the inequality $x > 3$ on the number line by shading in all the numbers to the right of three, to show that all numbers greater than three are solutions. Because the number three itself is not a solution, we put an open parenthesis at three.

We can also represent inequalities using **interval notation**. There is no upper end to the solution to this inequality. In interval notation, we express $x > 3$ as $(3, \infty)$. The symbol ∞ is read as "**infinity**." It is not an actual number. Figure $19.1.1$shows both the number line and the interval notation.

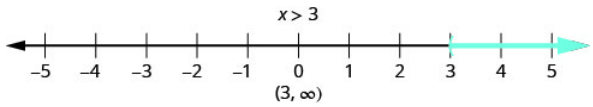

Figure 19.1.1: The inequality $x > 3$ is graphed on this number line and written in interval notation.

We use the left parenthesis symbol, (, to show that the endpoint of the inequality is not included. The left bracket symbol, [, shows that the endpoint is included.

The inequality $x \leq 1$ means all numbers less than or equal to one. Here we need to show that one is a solution, too. We do that by putting a bracket at $x = 1$. We then shade in all the numbers to the left of one, to show that all numbers less than one are solutions (Figure $19.1.2$). There is no lower end to those numbers. We write $x \leq 1 x \leq 1$ in interval notation as $(-\infty, 1]$. The symbol $-\infty$ is read as "negative infinity."

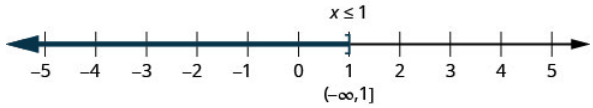

Figure 19.1.2: The inequality $x \leq 1$ is graphed on this number line and written in interval notation.

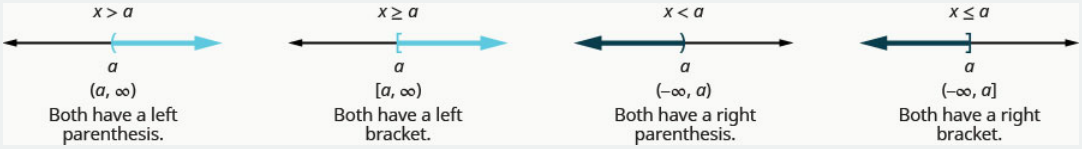
Figure $19.1.3$shows both the number line and interval notation.

INEQUALITIES, NUMBER LINES, AND INTERVAL NOTATION



The notation for inequalities on a number line and in interval notation use the same symbols to express the endpoints of intervals.

Example 19.1.1

Graph each inequality on the number line and write in interval notation.

a. $x \geq -3$
b. $x < 2.5$
c. $x \leq -\frac{3}{5}$

Answer

ⓐ

	$x \geq -3$
Shade to the right of -3, and put a bracket at -3.	
Write in interval notation.	$[-3, \infty)$

ⓑ

	$x < 2.5$
Shade to the left of 2.5 and put a parenthesis at 2.5.	
Write in interval notation.	$(-\infty, 2.5)$

ⓒ

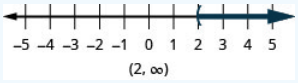
	$x \leq -\frac{3}{5}$
Shade to the left of $-\frac{3}{5}$, and put a bracket at $-\frac{3}{5}$.	
Write in interval notation.	$\left(-\infty, \frac{3}{5}\right]$

Graph each inequality on the number line and write in interval notation:

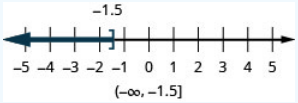
a. $x > 2$
b. $x \leq -1.5$
c. $x \geq \frac{3}{4}$.

Answer

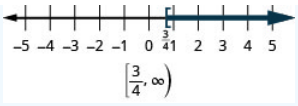
ⓐ



ⓑ



ⓒ



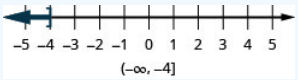
Example 19.1.3

Graph each inequality on the number line and write in interval notation:

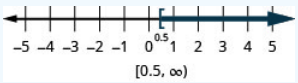
a. $x \leq -4$
b. $x \geq 0.5$
c. $x < -\frac{2}{3}$.

Answer

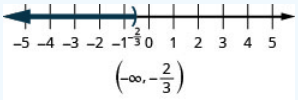
ⓐ



ⓑ



ⓒ



What numbers are greater than two but less than five? Are you thinking say, 2.5, 3, $3\frac{2}{3}$, 4, 4, 99? We can represent all the numbers between two and five with the inequality $2 < x < 5$. We can show $2 < x < 5$ on the number line by shading all the numbers between two and five. Again, we use the parentheses to show the numbers two and five are not included. See Figure.

The interval notation would be (2, 5).

Figure 19.1.3

Graph each inequality on the number line and write in interval notation.

ⓐ $-3 < x < 4$ ⓑ $-6 \leq x < -1$ ⓒ $0 \leq x \leq 2.5$

Answer

ⓐ

		$-3 < x < 4$
Shade between -3 and 4. Put a parentheses at -3 and 4.		
Write in interval notation.		$(-3, 4)$

ⓑ

			$-6 \leq x < -1$

Shade between -6 and -1. Put a bracket at -6, and a parenthesis at -1.			
Write in interval notation.			$[-6, 1)$

ⓒ

			$0 \leq x \leq 2.5$
Shade between 0 and 2.5. Put a bracket at 0 and at 2.5.			
Write in interval notation.			$[0, 2.5]$

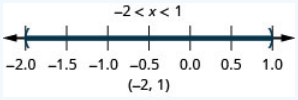
Example 19.1.5

Graph each inequality on the number line and write in interval notation:

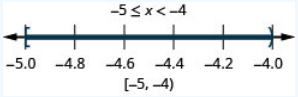
ⓐ $-2 < x < 1$ ⓑ $-5 \leq x < -4$ ⓒ $1 \leq x \leq 4.25$

Answer

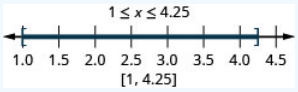
ⓐ



ⓑ



ⓒ



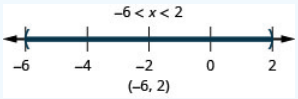
Example 19.1.6

Graph each inequality on the number line and write in interval notation:

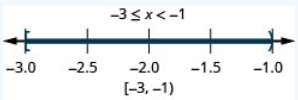
ⓐ $-6 < x < 2$ ⓑ $-3 \leq x < -1$ ⓒ $2.5 \leq x \leq 6$

Answer

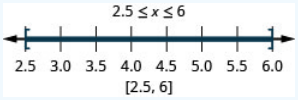
ⓐ



ⓑ



ⓒ



Solve Linear Inequalities

A linear inequality is much like a linear equation—but the equal sign is replaced with an inequality sign. A **linear inequality** is an inequality in one variable that can be written in one of the forms, $ax+b<c$, $ax+b\leq c$, $ax+b>c$, or $ax+b\geq c$.

LINEAR INEQUALITY

A linear inequality is an inequality in one variable that can be written in one of the following forms where a, b, and c are real numbers and $a\neq 0$:

$$ax+b<c,\quad ax+b\leq c,\quad ax+b>c,\quad ax+b\geq c.$$

When we solved linear equations, we were able to use the properties of equality to add, subtract, multiply, or divide both sides and still keep the equality. Similar properties hold true for inequalities.

We can add or subtract the same quantity from both sides of an inequality and still keep the inequality. For example:

$$\begin{array}{ll} -4<2 & -4<2 \\ -4-5<2-5 & -4+7<2+7 \\ -9<-3 \text{ True} & 3<9 \text{ True} \end{array}$$

Notice that the inequality sign stayed the same.

This leads us to the Addition and Subtraction Properties of Inequality.

ADDITION AND SUBTRACTION PROPERTY OF INEQUALITY

For any numbers a, b, and c, if $a<b$, then

$$\begin{array}{ll} a+c<b+c & a-c<b-c \\ a+c>b+c & a-c>b-c \end{array}$$

We can add or subtract the same quantity from both sides of an inequality and still keep the inequality

What happens to an inequality when we divide or multiply both sides by a constant?

Let's first multiply and divide both sides by a positive number.

$$\begin{array}{ll} 10<15 & 10<15 \\ 10(5)<15(5) & \frac{10}{5}<\frac{15}{5} \\ 50<75 \text{ True} & 2<3 \text{ True} \end{array}$$

The inequality signs stayed the same.

Does the inequality stay the same when we divide or multiply by a negative number?

$$\begin{array}{ll} 10<15 & 10<15 \\ 10(-5)\ ?\ 15(-5) & \frac{10}{-5}\ ?\ \frac{15}{-5} \\ -50\ ?\ -75 & -2\ ?\ -3 \\ -50>-75 & -2>-3 \end{array}$$

Notice that when we filled in the inequality signs, the inequality signs reversed their direction.

When we divide or multiply an inequality by a positive number, the inequality sign stays the same. When we divide or multiply an inequality by a negative number, the inequality sign reverses.

This gives us the Multiplication and Division Property of Inequality.

MULTIPLICATION AND DIVISION PROPERTY OF INEQUALITY

For any numbers a, b, and c,

multiply or divide by a positive

if $a<b$ and $c>0$, then $ac<bc$ and $\frac{a}{c}<\frac{b}{c}$.
if $a>b$ and $c>0$, then $ac>bc$ and $\frac{a}{c}>\frac{b}{c}$.

multiply or divide by a negative

if $a<b$ and $c<0$, then $ac>bc$ and $\frac{a}{c}>\frac{b}{c}$.
if $a>b$ and $c<0$, then $ac<bc$ and $\frac{a}{c}<\frac{b}{c}$.

When we divide or multiply an inequality by a:

- positive number, the inequality stays the same.
- negative number, the inequality reverses.

Sometimes when solving an inequality, as in the next example, the variable ends upon the right. We can rewrite the inequality in reverse to get the variable to the left.

$$x>a \text{ has the same meaning as } a<x$$

Think about it as "If Xander is taller than Andy, then Andy is shorter than Xander."

Example 19.1.7

Solve each inequality. Graph the solution on the number line, and write the solution in interval notation.

ⓐ $x-\frac{3}{8}\leq\frac{3}{4}$ ⓑ $9y<54$ ⓒ $-15<\frac{3}{5}z$

Answer

ⓐ

	$x-\frac{3}{8}\leq\frac{3}{4}$
Add 3838 to both sides of the inequality.	$x-\frac{3}{8}+\frac{3}{8}\leq\frac{3}{4}+\frac{3}{8}$
Simplify.	$x\leq\frac{9}{8}$
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty,\frac{9}{8}]$

ⓑ

	$9y<54$
Divide both sides of the inequality by 9; since 9 is positive, the inequality stays the same.	$\frac{9y}{9}<\frac{54}{9}$
Simplify.	$y<6$

Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty, 6)$

ⓒ

	$-15 < \frac{3}{5}z$
Multiply both sides of the inequality by $\frac{5}{3}$. Since $\frac{5}{3}$ is positive, the inequality stays the same.	$\frac{5}{3}(-15) < \frac{5}{3}\left(\frac{3}{5}z\right)$
Simplify.	$-25 < z$
Rewrite with the variable on the left.	$z > -25$
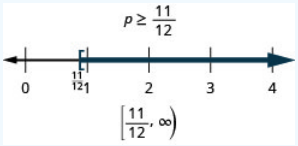
Graph the solution on the number line.	Write the solution in interval notation.	$(-25, \infty)$

Solve each inequality, graph the solution on the number line, and write the solution in interval notation:

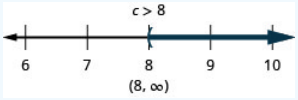
ⓐ $p - \frac{3}{4} \geq \frac{1}{6}$ ⓑ $9c > 72$ ⓒ $24 \leq \frac{3}{8}m$

Answer

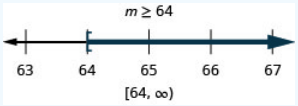
ⓐ



ⓑ



ⓒ



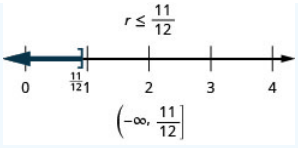
Example 19.1.9

Solve each inequality, graph the solution on the number line, and write the solution in interval notation:

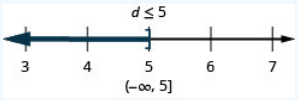
ⓐ $r - \frac{1}{3} \leq \frac{7}{12}$ ⓑ $12d \leq 60$ ⓒ $-24 < \frac{4}{3}n$

Answer

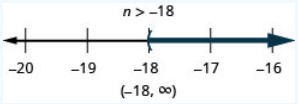
ⓐ



ⓑ



ⓒ



Be careful when you multiply or divide by a negative number—remember to reverse the inequality sign.

Example 19.1.10

Solve each inequality, graph the solution on the number line, and write the solution in interval notation.

ⓐ $-\frac{1}{3}m \ge \frac{6}{5}$ ⓑ $\frac{n}{-2} \ge 8$

Answer

ⓐ

	$-13m \ge 65$
Divide both sides of the inequality by $-\frac{1}{3}$. Since $-\frac{1}{3}$ is a negative, the inequality reverses.	$\frac{-13m}{-13} \le \frac{65}{-13}$
Simplify.	$m \le -5$
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty, -5]$

ⓑ

	$\frac{n}{-2} \ge 8$
Multiply both sides of the inequality by -2. Since -2 is a negative, the inequality reverses.	$-2\left(\frac{n}{-2}\right) \le -2(8)$
Simplify.	$n \le -16$
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty, -16]$

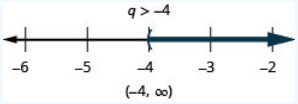
Example 19.1.11

Solve each inequality, graph the solution on the number line, and write the solution in interval notation:

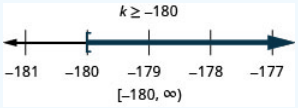
ⓐ $-8q < 32$ ⓑ $\frac{k}{-12} \le 15$.

Answer

ⓐ



ⓑ



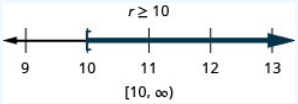
Example 19.1.12

Solve each inequality, graph the solution on the number line, and write the solution in interval notation:

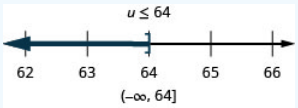
ⓐ $-7r \leq -70$ ⓑ $\frac{u}{-4} \geq -16$.

Answer

ⓐ



ⓑ



Most inequalities will take more than one step to solve. We follow the same steps we used in the general strategy for solving linear equations, but make sure to pay close attention when we multiply or divide to isolate the variable.

Solve the inequality $6y \leq 11y + 17$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$6y \leq 11y + 17$
Subtract 11y11y from both sides to collect the variables on the left.	$6y - 11y \leq 11y - 11y + 17$
Simplify.	$-5y \leq 17$
Divide both sides of the inequality by $-5,-5$, and reverse the inequality.	$\frac{-5y}{-5} \geq \frac{17}{-5}$
Simplify.	$y \geq \frac{17}{-5}$
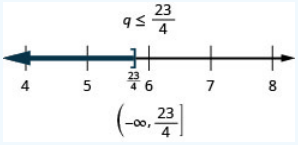
Graph the solution on the number line.	Write the solution in interval notation.	$\left[-\frac{17}{5}, \infty\right)$

Solve the inequality, graph the solution on the number line, and write the solution in interval notation: $3q \geq 7q - 23$.

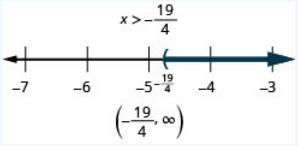
Answer



Example 19.1.15

Solve the inequality, graph the solution on the number line, and write the solution in interval notation: $6x < 10x + 19$.

Answer



When solving inequalities, it is usually easiest to collect the variables on the side where the coefficient of the variable is largest. This eliminates negative coefficients and so we don't have to multiply or divide by a negative—which means we don't have to remember to reverse the inequality sign.

Example 19.1.16

Solve the inequality $8p + 3(p - 12) > 7p - 28$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$8p + 3(p - 12) > 7p - 28$
Simplify each side as much as possible.	
Distribute.	$8p + 3p - 36 > 7p - 28$
Combine like terms.	$11p - 36 > 7p - 28$
Subtract $7p$ from both sides to collect the variables on the left, since $11 > 7$.	$11p - 36 - 7p > 7p - 28 - 7p$
Simplify.	$4p - 36 > -28$
Add 36 to both sides to collect the constants on the right.	$4p - 36 + 36 > -28 + 36$
Simplify.	$4p > 8$
Divide both sides of the inequality by 4; the inequality stays the same.	$\frac{4p}{4} > \frac{8}{4}$
Simplify.	$p > 2$
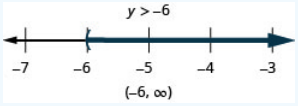
Graph the solution on the number line.	Write the solution in interval notation.	$(2, \infty)$

Example 19.1.17

Solve the inequality $9y+2(y+6)>5y-24$, graph the solution on the number line, and write the solution in interval notation.

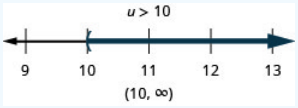
Answer



Example 19.1.18

Solve the inequality $6u+8(u-1)>10u+32$, graph the solution on the number line, and write the solution in interval notation.

Answer



Just like some equations are identities and some are contradictions, inequalities may be identities or contradictions, too. We recognize these forms when we are left with only constants as we solve the inequality. If the result is a true statement, we have an identity. If the result is a false statement, we have a contradiction.

Example 19.1.19

Solve the inequality $8x-2(5-x)<4(x+9)+6x$, graph the solution on the number line, and write the solution in interval notation.

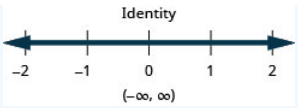
Answer

Simplify each side as much as possible.		$8x-2(5-x)<4(x+9)+6x$
Distribute.		$8x-10+2x<4x+36+6x$
Combine like terms.		$10x-10<10x+36$
Subtract $10x$ from both sides to collect the variables on the left.		$10x-10-10x<10x+36-10x$
Simplify.		$-10<36$
The x's are gone, and we have a true statement.		The inequality is an identity. The solution is all real numbers.
Graph the solution on the number line.		
Write the solution in interval notation.		$(-\infty,\infty)$

Example 19.1.20

Solve the inequality $4b-3(3-b)>5(b-6)+2b$, graph the solution on the number line, and write the solution in interval notation.

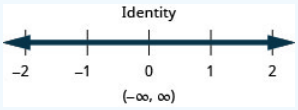
Answer



Example 19.1.21

Solve the inequality $9h-7(2-h)<8(h+11)+8h$, graph the solution on the number line, and write the solution in interval notation.

Answer



We can clear fractions in inequalities much as we did in equations. Again, be careful with the signs when multiplying or dividing by a negative.

Example 19.1.22

Solve the inequality $\frac{1}{3}a-\frac{1}{8}a>\frac{5}{24}a+\frac{3}{4}$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$\frac{1}{3}a-\frac{1}{8}a>\frac{5}{24}a+\frac{3}{4}$
Multiply both sides by the LCD, 24, to clear the fractions.	$24\left(\frac{1}{3}a-\frac{1}{8}a\right)>24\left(\frac{5}{24}a+\frac{3}{4}\right)$
Simplify.	$8a-3a>5a+18$
Combine like terms.	$5a>5a+18$
Subtract $5a$ from both sides to collect the variables on the left.	$5a-5a>5a-5a+18$
Simplify.	$0>18$
The statement is false.	The inequality is a contradiction. There is no solution.
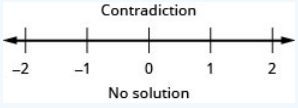
Graph the solution on the number line.	Write the solution in interval notation.	There is no solution.

Example 19.1.23

Solve the inequality $\frac{1}{4}x-\frac{1}{12}x>\frac{1}{6}x+\frac{7}{8}$, graph the solution on the number line, and write the solution in interval notation.

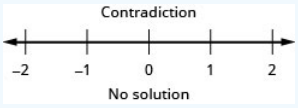
Answer



Example 19.1.24

Solve the inequality $\frac{2}{5}z - \frac{1}{3}z < \frac{1}{15}z - \frac{3}{5}$, graph the solution on the number line, and write the solution in interval notation.

Answer



Translate to an Inequality and Solve

To translate English sentences into inequalities, we need to recognize the phrases that indicate the inequality. Some words are easy, like “more than” and “less than.” But others are not as obvious. Table shows some common phrases that indicate inequalities.

$>$	$\geq$	$<$	$\leq$
is greater than	is greater than or equal to	is less than	is less than or equal to
is more than	is at least	is smaller than	is at most
is larger than	is no less than	has fewer than	is no more than
exceeds	is the minimum	is lower than	is the maximum

Example 19.1.25

Translate and solve. Then graph the solution on the number line, and write the solution in interval notation.

Twenty-seven less than x is at least 48.

Answer

	Twenty-seven less than x is at least 48.
Translate.	$x - 27 \geq 48$
Solve—add 27 to both sides.	$x - 27 + 27 \geq 48 + 27$
Simplify.	$x \geq 75$
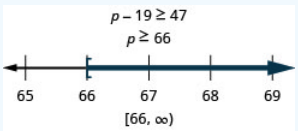
Graph on the number line.	Write in interval notation.	$[75, \infty)$

Translate and solve. Then graph the solution on the number line, and write the solution in interval notation.

Nineteen less than p is no less than 47.

Answer

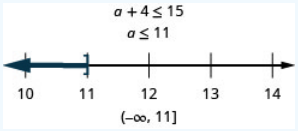


Example 19.1.27

Translate and solve. Then graph the solution on the number line, and write the solution in interval notation.

Four more than a is at most 15.

Answer



Solve Applications with Linear Inequalities

Many real-life situations require us to solve inequalities. The method we will use to solve applications with linear inequalities is very much like the one we used when we solved applications with equations.

We will read the problem and make sure all the words are understood. Next, we will identify what we are looking for and assign a variable to represent it. We will restate the problem in one sentence to make it easy to translate into an inequality. Then, we will solve the inequality.

Sometimes an application requires the solution to be a whole number, but the algebraic solution to the inequality is not a whole number. In that case, we must round the algebraic solution to a whole number. The context of the application will determine whether we round up or down.

Example 19.1.28

Dawn won a mini-grant of $4,000 to buy tablet computers for her classroom. The tablets she would like to buy cost $254.12 each, including tax and delivery. What is the maximum number of tablets Dawn can buy?

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the maximum number of tablets Dawn can buy
Step 3. Name what you are looking for. Choose a variable to represent that quantity.	Let n = the number of tablets.
Step 4. Translate Write a sentence that gives the information to find it.	$254.12 times the number of tablets is no more than $4,000.
Translate into an inequality.	$254.12n \leq 4000$
Step 5. Solve the inequality.	$n \leq 15.74$ but n must be a whole number of tablets, so round to 15. $n \leq 15$ tablets
Step 6. Check the answer in the problem and make sure it makes sense.	Rounding down the price to $250, 15 tablets would cost $3,750, while 16 tablets would be $4,000. So a maximum of 15 tablets at $254.12 seems reasonable.
Step 7. Write a sentence that answers the question.	Dawn can buy a maximum of 15 tablets.

Try It 19.1.29

Angie has $20 to spend on juice boxes for her son's preschool picnic. Each pack of juice boxes costs $2.63. What is the maximum number of packs she can buy?

Answer

Angie can buy 7 packs of juice.

Try It 19.1.30

Daniel wants to surprise his girlfriend with a birthday party at her favorite restaurant. It will cost $42.75 per person for dinner, including tip and tax. His budget for the party is $500. What is the maximum number of people Daniel can have at the party?

Answer

Daniel can have 11 people at the party.

Example 19.1.31

Taleisha's phone plan costs her $28.80 a month plus $0.20 per text message. How many text messages can she send/receive and keep her monthly phone bill no more than $50?

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the number of text messages Taleisha can make
Step 3. Name what you are looking for. Choose a variable to represent that quantity.	Let $t =$ the number of text messages.
Step 4. Translate Write a sentence that gives the information to find it.	$28.80 plus $0.20 times the number of text messages is less than or equal to $50.
Translate into an inequality.	$28.80 + 0.20t \leq 50$
Step 5. Solve the inequality.	$0.2t \leq 21.2$ $t \leq 106$ text messages
Step 6. Check the answer in the problem and make sure it makes sense.	Yes, $28.80 + 0.20(106) = 50$.
Step 7. Write a sentence that answers the question.	Taleisha can send/receive no more than 106 text messages to keep her bill no more than $50.

Try It 19.1.32

Sergio and Lizeth have a very tight vacation budget. They plan to rent a car from a company that charges $75 a week plus $0.25 a mile. How many miles can they travel during the week and still keep within their $200 budget?

Answer

Sergio and Lizeth can travel no more than 500 miles.

Try It 19.1.33

Rameen's heating bill is $5.42 per month plus $1.08 per therm. How many therms can Rameen use if he wants his heating bill to be a maximum of $87.50.

Answer

Rameen's heating bill is $5.42 per month plus $1.08 per therm. How many therms can Rameen use if he wants his heating bill to be a maximum of $87.50.

Profit is the money that remains when the costs have been subtracted from the revenue. In the next example, we will find the number of jobs a small businesswoman needs to do every month in order to make a certain amount of profit.

Example 19.1.34

Felicity has a calligraphy business. She charges $2.50 per wedding invitation. Her monthly expenses are $650. How many invitations must she write to earn a profit of at least $2,800 per month?

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the number of invitations Felicity needs to write
Step 3. Name what you are looking for. Choose a variable to represent that quantity.	Let $j =$ the number of invitations.
Step 4. Translate Write a sentence that gives the information to find it.	$2.50 times the number of invitations minus $650 is at least $2,800.
Translate into an inequality.	$2.50j - 650 \geq 2,800$
Step 5. Solve the inequality.	$2.5j \geq 3,450$ $j \geq 1,380$ invitations
Step 6. Check the answer in the problem and make sure it makes sense.	If Felicity wrote 1400 invitations, her profit would be $2.50(1400) - 650$, or $2,850. This is more than $2800.
Step 7. Write a sentence that answers the question.	Felicity must write at least 1,380 invitations.

Try It 19.1.35

Caleb has a pet sitting business. He charges $32 per hour. His monthly expenses are $2,272. How many hours must he work in order to earn a profit of at least $800 per month?

Answer

Caleb must work at least 96 hours.

Try It 19.1.36

Elliot has a landscape maintenance business. His monthly expenses are $1,100. If he charges $60 per job, how many jobs must he do to earn a profit of at least $4,000 a month?

Answer

Elliot must work at least 85 jobs.

There are many situations in which several quantities contribute to the total expense. We must make sure to account for all the individual expenses when we solve problems like this.

Example 19.1.37

Malik is planning a six-day summer vacation trip. He has $840 in savings, and he earns $45 per hour for tutoring. The trip will cost him $525 for airfare, $780 for food and sightseeing, and $95 per night for the hotel. How many hours must he tutor to have enough money to pay for the trip?

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the number of hours Malik must tutor
Step 3. Name what you are looking for. Choose a variable to represent that quantity.	Let h = the number of hours.
Step 4. Translate Write a sentence that gives the information to find it.	The expenses must be less than or equal to the income. The cost of airfare plus the cost of food and sightseeing and the hotel bill must be less than the savings plus the amount earned tutoring.
Translate into an inequality.	$525 + 780 + 95(6) \leq 840 + 45h$
Step 5. Solve the inequality.	$1,875 \leq 840 + 45h$ $1,035 \leq 45h$ $h \geq 23$ hours
Step 6. Check the answer in the problem and make sure it makes sense.	We substitute 23 into the inequality. $1,875 \leq 840 + 45h$ $1,875 \leq 840 + 45(23)$ $1,875 \leq 1875$
Step 7. Write a sentence that answers the question.	Malik must tutor at least 23 hours.

Try It 19.1.38

Brenda's best friend is having a destination wedding and the event will last three days. Brenda has $500 in savings and can earn $15 an hour babysitting. She expects to pay $350 airfare, $375 for food and entertainment and $60 a night for her share of a hotel room. How many hours must she babysit to have enough money to pay for the trip?

Answer

Brenda must babysit at least 27 hours.

Try It 19.1.39

Josue wants to go on a 10-night road trip with friends next spring. It will cost him $180 for gas, $450 for food, and $49 per night to share a motel room. He has $520 in savings and can earn $30 per driveway shoveling snow. How many driveways must he shovel to have enough money to pay for the trip?

Answer

Josue must shovel at least 20 driveways.

Key Concepts

- **Inequalities, Number Lines, and Interval Notation**

  $x > a \quad x \geq a \quad x < a \quad x \leq a$

- **Linear Inequality**
  - A **linear inequality** is an inequality in one variable that can be written in one of the following forms where a, b, and c are real numbers and $a \neq 0$:

$$ax + b < c, \qquad ax + b \leq c, \qquad ax + b > c, \qquad ax + b \geq c.$$

- **Addition and Subtraction Property of Inequality**
  - For any numbers *a*, *b*, and *c*, if a<b,thena<b,then

$$a+c<b+c \quad a-c<b-c$$
$$a+c>b+c \quad a-c>b-c$$

  - We can add or subtract the same quantity from both sides of an inequality and still keep the inequality.
- **Multiplication and Division Property of Inequality**
  - For any numbers *a*, *b*, and *c*,
    multiply or divide by a **positive**

$$\text{if } a<b \text{ and } c>0, \text{ then } ac<bc \text{ and } \tfrac{a}{c}<\tfrac{b}{c}.$$
$$\text{if } a>b \text{ and } c>0, \text{ then } ac>bc \text{ and } \tfrac{a}{c}>\tfrac{b}{c}.$$

    multiply or divide by a **negative**

$$\text{if } a<b \text{ and } c<0, \text{ then } ac>bc \text{ and } \tfrac{a}{c}>\tfrac{b}{c}.$$
$$\text{if } a>b \text{ and } c<0, \text{ then } ac<bc \text{ and } \tfrac{a}{c}<\tfrac{b}{c}.$$

- **Phrases that indicate inequalities**

$>$	$\geq$	$<$	$\leq$
is greater than	is greater than or equal to	is less than	is less than or equal to
is more than	is at least	is smaller than	is at most
is larger than	is no less than	has fewer than	is no more than
exceeds	is the minimum	is lower than	is the maximum

19.1E: Exercises

Practice Makes Perfect

Graph Inequalities on the Number Line

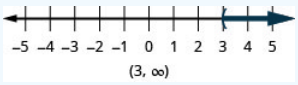
In the following exercises, graph each inequality on the number line and write in interval notation.

1. ⓐ $x < -2$
ⓑ $x \geq -3.5$
ⓒ $x \leq \frac{2}{3}$

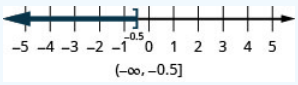
2. ⓐ $x > 3$
ⓑ $x \leq -0.5$
ⓒ $x \geq \frac{1}{3}$

Answer

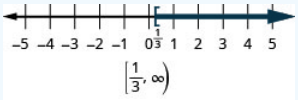
ⓐ



ⓑ



ⓒ

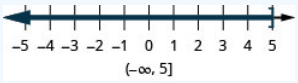


3. ⓐ $x \geq -4$
ⓑ $x < 2.5$
ⓒ $x > -\frac{3}{2}$

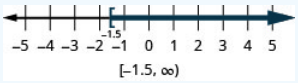
4. ⓐ $x \leq 5$
ⓑ $x \geq -1.5$
ⓒ $x < -\frac{7}{3}$

Answer

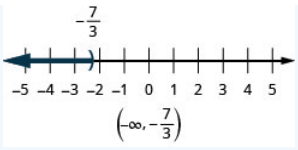
ⓐ



ⓑ



ⓒ

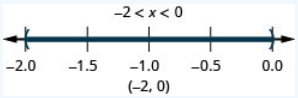


5. ⓐ $-5 < x < 2$
ⓑ $-3 \leq x < -1$
ⓒ $0 \leq x \leq 1.5$

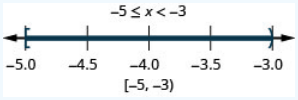
6. ⓐ $-2 < x < 0$
ⓑ $-5 \leq x < -3$
ⓒ $0 \leq x \leq 3.5$

Answer

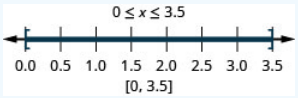
ⓐ



ⓑ



ⓒ

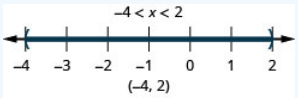


7. ⓐ $-1 < x < 3$
ⓑ $-3 < x \leq -2$
ⓒ $-1.25 \leq x \leq 0$

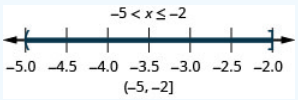
8. ⓐ $-4 < x < 2$
ⓑ $-5 < x \leq -2$
ⓒ $-3.75 \leq x \leq 0$

Answer

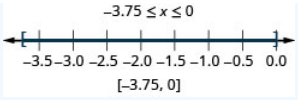
ⓐ



ⓑ



ⓒ



Solve Linear Inequalities

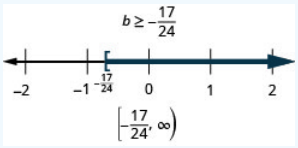
In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

9. ⓐ $a+\frac{3}{4}\geq\frac{7}{10}$
ⓑ $8x>72$
ⓒ $20>\frac{2}{5}h$

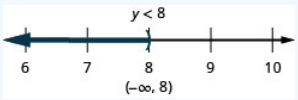
10. ⓐ $b+\frac{7}{8}\geq\frac{1}{6}$
ⓑ $6y<48$
ⓒ $40<\frac{5}{8}k$

Answer

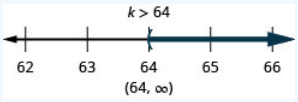
ⓐ



ⓑ



ⓒ

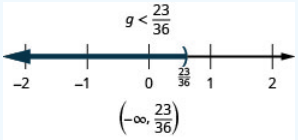


11. ⓐ $f-\frac{13}{20}<-\frac{5}{12}$
ⓑ $9t\geq-27$
ⓒ $\frac{7}{6}j\geq42$

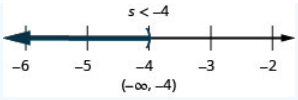
12. ⓐ $g-\frac{11}{12}<-\frac{5}{18}$
ⓑ $7s<-28$
ⓒ $\frac{9}{4}g\leq36$

Answer

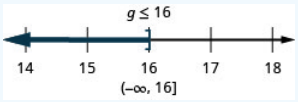
ⓐ



ⓑ



ⓒ

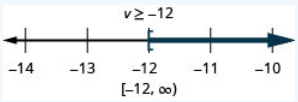


13. ⓐ $-5u \geq 65$
ⓑ $\frac{a}{-3} \leq 9$

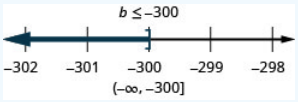
14. ⓐ $-8v \leq 96$
ⓑ $\frac{b}{-10} \geq 30$

Answer

ⓐ



ⓑ

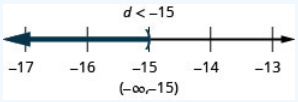


15. ⓐ $-9c < 126$
ⓑ $-25 < \frac{p}{-5}$

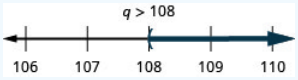
16. ⓐ $-7d > 105$
ⓑ $-18 > \frac{q}{-6}$

Answer

ⓐ



ⓑ



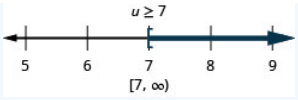
In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

17. $4v \geq 9v - 40$

18. $5u \leq 8u - 21$

Answer

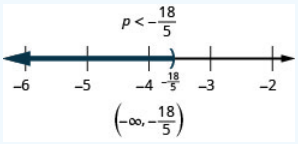
https://math.libretexts.org/@go/page/46455



19. $13q < 7q - 29$

20. $9p > 14p - 18$

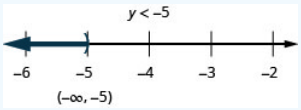
Answer



21. $12x + 3(x + 7) > 10x - 24$

22. $9y + 5(y + 3) < 4y - 35$

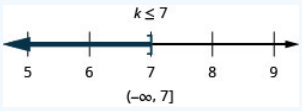
Answer



23. $6h - 4(h - 1) \leq 7h - 11$

24. $4k - (k - 2) \geq 7k - 26$

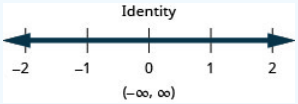
Answer



25. $8m - 2(14 - m) \geq 7(m - 4) + 3m$

26. $6n - 12(3 - n) \leq 9(n - 4) + 9n$

Answer

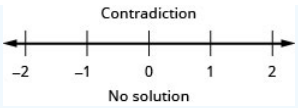


27. $\frac{3}{4}b - \frac{1}{3}b < \frac{5}{12}b - \frac{1}{2}$

28. $9u + 5(2u - 5) \geq 12(u - 1) + 7u$

Answer

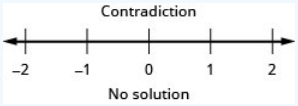
https://math.libretexts.org/@go/page/46455



29. $\frac{2}{3}g-\frac{1}{2}(g-14)\leq\frac{1}{6}(g+42)$

30. $\frac{4}{5}h-\frac{2}{3}(h-9)\geq\frac{1}{15}(2h+90)$

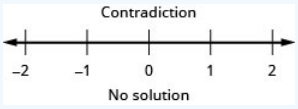
Answer



31. $\frac{5}{6}a-\frac{1}{4}a>\frac{7}{12}a+\frac{2}{3}$

32. $12v+3(4v-1)\leq19(v-2)+5v$

Answer

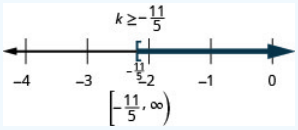


In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

33. $15k\leq-40$

34. $35k\geq-77$

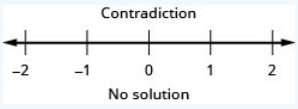
Answer



35. $23p-2(6-5p)>3(11p-4)$

36. $18q-4(10-3q)<5(6q-8)$

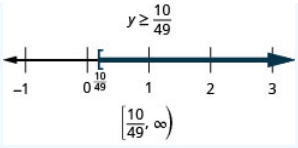
Answer



37. $-\frac{9}{4}x\geq-\frac{5}{12}$

38. $-\frac{21}{8}y\leq-\frac{15}{28}$

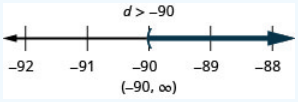
Answer



39. $c + 34 < -99$

40. $d + 29 > -61$

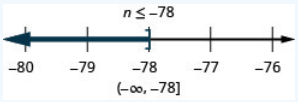
Answer



41. $\frac{m}{18} \geq -4$

42. $\frac{n}{13} \leq -6$

Answer



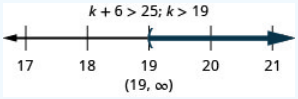
Translate to an Inequality and Solve

In the following exercises, translate and solve. Then graph the solution on the number line and write the solution in interval notation.

43. Three more than h is no less than 25.

44. Six more than k exceeds 25.

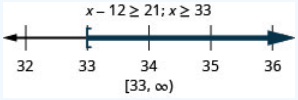
Answer



45. Ten less than w is at least 39.

46. Twelve less than x is no less than 21.

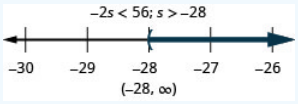
Answer



47. Negative five times r is no more than 95.

48. Negative two times s is lower than 56.

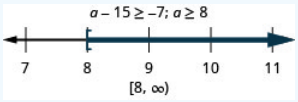
Answer



49. Nineteen less than b is at most -22.

50. Fifteen less than a is at least -7.

Answer



Solve Applications with Linear Inequalities

In the following exercises, solve.

51. Alan is loading a pallet with boxes that each weighs 45 pounds. The pallet can safely support no more than 900 pounds. How many boxes can he safely load onto the pallet?

52. The elevator in Yehire's apartment building has a sign that says the maximum weight is 2100 pounds. If the average weight of one person is 150 pounds, how many people can safely ride the elevator?

Answer

A maximum of 14 people can safely ride in the elevator.

53. Andre is looking at apartments with three of his friends. They want the monthly rent to be no more than $2,360. If the roommates split the rent evenly among the four of them, what is the maximum rent each will pay?

54. Arleen got a $20 gift card for the coffee shop. Her favorite iced drink costs $3.79. What is the maximum number of drinks she can buy with the gift card?

Answer

five drinks

55. Teegan likes to play golf. He has budgeted $60 next month for the driving range. It costs him $10.55 for a bucket of balls each time he goes. What is the maximum number of times he can go to the driving range next month?

56. Ryan charges his neighbors $17.50 to wash their car. How many cars must he wash next summer if his goal is to earn at least $1,500?

Answer

86 cars

57. Keshad gets paid $2,400 per month plus 6% of his sales. His brother earns $3,300 per month. For what amount of total sales will Keshad's monthly pay be higher than his brother's monthly pay?

58. Kimuyen needs to earn $4,150 per month in order to pay all her expenses. Her job pays her $3,475 per month plus 4% of her total sales. What is the minimum Kimuyen's total sales must be in order for her to pay all her expenses?

Answer

$16,875

59. Andre has been offered an entry-level job. The company offered him $48,000 per year plus 3.5% of his total sales. Andre knows that the average pay for this job is $62,000. What would Andre's total sales need to be for his pay to be at least as high as the average pay for this job?

60. Nataly is considering two job offers. The first job would pay her $83,000 per year. The second would pay her $66,500 plus 15% of her total sales. What would her total sales need to be for her salary on the second offer be higher than the first?

Answer

$110,000

61. Jake's water bill is $24.80 per month plus $2.20 per ccf (hundred cubic feet) of water. What is the maximum number of ccf Jake can use if he wants his bill to be no more than $60?

62. Kiyoshi's phone plan costs $17.50 per month plus $0.15 per text message. What is the maximum number of text messages Kiyoshi can use so the phone bill is no more than $56.60?

Answer

260 messages

63. Marlon's TV plan costs $49.99 per month plus $5.49 per first-run movie. How many first-run movies can he watch if he wants to keep his monthly bill to be a maximum of $100?

64. Kellen wants to rent a banquet room in a restaurant for her cousin's baby shower. The restaurant charges $350 for the banquet room plus $32.50 per person for lunch. How many people can Kellen have at the shower if she wants the maximum cost to be $1,500?

Answer

35 people

65. Moshde runs a hairstyling business from her house. She charges $45 for a haircut and style. Her monthly expenses are $960. She wants to be able to put at least $1,200 per month into her savings account order to open her own salon. How many "cut & styles" must she do to save at least $1,200 per month?

66. Noe installs and configures software on home computers. He charges $125 per job. His monthly expenses are $1,600. How many jobs must he work in order to make a profit of at least $2,400?

Answer

32 jobs

67. Katherine is a personal chef. She charges $115 per four-person meal. Her monthly expenses are $3,150. How many four-person meals must she sell in order to make a profit of at least $1,900?

68. Melissa makes necklaces and sells them online. She charges $88 per necklace. Her monthly expenses are $3,745. How many necklaces must she sell if she wants to make a profit of at least $1,650?

Answer

62 necklaces

69. Five student government officers want to go to the state convention. It will cost them $110 for registration, $375 for transportation and food, and $42 per person for the hotel. There is $450 budgeted for the convention in the student government savings account. They can earn the rest of the money they need by having a car wash. If they charge $5 per car, how many cars must they wash in order to have enough money to pay for the trip?

70. Cesar is planning a four-day trip to visit his friend at a college in another state. It will cost him $198 for airfare, $56 for local transportation, and $45 per day for food. He has $189 in savings and can earn $35 for each lawn he mows. How many lawns must he mow to have enough money to pay for the trip?

Answer

seven lawns

71. Alonzo works as a car detailer. He charges $175 per car. He is planning to move out of his parents' house and rent his first apartment. He will need to pay $120 for application fees, $950 for security deposit, and first and last months' rent at $1,140 per month. He has $1,810 in savings. How many cars must he detail to have enough money to rent the apartment?

72. Eun-Kyung works as a tutor and earns $60 per hour. She has $792 in savings. She is planning an anniversary party for her parents. She would like to invite 40 guests. The party will cost her $1,520 for food and drinks and $150 for the photographer. She will also have a favor for each of the guests, and each favor will cost $7.50. How many hours must she tutor to have enough money for the party?

Answer

20 hours

Everyday Math

73. Maximum load on a stage In 2014, a high school stage collapsed in Fullerton, California, when 250 students got on stage for the finale of a musical production. Two dozen students were injured. The stage could support a maximum of 12,750 pounds. If the average weight of a student is assumed to be 140 pounds, what is the maximum number of students who could safely be on the stage?

74. Maximum weight on a boat In 2004, a water taxi sank in Baltimore harbor and five people drowned. The water taxi had a maximum capacity of 3,500 pounds (25 people with average weight 140 pounds). The average weight of the 25 people on the water taxi when it sank was 168 pounds per person. What should the maximum number of people of this weight have been?

Answer

20 people

75. Wedding budget Adele and Walter found the perfect venue for their wedding reception. The cost is $9850 for up to 100 guests, plus $38 for each additional guest. How many guests can attend if Adele and Walter want the total cost to be no more than $12,500?

76. Shower budget Penny is planning a baby shower for her daughter-in-law. The restaurant charges $950 for up to 25 guests, plus $31.95 for each additional guest. How many guests can attend if Penny wants the total cost to be no more than $1,500?

Answer

42 guests

Writing Exercises

77. Explain why it is necessary to reverse the inequality when solving $-5x > 10$.

78. Explain why it is necessary to reverse the inequality when solving $n - 3 < 12$.

Answer

Answers will vary.

79. Find your last month's phone bill and the hourly salary you are paid at your job. Calculate the number of hours of work it would take you to earn at least enough money to pay your phone bill by writing an appropriate inequality and then solving it. Do you feel this is an appropriate number of hours? Is this the appropriate phone plan for you?

80. Find out how many units you have left, after this term, to achieve your college goal and estimate the number of units you can take each term in college. Calculate the number of terms it will take you to achieve your college goal by writing an appropriate inequality and then solving it. Is this an acceptable number of terms until you meet your goal? What are some ways you could accelerate this process?

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
graph inequalities on the number line.			
solve linear inequalities.			
translate words to an inequality and solve.			
solve applications with linear inequalities.			

ⓑ After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

This page titled 19.1E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

19.2: Solve Compound Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Solve compound inequalities with “and”
- Solve compound inequalities with “or”
- Solve applications with compound inequalities

Before you get started, take this readiness quiz.

1. Simplify: $\frac{2}{5}(x+10)$.
   If you missed this problem, review [link].
2. Simplify: $-(x-4)$.
   If you missed this problem, review [link].

Solve Compound Inequalities with “and”

Now that we know how to solve linear inequalities, the next step is to look at compound inequalities. A **compound inequality** is made up of two inequalities connected by the word “and” or the word “or.” For example, the following are compound inequalities.

$$\begin{array}{lll} x+3>-4 & \text{and} & 4x-5\leq 3 \\ 2(y+1)<0 & \text{or} & y-5\geq -2 \end{array}$$

COMPOUND INEQUALITY

A **compound inequality** is made up of two inequalities connected by the word “and” or the word “or.”

To solve a compound inequality means to find all values of the variable that make the compound inequality a true statement. We solve compound inequalities using the same techniques we used to solve linear inequalities. We solve each inequality separately and then consider the two solutions.

To solve a compound inequality with the word “and,” we look for all numbers that make *both* inequalities true. To solve a compound inequality with the word “or,” we look for all numbers that make *either* inequality true.

Let’s start with the compound inequalities with “and.” Our solution will be the numbers that are solutions to *both* inequalities known as the intersection of the two inequalities. Consider the intersection of two streets—the part where the streets overlap—belongs to both streets.

To find the solution of an "and" compound inequality, we look at the graphs of each inequality and then find the numbers that belong to both graphs—where the graphs overlap.

For the compound inequality $x>-3$ and $x\leq 2$, we graph each inequality. We then look for where the graphs “overlap”. The numbers that are shaded on both graphs, will be shaded on the graph of the solution of the compound inequality. See Figure 19.2.1.

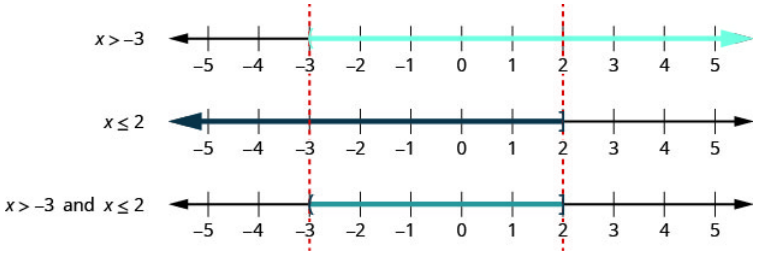

Figure 19.2.1

We can see that the numbers between -3 and 2 are shaded on both of the first two graphs. They will then be shaded on the solution graph.

The number -3 is not shaded on the first graph and so since it is not shaded on both graphs, it is not included on the solution graph.

The number two is shaded on both the first and second graphs. Therefore, it is be shaded on the solution graph.

This is how we will show our solution in the next examples.

Example 19.2.1

Solve $6x-3<9$ and $2x+7\geq 3$. Graph the solution and write the solution in interval notation.

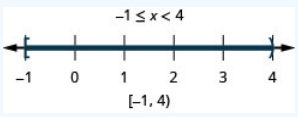
Solution

	$6x-3<9$	and	$2x+9\geq 3$
Step 1. Solve each inequality.	$6x-3<9$		$2x+9\geq 3$
	$6x<12$		$2x\geq -6$
	$x<2$	and	$x\geq -3$
Step 2. Graph each solution. Then graph the numbers that make both inequalities true. The final graph will show all the numbers that make both inequalities true—the numbers shaded on *both* of the first two graphs.			
Step 3. Write the solution in interval notation.	$[-3, 2)$		
All the numbers that make both inequalities true are the solution to the compound inequality.			

Try It 19.2.2

Solve the compound inequality. Graph the solution and write the solution in interval notation: $4x-7<9$ and $5x+8\geq 3$.

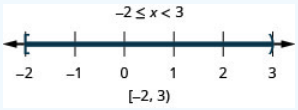
Answer



Try It 19.2.3

Solve the compound inequality. Graph the solution and write the solution in interval notation: $3x-4<5$ and $4x+9\geq 1$.

Answer



SOLVE A COMPOUND INEQUALITY WITH "AND."

1. Solve each inequality.
2. Graph each solution. Then graph the numbers that make *both* inequalities true.
   This graph shows the solution to the compound inequality.
3. Write the solution in interval notation.

Example 19.2.4

Solve $3(2x+5)\leq 18$ and $2(x-7)<-6$. Graph the solution and write the solution in interval notation.

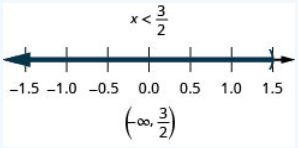
Solution

	$3(2x+5)\leq 18$	and	$2(x-7)<-6$
Solve each inequality.	$6x+15\leq 18$		$2x-14<-6$
	$6x\leq 3$		$2x<8$
	$x\leq \frac{1}{2}$	and	$x<4$
Graph each solution.			
Graph the numbers that make both inequalities true.			
Write the solution in interval notation.	$(-\infty, \frac{1}{2}]$		

Try It 19.2.5

Solve the compound inequality. Graph the solution and write the solution in interval notation: $2(3x+1)\leq 20$ and $4(x-1)<2$.

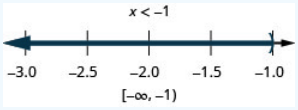
Answer



Try It 19.2.6

Solve the compound inequality. Graph the solution and write the solution in interval notation: $5(3x-1) \leq 10$ and $4(x+3) < 8$.

Answer



Example 19.2.7

Solve $\frac{1}{3}x - 4 \geq -2$ and $-2(x-3) \geq 4$. Graph the solution and write the solution in interval notation.

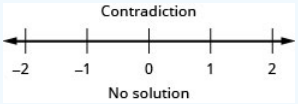
Solution

	$\frac{1}{3}x - 4 \geq -2$	and	$-2(x-3) \geq 4$
Solve each inequality.	$\frac{1}{3}x - 4 \geq -2$		$-2x + 6 \geq 4$
	$\frac{1}{3}x \geq 2$		$-2x \geq -2$
	$x \geq 6$	and	$x \leq 1$
Graph each solution.			
Graph the numbers that make both inequalities true.			
	This is a contradiction. There are no numbers that make both inequalities true, so there is no solution.		

Try It 19.2.8

Solve the compound inequality. Graph the solution and write the solution in interval notation: $\frac{1}{4}x - 3 \geq -1$ and $-3(x-2) \geq 2$.

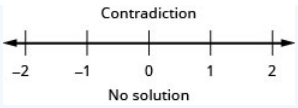
Answer



Try It 19.2.9

Solve the compound inequality. Graph the solution and write the solution in interval notation: $\frac{1}{5}x - 5 \geq -3$ and $-4(x-1) \geq -2$.

Answer



Sometimes we have a compound inequality that can be written more concisely. For example, $a < x$ and $x < b$ can be written simply as $a < x < b$ and then we call it a **double inequality**. The two forms are equivalent.

DOUBLE INEQUALITY

A double inequality is a compound inequality such as $a < x < b$. It is equivalent to $a < x$ and $x < b$.

Other forms:	$a < x < b$	is equivalent to	$a < x$	and	$x < b$
	$a \le x \le b$	is equivalent to	$a \le x$	and	$x \le b$
	$a > x > b$	is equivalent to	$a > x$	and	$x > b$
	$a \ge x \ge b$	is equivalent to	$a \ge x$	and	$x \ge b$

To solve a double inequality we perform the same operation on all three "parts" of the double inequality with the goal of isolating the variable in the center.

Example 19.2.10

Solve $-4 \le 3x - 7 < 8$. Graph the solution and write the solution in interval notation.

Solution

	$-4 \le 3x - 7 < 8$
Add 7 to all three parts.	$-4+7 \le 3x - 7+7 < 8+7$
Simplify.	$3 \le 3x < 15$
Divide each part by three.	$\frac{3}{3} \le \frac{3x}{3} < \frac{15}{3}$
Simplify.	$1 \le x < 5$
Graph the solution.	
Write the solution in interval notation.	$[1, 5)$

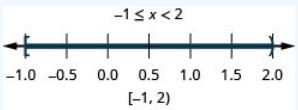
When written as a double inequality, $1 \le x < 5$, it is easy to see that the solutions are the numbers caught between one and five, including one, but not five. We can then graph the solution immediately as we did above.

Another way to graph the solution of $1 \le x < 5$ is to graph both the solution of $x \ge 1$ and the solution of $x < 5$. We would then find the numbers that make both inequalities true as we did in previous examples.

Try It 19.2.11

Solve the compound inequality. Graph the solution and write the solution in interval notation: $-5 \le 4x - 1 < 7$.

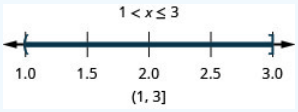
Answer



Try It 19.2.12

Solve the compound inequality. Graph the solution and write the solution in interval notation: $-3 < 2x - 5 \leq 1$.

Answer



Solve Compound Inequalities with "or"

To solve a **compound inequality** with "or", we start out just as we did with the compound inequalities with "and"—we solve the two inequalities. Then we find all the numbers that make *either* inequality true.

Just as the United States is the union of all of the 50 states, the solution will be the union of all the numbers that make either inequality true. To find the solution of the compound inequality, we look at the graphs of each inequality, find the numbers that belong to either graph and put all those numbers together.

To write the solution in **interval notation**, we will often use the **union symbol**, $\cup$, to show the union of the solutions shown in the graphs.

SOLVE A COMPOUND INEQUALITY WITH "OR."

1. Solve each inequality.
2. Graph each solution. Then graph the numbers that make either inequality true.
3. Write the solution in interval notation.

Example 19.2.13

Solve $5 - 3x \leq -1$ or $8 + 2x \leq 5$. Graph the solution and write the solution in interval notation.

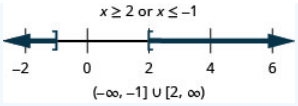
Solution

	$5 - 3x \leq -1$	or	$8 + 2x \leq 5$
Solve each inequality.	$5 - 3x \leq -1$		$8 + 2x \leq 5$
	$-3x \leq -6$		$2x \leq -3$
	$x \geq 2$	or	$x \leq -\frac{3}{2}$
Graph each solution.			
Graph numbers that make either inequality true.			
	$(-\infty, -\frac{3}{2}] \cup [2, \infty)$		

Try It 19.2.14

Solve the compound inequality. Graph the solution and write the solution in interval notation: $1 - 2x \leq -3$ or $7 + 3x \leq 4$.

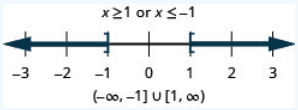
Answer



Try It 19.2.15

Solve the compound inequality. Graph the solution and write the solution in interval notation: $2-5x \leq -3$ or $5+2x \leq 3$.

Answer



Example 19.2.16

Solve $\frac{2}{3}x-4 \leq 3$ or $\frac{1}{4}(x+8) \geq -1$. Graph the solution and write the solution in interval notation.

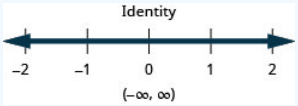
Solution

	$\frac{2}{3}x-4 \leq 3$	or	$\frac{1}{4}(x+8) \geq -1$
Solve each inequality.	$3(\frac{2}{3}x-4) \leq 3(3)$		$4 \cdot \frac{1}{4}(x+8) \geq 4 \cdot (-1)$
	$2x-12 \leq 9$		$x+8 \geq -4$
	$2x \leq 21$		$x \geq -12$
	$x \leq \frac{21}{2}$		
	$x \leq \frac{21}{2}$	or	$x \geq -12$
Graph each solution.			
Graph numbers that make either inequality true.			
	The solution covers all real numbers.		
	$(-\infty, \infty)$		

Try It 19.2.17

Solve the compound inequality. Graph the solution and write the solution in interval notation: $\frac{3}{5}x-7 \leq -1$ or $\frac{1}{3}(x+6) \geq -2$.

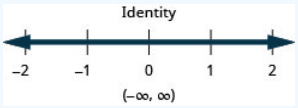
Answer



Try It 19.2.18

Solve the compound inequality. Graph the solution and write the solution in interval notation: $\frac{3}{4}x-3\leq 3$ or $\frac{2}{5}(x+10)\geq 0$.

Answer



Solve Applications with Compound Inequalities

Situations in the real world also involve compound inequalities. We will use the same problem solving strategy that we used to solve linear equation and inequality applications.

Recall the problem solving strategies are to first read the problem and make sure all the words are understood. Then, identify what we are looking for and assign a variable to represent it. Next, restate the problem in one sentence to make it easy to translate into a **compound inequality**. Last, we will solve the compound inequality.

Example 19.2.19

Due to the drought in California, many communities have tiered water rates. There are different rates for Conservation Usage, Normal Usage and Excessive Usage. The usage is measured in the number of hundred cubic feet (hcf) the property owner uses.

During the summer, a property owner will pay $24.72 plus $1.54 per hcf for Normal Usage. The bill for Normal Usage would be between or equal to $57.06 and $171.02. How many hcf can the owner use if he wants his usage to stay in the normal range?

Solution

Identify what we are looking for.	The number of hcf he can use and stay in the “normal usage” billing range.
Name what we are looking for.	Let x= the number of hcf he can use.
Translate to an inequality.	Bill is $24.72 plus $1.54 times the number of hcf he uses or $24.72+1.54x$.
	$\underbrace{\text{His bill will be between or equal to \$57.06 and \$171.02.}}$ $57.06\leq 24.72+1.54x\leq 171.02$
Solve the inequality.	$57.06\leq 24.72+1.54x\leq 171.02$ $57.06-24.72\leq 24.72-24.72+1.54x\leq 171.02-24.72$ $32.34\leq 1.54x\leq 146.3$ $\frac{32.34}{1.54}\leq \frac{1.54x}{1.54}\leq \frac{146.3}{1.54}$ $21\leq x\leq 95$
Answer the question.	The property owner can use $21-95$ hcf and still fall within the “normal usage” billing range.

Try It 19.2.20

Due to the drought in California, many communities now have tiered water rates. There are different rates for Conservation Usage, Normal Usage and Excessive Usage. The usage is measured in the number of hundred cubic feet (hcf) the property owner uses.

During the summer, a property owner will pay $24.72 plus $1.32 per hcf for Conservation Usage. The bill for Conservation Usage would be between or equal to $31.32 and $51.12. How many hcf can the owner use if she wants her usage to stay in the

conservation range?

Answer

The homeowner can use $5-20$ hcf and still fall within the "conservation usage" billing range.

? Try It 19.2.21

Due to the drought in California, many communities have tiered water rates. There are different rates for Conservation Usage, Normal Usage and Excessive Usage. The usage is measured in the number of hundred cubic feet (hcf) the property owner uses.

During the winter, a property owner will pay \$24.72 plus \$1.54 per hcf for Normal Usage. The bill for Normal Usage would be between or equal to \$49.36 and \$86.32. How many hcf will he be allowed to use if he wants his usage to stay in the normal range?

Answer

The homeowner can use $16-40$ hcf and still fall within the "normal usage" billing range.

Access this online resource for additional instruction and practice with solving compound inequalities.

- Compound inequalities

Key Concepts

- **How to solve a compound inequality with "and"**
  1. Solve each inequality.
  2. Graph each solution. Then graph the numbers that make *both* inequalities true. This graph shows the solution to the compound inequality.
  3. Write the solution in interval notation.
- **Double Inequality**
  - A **double inequality** is a compound inequality such as $a < x < b$. It is equivalent to $a < x$ and $x < b$.

    Other forms:

$$\begin{array}{lll} a < x < b & \text{is equivalent to} & a < x \text{ and } x < b \\ a \leq x \leq b & \text{is equivalent to} & a \leq x \text{ and } x \leq b \\ a > x > b & \text{is equivalent to} & a > x \text{ and } x > b \\ a \geq x \geq b & \text{is equivalent to} & a \geq x \text{ and } x \geq b \end{array}$$

- **How to solve a compound inequality with "or"**
  1. Solve each inequality.
  2. Graph each solution. Then graph the numbers that make either inequality true.
  3. Write the solution in interval notation.

Glossary

compound inequality

A compound inequality is made up of two inequalities connected by the word "and" or the word "or."

19.2E: Exercises

Practice Makes Perfect

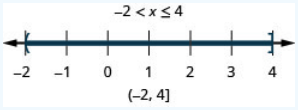
Solve Compound Inequalities with "and"

In the following exercises, solve each inequality, graph the solution, and write the solution in interval notation.

1. $x < 3$ and $x \geq 1$

2. $x \leq 4$ and $x > -2$

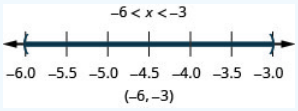
Answer



3. $x \geq -4$ and $x \leq -1$

4. $x > -6$ and $x < -3$

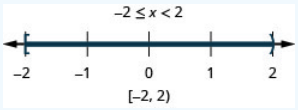
Answer



5. $5x - 2 < 8$ and $6x + 9 \geq 3$

6. $4x - 1 < 7$ and $2x + 8 \geq 4$

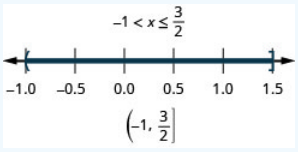
Answer



7. $4x + 6 \leq 2$ and $2x + 1 \geq -5$

8. $4x - 2 \leq 4$ and $7x - 1 > -8$

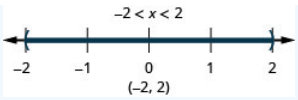
Answer



9. $2x - 11 < 5$ and $3x - 8 > -5$

10. $7x - 8 < 6$ and $5x + 7 > -3$

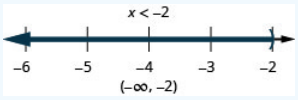
Answer



11. $4(2x-1) \leq 12$ and $2(x+1) < 4$

12. $5(3x-2) \leq 5$ and $3(x+3) < 3$

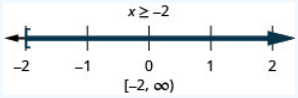
Answer



13. $3(2x-3) > 3$ and $4(x+5) \geq 4$

14. $-3(x+4) < 0$ and $-1(3x-1) \leq 7$

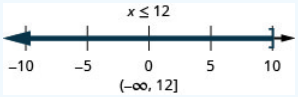
Answer



15. $\frac{1}{2}(3x-4) \leq 1$ and $\frac{1}{3}(x+6) \leq 4$

16. $\frac{3}{4}(x-8) \leq 3$ and $\frac{1}{5}(x-5) \leq 3$

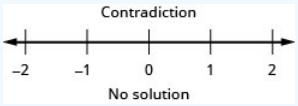
Answer



17. $5x-2 \leq 3x+4$ and $3x-4 \geq 2x+1$

18. $\frac{3}{4}x-5 \geq -2$ and $-3(x+1) \geq 6$

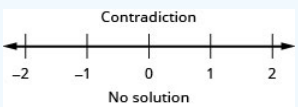
Answer



19. $\frac{2}{3}x-6 \geq -4$ and $-4(x+2) \geq 0$

20. $\frac{1}{2}(x-6)+2 < -5$ and $4-\frac{2}{3}x < 6$

Answer

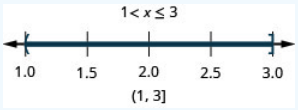


https://math.libretexts.org/@go/page/46457

21. $-5 \leq 4x - 1 < 7$

22. $-3 < 2x - 5 \leq 1$

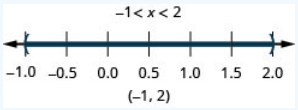
Answer



23. $5 < 4x + 1 < 9$

24. $-1 < 3x + 2 < 8$

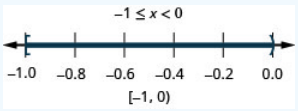
Answer



25. $-8 < 5x + 2 \leq -3$

26. $-6 \leq 4x - 2 < -2$

Answer



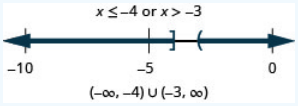
Solve Compound Inequalities with "or"

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

27. $x \leq -2$ or $x > 3$

28. $x \leq -4$ or $x > -3$

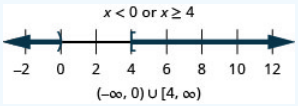
Answer



29. $x < 2$ or $x \geq 5$

30. $x < 0$ or $x \geq 4$

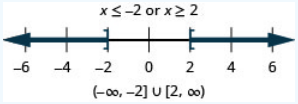
Answer



31. $2+3x \leq 4$ or $5-2x \leq -1$

32. $4-3x \leq -2$ or $2x-1 \leq -5$

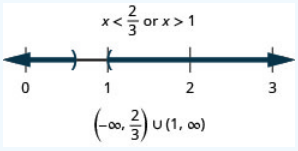
Answer



33. $2(3x-1) < 4$ or $3x-5 > 1$

34. $3(2x-3) < -5$ or
$4x-1 > 3$

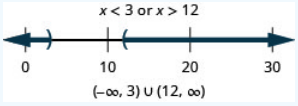
Answer



35. $\frac{3}{4}x-2 > 4$ or $4(2-x) > 0$

36. $\frac{2}{3}x-3 > 5$ or $3(5-x) > 6$

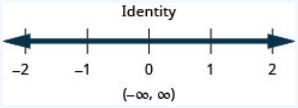
Answer



37. $3x-2 > 4$ or $5x-3 \leq 7$

38. $2(x+3) \geq 0$ or $3(x+4) \leq 6$

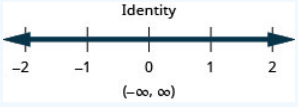
Answer



39. $\frac{1}{2}x-3 \leq 4$ or $\frac{1}{3}(x-6) \geq -2$

40. $\frac{3}{4}x+2 \leq -1$ or $\frac{1}{2}(x+8) \geq -3$

Answer



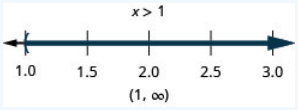
Mixed practice

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

41. $3x+7 \leq 1$ and $2x+3 \geq -5$

42. $6(2x-1) > 6$ and $5(x+2) \geq 0$

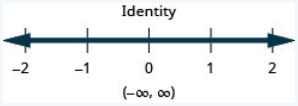
Answer



43. $4-7x \geq -3$ or $5(x-3)+8 > 3$

44. $\frac{1}{2}x-5 \leq 3$ or $\frac{1}{4}(x-8) \geq -3$

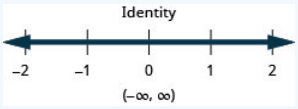
Answer



45. $-5 \leq 2x-1 < 7$

46. $\frac{1}{5}(x-5)+6 < 4$ and $3-\frac{2}{3}x < 5$

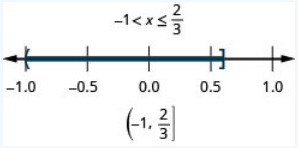
Answer



47. $4x-2 > 6$ or $3x-1 \leq -2$

48. $6x-3 \leq 1$ and $5x-1 > -6$

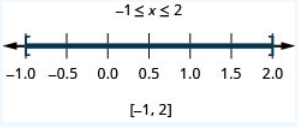
Answer



49. $-2(3x-4) \leq 2$ and $-4(x-1) < 2$

50. $-5 \leq 3x-2 \leq 4$

Answer



Solve Applications with Compound Inequalities

In the following exercises, solve.

51. Penelope is playing a number game with her sister June. Penelope is thinking of a number and wants June to guess it. Five more than three times her number is between 2 and 32. Write a compound inequality that shows the range of numbers that Penelope might be thinking of.

52. Gregory is thinking of a number and he wants his sister Lauren to guess the number. His first clue is that six less than twice his number is between four and forty-two. Write a compound inequality that shows the range of numbers that Gregory might be thinking of.

Answer

$5 \leq n \leq 24$

53. Andrew is creating a rectangular dog run in his back yard. The length of the dog run is 18 feet. The perimeter of the dog run must be at least 42 feet and no more than 72 feet. Use a compound inequality to find the range of values for the width of the dog run.

54. Elouise is creating a rectangular garden in her back yard. The length of the garden is 12 feet. The perimeter of the garden must be at least 36 feet and no more than 48 feet. Use a compound inequality to find the range of values for the width of the garden.

Answer

$6 \leq w \leq 12$

Everyday Math

55. Blood Pressure A person's blood pressure is measured with two numbers. The systolic blood pressure measures the pressure of the blood on the arteries as the heart beats. The diastolic blood pressure measures the pressure while the heart is resting.

ⓐ Let x be your systolic blood pressure. Research and then write the compound inequality that shows you what a normal systolic blood pressure should be for someone your age.

ⓑ Let y be your diastolic blood pressure. Research and then write the compound inequality that shows you what a normal diastolic blood pressure should be for someone your age.

56. Body Mass Index (BMI) is a measure of body fat is determined using your height and weight.

ⓐ Let x be your BMI. Research and then write the compound inequality to show the BMI range for you to be considered normal weight.

ⓑ Research a BMI calculator and determine your BMI. Is it a solution to the inequality in part (a)?

Answer

ⓐ answers vary ⓑ answers vary

Writing Exercises

57. In your own words, explain the difference between the properties of equality and the properties of inequality.

58. Explain the steps for solving the compound inequality $2 - 7x \geq -5$ or $4(x - 3) + 7 > 3$.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve compound inequalities with "and".			
solve compound inequalities with "or".			
solve applications with compound inequalities.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

19.3: Solve Absolute Value Equations and Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Solve absolute value equations
- Solve absolute value inequalities with “less than”
- Solve absolute value inequalities with “greater than”
- Solve applications with absolute value

Before you get started, take this readiness quiz.

1. Evaluate: $-|7|$.
   If you missed this problem, review [link].
2. Fill in $<, >, <, >$, or $=$ for each of the following pairs of numbers.
   ⓐ $|-8|___-|-8|$ ⓑ $12___-|-12|$ ⓒ $|-6|___-6$ ⓓ $-(-15)___-|-15|$
   If you missed this problem, review [link].
3. Simplify: $14-2|8-3(4-1)|$.
   If you missed this problem, review [link].

Solve Absolute Value Equations

As we prepare to solve absolute value equations, we review our definition of **absolute value**.

ABSOLUTE VALUE

The absolute value of a number is its distance from zero on the number line.

The absolute value of a number n is written as $|n|$ and $|n| \geq 0$ for all numbers.

Absolute values are always greater than or equal to zero.

We learned that both a number and its opposite are the same distance from zero on the number line. Since they have the same distance from zero, they have the same absolute value. For example:

- -5 is 5 units away from 0, so $|-5| = 5$.
- 5 is 5 units away from 0, so $|5| = 5$.

Figure $19.3.1$ illustrates this idea.

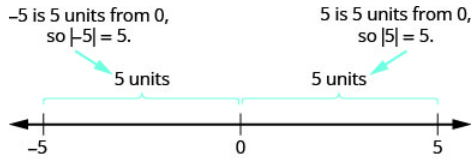

Figure 19.3.1: The numbers 5 and -5 are both five units away from zero.

For the equation |x|=5,|x|=5, we are looking for all numbers that make this a true statement. We are looking for the numbers whose distance from zero is 5. We just saw that both 5 and −5−5 are five units from zero on the number line. They are the solutions to the equation.

$$\begin{array}{ll} \text{If} & |x| = 5 \\ \text{then} & x = -5 \text{ or } x = 5 \end{array}$$

The solution can be simplified to a single statement by writing $x = \pm 5$. This is read, “x is equal to positive or negative 5”.

We can generalize this to the following property for absolute value equations.

ABSOLUTE VALUE EQUATIONS

For any algebraic expression, u, and any positive real number, a,

$$\begin{aligned} &\text{if} && |u| = a \\ &\text{then} && u = -a \text{ or } u = a \end{aligned}$$

Remember that an absolute value cannot be a negative number.

Example 19.3.1

Solve:

a. $|x| = 8$
b. $|y| = -6$
c. $|z| = 0$

Solution a

$$\begin{aligned} & && |x| = 8 \\ &\text{Write the equivalent equations.} && x = -8 \text{ or } x = 8 \\ & && x = \pm 8 \end{aligned}$$

Solution b

$$|y| = -6$$

No solution

Since an absolute value is always positive, there are no solutions to this equation.

Solution c

$$\begin{aligned} & && |z| = 0 \\ &\text{Write the equivalent equations.} && z = -0 \text{ or } z = 0 \\ &\text{Since } -0 = 0, && z = 0 \end{aligned}$$

Both equations tell us that z=0z=0 and so there is only one solution.

EXERCISE 19.3.2

Solve:

a. $|x| = 2$
b. $|y| = -4$
c. $|z| = 0$

Answer a

± 2

Answer b

no solution

Answer c

0

EXERCISE 19.3.3

Solve:

a. $|x| = 11$
b. $|y| = -5$

c. $|z| = 0$

Answer a

± 11

Answer b

no solution

Answer c

0

To solve an **absolute value equation**, we first isolate the absolute value expression using the same procedures we used to solve linear equations. Once we isolate the absolute value expression we rewrite it as the two equivalent equations.

How to Solve Absolute Value Equations

? Example 19.3.4

Solve $|5x - 4| - 3 = 8$.

Solution

Step 1. Isolate the absolute value expression.	Add 3 to both sides.	$\|5x-4\|-3=8$ $\|5x-4\|=11$
Step 2. Write the equivalent equations.		$5x-4=-11$ or $5x-4=11$
Step 3. Solve each equation.	Add 4 to each side. Divide each side by 5.	$5x=-7$ $\quad 5x=15$ $x=-\frac{7}{5}$ or $x=3$
Step 4. Check each solution.	Substitute 3 and $-\frac{7}{5}$ into the original equation.	$\|5x-4\|-3=8$ $x=3$ $\|5\cdot 3-4\|-3\stackrel{?}{=}8$ $\|15-4\|-3\stackrel{?}{=}8$ $\|11\|-3\stackrel{?}{=}8$ $11-3\stackrel{?}{=}8$ $8=8$ ✓ $\|5x-4\|-3=8$ $x=-\frac{7}{5}$ $\left\|5\left(-\frac{7}{5}\right)-4\right\|-3\stackrel{?}{=}8$ $\|-7-4\|-3\stackrel{?}{=}8$ $\|-11\|-3\stackrel{?}{=}8$ $11-3\stackrel{?}{=}8$ $8=8$ ✓

? EXERCISE 19.3.5

Solve: $|3x - 5| - 1 = 6$.

Answer

$x = 4,\ x = -\frac{2}{3}$

EXERCISE 19.3.6

Solve: $|4x - 3| - 5 = 2$.

Answer

$x = -1,\ x = \frac{5}{2}$

The steps for solving an absolute value equation are summarized here.

SOLVE ABSOLUTE VALUE EQUATIONS.

1. Isolate the absolute value expression.
2. Write the equivalent equations.
3. Solve each equation.
4. Check each solution.

Example 19.3.7

Solve $2|x - 7| + 5 = 9$.

Solution

	$2\|x - 7\| + 5 = 9$
Isolate the absolute value expression.	$2\|x - 7\| = 4$
	$\|x - 7\| = 2$
Write the equivalent equations.	$x - 7 = -2$ or $x - 7 = 2$
Solve each equation.	$x = 5$ or $x = 9$
Check: $2\|x-7\|+5=9$ $2\|5-7\|+5\stackrel{?}{=}9$ $2\|-2\|+5\stackrel{?}{=}9$ $2\cdot2+5\stackrel{?}{=}9$ $4+5\stackrel{?}{=}9$ $9=9$ ✓	$2\|x-7\|+5=9$ $2\|9-7\|+5\stackrel{?}{=}9$ $2\|2\|+5\stackrel{?}{=}9$ $2\cdot2+5\stackrel{?}{=}9$ $4+5\stackrel{?}{=}9$ $9=9$ ✓

Exercise 19.3.8

Solve: $3|x - 4| - 4 = 8$.

Answer

$x = 8,\ x = 0$

Exercise 19.3.9

Solve: $2|x - 5| + 3 = 9$.

Answer

$x = 8,\ x = 2$

Remember, an absolute value is always positive!

Example 19.3.10

Solve: $|\frac{2}{3}x - 4| + 11 = 3$.

Solution

	$|\frac{2}{3}x - 4| = -8$
Isolate the absolute value term.	$|\frac{2}{3}x - 4| = -8$
An absolute value cannot be negative.	No solution

Exercise 19.3.11

Solve: $|\frac{3}{4}x - 5| + 9 = 4$.

Answer

No solution

Exercise 19.3.12

Solve: $|\frac{5}{6}x + 3| + 8 = 6$.

Answer

No solution

Some of our absolute value equations could be of the form $|u| = |v|$ where u and v are algebraic expressions. For example, $|x - 3| = |2x + 1|$.

How would we solve them? If two algebraic expressions are equal in absolute value, then they are either equal to each other or negatives of each other. The property for absolute value equations says that for any algebraic expression, u, and a positive real number, a, if $|u| = a$, then $u = -a$ or $u = a$.

This tell us that

if	$|u| = |v|$		
then	$|u| = v$	or	$|u| = -v$
and so	$u = v$ or $u = -v$	or	$u = -v$ or $u = -(-v)$

This leads us to the following property for equations with two absolute values.

EQUATIONS WITH TWO ABSOLUTE VALUES

For any algebraic expressions, u and v,

if	$|u| = |v|$
then	$u = -v$ or $u = v$

When we take the opposite of a quantity, we must be careful with the signs and to add parentheses where needed.

Example 19.3.13

Solve: $|5x-1|=|2x+3|$.

Solution

$$|5x-1|=|2x+3|$$

Write the equivalent equations.	$5x-1=-(2x+3)$	or	$5x-1=2x+3$
	$5x-1=-2x-3$	or	$3x-1=3$
Solve each equation.	$7x-1=-3$		$3x=4$
	$7x=-2$		$x=43$
	$x=-27$	or	$x=43$

Check.

We leave the check to you.

Exercise 19.3.14

Solve: $|7x-3|=|3x+7|$.

Answer

$x=-\frac{2}{5},\ x=\frac{5}{2}$

Exercise 19.3.15

Solve: $|6x-5|=|3x+4|$.

Answer

$x=3, x=19$

Solve Absolute Value Inequalities with "Less Than"

Let's look now at what happens when we have an **absolute value inequality**. Everything we've learned about solving inequalities still holds, but we must consider how the absolute value impacts our work. Again we will look at our definition of absolute value. The absolute value of a number is its distance from zero on the number line. For the equation $|x|=5$, we saw that both 5 and -5 are five units from zero on the number line. They are the solutions to the equation.

$$|x|=5$$
$$x=-5 \quad \text{or} \quad x=5$$

What about the inequality $|x|\leq 5$? Where are the numbers whose distance is less than or equal to 5? We know -5 and 5 are both five units from zero. All the numbers between -5 and 5 are less than five units from zero (Figure 19.3.2).

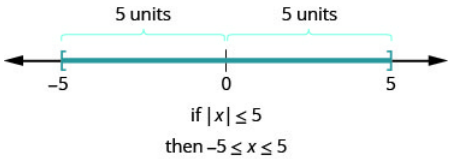

Figure 19.3.2.

In a more general way, we can see that if $|u|\leq a$, then $-a\leq u\leq a$ (Figure 19.3.3).

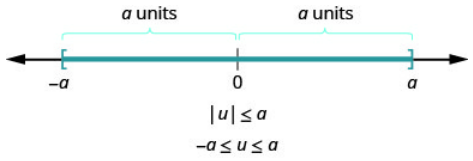

Figure 19.3.3.

This result is summarized here.

ABSOLUTE VALUE INEQUALITIES WITH $<$ OR $\leq$

For any algebraic expression, u, and any positive real number, a,

$$\text{if} \quad |u| < a, \quad \text{then} \quad -a < u < a$$
$$\text{if} \quad |u| \leq a, \quad \text{then} \quad -a \leq u \leq a$$

After solving an inequality, it is often helpful to check some points to see if the solution makes sense. The graph of the solution divides the number line into three sections. Choose a value in each section and substitute it in the original inequality to see if it makes the inequality true or not. While this is not a complete check, it often helps verify the solution.

Example 19.3.16

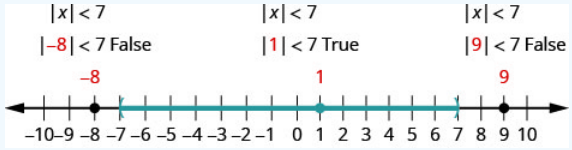
Solve $|x| < 7$. Graph the solution and write the solution in interval notation.

Solution

	$\|x\| < 7$
Write the equivalent inequality.	$-7 < x < 7$
Graph the solution.	
Write the solution using interval notation.	$(-7, 7)$

Check:

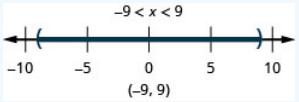
To verify, check a value in each section of the number line showing the solution. Choose numbers such as −8,−8, 1, and 9.



EXERCISE 19.3.17

Graph the solution and write the solution in interval notation: $|x| < 9$.

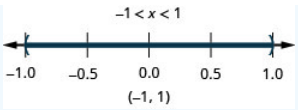
Answer



EXERCISE 19.3.18

Graph the solution and write the solution in interval notation: $|x| < 1$.

Answer



Example 19.3.19

Solve $|5x-6| \leq 4$. Graph the solution and write the solution in interval notation.

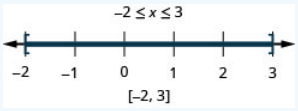
Solution

Step 1. Isolate the absolute value expression. It is isolated.	$\|5x-6\| \leq 4$
Step 2. Write the equivalent compound inequality.	$-4 \leq 5x-6 \leq 4$
Step 3. Solve the compound inequality.	$2 \leq 5x \leq 10$ $\frac{2}{5} \leq x \leq 2$
Step 4. Graph the solution.	
Step 5. Write the solution using interval notation.	$[\frac{2}{5}, 2]$
Check: The check is left to you.	

EXERCISE 19.3.20

Solve $|2x-1| \leq 5$. Graph the solution and write the solution in interval notation:

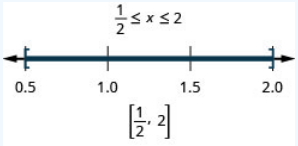
Answer



EXERCISE 19.3.21

Solve $|4x-5| \leq 3$. Graph the solution and write the solution in interval notation:

Answer



SOLVE ABSOLUTE VALUE INEQUALITIES WITH $<$ OR $\leq$

1. Isolate the absolute value expression.
2. Write the equivalent compound inequality.

$$|u| < a \quad \text{is equivalent to} \quad -a < u < a$$
$$|u| \leq a \quad \text{is equivalent to} \quad -a \leq u \leq a$$

3. Solve the compound inequality.
4. Graph the solution

5. Write the solution using interval notation.

Solve Absolute Value Inequalities with “Greater Than”

What happens for absolute value inequalities that have “greater than”? Again we will look at our definition of absolute value. The absolute value of a number is its distance from zero on the number line.

We started with the inequality $|x| \leq 5$. We saw that the numbers whose distance is less than or equal to five from zero on the number line were -5 and 5 and all the numbers between -5 and 5 (Figure 19.3.4).

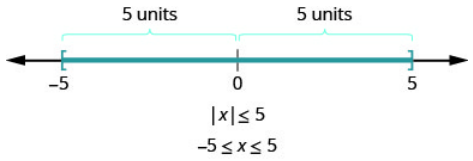


Figure 19.3.4.

Now we want to look at the inequality $|x| \geq 5$. Where are the numbers whose distance from zero is greater than or equal to five?

Again both -5 and 5 are five units from zero and so are included in the solution. Numbers whose distance from zero is greater than five units would be less than -5 and greater than 5 on the number line (Figure 19.3.5).

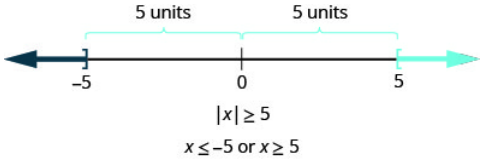

Figure 19.3.5.

In a more general way, we can see that if $|u| \geq a$, then $u \leq -a$ or $u \leq a$. See Figure.

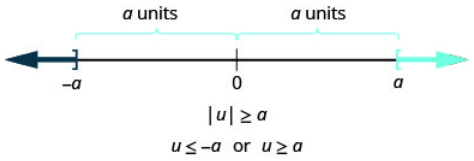

Figure 19.3.6.

This result is summarized here.

ABSOLUTE VALUE INEQUALITIES WITH $>$ OR $\geq$

For any algebraic expression, u, and any positive real number, a,

$$\text{if} \quad |u| > a, \quad \text{then } u < -a \text{ or } u > a$$
$$\text{if} \quad |u| \geq a, \quad \text{then } u \leq -a \text{ or } u \geq a$$

Example 19.3.22

Solve $|x| > 4$. Graph the solution and write the solution in interval notation.

Solution

	$\lvert x\rvert > 4$
Write the equivalent inequality.	$x < -4$ or $x > 4$
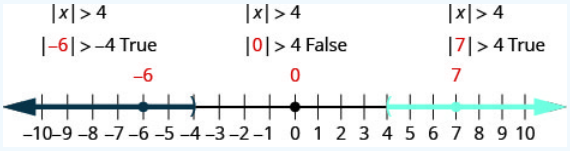
Graph the solution.	Write the solution using interval notation.	$(-\inf, -4) \cup (4, \inf)$
Check:	

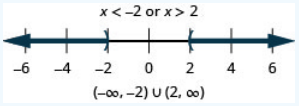
To verify, check a value in each section of the number line showing the solution. Choose numbers such as −6,−6, 0, and 7.



EXERCISE 19.3.23

Solve $|x| > 2$. Graph the solution and write the solution in interval notation.

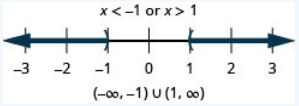
Answer



EXERCISE 19.3.24

Solve $|x| > 1$. Graph the solution and write the solution in interval notation.

Answer



Example 19.3.25

Solve $|2x-3| \geq 5$. Graph the solution and write the solution in interval notation.

Solution

	$\|2x-3\| \geq 5$
Step 1. Isolate the absolute value expression. It is isolated.	
Step 2. Write the equivalent compound inequality.	$2x-3 \leq -5$ or $2x-3 \geq 5$
Step 3. Solve the compound inequality.	$2x \leq -2$ or $2x \geq 8$ $x \leq -1$ or $x \geq 4$
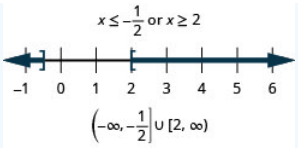
Step 4. Graph the solution.	Step 5. Write the solution using interval notation.	$(-\inf, -1] \cup [4, \inf)$
Check: The check is left to you.	

EXERCISE 19.3.26

Solve $|4x-3| \geq 5$. Graph the solution and write the solution in interval notation.

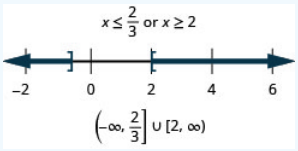
Answer



EXERCISE 19.3.27

Solve $|3x - 4| \ge 2$. Graph the solution and write the solution in interval notation.

Answer



SOLVE ABSOLUTE VALUE INEQUALITIES WITH $>$ OR $\ge$.

1. Isolate the absolute value expression.
2. Write the equivalent compound inequality.

$$\begin{array}{lllll} |u| > a & \text{is equivalent to} & u < -a & \text{or} & u > a \\ |u| \ge a & \text{is equivalent to} & u \le -a & \text{or} & u \ge a \\ |u| > a & \text{is equivalent to} & u < -a & \text{or} & u > a \\ |u| \ge a & \text{is equivalent to} & u \le -a & \text{or} & u \ge a \end{array}$$

3. Solve the compound inequality.
4. Graph the solution
5. Write the solution using interval notation.

Solve Applications with Absolute Value

Absolute value inequalities are often used in the manufacturing process. An item must be made with near perfect specifications. Usually there is a certain *tolerance* of the difference from the specifications that is allowed. If the difference from the specifications exceeds the tolerance, the item is rejected.

$$|\text{actual-ideal}| \le \text{tolerance}$$

Example 19.3.28

The ideal diameter of a rod needed for a machine is 60 mm. The actual diameter can vary from the ideal diameter by 0.075 mm. What range of diameters will be acceptable to the customer without causing the rod to be rejected?

Solution

	Let $x =$ the actual measurement
Use an absolute value inequality to express this situation.	$\|\text{actual-ideal}\| \le \text{tolerance}$
	$\|x - 60\| \le 0.075$
Rewrite as a compound inequality.	$-0.075 \le x - 60 \le 0.075$
Solve the inequality.	$59.925 \le x \le 60.075$
Answer the question.	The diameter of the rod can be between $59.925mm$ and $60.075mm$.

EXERCISE 19.3.29

The ideal diameter of a rod needed for a machine is 80 mm. The actual diameter can vary from the ideal diameter by 0.009 mm. What range of diameters will be acceptable to the customer without causing the rod to be rejected?

Answer

The diameter of the rod can be between 79.991 and 80.009 mm.

EXERCISE 19.3.30

The ideal diameter of a rod needed for a machine is 75 mm. The actual diameter can vary from the ideal diameter by 0.05 mm. What range of diameters will be acceptable to the customer without causing the rod to be rejected?

Answer

The diameter of the rod can be between 74.95 and 75.05 mm.

Access this online resource for additional instruction and practice with solving linear absolute value equations and inequalities.

- Solving Linear Absolute Value Equations and Inequalities

Key Concepts

- **Absolute Value**
  The absolute value of a number is its distance from 0 on the number line.
  The absolute value of a number *n* is written as $|n|$ and $|n| \geq 0$ for all numbers.
  Absolute values are always greater than or equal to zero.
- **Absolute Value Equations**
  For any algebraic expression, *u*, and any positive real number, *a*,
  if $|u| = a$
  then $u = -a$ or $u = a$
  Remember that an absolute value cannot be a negative number.
- **How to Solve Absolute Value Equations**
  1. Isolate the absolute value expression.
  2. Write the equivalent equations.
  3. Solve each equation.
  4. Check each solution.
- **Equations with Two Absolute Values**
  For any algebraic expressions, *u* and *v*,
  if $|u| = |v|$
  then $u = -v$ or $u = v$
- **Absolute Value Inequalities with** $<$ or $\leq$
  For any algebraic expression, *u*, and any positive real number, *a*,
  if $|u| = a$ then $-a < u < a$
  if $|u| \leq a$ then $-a \leq u \leq a$
- **How To Solve Absolute Value Inequalities with** $<$ or $\leq$
  1. Isolate the absolute value expression.
  2. Write the equivalent compound inequality.
     $|u| < a$ is equivalent to $-a < u < a$
     $|u| \leq a$ is equivalent to $-a \leq u \leq a$
  3. Solve the compound inequality.
  4. Graph the solution
  5. Write the solution using interval notation

- **Absolute Value Inequalities with $>$ or $\geq$**
  For any algebraic expression, u, and any positive real number, a,
  if $|u| > a$, then $u < -a$ or $u > a$
  if $|u| \geq a$, then $u \leq -a$ or $u \geq a$
- **How To Solve Absolute Value Inequalities with $>$ or $\geq$**
  1. Isolate the absolute value expression.
  2. Write the equivalent compound inequality.
     $|u| > a$ is equivalent to $u < -a$ or $u > a$
     $|u| \geq a$ is equivalent to $u \leq -a$ or $u \geq a$
  3. Solve the compound inequality.
  4. Graph the solution
  5. Write the solution using interval notation

19.3E: Exercises

Practice Makes Perfect

Solve Absolute Value Equations

In the following exercises, solve.

1. a. $|x| = 6$ b. $|y| = -3$ c. $|z| = 0$

2. a. $|x| = 4$ b. $|y| = -5$ c. $|z| = 0$

Answer

a. $x = 4, x = -4$ b. no solution c. $z = 0$

3. a. $|x| = 7$ b. $|y| = -11$ c. $|z| = 0$

4. a. $|x| = 3$ b. $|y| = -1$ c. $|z| = 0$

Answer

a. $x = 3, x = -3$ b. no solution c. $z = 0$

5. $|2x - 3| - 4 = 1$

6. $|4x - 1| - 3 = 0$

Answer

$x = 1,\ x = -\frac{1}{2}$

7. $|3x - 4| + 5 = 7$

8. $|4x + 7| + 2 = 5$

Answer

$x = -1,\ x = -\frac{5}{2}$

9. $4|x - 1| + 2 = 10$

10. $3|x - 4| + 2 = 11$

Answer

$x = 7,\ x = 1$

11. $3|4x - 5| - 4 = 11$

12. $3|x + 2| - 5 = 4$

Answer

$x = 1,\ x = -5$

13. $-2|x-3|+8=-4$

14. $-3|x-4|+4=-5$

Answer

$x=7,\ x=1$

15. $|34x-3|+7=2$

16. $|35x-2|+5=2$

Answer

no solution

17. $|12x+5|+4=1$

18. $|14x+3|+3=1$

Answer

no solution

19. $|3x-2|=|2x-3|$

20. $|4x+3|=|2x+1|$

Answer

$x=-1,\ x=-\frac{2}{3}$

21. $|6x-5|=|2x+3|$

22. $|6-x|=|3-2x|$

Answer

$x=-3,\ x=3$

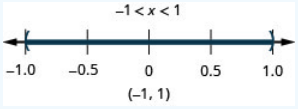
Solve Absolute Value Inequalities with "less than"

In the following exercises, solve each inequality. Graph the solution and write the solution in interval notation.

23. $|x|<5$

24. $|x|<1$

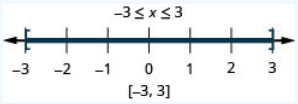
Answer



25. $|x|\leq 8$

26. $|x| \leq 3$

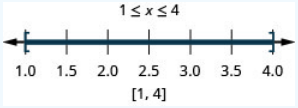
Answer



27. $|3x - 3| \leq 6$

28. $|2x - 5| \leq 3$

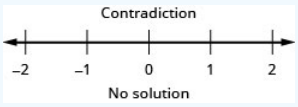
Answer



29. $|2x + 3| + 5 < 4$

30. $|3x - 7| + 3 < 1$

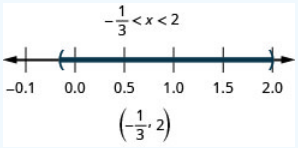
Answer



31. $|4x - 3| < 1$

32. $|6x - 5| < 7$

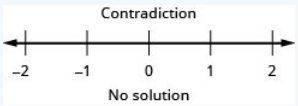
Answer



33. $|x - 4| \leq -1$

34. $|5x + 1| \leq -2$

Answer



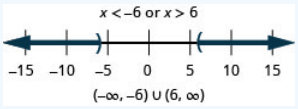
Solve Absolute Value Inequalities with "greater than"

In the following exercises, solve each inequality. Graph the solution and write the solution in interval notation.

35. $|x| > 3$

36. $|x| > 6$

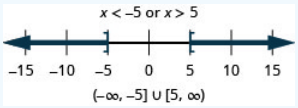
Answer



37. $|x| \geq 2$

38. $|x| \geq 5$

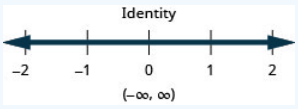
Answer



39. $|3x - 8| > -1$

40. $|x - 5| > -2$

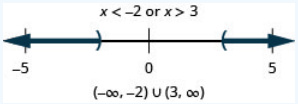
Answer



41. $|3x - 2| > 4$

42. $|2x - 1| > 5$

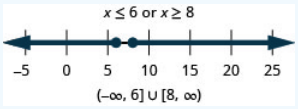
Answer



43. $|x + 3| \geq 5$

44. $|x - 7| \geq 1$

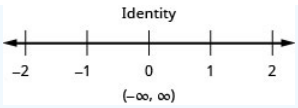
Answer



45. $3|x| + 4 \geq 1$

46. $5|x| + 6 \geq 1$

Answer



In the following exercises, solve. For each inequality, also graph the solution and write the solution in interval notation.

47. $2|x+6|+4=8$

48. $|3x-4| \geq 2$

Answer

$x=4, x=27$

49. $|6x-5|=|2x+3|$

50. $|4x-3|<5$

Answer

$x=3, x=2$

51. $|2x-5|+2=3$

52. $|3x+1|-3=7$

Answer

$x=3, x=-\frac{11}{3}$

53. $|7x+2|+8<4$

54. $5|2x-1|-3=7$

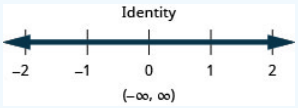
Answer

$x=\frac{3}{2}, x=-\frac{1}{2}$

55. $|x-7|>-3$

56. $|8-x|=|4-3x|$

Answer



Solve Applications with Absolute Value

In the following exercises, solve.

57. A chicken farm ideally produces 200,000 eggs per day. But this total can vary by as much as 25,000 eggs. What is the maximum and minimum expected production at the farm?

58. An organic juice bottler ideally produces 215,000 bottle per day. But this total can vary by as much as 7,500 bottles. What is the maximum and minimum expected production at the bottling company?

Answer

The minimum to maximum expected production is 207,500 to 2,225,000 bottles

59. In order to insure compliance with the law, Miguel routinely overshoots the weight of his tortillas by 0.5 gram. He just received a report that told him that he could be losing as much as $100,000 per year using this practice. He now plans to buy new equipment that guarantees the thickness of the tortilla within 0.005 inches. If the ideal thickness of the tortilla is 0.04 inches, what thickness of tortillas will be guaranteed?

60. At Lilly's Bakery, the ideal weight of a loaf of bread is 24 ounces. By law, the actual weight can vary from the ideal by 1.5 ounces. What range of weight will be acceptable to the inspector without causing the bakery being fined?

Answer

The acceptable weight is 22.5 to 25.5 ounces.

Writing Exercises

61. Write a graphical description of the absolute value of a number

62. In your own words, explain how to solve the absolute value inequality, $|3x-2| \geq 4$.

Answer

Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve absolute value equations.			
solve absolute value inequalities with "less than".			
solve absolute value inequalities with "greater than".			
solve applications with absolute value.			

b. What does this checklist tell you about your mastery of this section? What steps will you take to improve?

19.4: Solve Rational Inequalities

Learning Objectives

- Solve rational inequalities
- Solve an inequality with rational functions

Be Prepared

Before you get started, take this readiness quiz.

1. Find the value of $x-5$ when ⓐ $x=6$ ⓑ $x=-3$ ⓒ $x=5$
   If you missed this problem, review Example 1.2.16.
2. Solve: $8-2x<12$
   If you missed this problem, review Example 2.6.13.
3. Write in interval notation: $-3\le x<5$
   If you missed this problem, review Example 2.6.4.

Solve Rational Inequalities

We learned to solve linear inequalities after learning to solve linear equations. The techniques were very much the same with one major exception. When we multiplied or divided by a negative number, the inequality sign reversed.

Having just learned to solve rational equations we are now ready to solve rational inequalities. A rational inequality is an inequality that contains a rational expression.

Rational Inequality

A rational inequality is an inequality that contains a rational expression.

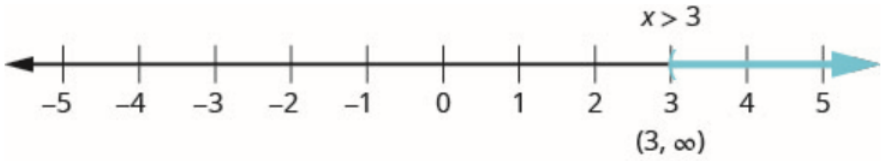
Inequalities such as $\frac{3}{2x}>1$, $\frac{2x}{x-3}<4$, $\frac{2x-3}{x-6}\ge x$, and $\frac{1}{4}-\frac{2}{x^2}\le\frac{3}{x}$ are rational inequalities as they each contain a rational expression.

When we solve a rational inequality, we will use many of the techniques we used solving linear inequalities. We especially must remember that when we multiply or divide by a negative number, the inequality sign must reverse.

Another difference is that we must carefully consider what value might make the rational expression undefined and so must be excluded.

When we solve an equation and the result is $x=3$, we know there is one solution, which is 3.

When we solve an inequality and the result is $x>3$, we know there are many solutions. We graph the result to better help show all the solutions, and we start with 3. Three becomes a critical point and then we decide whether to shade to the left or right of it. The numbers to the right of 3 are larger than 3, so we shade to the right.



To solve a rational inequality, we first must write the inequality with only one quotient on the left and 0 on the right.

Next we determine the critical points to use to divide the number line into intervals. A **critical point** is a number which make the rational expression zero or undefined.

We then will evaluate the factors of the numerator and denominator, and find the quotient in each interval. This will identify the interval, or intervals, that contains all the solutions of the rational inequality.

We write the solution in interval notation being careful to determine whether the endpoints are included.

Example 19.4.1

Solve and write the solution in interval notation: $\dfrac{x-1}{x+3} \geq 0$

Solution

Step 1. Write the inequality as one quotient on the left and zero on the right.

Our inequality is in this form.

$$\frac{x-1}{x+3} \geq 0$$

Step 2. Determine the critical points—the points where the rational expression will be zero or undefined.

The rational expression will be zero when the numerator is zero. Since $x-1=0$ when $x=1$, then 1 is a critical point.

The rational expression will be undefined when the denominator is zero. Since $x+3=0$ when $x=-3$, then -3 is a critical point.

The critical points are 1 and -3.

Step 3. Use the critical points to divide the number line into intervals.

The number line is divided into three intervals:

$$(-\infty,-3) \quad (-3,1) \quad (1,\infty)$$

Step 4. Test a value in each interval. Above the number line show the sign of each factor of the rational expression in each interval. Below the number line show the sign of the quotient.

To find the sign of each factor in an interval, we choose any point in that interval and use it as a test point. Any point in the interval will give the expression the same sign, so we can choose any point in the interval.

$$\text{Interval } (-\infty,-3)$$

The number -4 is in the interval $(-\infty,-3)$. Test $x=-4$ in the expression in the numerator and the denominator.

The numerator:

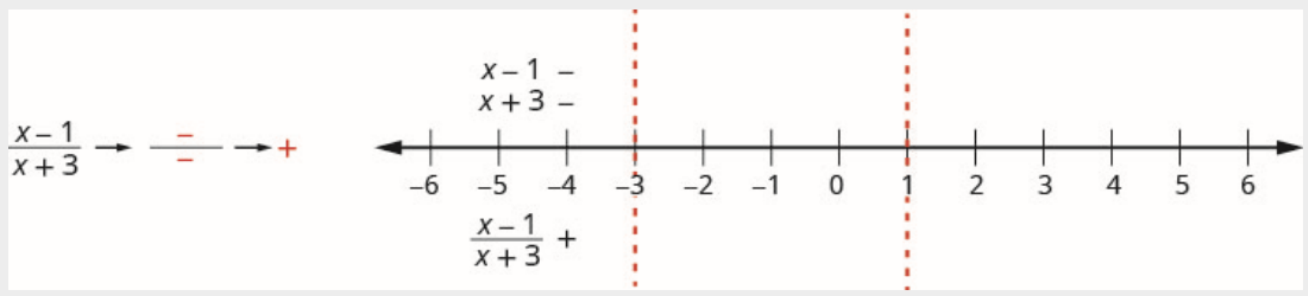
$$\begin{array}{l} x-1 \\ -4-1 \\ -5 \\ \text{Negative} \end{array}$$

The denominator:

$$\begin{array}{l} x+3 \\ -4+3 \\ -1 \\ \text{Negative} \end{array}$$

Above the number line, mark the factor $x-1$ negative and mark the factor $x+3$ negative.

Since a negative divided by a negative is positive, mark the quotient positive in the interval $(-\infty, -3)$.



Interval $(-3, 1)$

The number 0 is in the interval $(-3, 1)$. Test $x = 0$.

The numerator:

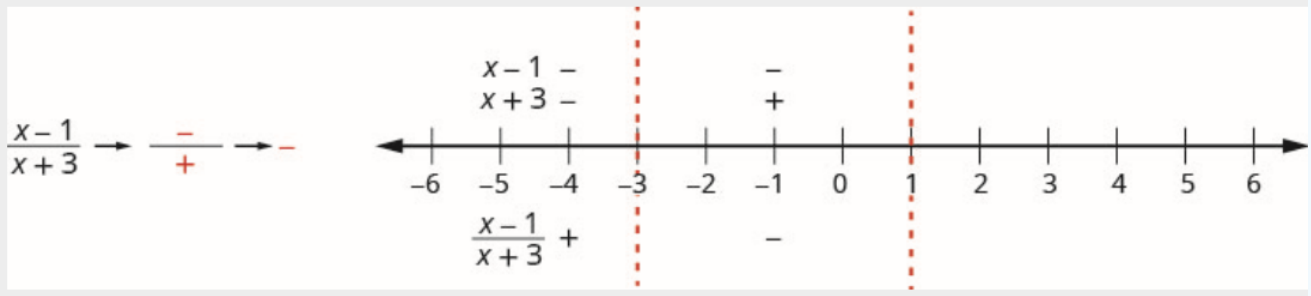
$$x-1$$
$$0-1$$
$$-1$$
Negative

The denominator:

$$x+3$$
$$0+3$$
$$3$$
Positive

Above the number line, mark the factor $x-1$ negative and mark $x+3$ positive.

Since a negative divided by a positive is negative, the quotient is marked negative in the interval $(-3, 1)$.



Interval $(1, \infty)$

The number 2 is in the interval $(1, \infty)$. Test $x = 2$.

The numerator:

$$x-1$$
$$2-1$$
$$1$$
Positive

The denominator:

$x+3$

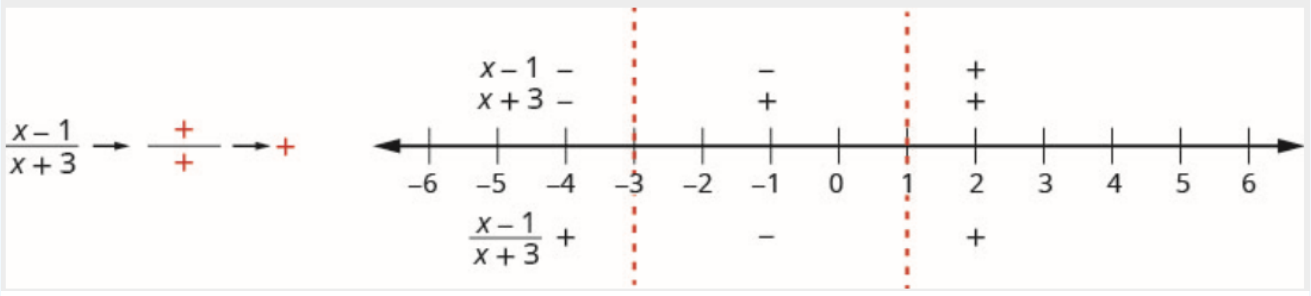
$2+3$

5

Positive

Above the number line, mark the factor $x-1$ positive and mark $x+3$ positive.

Since a positive divided by a positive is positive, mark the quotient positive in the interval $(1,\infty)$.



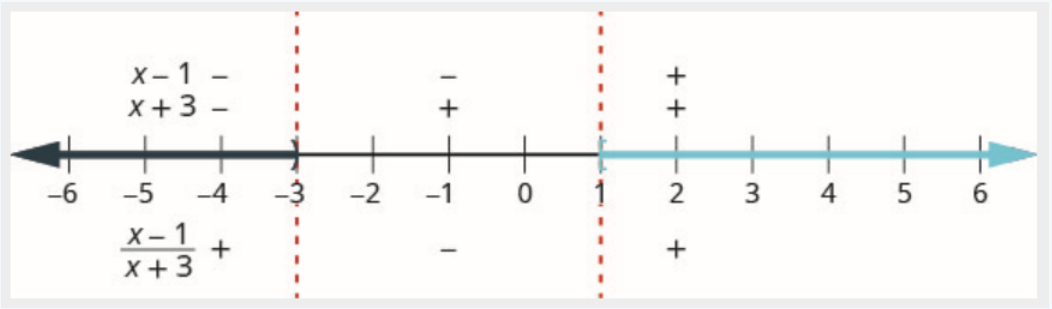
Step 5. Determine the intervals where the inequality is correct. Write the solution in interval notation.

We want the quotient to be greater than or equal to zero, so the numbers in the intervals $(-\infty,-3)$ and $(1,\infty)$are solutions.

But what about the critical points?

The critical point $x=-3$ makes the denominator 0, so it must be excluded from the solution and we mark it with a parenthesis.

The critical point $x=1$ makes the whole rational expression 0. The inequality requires that the rational expression be greater than or equal to. So, 1 is part of the solution and we will mark it with a bracket.



Recall that when we have a solution made up of more than one interval we use the union symbol, $\cup$, to connect the two intervals. The solution in interval notation is $(-\infty,-3)\cup[1,\infty)$.

Exercise 19.4.1

Solve and write the solution in interval notation: $\dfrac{x-2}{x+4}\geq 0$

Answer

$(-\infty,-4)\cup[2,\infty)$

Exercise 19.4.2

Solve and write the solution in interval notation: $\dfrac{x+2}{x-4}\geq 0$

Answer

$(-\infty, -2] \cup (4, \infty)$

We summarize the steps for easy reference.

How to Solve a rational inequality

Step 1. Write the inequality as one quotient on the left and zero on the right.

Step 2. Determine the critical points–the points where the rational expression will be zero or undefined.

Step 3. Use the critical points to divide the number line into intervals.

Step 4. Test a value in each interval. Above the number line show the sign of each factor of the numerator and denominator in each interval. Below the number line show the sign of the quotient.

Step 5. Determine the intervals where the inequality is correct. Write the solution in interval notation.

The next example requires that we first get the rational inequality into the correct form.

Example 19.4.2

Solve and write the solution in interval notation: $\frac{4x}{x-6} < 1$

Solution

$$\frac{4x}{x-6} < 1$$

Subtract 1 to get zero on the right.

$$\frac{4x}{x-6} - 1 < 0$$

Rewrite 1 as a fraction using the LCD.

$$\frac{4x}{x-6} - \frac{x-6}{x-6} < 0$$

Subtract the numerators and place the difference over the common denominator.

$$\frac{4x-(x-6)}{x-6} < 0$$

Simplify.

$$\frac{3x+6}{x-6} < 0$$

Factor the numerator to show all factors.

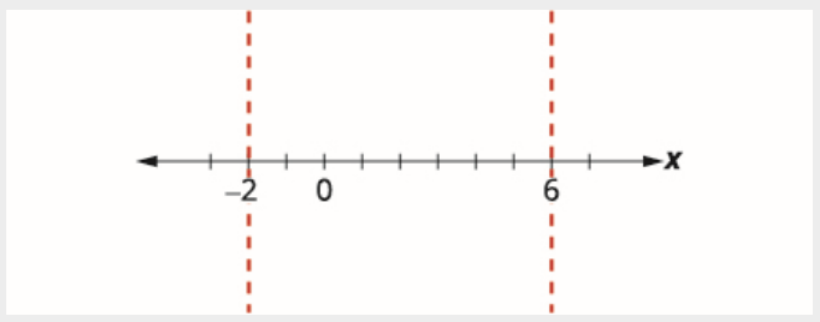
$$\frac{3(x+2)}{x-6} < 0$$

Find the critical points.

The quotient will be zero when the numerator is zero. The quotient is undefined when the denominator is zero.

$$\begin{aligned} x+2 &= 0 \qquad x-6 = 0 \\ x &= -2 \qquad\quad x = 6 \end{aligned}$$

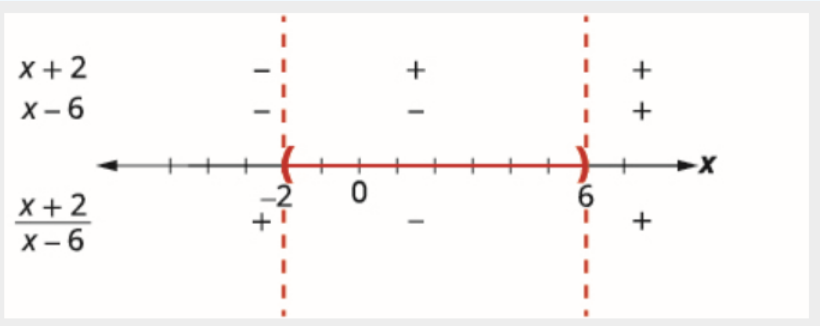
Use the critical points to divide the number line into intervals.



Test a value in each interval.

	$(-\infty, -2)$	$(-2, 6)$	$(6, \infty)$
$x + 2)$	x+2 -3+2 -1 -	x+2 0+2 2 +	x+2 7+2 9 +
$x - 6$	x-6 -3-6 -9 -	x-6 0-6 -6 -	x-6 7-6 1 +

Above the number line show the sign of each factor of the rational expression in each interval. Below the number line show the sign of the quotient.



Determine the intervals where the inequality is correct. We want the quotient to be negative, so the solution includes the points between −2 and 6. Since the inequality is strictly less than, the endpoints are not included.

We write the solution in interval notation as (−2, 6).

? Exercise 19.4.3

Solve and write the solution in interval notation: $\frac{3x}{x-3} < 1$.

Answer

$\left(-\frac{3}{2}, 3\right)$

Exercise 19.4.4

Solve and write the solution in interval notation: $\frac{3x}{x-4} < 2$.

Answer

$(-8, 4)$

In the next example, the numerator is always positive, so the sign of the rational expression depends on the sign of the denominator.

Example 19.4.3

Solve and write the solution in interval notation: $\frac{5}{x^2-2x-15} > 0$.

Solution

The inequality is in the correct form.

$$\frac{5}{x^2-2x-15} > 0$$

Factor the denominator.

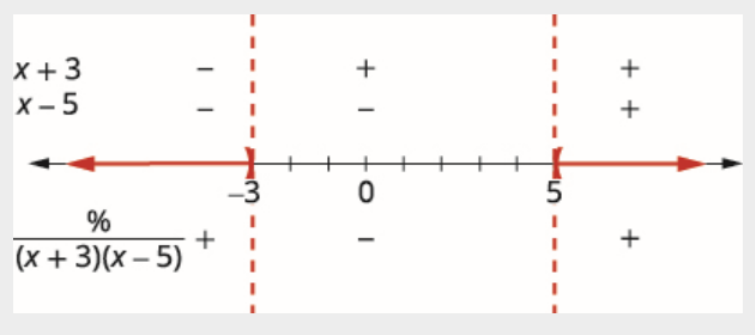
$$\frac{5}{(x+3)(x-5)} > 0$$

Find the critical points. The quotient is 0 when the numerator is 0. Since the numerator is always 5, the quotient cannot be 0.

The quotient will be undefined when the denominator is zero.

$$(x+3)(x-5) = 0$$
$$x = -3, x = 5$$

Use the critical points to divide the number line into intervals.



Test values in each interval. Above the number line show the sign of each factor of the denominator in each interval. Below the number line, show the sign of the quotient.

Write the solution in interval notation.

$$(-\infty, -3) \cup (5, \infty)$$

Exercise 19.4.5

Solve and write the solution in interval notation: $\frac{1}{x^2+2x-8} > 0$.

Answer

$(-\infty, -4) \cup (2, \infty)$

Exercise 19.4.6

Solve and write the solution in interval notation: $\dfrac{3}{x^2+x-12} > 0$.

Answer

$(-\infty, -4) \cup (3, \infty)$

The next example requires some work to get it into the needed form.

Example 19.4.4

Solve and write the solution in interval notation: $\dfrac{1}{3} - \dfrac{2}{x^2} < \dfrac{5}{3x}$.

Solution

$$\frac{1}{3} - \frac{2}{x^2} < \frac{5}{3x}$$

Subtract $\dfrac{5}{3x}$ to get zero on the right.

$$\frac{1}{3} - \frac{2}{x^2} - \frac{5}{3x} < 0$$

Rewrite to get each fraction with the LCD $3x^2$.

$$\frac{1 \cdot x^2}{3 \cdot x^2} - \frac{2 \cdot 3}{x^2 \cdot 3} - \frac{5 \cdot x}{3x - x} < 0$$

Simplify.

$$\frac{x^2}{3x^2} - \frac{6}{3x^2} - \frac{5x}{3x^2} < 0$$

Subtract the numerators and place the difference over the common denominator.

$$\frac{x^2 - 5x - 6}{3x^2} < 0$$

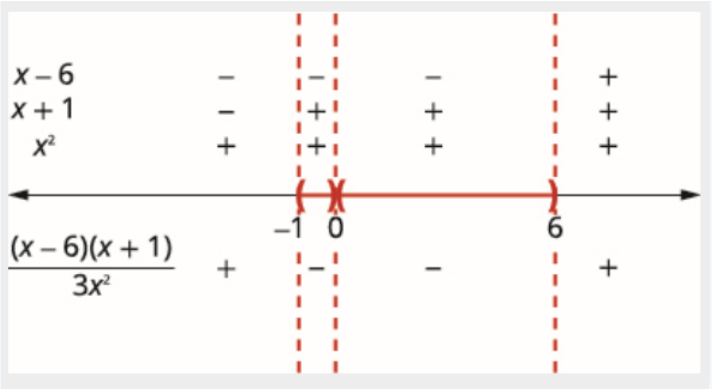
Factor the numerator.

$$\frac{(x-6)(x+1)}{3x^2} < 0$$

Find the critical points.

$$\begin{array}{lll} 3x^2 = 0 & x - 6 = 0 & x + 1 = 0 \\ x = 0 & x = 6 & x = -1 \end{array}$$

Use the critical points to divide the number line into intervals.



Above the number line show the sign of each factor in each interval. Below the number line, show the sign of the quotient.

Since, 0 is excluded, the solution is the two $(-1,0)\cup(0,6)$ intervals, $(-1,0)$ and $(0,6)$.

? Exercise 19.4.7

Solve and write the solution in interval notation: $\frac{1}{2}+\frac{4}{x^2}<\frac{3}{x}$.

Answer

$(2,4)$

? Exercise 19.4.8

Solve and write the solution in interval notation: $\frac{1}{3}+\frac{6}{x^2}<\frac{3}{x}$.

Answer

$(3,6)$

Solve an Inequality with Rational Functions

When working with rational functions, it is sometimes useful to know when the function is greater than or less than a particular value. This leads to a rational inequality.

✓ Example 19.4.5

Given the function $R(x)=\frac{x+3}{x-5}$, find the values of x that make the function less than or equal to 0.

Solution

We want the function to be less than or equal to 0.

$$R(x)\le 0$$

Substitute the rational expression for $R(x)$.

$$\frac{x+3}{x-5}\le 0 \quad x\neq 5$$

Find the critical points.

$$\begin{aligned} x+3&=0 & x-5&=0\\ x&=-3 & x&=5 \end{aligned}$$

Use the critical points to divide the number line into intervals.

Test values in each interval. Above the number line, show the sign of each factor in each interval. Below the number line, show the sign of the quotient. Write the solution in interval notation. Since 5 is excluded we, do not include it in the interval.

$$[-3, 5)$$

Exercise 19.4.9

Given the function $R(x) = \dfrac{x-2}{x+4}$, find the values of x that make the function less than or equal to 0.

Answer

$(-4, 2]$

Exercise 19.4.10

Given the function $R(x) = \dfrac{x+1}{x-4}$, find the values of x that make the function less than or equal to 0.

Answer

$[-1, 4)$

In economics, the function $C(x)$ is used to represent the cost of producing x units of a commodity. The average cost per unit can be found by dividing $C(x)$ by the number of items x. Then, the average cost per unit is \(c(x)=\dfrac{C(x)}{x}).

Example 19.4.6

The function$C(x) = 10x + 3000$ represents the cost to produce x, number of items. Find:

a. The average cost function, $c(x)$
b. How many items should be produced so that the average cost is less than $40.

Solution

a.
$$C(x) = 10x + 3000$$

The average cost function is $c(x) = \dfrac{C(x)}{x}$). To find the average cost function, divide the cost function by x.

$$c(x) = \frac{C(x)}{x}$$
$$c(x) = \frac{10x + 3000}{x}$$

The average cost function is $c(x) = \dfrac{10x + 3000}{x}$

b. We want the function $c(x)$ to be less than 40.

$$c(x) < 40$$

Substitute the rational expression forc(x).

$$\frac{10x+3000}{x} < 40, \quad x \neq 0$$

Subtract 40 to get 0 on the right.

$$\frac{10x+3000}{x} - 40 < 0$$

Rewrite the left side as one quotient by finding the LCD and performing the subtraction.

$$\begin{aligned} \frac{10x+3000}{x} - 40\left(\frac{x}{x}\right) &< 0 \\ \frac{10x+3000}{x} - \frac{40x}{x} &< 0 \\ \frac{10x+3000-40x}{x} &< 0 \\ \frac{-30x+3000}{x} &< 0 \end{aligned}$$

Factor the numerator to show all factors.

$$\begin{aligned} &\frac{-30(x-100)}{x} < 0 \\ &-30(x-100) = 0 \qquad x = 0 \end{aligned}$$

Find the critical points.

$$\begin{aligned} -30 \neq 0 \quad x - 100 &= 0 \\ x &= 100 \end{aligned}$$

More than 100 items must be produced to keep the average cost below $40 per item.

? Exercise 19.4.11

The function$C(x) = 20x + 6000$ represents the cost to produce x, number of items. Find:

a. How many items should be produced so that the average cost is less than $60.

Answer

a. $c(x) = \dfrac{20x+6000}{x}$

b. More than 150 items must be produced to keep the average cost below $60 per item.

? Exercise 19.4.12

The function$C(x) = 5x + 900$ represents the cost to produce x, number of items. Find:

a. How many items should be produced so that the average cost is less than $20.

Answer

a. $c(x) = \dfrac{5x+900}{x}$

b. More than 60 items must be produced to keep the average cost below $20 per item.

19.4E: Exercises

Solve Rational Inequalities

In the following exercises, solve each rational inequality and write the solution in interval notation.

1. $\frac{x-3}{x+4} \geq 0$

Answer

$(-\infty, -4) \cup [3, \infty)$

2. $\frac{x+6}{x-5} \geq 0$

3. $\frac{x+1}{x-3} \leq 0$

Answer

$[-1, 3)$

4. $\frac{x-4}{x+2} \leq 0$

5. $\frac{x-7}{x-1} > 0$

Answer

$(-\infty, 1) \cup (7, \infty)$

6. $\frac{x+8}{x+3} > 0$

7. $\frac{x-6}{x+5} < 0$

Answer

$(-5, 6)$

8. $\frac{x+5}{x-2} < 0$

9. $\frac{3x}{x-5} < 1$

Answer

$\left(-\frac{5}{2}, 5\right)$

10. $\frac{5x}{x-2} < 1$

11. $\frac{6x}{x-6} > 2$

Answer

$(-\infty, -3) \cup (6, \infty)$

12. $\frac{3x}{x-4} > 2$

13. $\frac{2x+3}{x-6} \leq 1$

Answer

$[-9, 6)$

14. $\frac{4x-1}{x-4} \leq 1$

15. $\frac{3x-2}{x-4} \geq 2$

Answer

$(-\infty, -6] \cup (4, \infty)$

16. $\frac{4x-3}{x-3} \geq 2$

17. $\frac{1}{a} + \frac{2}{5} = \frac{1}{2}$

Answer

$a = 10$

18. $\frac{1}{x^2-4x-12} > 0$

19. $\frac{3}{x^2-5x+4} < 0$

Answer

$(1, 4)$

20. $\frac{4}{x^2+7x+12} < 0$

21. $\frac{2}{2x^2+x-15} \geq 0$

Answer

$(-\infty, -3) \cup \left(\frac{5}{2}, \infty\right)$

22. $\dfrac{6}{3x^2-2x-5} \geq 0$

23. $\dfrac{-2}{6x^2-13x+6} \leq 0$

Answer

$\left(-\infty, \dfrac{2}{3}\right) \cup \left(\dfrac{3}{2}, \infty\right)$

24. $\dfrac{-1}{10x^2+11x-6} \leq 0$

17. $\dfrac{1}{a} + \dfrac{2}{5} = \dfrac{1}{2}$

Answer

$a = 10$

18. $\dfrac{1}{x^2-4x-12} > 0$

19. $\dfrac{3}{x^2-5x+4} < 0$

Answer

$(1, 4)$

20. $\dfrac{4}{x^2+7x+12} < 0$

25. $\dfrac{1}{2} + \dfrac{12}{x^2} > \dfrac{5}{x}$

Answer

$(-\infty, 0) \cup (0, 4) \cup (6, \infty)$

26. $\dfrac{1}{3} + \dfrac{1}{x^2} > \dfrac{4}{3x}$

27. $\dfrac{1}{2} - \dfrac{4}{x^2} \leq \dfrac{1}{x}$

Answer

$[-2, 0) \cup (0, 4]$

28. $\dfrac{1}{2} - \dfrac{3}{2x^2} \geq \dfrac{1}{x}$

29. $\dfrac{1}{x^2-16} < 0$

Answer

$(-4, 4)$

30. $\frac{4}{x^2 - 25} > 0$

31. $\frac{4}{x-2} \geq \frac{3}{x+1}$

Answer

$[-10, -1) \cup (2, \infty)$

32. $\frac{5}{x-1} \leq \frac{4}{x+2}$

Solve an Inequality with Rational Functions

In the following exercises, solve each rational function inequality and write the solution in interval notation.

33. Given the function $R(x) = \frac{x-5}{x-2}$, find the values of x that make the function less than or equal to 0.

Answer

$(2, 5]$

34. Given the function $R(x) = \frac{x+1}{x+3}$, find the values of x that make the function less than or equal to 0.

35. Given the function $R(x) = \frac{x-6}{x+2}$, find the values of x that make the function less than or equal to 0.

Answer

$(-\infty, -2) \cup [6, \infty)$

36. Given the function $R(x) = \frac{x+1}{x-4}$, find the values of x that make the function less than or equal to 0.

Writing Exercises

37. Write the steps you would use to explain solving rational inequalities to your little brother.

Answer

Answers will vary

38. Create a rational inequality whose solution is $(-\infty, -2] \cup [4, \infty)$.

19.5: Solve Quadratic Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Solve quadratic inequalities graphically
- Solve quadratic inequalities algebraically

Before you get started, take this readiness quiz.

1. Solve: $2x-3=0$.
   If you missed this problem, review Example 2.2.
2. Solve: $2y^2+y=15$.
   If you missed this problem, review Example 6.45.
3. Solve $\frac{1}{x^2+2x-8}>0$
   If you missed this problem, review Example 7.56.

We have learned how to solve linear inequalities and rational inequalities previously. Some of the techniques we used to solve them were the same and some were different. We will now learn to solve inequalities that have a quadratic expression. We will use some of the techniques from solving linear and rational inequalities as well as quadratic equations. We will solve quadratic inequalities two ways —both graphically and algebraically.

Solve Quadratic Inequalities Graphically

A **quadratic equation** is in standard form when written as $ax^2+bx+c=0$. If we replace the equal sign with an inequality sign, we have a **quadratic inequality** in standard form.

Definition 19.5.1: Quadratic Inequality

A **quadratic inequality** is an inequality that contains a quadratic expression. The standard form of a quadratic inequality is written:

$$ax^2+bx+c<0 \quad ax^2+bx+c\le 0$$
$$ax^2+bx+c>0 \quad ax^2+bx+c\ge 0$$

The graph of a quadratic function $f(x)=ax^2+bx+c=0$ is a parabola. When we ask when is $ax^2+bx+c<0$, we are asking when is $f(x)<0$. We want to know when the parabola is below the x-axis.

When we ask when is $ax^2+bx+c>0$, we are asking when is $f(x)>0$. We want to know when the parabola is above the y-axis.

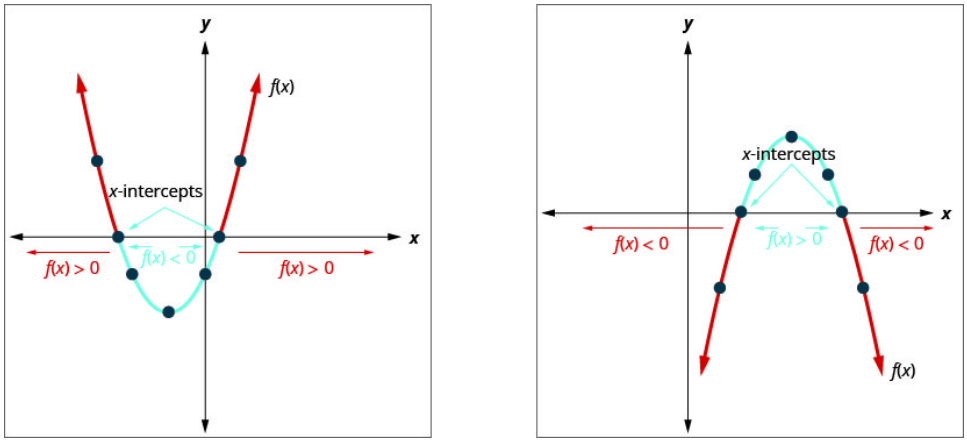

Figure 9.8.1

Example 19.5.1: How to Solve a Quadratic Inequality Graphically

Solve $x^2-6x+8<0$ graphically. Write the solution in interval notation.

Solution:

Step 1: Write the quadratic inequality in standard form.

The inequality is in standard form.

$$x^2-6x+8<0$$

Step 2: Graph the function $f(x)=ax^2+bx+c$ using properties or transformations.

We will graph using the properties.

$$f(x)=x^2-6x+8$$

Look at a in the equation.

$$a=1, b=-6, c=8$$

$f(x)=x^2-6x+8$

Since a is positive, the parabola opens upward.

The parabola opens upward.

Figure 9.8.2

$f(x)=x^2-6x+8$

The axis of symmetry is the line $x=-\frac{b}{2a}$.

Axis of Symmetry

$$x=-\frac{b}{2a}$$
$$x=-\frac{(-6)}{2\cdot 1}$$
$$x=3$$

The axis of symmetry is the line $x=3$.

The vertex is on the axis of symmetry. Substitute $x=3$ into the function.

Vertex

$$f(x)=x^2-6x+8$$
$$f(3)=(3)^2-6(3)+8$$
$$f(3)=-1$$

The vertex is $(3,-1)$.

We find $f(0)$

y-intercept

$$f(x)=x^2-6x+8$$
$$f(0)=(0)^2-6(0)+8$$
$$f(0)=8$$

The y-intercept is $(0,8)$.

We use the axis of symmetry to find a point symmetric to the y-intercept. The y-intercept is 3 units left of the axis of symmetry, $x=3$. A point 3 units to the right of the axis of symmetry has $x=6$.

Point symmetric to y-intercept

The point is $(6,8)$.

We solve $f(x) = 0$.

x-intercepts

We can solve this quadratic equation by factoring.

$$\begin{aligned} f(x) &= x^2 - 6x + 8 \\ 0 &= x^2 - 6x + 8 \\ 0 &= (x-2)(x-4) \\ x &= 2 \text{ or } x = 4 \end{aligned}$$

The x-intercepts are $(2,0)$ and $(4,0)$.

We graph the vertex, intercepts, and the point symmetric to the y-intercept. We connect these 5 points to sketch the parabola.

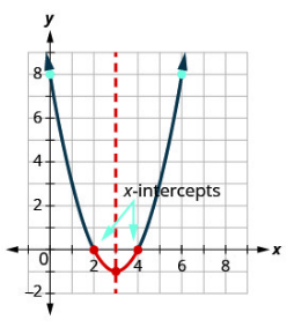

Figure 9.8.3

Step 3: Determine the solution from the graph.

$x^2 - 6x + 8 < 0$

The inequality asks for the values of x which make the function less than 0. Which values of x make the parabola below the x-axis.

We do not include the values 2, 4 as the inequality is less than only.

The solution, in interval notation, is $(2, 4)$.

Exercise 19.5.1

a. Solve $x^2 + 2x - 8 < 0$ graphically
b. Write the solution in interval notation

Answer

a.

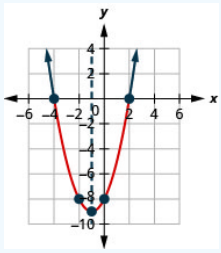

Figure 9.8.4

b. $(-4, 2)$

Exercise 19.5.2

a. Solve $x^2 - 8x + 12 \geq 0$ graphically
b. Write the solution in interval notation

Answer

a.

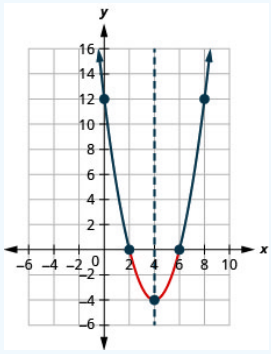

Figure 9.8.5

b. $(-\infty, 2] \cup [6, \infty)$

We list the steps to take to solve a quadratic inequality graphically.

Solve a Quadratic Inequality Graphically

1. Write the quadratic inequality in standard form.
2. Graph the function $f(x) = ax^2 + bx + c$.
3. Determine the solution from the graph.

In the last example, the parabola opened upward and in the next example, it opens downward. In both cases, we are looking for the part of the parabola that is below the x-axis but note how the position of the parabola affects the solution.

Example 19.5.2

Solve $-x^2 - 8x - 12 \leq 0$ graphically. Write the solution in interval notation.

Solution:

Table 9.8.1

The quadratic inequality in standard form.	$-x^2 - 8x - 12 \leq 0$
Graph the function $f(x) = -x^2 - 8x - 12$	The parabola opens downward. Figure 9.8.6
Find the line of symmetry.	$x = -\frac{b}{2a}$ $x = -\frac{-8}{2(-1)}$ $x = -4$
Find the vertex.	$f(x) = -x^2 - 8x - 12$ $f(-4) = -(-4)^2 - 8(-4) - 12$ $f(-4) = -16 + 32 - 12$ $f(-4) = 4$ Vertex $(-4, 4)$
Find the x-intercepts. Let $f(x) = 0$.	$f(x) = -x^2 - 8x - 12$ $0 = -x^2 - 8x - 12$
Factor: Use the Zero Product Property.	$0 = -1(x + 6)(x + 2)$ $x = -6 \quad x = -2$

Graph the parabola.	x-intercepts $(-6, 0), (-2.0)$  Figure 9.8.7
Determine the solution from the graph. We include the x-intercepts as the inequality is "less than or equal to."	$(-\infty, -6] \cup [-2, \infty)$

? Exercise 19.5.3

a. Solve $-x^2 - 6x - 5 > 0$ graphically
b. Write the solution in interval notation

Answer

a.

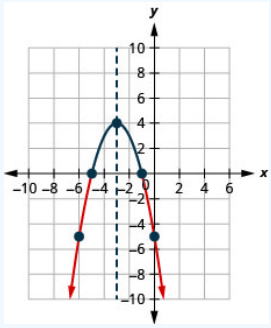

Figure 9.8.8

b. $(-5, -1)$

? Exercise 19.5.4

a. Solve $-x^2 + 10x - 16 \leq 0$ graphically
b. Write the solution in interval notation

Answer

a.

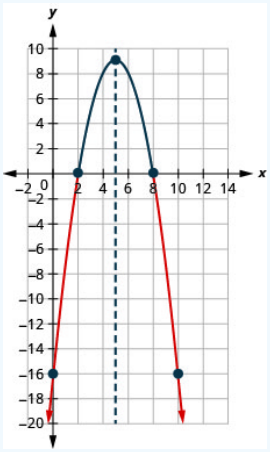

Figure 9.8.9

b. $(-\infty, 2] \cup [8, \infty)$

Solve Quadratic Inequalities Algebraically

The algebraic method we will use is very similar to the method we used to solve rational inequalities. We will find the critical points for the inequality, which will be the solutions to the related quadratic equation. Remember a polynomial expression can change signs only where the expression is zero.

We will use the **critical points** to divide the number line into intervals and then determine whether the quadratic expression will be positive or negative in the interval. We then determine the solution for the inequality.

Example 19.5.3: How to Solve Quadratic Inequalities Algebraically

Solve $x^2 - x - 12 \geq 0$ algebraically. Write the solution in interval notation.

Solution:

Table 9.8.2

Step 1: Write the quadratic inequality in standard form.	The inequality is in standard form.	$x^2 - x - 12 \geq 0$
Step 2: Determine the critical points--the solutions to the related quadratic equation.	Change the inequality sign to an equal sign and then solve the equation.	$x^2 - x - 12 = 0$ $(x+3)(x-4) = 0$ $x+3=0 \quad x-4=0$ $x=-3 \quad x=4$
Step 3: Use the critical points to divide the number line into intervals.	Use -3 and 4 to divide the number line into intervals.	Step 4: Above the number line show the sign of each quadratic expression using test points from each interval substituted from the original inequality.	Test: $x=-5$ $x=0$ $x=5$	$x^2 - x - 12$ $\quad$ $x^2 - x - 12$ $\quad$ $x^2 - x -$ $(-5)^2 - (-5) - 12$ $\quad$ $0^2 - 0 - 12$ $\quad$ $5^2 - 5 -$ $18 \quad -12 \quad 8$ 
Figure 9.8.11

Step 5: Determine the intervals where the inequality is correct. Write the solution in interval notation.	$x^2 - x - 12 \geq 0$ The inequality is positive in the first and last intervals and equals 0 at the points $-4, 3$.	The solution, in interval notation, is $(-\infty, -3] \cup [4, \infty)$.

? Exercise 19.5.5

Solve $x^2 + 2x - 8 \geq 0$ algebraically. Write the solution in interval notation.

Answer

$(-\infty, -4] \cup [2, \infty)$

? Exercise 19.5.6

Solve $x^2 - 2x - 15 \leq 0$ algebraically. Write the solution in interval notation.

Answer

$[-3, 5]$

In this example, since the expression $x^2 - x - 12$ factors nicely, we can also find the sign in each interval much like we did when we solved rational inequalities. We find the sign of each of the factors, and then the sign of the product. Our number line would like this:

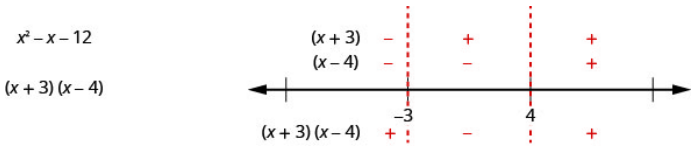

Figure 9.8.12

The result is the same as we found using the other method.

We summarize the steps here.

Solve a Quadratic Inequality Algebraically

1. Write the quadratic inequality in standard form.
2. Determine the critical points—the solutions to the related quadratic equation.
3. Use the critical points to divide the number line into intervals.
4. Above the number line show the sign of each quadratic expression using test points from each interval substituted into the original inequality.
5. Determine the intervals where the inequality is correct. Write the solution in interval notation.

✓ Example 19.5.4

Solve $x^2 + 6x - 7 \geq 0$ algebraically. Write the solution in interval notation.

Solution:

Table 9.8.3

Write the quadratic inequality in standard form.	$-x^2 + 6x - 7 \geq 0$
Multiply both sides of the inequality by -1. Remember to reverse the inequality sign.	$x^2 - 6x + 7 \leq 0$
Determine the critical points by solving the related quadratic equation.	$x^2 - 6x + 7 = 0$
Write the Quadratic Formula.	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$

Then substitute in the values of a, b, c.	$x = \frac{-(-6) \pm \sqrt{(-6)^2 - 4 \cdot 1 \cdot (7)}}{2 \cdot 1}$
Simplify.	$x = \frac{6 \pm \sqrt{8}}{2}$
Simplify the radical.	$x = \frac{6 \pm 2\sqrt{2}}{2}$
Remove the common factor, 2.	$x = \frac{2(3 \pm \sqrt{2})}{2}$ $x = 3 \pm \sqrt{2}$ $x = 3 + \sqrt{2} \quad x = 3 - \sqrt{2}$ $x \approx 1.6 \quad x \approx 4.4$
Use the critical points to divide the number line into intervals. Test numbers from each interval in the original inequality.	Determine the intervals where the inequality is correct. Write the solution in interval notation.	$-x^2 + 6x - 7 \geq 0$ in the middle interval $[3 - \sqrt{2}, 3 + \sqrt{2}]$

? Exercise 19.5.7

Solve $-x^2 + 2x + 1 \geq 0$ algebraically. Write the solution in interval notation.

Answer

$[-1 - \sqrt{2}, -1 + \sqrt{2}]$

? Exercise 19.5.8

Solve $-x^2 + 8x - 14 < 0$ algebraically. Write the solution in interval notation.

Answer

$(-\infty, 4 - \sqrt{2}) \cup (4 + \sqrt{2}, \infty)$

The solutions of the quadratic inequalities in each of the previous examples, were either an interval or the union of two intervals. This resulted from the fact that, in each case we found two solutions to the corresponding quadratic equation $ax^2 + bx + c = 0$. These two solutions then gave us either the two x-intercepts for the graph or the two critical points to divide the number line into intervals.

This correlates to our previous discussion of the number and type of solutions to a quadratic equation using the discriminant.

For a quadratic equation of the form $ax^2 + bc + c = 0, a \neq 0$.

Discriminant	Number/Type of solution	Typical Graph
$b^2 - 4ac > 0$	2 real solutions 2 x-intercepts on graph	$b^2 - 4ac = 0$	1 real solution 1 x-intercept on graph	$b^2 - 4ac < 0$	2 complex solutions No x-intercept	
Figure 9.8.14

The last row of the table shows us when the parabolas never intersect the x-axis. Using the Quadratic Formula to solve the quadratic equation, the radicand is a negative. We get two complex solutions.

In the next example, the quadratic inequality solutions will result from the solution of the quadratic equation being complex.

Example 19.5.5

Solve, writing any solution in interval notation:

a. $x^2 - 3x + 4 > 0$
b. $x^2 - 3x + 4 \leq 0$

Solution:

a.

Table 9.8.4

Write the quadratic inequality in standard form.	$-x^2 - 3x + 4 > 0$
Determine the critical points by solving the related quadratic equation.	$x^2 - 3x + 4 = 0$
Write the Quadratic Formula.	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
Then substitute in the values of a, b, c.	$x = \frac{-(-3) \pm \sqrt{(-3)^2 - 4 \cdot 1 \cdot (4)}}{2 \cdot 1}$
Simplify.	$x = \frac{3 \pm \sqrt{-7}}{2}$
Simplify the radicand.	$x = \frac{3 \pm \sqrt{7}i}{2}$
The complex solutions tell us the parabola does not intercept the x-axis. Also, the parabola opens upward. This tells us that the parabola is completely above the x-axis.	Complex solutions

Figure 9.8.15

We are to find the solution to $x^2-3x+4>0$. Since for all values of x the graph is above the x-axis, all values of x make the inequality true. In interval notation we write $(-\infty,\infty)$.

b. Write the quadratic inequality in standard form.

$$x^2-3x+4\leq 0$$

Determine the critical points by solving the related quadratic equation.

$$x^2-3x+4=0$$

Since the corresponding quadratic equation is the same as in part (a), the parabola will be the same. The parabola opens upward and is completely above the x-axis—no part of it is below the x-axis.

We are to find the solution to $x^2-3x+4\leq 0$. Since for all values of x the graph is never below the x-axis, no values of x make the inequality true. There is no solution to the inequality.

Exercise 19.5.9

Solve and write any solution in interval notation:

a. $-x^2+2x-4\leq 0$
b. $-x^2+2x-4\geq 0$

Answer

a. $(-\infty,\infty)$
b. no solution

Exercise 19.5.10

Solve and write any solution in interval notation:

a. $x^2+3x+3<0$
b. $x^2+3x+3>0$

Answer

a. no solution
b. $(-\infty,\infty)$

Key Concepts

- Solve a Quadratic Inequality Graphically
  1. Write the quadratic inequality in standard form.
  2. Graph the function $f(x)=ax^2+bx+c$ using properties or transformations.
  3. Determine the solution from the graph.
- How to Solve a Quadratic Inequality Algebraically
  1. Write the quadratic inequality in standard form.
  2. Determine the critical points -- the solutions to the related quadratic equation.
  3. Use the critical points to divide the number line into intervals.
  4. Above the number line show the sign of each quadratic expression using test points from each interval substituted into the original inequality.
  5. Determine the intervals where the inequality is correct. Write the solution in interval notation.

Glossary

quadratic inequality

A quadratic inequality is an inequality that contains a quadratic expression.

19.E: Review Exercises 1

Chapter Review Exercises

Use a General Strategy to Solve Linear Equations

Solve Equations Using the General Strategy for Solving Linear Equations

In the following exercises, determine whether each number is a solution to the equation.

1. $10x-1=5x, \quad x=\frac{1}{5}$

2. $-12n+5=8n, \quad n=-\frac{5}{4}$

Answer

no

In the following exercises, solve each linear equation.

3. $6(x+6)=24$

4. $-(s+4)=18$

Answer

$s=-22$ so the solution set is: $\{-22\}$.

5. $23-3(y-7)=8$

6. $\frac{1}{3}(6m+21)=m-7$

Answer

$m=-14$

7. $4(3.5y+0.25)=365$

8. $0.25(q-8)=0.1(q+7)$

Answer

$q=18$

9. $8(r-2)=6(r+10)$

10. $5+7(2-5x)=2(9x+1)-(13x-57)$

Answer

$x=-1$

11. $(9n+5)-(3n-7)=20-(4n-2)$

12. $2[-16+5(8k-6)]=8(3-4k)-32$

Answer

$k = \frac{3}{4}$

Classify Equations

In the following exercises, classify each equation as a conditional equation, an identity, or a contradiction and then state the solution.

13. $17y - 3(4 - 2y) = 11(y - 1) + 12y - 1$

14. $9u + 32 = 15(u - 4) - 3(2u + 21)$

Answer

contradiction; no solution

15. $-8(7m + 4) = -6(8m + 9)$

Solve Equations with Fraction or Decimal Coefficients

In the following exercises, solve each equation.

16. $\frac{2}{5}n - \frac{1}{10} = \frac{7}{10}$

Answer

$n = 2$

17. $\frac{3}{4}a - \frac{1}{3} = \frac{1}{2}a + \frac{5}{6}$

18. $\frac{1}{2}(k + 3) = \frac{1}{3}(k + 16)$

Answer

$k = 23$

19. $\frac{5y-1}{3} + 4 = \frac{-8y+4}{6}$

20. $0.8x - 0.3 = 0.7x + 0.2$

Answer

$x = 5$

21. $0.10d + 0.05(d - 4) = 2.05$

Use a Problem-Solving Strategy

Use a Problem Solving Strategy for Word Problems

In the following exercises, solve using the problem solving strategy for word problems.

22. Three-fourths of the people at a concert are children. If there are 87 children, what is the total number of people at the concert?

Answer

There are 116 people.

23. There are nine saxophone players in the band. The number of saxophone players is one less than twice the number of tuba players. Find the number of tuba players.

Solve Number Word Problems

In the following exercises, solve each number word problem.

24. The sum of a number and three is forty-one. Find the number.

Answer

38

25. One number is nine less than another. Their sum is negative twenty-seven. Find the numbers.

26. One number is two more than four times another. Their sum is negative thirteen. Find the numbers.

Answer

$-3, -10$

27. The sum of two consecutive integers is -135. Find the numbers.

28. Find three consecutive even integers whose sum is 234.

Answer

76, 78, 80

29. Find three consecutive odd integers whose sum is 51.

30. Koji has $5,502 in his savings account. This is $30 less than six times the amount in his checking account. How much money does Koji have in his checking account?

Answer

$922

Solve Percent Applications

In the following exercises, translate and solve.

31. What number is 67% of 250?

32. 12.5% of what number is 20?

Answer

160

33. What percent of 125 is 150?

In the following exercises, solve.

34. The bill for Dino's lunch was $19.45. He wanted to leave 20% of the total bill as a tip. How much should the tip be?

Answer

$3.89

35. Dolores bought a crib on sale for $350. The sale price was 40% of the original price. What was the original price of the crib?

36. Jaden earns $2,680 per month. He pays $938 a month for rent. What percent of his monthly pay goes to rent?

Answer

35

37. Angel received a raise in his annual salary from $55,400 to $56,785. Find the percent change.

38. Rowena's monthly gasoline bill dropped from $83.75 last month to $56.95 this month. Find the percent change.

Answer

32

39. Emmett bought a pair of shoes on sale at 40% off from an original price of $138. Find ⓐ the amount of discount and ⓑthe sale price.

40. Lacey bought a pair of boots on sale for $95. The original price of the boots was $200. Find ⓐ the amount of discount and ⓑ the discount rate. (Round to the nearest tenth of a percent, if needed.)

Answer

ⓐ $105ⓑ 52.5

41. Nga and Lauren bought a chest at a flea market for $50. They re-finished it and then added a 350% mark-up. Find ⓐthe amount of the mark-up and ⓑ the list price.

Solve Simple Interest Applications

In the following exercises, solve.

42. Winston deposited $3,294 in a bank account with interest rate 2.6% How much interest was earned in five years?

Answer

$428.22

43. Moira borrowed $4,500 from her grandfather to pay for her first year of college. Three years later, she repaid the $4,500 plus $243 interest. What was the rate of interest?

44. Jaime's refrigerator loan statement said he would pay $1,026 in interest for a four-year loan at 13.5%. How much did Jaime borrow to buy the refrigerator?

Answer

$1,900

Solve a formula for a Specific Variable

Solve a Formula for a Specific Variable

In the following exercises, solve the formula for the specified variable.

45. Solve the formula
$V = LWH$ for L.

46. Solve the formula
$A = \frac{1}{2}d_1 d_2$ for d_2.

Answer

$d_2 = \frac{2A}{d_1}$

47. Solve the formula
$h = 48t + \frac{1}{2}at^2$ for t.

48. Solve the formula
4x−3y=12 for y.

Answer

$y = \frac{4x}{3} - 4$

Use Formulas to Solve Geometry Applications

In the following exercises, solve using a geometry formula.

49. What is the height of a triangle with area 67.567.5 square meters and base 9 meters?

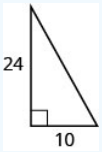
50. The measure of the smallest angle in a right triangle is 45°45° less than the measure of the next larger angle. Find the measures of all three angles.

Answer

$22.5^\circ,\ 67.5^\circ,\ 90^\circ$

51. The perimeter of a triangle is 97 feet. One side of the triangle is eleven feet more than the smallest side. The third side is six feet more than twice the smallest side. Find the lengths of all sides.

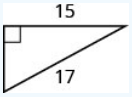
52. Find the length of the hypotenuse.



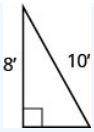
Answer

26

53. Find the length of the missing side. Round to the nearest tenth, if necessary.



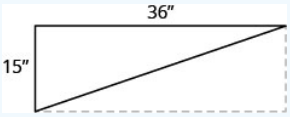
54. Sergio needs to attach a wire to hold the antenna to the roof of his house, as shown in the figure. The antenna is eight feet tall and Sergio has 10 feet of wire. How far from the base of the antenna can he attach the wire? Approximate to the nearest tenth, if necessary.



Answer

6 feet

55. Seong is building shelving in his garage. The shelves are 36 inches wide and 15 inches tall. He wants to put a diagonal brace across the back to stabilize the shelves, as shown. How long should the brace be?



56. The length of a rectangle is 12 cm more than the width. The perimeter is 74 cm. Find the length and the width.

Answer

24.5cm, 12.5cm

57. The width of a rectangle is three more than twice the length. The perimeter is 96 inches. Find the length and the width.

58. The perimeter of a triangle is 35 feet. One side of the triangle is five feet longer than the second side. The third side is three feet longer than the second side. Find the length of each side.

Answer

9 ft, 14 ft, 12 ft

Solve Mixture and Uniform Motion Applications

Solve Coin Word Problems

In the following exercises, solve.

59. Paulette has $140 in $5 and $10 bills. The number of $10 bills is one less than twice the number of $5 bills. How many of each does she have?

60. Lenny has $3.69 in pennies, dimes, and quarters. The number of pennies is three more than the number of dimes. The number of quarters is twice the number of dimes. How many of each coin does he have?

Answer

nine pennies, six dimes, 12 quarters

Solve Ticket and Stamp Word Problems

In the following exercises, solve each ticket or stamp word problem.

61. Tickets for a basketball game cost $2 for students and $5 for adults. The number of students was three less than 10 times the number of adults. The total amount of money from ticket sales was $619. How many of each ticket were sold?

62. 125 tickets were sold for the jazz band concert for a total of $1,022. Student tickets cost $6 each and general admission tickets cost $10 each. How many of each kind of ticket were sold?

Answer

57 students, 68 adults

63. Yumi spent $34.15 buying stamps. The number of $0.56 stamps she bought was 10 less than four times the number of $0.41 stamps. How many of each did she buy?

Solve Mixture Word Problems

In the following exercises, solve.

64. Marquese is making 10 pounds of trail mix from raisins and nuts. Raisins cost $3.45 per pound and nuts cost $7.95 per pound. How many pounds of raisins and how many pounds of nuts should Marquese use for the trail mix to cost him $6.96 per pound?

Answer

2.2 lbs of raisins, 7.8 lbs of nuts

65. Amber wants to put tiles on the backsplash of her kitchen counters. She will need 36 square feet of tile. She will use basic tiles that cost $8 per square foot and decorator tiles that cost $20 per square foot. How many square feet of each tile should she use so that the overall cost of the backsplash will be $10 per square foot?

66. Enrique borrowed $23,500 to buy a car. He pays his uncle 2% interest on the $4,500 he borrowed from him, and he pays the bank 11.5% interest on the rest. What average interest rate does he pay on the total $23,500? (Round your answer to the nearest tenth of a percent.)

Answer

9.7

Solve Uniform Motion Applications

In the following exercises, solve.

67. When Gabe drives from Sacramento to Redding it takes him 2.2 hours. It takes Elsa two hours to drive the same distance. Elsa's speed is seven miles per hour faster than Gabe's speed. Find Gabe's speed and Elsa's speed.

68. Louellen and Tracy met at a restaurant on the road between Chicago and Nashville. Louellen had left Chicago and drove 3.2 hours towards Nashville. Tracy had left Nashville and drove 4 hours towards Chicago, at a speed one mile per hour faster than Louellen's speed. The distance between Chicago and Nashville is 472 miles. Find Louellen's speed and Tracy's speed.

Answer

Louellen 65 mph, Tracy 66 mph

69. Two busses leave Amarillo at the same time. The Albuquerque bus heads west on the I-40 at a speed of 72 miles per hour, and the Oklahoma City bus heads east on the I-40 at a speed of 78 miles per hour. How many hours will it take them to be 375 miles apart?

70. Kyle rowed his boat upstream for 50 minutes. It took him 30 minutes to row back downstream. His speed going upstream is two miles per hour slower than his speed going downstream. Find Kyle's upstream and downstream speeds.

Answer

upstream 3 mph, downstream 5 mph

71. At 6:30, Devon left her house and rode her bike on the flat road until 7:30. Then she started riding uphill and rode until 8:00. She rode a total of 15 miles. Her speed on the flat road was three miles per hour faster than her speed going uphill. Find Devon's speed on the flat road and riding uphill.

72. Anthony drove from New York City to Baltimore, which is a distance of 192 miles. He left at 3:45 and had heavy traffic until 5:30. Traffic was light for the rest of the drive, and he arrived at 7:30. His speed in light traffic was four miles per hour more than twice his speed in heavy traffic. Find Anthony's driving speed in heavy traffic and light traffic.

Answer

heavy traffic 32 mph, light traffic 66 mph

Solve Linear Inequalities

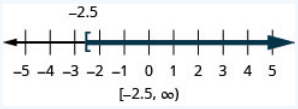
Graph Inequalities on the Number Line

In the following exercises, graph the inequality on the number line and write in interval notation.

73. $x < -1$

74. $x \geq -2.5$

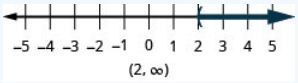
Answer



75. $x \leq \frac{5}{4}$

76. $x > 2$

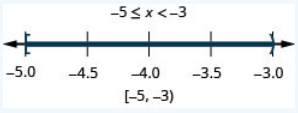
Answer



77. $-2 < x < 0$

78. $-5 \leq x < -3$

Answer



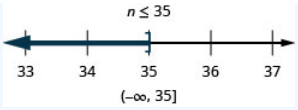
79. $0 \leq x \leq 3.5$

Solve Linear Inequalities

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

80. $n - 12 \leq 23$

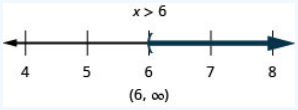
Answer



81. $a+\frac{2}{3} \geq \frac{7}{12}$

82. $9x > 54$

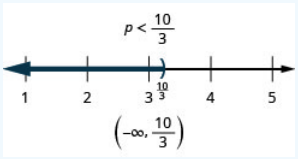
Answer



83. $\frac{q}{-2} \geq -24$

84. $6p > 15p - 30$

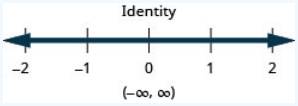
Answer



85. $9h - 7(h-1) \leq 4h - 23$

86. $5n - 15(4-n) < 10(n-6) + 10n$

Answer



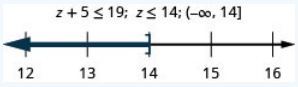
87. $\frac{3}{8}a - \frac{1}{12}a > \frac{5}{12}a + \frac{3}{4}$

Translate Words to an Inequality and Solve

In the following exercises, translate and solve. Then write the solution in interval notation and graph on the number line.

88. Five more than z is at most 19.

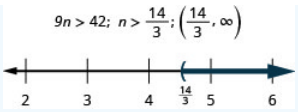
Answer



89. Three less than c is at least 360.

90. Nine times n exceeds 42.

Answer



91. Negative two times a is no more than eight.

Solve Applications with Linear Inequalities

In the following exercises, solve.

92. Julianne has a weekly food budget of $231 for her family. If she plans to budget the same amount for each of the seven days of the week, what is the maximum amount she can spend on food each day?

Answer

$33 per day

93. Rogelio paints watercolors. He got a $100 gift card to the art supply store and wants to use it to buy 12″ × 16″ canvases. Each canvas costs $10.99. What is the maximum number of canvases he can buy with his gift card?

94. Briana has been offered a sales job in another city. The offer was for $42,500 plus 8% of her total sales. In order to make it worth the move, Briana needs to have an annual salary of at least $66,500. What would her total sales need to be for her to move?

Answer

at least $300,000

95. Renee's car costs her $195 per month plus $0.09 per mile. How many miles can Renee drive so that her monthly car expenses are no more than $250?

96. Costa is an accountant. During tax season, he charges $125 to do a simple tax return. His expenses for buying software, renting an office, and advertising are $6,000. How many tax returns must he do if he wants to make a profit of at least $8,000?

Answer

at least 112 jobs

97. Jenna is planning a five-day resort vacation with three of her friends. It will cost her $279 for airfare, $300 for food and entertainment, and $65 per day for her share of the hotel. She has $550 saved towards her vacation and can earn $25 per hour as an assistant in her uncle's photography studio. How many hours must she work in order to have enough money for her vacation?

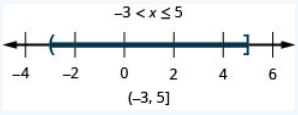
Solve Compound Inequalities

Solve Compound Inequalities with "and"

In each of the following exercises, solve each inequality, graph the solution, and write the solution in interval notation.

98. $x \leq 5$ and $x > -3$

Answer

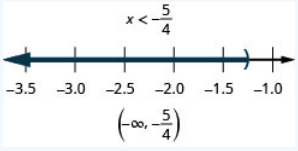


https://math.libretexts.org/@go/page/46464

99. $4x-2\leq 4$ and $7x-1>-8$

100. $5(3x-2)\leq 5$ and $4(x+2)<3$

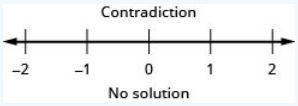
Answer



101. $34(x-8)\leq 3$ and $15(x-5)\leq 3$

102. $34x-5\geq -2$ and $-3(x+1)\geq 6$

Answer



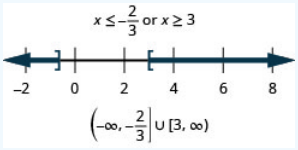
103. $-5\leq 4x-1<7$

Solve Compound Inequalities with "or"

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

104. $5-2x\leq -1$ or $6+3x\leq 4$

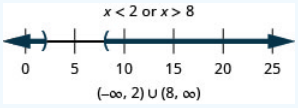
Answer



105. $3(2x-3)<-5$ or $4x-1>3$

106. $34x-2>4$ or $4(2-x)>0$

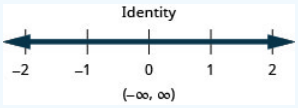
Answer



107. $2(x+3)\geq 0$ or $3(x+4)\leq 6$

108. $12x-3\leq 4$ or $13(x-6)\geq -2$

Answer



Solve Applications with Compound Inequalities

In the following exercises, solve.

109. Liam is playing a number game with his sister Audry. Liam is thinking of a number and wants Audry to guess it. Five more than three times her number is between 2 and 32. Write a compound inequality that shows the range of numbers that Liam might be thinking of.

110. Elouise is creating a rectangular garden in her back yard. The length of the garden is 12 feet. The perimeter of the garden must be at least 36 feet and no more than 48 feet. Use a compound inequality to find the range of values for the width of the garden.

Answer

$6 \leq w \leq 12$

Solve Absolute Value Inequalities

Solve Absolute Value Equations

In the following exercises, solve.

111. $|x| = 8$

112. $|y| = -14$

Answer

no solution

113. $|z| = 0$

114. $|3x - 4| + 5 = 7$

Answer

$x = 2, x = \frac{2}{3}$

115. $4|x - 1| + 2 = 10$

116. $-2|x - 3| + 8 = -4$

Answer

$x = 9, x = -3$

117. $|12x + 5| + 4 = 1$

118. $|6x - 5| = |2x + 3|$

Answer

$x = 2, x = 14$

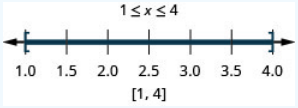
Solve Absolute Value Inequalities with “less than”

In the following exercises, solve each inequality. Graph the solution and write the solution in interval notation.

119. $|x| \leq 8$

120. $|2x-5| \leq 3$

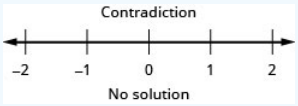
Answer



121. $|6x-5| < 7$

122. $|5x+1| \leq -2$

Answer



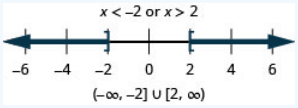
Solve Absolute Value Inequalities with "greater than"

In the following exercises, solve. Graph the solution and write the solution in interval notation.

123. $|x| > 6$

124. $|x| \geq 2$

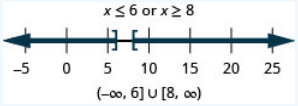
Answer



125. $|x-5| > -2$

126. $|x-7| \geq 1$

Answer



127. $3|x|+4 \geq 1$

Solve Applications with Absolute Value

In the following exercises, solve.

128. A craft beer brewer needs 215,000 bottle per day. But this total can vary by as much as 5,000 bottles. What is the maximum and minimum expected usage at the bottling company?

Answer

The minimum to maximum expected usage is 210,000 to 220,000 bottles

129. At Fancy Grocery, the ideal weight of a loaf of bread is 16 ounces. By law, the actual weight can vary from the ideal by 1.5 ounces. What range of weight will be acceptable to the inspector without causing the bakery being fined?

Practice Test

In the following exercises, solve each equation.

1. $-5(2x+1)=45$

Answer

$x=-5$

2. $\frac{1}{4}(12m+28)=6+2(3m+1)$

3. $8(3a+5)-7(4a-3)=20-3a$

Answer

$a=41$

4. $0.1d+0.25(d+8)=4.1$

5. $14n-3(4n+5)=-9+2(n-8)$

Answer

contradiction; no solution

6. $3(3u+2)+4[6-8(u-1)]=3(u-2)$

7. $\frac{3}{4}x-\frac{2}{3}=\frac{1}{2}x+\frac{5}{6}$

Answer

$x=6$

8. $|3x-4|=8$

9. $|2x-1|=|4x+3|$

Answer

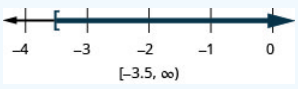
$x=-2, x=-13$

10. Solve the formula $x+2y=5$ for y.

In the following exercises, graph the inequality on the number line and write in interval notation.

11. $x\geq -3.5$

Answer

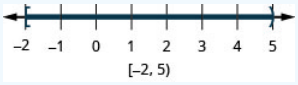


https://math.libretexts.org/@go/page/46464

12. $x < \frac{11}{4}$

13. $-2 \leq x < 5$

Answer

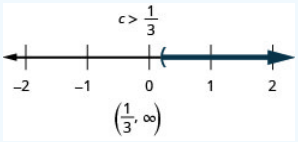


In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

14. $8k \geq 5k - 120$

15. $3c - 10(c-2) < 5c + 16$

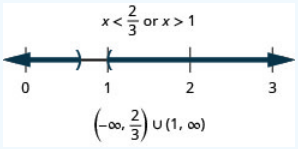
Answer



16. $\frac{3}{4}x - 5 \geq -2$ and $-3(x+1) \geq 6$

17. $3(2x-3) < -5$ or $4x - 1 > 3$

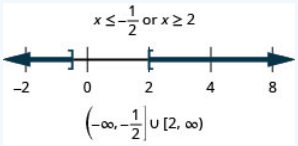
Answer



18. $\frac{1}{2}x - 3 \leq 4$ or $\frac{1}{3}(x-6) \geq -2$

19. $|4x - 3| \geq 5$

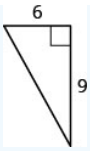
Answer



In the following exercises, translate to an equation or inequality and solve.

20. Four less than twice x is 16.

21. Find the length of the missing side.



Answer

10.8

22. One number is four more than twice another. Their sum is -47. Find the numbers.

23. The sum of two consecutive odd integers is -112. Find the numbers.

Answer

$-57, -55$

24. Marcus bought a television on sale for \$626.50 The original price of the television was \$895. Find ⓐ the amount of discount and ⓑ the discount rate.

25. Bonita has \$2.95 in dimes and quarters in her pocket. If she has five more dimes than quarters, how many of each coin does she have?

Answer

12 dimes, seven quarters

26. Kim is making eight gallons of punch from fruit juice and soda. The fruit juice costs \$6.04 per gallon and the soda costs \$4.28 per gallon. How much fruit juice and how much soda should she use so that the punch costs \$5.71 per gallon?

27. The measure of one angle of a triangle is twice the measure of the smallest angle. The measure of the third angle is three times the measure of the smallest angle. Find the measures of all three angles.

Answer

$30^\circ, 60^\circ, 90^\circ$

28. The length of a rectangle is five feet more than four times the width. The perimeter is 60 feet. Find the dimensions of the rectangle.

29. Two planes leave Dallas at the same time. One heads east at a speed of 428 miles per hour. The other plane heads west at a speed of 382 miles per hour. How many hours will it take them to be 2,025 miles apart?

Answer

2.5 hours

30. Leon drove from his house in Cincinnati to his sister's house in Cleveland, a distance of 252 miles. It took him $4\frac{1}{2}$ hours. For the first half hour, he had heavy traffic, and the rest of the time his speed was five miles per hour less than twice his speed in heavy traffic. What was his speed in heavy traffic?

31. Sara has a budget of \$1,000 for costumes for the 18 members of her musical theater group. What is the maximum she can spend for each costume?

Answer

> At most $55.56 per costume.

19.E: Review Exercises 2

Chapter Review Exercises

Solve Quadratic Equations Using the Square Root Property

Exercise 19.E.1 Solve Quadratic Equations of the Form $ax^2 = k$ Using the Square Root Property

In the following exercises, solve using the Square Root Property.

1. $y^2 = 144$
2. $n^2 - 80 = 0$
3. $4a^2 = 100$
4. $2b^2 = 72$
5. $r^2 + 32 = 0$
6. $t^2 + 18 = 0$
7. $\frac{2}{3}w^2 - 20 = 30$
8. $5c^2 + 3 = 19$

Answer

1. $y = \pm 12$
3. $a = \pm 5$
5. $r = \pm 4\sqrt{2}i$
7. $w = \pm 5\sqrt{3}$

Exercise 19.E.2 Solve Quadratic Equations of the Form $a(x-h)^2 = k$ Using the Square Root Property

In the following exercises, solve using the Square Root Property.

1. $(p-5)^2 + 3 = 19$
2. $(u+1)^2 = 45$
3. $\left(x - \frac{1}{4}\right)^2 = \frac{3}{16}$
4. $\left(y - \frac{2}{3}\right)^2 = \frac{2}{9}$
5. $(n-4)^2 - 50 = 150$
6. $(4c-1)^2 = -18$
7. $n^2 + 10n + 25 = 12$
8. $64a^2 + 48a + 9 = 81$

Answer

1. $p = -1, 9$
3. $x = \frac{1}{4} \pm \frac{\sqrt{3}}{4}$
5. $n = 4 \pm 10\sqrt{2}$
7. $n = -5 \pm 2\sqrt{3}$

Solve Quadratic Equations by Completing the Square

Exercise 19.E.3 Solve Quadratic Equations Using Completing the Square

In the following exercises, complete the square to make a perfect square trinomial. Then write the result as a binomial squared.

1. $x^2 + 22x$

2. $m^2 - 8m$
3. $a^2 - 3a$
4. $b^2 + 13b$

Answer

1. $(x+11)^2$
3. $\left(a - \frac{3}{2}\right)^2$

Exercise $19.E.4$ Solve Quadratic Equations Using Completing the Square

In the following exercises, solve by completing the square.

1. $d^2 + 14d = -13$
2. $y^2 - 6y = 36$
3. $m^2 + 6m = -109$
4. $t^2 - 12t = -40$
5. $v^2 - 14v = -31$
6. $w^2 - 20w = 100$
7. $m^2 + 10m - 4 = -13$
8. $n^2 - 6n + 11 = 34$
9. $a^2 = 3a + 8$
10. $b^2 = 11b - 5$
11. $(u+8)(u+4) = 14$
12. $(z-10)(z+2) = 28$

Answer

1. $d = -13, -1$
3. $m = -3 \pm 10i$
5. $v = 7 \pm 3\sqrt{2}$
7. $m = -9, -1$
9. $a = \frac{3}{2} \pm \frac{\sqrt{41}}{2}$
11. $u = -6 \pm 2\sqrt{2}$

Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

Exercise $19.E.5$ Solve Quadratic Equations of the Form $ax^2 + bx + c = 0$ by Completing the Square

In the following exercises, solve by completing the square.

1. $3p^2 - 18p + 15 = 15$
2. $5q^2 + 70q + 20 = 0$
3. $4y^2 - 6y = 4$
4. $2x^2 + 2x = 4$
5. $3c^2 + 2c = 9$
6. $4d^2 - 2d = 8$
7. $2x^2 + 6x = -5$
8. $2x^2 + 4x = -5$

Answer

1. $p = 0, 6$

3. $y = -\frac{1}{2}, 2$

5. $c = -\frac{1}{3} \pm \frac{2\sqrt{7}}{3}$

7. $x = \frac{3}{2} \pm \frac{1}{2}i$

Exercise 19.E.6 Solve Quadratic Equations Using the Quadratic Formula

In the following exercises, solve by using the Quadratic Formula.

1. $4x^2 - 5x + 1 = 0$
2. $7y^2 + 4y - 3 = 0$
3. $r^2 - r - 42 = 0$
4. $t^2 + 13t + 22 = 0$
5. $4v^2 + v - 5 = 0$
6. $2w^2 + 9w + 2 = 0$
7. $3m^2 + 8m + 2 = 0$
8. $5n^2 + 2n - 1 = 0$
9. $6a^2 - 5a + 2 = 0$
10. $4b^2 - b + 8 = 0$
11. $u(u - 10) + 3 = 0$
12. $5z(z - 2) = 3$
13. $\frac{1}{8}p^2 - \frac{1}{5}p = -\frac{1}{20}$
14. $\frac{2}{5}q^2 + \frac{3}{10}q = \frac{1}{10}$
15. $4c^2 + 4c + 1 = 0$
16. $9d^2 - 12d = -4$

Answer

1. $x = \frac{1}{4}, 1$

3. $r = -6, 7$

5. $v = \frac{-1 \pm \sqrt{21}}{8}$

7. $m = \frac{-4 \pm \sqrt{10}}{3}$

9. $a = \frac{5}{12} \pm \frac{\sqrt{23}}{12}i$

11. $u = 5 \pm \sqrt{21}$

13. $p = \frac{4 \pm \sqrt{5}}{5}$

15. $c = -\frac{1}{2}$

Exercise 19.E.7 Use the Discriminant to Predict the Number of Solutions of a Quadratic Equation

In the following exercises, determine the number of solutions for each quadratic equation.

1. a. $9x^2 - 6x + 1 = 0$
   b. $3y^2 - 8y + 1 = 0$
   c. $7m^2 + 12m + 4 = 0$
   d. $5n^2 - n + 1 = 0$
2. a. $5x^2 - 7x - 8 = 0$
   b. $7x^2 - 10x + 5 = 0$
   c. $25x^2 - 90x + 81 = 0$
   d. $15x^2 - 8x + 4 = 0$

Answer

1.

a. 1
b. 2
c. 2
d. 2

Exercise 19.E.8 Identify the Most Appropriate Method to Use to Solve a Quadratic Equation

In the following exercises, identify the most appropriate method (Factoring, Square Root, or Quadratic Formula) to use to solve each quadratic equation. Do not solve.

1. a. $16r^2-8r+1=0$
   b. $5t^2-8t+3=9$
   c. $3(c+2)^2=15$
2. a. $4d^2+10d-5=21$
   b. $25x^2-60x+36=0$
   c. $6(5v-7)^2=150$

Answer

1.

a. Factor
b. Quadratic Formula
c. Square Root

Solve Equations in Quadratic Form

Exercise 19.E.9 Solve Equations in Quadratic Form

In the following exercises, solve.

1. $x^4-14x^2+24=0$
2. $x^4+4x^2-32=0$
3. $4x^4-5x^2+1=0$
4. $(2y+3)^2+3(2y+3)-28=0$
5. $x+3\sqrt{x}-28=0$
6. $6x+5\sqrt{x}-6=0$
7. $x^{\frac{2}{3}}-10x^{\frac{1}{3}}+24=0$
8. $x+7x^{\frac{1}{2}}+6=0$
9. $8x^{-2}-2x^{-1}-3=0$

Answer

1. $x=\pm\sqrt{2}, x=\pm 2\sqrt{3}$
3. $x=\pm 1, x=\pm\frac{1}{2}$
5. $x=16$
7. $x=64, x=216$
9. $x=-2, x=\frac{4}{3}$

Exercise 19.E.10 Solve Applications Modeled by Quadratic Equations

In the following exercises, solve by using the method of factoring, the square root principle, or the Quadratic Formula. Round your answers to the nearest tenth, if needed.

1. Find two consecutive odd numbers whose product is 323.
2. Find two consecutive even numbers whose product is 624.
3. A triangular banner has an area of 351 square centimeters. The length of the base is two centimeters longer than four times the height. Find the height and length of the base.
4. Julius built a triangular display case for his coin collection. The height of the display case is six inches less than twice the width of the base. The area of the of the back of the case is 70 square inches. Find the height and width of the case.
5. A tile mosaic in the shape of a right triangle is used as the corner of a rectangular pathway. The hypotenuse of the mosaic is 5 feet. One side of the mosaic is twice as long as the other side. What are the lengths of the sides? Round to the nearest tenth.

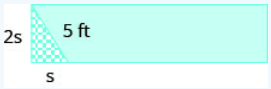

Figure 9.E.1

6. A rectangular piece of plywood has a diagonal which measures two feet more than the width. The length of the plywood is twice the width. What is the length of the plywood's diagonal? Round to the nearest tenth.

7. The front walk from the street to Pam's house has an area of 250 square feet. Its length is two less than four times its width. Find the length and width of the sidewalk. Round to the nearest tenth.

8. For Sophia's graduation party, several tables of the same width will be arranged end to end to give serving table with a total area of 75 square feet. The total length of the tables will be two more than three times the width. Find the length and width of the serving table so Sophia can purchase the correct size tablecloth . Round answer to the nearest tenth.

9. A ball is thrown vertically in the air with a velocity of 160 ft/sec. Use the formula $h = -16t^2 + v_0 t$ to determine when the ball will be 384 feet from the ground. Round to the nearest tenth.

10. The couple took a small airplane for a quick flight up to the wine country for a romantic dinner and then returned home. The plane flew a total of 5 hours and each way the trip was 360 miles. If the plane was flying at 150 mph, what was the speed of the wind that affected the plane?

11. Ezra kayaked up the river and then back in a total time of 6 hours. The trip was 4 miles each way and the current was difficult. If Roy kayaked at a speed of 5 mph, what was the speed of the current?

12. Two handymen can do a home repair in 2 hours if they work together. One of the men takes 3 hours more than the other man to finish the job by himself. How long does it take for each handyman to do the home repair individually?

Answer

2. Two consecutive even numbers whose product is 624 are 24 and 26, and -24 and -26.

4. The height is 14 inches and the width is 10 inches.

6. The length of the diagonal is 3.6 feet.

8. The width of the serving table is 4.7 feet and the length is 16.1 feet.

Figure 9.E.2

10. The speed of the wind was 30 mph.

12. One man takes 3 hours and the other man 6 hours to finish the repair alone.

Graph Quadratic Functions Using Properties

Exercise 19.E.11 Recognize the Graph of a Quadratic Function

In the following exercises, graph by plotting point.

1. Graph $y = x^2 - 2$
2. Graph $y = -x^2 + 3$

Answer

2.

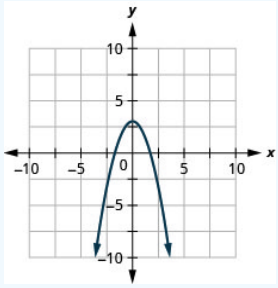

Figure 9.E.3

Exercise 19.E.12 Recognize the Graph of a Quadratic Function

In the following exercises, determine if the following parabolas open up or down.

1. a. $y = -3x^2 + 3x - 1$
   b. $y = 5x^2 + 6x + 3$
2. a. $y = x^2 + 8x - 1$
   b. $y = -4x^2 - 7x + 1$

Answer

2.

a. Up
b. Down

Exercise 19.E.13 Find the Axis of Symmetry and Vertex of a Parabola

In the following exercises, find

a. The equation of the axis of symmetry
b. The vertex

1. $y = -x^2 + 6x + 8$
2. $y = 2x^2 - 8x + 1$

Answer

2. $x = 2$; $(2, -7)$

Exercise 19.E.14 Find the Intercepts of a Parabola

In the following exercises, find the x- and y-intercepts.

1. $y = x^2 - 4x + 5$

2. $y = x^2 - 8x + 15$
3. $y = x^2 - 4x + 10$
4. $y = -5x^2 - 30x - 46$
5. $y = 16x^2 - 8x + 1$
6. $y = x^2 + 16x + 64$

Answer

2. $y : (0, 15)$
   $x : (3, 0), (5, 0)$
4. $y : (0, -46)$
   $x :$ none
6. $y : (0, -64)$
   $x : (-8, 0)$

Graph Quadratic Functions Using Properties

Exercise $19.E.15$ Graph Quadratic Functions Using Properties

In the following exercises, graph by using its properties.

1. $y = x^2 + 8x + 15$
2. $y = x^2 - 2x - 3$
3. $y = -x^2 + 8x - 16$
4. $y = 4x^2 - 4x + 1$
5. $y = x^2 + 6x + 13$
6. $y = -2x^2 - 8x - 12$

Answer

2.

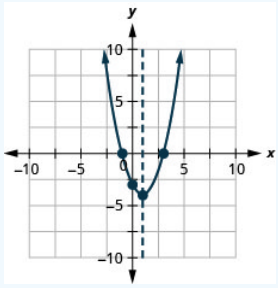

Figure 9.E.4

4.

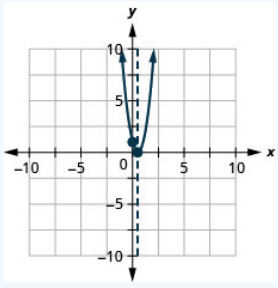

Figure 9.E.5

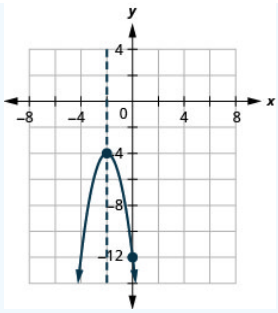

Figure 9.E.6

Exercise 19.E.16 Solve Maximum and Minimum Applications

In the following exercises, find the minimum or maximum value.

1. $y = 7x^2 + 14x + 6$
2. $y = -3x^2 + 12x - 10$

Answer

2. The maximum value is 2 when $x = 2$.

Exercise 19.E.17 Solve Maximum and Minimum Applications

In the following exercises, solve. Rounding answers to the nearest tenth.

1. A ball is thrown upward from the ground with an initial velocity of 112 ft/sec. Use the quadratic equation $h = -16t^2 + 112t$ to find how long it will take the ball to reach maximum height, and then find the maximum height.
2. A daycare facility is enclosing a rectangular area along the side of their building for the children to play outdoors. They need to maximize the area using 180 feet of fencing on three sides of the yard. The quadratic equation $A = -2x^2 + 180x$ gives the area, A, of the yard for the length, x, of the building that will border the yard. Find the length of the building that should border the yard to maximize the area, and then find the maximum area.

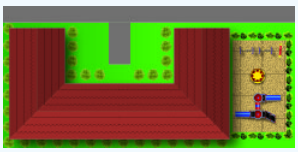

Figure 9.E.7

Answer

2. The length adjacent to the building is 90 feet giving a maximum area of $4,050$ square feet.

Graph Quadratic Functions Using Transformations

Exercise 19.E.18 Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using a vertical shift.

1. $g(x) = x^2 + 4$
2. $h(x) = x^2 - 3$

Answer

2.

https://math.libretexts.org/@go/page/46465

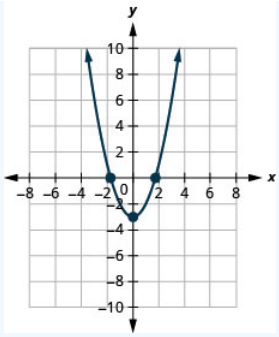

Figure 9.E.8

Exercise $19.E.19$ Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using a horizontal shift.

1. $f(x) = (x+1)^2$
2. $g(x) = (x-3)^2$

Answer

2.

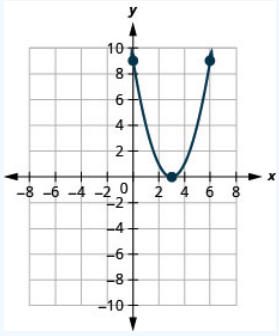

Figure 9.E.9

Exercise $19.E.20$ Graph Quadratic Functions of the Form $f(x) = x^2 + k$

In the following exercises, graph each function using transformations.

1. $f(x) = (x+2)^2 + 3$
2. $f(x) = (x+3)^2 - 2$
3. $f(x) = (x-1)^2 + 4$
4. $f(x) = (x-4)^2 - 3$

Answer

2.

https://math.libretexts.org/@go/page/46465

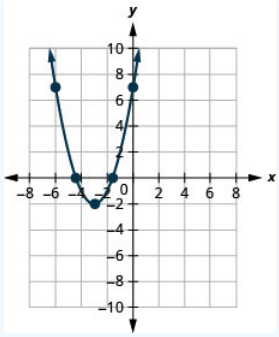

Figure 9.E.10

4.

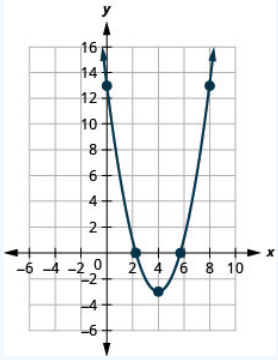

Figure 9.E.11

Exercise $19.E.21$ Graph Quadratic Functions of the Form $f(x) = ax^2$

In the following exercises, graph each function.

1. $f(x) = 2x^2$
2. $f(x) = -x^2$
3. $f(x) = \frac{1}{2}x^2$

Answer

2.

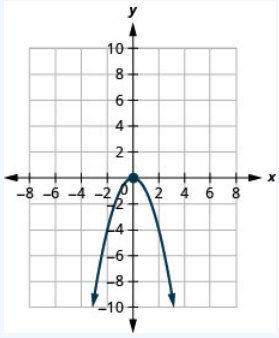

Figure 9.E.12

Exercise $19.E.22$ Graph Quadratic Functions Using Transformations

In the following exercises, rewrite each function in the $f(x) = a(x-h)^2 + k$ form by completing the square.

1. $f(x) = 2x^2 - 4x - 4$

2. $f(x) = 3x^2 + 12x + 8$

Answer

1. $f(x) = 2(x-1)^2 - 6$

Exercise $19.E.23$ Graph Quadratic Functions Using Transformations

In the following exercises,

a. Rewrite each function in $f(x) = a(x-h)^2 + k$ form
b. Graph it by using transformations

1. $f(x) = 3x^2 - 6x - 1$
2. $f(x) = -2x^2 - 12x - 5$
3. $f(x) = 2x^2 + 4x + 6$
4. $f(x) = 3x^2 - 12x + 7$

Answer

1.

a. $f(x) = 3(x-1)^2 - 4$
b.

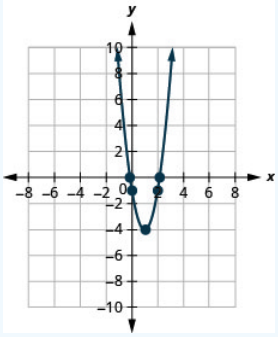

Figure 9.E.13

3.

a. $f(x) = 2(x+1)^2 + 4$
b.

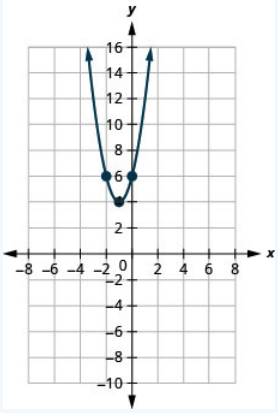

Figure 9.E.14

Exercise $19.E.24$ Graph Quadratic Functions Using Transformations

In the following exercises,

a. Rewrite each function in $f(x)=a(x-h)^2+k$ form
b. Graph it using properties

1. $f(x)=-3x^2-12x-5$
2. $f(x)=2x^2-12x+7$

Answer

1.

a. $f(x)=-3(x+2)^2+7$
b.

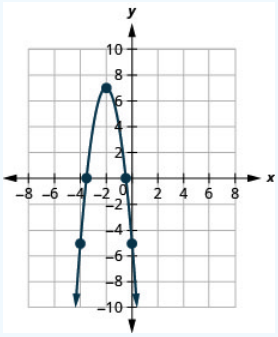

Figure 9.E.15

Exercise $19.E.25$ Find a Quadratic Function From its Graph

In the following exercises, write the quadratic function in $f(x)=a(x-h)^2+k$ form.

1.

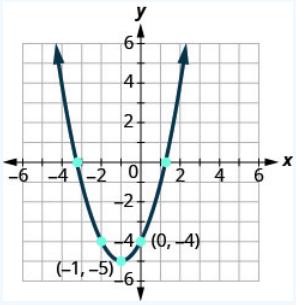

Figure 9.E.16

2.

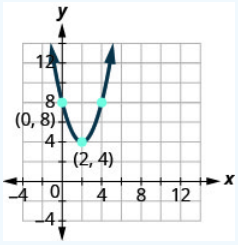

Figure 9.E.17

Answer

1. $f(x)=(x+1)^2-5$

https://math.libretexts.org/@go/page/46465

Exercise $19.E.26$ Solve Quadratic Inequalities Graphically

In the following exercises, solve graphically and write the solution in interval notation.

1. $x^2 - x - 6 > 0$
2. $x^2 + 4x + 3 \leq 0$
3. $-x^2 - x + 2 \geq 0$
4. $-x^2 + 2x + 3 < 0$

Answer

1.

a.

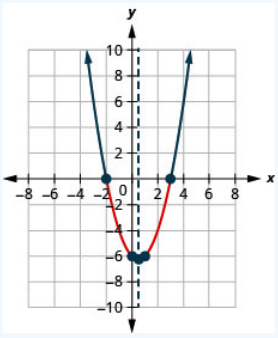

Figure 9.E.18

b. $(-\infty, -2) \cup (3, \infty)$

3.

a.

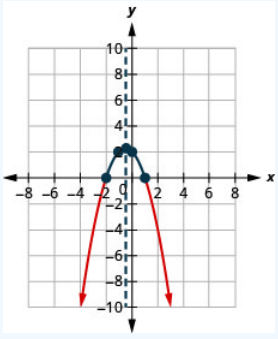

Figure 9.E.19

b. $[-2, 1]$

Exercise $19.E.27$ Solve Quadratic Inequalities Graphically

In the following exercises, solve each inequality algebraically and write any solution in interval notation.

1. $x^2 - 6x + 8 < 0$
2. $x^2 + x > 12$
3. $x^2 - 6x + 4 \leq 0$
4. $2x^2 + 7x - 4 > 0$
5. $-x^2 + x - 6 > 0$
6. $x^2 - 2x + 4 \geq 0$

Answer

1. $(2, 4)$
3. $[3-\sqrt{5}, 3+\sqrt{5}]$
5. no solution

Practice Test

Exercise 19.E.28

1. Use the Square Root Property to solve the quadratic equation $3(w+5)^2 = 27$.
2. Use Completing the Square to solve the quadratic equation $a^2 - 8a + 7 = 23$.
3. Use the Quadratic Formula to solve the quadratic equation $2m^2 - 5m + 3 = 0$.

Answer

1. $w = -2, w = -8$
3. $m = 1, m = \frac{3}{2}$

Exercise 19.E.29

Solve the following quadratic equations. Use any method.

1. $2x(3x-2) - 1 = 0$
2. $\frac{9}{4}y^2 - 3y + 1 = 0$

Answer

2. $y = \frac{2}{3}$

Exercise 19.E.30

Use the discriminant to determine the number and type of solutions of each quadratic equation.

1. $6p^2 - 13p + 7 = 0$
2. $3q^2 - 10q + 12 = 0$

Answer

2. 2 complex

Exercise 19.E.31

Solve each equation.

1. $4x^4 - 17x^2 + 4 = 0$
2. $y^{\frac{2}{3}} + 2y^{\frac{1}{3}} - 3 = 0$

Answer

2. $y = 1, y = -27$

Exercise 19.E.32

For each parabola, find

a. Which direction it opens
b. The equation of the axis of symmetry

c. The vertex
d. The x-and y-intercepts
e. The maximum or minimum value

1. $y = 3x^2 + 6x + 8$
2. $y = -x^2 - 8x + 16$

Answer

2.

a. down
b. $x = -4$
c. $(-4, 0)$
d. $y : (0, 16); x : (-4, 0)$
e. minimum value of -4 when $x = 0$

Exercise $19.E.33$

Graph each quadratic function using intercepts, the vertex, and the equation of the axis of symmetry.

1. $f(x) = x^2 + 6x + 9$
2. $f(x) = -2x^2 + 8x + 4$

Answer

2.

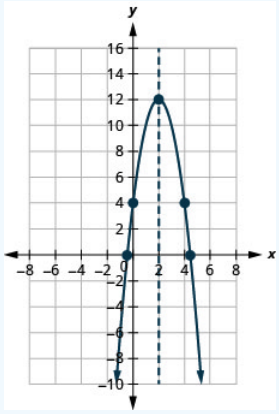

Figure 9.E.20

Exercise $19.E.34$

In the following exercises, graph each function using transformations.

1. $f(x) = (x + 3)^2 + 2$
2. $f(x) = x^2 - 4x - 1$

Answer

2.

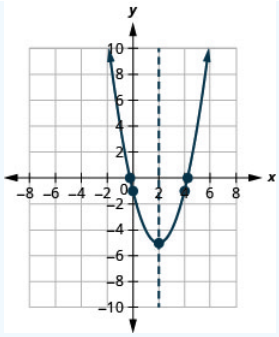

Figure 9.E.21

Exercise $19.E.35$

In the following exercises, solve each inequality algebraically and write any solution in interval notation.

1. $x^2 - 6x - 8 \leq 0$
2. $2x^2 + x - 10 > 0$

Answer

2. $\left(-\infty, -\frac{5}{2}\right) \cup (2, \infty)$

Exercise $19.E.36$

Model the situation with a quadratic equation and solve by any method.

1. Find two consecutive even numbers whose product is 360.
2. The length of a diagonal of a rectangle is three more than the width. The length of the rectangle is three times the width. Find the length of the diagonal. (Round to the nearest tenth.)

Answer

2. A water balloon is launched upward at the rate of 86 ft/sec. Using the formula $h = -16t^2 + 86t$ find how long it will take the balloon to reach the maximum height, and then find the maximum height. Round to the nearest tenth.

20.1: Prelude to Exponential and Logarithmic Functions

As the world population continues to grow, food supplies are becoming less able to meet the increasing demand. At the same time, available resources of fertile soil for growing plants is dwindling. One possible solution—grow plants without soil. Botanists around the world are expanding the potential of hydroponics, which is the process of growing plants without soil. To provide the plants with the nutrients they need, the botanists keep careful growth records. Some growth is described by the types of functions you will explore in this chapter—exponential and logarithmic. You will evaluate and graph these functions, and solve equations using them.

Figure 10.0.1: Hydroponic systems allow botanists to grow crops without land. (credit: “Izhamwong”/Wikimedia Commons)

20.2: Finding Composite and Inverse Functions

Learning Objectives

By the end of this section, you will be able to:

- Find and evaluate composite functions
- Determine whether a function is one-to-one
- Find the inverse of a function

Before you get started, take this readiness quiz.

1. If $f(x) = 2x - 3$ and $g(x) = x^2 + 2x - 3$, find $f(4)$.
   If you missed this problem, review Example 3.48.
2. Solve for x, $3x + 2y = 12$.
   If you missed this problem, review Example 2.31.
3. Simplify: $5\frac{(x+4)}{5} - 4$.
   If you missed this problem, review Example 1.25.

In this chapter, we will introduce two new types of functions, exponential functions and logarithmic functions. These functions are used extensively in business and the sciences as we will see.

Find and Evaluate Composite Functions

Before we introduce the functions, we need to look at another operation on functions called composition. In composition, the output of one function is the input of a second function. For functions f and g, the composition is written $f \circ g$ and is defined by $(f \circ g)(x) = f(g(x))$.

We read $f(g(x))$ as "f of g of x."

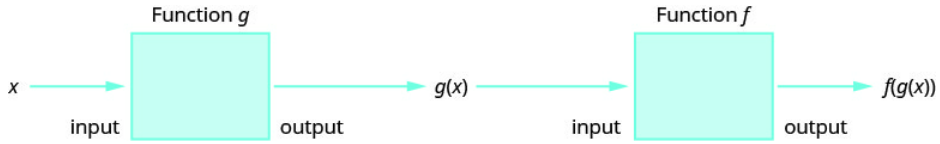

Figure 10.1.1

To do a composition, the output of the first function, $g(x)$, becomes the input of the second function, f, and so we must be sure that it is part of the domain of f.

Definition 20.2.1

The composition of functions f and g is written $f \cdot g$ and is defined by

$$(f \circ g)(x) = f(g(x))$$

We read $f(g(x))$ as f of g of x.

We have actually used composition without using the notation many times before. When we graphed quadratic functions using translations, we were composing functions. For example, if we first graphed $g(x) = x^2$ as a parabola and then shifted it down vertically four units, we were using the composition defined by $(f \circ g)(x) = f(g(x))$ where $f(x) = x - 4$.

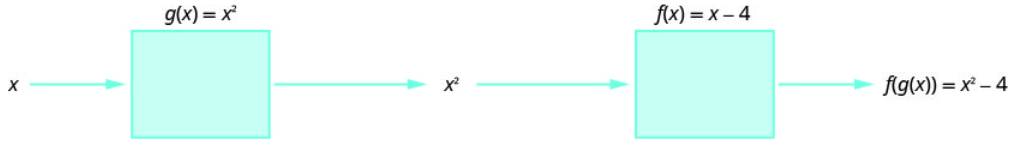

Figure 10.1.2

Example 20.2.1

For functions $f(x) = 4x - 5$ and $g(x) = 2x + 3$, find

a. $(f \circ g)(x)$
b. $(g \circ f)(x)$
c. $(f \cdot g)(x)$

Solution:

Table 10.1.1

a.

Use the definition of $(f \circ g)(x)$.	$(f \circ g)(x) = f(g(x))$
Substitute $2x + 3$ for $g(x)$.	$(f \circ g)(x) = f(2x + 3)$
Find $f(2x + 3)$ where $f(x) = 4x - 5$.	$(f \circ g)(x) = 4(2x + 3) - 5$
Distribute.	$(f \circ g)(x) = 8x + 12 - 5$
Simplify.	$(f \circ g)(x) = 8x + 7$

Table 10.1.2

b.

Use the definition of $(f \circ g)(x)$.	$(g \circ f)(x) = g(f(x))$
Substitute $4x - 5$ for $f(x)$.	$(g \circ f)(x) = g(4x - 5)$
Find $g(4x - 5)$ where $g(x) = 2x + 3$.	$(g \circ f)(x) = 2(4x - 5) + 3$
Distribute.	$(g \circ f)(x) = 8x - 10 + 3$
Simplify.	$(g \circ f)(x) = 8x - 7$

Notice the difference in the result in part a. and part b.

c. Notice that $(f \cdot g)(x)$ is different than $(f \circ g)(x)$. In part a. we did the composition of the functions. Now in part c. we are not composing them, we are multiplying them.

Use the definition of $(f \cdot g)(x)$.

$$(f \cdot g)(x) = f(x) \cdot g(x)$$

Substitute $f(x) = 4x - 5$ and $g(x) = 2x + 3$.

$$(f \cdot g)(x) = (4x - 5) \cdot (2x + 3)$$

Multiply.

$$(f \cdot g)(x) = 8x^2 + 2x - 15$$

Exercise 20.2.1

For functions $f(x) = 3x - 2$ and $g(x) = 5x + 1$, find

a. $(f \circ g)(x)$
b. $(g \circ f)(x)$
c. $(f \cdot g)(x)$

Answer

a. $15x + 1$
b. $15x - 9$
c. $15x^2 - 7x - 2$

Exercise 20.2.2

For functions $f(x) = 4x - 3$, and $g(x) = 6x - 5$, find

a. $(f \circ g)(x)$
b. $(g \circ f)(x)$
c. $(f \cdot g)(x)$

Answer

a. $24x - 23$
b. $24x - 23$
c. $24x^2 - 38x + 15$

In the next example we will evaluate a composition for a specific value.

Example 20.2.2

For functions $f(x) = x^2 - 4$, and $g(x) = 3x + 2$, find:

a. $(f \circ g)(-3)$
b. $(g \circ f)(-1)$
c. $(f \circ f)(2)$

Solution:

Table 10.1.3

a.

Use the definition of $(f \circ g)(-3)$.	$(f \circ g)(-3) = f(g(-3))$
Find $g(-3)$ where $g(x) = 3x + 2$.	$(f \circ g)(-3) = f(3 \cdot (-3) + 2)$
Simplify.	$(f \circ g)(-3) = f(-7)$
Find $f(-7)$ where $f(x) = x^2 - 4$.	$(f \circ g)(-3) = (-7)^2 - 4$
Simplify.	$(f \circ g)(-3) = 45$

Table 10.1.4

b.

Use the definition of $(g \circ f)(-1)$.	$(g \circ f)(-1) = g(f(-1))$
Find $f(-1)$ where $f(x) = x^2 - 4$.	$(g \circ f)(-1) = g((-1)^2 - 4)$
Simplify.	$(g \circ f)(-1) = g(-3)$
Find $g(-3)$ where $g(x) = 3x + 2$.	$(g \circ f)(-1) = 3(-3) + 2$
Simplify.	$(g \circ f)(-1) = -7$

Table 10.1.5

c.

Use the definition of $(f \circ f)(2)$.	$(f \circ f)(2) = f(f(2))$
Find $f(2)$ where $f(x) = x^2 - 4$.	$(f \circ f)(2) = f(2^2 - 4)$
Simplify.	$(f \circ f)(2) = f(0)$
Find $f(0)$ where $f(x) = x^2 - 4$.	$(f \circ f)(2) = 0^2 - 4$
Simplify.	$(f \circ f)(2) = -4$

Exercise 20.2.3

For functions $f(x) = x^2 - 9$, and $g(x) = 2x + 5$, find

a. $(f \circ g)(-2)$
b. $(g \circ f)(-3)$
c. $(f \circ f)(4)$

Answer

a. -8
b. 5
c. 40

Exercise 20.2.4

For functions $f(x) = x^2 + 1$, and $g(x) = 3x - 5$, find

a. $(f \circ g)(-1)$
b. $(g \circ f)(2)$
c. $(f \circ f)(-1)$

Answer

a. 65
b. 10
c. 5

Determine Whether a Function is One-to-One

When we first introduced functions, we said a **function** is a relation that assigns to each element in its domain exactly one element in the range. For each ordered pair in the relation, each x-value is matched with only one y-value.

We used the birthday example to help us understand the definition. Every person has a birthday, but no one has two birthdays and it is okay for two people to share a birthday. Since each person has exactly one birthday, that relation is a function.

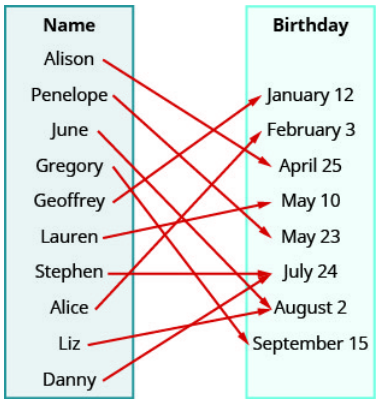

Figure 10.1.38

A function is **one-to-one** if each value in the range has exactly one element in the domain. For each ordered pair in the function, each *y*-value is matched with only one x-value.

Our example of the birthday relation is not a one-to-one function. Two people can share the same birthday. The range value August 2 is the birthday of Liz and June, and so one range value has two domain values. Therefore, the function is not one-to-one.

Definition 20.2.2

A function is **one-to-one** if each value in the range corresponds to one element in the domain. For each ordered pair in the function, each y-value is matched with only one x-value. There are no repeated y-values.

Example 20.2.3

For each set of ordered pairs, determine if it represents a function and, if so, if the function is one-to-one.

a. $\{(-3,27),(-2,8),(-1,1),(0,0),(1,1),(2,8),(3,27)\}$
b. $\{(0,0),(1,1),(4,2),(9,3),(16,4)\}$

Solution:

a. $\{(-3,27),(-2,8),(-1,1),(0,0),(1,1),(2,8),(3,27)\}$

Each x-value is matched with only one y-value. So this relation is a function.

But each y-value is not paired with only one x-value, $(-3,27)$ and $(3,27)$, for example. So this function is not one-to-one.

b. $\{(0,0),(1,1),(4,2),(9,3),(16,4)\}$

Each x-value is matched with only one y-value. So this relation is a function.

Since each y-value is paired with only one x-value, this function is one-to-one.

Exercise 20.2.5

For each set of ordered pairs, determine if it represents a function and if so, is the function one-to-one.

a. $\{(-3,-6),(-2,-4),(-1,-2),(0,0),(1,2),(2,4),(3,6)\}$
b. $\{(-4,8),(-2,4),(-1,2),(0,0),(1,2),(2,4),(4,8)\}$

Answer

a. One-to-one function
b. Function; not one-to-one

Exercise 20.2.6

For each set of ordered pairs, determine if it represents a function and if so, is the function one-to-one.

a. $\{(27,-3),(8,-2),(1,-1),(0,0),(1,1),(8,2),(27,3)\}$
b. $\{(7,-3),(-5,-4),(8,0),(0,0),(-6,4),(-2,2),(-1,3)\}$

Answer

a. Not a function
b. Function; not one-to-one

To help us determine whether a relation is a function, we use the **vertical line test**. A set of points in a rectangular coordinate system is the graph of a function if every vertical line intersects the graph in at most one point. Also, if any vertical line intersects the graph in more than one point, the graph does not represent a function.

The vertical line is representing an x-value and we check that it intersects the graph in only one y-value. Then it is a function.

To check if a function is one-to-one, we use a similar process. We use a horizontal line and check that each horizontal line intersects the graph in only one point. The horizontal line is representing a y-value and we check that it intersects the graph in only one x-value. If every horizontal line intersects the graph of a function in at most one point, it is a one-to-one function. This is the **horizontal line test**.

Definition 20.2.3

Horizontal Line Test

If every horizontal line intersects the graph of a function in at most one point, it is a one-to-one function.

We can test whether a graph of a relation is a function by using the vertical line test. We can then tell if the function is one-to-one by applying the horizontal line test.

Example 20.2.4

Determine

a. whether each graph is the graph of a function and, if so,
b. whether it is one-to-one

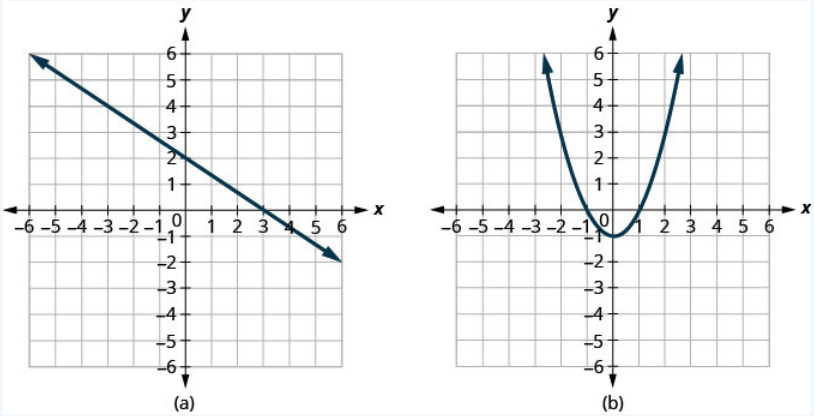

Figure 10.1.39

Solution:

a.

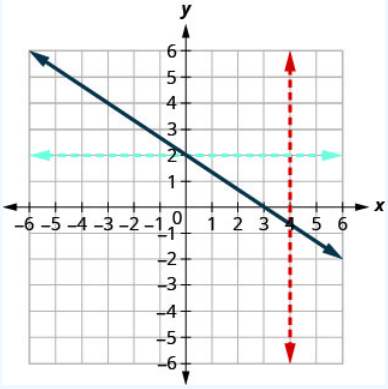

Figure 10.1.40

Since any vertical line intersects the graph in at most one point, the graph is the graph of a function. Since any horizontal line intersects the graph in at most one point, the graph is the graph of a one-to-one function.

b.

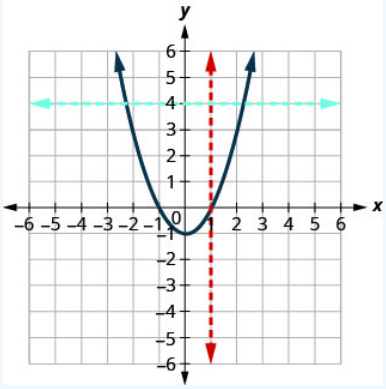

Figure 10.1.41

Since any vertical line intersects the graph in at most one point, the graph is the graph of a function. The horizontal line shown on the graph intersects it in two points. This graph does not represent a one-to-one function.

Exercise 20.2.7

Determine

a. whether each graph is the graph of a function and, if so,
b. whether it is one-to-one

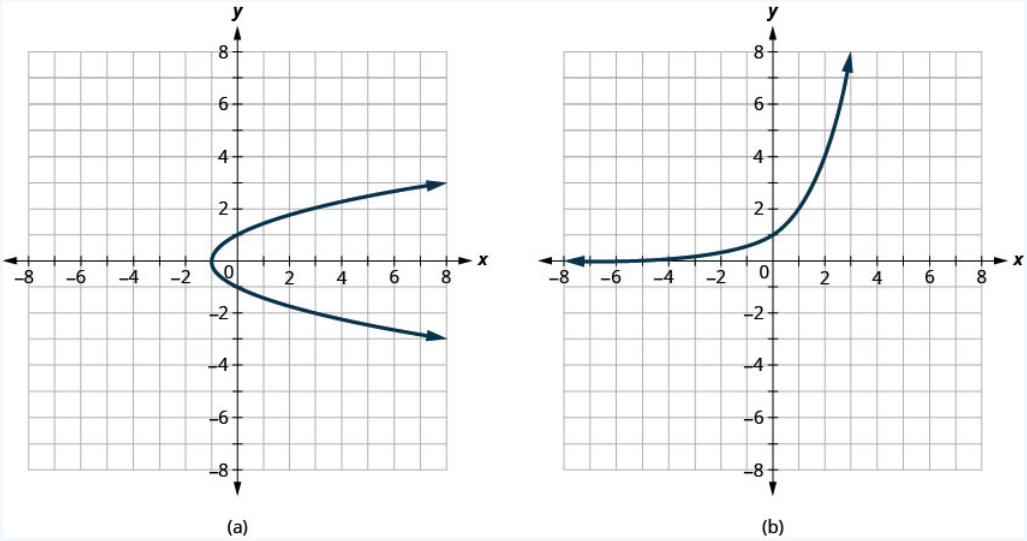

Figure 10.1.42

Answer

a. Not a function
b. One-to-one function

Exercise 20.2.8

Determine

a. whether each graph is the graph of a function and, if so,
b. whether it is one-to-one

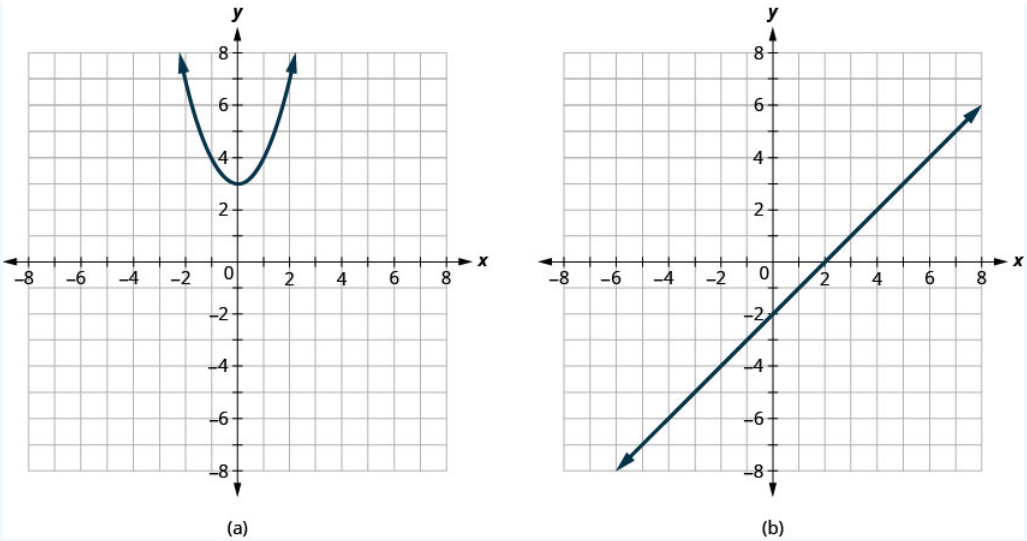

Figure 10.1.43

Answer

a. Function; not one-to-one
b. One-to-one function

Find the Inverse of a Function

Let's look at a one-to one function, f, represented by the ordered pairs $\{(0,5),(1,6),(2,7),(3,8)\}$ For each x-value, f adds 5 to get the y-value. To 'undo' the addition of 5, we subtract 5 from each y-value and get back to the original x-value. We can call this "taking the inverse of f" and name the function f^{-1}.

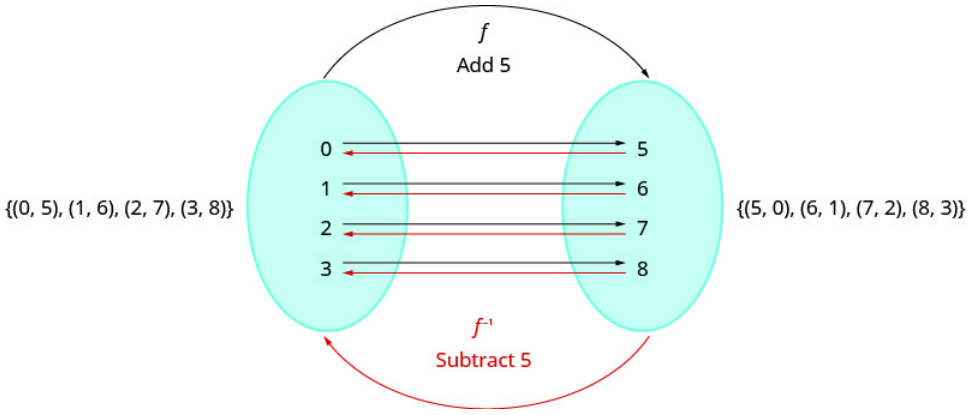

Figure 10.1.44

Notice that that the ordered pairs of f and f^{-1} have their x-values and y-values reversed. The domain of f is the range of f^{-1} and the domain of f^{-1} is the range of f.

Definition 20.2.4

Inverse of a Function Defined by Ordered Pairs

If $f(x)$ is a one-to-one function whose ordered pairs are of the form (x,y), then its inverse function $f^{-1}(x)$ is the set of ordered pairs (y,x).

In the next example we will find the inverse of a function defined by ordered pairs.

Example 20.2.5

Find the inverse of the function $\{(0,3),(1,5),(2,7),(3,9)\}$ Determine the domain and range of the inverse function.

Solution:

This function is one-to-one since every x-value is paired with exactly one y-value.

To find the inverse we reverse the x-values and y-values in the ordered pairs of the function.

Function	$\{(0,3),(1,5),(2,7),(3,9)\}$
Inverse Function	$\{(3,0),(5,1),(7,2),(9,3)\}$
Domain of Inverse Function	$\{3,5,7,9\}$
Range of Inverse Function	$\{0,1,2,3\}$

Exercise 20.2.9

Find the inverse of $\{(0,4),(1,7),(2,10),(3,13)\}$Determine the domain and range of the inverse function.

Answer

Inverse function: $\{(4,0),(7,1),(10,2),(13,3)\}$Domain: $\{4,7,10,13\}$Range: $\{0,1,2,3\}$

Exercise 20.2.10

Find the inverse of $\{(-1,4),(-2,1),(-3,0),(-4,2)\}$ Determine the domain and range of the inverse function.

Answer

Inverse function: $\{(4,-1),(1,-2),(0,-3),(2,-4)\}$. Domain: $\{0,1,2,4\}$ Range: $\{-4,-3,-2,-1\}$.

We just noted that if $f(x)$ is a one-to-one function whose ordered pairs are of the form (x,y), then its inverse function $f^{-1}(x)$ is the set of ordered pairs (y,x).

So if a point (a,b) is on the graph of a function $f(x)$, then the ordered pair (b,a) is on the graph of $f^{-1}(x)$. See Figure 10.1.43.

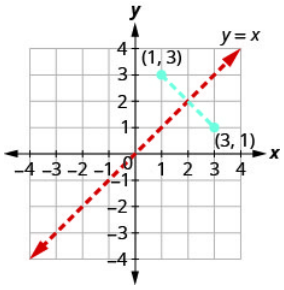

Figure 10.1.45

The distance between any two pairs (a,b) and (b,a) is cut in half by the line $y=x$. So we say the points are mirror images of each other through the line $y=x$.

Since every point on the graph of a function $f(x)$ is a mirror image of a point on the graph of $f^{-1}(x)$, we say the graphs are mirror images of each other through the line $y=x$. We will use this concept to graph the inverse of a function in the next example.

Example 20.2.6

Graph, on the same coordinate system, the inverse of the one-to one function shown.

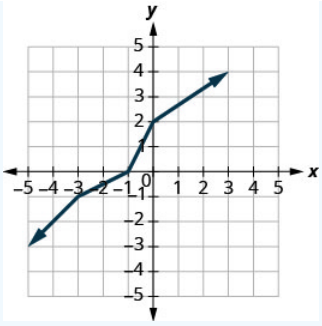

Figure 10.1.46

Solution:

We can use points on the graph to find points on the inverse graph. Some points on the graph are: $(-5,-3),(-3,-1),(-1,0),(0,2),(3,4)$

So, the inverse function will contain the points: $(-3,-5),(-1,-3),(0,-1),(2,0),(4,3)$

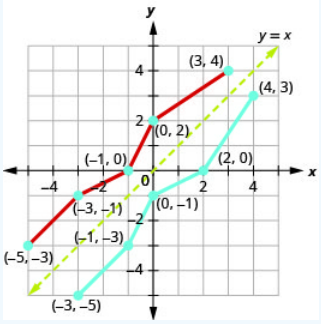

Figure 10.1.47

Notice how the graph of the original function and the graph of the inverse functions are mirror images through the line $y = x$.

Exercise 20.2.11

Graph, on the same coordinate system, the inverse of the one-to one function.

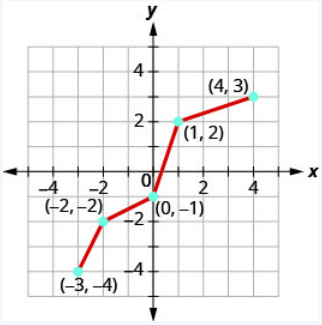

Figure 10.1.48

Answer

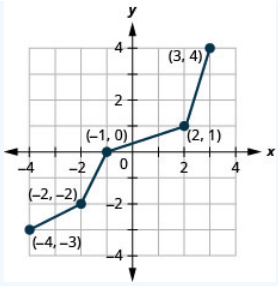

Figure 10.1.49

Exercise 20.2.12

Graph, on the same coordinate system, the inverse of the one-to one function.

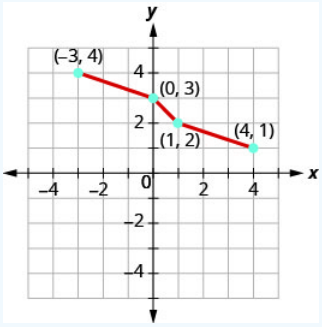

Figure 10.1.50

Answer

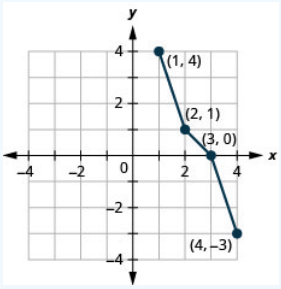

Figure 10.1.51

When we began our discussion of an inverse function, we talked about how the inverse function 'undoes' what the original function did to a value in its domain in order to get back to the original x-value.

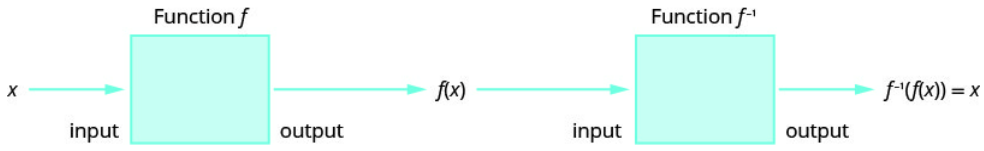

Figure 10.1.52

Definition 20.2.5

Inverse Functions

$f^{-1}(f(x)) = x$, for all x in the domain of f

$f\left(f^{-1}(x)\right) = x$, for all x in the domain of f^{-1}

We can use this property to verify that two functions are inverses of each other.

Example 20.2.7

Verify that $f(x) = 5x - 1$ and $g(x) = \frac{x+1}{5}$ are inverse functions.

Solution:

The functions are inverses of each other if $g(f(x)) = x$ and $f(g(x)) = x$.

Table 10.1.6

	$g(f(x)) \stackrel{?}{=} x$
Substitue $5x - 1$ for $f(x)$.	$g(5x-1) \stackrel{?}{=} x$
Find $g(5x-1)$ where $g(x) = \frac{x+1}{5}$.	$\frac{(5x-1)+1}{5} \stackrel{?}{=} x$
Simplify.	$\frac{5x}{5} \stackrel{?}{=} x$
Simplify.	$x = x$ ✓

$f(g(x)) \stackrel{?}{=} x$

Figure 10.1.59

Substitute $\frac{x+1}{5}$ for $g(x)$.	$f\left(\frac{x+1}{5}\right) \stackrel{?}{=} x$
Find $f\left(\frac{x+1}{5}\right)$ where $f(x) = 5x - 1$.	$5\left(\frac{x+1}{5}\right) - 1 \stackrel{?}{=} x$
Simplify.	$x + 1 - 1 \stackrel{?}{=} x$
Simplify.	$x = x$ ✓

Since both $g(f(x)) = x$ and $f(g(x)) = x$ are true, the functions $f(x) = 5x - 1$ and $g(x) = \frac{x+1}{5}$ are inverse functions. That is, they are inverses of each other.

Exercise 20.2.13

Verify that the functions are inverse functions. $f(x) = 4x - 3$ and $g(x) = \frac{x+3}{4}$.

Answer

$g(f(x)) = x$, and $f(g(x)) = x$, so they are inverses.

Exercise 20.2.14

Verify that the functions are inverse functions. $f(x) = 2x + 6$ and $g(x) = \frac{x-6}{2}$

Answer

$g(f(x)) = x$, and $f(g(x)) = x$, so they are inverses.

We have found inverses of function defined by ordered pairs and from a graph. We will now look at how to find an inverse using an algebraic equation. The method uses the idea that if $f(x)$ is a one-to-one function with ordered pairs (x, y), then its inverse function $f^{-1}(x)$ is the set of ordered pairs (y, x).

If we reverse the x and y in the function and then solve for y, we get our **inverse function**.

Example 20.2.8 How to Find the Inverse of a One-to-One Function

Find the inverse of $f(x) = 4x + 7$.

Solution:

Table 10.1.7

Step 1. Substitute y for $f(x)$.	Replace $f(x)$ with y.	$f(x) = 4x + 7$ $y = 4x + 7$
Step 2: Interchange the variables x and y.	Replace x with y and then y with x.	$x = 4y + 7$
Step 3: Solve for y.	Subtract 7 from each side. Divide by 4.	$x - 7 = 4y$ $\frac{x-7}{4} = y$
Step 4: Substitute $f^{-1}(x)$ for y.	Replace y with $f^{-1}(x)$.	$\frac{x-7}{4} = f^{-1}(x)$
Step 5: Verify that the functions are inverses.	Show $f^{-1}(f(x)) = x$ and $f\left(f^{-1}(x)\right) = x$	$f^{-1}(f(x)) \stackrel{?}{=} x$ $f^{-1}(4x+7) \stackrel{?}{=} x$ $\frac{(4x+7)-7}{4} \stackrel{?}{=} x$ $\frac{4x}{4} \stackrel{?}{=} x$ $x = x$ $f(f^{-1}(x)) \stackrel{?}{=} x$ $f\left(\frac{x-7}{4}\right) \stackrel{?}{=} x$ $4\left(\frac{x-7}{4}\right) + 7 \stackrel{?}{=} x$ $x - 7 + 7 \stackrel{?}{=} x$ $x = x$

Exercise 20.2.15

Find the inverse of the function $f(x) = 5x - 3$.

Answer

$f^{-1}(x) = \frac{x+3}{5}$

Exercise 20.2.16

Find the inverse of the function $f(x) = 8x + 5$.

Answer

$f^{-1}(x) = \frac{x-5}{8}$

We summarize the steps below.

How to Find the Inverse of a One-to-One Function

1. Substitute y for $f(x)$.
2. Interchange the variables x and y.
3. Solve for y.
4. Substitute $f^{-1}(x)$ for y.

5. Verify that the functions are inverses.

Example 20.2.9 How to Find the Inverse of a One-to-One Function

Find the inverse of $f(x)=\sqrt[5]{2x-3}$.

Solution:

$$f(x)=\sqrt[5]{2x-3}$$

Substitute y for $f(x)$.

$$y=\sqrt[5]{2x-3}$$

Interchange the variables x and y.

$$x=\sqrt[5]{2y-3}$$

Solve for y.

$$\begin{aligned}(x)^5&=(\sqrt[5]{2y-3})^5\\ x^5&=2y-3\\ x^5+3&=2y\\ \frac{x^5+3}{2}&=y\end{aligned}$$

Substitute $f^{-1}(x)$ for y.

$$f^{-1}(x)=\tfrac{x^5+3}{2}$$

Verify that the functions are inverses.

$$\begin{aligned} f^{-1}(f(x))&\stackrel{?}{=}x & f\left(f^{-1}(x)\right)&\stackrel{?}{=}x\\ f^{-1}(\sqrt[5]{2x-3})&\stackrel{?}{=}x & f\left(\tfrac{x^5+3}{2}\right)&\stackrel{?}{=}x\\ \tfrac{(\sqrt[5]{2x-3})^5+3}{2}&\stackrel{?}{=}x & \sqrt[5]{2\left(\tfrac{x^5+3}{2}\right)-3}&\stackrel{?}{=}x\\ \tfrac{2x-3+3}{2}&\stackrel{?}{=}x & \sqrt[5]{x^5+3-3}&\stackrel{?}{=}x\\ \tfrac{2x}{2}&\stackrel{?}{=}x & \sqrt[5]{x^5}&\stackrel{?}{=}x\\ x&=x & x&=x\end{aligned}$$

Exercise 20.2.17

Find the inverse of the function $f(x)=\sqrt[5]{3x-2}$.

Answer

$f^{-1}(x)=\tfrac{x^5+2}{3}$

Exercise 20.2.18

Find the inverse of the function $f(x)=\sqrt[4]{6x-7}$.

Answer

$f^{-1}(x)=\tfrac{x^4+7}{6}$

Key Concepts

- **Composition of Functions:** The composition of functions f and g, is written $f \circ g$ and is defined by

$$(f \circ g)(x) = f(g(x))$$

  We read $f(g(x))$ as f of g of x.
- **Horizontal Line Test:** If every horizontal line, intersects the graph of a function in at most one point, it is a one-to-one function.
- **Inverse of a Function Defined by Ordered Pairs:** If $f(x)$ is a one-to-one function whose ordered pairs are of the form (x, y), then its inverse function $f^{-1}(x)$ is the set of ordered pairs (y, x).
- **Inverse Functions:** For every x in the domain of one-to-one function f and f^{-1},

$$f^{-1}(f(x)) = x$$
$$f\left(f^{-1}(x)\right) = x$$

- **How to Find the Inverse of a One-to-One Function:**
  1. Substitute y for $f(x)$.
  2. Interchange the variables x and y.
  3. Solve for y.
  4. Substitute $f^{-1}(x)$ for y.
  5. Verify that the functions are inverses.

Glossary

one-to-one function

A function is one-to-one if each value in the range has exactly one element in the domain. For each ordered pair in the function, each y-value is matched with only one x-value.

20.2E: Exercises

Practice Makes Perfect

Exercise $20.2E.19$ Find and Evaluate Composite Functions

In the following exercises, find

a. $(f \circ g)(x)$
b. $(g \circ f)(x)$
c. $(f \cdot g)(x)$

1. $f(x) = 4x + 3$ and $g(x) = 2x + 5$
2. $f(x) = 3x - 1$ and $g(x) = 5x - 3$
3. $f(x) = 6x - 5$ and $g(x) = 4x + 1$
4. $f(x) = 2x + 7$ and $g(x) = 3x - 4$
5. $f(x) = 3x$ and $g(x) = 2x^2 - 3x$
6. $f(x) = 2x$ and $g(x) = 3x^2 - 1$
7. $f(x) = 2x - 1$ and $g(x) = x^2 + 2$
8. $f(x) = 4x + 3$ and $g(x) = x^2 - 4$

Answer

1.

a. $8x + 23$
b. $8x + 11$
c. $8x^2 + 26x + 15$

3.

a. $24x + 1$
b. $24x - 19$
c. $24x^2 + 19x - 5$

5.

a. $6x^2 - 9x$
b. $18x^2 - 9x$
c. $6x^3 - 9x^2$

7.

a. $2x^2 + 3$
b. $4x^2 - 4x + 3$
c. $2x^3 - x^2 + 4x - 2$

Exercise $20.2E.20$ Find and Evaluate Composite Functions

In the following exercises, find the values described.

1. For functions $f(x) = 2x^2 + 3$ and $g(x) = 5x - 1$, find
   a. $(f \circ g)(-2)$
   b. $(g \circ f)(-3)$
   c. $(f \circ f)(-1)$
2. For functions $f(x) = 5x^2 - 1$ and $g(x) = 4x - 1$, find
   a. $(f \circ g)(1)$
   b. $(g \circ f)(-1)$
   c. $(f \circ f)(2)$

3. For functions $f(x) = 2x^3$ and $g(x) = 3x^2 + 2$, find
   a. $(f \circ g)(-1)$
   b. $(g \circ f)(1)$
   c. $(g \circ g)(1)$
4. For functions $f(x) = 3x^3 + 1$ and $g(x) = 2x^2 = 3$, find
   a. $(f \circ g)(-2)$
   b. $(g \circ f)(-1)$
   c. $(g \circ g)(1)$

Answer

1.
   a. 245
   b. 104
   c. 53

3.
   a. 250
   b. 14
   c. 77

Exercise $20.2E.21$ Determine Whether a Function is One-to-One

In the following exercises, determine if the set of ordered pairs represents a function and if so, is the function one-to-one.

1. $\{(-3, 9), (-2, 4), (-1, 1), (0, 0), (1, 1), (2, 4), (3, 9)\}$
2. $\{(9, -3), (4, -2), (1, -1), (0, 0), (1, 1), (4, 2), (9, 3)\}$
3. $\{(-3, -5), (-2, -3), (-1, -1), (0, 1), (1, 3), (2, 5), (3, 7)\}$
4. $\{(5, 3), (4, 2), (3, 1), (2, 0), (1, -1), (0, -2), (-1, -3)\}$

Answer

1. Function; not one-to-one

3. One-to-one function

Exercise $20.2E.22$ Determine Whether a Function is One-to-One

In the following exercises, determine whether each graph is the graph of a function and if so, is it one-to-one.

1.

   a.

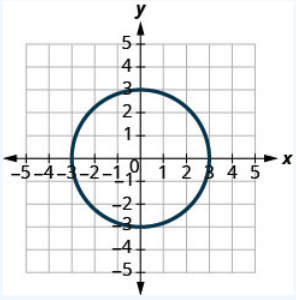

Figure 10.1.65

https://math.libretexts.org/@go/page/46469

b.

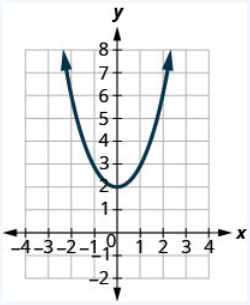

Figure 10.1.66

2.

b.

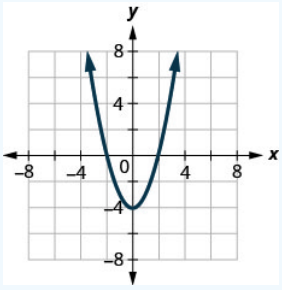

Figure 10.1.70

4.

a.

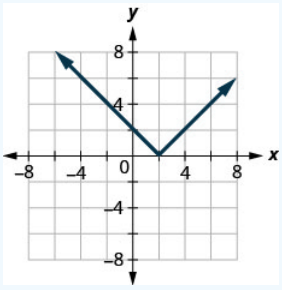

Figure 10.1.71

b.

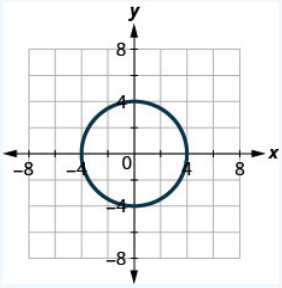

Figure 10.1.72

Answer

1.

a. Not a function
b. Function; not one-to-one

3.

a. One-to-one function
b. Function; not one-to-one

? Exercise $20.2E.23$ Determine Whether a Function is One-to-One

In the following exercises, find the inverse of each function. Determine the domain and range of the inverse function.

1. $\{(2,1),(4,2),(6,3),(8,4)\}$
2. $\{(6,2),(9,5),(12,8),(15,11)\}$
3. $\{(0,-2),(1,3),(2,7),(3,12)\}$
4. $\{(0,0),(1,1),(2,4),(3,9)\}$
5. $\{(-2,-3),(-1,-1),(0,1),(1,3)\}$

https://math.libretexts.org/@go/page/46469

6. $\{(5,3),(4,2),(3,1),(2,0)\}$

Answer

1. Inverse function: $\{(1,2),(2,4),(3,6),(4,8)\}$. Domain: $\{1,2,3,4\}$. Range: $\{2,4,6,8\}$.
3. Inverse function: $\{(-2,0),(3,1),(7,2),(12,3)\}$. Domain: $\{-2,3,7,12\}$. Range: $\{0,1,2,3\}$
5. Inverse function: $\{(-3,-2),(-1,-1),(1,0),(3,1)\}$. Domain: $\{-3,-1,1,3\}$. Range: $\{-2,-1,0,1\}$

Exercise $20.2E.24$ Determine Whether a Function is One-to-One

In the following exercises, graph, on the same coordinate system, the inverse of the one-to-one function shown.

1.

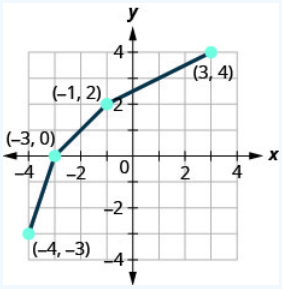

Figure 10.1.73

2.

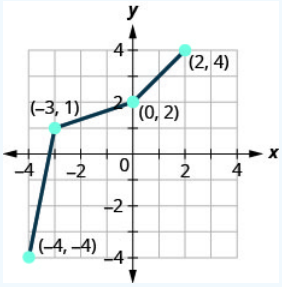

Figure 10.1.74

3.

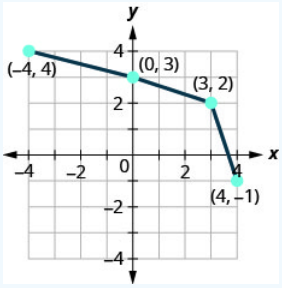

Figure 10.1.75

3.

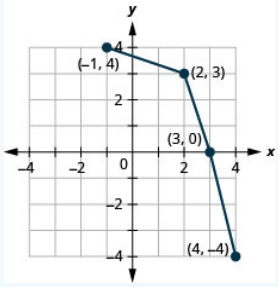

Figure 10.1.78

? Exercise $20.2E.25$ Determine Whether the given functions are inverses

In the following exercises, determine whether or not the given functions are inverses.

1. $f(x) = x + 8$ and $g(x) = x - 8$
2. $f(x) = x - 9$ and $g(x) = x + 9$
3. $f(x) = 7x$ and $g(x) = \frac{x}{7}$
4. $f(x) = \frac{x}{11}$ and $g(x) = 11x$
5. $f(x) = 7x + 3$ and $g(x) = \frac{x-3}{7}$
6. $f(x) = 5x - 4$ and $g(x) = \frac{x-4}{5}$
7. $f(x) = \sqrt{x+2}$ and $g(x) = x^2 - 2$
8. $f(x) = \sqrt[3]{x-4}$ and $g(x) = x^3 + 4$

Answer

1. $g(f(x)) = x,$ and $f(g(x)) = x,$ so they are inverses.
3. $g(f(x)) = x,$ and $f(g(x)) = x,$ so they are inverses.

https://math.libretexts.org/@go/page/46469

5. $g(f(x))=x,$ and $f(g(x))=x,$ so they are inverses.
7. $g(f(x))=x,$ and $f(g(x))=x,$ so they are inverses (for nonnegative x)

Exercise $20.2E.26$ Determine the inverse of a function

In the following exercises, find the inverse of each function.

1. $f(x)=x-12$
2. $f(x)=x+17$
3. $f(x)=9x$
4. $f(x)=8x$
5. $f(x)=\frac{x}{6}$
6. $f(x)=\frac{x}{4}$
7. $f(x)=6x-7$
8. $f(x)=7x-1$
9. $f(x)=-2x+5$
10. $f(x)=-5x-4$
11. $f(x)=x^2+6, x\geq 0$
12. $f(x)=x^2-9, x\geq 0$
13. $f(x)=x^3-4$
14. $f(x)=x^3+6$
15. $f(x)=\frac{1}{x+2}$
16. $f(x)=\frac{1}{x-6}$
17. $f(x)=\sqrt{x-2}, x\geq 2$
18. $f(x)=\sqrt{x+8}, x\geq -8$
19. $f(x)=\sqrt[3]{x-3}$
20. $f(x)=\sqrt[3]{x+5}$
21. $f(x)=\sqrt[4]{9x-5}, x\geq \frac{5}{9}$
22. $f(x)=\sqrt[4]{8x-3}, x\geq \frac{3}{8}$
23. $f(x)=\sqrt[5]{-3x+5}$
24. $f(x)=\sqrt[5]{-4x-3}$

Answer

1. $f^{-1}(x)=x+12$
3. $f^{-1}(x)=\frac{x}{9}$
5. $f^{-1}(x)=6x$
7. $f^{-1}(x)=\frac{x+7}{6}$
9. $f^{-1}(x)=\frac{x-5}{-2}$
11. $f^{-1}(x)=\sqrt{x-6}$
13. $f^{-1}(x)=\sqrt[3]{x+4}$
15. $f^{-1}(x)=\frac{1}{x}-2$
17. $f^{-1}(x)=x^2+2, x\geq 0$
19. $f^{-1}(x)=x^3+3$
21. $f^{-1}(x)=\frac{x^4+5}{9}, x\geq 0$
23. $f^{-1}(x)=\frac{x^5-5}{-3}$

Exercise $20.2E.27$ Writing Exercises

1. Explain how the graph of the inverse of a function is related to the graph of the function.
2. Explain how to find the inverse of a function from its equation. Use an example to demonstrate the steps.

Answer

1. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find and evaluate composite functions.			
determine whether a function is one-to-one.			
find the inverse of a function.			

Figure 10.1.79

b. If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

20.3: Evaluate and Graph Exponential Functions

Learning Objectives

By the end of this section, you will be able to:

- Graph exponential functions
- Solve Exponential equations
- Use exponential models in applications

Before you get started, take this readiness quiz.

1. Simplify: $\left(\frac{x^3}{x^2}\right)$.
   If you missed this problem, review Example 5.13.
2. Evaluate: a. 2^0 b. $\left(\frac{1}{3}\right)^0$.
   If you missed this problem, review Example 5.14.
3. Evaluate: a. 2^{-1} b. $\left(\frac{1}{3}\right)^{-1}$.
   If you missed this problem, review Example 5.15.

Graph Exponential Functions

The functions we have studied so far do not give us a model for many naturally occurring phenomena. From the growth of populations and the spread of viruses to radioactive decay and compounding interest, the models are very different from what we have studied so far. These models involve exponential functions.

An **exponential function** is a function of the form $f(x) = a^x$ where $a > 0$ and $a \neq 1$.

Definition 20.3.1

An exponential function, where $a > 0$ and $a \neq 1$, is a function of the form

$$f(x) = a^x$$

Notice that in this function, the variable is the exponent. In our functions so far, the variables were the base.

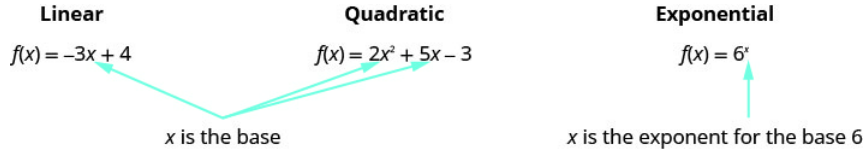

Figure 10.2.1

Our definition says $a \neq 1$. If we let $a = 1$, then $f(x) = a^x$ becomes $f(x) = 1^x$. Since $1^x = 1$ for all real numbers, $f(x) = 1$. This is the constant function.

Our definition also says $a > 0$. If we let a base be negative, say -4, then $f(x) = (-4)^x$ is not a real number when $x = \frac{1}{2}$.

$$f(x) = (-4)^x$$
$$f\left(\frac{1}{2}\right) = (-4)^{\frac{1}{2}}$$
$$f\left(\frac{1}{2}\right) = \sqrt{-4} \text{ not a real number}$$

In fact, $f(x) = (-4)^x$ would not be a real number any time x is a fraction with an even denominator. So our definition requires $a > 0$.

By graphing a few exponential functions, we will be able to see their unique properties.

Example 20.3.1

On the same coordinate system graph $f(x) = 2^x$ and $g(x) = 3^x$.

Solution:

We will use point plotting to graph the functions.

x	$f(x) = 2^x$	$(x, f(x))$	$g(x) = 3^x$	$(x, g(x))$
-2	$2^{-2} = \frac{1}{2^2} = \frac{1}{4}$	$\left(-2, \frac{1}{4}\right)$	$3^{-2} = \frac{1}{3^2} = \frac{1}{9}$	$\left(-2, \frac{1}{9}\right)$
-1	$2^{-1} = \frac{1}{2^1} = \frac{1}{2}$	$\left(-1, \frac{1}{2}\right)$	$3^{-1} = \frac{1}{3^1} = \frac{1}{3}$	$\left(-1, \frac{1}{3}\right)$
0	$2^0 = 1$	(0, 1)	$3^0 = 1$	(0, 1)
1	$2^1 = 2$	(1, 2)	$3^1 = 3$	(1, 3)
2	$2^2 = 4$	(2, 4)	$3^2 = 9$	(2, 9)
3	$2^3 = 8$	(3, 8)	$3^3 = 27$	(3, 27)

Exercise 20.3.1

Graph: $f(x) = 4^x$.

Answer

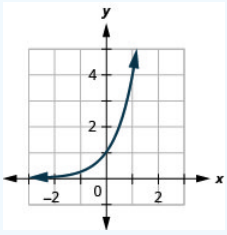

Figure 10.2.4

Exercise 20.3.2

Graph: $g(x) = 5^x$

Answer

https://math.libretexts.org/@go/page/46470

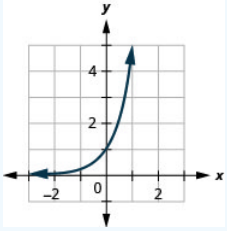

Figure 10.2.5

If we look at the graphs from the previous Example 10.2.1 and Exercises 10.2.1 and 10.2.2, we can identify some of the properties of exponential functions.

The graphs of $f(x) = 2^x$ and $g(x) = 3^x$, as well as the graphs of $f(x) = 4^x$ and $g(x) = 5^x$, all have the same basic shape. This is the shape we expect from an exponential function where $a > 1$.

We notice, that for each function, the graph contains the point $(0, 1)$. This make sense because $a^0 = 1$ for any a.

The graph of each function, $f(x) = a^x$ also contains the point $(1, a)$. The graph of $f(x) = 2^x$ contained $(1, 2)$ and the graph of $g(x) = 3^x$ contained $(1, 3)$. This makes sense as $a^1 = a$.

Notice too, the graph of each function $f(x) = a^x$ also contains the point $(-1, \frac{1}{a})$. The graph of $f(x) = 2^x$ contained $(-1, \frac{1}{2})$ and the graph of $g(x) = 3^x$ contained $(-1, \frac{1}{3})$.This makes sense as $a^{-1} = \frac{1}{a}$.

What is the domain for each function? From the graphs we can see that the domain is the set of all real numbers. There is no restriction on the domain. We write the domain in interval notation as $(-\infty, \infty)$.

Look at each graph. What is the range of the function? The graph never hits the x-axis. The range is all positive numbers. We write the range in interval notation as $(0, \infty)$.

Whenever a graph of a function approaches a line but never touches it, we call that line an **asymptote**. For the exponential functions we are looking at, the graph approaches the x-axis very closely but will never cross it, we call the line $y = 0$, the x-axis, a horizontal asymptote.

Properties of the Graph of $f(x) = a^x$ when $a > 1$

Table 10.2.1

Domain	$(-\infty, \infty)$
Range	$(0, \infty)$
x-intercept	None
y-intercept	$(0, 1)$
Contains	$(1, a)$, $(-1, \frac{1}{a})$
Asymptote	x-axis, the line $y = 0$

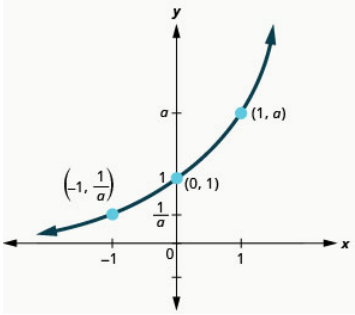

Figure 10.2.6

https://math.libretexts.org/@go/page/46470

Our definition of an exponential function $f(x) = a^x$ says $a > 0$, but the examples and discussion so far has been about functions where $a > 1$. What happens when $0 < a < 1$ The next example will explore this possibility.

Example 20.3.2

On the same coordinate system, graph $f(x) = \left(\frac{1}{2}\right)^x$ and $g(x) = \left(\frac{1}{3}\right)^x$.

Solution:

We will use point plotting to graph the functions.

x	$f(x) = \left(\frac{1}{2}\right)^x$	$(x, f(x))$	$g(x) = \left(\frac{1}{3}\right)^x$	$(x, g(x))$
–2	$\left(\frac{1}{2}\right)^{-2} = 2^2 = 4$	(–2, 4)	$\left(\frac{1}{3}\right)^{-2} = 3^2 = 9$	(–2, 9)
–1	$\left(\frac{1}{2}\right)^{-1} = 2^1 = 2$	(–1, 2)	$\left(\frac{1}{3}\right)^{-1} = 3^1 = 3$	(–1, 3)
0	$\left(\frac{1}{2}\right)^0 = 1$	(0, 1)	$\left(\frac{1}{3}\right)^0 = 1$	(0, 1)
1	$\left(\frac{1}{2}\right)^1 = \frac{1}{2}$	$\left(1, \frac{1}{2}\right)$	$\left(\frac{1}{3}\right)^1 = \frac{1}{3}$	$\left(1, \frac{1}{3}\right)$
2	$\left(\frac{1}{2}\right)^2 = \frac{1}{4}$	$\left(2, \frac{1}{4}\right)$	$\left(\frac{1}{3}\right)^2 = \frac{1}{9}$	$\left(2, \frac{1}{9}\right)$
3	$\left(\frac{1}{2}\right)^3 = \frac{1}{8}$	$\left(3, \frac{1}{8}\right)$	$\left(\frac{1}{3}\right)^3 = \frac{1}{27}$	$\left(3, \frac{1}{27}\right)$

Figure 10.2.7

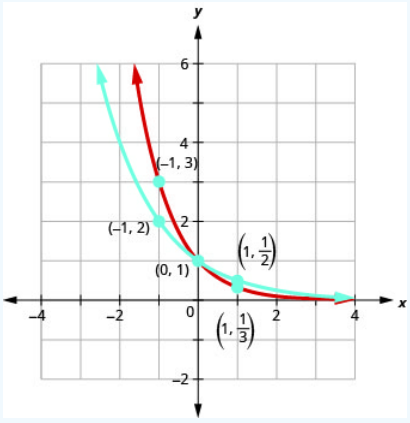

Figure 10.2.8

Exercise 20.3.3

Graph: $f(x) = \left(\frac{1}{4}\right)^x$.

Answer

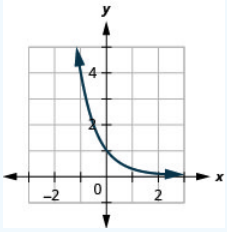

Figure 10.2.9

https://math.libretexts.org/@go/page/46470

Exercise 20.3.4

Graph: $g(x) = \left(\frac{1}{5}\right)^x$.

Answer

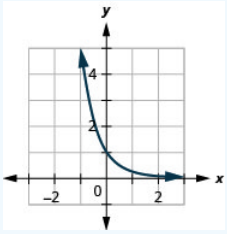

Figure 10.2.10

Now let's look at the graphs from the previous Example 10.2.2 and Exercises 10.2.3 and 10.2.4 so we can now identify some of the properties of exponential functions where $0 < a < 1$.

The graphs of $f(x) = \left(\frac{1}{2}\right)^x$ and $g(x) = \left(\frac{1}{3}\right)^x$ as well as the graphs of $f(x) = \left(\frac{1}{4}\right)^x$ and $g(x) = \left(\frac{1}{5}\right)^x$ all have the same basic shape. While this is the shape we expect from an exponential function where $0 < a < 1$, the graphs go down from left to right while the previous graphs, when $a > 1$, went from up from left to right.

We notice that for each function, the graph still contains the point $(0, 1)$. This make sense because $a^0 = 1$ for any a.

As before, the graph of each function, $f(x) = a^x$, also contains the point $(1, a)$. The graph of $f(x) = \left(\frac{1}{2}\right)^x$ contained $\left(1, \frac{1}{2}\right)$ and the graph of $g(x) = \left(\frac{1}{3}\right)^x$ contained $\left(1, \frac{1}{3}\right)$. This makes sense as $a^1 = a$.

Notice too that the graph of each function, $f(x) = a^x$, also contains the point $\left(-1, \frac{1}{a}\right)$. The graph of $f(x) = \left(\frac{1}{2}\right)^x$ contained $(-1, 2)$ and the graph of $g(x) = \left(\frac{1}{3}\right)^x$ contained $(-1, 3)$. This makes sense as $a^{-1} = \frac{1}{a}$.

What is the domain and range for each function? From the graphs we can see that the domain is the set of all real numbers and we write the domain in interval notation as $(-\infty, \infty)$. Again, the graph never hits the x-axis. The range is all positive numbers. We write the range in interval notation as $(0, \infty)$.

We will summarize these properties in the chart below. Which also include when $a > 1$.

Properties of the Graph of $f(x) = a^x$

Table 10.2.2

When $a > 1$		When $0 < a < 1$	
1\)">Domain	$(-\infty, \infty)$	Domain	$(-\infty, \infty)$
1\)">Range	$(0, \infty)$	Range	$(0, \infty)$
1\)">x-intercept	none	x-intercept	none
1\)">y-intercept	$(0, 1)$	y-intercept	$(0, 1)$
1\)">Contains	$(1, a)$, $\left(-1, \frac{1}{a}\right)$	Contains	$(1, a)$, $\left(-1, \frac{1}{a}\right)$
1\)">Asymptote	x-axis, the line $y = 0$	Asymptote	x-axis, the line $y = 0$
1\)">Basic Shape	increasing	Basic Shape	decreasing

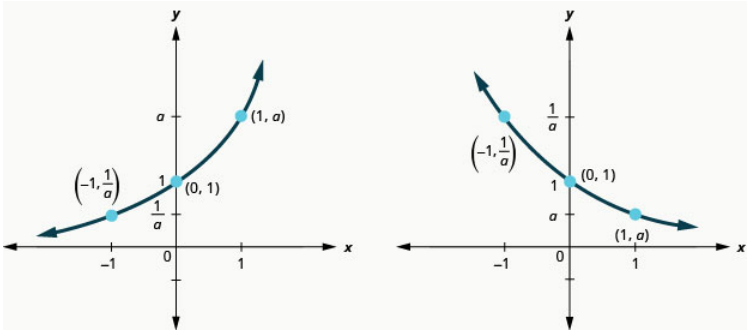

Figure 10.2.11

It is important for us to notice that both of these graphs are one-to-one, as they both pass the horizontal line test. This means the exponential function will have an inverse. We will look at this later.

When we graphed quadratic functions, we were able to graph using translation rather than just plotting points. Will that work in graphing exponential functions?

Example 20.3.3

On the same coordinate system graph $f(x) = 2^x$ and $g(x) = 2^{x+1}$.

Solution:

We will use point plotting to graph the functions.

x	$f(x) = 2^x$	$(x, f(x))$	$g(x) = 2^{x+1}$	$(x, g(x))$
–2	$2^{-2} = \frac{1}{2^2} = \frac{1}{4}$	$\left(-2, \frac{1}{4}\right)$	$2^{-2+1} = \frac{1}{2^1} = \frac{1}{2}$	$\left(-2, \frac{1}{2}\right)$
–1	$2^{-1} = \frac{1}{2^1} = \frac{1}{2}$	$\left(-1, \frac{1}{2}\right)$	$2^{-1+1} = 2^0 = 1$	(–1, 1)
0	$2^0 = 1$	(0, 1)	$2^{0+1} = 2^1 = 2$	(0, 2)
1	$2^1 = 2$	(1, 2)	$2^{1+1} = 2^2 = 4$	(1, 4)
2	$2^2 = 4$	(2, 4)	$2^{2+1} = 2^3 = 8$	(2, 8)
3	$2^3 = 8$	(3, 8)	$2^{3+1} = 2^4 = 16$	(3, 16)

Figure 10.2.12

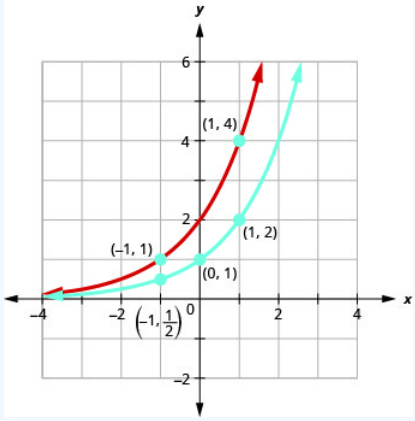

Figure 10.2.13

Exercise 20.3.5

On the same coordinate system, graph: $f(x) = 2^x$ and $g(x) = 2^{x-1}$.

Answer

https://math.libretexts.org/@go/page/46470

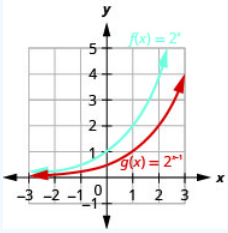

Figure 10.2.14

Exercise 20.3.6

On the same coordinate system, graph $f(x) = 3^x$ and $g(x) = 3^{x+1}$.

Answer

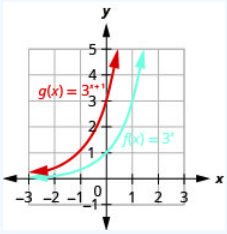

Figure 10.2.15

Looking at the graphs of the functions $f(x) = 2^x$ and $g(x) = 2^{x+1}$ in the last example, we see that adding one in the exponent caused a horizontal shift of one unit to the left. Recognizing this pattern allows us to graph other functions with the same pattern by translation.

Let's now consider another situation that might be graphed more easily by translation, once we recognize the pattern.

Example 20.3.4

On the same coordinate system graph $f(x) = 3^x$ and $g(x) = 3^x - 2$.

Solution:

We will use point plotting to graph the functions.

x	$f(x) = 3^x$	$(x, g(x))$		$g(x) = 3^x - 2$	$(x, g(x))$
−2	$3^{-2} = \frac{1}{9}$	$\left(-2, \frac{1}{9}\right)$		$3^{-2} - 2 = \frac{1}{9} - 2 = -\frac{17}{9}$	$\left(-2, -\frac{17}{9}\right)$
−1	$3^{-1} = \frac{1}{3}$	$\left(-1, \frac{1}{3}\right)$		$3^{-1} - 2 = \frac{1}{3} - 2 = -\frac{5}{3}$	$\left(-1, -\frac{5}{3}\right)$
0	$3^0 = 1$	(0, 1)		$3^0 - 2 = 1 - 2 = -1$	(0, −1)
1	$3^1 = 3$	(1, 3)		$3^1 - 2 = 3 - 2 = 1$	(1, 1)
2	$3^2 = 9$	(2, 9)		$3^2 - 2 = 9 - 2 = 7$	(2, 8)

Figure 10.2.16

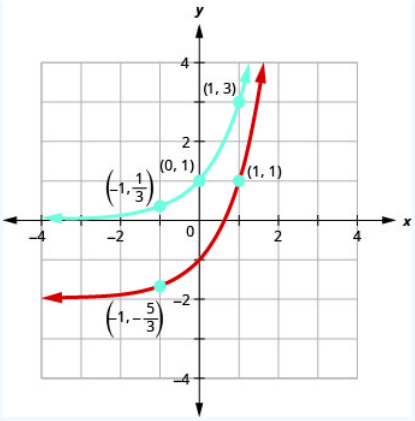

Figure 10.2.17

Exercise 20.3.7

On the same coordinate system, graph $f(x)=3^x$ and $g(x)=3^x+2$.

Answer

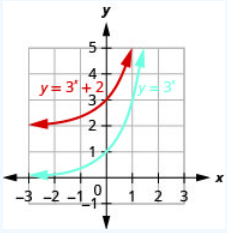

Figure 10.2.18

Exercise 20.3.8

On the same coordinate system, graph $f(x)=4^x$ and $g(x)=4^x-2$.

Answer

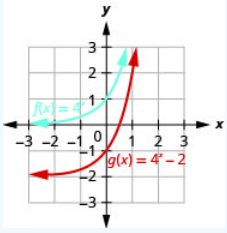

Figure 10.2.19

Looking at the graphs of the functions $f(x)=3^x$ and $g(x)=3^x-2$ in the last example, we see that subtracting 2 caused a vertical shift of down two units. Notice that the horizontal asymptote also shifted down 2 units. Recognizing this pattern allows us to graph other functions with the same pattern by translation.

All of our exponential functions have had either an integer or a rational number as the base. We will now look at an exponential function with an irrational number as the base.

Before we can look at this exponential function, we need to define the irrational number, e. This number is used as a base in many applications in the sciences and business that are modeled by exponential functions. The number is defined as the value of $\left(1+\frac{1}{n}\right)^n$ as n gets larger and larger. We say, as n approaches infinity, or increases without bound. The table shows the value of $\left(1+\frac{1}{n}\right)^n$ for several values of n.

Table 10.2.3

n	$\left(1+\frac{1}{n}\right)^n$
1	2
2	2.25
5	2.48832
10	2.59374246
100	$2.704813829\ldots$
$1,000$	$2.716923932\ldots$
$10,000$	$2.718145927\ldots$
$100,000$	$2.718268237\ldots$
$1,000,000$	$2.718280469\ldots$
$1,000,000,000$	$2.718281827\ldots$

$$e \approx 2.718281827$$

The number e is like the number π in that we use a symbol to represent it because its decimal representation never stops or repeats. The irrational number e is called the **natural base**.

Definition 20.3.2

Natural Base e

The number e is defined as the value of $\left(1+\frac{1}{n}\right)^n$, as n increases without bound. We say, as n approaches infinity,

$$e \approx 2.718281827$$

The exponential function whose base is e, $f(x) = e^x$ is called the **natural exponential function**.

Definition 20.3.3

Natural Exponential Function

The natural exponential function is an exponential function whose base is e

$$f(x) = e^x$$

The domain is $(-\infty, \infty)$ and the range is $(0, \infty)$.

Let's graph the function $f(x) = e^x$ on the same coordinate system as $g(x) = 2^x$ and $h(x) = 3^x$.

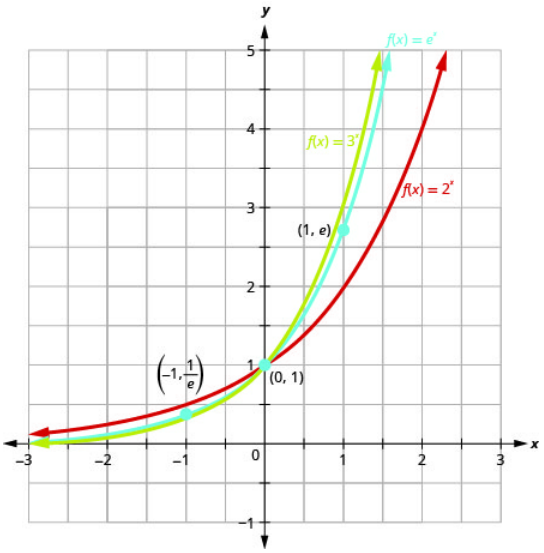

Figure 10.2.20

Notice that the graph of $f(x) = e^x$ is "between" the graphs of $g(x) = 2^x$ and $h(x) = 3^x$.Does this make sense as $2 < e < 3$?

Solve Exponential Equations

Equations that include an exponential expression a^x are called exponential equations. To solve them we use a property that says as long as $a > 0$ and $a \neq 1$, if $a^x = a^y$ then it is true that $x = y$. In other words, in an exponential equation, if the bases are equal then the exponents are equal.

Definition 20.3.4

One-to-One Property of Exponential Equations

For $a > 0$ and $a \neq 1$,

$$\text{If } a^x = a^y \text{,then } x = y.$$

To use this property, we must be certain that both sides of the equation are written with the same base.

Example 20.3.5 How to Solve an Exponential Equation

Solve: $3^{2x-5} = 27$.

Solution:

Table 10.2.4

Step 1: Write both sides of the equation with the same base.	Since the left side has base 3, we write the right side with base 3. $27 = 3^3$	$3^{2x-5} = 27$ $3^{2x-5} = 3^3$
Step 2: Write a new equation by setting the exponents equal.	Since the bases are the same, the exponents must be equal.	$2x - 5 = 3$
Step 3: Solve the equation.	Add 5 to each side. Divide by 2.	$2x = 8$ $x = 4$
Step 4: Check the solution.	Substitute $x = 4$ into the original equation.	$3^{2x-5} = 27$ $3^{2\cdot 4-5} \stackrel{?}{=} 27$ $3^3 \stackrel{?}{=} 27$ $27 = 27$

Exercise 20.3.9

Solve: $3^{3x-2} = 81$.

Answer

$x = 2$

Exercise 20.3.10

Solve: $7^{x-3} = 7$.

Answer

$x = 4$

The steps are summarized below.

How to Solve an Exponential Function

1. Write both sides of the equation with the same base, if possible.
2. Write a new equation by setting the exponents equal.
3. Solve the equation.
4. Check the solution.

In the next example, we will use our properties on exponents.

Example 20.3.6

Solve $\frac{e^{x^2}}{e^3} = e^{2x}$.

Solution:

Table 10.2.5

	$\frac{e^{x^2}}{e^3} = e^{2x}$
Use the Property of Exponents: $\frac{a^m}{a^n} = a^{m-n}$.	$e^{x^2-3} = e^{2x}$
Write a new equation by setting the exponents equal.	$x^2 - 3 = 2x$
Solve the equation.	$x^2 - 2x - 3 = 0$
	$(x-3)(x+1) = 0$
	$x = 3, x = -1$
Check the solutions.	
$x = 3$ $\frac{e^{x^2}}{e^3} \stackrel{?}{=} e^{2x}$ $\frac{e^{3^2}}{e^3} \stackrel{?}{=} e^{2\cdot 3}$ $\frac{e^9}{e^3} \stackrel{?}{=} e^6$ $e^6 = e^6$ ✓	$x = -1$ $\frac{e^{x^2}}{e^3} \stackrel{?}{=} e^{2x}$ $\frac{e^{(-1)^2}}{e^3} \stackrel{?}{=} e^{2\cdot(-1)}$ $\frac{e^1}{e^3} \stackrel{?}{=} e^{-2}$ $e^{-2} = e^{-2}$ ✓

Exercise 20.3.11

Solve: $\frac{e^{x^2}}{e^x} = e^2$.

Answer

$x = -1, x = 2$

Exercise 20.3.12

Solve: $\frac{e^{x^2}}{e^x} = e^6$.

Answer

$x = -2, x = 3$

Use Exponential Models in Applications

Exponential functions model many situations. If you own a bank account, you have experienced the use of an exponential function. There are two formulas that are used to determine the balance in the account when interest is earned. If a principal, P, is invested at an interest rate, r, for t years, the new balance, A, will depend on how often the interest is compounded. If the interest is compounded n times a year we use the formula $A = P\left(1 + \frac{r}{n}\right)^{nt}$. If the interest is compounded continuously, we use the formula $A = Pe^{rt}$. These are the formulas for **compound interest**.

Definition 20.3.5

Compound Interest

For a principal, P, invested at an interest rate, r, for t years, the new balance, A, is:

$$A = P\left(1 + \frac{r}{n}\right)^{nt} \quad \text{when compounded } n \text{ times a year.}$$
$$A = Pe^{rt} \quad \text{when compounded continuously.}$$

As you work with the Interest formulas, it is often helpful to identify the values of the variables first and then substitute them into the formula.

Example 20.3.7

A total of $\$10,000$ was invested in a college fund for a new grandchild. If the interest rate is 5%, how much will be in the account in 18 years by each method of compounding?

a. compound quarterly
b. compound monthly
c. compound continuously

Solution:

Identify the values of each variable in the formulas. Remember to express the percent as a decimal.

$$A = ?$$
$$P = \$10,000$$
$$r = 0.05$$
$$t = 18 \text{ years}$$

a. For quarterly compounding, $n = 4$. There are 4 quarters in a year.

$$A = P\left(1 + \frac{r}{n}\right)^{nt}$$

Substitute the values in the formula.

$$A = 10,000\left(1+\frac{0.05}{4}\right)^{4\cdot 18}$$

Compute the amount. Be careful to consider the order of operations as you enter the expression into your calculator.

$$A = \$24,459.20$$

b. For monthly compounding, $n = 12$.There are 12 months in a year.

$$A = P\left(1+\frac{r}{n}\right)^{nt}$$

Substitute the values in the formula.

$$A = 10,000\left(1+\frac{0.05}{12}\right)^{12\cdot 18}$$

Compute the amount.

$$A = \$24,550.08$$

c. For compounding continuously,

$$A = Pe^{rt}$$

Substitute the values in the formula.

$$A = 10,000e^{0.05\cdot 18}$$

Compute the amount.

$$A = \$24,596.03$$

? Exercise 20.3.13

Angela invested $\$15,000$ in a savings account. If the interest rate is 4%, how much will be in the account in 10 years by each method of compounding?

a. compound quarterly
b. compound monthly
c. compound continuously

Answer

a. $\$22,332.96$
b. $\$22,362.49$
c. $\$22,377.37$

? Exercise 20.3.14

Allan invested $\$10,000$ in a mutual fund. If the interest rate is 5%, how much will be in the account in 15 years by each method of compounding?

a. compound quarterly
b. compound monthly
c. compound continuously

Answer

a. $\$21,071.81$
b. $\$21,137.04$
c. $\$21,170.00$

Other topics that are modeled by exponential functions involve growth and decay. Both also use the formula $A = Pe^{rt}$ we used for the growth of money. For growth and decay, generally we use A_0, as the original amount instead of calling it P, the principal. We see that **exponential growth** has a positive rate of growth and **exponential decay** has a negative rate of growth.

Definition 20.3.6

Exponential Growth and Decay

For an original amount, A_0, that grows or decays at a rate, r, for a certain time, t, the final amount, A, is:

$$A = A_0 e^{rt}$$

Exponential growth is typically seen in the growth of populations of humans or animals or bacteria. Our next example looks at the growth of a virus.

Example 20.3.8

Chris is a researcher at the Center for Disease Control and Prevention and he is trying to understand the behavior of a new and dangerous virus. He starts his experiment with 100 of the virus that grows at a rate of 25% per hour. He will check on the virus in 24 hours. How many viruses will he find?

Solution:

Identify the values of each variable in the formulas. Be sure to put the percent in decimal form. Be sure the units match--the rate is per hour and the time is in hours.

$$\begin{aligned} A &= ? \\ A_0 &= 100 \\ r &= 0.25/\text{ hour} \\ t &= 24 \text{ hours} \end{aligned}$$

Substitute the values in the formula: $A = A_0 e^{rt}$.

$$A = 100e^{0.25 \cdot 24}$$

Compute the amount.

$$A = 40,342.88$$

Round to the nearest whole virus.

$$A = 40,343$$

The researcher will find $40,343$ viruses.

Exercise 20.3.15

Another researcher at the Center for Disease Control and Prevention, Lisa, is studying the growth of a bacteria. She starts his experiment with 50 of the bacteria that grows at a rate of 15% per hour. He will check on the bacteria every 8 hours. How many bacteria will he find in 8 hours?

Answer

She will find 166 bacteria.

Exercise 20.3.16

Maria, a biologist is observing the growth pattern of a virus. She starts with 100 of the virus that grows at a rate of 10% per hour. She will check on the virus in 24 hours. How many viruses will she find?

Answer

She will find $1,102$ viruses.

Glossary

asymptote

A line which a graph of a function approaches closely but never touches.

exponential function

An exponential function, where $a > 0$ and $a \neq 1$, is a function of the form $f(x) = a^x$.

natural base

The number e is defined as the value of $(1 + \frac{1}{n})^n$, as n gets larger and larger. We say, as n increases without bound, $e \approx 2.718281827\ldots$

natural exponential function

The natural exponential function is an exponential function whose base is e: $f(x) = e^x$. The domain is $(-\infty, \infty)$ and the range is $(0, \infty)$.

20.3E: Exercises

Practice Makes Perfect

Exercise $20.3E.17$ Graph Exponential Functions

In the following exercises, graph each exponential function.

1. $f(x) = 2^x$
2. $g(x) = 3^x$
3. $f(x) = 6^x$
4. $g(x) = 7^x$
5. $f(x) = (1.5)^x$
6. $g(x) = (2.5)^x$
7. $f(x) = \left(\frac{1}{2}\right)^x$
8. $g(x) = \left(\frac{1}{3}\right)^x$
9. $f(x) = \left(\frac{1}{6}\right)^x$
10. $g(x) = \left(\frac{1}{7}\right)^x$
11. $f(x) = (0.4)^x$
12. $g(x) = (0.6)^x$

? Exercise $20.3E.18$ Graph Exponential Functions

In the following exercises, graph each function in the same coordinate system.

1. $f(x) = 4^x, g(x) = 4^{x-1}$
2. $f(x) = 3^x, g(x) = 3^{x-1}$
3. $f(x) = 2^x, g(x) = 2^{x-2}$
4. $f(x) = 2^x, g(x) = 2^{x+2}$
5. $f(x) = 3^x, g(x) = 3^x + 2$
6. $f(x) = 4^x, g(x) = 4^x + 2$
7. $f(x) = 2^x, g(x) = 2^x + 1$
8. $f(x) = 2^x, g(x) = 2^x - 1$

Exercise $20.3E.20$ Solve Exponential Equations

In the following exercises, solve each equation.

1. $2^{3x-8} = 16$
2. $2^{2x-3} = 32$
3. $3^{x+3} = 9$
4. $3^{x^2} = 81$
5. $4^{x^2} = 4$
6. $4^{x} = 32$
7. $4^{x+2} = 64$
8. $4^{x+3} = 16$
9. $2^{x^2+2x} = \frac{1}{2}$
10. $3^{x^2-2x} = \frac{1}{3}$
11. $e^{3x} \cdot e^{4} = e^{10}$
12. $e^{2x} \cdot e^{3} = e^{9}$
13. $\frac{e^{x^2}}{e^2} = e^{x}$
14. $\frac{e^{x^2}}{e^3} = e^{2x}$

Answer

1. $x = 4$
3. $x = -1$
5. $x = -1, x = 1$
7. $x = 1$
9. $x = -1$
11. $x = 2$
13. $x = -1, x = 2$

Exercise $20.3E.21$ Solve Exponential Equations

In the following exercises, match the graphs to one of the following functions:

a. 2^{x}
b. 2^{x+1}
c. 2^{x-1}
d. $2^{x} + 2$
e. $2^{x} - 2$
f. 3^{x}

Exercise $20.3E.22$ Use Exponential Models in Applications

In the following exercises, use an exponential model to solve.

1. Edgar accumulated $\$5,000$ in credit card debt. If the interest rate is 20% per year, and he does not make any payments for 2 years, how much will he owe on this debt in 2 years by each method of compounding?
   a. compound quarterly
   b. compound monthly
   c. compound continuously
2. Cynthia invested $\$12,000$ in a savings account. If the interest rate is 6%, how much will be in the account in 10 years by each method of compounding?
   a. compound quarterly
   b. compound monthly
   c. compound continuously
3. Rochelle deposits $\$5,000$ in an IRA. What will be the value of her investment in 25 years if the investment is earning 8% per year and is compounded continuously?
4. Nazerhy deposits $\$8,000$ in a certificate of deposit. The annual interest rate is 6% and the interest will be compounded quarterly. How much will the certificate be worth in 10 years?
5. A researcher at the Center for Disease Control and Prevention is studying the growth of a bacteria. He starts his experiment with 100 of the bacteria that grows at a rate of 6% per hour. He will check on the bacteria every 8 hours. How many bacteria will he find in 8 hours?
6. A biologist is observing the growth pattern of a virus. She starts with 50 of the virus that grows at a rate of 20% per hour. She will check on the virus in 24 hours. How many viruses will she find?
7. In the last ten years the population of Indonesia has grown at a rate of 1.12% per year to $258,316,051$ If this rate continues, what will be the population in 10 more years?
8. In the last ten years the population of Brazil has grown at a rate of 0.9% per year to $205,823,665$ If this rate continues, what will be the population in 10 more years?

Answer

1.
   a. $\$7,387.28$
   b. $\$7,434.57$
   c. $\$7,459.12$
3. $\$36,945.28$
5. 223 bacteria
7. $288,929,825$

Exercise $20.3E.23$ Writing Exercises

1. Explain how you can distinguish between exponential functions and polynomial functions.
2. Compare and contrast the graphs of $y = x^2$ and $y = 2^x$.
3. What happens to an exponential function as the values of x decreases? Will the graph ever cross the x-axis? Explain.

Answer

1. Answers will vary
3. Answers will vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
graph exponential eunctions.			
solve exponential equations.			
use exponential models in applications.			

Figure 10.2.43

b. After reviewing this checklist, what will you do to become confident for all objectives?

20.4: Evaluate and Graph Logarithmic Functions

Learning Objectives

By the end of this section, you will be able to:

- Convert between exponential and logarithmic form
- Evaluate logarithmic functions
- Graph Logarithmic functions
- Solve logarithmic equations
- Use logarithmic models in applications

Before you get started, take this readiness quiz.

1. Solve: $x^2 = 81$.
   If you missed this problem, review Example 6.46.
2. Evaluate: 3^{-2}.
   If you missed this problem, review Example 5.15.
3. Solve: $2^4 = 3x - 5$.
   If you missed this problem, review Example 2.2.

We have spent some time finding the inverse of many functions. It works well to 'undo' an operation with another operation. Subtracting 'undoes' addition, multiplication 'undoes' division, taking the square root 'undoes' squaring.

As we studied the exponential function, we saw that it is one-to-one as its graphs pass the horizontal line test. This means an exponential function does have an inverse. If we try our algebraic method for finding an inverse, we run into a problem.

$$f(x) = a^x$$

Rewrite with $y = f(x)$.

$$y = a^x$$

Interchange the variables x and y.

$$x = a^y$$

Solve for y.

Oops! We have no way to solve for y!

To deal with this we define the logarithm function with base a to be the inverse of the exponential function $f(x) = a^x$. We use the notation $f^{-1}(x) = log_a x$ and say the inverse function of the exponential function is the logarithmic function.

Definition 20.4.1: Logarithmic Function

The function $f(x) = \log_a x$ is the **logarithmic function** with base a, where $a > 0, x > 0$, and $a \neq 1$.

$$y = \log_a x \text{ is equivalent to } x = a^y$$

Convert Between Exponential and Logarithmic Form

Since the equations $y = \log_a x$ and $x = a^y$ are equivalent, we can go back and forth between them. This will often be the method to solve some exponential and logarithmic equations. To help with converting back and forth let's take a close look at the equations. See *Figure 10.3.1*. Notice the positions of the exponent and base.

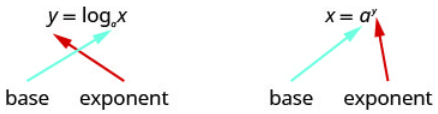

Figure 10.3.1

If we realize the logarithm is the exponent it makes the conversion easier. You may want to repeat, “base to the exponent give us the number.”

Example 20.4.1

Convert to logarithmic form:

a. $2^3 = 8$
b. $5^{\frac{1}{2}} = \sqrt{5}$
c. $\left(\frac{1}{2}\right)^x = \frac{1}{16}$

Solution:

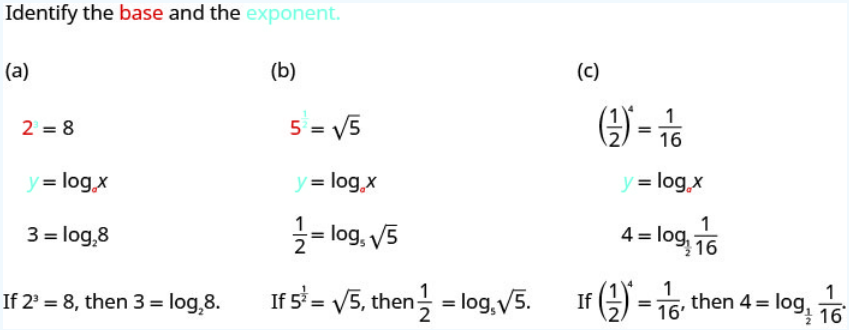

Figure 10.3.2

Exercise 20.4.1

Convert to logarithmic form:

a. $3^2 = 9$
b. $7^{\frac{1}{2}} = \sqrt{7}$
c. $\left(\frac{1}{3}\right)^x = \frac{1}{27}$

Answer

a. $\log_3 9 = 2$
b. $\log_7 \sqrt{7} = \frac{1}{2}$
c. $\log_{\frac{1}{3}} \frac{1}{27} = x$

Exercise 20.4.2

Convert to logarithmic form:

a. $4^3 = 64$
b. $4^{\frac{1}{3}} = \sqrt[3]{4}$
c. $\left(\frac{1}{2}\right)^x = \frac{1}{32}$

Answer

a. $\log_4 64 = 3$
b. $\log_4 \sqrt[3]{4} = \frac{1}{3}$
c. $\log_{\frac{1}{2}} \frac{1}{32} = x$

In the next example we do the reverse—convert logarithmic form to exponential form.

Example 20.4.2

Convert to exponential form:

a. $2 = \log_8 64$
b. $0 = \log_4 1$
c. $-3 = \log_{10} \frac{1}{1000}$

Solution:

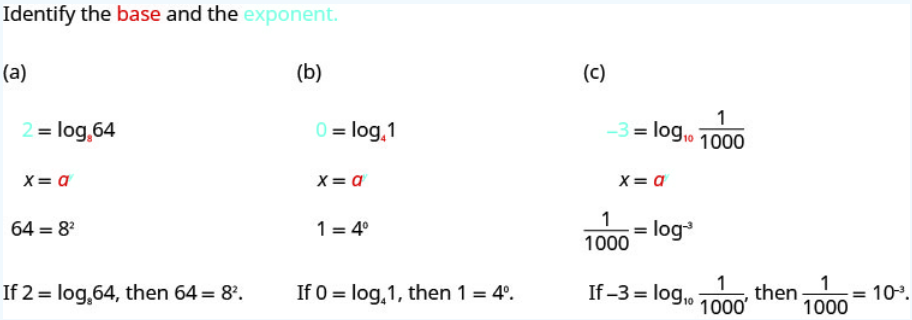

Figure 10.3.3

Exercise 20.4.3

Convert to exponential form:

a. $3 = \log_4 64$
b. $0 = \log_x 1$
c. $-2 = \log_{10} \frac{1}{100}$

Answer

a. $64 = 4^3$
b. $1 = x^0$
c. $\frac{1}{100} = 10^{-2}$

Exercise 20.4.4

Convert to exponential form:

a. $3 = \log_3 27$
b. $0 = \log_x 1$
c. $-1 = \log_{10} \frac{1}{10}$

Answer

a. $27 = 3^3$
b. $1 = x^0$
c. $\frac{1}{10} = 10^{-1}$

Evaluate Logarithmic Functions

We can solve and evaluate logarithmic equations by using the technique of converting the equation to its equivalent exponential equation.

Example 20.4.3

Find the value of x:

a. $\log_x 36 = 2$
b. $\log_4 x = 3$
c. $\log_{\frac{1}{2}} \frac{1}{8} = x$

Solution:

a.

$$\log_x 36 = 2$$

Convert to exponential form.

$$x^2 = 36$$

Solve the quadratic.

$$x = 6, \quad x = \cancel{-6}$$

The base of a logarithmic function must be positive, so we eliminate $x = -6$.

$$x = 6 \quad \text{Therefore, } \log_6 36 = 2$$

b.

$$\log_4 x = 3$$

Convert to exponential form.

$$4^3 = x$$

Simplify.

$$x = 64 \quad \text{Therefore , } \log_4 64 = 3$$

c.

$$\log_{\frac{1}{2}} \frac{1}{8} = x$$

Convert to exponential form.

$$\left(\frac{1}{2}\right)^x = \frac{1}{8}$$

Rewrite $\frac{1}{8}$ as $\left(\frac{1}{2}\right)^3$.

$$\left(\frac{1}{2}\right)^x = \left(\frac{1}{2}\right)^3$$

With the same base, the exponents must be equal.

$$x = 3 \quad \text{Therefore } \log_{\frac{1}{2}} \frac{1}{8} = 3$$

Exercise 20.4.5

Find the value of x:

a. $\log_x 64 = 2$
b. $\log_5 x = 3$
c. $\log_{\frac{1}{2}} \frac{1}{4} = x$

Answer

a. $x = 8$
b. $x = 125$
c. $x = 2$

Exercise 20.4.6

Find the value of x:

a. $\log_x 81 = 2$
b. $\log_3 x = 5$
c. $\log_{\frac{1}{3}} \frac{1}{27} = x$

Answer

a. $x = 9$
b. $x = 243$
c. $x = 3$

When see an expression such as $log_3 27$, we can find its exact value two ways. By inspection we realize it means "3 to what power will be 27"? Since $3^3 = 27$, we know $log_3 27 = 3$. An alternate way is to set the expression equal to x and then convert it into an exponential equation.

Example 20.4.4

Find the exact value of each logarithm without using a calculator:

a. $\log_5 25$
b. $\log_9 3$
c. $\log_2 \frac{1}{16}$

Solution:

a.

$$\log_5 25$$

5 to what power will be 25?

$$\log_5 25 = 2$$

Or

Set the expression equal to x.

$$\log_5 25 = x$$

Change to exponential form.

$$5^x = 25$$

Rewrite 25 as 5^2.

$$5^x = 5^2$$

With the same base the exponents must be equal.

$$x = 2 \quad \text{Therefore , } \log_5 25 = 2.$$

b.

$$\log_9 3$$

Set the expression equal to x.

$$\log_9 3 = x$$

Change to exponential form.

$$9^x = 3$$

Rewrite 9 as 3^2.

$$\left(3^2\right)^x = 3^1$$

Simplify the exponents.

$$3^{2x} = 3^1$$

With the same base the exponents must be equal.

$$2x = 1$$

Solve the equation.

$$x = \tfrac{1}{2} \quad \text{Therefore , } \log_9 3 = \tfrac{1}{2}\,.$$

c.

$$\log_2 \tfrac{1}{16}$$

Set the expression equal to x.

$$\log_2 \tfrac{1}{16} = x$$

Change to exponential form.

$$2^x = \tfrac{1}{16}$$

Rewrite 16 as 2^4.

$$2^x = \tfrac{1}{2^4}$$

$$2^x = 2^{-4}$$

With the same base the exponents must be equal.

$$x = -4 \quad \text{Therefore , } \log_2 \tfrac{1}{16} = -4\,.$$

Exercise 20.4.7

Find the exact value of each logarithm without using a calculator:

a. $\log_{12} 144$
b. $\log_4 2$
c. $\log_2 \frac{1}{32}$

Answer

a. 2
b. $\frac{1}{2}$
c. -5

Exercise 20.4.8

Find the exact value of each logarithm without using a calculator:

a. $\log_9 81$
b. $\log_8 2$
c. $\log_3 \frac{1}{9}$

Answer

a. 2
b. $\frac{1}{3}$
c. -2

Graph Logarithmic Functions

To graph a logarithmic function $y = log_a x$, it is easiest to convert the equation to its exponential form, $x = a^y$. Generally, when we look for ordered pairs for the graph of a function, we usually choose an x-value and then determine its corresponding y-value. In this case you may find it easier to choose y-values and then determine its corresponding x-value.

Example 20.4.5

Graph $y = \log_2 x$.

Solution:

To graph the function, we will first rewrite the logarithmic equation, $y = \log_2 x$, in exponential form, $2^y = x$.

We will use point plotting to graph the function. It will be easier to start with values of y and then get x.

Table 10.3.1

y	$2^y = x$	(x, y)
-2	$2^{-2} = \frac{1}{2^2} = \frac{1}{4}$	$(\frac{1}{4}, 2)$
-1	$2^{-1} = \frac{1}{2^1} = \frac{1}{2}$	$(\frac{1}{2}, -1)$
0	$2^0 = 1$	$(1, 0)$
1	$2^1 = 2$	$(2, 1)$
2	$2^2 = 4$	$(4, 2)$
3	$2^3 = 8$	$(8, 3)$

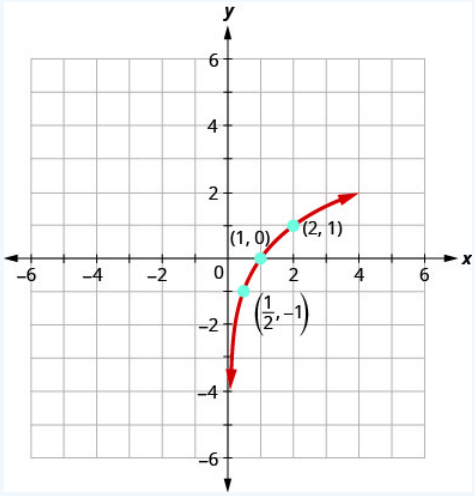

Figure 10.3.4

Exercise 20.4.9

Graph: $y = \log_3 x$.

Answer

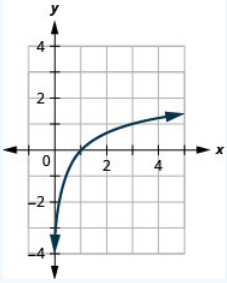

Figure 10.3.5

? Exercise 20.4.10

Graph: $y = \log_5 x$.

Answer

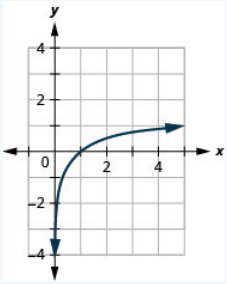

Figure 10.3.6

The graphs of $y = \log_2 x, y = \log_3 x$, and $y = \log_5 x$ are the shape we expect from a logarithmic function where $a > 1$.

We notice that for each function the graph contains the point $(1, 0)$. This make sense because $0 = log_a 1$ means $a^0 = 1$ which is true for any a.

The graph of each function, also contains the point $(a, 1)$. This makes sense as $1 = \log_a a$ means $a^1 = a$. which is true for any a.

Notice too, the graph of each function $y = \log_a x$ also contains the point $\left(\frac{1}{a}, -1\right)$. This makes sense as $-1 = \log_a \frac{1}{a}$ means $a^{-1} = \frac{1}{a}$, which is true for any a.

Look at each graph again. Now we will see that many characteristics of the logarithm function are simply 'mirror images' of the characteristics of the corresponding exponential function.

What is the domain of the function? The graph never hits the y-axis. The domain is all positive numbers. We write the domain in interval notation as $(0, \infty)$.

What is the range for each function? From the graphs we can see that the range is the set of all real numbers. There is no restriction on the range. We write the range in interval notation as $(-\infty, \infty)$.

When the graph approaches the y-axis so very closely but will never cross it, we call the line $x = 0$, the y-axis, a vertical asymptote.

Table 10.3.2: Properties of the Graph of $y = \log_a x$ When $a > 1$

Domain	$(0, \infty)$
Range	$(-\infty, \infty)$
x-intercept	$(1, 0)$
y-intercept	None
Contains	$(a, 1), \left(\frac{1}{a}, -1\right)$

Asymptote	y-axis

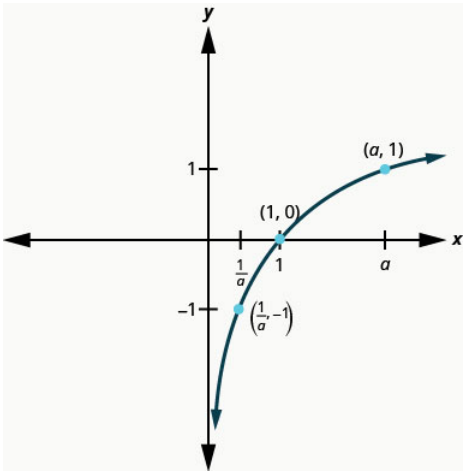

Figure 10.3.7

Our next example looks at the graph of $y = log_a x$ when $0 < a < 1$.

Example 20.4.6

Graph $y = \log_{\frac{1}{3}} x$.

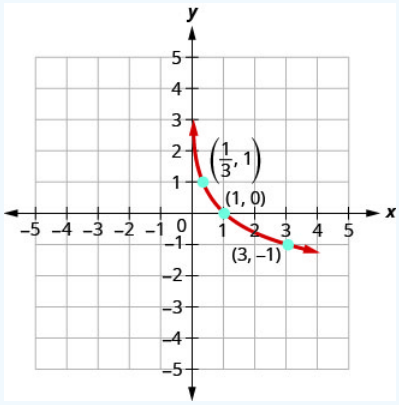
Solution:

To graph the function, we will first rewrite the logarithmic equation, $y = \log_{\frac{1}{3}} x$, in exponential form, $\left(\frac{1}{3}\right)^y = x$.

We will use point plotting to graph the function. It will be easier to start with values of y and then get x.

Table 10.3.3

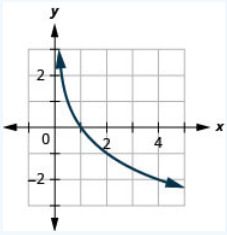
y	$\left(\frac{1}{3}\right)^y = x$	(x, y)
-2	$\left(\frac{1}{3}\right)^{-2} = 3^2 = 9$	$(9, -2)$
-1	$\left(\frac{1}{3}\right)^{-1} = 3^1 = 3$	$(3, -1)$
0	$\left(\frac{1}{3}\right)^0 = 1$	$(1, 0)$
1	$\left(\frac{1}{3}\right)^1 = \frac{1}{3}$	$\left(\frac{1}{3}, 1\right)$
2	$\left(\frac{1}{3}\right)^2 = \frac{1}{9}$	$\left(\frac{1}{9}, 2\right)$
3	$\left(\frac{1}{3}\right)^3 = \frac{1}{27}$	$\left(\frac{1}{27}, 3\right)$



Exercise 20.4.11

Graph: $y = \log_{\frac{1}{2}} x$.

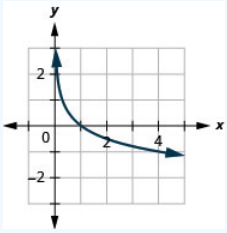
Answer



Exercise 20.4.12

Graph: $y = \log_{\frac{1}{4}} x$.

Answer



Now, let's look at the graphs $y = \log_{\frac{1}{2}} x, y = \log_{\frac{1}{3}} x$ and $y = \log_{\frac{1}{4}} x$, so we can identify some of the properties of logarithmic functions where $0 < a < 1$.

The graphs of all have the same basic shape. While this is the shape we expect from a logarithmic function where $0 < a < 1$.

We notice, that for each function again, the graph contains the points,$(1, 0), (a, 1), \left(\frac{1}{a}, -1\right)$. This make sense for the same reasons we argued above.

We notice the domain and range are also the same—the domain is $(0, \infty)$ and the range is $(-\infty, \infty)$. The y-axis is again the vertical asymptote.

We will summarize these properties in the chart below. Which also include when $a > 1$.

Table 10.3.4: Properties of the Graph of $y = \log_a x$

When $a > 1$		**When $0 < a < 1$**	
1\)">Domain	$(0, \infty)$	Domain	$(0, \infty)$
1\)">Range	$(-\infty, \infty)$	Range	$(-\infty, \infty)$
1\)">x-intercept	$(1, 0)$	x-intercept	$(1, 0)$
1\)">y-intercept	None	y-intercept	None
1\)">Contains	$(a, 1), \left(\frac{1}{a}, -1\right)$	Contains	$(a, 1), \left(\frac{1}{a}, -1\right)$
1\)">Asymptote	y -axis	Asymptote	y -axis
1\)">Basic shape	Increasing	Basic shape	Decreasing

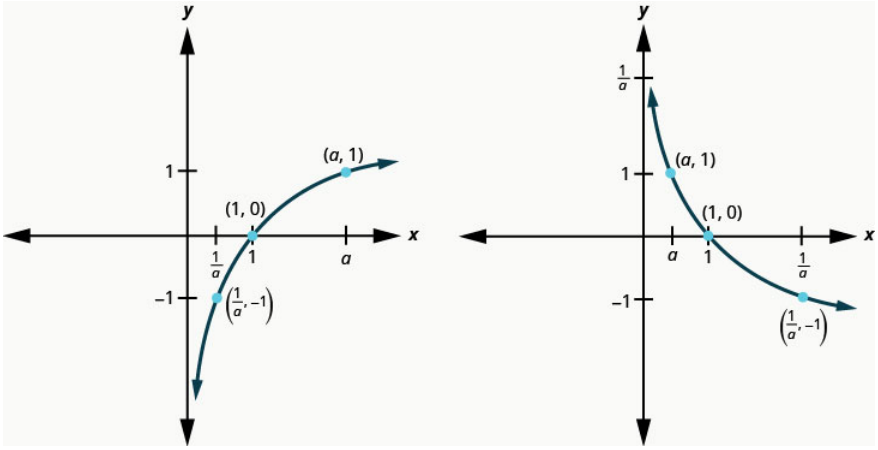


Figure 10.3.11

We talked earlier about how the logarithmic function $f^{-1}(x) = \log_a x$ is the inverse of the exponential function $f(x) = a^x$. The graphs in *Figure 10.3.12* show both the exponential (blue) and logarithmic (red) functions on the same graph for both $a > 1$ and $0 < a < 1$.

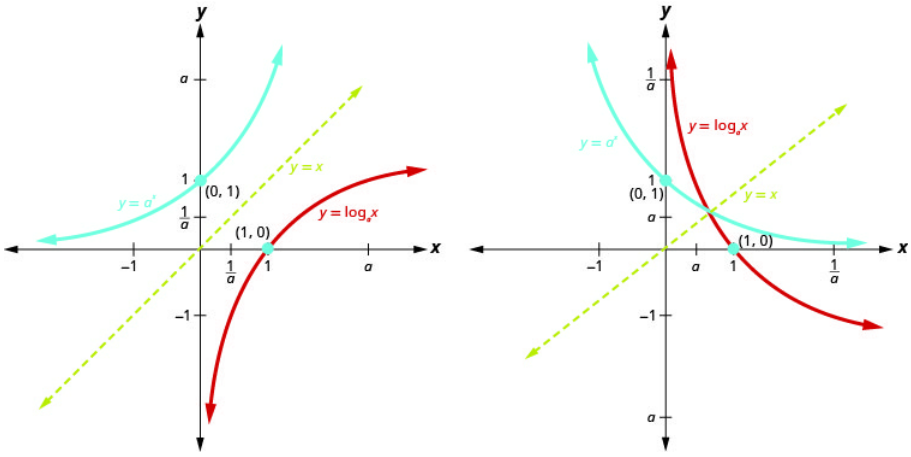

Figure 10.3.12

Notice how the graphs are reflections of each other through the line $y = x$. We know this is true of inverse functions. Keeping a visual in your mind of these graphs will help you remember the domain and range of each function. Notice the x-axis is the horizontal asymptote for the exponential functions and the y-axis is the vertical asymptote for the logarithmic functions.

Solve Logarithmic Equations

When we talked about exponential functions, we introduced the number e. Just as e was a base for an exponential function, it can be used a base for logarithmic functions too. The logarithmic function with base e is called the **natural logarithmic function**. The function $f(x) = \log_e x$ is generally written $f(x) = \ln x$ and we read it as "el en of x."

Definition 20.4.2: Natural Logarithmic Function

The function $f(x) = \ln x$ is the **natural logarithmic function** with base e, where $x > 0$.

$$y = \ln x \text{ is equivalent to } x = e^y$$

When the base of the logarithm function is 10, we call it the **common logarithmic function** and the base is not shown. If the base a of a logarithm is not shown, we assume it is 10.

Definition 20.4.3: Common Logarithmic Function

The function $f(x) = \log x$ is the **common logarithmic function** with base 10, where $x > 0$.

$$y = \log x \text{ is equivalent to } x = 10^y$$

It will be important for you to use your calculator to evaluate both common and natural logarithms.

Look for the log and ln keys on your calculator.

To solve logarithmic equations, one strategy is to change the equation to exponential form and then solve the exponential equation as we did before. As we solve logarithmic equations, $y = log_a x$, we need to remember that for the base a, $a > 0$ and $a \neq 1$. Also, the domain is $x > 0$. Just as with radical equations, we must check our solutions to eliminate any extraneous solutions.

Example 20.4.7

Solve:

a. $\log_a 49 = 2$
b. $\ln x = 3$

Solution:

a.

$$\log_a 49 = 2$$

Rewrite in exponential form.

$$a^2 = 49$$

Solve the equation using the square root property.

$$a = \pm 7$$

The base cannot be negative, so we eliminate $a = -7$.

$$a = 7, \quad \cancel{a = -7}$$

Check. $a = 7$

$$\log_a 49 = 2$$
$$\log_7 49 \stackrel{?}{=} 2$$
$$7^2 \stackrel{?}{=} 49$$
$$49 = 49$$

b.

$$\ln x = 3$$

Rewrite in exponential form.

$$e^3 = x$$

Check. $x = e^3$

$$\ln x = 3$$
$$\ln e^3 \stackrel{?}{=} 3$$
$$e^3 = e^3$$

Exercise 20.4.13

Solve:

a. $\log_a 121 = 2$
b. $\ln x = 7$

Answer

a. $a = 11$
b. $x = e^7$

? Exercise 20.4.14

Solve:

a. $\log_a 64 = 3$
b. $\ln x = 9$

Answer

a. $a = 4$
b. $x = e^9$

✓ Example 20.4.8

Solve:

a. $\log_2(3x - 5) = 4$
b. $\ln e^{2x} = 4$

Solution:

a.

$$\log_2(3x - 5) = 4$$

Rewrite in exponential form.

$$2^4 = 3x - 5$$

Simplify.

$$16 = 3x - 5$$

Solve the equation.

$$21 = 3x$$

$$7 = x$$

Check. $x = 7$

$$\begin{aligned} \log_2(3x - 5) &= 4 \\ \log_2(3 \cdot 7 - 5) &\stackrel{?}{=} 4 \\ \log_2(16) &\stackrel{?}{=} 4 \\ 2^4 &\stackrel{?}{=} 16 \\ 16 &= 16 \end{aligned}$$

b.

$$\ln e^{2x} = 4$$

Rewrite in exponential form.

$$e^4 = e^{2x}$$

Since the bases are the same the exponents are equal.

$$4 = 2x$$

Solve the equation.

$$2 = x$$

Check. $x = 2$

$$\ln e^{2x} = 4$$
$$\ln e^{2 \cdot 2} \stackrel{?}{=} 4$$
$$\ln e^{4} = 4$$
$$e^{4} = e^{4}$$

Exercise 20.4.15

Solve:

a. $\log_2(5x - 1) = 6$
b. $\ln e^{3x} = 6$

Answer

a. $x = 13$
b. $x = 2$

Exercise 20.4.16

Solve:

a. $\log_3(4x + 3) = 3$
b. $\ln e^{4x} = 4$

Answer

a. $x = 6$
b. $x = 1$

Use Logarithmic Models in Applications

There are many applications that are modeled by logarithmic equations. We will first look at the logarithmic equation that gives the decibel (dB) level of sound. Decibels range from 0, which is barely audible to 160, which can rupture an eardrum. The 10^{-12} in the formula represents the intensity of sound that is barely audible.

Definition 20.4.4

Decibel Level of Sound

The loudness level, D, measured in decibels, of a sound of intensity, I, measured in watts per square inch is

$$D = 10 \log\left(\frac{I}{10^{-12}}\right)$$

Example 20.4.9

Extended exposure to noise that measures 85 dB can cause permanent damage to the inner ear which will result in hearing loss. What is the decibel level of music coming through ear phones with intensity 10^{-2} watts per square inch?

Solution:

	$D = 10 \log\left(\frac{I}{10^{-12}}\right)$
Substitute in the intensity level, I.	$D = 10 \log\left(\frac{10^{-2}}{10^{-12}}\right)$
Simplify.	$D = 10 \log(10^{10})$
Since $\log 10^{10} = 10$.	$D = 10 \cdot 10$

Multiply.	$D = 100$
	The decibel level of music coming through earphones is 100 dB.

Exercise 20.4.17

What is the decibel level of one of the new quiet dishwashers with intensity 10^{-7} watts per square inch?

Answer

The quiet dishwashers have a decibel level of 50 dB.

Exercise 20.4.18

What is the decibel level heavy city traffic with intensity 10^{-3} watts per square inch?

Answer

The decibel level of heavy traffic is 90 dB.

The magnitude R of an earthquake is measured by a logarithmic scale called the Richter scale. The model is $R = \log I$, where I is the intensity of the shock wave. This model provides a way to measure **earthquake intensity**.

Definition 20.4.5: Earthquake Intensity

The magnitude R of an earthquake is measured by$R = \log I$, where I is the intensity of its shock wave.

Example 20.4.10

In 1906, San Francisco experienced an intense earthquake with a magnitude of 7.8 on the Richter scale. Over 80% of the city was destroyed by the resulting fires. In 2014, Los Angeles experienced a moderate earthquake that measured 5.1 on the Richter scale and caused $108 million dollars of damage. Compare the intensities of the two earthquakes.

Solution:

To compare the intensities, we first need to convert the magnitudes to intensities using the log formula. Then we will set up a ratio to compare the intensities.

Convert the magnitudes to intensities.

$$R = \log I$$

1906 earthquake

$$7.8 = \log I$$

Convert to exponential form.

$$I = 10^{7.8}$$

2014 earthquake

$$5.1 = \log I$$

Convert to exponential form.

$$I = 10^{5.1}$$

Form a ratio of the intensities.

$$\frac{\text{Intensity for 1906}}{\text{Intensity for 2014}}$$

Substitute in the values.

$$\frac{10^{7.8}}{10^{5.1}}$$

Divide by subtracting the exponents.

$$10^{2.7}$$

Evaluate.

$$501$$

The intensity of the 1906 earthquake was about 501 times the intensity of the 2014 earthquake.

? Exercise 20.4.19

In 1906, San Francisco experienced an intense earthquake with a magnitude of 7.8 on the Richter scale. In 1989, the Loma Prieta earthquake also affected the San Francisco area, and measured 6.9 on the Richter scale. Compare the intensities of the two earthquakes.

Answer

The intensity of the 1906 earthquake was about 8 times the intensity of the 1989 earthquake.

? Exercise 20.4.20

In 2014, Chile experienced an intense earthquake with a magnitude of 8.2 on the Richter scale. In 2014, Los Angeles also experienced an earthquake which measured 5.1 on the Richter scale. Compare the intensities of the two earthquakes.

Answer

The intensity of the earthquake in Chile was about $1,259$ times the intensity of the earthquake in Los Angeles.

Glossary

common logarithmic function

The function $f(x) = \log x$ is the common logarithmic function with base 10, where $x > 0$.

$$y = \log x \text{ is equivalent to } x = 10^y$$

logarithmic function

The function $f(x) = \log_a x$ is the logarithmic function with base a, where $a > 0, x > 0$, and $a \neq 1$.

$$y = \log_a x \text{ is equivalent to } x = a^y$$

natural logarithmic function

The function $f(x) = \ln x$ is the natural logarithmic function with base e, where $x > 0$.

$$y = \ln x \text{ is equivalent to } x = e^y$$

20.4E: Exercises

Section 10.3 Exercises

Practice Makes Perfect

Exercise $20.4E.21$ Convert Between Exponential and Logarithmic Form

In the following exercises, convert from exponential to logarithmic form.

1. $4^2 = 16$
2. $2^5 = 32$
3. $3^3 = 27$
4. $5^3 = 125$
5. $10^3 = 1000$
6. $10^{-2} = \frac{1}{100}$
7. $x^{\frac{1}{2}} = \sqrt{3}$
8. $x^{\frac{1}{3}} = \sqrt[3]{6}$
9. $32^x = \sqrt[4]{32}$
10. $17^x = \sqrt[5]{17}$
11. $\left(\frac{1}{4}\right)^2 = \frac{1}{16}$
12. $\left(\frac{1}{3}\right)^4 = \frac{1}{81}$
13. $3^{-2} = \frac{1}{9}$
14. $4^{-3} = \frac{1}{64}$
15. $e^x = 6$
16. $e^3 = x$

Answer

2. $\log_2 32 = 5$
4. $\log_5 125 = 3$
6. $\log \frac{1}{100} = -2$
8. $\log_x \sqrt[3]{6} = \frac{1}{3}$
10. $\log_{17} \sqrt[5]{17} = x$
12. $\log_{\frac{1}{3}} \frac{1}{81} = 4$
14. $\log_4 \frac{1}{64} = -3$
16. $\ln x = 3$

Exercise $20.4E.22$ Convert Between Exponential and Logarithmic Form

In the following exercises, convert each logarithmic equation to exponential form.

1. $3 = \log_4 64$
2. $6 = \log_2 64$
3. $4 = \log_x 81$
4. $5 = \log_x 32$
5. $0 = \log_{12} 1$
6. $0 = \log_7 1$
7. $1 = \log_3 3$
8. $1 = \log_9 9$

9. $-4 = \log_{10} \frac{1}{10,000}$
10. $3 = \log_{10} 1,000$
11. $5 = \log_e x$
12. $x = \log_e 43$

Answer

2. $64 = 2^6$
4. $32 = x^5$
6. $1 = 7^0$
8. $9 = 9^1$
10. $1,000 = 10^3$
12. $43 = e^x$

Exercise $20.4E.23$ Evaluate Logarithmic Functions

In the following exercises, find the value of x in each logarithmic equation.

1. $\log_x 49 = 2$
2. $\log_x 121 = 2$
3. $\log_x 27 = 3$
4. $\log_x 64 = 3$
5. $\log_3 x = 4$
6. $\log_5 x = 3$
7. $\log_2 x = -6$
8. $\log_3 x = -5$
9. $\log_{\frac{1}{4}} \frac{1}{16} = x$
10. $\log_{\frac{1}{3}} \frac{1}{9} = x$
11. $\log_{\frac{1}{4}} 64 = x$
12. $\log_{\frac{1}{9}} 81 = x$

Answer

2. $x = 11$
4. $x = 4$
6. $x = 125$
8. $x = \frac{1}{243}$
10. $x = 2$
12. $x = -2$

Exercise $20.4E.24$ Evaluate Logarithmic Functions

In the following exercises, find the exact value of each logarithm without using a calculator.

1. $\log_7 49$
2. $\log_6 36$
3. $\log_4 1$
4. $\log_5 1$
5. $\log_{16} 4$
6. $\log_{27} 3$

7. $\log_{\frac{1}{2}} 2$
8. $\log_{\frac{1}{2}} 4$
9. $\log_2 \frac{1}{16}$
10. $\log_3 \frac{1}{27}$
11. $\log_4 \frac{1}{16}$
12. $\log_9 \frac{1}{81}$

Answer

2. 2

4. 0

6. $\frac{1}{3}$

8. -2

10. -3

12. -2

Exercise $20.4E.25$ Graph Logarithmic Functions

In the following exercises, graph each logarithmic function.

1. $y = \log_2 x$
2. $y = \log_4 x$
3. $y = \log_6 x$
4. $y = \log_7 x$
5. $y = \log_{1.5} x$
6. $y = \log_{2.5} x$
7. $y = \log_{\frac{1}{3}} x$
8. $y = \log_{\frac{1}{5}} x$
9. $y = \log_{0.4} x$
10. $y = \log_{0.6} x$

Answer

2.

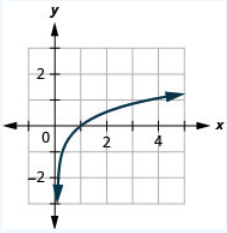

Figure 10.3.19

4.

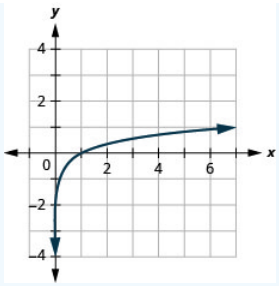

Figure 10.3.20

6.

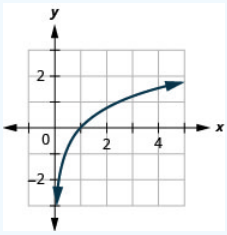

Figure 10.3.21

8.

10.

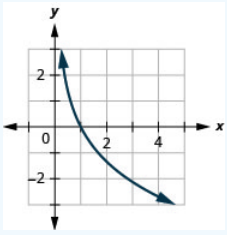

Figure 10.3.23

Exercise $20.4E.26$ Solve Logarithmic Equations

In the following exercises, solve each logarithmic equation.

1. $\log_a 16 = 2$
2. $\log_a 81 = 2$
3. $\log_a 8 = 3$
4. $\log_a 27 = 3$
5. $\log_a 32 = 2$
6. $\log_a 24 = 3$
7. $\ln x = 5$
8. $\ln x = 4$
9. $\log_2(5x+1) = 4$

https://math.libretexts.org/@go/page/46473

10. $\log_2(6x+2)=5$
11. $\log_3(4x-3)=2$
12. $\log_3(5x-4)=4$
13. $\log_4(5x+6)=3$
14. $\log_4(3x-2)=2$
15. $\ln e^{4x}=8$
16. $\ln e^{2x}=6$
17. $\log x^2=2$
18. $\log\left(x^2-25\right)=2$
19. $\log_2\left(x^2-4\right)=5$
20. $\log_3\left(x^2+2\right)=3$

Answer

2. $a=9$

4. $a=3$

6. $a=\sqrt[3]{24}$

8. $x=e^4$

10. $x=5$

12. $x=17$

14. $x=6$

16. $x=3$

18. $x=-5\sqrt{5}, x=5\sqrt{5}$

20. $x=-5, x=5$

? Exercise $20.4E.27$ Use Logarithmic Models in Applications

In the following exercises, use a logarithmic model to solve.

1. What is the decibel level of normal conversation with intensity 10^{-6} watts per square inch?
2. What is the decibel level of a whisper with intensity 10^{-10} watts per square inch?
3. What is the decibel level of the noise from a motorcycle with intensity 10^{-2} watts per square inch?
4. What is the decibel level of the sound of a garbage disposal with intensity 10^{-2} watts per square inch?
5. In 2014, Chile experienced an intense earthquake with a magnitude of 8.2 on the Richter scale. In 2010, Haiti also experienced an intense earthquake which measured 7.0 on the Richter scale. Compare the intensities of the two earthquakes.
6. The Los Angeles area experiences many earthquakes. In 1994, the Northridge earthquake measured magnitude of 6.7 on the Richter scale. In 2014, Los Angeles also experienced an earthquake which measured 5.1 on the Richter scale. Compare the intensities of the two earthquakes.

Answer

2. A whisper has a decibel level of 20 dB.

4. The sound of a garbage disposal has a decibel level of 100 dB.

6. The intensity of the 1994 Northridge earthquake in the Los Angeles area was about 40 times the intensity of the 2014 earthquake.

Exercise $20.4E.28$ Writing Exercises

1. Explain how to change an equation from logarithmic form to exponential form.
2. Explain the difference between common logarithms and natural logarithms.
3. Explain why $\log_a a^x = x$.
4. Explain how to find the $\log_7 32$ on your calculator.

Answer

2. Answers may vary

4. Answers may vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
convert between exponential and logarithmic form.			
evaluate logarithmic functions.			
graph logarithmic functions.			
solve logarithmic functions.			
use logarithmic models in applications.			

Figure 10.3.24

b. After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 20.4E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

20.5: Use the Properties of Logarithms

Learning Objectives

By the end of this section, you will be able to:

- Use the properties of logarithms
- Use the Change of Base Formula

Before you get started, take this readiness quiz.

1. Evaluate: a. a^0 b. a^1.
   If you missed this problem, review Example 5.14.
2. Write with a rational exponent: $\sqrt[3]{x^2y}$.
   If you missed this problem, review Example 8.27.
3. Round to three decimal places: 2.5646415
   If you missed this problem, review Example 1.34.

Use the Properties of Logarithms

Now that we have learned about exponential and logarithmic functions, we can introduce some of the properties of logarithms. These will be very helpful as we continue to solve both exponential and logarithmic equations.

The first two properties derive from the definition of logarithms. Since $a^0 = 1$, we can convert this to logarithmic form and get $\log_a 1 = 0$. Also, since $a^1 = a$, we get $\log_a a = 1$.

Definition 20.5.1

Properties of Logarithms

$$\log_a 1 = 0 \quad \log_a a = 1$$

In the next example we could evaluate the logarithm by converting to exponential form, as we have done previously, but recognizing and then applying the properties saves time.

Example 20.5.1

Evaluate using the properties of logarithms:

a. $\log_8 1$
b. $\log_6 6$

Solution:

a.

$$\log_8 1$$

Use the property, $\log_a 1 = 0$.

$$0 \quad \log_8 1 = 0$$

b.

$$\log_6 6$$

Use the property, $\log_a a = 1$.

$$1 \quad \log_6 6 = 1$$

Exercise 20.5.1

Evaluate using the properties of logarithms:

a. $\log_{13} 1$
b. $\log_9 9$

Answer

a. 0
b. 1

Exercise 20.5.2

Evaluate using the properties of logarithms:

a. $\log_5 1$
b. $\log_7 7$

Answer

a. 0
b. 1

The next two properties can also be verified by converting them from exponential form to logarithmic form, or the reverse.

The exponential equation $a^{\log_a x} = x$ converts to the logarithmic equation $\log_a x = \log_a x$, which is a true statement for positive values for x only.

The logarithmic equation $\log_a a^x = x$ converts to the exponential equation $a^x = a^x$, which is also a true statement.

These two properties are called inverse properties because, when we have the same base, raising to a power "undoes" the log and taking the log "undoes" raising to a power. These two properties show the **composition** of functions. Both ended up with the identity function which shows again that the exponential and logarithmic functions are inverse functions.

Definition 20.5.2

Inverse Properties of Logarithms

For $a > 0, x > 0$ and $a \neq 1$,

$$a^{\log_a x} = x \quad \log_a a^x = x$$

In the next example, apply the inverse properties of logarithms.

Example 20.5.2

Evaluate using the properties of logarithms:

a. $4^{\log_4 9}$
b. $\log_3 3^5$

Solution:

a.

$$4^{\log_4 9}$$

Use the property, $a^{\log_a x} = x$.

$$9 \quad 4^{\log_4 9} = 9$$

b.

$$\log_3 3^5$$

Use the property, $a^{\log_a x} = x$.

$$5 \quad \log_3 3^5 = 5$$

Exercise 20.5.3

Evaluate using the properties of logarithms:

a. $5^{\log_5 15}$
b. $\log_7 7^4$

Answer

a. 15
b. 4

Exercise 20.5.4

Evaluate using the properties of logarithms:

a. $2^{\log_2 8}$
b. $\log_2 2^{15}$

Answer

a. 8
b. 15

There are three more properties of logarithms that will be useful in our work. We know exponential functions and logarithmic function are very interrelated. Our definition of logarithm shows us that a logarithm is the exponent of the equivalent exponential. The properties of exponents have related properties for exponents.

In the Product Property of Exponents, $a^m \cdot a^n = a^{m+n}$, we see that to multiply the same base, we add the exponents. The **Product Property of Logarithms**, $\log_a M \cdot N = \log_a M + \log_a N$ tells us to take the log of a product, we add the log of the factors.

Definition 20.5.3

Product Property of Logarithms

If $M > 0, N > 0$, a > 0 and a $\neq 1$, then

$$\log_a (M \cdot N) = \log_a M + \log_a N$$

The logarithm of a product is the sum of the logarithms.

We use this property to write the log of a product as a sum of the logs of each factor.

Example 20.5.3

Use the Product Property of Logarithms to write each logarithm as a sum of logarithms. Simplify, if possible:

a. $\log_3 7x$
b. $\log_4 64xy$

Solution:

a.

$$\log_3 7x$$

Use the Product Property, $\log_a (M \cdot N) = \log_a M + \log_a N$.

$$\log_3 7 + \log_3 x$$
$$\log_3 7x = \log_3 7 + \log_3 x$$

b.

$$\log_4 64xy$$

Use the Product Property, $\log_a (M \cdot N) = \log_a M + \log_a N$.

$$\log_4 64 + \log_4 x + \log_4 y$$

Simplify be evaluating, $\log_4 64$.

$$3 + \log_4 x + \log_4 y$$
$$\log_4 64xy = 3 + \log_4 x + \log_4 y$$

? Exercise 20.5.5

Use the Product Property of Logarithms to write each logarithm as a sum of logarithms. Simplify, if possible:

a. $\log_3 3x$
b. $\log_2 8xy$

Answer

a. $1 + \log_3 x$
b. $3 + \log_2 x + \log_2 y$

? Exercise 20.5.6

Use the Product Property of Logarithms to write each logarithm as a sum of logarithms. Simplify, if possible:

a. $\log_9 9x$
b. $\log_3 27xy$

Answer

a. $1 + \log_9 x$
b. $3 + \log_3 x + \log_3 y$

Similarly, in the Quotient Property of Exponents, $\frac{a^m}{a^n} = a^{m-n}$, we see that to divide the same base, we subtract the exponents. The **Quotient Property of Logarithms**, $\log_a \frac{M}{N} = \log_a M - \log_a N$ tells us to take the log of a quotient, we subtract the log of the numerator and denominator.

Definition 20.5.4

Quotient Property of Logarithms

If $M > 0, N > 0,$ a > 0 and a $\neq 1$, then

$$\log_a \frac{M}{N} = \log_a M - \log_a N$$

The logarithm of a quotient is the difference of the logarithms.

Note that $\log_a M = \log_a N \neq \log_a (M - N)$.

We use this property to write the log of a quotient as a difference of the logs of each factor.

Example 20.5.4

Use the Quotient Property of Logarithms to write each logarithm as a difference of logarithms. Simplify, if possible.

a. $\log_5 \frac{5}{7}$
b. $\log \frac{x}{100}$

Solution:

a.

$$\log_5 \tfrac{5}{7}$$

Use the Quotient Property, $\log_a \frac{M}{N} = \log_a M - \log_a N$.

$$\log_5 5 - \log_5 7$$

Simplify.

$$1 - \log_5 7$$

$$\log_5 \tfrac{5}{7} = 1 - \log_5 7$$

b.

$$\log \tfrac{x}{100}$$

Use the Quotient Property, $\log_a \frac{M}{N} = \log_a M - \log_a N$.

$$\log x - \log 100$$

Simplify.

$$\log x - 2$$

$$\log \tfrac{x}{100} = \log x - 2$$

Exercise 20.5.7

Use the Quotient Property of Logarithms to write each logarithm as a difference of logarithms. Simplify, if possible.

a. $\log_4 \frac{3}{4}$
b. $\log \frac{x}{1000}$

Answer

a. $\log_4 3 - 1$
b. $\log x - 3$

Exercise 20.5.8

Use the Quotient Property of Logarithms to write each logarithm as a difference of logarithms. Simplify, if possible.

a. $\log_2 \frac{5}{4}$
b. $\log \frac{10}{y}$

Answer

a. $\log_2 5 - 2$
b. $1 - \log y$

The third property of logarithms is related to the Power Property of Exponents, $(a^m)^n = a^{m \cdot n}$, we see that to raise a power to a power, we multiply the exponents. The **Power Property of Logarithms**, $\log_a M^p = p \log_a M$ tells us to take the log of a number raised to a power, we multiply the power times the log of the number.

Definition 20.5.5

Power Property of Logarithms

If $M > 0, \mathrm{a} > 0, \mathrm{a} \neq 1$ and p is any real number then,

$$\log_a M^p = p \log_a M$$

The log of a number raised to a power as the product product of the power times the log of the number.

We use this property to write the log of a number raised to a power as the product of the power times the log of the number. We essentially take the exponent and throw it in front of the logarithm.

Example 20.5.5

Use the Power Property of Logarithms to write each logarithm as a product of logarithms. Simplify, if possible.

a. $\log_5 4^3$
b. $\log x^{10}$

Solution:

a.

$$\log_5 4^3$$

Use the Power Property, $\log_a M^p = p \log_a M$.

$$3 \log_5 4$$

$$\log_5 4^3 = 3 \log_5 4$$

b.

$$\log x^{10}$$

Use the Power Property, $\log_a M^p = p \log_a M$.

$$10 \log x$$

$$\log x^{10} = 10 \log x$$

Exercise 20.5.9

Use the Power Property of Logarithms to write each logarithm as a product of logarithms. Simplify, if possible.

a. $\log_7 5^4$
b. $\log x^{100}$

Answer

a. $4 \log_7 5$
b. $100 \cdot \log x$

Exercise 20.5.10

Use the Power Property of Logarithms to write each logarithm as a product of logarithms. Simplify, if possible.

a. $\log_2 3^7$
b. $\log x^{20}$

Answer

a. $7 \log_2 3$
b. $20 \cdot \log x$

We summarize the Properties of Logarithms here for easy reference. While the natural logarithms are a special case of these properties, it is often helpful to also show the natural logarithm version of each property.

Properties of Logarithms

If $M > 0, \text{a} > 0, \text{a} \neq 1$ and p is any real number then,

Table 10.4.1

Property	Base a	Base e
	$\log_a 1 = 0$	$\ln 1 = 0$
	$\log_a a = 1$	$\ln e = 1$
Inverse Properties	$a^{\log_a x} = x$ $\log_a a^x = x$	$e^{\ln x} = x$ $\ln e^x = x$
Product Property of Logarithms	$\log_a (M \cdot N) = \log_a M + \log_a N$	$\ln(M \cdot N) = \ln M + \ln N$
Quotient Property of Logarithms	$\log_a \frac{M}{N} = \log_a M - \log_a N$	$\ln \frac{M}{N} = \ln M - \ln N$
Power Property of Logarithms	$\log_a M^p = p \log_a M$	$\ln M^p = p \ln M$

Now that we have the properties we can use them to "expand" a logarithmic expression. This means to write the logarithm as a sum or difference and without any powers.

We generally apply the Product and Quotient Properties before we apply the Power Property.

Example 20.5.6

Use the Properties of Logarithms to expand the logarithm $\log_4 \left(2x^3y^2\right)$. Simplify, if possible.

Solution:

Use the Product Property, $\log_a M \cdot N = \log_a M + \log_a N$.

Use the Power Property, $\log_a M^p = p \log_a M$, on the last two terms. Simplify.

Exercise 20.5.11

Use the Properties of Logarithms to expand the logarithm $\log_2 \left(5x^4y^2\right)$. Simplify, if possible.

Answer

$\log_2 5 + 4 \log_2 x + 2 \log_2 y$

Exercise 20.5.12

Use the Properties of Logarithms to expand the logarithm $\log_3 \left(7x^5y^3\right)$. Simplify, if possible.

Answer

$\log_3 7 + 5 \log_3 x + 3 \log_3 y$

When we have a radical in the logarithmic expression, it is helpful to first write its radicand as a rational exponent.

Example 20.5.7

Use the Properties of Logarithms to expand the logarithm $\log_2 \sqrt[4]{\frac{x^3}{3y^2z}}$. Simplify, if possible.

Solution

$$\log_2 \sqrt[4]{\frac{x^3}{3y^2z}}$$

Rewrite the radical with a rational exponent.

$$\log_2 \left(\frac{x^3}{3y^2z}\right)^{\frac{1}{4}}$$

Use the Power Property, $\log_a M^p = p \log_a M$.

$$\frac{1}{4}\log_2 \left(\frac{x^3}{3y^2z}\right)$$

Use the Quotient Property, $\log_a M \cdot N = \log_a M - \log_a N$.

$$\frac{1}{4}\left(\log_2\left(x^3\right) - \log_2\left(3y^2z\right)\right)$$

Use the Product Property, $\log_a M \cdot N = \log_a M + \log_a N$, in the second term.

$$\frac{1}{4}\left(\log_2\left(x^3\right) - \left(\log_2 3 + \log_2 y^2 + \log_2 z\right)\right)$$

Use the Power Property, $\log_a M^p = p \log_a M$, inside the parentheses.

$$\frac{1}{4}(3\log_2 x - (\log_2 3 + 2\log_2 y + \log_2 z))$$

Simplify by distributing.

$$\frac{1}{4}(3\log_2 x - \log_2 3 - 2\log_2 y - \log_2 z)$$

$$\log_2 \sqrt[4]{\frac{x^3}{3y^2z}} = \frac{1}{4}(3\log_2 x - \log_2 3 - 2\log_2 y - \log_2 z)$$

? Exercise 20.5.13

Use the Properties of Logarithms to expand the logarithm $\log_4 \sqrt[5]{\frac{x^4}{2y^3z^2}}$. Simplify, if possible.

Answer

$\frac{1}{5}\left(4\log_4 x - \frac{1}{2} - 3\log_4 y - 2\log_4 z\right)$

? Exercise 20.5.14

Use the Properties of Logarithms to expand the logarithm $\log_3 \sqrt[3]{\frac{x^2}{5yz}}$. Simplify, if possible.

Answer

$\frac{1}{3}(2\log_3 x - \log_3 5 - \log_3 y - \log_3 z)$

The opposite of expanding a logarithm is to condense a sum or difference of logarithms that have the same base into a single logarithm. We again use the properties of logarithms to help us, but in reverse.

To condense logarithmic expressions with the same base into one logarithm, we start by using the Power Property to get the coefficients of the log terms to be one and then the Product and Quotient Properties as needed.

✓ Example 20.5.8

Use the Properties of Logarithms to condense the logarithm $\log_4 3 + \log_4 x - \log_4 y$. Simplify, if possible.

Solution:

The log expressions all have the same base, 4.

The first two terms are added, so we use the Product Property, $\log_a M + \log_a N = \log_a M : N$.

Since the logs are subtracted, we use the Quotient Property, $\log_a M - \log_a N = \log_a \frac{M}{N}$.

Exercise 20.5.15

Use the Properties of Logarithms to condense the logarithm $\log_2 5 + \log_2 x - \log_2 y$. Simplify, if possible.

Answer

$\log_2 \frac{5x}{y}$

Exercise 20.5.16

Use the Properties of Logarithms to condense the logarithm $\log_3 6 - \log_3 x - \log_3 y$. Simplify, if possible.

Answer

$\log_3 \frac{6}{xy}$

Example 20.5.9

Use the Properties of Logarithms to condense the logarithm $2\log_3 x + 4\log_3(x+1)$. Simplify, if possible.

Solution:

The log expressions have the same base, 3.

$$2\log_3 x + 4\log_3(x+1)$$

Use the Power Property, $\log_a M + \log_a N = \log_a M \cdot N$.

$$\log_3 x^2 + \log_3(x+1)^4$$

The terms are added, so we use the Product Property, $\log_a M + \log_a N = \log_a M \cdot N$.

$$\log_3 x^2(x+1)^4$$

$$2\log_3 x + 4\log_3(x+1) = \log_3 x^2(x+1)^4$$

Exercise 20.5.17

Use the Properties of Logarithms to condense the logarithm $3\log_2 x + 2\log_2(x-1)$. Simplify, if possible.

Answer

$\log_2 x^3(x-1)^2$

Exercise 20.5.18

Use the Properties of Logarithms to condense the logarithm $2\log x + 2\log(x+1)$. Simplify, if possible.

Answer

$\log x^2(x+1)^2$

Use the Change-of-Base Formula

To evaluate a logarithm with any other base, we can use the **Change-of-Base Formula**. We will show how this is derived.

Suppose we want to evaluate $\log_a M$	$\log_a M$
Let $y = \log_a M$.	$y = \log_a M$
Rewrite the epression in exponential form.	$a^y = M$
Take the $\log_b$ of each side.	$\log_b a^y = \log_b M$
Use the Power Property.	$y \log_b a = \log_b M$
Solve for y.	$y = \frac{\log_b M}{\log_b a}$
Substiture $y = \log_a M$.	$\log_a M = \frac{\log_b M}{\log_b a}$

The Change-of-Base Formula introduces a new base b. This can be any base b we want where $b > 0, b \neq 1$. Because our calculators have keys for logarithms base 10 and base e, we will rewrite the Change-of-Base Formula with the new base as 10 or e.

Definition 20.5.6

Change-of-Base Formula

For any logarithmic bases a, b and $M > 0$,

$$\log_a M = \frac{\log_b M}{\log_b a} \quad \log_a M = \frac{\log M}{\log a} \quad \log_a M = \frac{\ln M}{\ln a}$$
$$\text{new base } b \qquad \text{new base } 10 \qquad \text{new base } e$$

When we use a calculator to find the logarithm value, we usually round to three decimal places. This gives us an approximate value and so we use the approximately equal symbol ($\approx$).

Example 20.5.10

Rounding to three decimal places, approximate $\log_4 35$.

Solution:

Table 10.4.2

	$\log_4 35$
Use the Change-of-Base Formula.	$\log_a M = \frac{\log_b M}{\log_b a}$
Identify a and M. Choose 10 for b.	$\log_4 35 = \frac{\log 35}{\log 4}$
Enter the expression $\frac{\log 35}{\log 4}$ in the calculator using the log button for base 10. Round to three decimal places.	$\log_4 35 \approx 2.565$

Exercise 20.5.19

Rounding to three decimal places, approximate $\log_3 42$.

Answer

3.402

Exercise 20.5.20

Rounding to three decimal places, approximate $\log_5 46$.

Answer

2.379

20.5E: Exercises

Practice Makes Perfect

Exercise $20.5E.21$ Use the Properties of Logarithms

In the following exercises, use the properties of logarithms to evaluate.

1. a. $\log_4 1$
   b. $\log_8 8$
2. a. $\log_{12} 1$
   b. $\ln e$
3. a. $3^{\log_3 6}$
   b. $\log_2 2^7$
4. a. $5^{\log_5 10}$
   b. $\log_4 4^{10}$
5. a. $8^{\log_8 7}$
   b. $\log_6 6^{-2}$
6. a. $6^{\log_6 15}$
   b. $\log_8 8^{-4}$
7. a. $10^{\log \sqrt{5}}$
   b. $\log 10^{-2}$
8. a. $10^{\log \sqrt{3}}$
   b. $\log 10^{-1}$
9. a. $e^{\ln 4}$
   b. $\ln e^2$
10. a. $e^{\ln 3}$
    b. $\ln e^7$

Answer

2.
   a. 0
   b. 1

4.
   a. 10
   b. 10

6.
   a. 15
   b. -4

8.

Exercise $20.5E.22$ Use the Properties of Logarithms

In the following exercises, use the Product Property of Logarithms to write each logarithm as a sum of logarithms. Simplify if possible.

1. $\log_4 6x$
2. $\log_5 8y$
3. $\log_2 32xy$
4. $\log_3 81xy$
5. $\log 100x$
6. $\log 1000y$

Answer

2. $\log_5 8 + \log_5 y$
4. $4 + \log_3 x + \log_3 y$
6. $3 + \log y$

Exercise $20.5E.23$ Use the Properties of Logarithms

In the following exercises, use the Quotient Property of Logarithms to write each logarithm as a sum of logarithms. Simplify if possible.

1. $\log_3 \frac{3}{8}$
2. $\log_6 \frac{5}{6}$
3. $\log_4 \frac{16}{y}$
4. $\log_5 \frac{125}{x}$
5. $\log \frac{x}{10}$
6. $\log \frac{10{,}000}{y}$
7. $\ln \frac{e^3}{3}$
8. $\ln \frac{e^4}{16}$

Answer

2. $\log_6 5 - 1$
4. $3 - \log_5 x$
6. $4 - \log y$
8. $4 - \ln 16$

Exercise $20.5E.24$ Use the Properties of Logarithms

In the following exercises, use the Power Property of Logarithms to expand each. Simplify if possible.

1. $\log_3 x^2$
2. $\log_2 x^5$
3. $\log x^{-2}$
4. $\log x^{-3}$
5. $\log_4 \sqrt{x}$
6. $\log_5 \sqrt[3]{x}$
7. $\ln x^{\sqrt{3}}$
8. $\ln x^{\sqrt[3]{4}}$

Answer

2. $5\log_2 x$

4. $-3\log x$

6. $\frac{1}{3}\log_5 x$

8. $\sqrt[3]{4}\ln x$

Exercise $20.5E.25$ Use the Properties of Logarithms

In the following exercises, use the Properties of Logarithms to expand the logarithm. Simplify if possible.

1. $\log_5\left(4x^6y^4\right)$
2. $\log_2\left(3x^5y^3\right)$
3. $\log_3\left(\sqrt{2}x^2\right)$
4. $\log_5\left(\sqrt[4]{21}y^3\right)$
5. $\log_3 \frac{xy^2}{z^2}$
6. $\log_5 \frac{4ab^3c^4}{d^2}$
7. $\log_4 \frac{\sqrt{x}}{16y^4}$
8. $\log_3 \frac{\sqrt[3]{x^2}}{27y^4}$
9. $\log_2 \frac{\sqrt{2x+y^2}}{z^2}$
10. $\log_3 \frac{\sqrt{3x+2y^2}}{5z^2}$
11. $\log_2 \sqrt[4]{\frac{5x^3}{2y^2z^4}}$
12. $\log_5 \sqrt[3]{\frac{3x^2}{4y^3z}}$

Answer

2. $\log_2 3+5\log_2 x+3\log_2 y$

4. $\frac{1}{4}\log_5 21+3\log_5 y$

6. $\log_5 4+\log_5 a+3\log_5 b+4\log_5 c-2\log_5 d$

8. $\frac{2}{3}\log_3 x-3-4\log_3 y$

10. $\frac{1}{2}\log_3\left(3x+2y^2\right)-\log_3 5-2\log_3 z$

12. $\frac{1}{3}(\log_5 3+2\log_5 x-\log_5 4-3\log_5 y-\log_5 z)$

Exercise $20.5E.26$ Use the Properties of Logarithms

In the following exercises, use the Properties of Logarithms to condense the logarithm. Simplify if possible.

1. $\log_6 4+\log_6 9$
2. $\log 4+\log 25$
3. $\log_2 80-\log_2 5$
4. $\log_3 36-\log_3 4$
5. $\log_3 4+\log_3(x+1)$
6. $\log_2 5-\log_2(x-1)$
7. $\log_7 3+\log_7 x-\log_7 y$
8. $\log_5 2-\log_5 x-\log_5 y$
9. $4\log_2 x+6\log_2 y$
10. $6\log_3 x+9\log_3 y$
11. $\log_3\left(x^2-1\right)-2\log_3(x-1)$
12. $\log\left(x^2+2x+1\right)-2\log(x+1)$

13. $4\log x - 2\log y - 3\log z$
14. $3\ln x + 4\ln y - 2\ln z$
15. $\frac{1}{3}\log x - 3\log(x+1)$
16. $2\log(2x+3) + \frac{1}{2}\log(x+1)$

Answer

2. 2

4. 2

6. $\log_2 \frac{5}{x-1}$

8. $\log_5 \frac{2}{xy}$

10. $\log_3 x^6 y^9$

12. 0

14. $\ln \frac{x^3 y^4}{z^2}$

16. $\log(2x+3)^2 \cdot \sqrt{x+1}$

Exercise $20.5E.27$ Use the Change-of-Base Formula

In the following exercises, use the Change-of-Base Formula, rounding to three decimal places, to approximate each logarithm.

1. $\log_3 42$
2. $\log_5 46$
3. $\log_{12} 87$
4. $\log_{15} 93$
5. $\log_{\sqrt{2}} 17$
6. $\log_{\sqrt{3}} 21$

Answer

2. 2.379

4. 1.674

6. 5.542

Exercise $20.5E.28$ Writing Exercises

1. Write the Product Property in your own words. Does it apply to each of the following? $\log_a 5x, \log_a(5+x)$. Why or why not?
2. Write the Power Property in your own words. Does it apply to each of the following? $\log_a x^p, (\log_a x)^r$. Why or why not?
3. Use an example to show that $\log(a+b) \neq \log a + \log b$?
4. Explain how to find the value of $\log_7 15$ using your calculator.

20.6: Solve Exponential and Logarithmic Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve logarithmic equations using the properties of logarithms
- Solve exponential equations using logarithms
- Use exponential models in applications

Before you get started, take this readiness quiz.

1. Solve: $x^2 = 16$.
   If you missed this problem, review Example 6.46.
2. Solve: $x^2 - 5x + 6 = 0$.
   If you missed this problem, review Example 6.45.
3. Solve: $x(x+6) = 2x + 5$.
   If you missed this problem, review Example 6.47.

Solve Logarithmic Equations Using the Properties of Logarithms

In the section on logarithmic functions, we solved some equations by rewriting the equation in exponential form. Now that we have the properties of logarithms, we have additional methods we can use to solve logarithmic equations.

If our equation has two logarithms we can use a property that says that if $\log_a M = \log_a N$ then it is true that $M = N$. This is the **One-to-One Property of Logarithmic Equations**.

Definition 20.6.1

One-to-One Property of Logarithmic Equations

For $M > 0, N > 0, a > 0$, and $a \neq 1$ is any real number:

$$\text{If } \log_a M = \log_a N, \text{ then } M = N.$$

To use this property, we must be certain that both sides of the equation are written with the same base.

Remember that logarithms are defined only for positive real numbers. Check your results in the original equation. You may have obtained a result that gives a logarithm of zero or a negative number.

Example 20.6.1

Solve: $2\log_5 x = \log_5 81$.

Solution:

$$2\log_5 x = \log_5 81$$

Use the Power Property.

$$\log_5 x^2 = \log_5 81$$

Use the One-to-One Property, if $\log_a M = \log_a N$, then $M = N$.

$$x^2 = 81$$

Solve using the Square Root Property.

$$x = \pm 9$$

We eliminate $x = -9$ as we cannot take the logarithm of a negative number.

$$x = 9, \ \cancel{x = -9}$$

Check. $x = 9$

$$2\log_5 x = \log_5 81$$
$$2\log_5 9 \stackrel{?}{=} \log_5 81$$
$$\log_5 9^2 \stackrel{?}{=} \log_5 81$$
$$\log_5 81 = \log_5 81$$

Exercise 20.6.1

Solve: $2\log_3 x = \log_3 36$

Answer

$x = 6$

Exercise 20.6.2

Solve: $3\log x = \log 64$

Answer

$x = 4$

Another strategy to use to solve logarithmic equations is to condense sums or differences into a single logarithm.

Example 20.6.2

Solve: $\log_3 x + \log_3(x-8) = 2$.

Solution:

$$\log_3 x + \log_3(x-8) = 2$$

Use the Product Property, $\log_a M + \log_a N = \log_a M \cdot N$.

$$\log_3 x(x-8) = 2$$

Rewrite in exponential form.

$$3^2 = x(x-8)$$

Simplify.

$$9 = x^2 - 8x$$

Subtract 9 from each side.

$$0 = x^2 - 8x - 9$$

Factor.

$$0 = (x-9)(x+1)$$

Use the Zero-Product-Property

$$x - 9 = 0, \quad x + 1 = 0$$

Solve each equation.

$$x = 9, \quad x = \cancel{-1}$$

Check. $x = -1$

$$\log_3 x + \log_3(x-8) = 2$$
$$\log_3(-1) + \log_3(-1-8) \stackrel{?}{=} 2$$

We cannot take the log of a negative number.

Check. $x = 9$

$$\begin{aligned} \log_3 x + \log_3 (x-8) &= 2 \\ \log_3 9 + \log_3 (9-8) &\stackrel{?}{=} 2 \\ 2 + 0 &\stackrel{?}{=} 2 \\ 2 &= 2 \end{aligned}$$

Exercise 20.6.3

Solve: $\log_2 x + \log_2 (x-2) = 3$

Answer

$x = 4$

Exercise 20.6.4

Solve: $\log_2 x + \log_2 (x-6) = 4$

Answer

$x = 8$

When there are logarithms on both sides, we condense each side into a single logarithm. Remember to use the Power Property as needed.

Example 20.6.3

Solve: $\log_4 (x+6) - \log_4 (2x+5) = -\log_4 x$.

Solution:

$$\log_4 (x+6) - \log_4 (2x+5) = -\log_4 x$$

Use the Quotient Property on the left side and the PowerProperty on the right.

$$\log_4 \left(\tfrac{x+6}{2x+5} \right) = \log_4 x^{-1}$$

Rewrite $x^{-1} = \frac{1}{x}$.

$$\log_4 \left(\tfrac{x+6}{2x+5} \right) = \log_4 \tfrac{1}{x}$$

Use the One-to-One Property, if $\log_a M = \log_a N$, then $M = N$.

$$\tfrac{x+6}{2x+5} = \tfrac{1}{x}$$

Solve the rational equation.

$$x(x+6) = 2x+5$$

Distribute.

$$x^2 + 6x = 2x + 5$$

Write in standard form.

$$x^2 + 4x - 5 = 0$$

Factor.

$$(x+5)(x-1) = 0$$

Use the Zero-Product-Property.

$$x+5=0, \quad x-1=0$$

Solve each equation.

$$x=\cancel{-5}, \quad x=1$$

Check.

We leave the check for you.

Exercise 20.6.5

Solve: $\log(x+2)-\log(4x+3)=-\log x$.

Answer

$x=3$

Exercise 20.6.6

Solve: $\log(x-2)-\log(4x+16)=\log\frac{1}{x}$.

Answer

$x=8$

Example 20.6.4 Solve Exponential Equations Using Logarithms

Solve $5^x=11$. Find the exact answer and then approximate it to three decimal places.

Solution:

$$5^x=11$$

Since the exponential is isolated, take the logarithm of both sides.

$$\log 5^x=\log 11$$

Use the Power Property to get the x as a factor, not an exponent.

$$x\log 5=\log 11$$

Solve for x. Find the exact answer.

$$x=\frac{\log 11}{\log 5}$$

Approximate the answer.

$$x\approx 1.490$$

Since $5^1=5$ and $5^2=25$, does it makes sense that $5^{1.490}\approx 11$?

Exercise 20.6.7

Solve $7^x=43$. Find the exact answer and then approximate it to three decimal places.

Answer

$x=\frac{\log 43}{\log 7}\approx 1.933$

Exercise 20.6.8

Solve $8^x = 98$. Find the exact answer and then approximate it to three decimal places.

Answer

$x = \frac{\log 98}{\log 8} \approx 2.205$

When we take the logarithm of both sides we will get the same result whether we use the common or the natural logarithm (try using the natural log in the last example. Did you get the same result?) When the exponential has base e, we use the natural logarithm.

Example 20.6.5

Solve $3e^{x+2} = 24$. Find the exact answer and then approximate it to three decimal places.

Solution:

$$3e^{x+2} = 24$$

Isolate the exponential by dividing both sides by 3.

$$e^{x+2} = 8$$

Take the natural logarithm of both sides.

$$\ln e^{x+2} = \ln 8$$

Use the Power Property to get the x as a factor, not an exponent.

$$(x+2)\ln e = \ln 8$$

Use the property $\ln e = 1$ to simplify.

$$x + 2 = \ln 8$$

Solve the equation. Find the exact answer.

$$x = \ln 8 - 2$$

Approximate the answer.

$$x \approx 0.079$$

Exercise 20.6.9

Solve $2e^{x-2} = 18$. Find the exact answer and then approximate it to three decimal places.

Answer

$x = \ln 9 + 2 \approx 4.197$

Exercise 20.6.10

Solve $5e^{2x} = 25$. Find the exact answer and then approximate it to three decimal places.

Answer

$x = \frac{\ln 5}{2} \approx 0.805$

Use Exponential Models in Applications

In previous sections we were able to solve some applications that were modeled with exponential equations. Now that we have so many more options to solve these equations, we are able to solve more applications.

We will again use the Compound Interest Formulas and so we list them here for reference.

Definition 20.6.2

Compound Interest

For a principal, P, invested at an interest rate, r, for t years, the new balance, A is:

$$A = P\left(1+\frac{r}{n}\right)^{nt} \quad \text{when compounded } n \text{ times a year.}$$
$$A = Pe^{rt} \quad \text{when compounded continuously.}$$

Example 20.6.6

Jermael's parents put $\$10,000$ in investments for his college expenses on his first birthday. They hope the investments will be worth $\$50,000$ when he turns 18. If the interest compounds continuously, approximately what rate of growth will they need to achieve their goal?

Solution:

Identify the variables in the formula.

$$A = \$50,000$$
$$P = \$10,000$$
$$r = ?$$
$$t = 17 \text{ years}$$
$$A = Pe^{rt}$$

Substitute the values into the formula.

$$50,000 = 10,000e^{r\cdot 17}$$

Solve for r. Divide each side by $10,000$.

$$5 = e^{17r}$$

Take the natural log of each side.

$$\ln 5 = \ln e^{17r}$$

Use the Power Property.

$$\ln 5 = 17r \ln e$$

Simplify.

$$\ln 5 = 17r$$

Divide each side by 17.

$$\frac{\ln 5}{17} = r$$

Approximate the answer.

$$r \approx 0.095$$

Convert to a percentage.

$$r \approx 9.5\%$$

They need the rate of growth to be approximately 9.5%.

Exercise 20.6.11

Hector invests $\$10,000$ at age 21. He hopes the investments will be worth $\$150,000$ when he turns 50. If the interest compounds continuously, approximately what rate of growth will he need to achieve his goal?

Answer

$r \approx 9.3\%$

Exercise 20.6.12

Rachel invests $\$15,000$ at age 25. She hopes the investments will be worth $\$90,000$ when she turns 40. If the interest compounds continuously, approximately what rate of growth will she need to achieve her goal?

Answer

$r \approx 11.9\%$

We have seen that growth and decay are modeled by exponential functions. For growth and decay we use the formula $A = A_0 e^{kt}$. Exponential growth has a positive rate of growth or growth constant, k, and **exponential decay** has a negative rate of growth or decay constant, k.

Definition 20.6.3

Exponential Growth and Decay

For an original amount, A_0, that grows or decays at a rate, k, for a certain time, t, the final amount, A, is:

$$A = A_0 e^{kt}$$

We can now solve applications that give us enough information to determine the rate of growth. We can then use that rate of growth to predict other situations.

Example 20.6.7

Researchers recorded that a certain bacteria population grew from 100 to 300 in 3 hours. At this rate of growth, how many bacteria will there be 24 hours from the start of the experiment?

Solution:

This problem requires two main steps. First we must find the unknown rate, k. Then we use that value of k to help us find the unknown number of bacteria.

Identify the variables in the formula.

$$\begin{aligned} A &= 300 \\ A_0 &= 100 \\ k &= ? \\ t &= 3 \text{ hours} \\ A &= A_0 e^{kt} \end{aligned}$$

Substitute the values in the formula.

$$300 = 100 e^{k \cdot 3}$$

Solve for k. Divide each side by 100.

$$3 = e^{3k}$$

Take the natural log of each side.

$$\ln 3 = \ln e^{3k}$$

Use the Power Property.

$$\ln 3 = 3k \ln e$$

Simplify.

$$\ln 3 = 3k$$

Divide each side by 3.

$$\frac{\ln 3}{3} = k$$

Approximate the answer.

$$k \approx 0.366$$

We use this rate of growth to predict the number of bacteria there will be in 24 hours.

$$\begin{aligned} A &= ? \\ A_0 &= 100 \\ k &= \frac{\ln 3}{3} \\ t &= 24 \text{ hours} \\ A &= A_0 e^{kt} \end{aligned}$$

Substitute in the values.

$$A = 100e^{\frac{\ln 3}{3} \cdot 24}$$

Evaluate.

$$A \approx 656,100$$

At this rate of growth, they can expect $656,100$ bacteria.

? Exercise 20.6.13

Researchers recorded that a certain bacteria population grew from 100 to 500 in 6 hours. At this rate of growth, how many bacteria will there be 24 hours from the start of the experiment?

Answer

There will be $62,500$ bacteria.

? Exercise 20.6.14

Researchers recorded that a certain bacteria population declined from $700,000$ to $400,000$ in 5 hours after the administration of medication. At this rate of decay, how many bacteria will there be 24 hours from the start of the experiment?

Answer

There will be $5,870,061$ bacteria.

Radioactive substances decay or decompose according to the exponential decay formula. The amount of time it takes for the substance to decay to half of its original amount is called the **half-life** of the substance.

Similar to the previous example, we can use the given information to determine the constant of decay, and then use that constant to answer other questions.

✓ Example 20.6.8

The half-life of radium-226 is $1,590$ years. How much of a 100 mg sample will be left in 500 years?

Solution:

This problem requires two main steps. First we must find the decay constant k. If we start with 100-mg, at the half-life there will be 50-mg remaining. We will use this information to find k. Then we use that value of k to help us find the amount of sample that will be left in 500 years.

Identify the variables in the formula.

$$A = 50$$
$$A_0 = 100$$
$$k = ?$$
$$t = 1590 \text{ years}$$
$$A = A_0 e^{kt}$$

Substitute the values in the formula.

$$50 = 100e^{k \cdot 1590}$$

Solve for k. Divide each side by 100.

$$0.5 = e^{1590k}$$

Take the natural log of each side.

$$\ln 0.5 = \ln e^{1590k}$$

Use the Power Property.

$$\ln 0.5 = 1590k \ln e$$

Simplify.

$$\ln 0.5 = 1590k$$

Divide each side by 1590.

$$\frac{\ln 0.5}{1590} = k \text{ exact answer}$$

We use this rate of growth to predict the amount that will be left in 500 years.

$$A = ?$$
$$A_0 = 100$$
$$k = \frac{\ln 0.5}{1590}$$
$$t = 500 \text{ years}$$
$$A = A_0 e^{kt}$$

Substitute in the values.

$$A = 100e^{\frac{\ln 0.5}{1500} \cdot 500}$$

Evaluate.

$$A \approx 80.4 \text{mg}$$

In 500 years there would be approximately 80.4 mg remaining.

? Exercise 20.6.15

The half-life of magnesium-27 is 9.45 minutes. How much of a 10-mg sample will be left in 6 minutes?

Answer

There will be 6.43mg left.

? Exercise 20.6.16

The half-life of radioactive iodine is 60 days. How much of a 50-mg sample will be left in 40 days?

Answer

There will be 31.5mg left.

Access these online resources for additional instruction and practice with solving exponential and logarithmic equations.

- Solving Logarithmic Equations
- Solving Logarithm Equations
- Finding the rate or time in a word problem on exponential growth or decay
- Finding the rate or time in a word problem on exponential growth or decay

Key Concepts

- **One-to-One Property of Logarithmic Equations:** For $M > 0, N > 0, a > 0$, and $a \neq 1$ is any real number:

$$\text{If } \log_a M = \log_a N, \text{ then } M = N$$

- **Compound Interest:**
  For a principal, P, invested at an interest rate, r, for t years, the new balance, A, is:

$$\begin{aligned} A &= P\left(1+\tfrac{r}{n}\right)^{nt} && \text{when compounded } n \text{ times a year.} \\ A &= Pe^{rt} && \text{when compounded continuously.} \end{aligned}$$

- **Exponential Growth and Decay:** For an original amount, A_0 that grows or decays at a rate, r, for a certain time t, the final amount, A, is $A = A_0 e^{rt}$.

20.6E: Exercises

Practice Makes Perfect

Exercise $20.6E.17$ Solve Logarithmic Equations Using the Properties of Logarithms

In the following exercises, solve for x.

1. $\log_4 64 = 2\log_4 x$
2. $\log 49 = 2\log x$
3. $3\log_3 x = \log_3 27$
4. $3\log_6 x = \log_6 64$
5. $\log_5(4x-2) = \log_5 10$
6. $\log_3\left(x^2+3\right) = \log_3 4x$
7. $\log_3 x + \log_3 x = 2$
8. $\log_4 x + \log_4 x = 3$
9. $\log_2 x + \log_2(x-3) = 2$
10. $\log_3 x + \log_3(x+6) = 3$
11. $\log x + \log(x+3) = 1$
12. $\log x + \log(x-15) = 2$
13. $\log(x+4) - \log(5x+12) = -\log x$
14. $\log(x-1) - \log(x+3) = \log \frac{1}{x}$
15. $\log_5(x+3) + \log_5(x-6) = \log_5 10$
16. $\log_5(x+1) + \log_5(x-5) = \log_5 7$
17. $\log_3(2x-1) = \log_3(x+3) + \log_3 3$
18. $\log(5x+1) = \log(x+3) + \log 2$

Answer

2. $x = 7$
4. $x = 4$
6. $x = 1, x = 3$
8. $x = 8$
10. $x = 3$
12. $x = 20$
14. $x = 3$
16. $x = 6$
18. $x = \frac{5}{3}$

Exercise $20.6E.18$ Solve Exponential Equations Using Logarithms

In the following exercises, solve each exponential equation. Find the exact answer and then approximate it to three decimal places.

1. $3^x = 89$
2. $2^x = 74$
3. $5^x = 110$
4. $4^x = 112$
5. $e^x = 16$
6. $e^x = 8$
7. $\left(\frac{1}{2}\right)^x = 6$

8. $\left(\frac{1}{3}\right)^x = 8$
9. $4e^{x+1} = 16$
10. $3e^{x+2} = 9$
11. $6e^{2x} = 24$
12. $2e^{3x} = 32$
13. $\frac{1}{4}e^x = 3$
14. $\frac{1}{3}e^x = 2$
15. $e^{x+1} + 2 = 16$
16. $e^{x-1} + 4 = 12$

Answer

2. $x = \frac{\log 74}{\log 2} \approx 6.209$
4. $x = \frac{\log 112}{\log 4} \approx 3.404$
6. $x = \ln 8 \approx 2.079$
8. $x = \frac{\log 8}{\log \frac{1}{3}} \approx -1.893$
10. $x = \ln 3 - 2 \approx -0.901$
12. $x = \frac{\ln 16}{3} \approx 0.924$
14. $x = \ln 6 \approx 1.792$
16. $x = \ln 8 + 1 \approx 3.079$

Exercise $20.6E.19$ Solve Exponential Equations Using Logarithms

In the following exercises, solve each equation.

1. $3^{3x+1} = 81$
2. $6^{4x-17} = 216$
3. $\frac{e^{x^2}}{e^{14}} = e^{5x}$
4. $\frac{e^{x^2}}{e^x} = e^{20}$
5. $\log_a 64 = 2$
6. $\log_a 81 = 4$
7. $\ln x = -8$
8. $\ln x = 9$
9. $\log_5(3x - 8) = 2$
10. $\log_4(7x + 15) = 3$
11. $\ln e^{5x} = 30$
12. $\ln e^{6x} = 18$
13. $3 \log x = \log 125$
14. $7 \log_3 x = \log_3 128$
15. $\log_6 x + \log_6(x - 5) = \log_6 24$
16. $\log_9 x + \log_9(x - 4) = \log_9 12$
17. $\log_2(x + 2) - \log_2(2x + 9) = -\log_2 x$
18. $\log_6(x + 1) - \log_6(4x + 10) = \log_6 \frac{1}{x}$

Answer

2. $x = 5$
4. $x = -4, x = 5$
6. $a = 3$

https://math.libretexts.org/@go/page/46477

8. $x = e^9$

10. $x = 7$

12. $x = 3$

14. $x = 2$

16. $x = 6$

18. $x = 5$

Exercise $20.6E.20$ Solve Exponential Equations Using Logarithms

In the following exercises, solve for x, giving an exact answer as well as an approximation to three decimal places.

1. $6^x = 91$
2. $\left(\frac{1}{2}\right)^x = 10$
3. $7e^{x-3} = 35$
4. $8e^{x+5} = 56$

Answer

2. $x = \frac{\log 10}{\log \frac{1}{2}} \approx -3.322$

4. $x = \ln 7 - 5 \approx -3.054$

Exercise $20.6E.21$ Use Exponential Models in Applications

In the following exercises, solve.

1. Sung Lee invests $\$5,000$ at age 18. He hopes the investments will be worth $\$10,000$ when he turns 25. If the interest compounds continuously, approximately what rate of growth will he need to achieve his goal? Is that a reasonable expectation?
2. Alice invests $\$15,000$ at age 30 from the signing bonus of her new job. She hopes the investments will be worth $\$30,000$ when she turns 40. If the interest compounds continuously, approximately what rate of growth will she need to achieve her goal?
3. Coralee invests $\$5,000$ in an account that compounds interest monthly and earns 7%. How long will it take for her money to double?
4. Simone invests $\$8,000$ in an account that compounds interest quarterly and earns 5%. How long will it take for his money to double?
5. Researchers recorded that a certain bacteria population declined from $100,000$ to 100 in 24 hours. At this rate of decay, how many bacteria will there be in 16 hours?
6. Researchers recorded that a certain bacteria population declined from $800,000$ to $500,000$ in 6 hours after the administration of medication. At this rate of decay, how many bacteria will there be in 24 hours?
7. A virus takes 6 days to double its original population $(A = 2A_0)$. How long will it take to triple its population?
8. A bacteria doubles its original population in 24 hours $(A = 2A_0)$. How big will its population be in 72 hours?
9. Carbon-14 is used for archeological carbon dating. Its half-life is $5,730$ years. How much of a 100-gram sample of Carbon-14 will be left in 1000 years?
10. Radioactive technetium-99m is often used in diagnostic medicine as it has a relatively short half-life but lasts long enough to get the needed testing done on the patient. If its half-life is 6 hours, how much of the radioactive material form a 0.5 ml injection will be in the body in 24 hours?

Answer

2. 6.9%

4. 13.9 years

6. $122,070$bacteria

8. 8 times as large as the original population

10. 0.03mL

Exercise $20.6E.22$ Writing Exercises

1. Explain the method you would use to solve these equations: $3^{x+1}=81$, $3^{x+1}=75$. Does your method require logarithms for both equations? Why or why not?
2. What is the difference between the equation for exponential growth versus the equation for exponential decay?

Answer

2. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve logarithmic equations using the properties of logarithms.			
solve exponential equations using logarithms.			
use exponential models in applications.			

Figure 10.5.1

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

20.7: Review Exercises

Chapter Review Exercises

Finding Composite and Inverse Functions

Exercise 20.7.1 Find and Evaluate Composite Functions

In the following exercises, for each pair of functions, find

a. $(f \circ g)(x)$
b. $(g \circ f)(x)$
c. $(f \cdot g)(x)$

1. $f(x) = 7x - 2$ and $g(x) = 5x + 1$
2. $f(x) = 4x$ and $g(x) = x^2 + 3x$

Answer

2.

a. $4x^2 + 12x$
b. $16x^2 + 12x$
c. $4x^3 + 12x^2$

Exercise 20.7.2 Find and Evaluate Composite Functions

In the following exercises, evaluate the composition.

1. For functions $f(x) = 3x^2 + 2$ and $g(x) = 4x - 3$, find
   a. $(f \circ g)(-3)$
   b. $(g \circ f)(-2)$
   c. $(f \circ f)(-1)$
2. For functions $f(x) = 2x^3 + 5$ and $g(x) = 3x^2 - 7$, find
   a. $(f \circ g)(-1)$
   b. $(g \circ f)(-2)$
   c. $(g \circ g)(1)$

Answer

2.

a. -123
b. 356
c. 41

Exercise 20.7.3 Determine Whether a Function is One-to-One

In the following exercises, for each set of ordered pairs, determine if it represents a function and if so, is the function one-to-one.

1. $\{(-3,-5),(-2,-4),(-1,-3),(0,-2),(-1,-1),(-2,0),(-3,1)\}$
2. $\{(-3,0),(-2,-2),(-1,0),(0,1),(1,2),(2,1),(3,-1)\}$
3. $\{(-3,3),(-2,1),(-1,-1),(0,-3),(1,-5),(2,-4),(3,-2)\}$

Answer

2. Function; not one-to-one

Exercise 20.7.4 Determine Whether a Function is One-to-One

In the following exercises, determine whether each graph is the graph of a function and if so, is it one-to-one.

1. a.

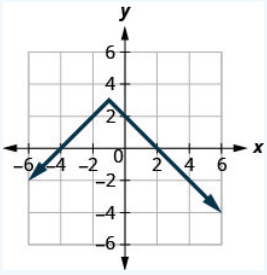

Figure 10.E.1

b.

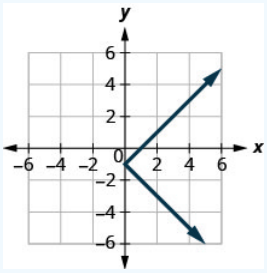

Figure 10.E.2

2. a.

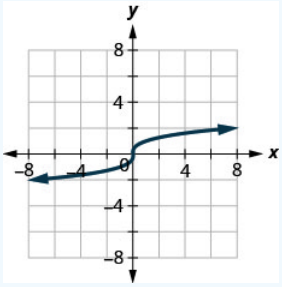

Figure 10.E.3

b.

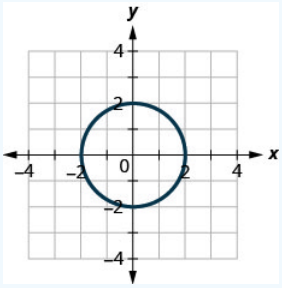

Figure 10.E.4

Answer

1.

a. Function; not one-to-one
b. Not a function

https://math.libretexts.org/@go/page/46478

Exercise 20.7.5 Find the Inverse of a Function

In the following exercise, find the inverse of the function. Determine the domain and range of the inverse function.

1. $\{(-3,10),(-2,5),(-1,2),(0,1)\}$

Answer

1. Inverse function: $\{(10,-3),(5,-2),(2,-1),(1,0)\}$ Domain: $\{1,2,5,10\}$ Range: $\{-3,-2,-1,0\}$.

Exercise 20.7.6 Find the Inverse of a Function

In the following exercise, graph the inverse of the one-to-one function shown.

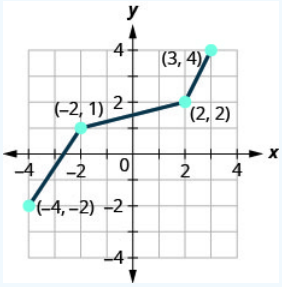

Figure 10.E.5

Answer

Solve on your own

Exercise 20.7.7 Find the Inverse of a Function

In the following exercises, verify that the functions are inverse functions.

1. $f(x)=3x+7$ and $g(x)=\frac{x-7}{3}$
2. $f(x)=2x+9$ and $g(x)=\frac{x+9}{2}$

Answer

1. $g(f(x))=x,$ and $f(g(x))=x,$ so they are inverses.

Exercise 20.7.8 Find the Inverse of a Function

1. $f(x)=6x-11$
2. $f(x)=x^3+13$
3. $f(x)=\frac{1}{x+5}$
4. $f(x)=\sqrt[5]{x-1}$

Answer

1. $f^{-1}(x)=\frac{x+11}{6}$
3. $f^{-1}(x)=\frac{1}{x}-5$

Evaluate and Graph Exponential Functions

Exercise 20.7.9 Graph Exponential Functions

In the following exercises, graph each of the following functions.

1. $f(x) = 4^x$
2. $f(x) = \left(\frac{1}{5}\right)^x$
3. $g(x) = (0.75)^x$
4. $g(x) = 3^{x+2}$
5. $f(x) = (2.3)^x - 3$
6. $f(x) = e^x + 5$
7. $f(x) = -e^x$

Answer

1.

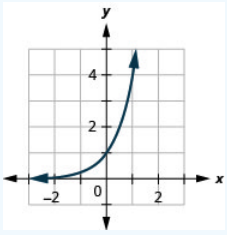

Figure 10.E.6

3.

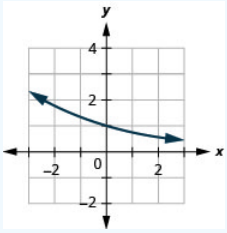

Figure 10.E.7

5.

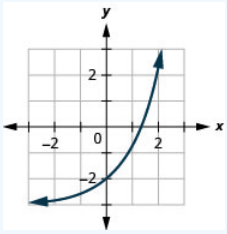

Figure 10.E.8

7.

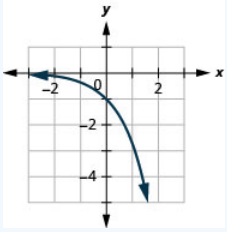

Figure 10.E.9

Exercise 20.7.10 Solve Exponential Equations

In the following exercises, solve each equation.

1. $3^{5x-6} = 81$
2. $2^{x^2} = 16$
3. $9^x = 27$
4. $5^{x^2+2x} = \frac{1}{5}$
5. $e^{4x} \cdot e^7 = e^{19}$
6. $\frac{e^{x^2}}{e^{15}} = e^{2x}$

Answer

2. $x = -2, x = 2$
4. $x = -1$
6. $x = -3, x = 5$

Exercise 20.7.11 Use Exponential Models in Applications

In the following exercises, solve.

1. Felix invested $\$12,000$ in a savings account. If the interest rate is 4% how much will be in the account in 12 years by each method of compounding?
   a. compound quarterly
   b. compound monthly
   c. compound continuously
2. Sayed deposits $\$20,000$ in an investment account. What will be the value of his investment in 30 years if the investment is earning 7% per year and is compounded continuously?
3. A researcher at the Center for Disease Control and Prevention is studying the growth of a bacteria. She starts her experiment with 150 of the bacteria that grows at a rate of 15% per hour. She will check on the bacteria every 24 hours. How many bacteria will he find in 24 hours?
4. In the last five years the population of the United States has grown at a rate of 0.7% per year to about $318,900,000$ If this rate continues, what will be the population in 5 more years?

Answer

2. $\$163,323.40$
4. $330,259,000$

Evaluate and Graph Logarithmic Functions

Exercise 20.7.12 Convert Between Exponential and Logarithmic Form

In the following exercises, convert from exponential to logarithmic form.

1. $5^4 = 625$
2. $10^{-3} = \frac{1}{1,000}$
3. $63^{\frac{1}{5}} = \sqrt[5]{63}$
4. $e^y = 16$

Answer

2. $\log \frac{1}{1,000} = -3$
4. $\ln 16 = y$

Exercise 20.7.13 Convert Between Exponential and Logarithmic Form

In the following exercises, convert each logarithmic equation to exponential form.

1. $7 = \log_2 128$
2. $5 = \log 100,000$
3. $4 = \ln x$

Answer

2. $100000 = 10^5$

Exercise 20.7.14 Evaluate Logarithmic Functions

In the following exercises, solve for x.

1. $\log_x 125 = 3$
2. $\log_7 x = -2$
3. $\log_{\frac{1}{2}} \frac{1}{16} = x$

Answer

1. $x = 5$
3. $x = 4$

Exercise 20.7.15 Evaluate Logarithmic Functions

In the following exercises, find the exact value of each logarithm without using a calculator.

1. $\log_2 32$
2. $\log_8 1$
3. $\log_3 \frac{1}{9}$

Answer

2. 0

Exercise 20.7.16 Graph Logarithmic Functions

In the following exercises, graph each logarithmic function.

1. $y = \log_5 x$
2. $y = \log_{\frac{1}{4}} x$
3. $y = \log_{0.8} x$

Answer

1.

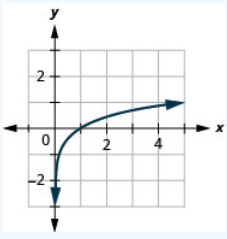

Figure 10.E.10

https://math.libretexts.org/@go/page/46478

3.

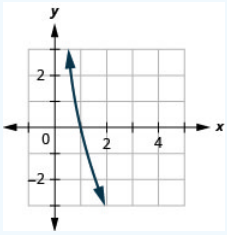

Figure 10.E.11

Exercise 20.7.17 Solve Logarithmic Equations

In the following exercises, solve each logarithmic equation.

1. $\log_a 36 = 5$
2. $\ln x = -3$
3. $\log_2(5x - 7) = 3$
4. $\ln e^{3x} = 24$
5. $\log\left(x^2 - 21\right) = 2$

Answer

2. $x = e^{-3}$

4. $x = 8$

Exercise 20.7.18 Use Logarithmic Models in Applications

What is the decibel level of a train whistle with intensity 10^{-3} watts per square inch?

Answer

90 dB

Use the Properties of Logarithms

Exercise 20.7.19 Use the Properties of Logarithms

In the following exercises, use the properties of logarithms to evaluate.

1. a. $\log_7 1$
   b. $\log_{12} 12$
2. a. $5^{\log_5 13}$
   b. $\log_3 3^{-9}$
3. a. $10^{\log\sqrt{5}}$
   b. $\log 10^{-3}$
4. a. $e^{\ln 8}$
   b. $\ln e^5$

Answer

2.

a. 13
b. -9

4.

a. 8
b. 5

Exercise 20.7.20 Use the Properties of Logarithms

In the following exercises, use the Product Property of Logarithms to write each logarithm as a sum of logarithms. Simplify if possible.

1. $\log_4(64xy)$
2. $\log 10,000m$

Answer

2. $4+\log m$

Exercise 20.7.21 Use the Properties of Logarithms

In the following exercises, use the Quotient Property of Logarithms to write each logarithm as a sum of logarithms. Simplify, if possible.

1. $\log_7 \frac{49}{y}$
2. $\ln \frac{e^5}{2}$

Answer

2. $5-\ln 2$

Exercise 20.7.22 Use the Properties of Logarithms

In the following exercises, use the Power Property of Logarithms to expand each logarithm. Simplify, if possible.

1. $\log x^{-9}$
2. $\log_4 \sqrt[7]{z}$

Answer

2. $\frac{1}{7}\log_4 z$

Exercise 20.7.23 Use the Properties of Logarithms

In the following exercises, use properties of logarithms to write each logarithm as a sum of logarithms. Simplify if possible.

1. $\log_3\left(\sqrt{4}x^7y^8\right)$
2. $\log_5 \frac{8a^2b^6c}{d^3}$
3. $\ln \frac{\sqrt{3x^2-y^2}}{z^4}$
4. $\log_6 \sqrt[3]{\frac{7x^2}{6y^3z^5}}$

Answer

2. $\log_5 8+2\log_5 a+6\log_5 b+\log_5 c-3\log_5 d$
4. $\frac{1}{3}(\log_6 7+2\log_6 x-1-3\log_6 y-5\log_6 z)$

Exercise 20.7.24 Use the Properties of Logarithms

In the following exercises, use the Properties of Logarithms to condense the logarithm. Simplify if possible.

1. $\log_2 56 - \log_2 7$
2. $3\log_3 x + 7\log_3 y$
3. $\log_5\left(x^2-16\right) - 2\log_5(x+4)$
4. $\frac{1}{4}\log y - 2\log(y-3)$

Answer

2. $\log_3 x^3y^7$
4. $\log \frac{\sqrt[4]{y}}{(y-3)^2}$

Exercise 20.7.25 Use the Change-of-Base Formula

In the following exercises, rounding to three decimal places, approximate each logarithm.

1. $\log_5 97$
2. $\log_{\sqrt{3}} 16$

Answer

2. 5.047

Solve Exponential and Logarithmic Equations

Exercise 20.7.26 Solve Logarithmic Equations Using the Properties of Logarithms

In the following exercises, solve for x.

1. $3\log_5 x = \log_5 216$
2. $\log_2 x + \log_2(x-2) = 3$
3. $\log(x-1) - \log(3x+5) = -\log x$
4. $\log_4(x-2) + \log_4(x+5) = \log_4 8$
5. $\ln(3x-2) = \ln(x+4) + \ln 2$

Answer

2. $x = 4$
4. $x = 3$

Exercise 20.7.27 Solve Exponential Equations Using Logarithms

In the following exercises, solve each exponential equation. Find the exact answer and then approximate it to three decimal places.

1. $2^x = 101$
2. $e^x = 23$
3. $\left(\frac{1}{3}\right)^x = 7$
4. $7e^{x+3} = 28$
5. $e^{x-4} + 8 = 23$

Answer

1. $x = \frac{\log 101}{\log 2} \approx 6.658$

3. $x = \frac{\log 7}{\log \frac{1}{3}} \approx -1.771$

5. $x = \ln 15 + 4 \approx 6.708$

Exercise 20.7.28 Use Exponential Models in Applications

1. Jerome invests $\$18,000$ at age 17. He hopes the investments will be worth $\$30,000$ when he turns 26. If the interest compounds continuously, approximately what rate of growth will he need to achieve his goal? Is that a reasonable expectation?
2. Elise invests $\$4500$ in an account that compounds interest monthly and earns 6%.How long will it take for her money to double?
3. Researchers recorded that a certain bacteria population grew from 100 to 300 in 8 hours. At this rate of growth, how many bacteria will there be in 24 hours?
4. Mouse populations can double in 8 months $(A = 2A_0)$. How long will it take for a mouse population to triple?
5. The half-life of radioactive iodine is 60 days. How much of a 50 mg sample will be left in 40 days?

Answer

2. 11.6 years

4. 12.7 months

Practice Test

Exercise 20.7.29

1. For the functions, $f(x) = 6x + 1$ and $g(x) = 8x - 3$, find
   a. $(f \circ g)(x)$
   b. $(g \circ f)(x)$
   c. $(f \cdot g)(x)$
2. Determine if the following set of ordered pairs represents a function and if so, is the function one-to-one.
   $\{(-2, 2), (-1, -3), (0, 1), (1, -2), (2, -3)\}$
3. Determine whether each graph is the graph of a function and if so, is it one-to-one.
   a.

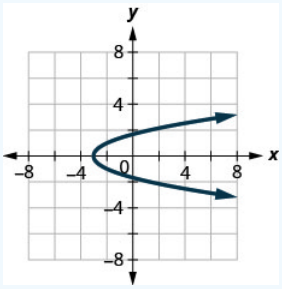

Figure 10.E.12

   b.

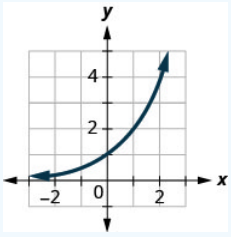

Figure 10.E.13

https://math.libretexts.org/@go/page/46478

4. Graph, on the same coordinate system, the inverse of the one-to-one function shown.

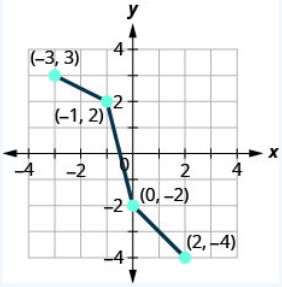

Figure 10.E.14

5. Find the inverse of the function $f(x) = x^5 - 9$.

6. Graph the function $g(x) = 2^{x-3}$.

7. Solve the equation $2^{2x-4} = 64$.

8. Solve the equation $\frac{e^{x^2}}{e^4} = e^{3x}$.

9. Megan invested $\$21,000$ in a savings account. If the interest rate is 5%, how much will be in the account in 8 years by each method of compounding?

a. compound quarterly
b. compound monthly
c. compound continuously

10. Convert the equation from exponential to logarithmic form: $10^{-2} = \frac{1}{100}$.

11. Convert the equation from logarithmic equation to exponential form: $3 = \log_7 343$.

12. Solve for x: $\log_5 x = -3$

13. Evaluate $\log_{11} 1$.

14. Evaluate $\log_4 \frac{1}{64}$.

15. Graph the function $y = \log_3 x$.

16. Solve for x: $\log\left(x^2 - 39\right) = 1$

17. What is the decibel level of a small fan with intensity 10^{-8} watts per square inch?

18. Evaluate each.

a. $6^{\log_6 17}$
b. $\log_9 9^{-3}$

Answer

1.

a. $48x - 17$
b. $48x + 5$
c. $48x^2 - 10x - 3$

3.

a. Not a function
b. One-to-one function

5. $f^{-1}(x) = \sqrt[5]{x+9}$

7. $x = 5$

9.

a. $\$31,250.74$
b. $\$31,302.29$
c. $\$31,328.32$

11. $343 = 7^3$

13. 0

15.

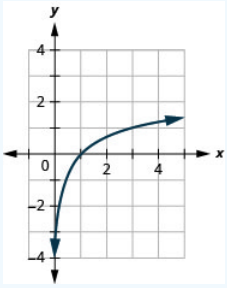

Figure 10.E.15

17. 40 dB

Exercise 20.7.30

In the following exercises, use properties of logarithms to write each expression as a sum of logarithms, simplifying if possible.

1. $\log_5 25ab$
2. $\ln \frac{e^{12}}{8}$
3. $\log_2 \sqrt[4]{\frac{5x^3}{16y^2z^7}}$

Answer

1. $2 + \log_5 a + \log_5 b$
3. $\frac{1}{4}(\log_2 5 + 3\log_2 x - 4 - 2\log_2 y - 7\log_2 z)$

Exercise 20.7.31

In the following exercises, use the Properties of Logarithms to condense the logarithm, simplifying if possible.

1. $5\log_4 x + 3\log_4 y$
2. $\frac{1}{6}\log x - 3\log(x+5)$
3. Rounding to three decimal places, approximate $\log_4 73$.
4. Solve for x: $\log_7(x+2) + \log_7(x-3) = \log_7 24$

Answer

2. $\log \frac{\sqrt[6]{x}}{(x+5)^3}$
4. $x = 6$

Exercise 20.7.32

In the following exercises, solve each exponential equation. Find the exact answer and then approximate it to three decimal places.

1. $\left(\frac{1}{5}\right)^x = 9$
2. $5e^{x-4} = 40$

3. Jacob invests $\$14,000$ in an account that compounds interest quarterly and earns 4%. How long will it take for his money to double?
4. Researchers recorded that a certain bacteria population grew from 500 to 700 in 5 hours. At this rate of growth, how many bacteria will there be in 20 hours?
5. A certain beetle population can double in 3 months $(A = 2A_0)$. How long will it take for that beetle population to triple?

Answer

2. $x = \ln 8 + 4 \approx 6.079$

4. $1,921$ bacteria

21.1: Introduction

Figure 21.1.1: In the future, car drivers may become passengers because cars will be able to drive themselves. (credit: jingoba/Pixabay)

Climb into your car. Put on your seatbelt. Choose your destination and then…relax. That's right. You don't have to do anything else because you are in an autonomous car, or one that navigates its way to your destination! No cars are fully autonomous at the moment and so you theoretically still need to have your hands on the wheel. Self-driving cars may help ease traffic congestion, prevent accidents, and lower pollution. The technology is thanks to computer programmers who are developing software to control the navigation of the car. These programmers rely on their understanding of mathematics, including relationships between equations. In this chapter, you will learn how to solve systems of linear equations in different ways and use them to analyze real-world situations.

21.2: Solve Systems of Linear Equations with Two Variables

Learning Objectives

By the end of this section, you will be able to:

- Determine whether an ordered pair is a solution of a system of equations
- Solve a system of linear equations by graphing
- Solve a system of equations by substitution
- Solve a system of equations by elimination
- Choose the most convenient method to solve a system of linear equations

Before you get started, take this readiness quiz.

1. For the equation $y = \frac{2}{3}x - 4$,
   ⓐ Is $(6, 0)$ a solution? ⓑ Is $(-3, -2)$ a solution?
   If you missed this problem, review [link].
2. Find the slope and y-intercept of the line $3x - y = 12$.
   If you missed this problem, review [link].
3. Find the x- and y-intercepts of the line $2x - 3y = 12$.
   If you missed this problem, review [link].

Determine Whether an Ordered Pair is a Solution of a System of Equations

In Solving Linear Equations, we learned how to solve linear equations with one variable. Now we will work with two or more linear equations grouped together, which is known as a **system of linear equations**.

SYSTEM OF LINEAR EQUATIONS

When two or more linear equations are grouped together, they form a **system of linear equations**.

In this section, we will focus our work on systems of two linear equations in two unknowns. We will solve larger systems of equations later in this chapter.

An example of a system of two linear equations is shown below. We use a brace to show the two equations are grouped together to form a system of equations.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

A linear equation in two variables, such as $2x + y = 7$, has an infinite number of solutions. Its graph is a line. Remember, every point on the line is a solution to the equation and every solution to the equation is a point on the line.

To solve a system of two linear equations, we want to find the values of the variables that are solutions to *both* equations. In other words, we are looking for the ordered pairs (x, y) that make both equations true. These are called the **solutions of a system of equations**.

SolutionS OF A SYSTEM OF EQUATIONS

The **solutions of a system of equations** are the values of the variables that make *all* the equations true. A solution of a system of two linear equations is represented by an ordered pair (x, y).

To determine if an ordered pair is a solution to a system of two equations, we substitute the values of the variables into each equation. If the ordered pair makes both equations true, it is a solution to the system.

Example 21.2.1

Determine whether the ordered pair is a solution to the system $\begin{cases} x - y = -1 \\ 2x - y = -5 \end{cases}$.

ⓐ $(-2, -1)$ ⓑ $(-4, -3)$

Answer

ⓐ

$$\begin{cases} x-y=-1 \\ 2x-y=-5 \end{cases}$$

We substitute $x=-2$ and $y=-1$ into both equations.

$x-y=-1$	$2x-y=-5$
$-2-(-1)\stackrel{?}{=}-1$	$2\cdot -2-(-1)\stackrel{?}{=}-5$
$-1=-1$ ✓	$5\neq -5$
$(-2,-1)$ does not make both equations true.	$(-2,-1)$ is not a solution.

ⓑ

We substitute $x=-4$ and $y=-3$ into both equations.

$x-y=-1$	$2x-y=-5$
$-4-(-3)\stackrel{?}{=}-1$	$2\cdot(-4)-(-3)\stackrel{?}{=}-5$
$-1=-1$ ✓	$-5=-5$ ✓
$(-4,-3)$ does make both equations true.	$(-4,-3)$ is a solution.

? Example 21.2.2

Determine whether the ordered pair is a solution to the system $\begin{cases} x+y=0 \\ x+2y=-5 \end{cases}$.

ⓐ $(1,-3)$ ⓑ $(0,0)$

Answer

ⓐ yes ⓑ no

? Example 21.2.3

Determine whether the ordered pair is a solution to the system $\begin{cases} -3y=-8 \\ -3x-y=4 \end{cases}$.

ⓐ $(2,-2)$ ⓑ $(-2,2)$

Answer

ⓐ no ⓑ yes

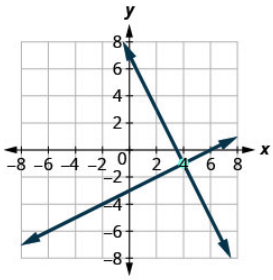
Solve a System of Linear Equations by Graphing

In this section, we will use three methods to solve a system of linear equations. The first method we'll use is graphing.

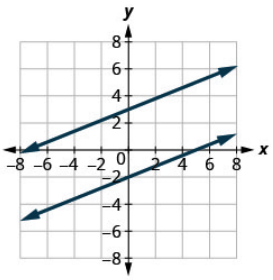
The graph of a linear equation is a line. Each point on the line is a solution to the equation. For a system of two equations, we will graph two lines. Then we can see all the points that are solutions to each equation. And, by finding what the lines have in common, we'll find the solution to the system.

Most linear equations in one variable have one solution, but we saw that some equations, called contradictions, have no solutions and for other equations, called identities, all numbers are solutions.

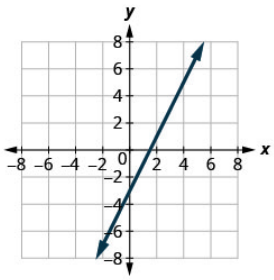
Similarly, when we solve a system of two linear equations represented by a graph of two lines in the same plane, there are three possible cases, as shown.



The lines intersect.
Intersecting lines have one point in common.
There is one solution to this system.



The lines are parallel.
Parallel lines have no points in common.
There is no solution to this system.



Both equations give the same line.
Because we have just one line, there are infinitely many solutions.

Figure 21.2.1

Each time we demonstrate a new method, we will use it on the same system of linear equations. At the end of the section you'll decide which method was the most convenient way to solve this system.

Example 21.2.4: How to Solve a System of Equations by Graphing

Solve the system by graphing $\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$.

Answer

Step 1. Graph the first equation.

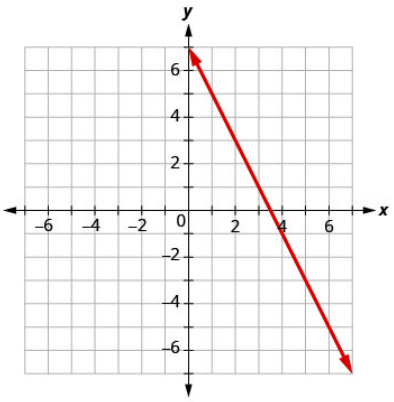
To graph the first line, write the equation in slope–intercept form.

$2x+y=7$

$y=-2x+7$

$m=-2 \qquad b=7$

$\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$

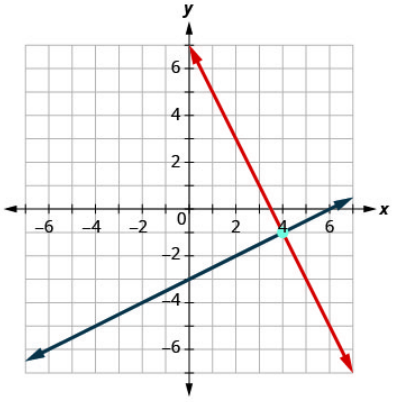


Step 2. Graph the second equation on the same rectangular coordinate system.

To graph the second line, use intercepts.

$x-2y=6$

$(0,-3) \quad (6,0)$



Step 3. Determine whether the lines intersect, are parallel, or are the same line.	Look at the graph of the lines.	The lines intersect.
Step 4. Identify the solution to the system. • If the lines intersect, identify the point of intersection. Check to make sure it is a solution to both equations. This is the solution to the system. • If the lines are parallel, the system has no solution. • If the lines are the same, the system has an infinite number of solutions.	Since the lines intersect, find the point of intersection. Check the point in both equations.	The lines intersect at (4, –1). $2x + y = 7$ $2(4) + (-1) \stackrel{?}{=} 7$ $8 - 1 \stackrel{?}{=} 7$ $7 = 7$ ✓ $x - 2y = 6$ $4 - 2(-1) \stackrel{?}{=} 6$ $6 = 6$ ✓ The solution is (4, –1).

Example 21.2.5

Solve the system by graphing: $\begin{cases} x - 3y = -3 \\ x + y = 5 \end{cases}$.

Answer

$(3, 2)$

Example 21.2.6

Solve the system by graphing: $\begin{cases} -x + y = 1 \\ 3x + 2y = 12 \end{cases}$

Answer

$(2, 3)$

The steps to use to solve a system of linear equations by graphing are shown here.

SOLVE A SYSTEM OF LINEAR EQUATIONS BY GRAPHING.

1. Graph the first equation.
2. Graph the second equation on the same rectangular coordinate system.
3. Determine whether the lines intersect, are parallel, or are the same line.
4. Identify the solution to the system.
   - If the lines intersect, identify the point of intersection. This is the solution to the system.
   - If the lines are parallel, the system has no solution.
   - If the lines are the same, the system has an infinite number of solutions.
5. Check the solution in both equations.

In the next example, we'll first re-write the equations into slope–intercept form as this will make it easy for us to quickly graph the lines.

Example 21.2.7

Solve the system by graphing: $\begin{cases} 3x + y = -1 \\ 2x + y = 0 \end{cases}$

Answer

We'll solve both of these equations for y so that we can easily graph them using their slopes and y-intercepts.

	$\begin{cases} 3x+y=-1 \\ 2x+y=0 \end{cases}$
Solve the first equation for y.	$\begin{aligned} 3x+y&=-1 \\ y&=-3x-1 \end{aligned}$
Find the slope and y-intercept.	$\begin{aligned} m&=-3 \\ b&=-1 \end{aligned}$
Solve the second equation for y.	$\begin{aligned} 2x+y&=0 \\ y&=-2x \end{aligned}$
Find the slope and y-intercept.	$\begin{aligned} m&=-2 \\ b&=0 \end{aligned}$
Graph the lines.	Determine the point of intersection.	The lines intersect at $(-1, 2)$.
Check the solution in both equations. $\begin{aligned} 3x+y&=-1 \\ 3(-1)+2&\stackrel{?}{=}-1 \\ -1&=-1\ \checkmark \end{aligned}$ $\begin{aligned} 2x+y&=0 \\ 2(-1)+2&\stackrel{?}{=}0 \\ 0&=0\ \checkmark \end{aligned}$	
	The solution is $(-1, 2)$.

Example 21.2.8

Solve the system by graphing: $\begin{cases} -x+y=1 \\ 2x+y=10 \end{cases}$.

Answer

$(3, 4)$

Example 21.2.9

Solve the system by graphing: $\begin{cases} 2x+y=6 \\ x+y=1 \end{cases}$.

Answer

$(5, -4)$

In all the systems of linear equations so far, the lines intersected and the solution was one point. In the next two examples, we'll look at a system of equations that has no solution and at a system of equations that has an infinite number of solutions.

Example 21.2.10

Solve the system by graphing: $\begin{cases} y=\frac{1}{2}x-3 \\ x-2y=4 \end{cases}$.

Answer

	$\begin{cases} y = \frac{1}{2}x - 3 \\ x - 2y = 4 \end{cases}$
To graph the first equation, we will use its slope and y-intercept.	$y = \frac{1}{2}x - 3$ $m = \frac{1}{2}$ $b = -3$
To graph the second equation, we will use the intercepts.	$x - 2y = 4$
	x | y 0 | −2 4 | 0
Graph the lines.	Determine the points of intersection.	The lines are parallel. Since no point is on both lines, there is no ordered pair that makes both equations true. There is no solution to this system.

? Example 21.2.11

Solve the system by graphing: $\begin{cases} y = -\frac{1}{4}x + 2 \\ x + 4y = 4 \end{cases}$.

Answer

no solution

? Example 21.2.12

Solve the system by graphing: $\begin{cases} y = 3x - 1 \\ 6x - 2y = 6 \end{cases}$.

Answer

no solution

Sometimes the equations in a system represent the same line. Since every point on the line makes both equations true, there are infinitely many ordered pairs that make both equations true. There are infinitely many solutions to the system.

Example 21.2.13

Solve the system by graphing: $\begin{cases} y = 2x - 3 \\ -6x + 3y = 9 \end{cases}$.

Answer

	$\begin{cases} y = 2x - 3 \\ -6x + 3y = -9 \end{cases}$
Find the slope and y-intercept of the first equation.	$y = 2x - 3$ $m = 2$ $b = -3$
Find the intercepts of the second equation.	$-6x + 3y = -9$
	x | y 0 | -3 $\frac{3}{2}$ | 0
Graph the lines.		The lines are the same! Since every point on the line makes both equations true, there are infinitely many ordered pairs that make both equations true. There are infinitely many solutions to this system.

If you write the second equation in slope-intercept form, you may recognize that the equations have the same slope and same y-intercept.

Example 21.2.14

Solve the system by graphing: $\begin{cases} y = -3x - 6 \\ 6x + 2y = -12 \end{cases}$.

Answer

infinitely many solutions

Example 21.2.15

Solve the system by graphing: $\begin{cases} y = \frac{1}{2}x - 4 \\ 2x - 4y = 16 \end{cases}$.

Answer

infinitely many solutions

When we graphed the second line in the last example, we drew it right over the first line. We say the two lines are **coincident**. Coincident lines have the same slope and same *y*-intercept.

COINCIDENT LINES

Coincident lines have the same slope and same *y*-intercept.

The systems of equations in Example and Example each had two intersecting lines. Each system had one solution.

In Example, the equations gave coincident lines, and so the system had infinitely many solutions.

The systems in those three examples had at least one solution. A system of equations that has at least one solution is called a *consistent* system.

A system with parallel lines, like Example, has no solution. We call a system of equations like this *inconsistent*. It has no solution.

CONSISTENT AND INCONSISTENT SYSTEMS

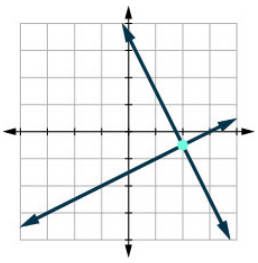
A **consistent system of equations** is a system of equations with at least one solution.

An **inconsistent system of equations** is a system of equations with no solution.

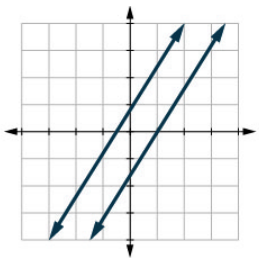
We also categorize the equations in a system of equations by calling the equations *independent* or *dependent*. If two equations are independent, they each have their own set of solutions. Intersecting lines and parallel lines are independent.

If two equations are dependent, all the solutions of one equation are also solutions of the other equation. When we graph two dependent equations, we get coincident lines.

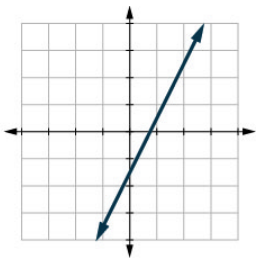
Let's sum this up by looking at the graphs of the three types of systems. See below and Table.



Intersecting



Parallel



Coincident

Lines	Intersecting	Parallel	Coincident
Number of solutions	1 point	No solution	Infinitely many
Consistent/inconsistent	Consistent	Inconsistent	Consistent
Dependent/ independent	Independent	Independent	Dependent

Example 21.2.16

Without graphing, determine the number of solutions and then classify the system of equations.

ⓐ $\begin{cases} y = 3x - 1 \\ 6x - 2y = 12 \end{cases}$ ⓑ $\begin{cases} 2x + y = -3 \\ x - 5y = 5 \end{cases}$

Answer

ⓐ We will compare the slopes and intercepts of the two lines.

$$\begin{cases} y = 3x - 1 \\ 6x - 2y = 12 \end{cases}$$

$y = 3x - 1$

The first equation is already in slope-intercept form.
Write the second equation in slope-intercept form.

$$6x - 2y = 12$$
$$-2y = -6x + 12$$
$$\frac{-2y}{-2} = \frac{-6x+12}{-2}$$
$$y = 3x - 6$$

$y = 3x - 1$
$m = 3$
$b = -1$

$y = 3x - 6$
$m = 3$
$b = -6$

Find the slope and intercept of each line.

Since the slopes are the same andy-intercepts are different, the lines are parallel.

ⓑ We will compare the slope and intercepts of the two lines.

$$\begin{cases} 2x + y = -3 \\ x - 5y = 5 \end{cases}$$

Write both equations in slope–intercept form.

$2x + y = -3$
$y = -2x - 3$

$x - 5y = 5$
$-5y = -x + 5$
$\frac{-5y}{-5} = \frac{-x+5}{-5}$
$y = \frac{1}{5} - 1$

Find the slope and intercept of each line.

$y = -2x - 3$
$m = -2$
$b = -3$

$y = \frac{1}{5} - 1$
$m = \frac{1}{5}$
$b = -1$

Since the slopes are different, the lines intersect.

A system of equations whose graphs are intersect has 1 solution and is consistent and independent.

Example 21.2.17

Without graphing, determine the number of solutions and then classify the system of equations.

ⓐ $\begin{cases} y = -2x - 4 \\ 4x + 2y = 9 \end{cases}$ ⓑ $\begin{cases} 3x + 2y = 2 \\ 2x + y = 1 \end{cases}$

Answer

ⓐ no solution, inconsistent, independent ⓑ one solution, consistent, independent

Example 21.2.18

Without graphing, determine the number of solutions and then classify the system of equations.

ⓐ $\begin{cases} y = \frac{1}{3}x - 5 \\ x - 3y = 6 \end{cases}$ ⓑ $\begin{cases} x + 4y = 12 \\ -x + y = 3 \end{cases}$

Answer

ⓐ no solution, inconsistent, independent ⓑ one solution, consistent, independent

Solving systems of linear equations by graphing is a good way to visualize the types of solutions that may result. However, there are many cases where solving a system by graphing is inconvenient or imprecise. If the graphs extend beyond the small grid with x and y both between -10 and 10, graphing the lines may be cumbersome. And if the solutions to the system are not integers, it can be hard to read their values precisely from a graph.

Solve a System of Equations by Substitution

We will now solve systems of linear equations by the substitution method.

We will use the same system we used first for graphing.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

We will first solve one of the equations for either x or y. We can choose either equation and solve for either variable—but we'll try to make a choice that will keep the work easy.

Then we substitute that expression into the other equation. The result is an equation with just one variable—and we know how to solve those!

After we find the value of one variable, we will substitute that value into one of the original equations and solve for the other variable. Finally, we check our solution and make sure it makes both equations true.

Example 21.2.19: How to Solve a System of Equations by Substitution

Solve the system by substitution: $\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$

Answer

Step 1. Solve one of the equations for either variable.	We'll solve the first equation for y.	$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$ $2x + y = 7$ $y = 7 - 2x$
Step 2. Substitute the expression from Step 1 into the other equation.	We replace y in the second equation with the expression $7 - 2x$.	$x - 2y = 6$ $x - 2(7 - 2x) = 6$

Step 3. Solve the resulting equation.	Now we have an equation with just 1 variable. We know how to solve this!	$x-2(7-2x)=6$ $x-14+4x=6$ $5x=20$ $x=4$
Step 4. Substitute the solution from Step 3 into one of the original equations to find the other variable.	We'll use the first equation and replace x with 4.	$2x+y=7$ $2(4)+y=7$ $8+y=7$ $y=-1$
Step 5. Write the solution as an ordered pair.	The ordered pair is (x, y).	$(4, -1)$
Step 6. Check that the ordered pair is a solution to **both** original equations.	Substitute $x=4$, $y=-1$ into both equations and make sure they are both true.	$2x+y=7$ $\quad$ $x-2y=6$ $2(4)+(-1)\stackrel{?}{=}7$ $\quad$ $4-2(-1)\stackrel{?}{=}6$ $7=7$ ✓ $\quad$ $6=6$ ✓ Both equations are true. $(4, -1)$ is the solution to the system.

? Example 21.2.20

Solve the system by substitution: $\begin{cases} -2x+y=-11 \\ x+3y=9 \end{cases}$

Answer

$(6, 1)$

? Example 21.2.21

Solve the system by substitution: $\begin{cases} 2x+y=-1 \\ 4x+3y=3 \end{cases}$

Answer

$(-3, 5)$

SOLVE A SYSTEM OF EQUATIONS BY SUBSTITUTION.

1. Solve one of the equations for either variable.
2. Substitute the expression from Step 1 into the other equation.
3. Solve the resulting equation.
4. Substitute the solution in Step 3 into either of the original equations to find the other variable.
5. Write the solution as an ordered pair.
6. Check that the ordered pair is a solution to **both** original equations.

Be very careful with the signs in the next example.

? Example 21.2.22

Solve the system by substitution: $\begin{cases} 4x+2y=4 \\ 6x-y=8 \end{cases}$

Answer

We need to solve one equation for one variable. We will solve the first equation for y.

	$\begin{cases} 4x+2y=4 \\ 6x-y=8 \end{cases}$
Solve the first equation for y. Substitute $-2x+2$ for y in the second equation.	$4x+2y=4$ $2y=-4x+4$ $y=-2x+2$ $6x-y=8$
Replace the y with $-2x+2$.	$6x-(-2x+2)=8$
Solve the equation for x.	$6x+2x-2=8$ $8x-2=8$ $8x=10$ $x=\frac{5}{4}$
Substitute $x=54$ into $4x+2y=4$ to find y.	$4x+2y=4$ $4\left(\frac{5}{4}\right)+2y=4$ $5+2y=4$ $2y=-1$ $y=-\frac{1}{2}$
	The ordered pair is $(54,-12)$.
Check the ordered pair in both equations.	$4x+2y=4$ $4\left(\frac{5}{4}\right)+2\left(-\frac{1}{2}\right)\stackrel{?}{=}4$ $5-1\stackrel{?}{=}4$ $4=4\checkmark$ $6x-y=8$ $6\left(\frac{5}{4}\right)-\left(-\frac{1}{2}\right)\stackrel{?}{=}8$ $\frac{15}{4}-\left(-\frac{1}{2}\right)\stackrel{?}{=}8$ $\frac{16}{2}\stackrel{?}{=}8$ $8=8\checkmark$
	The solution is $(54,-12)$.

? Example 21.2.23

Solve the system by substitution: $\begin{cases} x-4y=-4 \\ -3x+4y=0 \end{cases}$

Answer

$(2,32)$

? Example 21.2.24

Solve the system by substitution: $\begin{cases} 4x-y=0 \\ 2x-3y=5 \end{cases}$

Answer

$(-12,-2)$

Solve a System of Equations by Elimination

We have solved systems of linear equations by graphing and by substitution. Graphing works well when the variable coefficients are small and the solution has integer values. Substitution works well when we can easily solve one equation for one of the variables and not have too many fractions in the resulting expression.

The third method of solving systems of linear equations is called the Elimination Method. When we solved a system by substitution, we started with two equations and two variables and reduced it to one equation with one variable. This is what we'll do with the elimination

method, too, but we'll have a different way to get there.

The Elimination Method is based on the Addition Property of Equality. The Addition Property of Equality says that when you add the same quantity to both sides of an equation, you still have equality. We will extend the Addition Property of Equality to say that when you add equal quantities to both sides of an equation, the results are equal.

For any expressions *a*, *b*, *c*, and *d*.

$$\begin{aligned} &\text{if} && a=b \\ &\text{and} && c=d \\ &\text{then} && a+c=b+d. \end{aligned}$$

To solve a system of equations by elimination, we start with both equations in standard form. Then we decide which variable will be easiest to eliminate. How do we decide? We want to have the coefficients of one variable be opposites, so that we can add the equations together and eliminate that variable.

Notice how that works when we add these two equations together:

$$\begin{cases} 3x+y=5 \\ 2x-y=0 \end{cases}$$
$$\underline{\qquad\qquad}$$
$$5x=5$$

The *y*'s add to zero and we have one equation with one variable.

Let's try another one:

$$\begin{cases} +4y=2 \\ 2x+5y=-2 \end{cases}$$

This time we don't see a variable that can be immediately eliminated if we add the equations.

But if we multiply the first equation by -2, we will make the coefficients of *x* opposites. We must multiply every term on both sides of the equation by -2.

$$\begin{aligned} -2(x+4y) &= -2(2) \\ 2x+5y &= -2 \end{aligned}$$

Then rewrite the system of equations.

$$\begin{aligned} -2x-8y &= -4 \\ 2x+5y &= -2 \end{aligned}$$

Now we see that the coefficients of the *x* terms are opposites, so *x* will be eliminated when we add these two equations.

$$\begin{array}{r} -2x-8y=-4 \\ 2x+5y=-2 \\ \hline -3y=-6 \end{array}$$

Once we get an equation with just one variable, we solve it. Then we substitute that value into one of the original equations to solve for the remaining variable. And, as always, we check our answer to make sure it is a solution to both of the original equations.

Now we'll see how to use elimination to solve the same system of equations we solved by graphing and by substitution.

? Exercise 21.2.25: How to Solve a System of Equations by Elimination

Solve the system by elimination: $\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$

Answer

Step 1. Write both equations in standard form. • If any coefficients are fractions, clear them.	Both equations are in standard form, $Ax + By = C$. There are no fractions.	$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$
Step 2. Make the coefficients of one variable opposites. • Decide which variable you will eliminate. • Multiply one or both equations so that the coefficients of that variable are opposites.	We can eliminate the y's by multiplying the first equation by 2. Multiply both sides of $2x + y = 7$ by 2.	$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$ $\begin{cases} 2(2x + y) = 2(7) \\ x - 2y = 6 \end{cases}$
Step 3. Add the equations resulting from Step 2 to eliminate one variable.	We add the x's, y's, and constants.	$\begin{array}{r} 4x + 2y = 14 \\ x - 2y = 6 \\ \hline 5x \quad\quad = 20 \end{array}$
Step 4. Solve for the remaining variable.	Solve for x.	$x = 4$
Step 5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.	Substitute $x = 4$ into the second equation, $x - 2y = 6$. Then solve for y.	$x - 2y = 6$ $4 - 2y = 6$ $-2y = 2$ $y = -1$
Step 6. Write the solution as an ordered pair.	Write it as (x, y).	$(4, -1)$
Step 7. Check that the ordered pair is a solution to **both** original equations.	Substitute $x = 4$, $y = -1$ into $2x + y = 7$ and $x - 2y = 6$. Do they make both equations true? Yes!	$2x + y = 7$ $\quad$ $x - 2y = 6$ $2(4) + (-1) \stackrel{?}{=} 7$ $\quad$ $4 - 2(-1) \stackrel{?}{=} 6$ $7 = 7$ ✓ $\quad$ $6 = 6$ ✓ The solution is $(4, -1)$.

? Exercise 21.2.26

Solve the system by elimination: $\begin{cases} 3x + y = 5 \\ 2x - 3y = 7 \end{cases}$

Answer

$(2, -1)$

? Exercise 21.2.27

Solve the system by elimination: $\begin{cases} 4x + y = -5 \\ -2x - 2y = -2 \end{cases}$

Answer

$(-2, 3)$

The steps are listed here for easy reference.

SOLVE A SYSTEM OF EQUATIONS BY ELIMINATION.

1. Write both equations in standard form. If any coefficients are fractions, clear them.
2. Make the coefficients of one variable opposites.
   - Decide which variable you will eliminate.

- Multiply one or both equations so that the coefficients of that variable are opposites.

3. Add the equations resulting from Step 2 to eliminate one variable.
4. Solve for the remaining variable.
5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.
6. Write the solution as an ordered pair.
7. Check that the ordered pair is a solution to **both** original equations.

Now we'll do an example where we need to multiply both equations by constants in order to make the coefficients of one variable opposites.

Exercise 21.2.28

Solve the system by elimination: $\begin{cases} 4x-3y=9 \\ 7x+2y=-6 \end{cases}$

Answer

In this example, we cannot multiply just one equation by any constant to get opposite coefficients. So we will strategically multiply both equations by different constants to get the opposites.

	$\begin{aligned} 4x-3y&=9 \\ 7x+2y&=-6 \end{aligned}$
Both equations are in standard form. To get opposite coefficients of y, we will multiply the first equation by 2 and the second equation by 3.	$\begin{aligned} 2(4x-3y)&=2(9) \\ 3(7x+2y)&=3(-6) \end{aligned}$
Simplify.	$\begin{aligned} 8x-6y&=18 \\ 21x+6y&=-18 \end{aligned}$
Add the two equations to eliminate y.	$\begin{aligned} 8x-6y&=18 \\ 21x+6y&=-18 \\ \hline 29x&=0 \end{aligned}$
Solve for x.	$\begin{aligned} x&=0 \\ 7x+2y&=-6 \end{aligned}$
Substitute x=0x=0 into one of the original equations.	$7\cdot 0+2y=-6$
Solve for y.	$\begin{aligned} 2y&=-6 \\ y&=-3 \end{aligned}$
Write the solution as an ordered pair.	The ordered pair is $(0,-3)$.
Check that the ordered pair is a solution to **both** original equations. $\begin{aligned} 4x-3y&=9 \\ 4(0)-3(-3)&\stackrel{?}{=}9 \\ 9&=9\checkmark \end{aligned}$ $\begin{aligned} 7x+2y&=-6 \\ 7(0)+2(-3)&\stackrel{?}{=}-6 \\ -6&=-6\checkmark \end{aligned}$	
	The solution is $(0,-3)$.

Exercise 21.2.29

Solve the system by elimination: $\begin{cases} 3x-4y=-9 \\ 5x+3y=14 \end{cases}$

Answer

$(1,3)$

Exercise 21.2.30

Solve each system by elimination: $\begin{cases} 7x+8y=4 \\ 3x-5y=27 \end{cases}$

Answer

$(4,-3)$

When the system of equations contains fractions, we will first clear the fractions by multiplying each equation by the LCD of all the fractions in the equation.

Exercise 21.2.31

Solve the system by elimination: $\begin{cases} x+\frac{1}{2}y=6 \\ \frac{3}{2}x+\frac{2}{3}y=\frac{17}{2} \end{cases}$

Answer

In this example, both equations have fractions. Our first step will be to multiply each equation by the LCD of all the fractions in the equation to clear the fractions.

	$\begin{aligned} x+\tfrac{1}{2}y&=6 \\ \tfrac{3}{2}x+\tfrac{2}{3}y&=\tfrac{17}{2} \end{aligned}$
To clear the fractions, multiply each equation by its LCD.	$\begin{aligned} 2\left(x+\tfrac{1}{2}y\right)&=2(6) \\ 6\left(\tfrac{3}{2}x+\tfrac{2}{3}y\right)&=6\left(\tfrac{17}{2}\right) \end{aligned}$
Simplify.	$\begin{aligned} 2x+\ y&=12 \\ 9x+4y&=51 \end{aligned}$
Now we are ready to eliminate one of the variables. Notice that both equations are in standard form.	
We can eliminate y by multiplying the top equation by -4.	$\begin{aligned} -4(2x+\ y)&=-4(12) \\ 9x+4y\ &=51 \end{aligned}$
Simplify and add. Substitute $x=3$ into one of the original equations.	$\begin{aligned} -8x-4y&=-48 \\ 9x+4y\ &=\ 51 \\ \hline x\quad &=\ 3 \end{aligned}$ $x+\frac{1}{2}y=6$
Solve for y.	$\begin{aligned} 3+\tfrac{1}{2}y&=6 \\ \tfrac{1}{2}y&=3 \\ y&=6 \end{aligned}$
Write the solution as an ordered pair.	The ordered pair is $(3,6)$.
Check that the ordered pair is a solution to both original equations.	$\begin{aligned} x+\tfrac{1}{2}y&=6 \\ 3+\tfrac{1}{2}(6)&\stackrel{?}{=}6 \\ 3+3&\stackrel{?}{=}6 \\ 6&=6\ \checkmark \end{aligned}$ $\begin{aligned} \tfrac{3}{2}x+\tfrac{2}{3}y&=\tfrac{17}{2} \\ \tfrac{3}{2}(3)+\tfrac{2}{3}(6)&\stackrel{?}{=}\tfrac{17}{2} \\ \tfrac{9}{2}+4&\stackrel{?}{=}\tfrac{17}{2} \\ \tfrac{9}{2}+\tfrac{8}{2}&\stackrel{?}{=}\tfrac{17}{2} \\ \tfrac{17}{2}&=\tfrac{17}{2}\ \checkmark \end{aligned}$
	The solution is $(3,6)$.

Exercise 21.2.32

Solve each system by elimination: $\begin{cases} \frac{1}{3}x - \frac{1}{2}y = 1 \\ \frac{3}{4}x - y = \frac{5}{2} \end{cases}$

Answer

$(6, 2)$

Exercise 21.2.33

Solve each system by elimination: $\begin{cases} x + \frac{3}{5}y = -\frac{1}{5} \\ -\frac{1}{2}x - \frac{2}{3}y = \frac{5}{6} \end{cases}$

Answer

$(1, -2)$

When we solved the system by graphing, we saw that not all systems of linear equations have a single ordered pair as a solution. When the two equations were really the same line, there were infinitely many solutions. We called that a consistent system. When the two equations described parallel lines, there was no solution. We called that an inconsistent system.

The same is true using substitution or elimination. If the equation at the end of substitution or elimination is a true statement, we have a consistent but dependent system and the system of equations has infinitely many solutions. If the equation at the end of substitution or elimination is a false statement, we have an inconsistent system and the system of equations has no solution.

Exercise 21.2.34

Solve the system by elimination: $\begin{cases} 3x + 4y = 12 \\ y = 3 - \frac{3}{4}x \end{cases}$

Answer

$$\begin{cases} 3x + 4y = 12 \\ y = 3 - \frac{3}{4}x \end{cases}$$

Write the second equation in standard form.

$$\begin{cases} 3x + 4y = 12 \\ \frac{3}{4}x + y = 3 \end{cases}$$

Clear the fractions by multiplying the second equation by 4.

$$\begin{cases} 3x + 4y = 12 \\ 4(\frac{3}{4}x + y) = 4(3) \end{cases}$$

Simplify.

$$\begin{cases} 3x + 4y = 12 \\ 3x + 4y = 12 \end{cases}$$

To eliminate a variable, we multiply the second equation by -1. Simplify and add.

$$\begin{cases} 3x + 4y = 12 \\ -3x - 4y = -12 \end{cases}$$
$$0 = 0$$

This is a true statement. The equations are consistent but dependent. Their graphs would be the same line. The system has infinitely many solutions.

After we cleared the fractions in the second equation, did you notice that the two equations were the same? That means we have coincident lines.

Exercise 21.2.35

Solve the system by elimination: $\begin{cases} 5x-3y=15 \\ 5y=-5+\frac{5}{3}x \end{cases}$

Answer

infinitely many solutions

Exercise 21.2.36

Solve the system by elimination: $\begin{cases} x+2y=6 \\ y=-\frac{1}{2}x+3 \end{cases}$

Answer

infinitely many solutions

Choose the Most Convenient Method to Solve a System of Linear Equations

When you solve a system of linear equations in in an application, you will not be told which method to use. You will need to make that decision yourself. So you'll want to choose the method that is easiest to do and minimizes your chance of making mistakes.

Choose the Most Convenient Method to Solve a System of Linear Equations

Graphing	Substitution	Elimination
Use when you need a picture of the situation.	Use when one equation is already solved or can be easily solved for one variable.	Use when the equations a rein standard form.

Example 21.2.37

For each system of linear equations, decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

ⓐ $\begin{cases} 3x+8y=40 \\ 7x-4y=-32 \end{cases}$ ⓑ $\begin{cases} 5x+6y=12 \\ y=\frac{2}{3}x-1 \end{cases}$

Answer

ⓐ

$$\begin{cases} 3x+8y=40 \\ 7x-4y=-32 \end{cases}$$

Since both equations are in standard form, using elimination will be most convenient.

ⓑ

$$\begin{cases} 5x+6y=12 \\ y=\frac{2}{3}x-1 \end{cases}$$

Since one equation is already solved for y, using substitution will be most convenient.

Example 21.2.38

For each system of linear equations decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

ⓐ $\begin{cases} 4x-5y=-32 \\ 3x+2y=-1 \end{cases}$ ⓑ $\begin{cases} x=2y-1 \\ 3x-5y=-7 \end{cases}$

Answer

ⓐ Since both equations are in standard form, using elimination will be most convenient. ⓑ Since one equation is already solved for x, using substitution will be most convenient.

? Example 21.2.39

For each system of linear equations decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

ⓐ $\begin{cases} y = 2x - 1 \\ 3x - 4y = -6 \end{cases}$ ⓑ $\begin{cases} 6x - 2y = 12 \\ 3x + 7y = -13 \end{cases}$

Answer

ⓐ Since one equation is already solved for y, using substitution will be most convenient. ⓑ Since both equations are in standard form, using elimination will be most convenient.

Key Concepts

- **How to solve a system of linear equations by graphing.**
  1. Graph the first equation.
  2. Graph the second equation on the same rectangular coordinate system.
  3. Determine whether the lines intersect, are parallel, or are the same line.
  4. Identify the solution to the system.
     If the lines intersect, identify the point of intersection. This is the solution to the system.
     If the lines are parallel, the system has no solution.
     If the lines are the same, the system has an infinite number of solutions.
  5. Check the solution in both equations.
- **How to solve a system of equations by substitution.**
  1. Solve one of the equations for either variable.
  2. Substitute the expression from Step 1 into the other equation.
  3. Solve the resulting equation.
  4. Substitute the solution in Step 3 into either of the original equations to find the other variable.
  5. Write the solution as an ordered pair.
  6. Check that the ordered pair is a solution to **both** original equations.
- **How to solve a system of equations by elimination.**
  1. Write both equations in standard form. If any coefficients are fractions, clear them.
  2. Make the coefficients of one variable opposites.
     Decide which variable you will eliminate.
     Multiply one or both equations so that the coefficients of that variable are opposites.
  3. Add the equations resulting from Step 2 to eliminate one variable.
  4. Solve for the remaining variable.
  5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.
  6. Write the solution as an ordered pair.
  7. Check that the ordered pair is a solution to **both** original equations.

Choose the Most Convenient Method to Solve a System of Linear Equations

Graphing	Substitution	Elimination
Use when you need a picture of the situation.	Use when one equation is already solved or can be easily solved for one variable.	Use when the equations a rein standard form.

Glossary

coincident lines

Coincident lines have the same slope and same y-intercept.

consistent and inconsistent systems

Consistent system of equations is a system of equations with at least one solution; inconsistent system of equations is a system of equations with no solution.

solutions of a system of equations

Solutions of a system of equations are the values of the variables that make *all* the equations true; solution is represented by an ordered pair (x,y).(x,y).

system of linear equations

When two or more linear equations are grouped together, they form a system of linear equations.

21.2E: Exercises

Practice Makes Perfect

Determine Whether an Ordered Pair is a Solution of a System of Equations

In the following exercises, determine if the following points are solutions to the given system of equations.

1. $\begin{cases} 2x-6y=0 \\ 3x-4y=5 \end{cases}$

ⓐ $(3,1)$
ⓑ $(-3,4)$

Answer

ⓐ yes ⓑ no

2. $\begin{cases} -3x+y=8 \\ -x+2y=-9 \end{cases}$

ⓐ $(-5,-7)$
ⓑ $(-5,7)$

3. $\begin{cases} x+y=2 \\ y=\frac{3}{4}x \end{cases}$

ⓐ $(87,67)$
ⓑ $(1,34)$

Answer

ⓐ yes ⓑ no

4. $\begin{cases} 2x+3y=6 \\ y=\frac{2}{3}x+2 \end{cases}$

ⓐ $(-6,2)$
ⓑ $(-3,4)$

Solve a System of Linear Equations by Graphing

In the following exercises, solve the following systems of equations by graphing.

5. $\begin{cases} 3x+y=-3 \\ 2x+3y=5 \end{cases}$

Answer

$(-3,2)$

6. $\begin{cases} -x+y=2 \\ 2x+y=-4 \end{cases}$

7. $\begin{cases} y=x+2 \\ y=-2x+2 \end{cases}$

Answer

$(0, 2)$

8. $\begin{cases} y = x - 2 \\ y = -3x + 2 \end{cases}$

9. $\begin{cases} y = \frac{3}{2}x + 1 \\ y = -\frac{1}{2}x + 5 \end{cases}$

Answer

$(2, 4)$

10. $\begin{cases} y = \frac{2}{3}x - 2 \\ y = -\frac{1}{3}x - 5 \end{cases}$

11. $\begin{cases} x + y = -4 \\ -x + 2y = -2 \end{cases}$

Answer

$(-2, 2)$

12. $\begin{cases} -x + 3y = 3 \\ x + 3y = 3 \end{cases}$

13. $\begin{cases} -2x + 3y = 3 \\ x + 3y = 12 \end{cases}$

Answer

$(3, 3)$

14. $\begin{cases} 2x - y = 4 \\ 2x + 3y = 12 \end{cases}$

15. $\begin{cases} x + 3y = -6 \\ y = -\frac{4}{3}x + 4 \end{cases}$

Answer

$(6, -4)$

16. $\begin{cases} -x + 2y = -6 \\ y = -\frac{1}{2}x - 1 \end{cases}$

17. $\begin{cases} -2x + 4y = 4 \\ y = \frac{1}{2}x \end{cases}$

Answer

no solution

18. $\begin{cases} 3x+5y=10 \\ y=-\frac{3}{5}x+1 \end{cases}$

19. $\begin{cases} 4x-3y=8 \\ 8x-6y=14 \end{cases}$

Answer

no solution

20. $\begin{cases} x+3y=4 \\ -2x-6y=3 \end{cases}$

21. $\begin{cases} x=-3y+4 \\ 2x+6y=8 \end{cases}$

Answer

infinite solutions with solution set: $\{(x,y)|2x+6y=8\}$

22. $\begin{cases} 4x=3y+7 \\ 8x-6y=14 \end{cases}$

23. $\begin{cases} 2x+y=6 \\ -8x-4y=-24 \end{cases}$

Answer

infinite solutions with solution set: $\{(x,y)|2x+y=6\}$

24. $\begin{cases} 5x+2y=7 \\ -10x-4y=-14 \end{cases}$

Without graphing, determine the number of solutions and then classify the system of equations.

25. $\begin{cases} y=\frac{2}{3}x+1 \\ -2x+3y=5 \end{cases}$

Answer

1 point, consistent and independent

26. $\begin{cases} y=\frac{3}{2}x+1 \\ 2x-3y=7 \end{cases}$

27. $\begin{cases} 5x+3y=4 \\ 2x-3y=5 \end{cases}$

Answer

1 point, consistent and independent

28. $\begin{cases} y=-12x+5 \\ x+2y=10 \end{cases}$

29. $\begin{cases} 5x-2y=10 \\ y=52x-5 \end{cases}$

Answer

infinite solutions, consistent, dependent

Solve a System of Equations by Substitution

In the following exercises, solve the systems of equations by substitution.

30. $\begin{cases} 2x+y=-4 \\ 3x-2y=-6 \end{cases}$

31. $\begin{cases} 2x+y=-2 \\ 3x-y=7 \end{cases}$

Answer

$(1,-4)$

32. $\begin{cases} x-2y=-5 \\ 2x-3y=-4 \end{cases}$

33. $\begin{cases} x-3y=-9 \\ 2x+5y=4 \end{cases}$

Answer

$(-3,2)$

34. $\begin{cases} 5x-2y=-6 \\ y=3x+3 \end{cases}$

35. $\begin{cases} -2x+2y=6 \\ y=-3x+1 \end{cases}$

Answer

$(-1/2,5/2)$

36. $\begin{cases} 2x+5y=1 \\ y=\frac{1}{3}x-2 \end{cases}$

37. $\begin{cases} 3x+4y=1 \\ y=-\frac{2}{5}x+2 \end{cases}$

Answer

$(-5,4)$

38. $\begin{cases} 2x+y=5 \\ x-2y=-15 \end{cases}$

39. $\begin{cases} 4x+y=10 \\ x-2y=-20 \end{cases}$

Answer

$(0, 10)$

40. $\begin{cases} y=-2x-1 \\ y=-\frac{1}{3}x+4 \end{cases}$

41. $\begin{cases} y=x-6 \\ y=-\frac{3}{2}x+4 \end{cases}$

Answer

$(4, -2)$

42. $\begin{cases} x=2y \\ 4x-8y=0 \end{cases}$

43. $\begin{cases} 2x-16y=8 \\ -x-8y=-4 \end{cases}$

Answer

$(4, 0)$

44. $\begin{cases} y=\frac{7}{8}x+4 \\ -7x+8y=6 \end{cases}$

45. $\begin{cases} y=-\frac{2}{3}x+5 \\ 2x+3y=11 \end{cases}$

Answer

no solution

Solve a System of Equations by Elimination

In the following exercises, solve the systems of equations by elimination.

46. $\begin{cases} 5x+2y=2 \\ -3x-y=0 \end{cases}$

47. $\begin{cases} 6x-5y=-1 \\ 2x+y=13 \end{cases}$

Answer

$(4, 5)$

48. $\begin{cases} 2x-5y=7 \\ 3x-y=17 \end{cases}$

49. $\begin{cases} 5x-3y=-1 \\ 2x-y=2 \end{cases}$

Answer

$(7,12)$

50. $\begin{cases} 3x-5y=-9 \\ 5x+2y=16 \end{cases}$

51. $\begin{cases} 4x-3y=3 \\ 2x+5y=-31 \end{cases}$

Answer

$(-3,-5)$

52. $\begin{cases} 3x+8y=-3 \\ 2x+5y=-3 \end{cases}$

53. $\begin{cases} 11x+9y=-5 \\ 7x+5y=-1 \end{cases}$

Answer

$(2,-3)$

54. $\begin{cases} 3x+8y=67 \\ 5x+3y=60 \end{cases}$

55. $\begin{cases} 2x+9y=-4 \\ 3x+13y=-7 \end{cases}$

Answer

$(-11,2)$

56. $\begin{cases} \frac{1}{3}x-y=-3 \\ x+\frac{5}{2}y=2 \end{cases}$

57. $\begin{cases} x+\frac{1}{2}y=\frac{3}{2} \\ \frac{1}{5}x-\frac{1}{5}y=3 \end{cases}$

Answer

$(6/-9,24/7)$

58. $\begin{cases} x+\frac{1}{3}y=-1 \\ \frac{1}{3}x+\frac{1}{2}y=1 \end{cases}$

59. $\begin{cases} \frac{1}{3}x-y=-3 \\ \frac{2}{3}x+\frac{5}{2}y=3 \end{cases}$

Answer

$(-3, 2)$

60. $\begin{cases} 2x+y=3 \\ 6x+3y=9 \end{cases}$

61. $\begin{cases} x-4y=-1 \\ -3x+12y=3 \end{cases}$

Answer

infinitely many solutions with solution set: $\{(x, y)|x-4y=-1\}$

62. $\begin{cases} -3x-y=8 \\ 6x+2y=-16 \end{cases}$

63. $\begin{cases} 4x+3y=2 \\ 20x+15y=10 \end{cases}$

Answer

infinitely many solutions with solution set: $\{(x, y)|4x+3y=2\}$

Choose the Most Convenient Method to Solve a System of Linear Equations

In the following exercises, decide whether it would be more convenient to solve the system of equations by substitution or elimination.

64.

ⓐ $\begin{cases} 8x-15y=-32 \\ 6x+3y=-5 \end{cases}$

ⓑ $\begin{cases} x=4y-3 \\ 4x-2y=-6 \end{cases}$

65.

ⓐ $\begin{cases} y=7x-5 \\ 3x-2y=16 \end{cases}$

ⓑ $\begin{cases} 12x-5y=-42 \\ 3x+7y=-15 \end{cases}$

Answer

ⓐ substitution ⓑ elimination

66.

ⓐ $\begin{cases} y=4x+95 \\ x-2y=-21 \end{cases}$

ⓑ $\begin{cases} 9x-4y=24 \\ 3x+5y=-14 \end{cases}$

67.

ⓐ $\begin{cases} 14x-15y=-30 \\ 7x+2y=10 \end{cases}$

ⓑ $\begin{cases} x = 9y - 11 \\ 2x - 7y = -27 \end{cases}$

Answer

ⓐ elimination ⓑ substitution

Writing Exercises

68. In a system of linear equations, the two equations have the same intercepts. Describe the possible solutions to the system.

69. Solve the system of equations by substitution and explain all your steps in words: $\begin{cases} 3x + y = 1 \\ 2x = y - 8 \end{cases}$

Answer

Answers will vary.

70. Solve the system of equations by elimination and explain all your steps in words: $\begin{cases} 5x + 4y = 10 \\ 2x = 3y + 27 \end{cases}$

71. Solve the system of equations $\begin{cases} x + y = 10 \\ x - y = 6 \end{cases}$

ⓐ by graphing ⓑ by substitution
ⓒ Which method do you prefer? Why?

Answer

Answers will vary.

Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether an ordered pair is a solution of a system of equations.			
solve a system of linear equations by graphing.			
solve a system of equations by substitution.			
solve a system of equations by elimination.			
choose the most convenient method to solve a system of linear equations.			

If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

21.3: Solve Applications with Systems of Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve direct translation applications
- Solve geometry applications
- Solve uniform motion applications

Before you get started, take this readiness quiz.

1. The sum of twice a number and nine is 31. Find the number.
   If you missed this problem, review [link].
2. Twins Jon and Ron together earned $96,000 last year. Ron earned $8000 more than three times what Jon earned. How much did each of the twins earn?
   If you missed this problem, review [link].
3. An express train and a local train leave Pittsburgh to travel to Washington, D.C. The express train can make the trip in four hours and the local train takes five hours for the trip. The speed of the express train is 12 miles per hour faster than the speed of the local train. Find the speed of both trains.
   If you missed this problem, review [link].

Solve Direct Translation Applications

Systems of linear equations are very useful for solving applications. Some people find setting up word problems with two variables easier than setting them up with just one variable. To solve an application, we'll first translate the words into a system of linear equations. Then we will decide the most convenient method to use, and then solve the system.

SOLVE APPLICATIONS WITH SYSTEMS OF EQUATIONS.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose variables to represent those quantities.
4. **Translate** into a system of equations.
5. **Solve** the system of equations using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

We solved number problems with one variable earlier. Let's see how differently it works using two variables.

?

The sum of two numbers is zero. One number is nine less than the other. Find the numbers.

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for two numbers.
Step 3. Name what we are looking for.	Let $n =$ the first number. $m =$ the second number
Step 4. Translate into a system of equations.	The sum of two numbers is zero.
	$n + m = 0$
	One number is nine less than the other.

	$n = m - 9$
The system is:	$n + m = 0$ $n = m - 9$
Step 5. Solve the system of equations. We will use substitution since the second equation is solved for n.	
Substitute $m - 9$ for n in the first equation.	$n = (m - 9)$ $n + m = 0$
Solve for m.	$m - 9 + m = 0$
	$2m - 9 = 0$
	$2m = 9$
Substitute $m = \frac{9}{2}$ into the second equation and then solve for n.	$m = \frac{9}{2}$ $n = m - 9$
	$m = \frac{9}{2} - 9$ $m = \frac{9}{2} - \frac{18}{2}$
	$n = -\frac{9}{2}$
Step 6. Check the answer in the problem.	Do these numbers make sense in the problem? We will leave this to you!
Step 7. Answer the question.	The numbers are $\frac{9}{2}$ and $-\frac{9}{2}$.

? Example 21.3.2

The sum of two numbers is 10. One number is 4 less than the other. Find the numbers.

Answer

$3, 7$

? Example 21.3.3

The sum of two numbers is -6. One number is 10 less than the other. Find the numbers.

Answer

$2, -8$

?

Heather has been offered two options for her salary as a trainer at the gym. Option A would pay her \$25,000 plus \$15 for each training session. Option B would pay her $\$10,000 + \$40$ for each training session. How many training sessions would make the salary options equal?

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for the number of training sessions that would make the pay equal.
Step 3. Name what we are looking for.	Let s=s= Heather's salary. n=n= the number of training sessions
Step 4. Translate into a system of equations.	Option A would pay her $25,000 plus $15 for each training session.
	$s = 25{,}000 + 15n$
	Option B would pay her $10,000 + $40 for each training session.
	$s = 10{,}000 + 40n$
The system is shown.	$s = 25{,}000 + 15n$ $s = 10{,}000 + 40n$
Step 5. Solve the system of equations. We will use substitution.	$s = 25{,}000 + 15n$ $s = 10{,}000 + 40n$
Substitute 25,000 +15n for s in the second equation.	$25{,}000 + 15n = 10{,}000 + 40n$
Solve for n.	$25{,}000 = 10{,}000 + 25n$ $15{,}000 = 25n$ $600 = n$
Step 6. Check the answer.	Are 600 training sessions a year reasonable? Are the two options equal when n = 600?
Step 7. Answer the question.	The salary options would be equal for 600 training sessions.

Example 21.3.5

Geraldine has been offered positions by two insurance companies. The first company pays a salary of $12,000 plus a commission of $100 for each policy sold. The second pays a salary of $20,000 plus a commission of $50 for each policy sold. How many policies would need to be sold to make the total pay the same?

Answer

160 policies

Example 21.3.6

Kenneth currently sells suits for company A at a salary of $22,000 plus a $10 commission for each suit sold. Company B offers him a position with a salary of $28,000 plus a $4 commission for each suit sold. How many suits would Kenneth need to sell for the options to be equal?

Answer

1000 suits

As you solve each application, remember to analyze which method of solving the system of equations would be most convenient.

Example 21.3.7

Translate to a system of equations and then solve:

When Jenna spent 10 minutes on the elliptical trainer and then did circuit training for 20 minutes, her fitness app says she burned 278 calories. When she spent 20 minutes on the elliptical trainer and 30 minutes circuit training she burned 473 calories. How many calories does she burn for each minute on the elliptical trainer? How many calories for each minute of circuit training?

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for the number of calories burned each minute on the elliptical trainer and each minute of circuit training.
Step 3. Name what we are looking for.	Let e=e= number of calories burned per minute on the elliptical trainer. c=c= number of calories burned per minute while circuit training
Step 4. Translate into a system of equations.	10 minutes on the elliptical and circuit training for 20 minutes, burned 278 calories
	$10e + 20c = 278$
	20 minutes on the elliptical and 30 minutes of circuit training burned 473 calories
	$20e + 30c = 473$
The system is:	$\begin{cases} 10e + 20c = 278 \\ 20e + 30c = 473 \end{cases}$
Step 5. Solve the system of equations.	
Multiply the first equation by −2 to get opposite coefficients of e.	$\begin{cases} -2(10e + 20c) = -2(278) \\ 20e + 30c = 473 \end{cases}$
Simplify and add the equations. Solve for c.	$\begin{cases} -20e - 40c = -556 \\ 20e + 30c = 473 \end{cases}$ $-10c = -83$ $c = 8.3$
Substitute $c = 8.3$ into one of the original equations to solve for e.	$10e + 20c = 278$ $10e + 20(8.3) = 278$ $10e + 166 = 278$ $10e = 112$ $e = 11.2$
Step 6. Check the answer in the problem.	Check the math on your own.
	$\begin{cases} 10(11.2) + 20(8.3) \stackrel{?}{=} 278 \\ 20(11.2) + 30(8.3) \stackrel{?}{=} 473 \end{cases}$
Step 7. Answer the question.	Jenna burns 8.3 calories per minute circuit training and 11.2 calories per minute while on the elliptical trainer.

Example 21.3.8

Translate to a system of equations and then solve:

Mark went to the gym and did 40 minutes of Bikram hot yoga and 10 minutes of jumping jacks. He burned 510 calories. The next time he went to the gym, he did 30 minutes of Bikram hot yoga and 20 minutes of jumping jacks burning 470 calories. How many calories were burned for each minute of yoga? How many calories were burned for each minute of jumping jacks?

Answer

Mark burned 11 calories for each minute of yoga and 7 calories for each minute of jumping jacks.

Example 21.3.9

Translate to a system of equations and then solve:

Erin spent 30 minutes on the rowing machine and 20 minutes lifting weights at the gym and burned 430 calories. During her next visit to the gym she spent 50 minutes on the rowing machine and 10 minutes lifting weights and burned 600 calories. How many calories did she burn for each minutes on the rowing machine? How many calories did she burn for each minute of weight lifting?

Answer

Erin burned 11 calories for each minute on the rowing machine and 5 calories for each minute of weight lifting.

Solve Geometry Applications

We will now solve geometry applications using systems of linear equations. We will need to add complementary angles and supplementary angles to our list some properties of angles.

The measures of two **complementary angles** add to 90 degrees. The measures of two **supplementary angles** add to 180 degrees.

COMPLEMENTARY AND SUPPLEMENTARY ANGLES

Two angles are complementary if the sum of the measures of their angles is 90 degrees.

Two angles are supplementary if the sum of the measures of their angles is 180 degrees

If two angles are complementary, we say that *one angle is the complement of the other.*

If two angles are supplementary, we say that *one angle is the supplement of the other.*

Example 21.3.10

Translate to a system of equations and then solve.

The difference of two complementary angles is 26 degrees. Find the measures of the angles.

Answer

Step 1. Read the problem.

Step 2. Identify what we are looking for. We are looking for the measure of each angle.

Step 3. Name what we are looking for. Let $x =$ the measure of the first angle.
$y =$ the measure of the second angle

Step 4. Translate into a system of equations. The angles are complementary.

$$x + y = 90$$

The difference of the two angles is 26 degrees.

$$x - y = 26$$

The system is shown.

$$\begin{cases} x + y = 90 \\ x - y = 26 \end{cases}$$

Step 5. Solve the system of equations by elimination.

$$\begin{cases} x + y = 90 \\ \underline{x - y = 26} \end{cases}$$
$$2x = 116$$
$$x = 58$$

Substitute $x = 58$ into the first equation.

$$x + y = 90$$
$$58 + y = 90$$
$$y = 32$$

Step 6. Check the answer in the problem.

$58 + 32 = 90$✓
$58 - 32 = 26$✓

Step 7. Answer the question. The angle measures are 58 and 32 degrees.

Example 21.3.11

Translate to a system of equations and then solve:

The difference of two complementary angles is 20 degrees. Find the measures of the angles.

Answer

The angle measures are 55 and 35.

Example 21.3.12

Translate to a system of equations and then solve:

The difference of two complementary angles is 80 degrees. Find the measures of the angles.

Answer

The angle measures are 5 and 85.

In the next example, we remember that the measures of supplementary angles add to 180.

Example 21.3.13

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is twelve degrees less than five times the measure of the smaller angle. Find the measures of both angles.

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for measure of each angle.
Step 3. Name what we are looking for.	Let x=x= the measure of the first angle. y=y= the measure of the second angle
Step 4. Translate into a system of equations.	The angles are supplementary.
	$x+y=180$
	The larger angle is twelve less than five times the smaller angle.
	$y=5x-12$
The system is shown: **Step 5. Solve** the system of equations substitution.	$\begin{cases} x+y=180 \\ y=5x-12 \end{cases}$ $x+y=180$
Substitute $5x-12$ for y in the first equation. Solve for x.	$x+5x-12=180$ $6x-12=180$
Substitute 32 for x in the second equation, then solve for y.	$6x=192$ $x=32$ $y=5x-12$ $y=5\cdot 32-12$ $y=160-12$ $y=148$
Step 6. Check the answer in the problem.	$32+148=180$ ✓ $5\cdot 32-12=148$ ✓
Step 7. Answer the question.	The angle measures are 148 and 32 degrees.

Example 21.3.14

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is 12 degrees more than three times the smaller angle. Find the measures of the angles.

Answer

The angle measures are 42 and 138.

Example 21.3.15

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is 18 less than twice the measure of the smaller angle. Find the measures of the angles.

Answer

The angle measures are 66 and 114.

Recall that the angles of a triangle add up to 180 degrees. A right triangle has one angle that is 90 degrees. What does that tell us about the other two angles? In the next example we will be finding the measures of the other two angles.

Example 21.3.16

The measure of one of the small angles of a right triangle is ten more than three times the measure of the other small angle. Find the measures of both angles.

Answer

We will draw and label a figure.

Step 1. Read the problem.	Step 2. Identify what you are looking for.	We are looking for the measures of the angles.
Step 3. Name what we are looking for.	Let a=a= the measure of the first angle. b=b= the measure of the second angle
Step 4. Translate into a system of equations.	The measure of one of the small angles of a right triangle is ten more than three times the measure of the other small angle.
	$a = 3b + 10$
	The sum of the measures of the angles of a triangle is 180.
	$a + b + 90 = 180$
The system is shown.	$a = 3b + 10$ $a + b + 90 = 180$
Step 5. Solve the system of equations. We will use substitution since the first equation is solved for a.	$a = 3b + 10$ $a + b + 90 = 180$
Substitute 3b+103b+10 for a in the second equation.	$(3b + 10) + b + 90 = 180$
Solve for b.	$4b + 100 = 180$ $4b = 80$ $b = 20$ $a = 3b + 10$
Substitute b=20b=20 into the first equation and then solve for a.	$a = 3 \cdot 20 + 10$ $a = 70$
Step 6. Check the answer in the problem.	We will leave this to you!
Step 7. Answer the question.	The measures of the small angles are 20 and 70 degrees.

Example 21.3.17

The measure of one of the small angles of a right triangle is 2 more than 3 times the measure of the other small angle. Find the measure of both angles.

Answer

$22, 68$

Example 21.3.18

The measure of one of the small angles of a right triangle is 18 less than twice the measure of the other small angle. Find the measure of both angles.

Answer

$36, 54$

Often it is helpful when solving geometry applications to draw a picture to visualize the situation.

Example 21.3.19

Translate to a system of equations and then solve:

Randall has 125 feet of fencing to enclose the part of his backyard adjacent to his house. He will only need to fence around three sides, because the fourth side will be the wall of the house. He wants the length of the fenced yard (parallel to the house wall) to be 5 feet more than four times as long as the width. Find the length and the width.

Answer

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	We are looking for the length and width.
Step 3. Name what we are looking for.	Let L=L= the length of the fenced yard. W=W= the width of the fenced yard
Step 4. Translate into a system of equations.	One lenth and two widths equal 125.
	$L + 2W = 125$
	The length will be 5 feet more than four times the width.
	$L = 4W + 5$
The system is shown. **Step 5. Solve** The system of equations by substitution.	$\begin{cases} L + 2W = 125 \\ L = 4W + 5 \end{cases}$ $L + 2W = 125$
Substitute $L = 4W + 5$ into the first equation, then solve for W.	$4W + 5 + 2W = 125$

	$6W + 5 = 125$ $6W = 120$ $W = 20$
Substitute 20 for W in the second equation, then solve for L.	$L = 4W + 5$ $L = 4 \cdot 20 + 5$ $L = 80 + 5$ $L = 85$
Step 6. Check the answer in the problem.	$20 + 85 + 20 = 125$ $85 = 4 \cdot 20 + 5$ $85 = 85$ ✓
Step 7. Answer the equation.	The length is 85 feet and the width is 20 feet.

? Example 21.3.20

Translate to a system of equations and then solve:

Mario wants to put a fence around the pool in his backyard. Since one side is adjacent to the house, he will only need to fence three sides. There are two long sides and the one shorter side is parallel to the house. He needs 155 feet of fencing to enclose the pool. The length of the long side is 10 feet less than twice the width. Find the length and width of the pool area to be enclosed.

Answer

The length is 60 feet and the width is 35 feet.

? Example 21.3.21

Translate to a system of equations and then solve:

Alexis wants to build a rectangular dog run in her yard adjacent to her neighbor's fence. She will use 136 feet of fencing to completely enclose the rectangular dog run. The length of the dog run along the neighbor's fence will be 16 feet less than twice the width. Find the length and width of the dog run.

Answer

The length is 60 feet and the width is 38 feet.

Solve uniform motion applications

We used a table to organize the information in uniform motion problems when we introduced them earlier. We'll continue using the table here. The basic equation was $D = rt$ where D is the distance traveled, r is the rate, and t is the time.

Our first example of a uniform motion application will be for a situation similar to some we have already seen, but now we can use two variables and two equations.

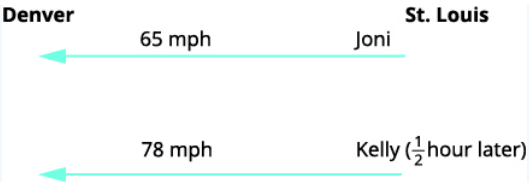
? Example 21.3.22

Translate to a system of equations and then solve:

Joni left St. Louis on the interstate, driving west towards Denver at a speed of 65 miles per hour. Half an hour later, Kelly left St. Louis on the same route as Joni, driving 78 miles per hour. How long will it take Kelly to catch up to Joni?

Answer

A diagram is useful in helping us visualize the situation.



Identify and name what we are looking for. A chart will help us organize the data. We know the rates of both Joni and Kelly, and so we enter them in the chart. We are looking for the length of time Kelly, *k*, and Joni, *j*, will each drive.

	Rate · Time = Distance		
Joni	65	j	$65j$
Kelly	78	k	$78k$

Since $D = r \cdot t$ we can fill in the Distance column.

Translate into a system of equations.

To make the system of equations, we must recognize that Kelly and Joni will drive the same distance. So,

$$65j = 78k$$

Also, since Kelly left later, her time will be $\frac{1}{2}$ hour less than Joni's time. So,

$$k = j - \tfrac{1}{2}$$

Now we have the system.

$$\begin{cases} k = j - \frac{1}{2} \\ 65j = 78k \end{cases}$$

Solve the system of equations by substitution.

Substitute $k = j - 12$ into the second equation, then solve for j.

$$\begin{aligned} 65j &= 78k \\ 65j &= 78(j - \tfrac{1}{2}) \\ 65j &= 78j - 39 \\ -13j &= -39 \\ j &= 3 \end{aligned}$$

To find Kelly's time, substitute $j = 3$ into the first equation, then solve for k.

$$\begin{aligned} k &= j - \tfrac{1}{2} \\ k &= 3 - \tfrac{1}{2} \\ k &= \tfrac{5}{2} \text{ or } k = 2\tfrac{1}{2} \end{aligned}$$

Check the answer in the problem.

Joni 3 hours (65 mph) = 195 miles

Kelly $2\frac{1}{2}$ hours (78 mph) = 195 miles

Yes, they will have traveled the same distance when they meet.

Answer the question.

Kelly will catch up to Joni in $2\frac{1}{2}$ hours. By then, Joni will have traveled 3 hours.

Example 21.3.23

Translate to a system of equations and then solve:

Mitchell left Detroit on the interstate driving south towards Orlando at a speed of 60 miles per hour. Clark left Detroit 1 hour later traveling at a speed of 75 miles per hour, following the same route as Mitchell. How long will it take Clark to catch Mitchell?

Answer

It will take Clark 4 hours to catch Mitchell.

Example 21.3.24

Translate to a system of equations and then solve:

Charlie left his mother's house traveling at an average speed of 36 miles per hour. His sister Sally left 15 minutes $(\frac{1}{4}\text{ hour})$ later traveling the same route at an average speed of 42 miles per hour. How long before Sally catches up to Charlie?

Answer

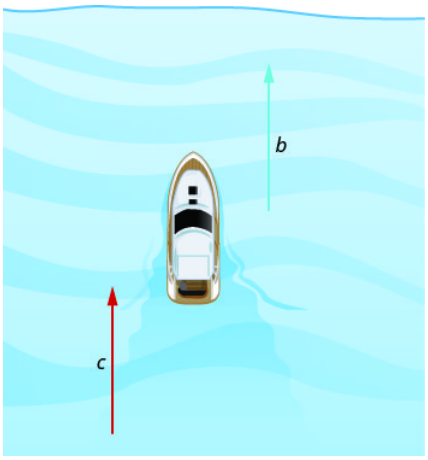
It will take Sally 112 hours to catch up to Charlie.

Many real-world applications of uniform motion arise because of the effects of currents—of water or air—on the actual speed of a vehicle. Cross-country airplane flights in the United States generally take longer going west than going east because of the prevailing wind currents.

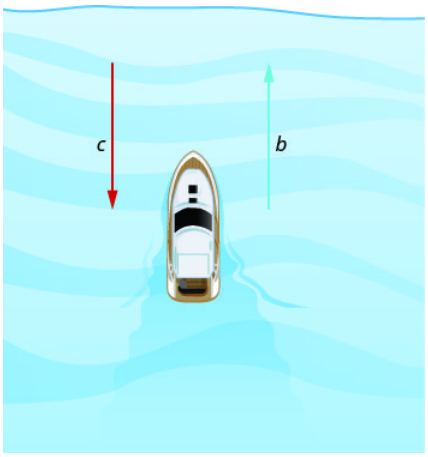
Let's take a look at a boat travelling on a river. Depending on which way the boat is going, the current of the water is either slowing it down or speeding it up.

The images below show how a river current affects the speed at which a boat is actually travelling. We'll call the speed of the boat in still water b and the speed of the river current c.

The boat is going downstream, in the same direction as the river current. The current helps push the boat, so the boat's actual speed is faster than its speed in still water. The actual speed at which the boat is moving is $b+c$.



Now, the boat is going upstream, opposite to the river current. The current is going against the boat, so the boat's actual speed is slower than its speed in still water. The actual speed of the boat is $b-c$.



We'll put some numbers to this situation in the next example.

? Example 21.3.25

Translate to a system of equations and then solve.

A river cruise ship sailed 60 miles downstream for 4 hours and then took 5 hours sailing upstream to return to the dock. Find the speed of the ship in still water and the speed of the river current.

Answer

Read the problem.	This is a uniform motion problem and a picture will help us visualize the situation.
	Identify what we are looking for.	We are looking for the speed of the ship in still water and the speed of the current.
Name what we are looking for.	Let $s =$ the rate of the ship in still water. $c =$ the rate of the current
A chart will help us organize the information. The ship goes downstream and then upstream. Going downstream, the current helps the ship and so the ship's actual rate is $s + c$. Going upstream, the current slows the ship and so the actual rate is $s - c$.	<table><tr><th></th><th colspan="3">Rate • Time = Distance</th></tr><tr><td>downstream</td><td>$s + c$</td><td>4</td><td>60</td></tr><tr><td>upstream</td><td>$s - c$</td><td>5</td><td>60</td></tr></table>
Downstream it takes 4 hours. Upstream it takes 5 hours. Each way the distance is 60 miles.	
Translate into a system of equations. Since rate times time is distance, we can write the system of equations.	$\begin{cases} 4(s + c) = 60 \\ 5(s - c) = 60 \end{cases}$
Solve the system of equations. Distribute to put both equations in standard form, then solve by elimination.	$\begin{cases} 4s + 4c = 60 \\ 5s - 5c = 60 \end{cases}$

Multiply the top equation by 5 and the bottom equation by 4. Add the equations, then solve for s.	$20s + 20c = 300$ $20s - 20c = 240$ $40s = 540$ $s = 13.5$ $4(s + c) = 60$
Substitute $s = 13.5$ into of the original equations.	$4(13.5 + c) = 60$ $54 + 4c = 60$ $4c = 6$ $c = 1.5$
Check the answer in the problem. The downstream rate would be $13.5 + 1.5 = 15$ mph. In 4 hours the ship would travel $15 \cdot 4 = 60$ miles. The upstream rate would be $13.5 - 1.5 = 12$ mph. In 5 hours the ship would travel $12 \cdot 5 = 60$ miles.	
Answer the question.	The rate of the ship is 13.5 mph and the rate of the current is 1.5 mph.

Example 21.3.26

Translate to a system of equations and then solve:

A Mississippi river boat cruise sailed 120 miles upstream for 12 hours and then took 10 hours to return to the dock. Find the speed of the river boat in still water and the speed of the river current.

Answer

The rate of the boat is 11 mph and the rate of the current is 1 mph.

Example 21.3.27

Translate to a system of equations and then solve:

Jason paddled his canoe 24 miles upstream for 4 hours. It took him 3 hours to paddle back. Find the speed of the canoe in still water and the speed of the river current.

Answer

The speed of the canoe is 7 mph and the speed of the current is 1 mph.

Wind currents affect airplane speeds in the same way as water currents affect boat speeds. We'll see this in the next example. A wind current in the same direction as the plane is flying is called a *tailwind*. A wind current blowing against the direction of the plane is called a *headwind*.

Example 21.3.28

Translate to a system of equations and then solve:

A private jet can fly 1,095 miles in three hours with a tailwind but only 987 miles in three hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

Read the problem.	This is a uniform motion problem and a picture will help us visualize.
	Identify what we are looking for.	We are looking for the speed of the jet in still air and the speed of the wind.
Name what we are looking for.	Let j=j= the speed of the jet in still air. w=w= the speed of the wind.
A chart will help us organize the information. The jet makes two trips—one in a tailwind and one in a headwind. In a tailwind, the wind helps the jet and so the rate is $j + w$. In a headwind, the wind slows the jet and so the rate is $j - w$.	

	Rate •	Time =	Distance
tailwind	$j+w$	3	1095
headwind	$j-w$	3	987

Each trip takes 3 hours. In a tailwind the jet flies 1,095 miles. In a headwind the jet flies 987 miles.	
Translate into a system of equations. Since rate times time is distance, we get the system of equations.	$3(j+w)=1095$ $3(j-w)=\ 987$
Solve the system of equations. Distribute, then solve by elimination. Add, and solve for j.	$3j+3w=1095$ $3j-3w=\ 987$ $6j\ \ =2082$ $j\ \ =347$ $4(j+w)=1095$
Substitute $j = 347$ into one of the original equations, then solve for w.	$3(347+w)=1095$ $1041+3w=1095$ $3w=54$ $w=18$
Check the answer in the problem. With the tailwind, the actual rate of the jet would be $347+18=365$ mph. In 3 hours the jet would travel $365 \cdot 3 = 1,095$ miles Going into the headwind, the jet's actual rate would be $347-18=329$ mph. In 3 hours the jet would travel $329 \cdot 3 = 987$ miles.	
Answer the question.	The rate of the jet is 347 mph and the rate of the wind is 18 mph.

Example 21.3.29

Translate to a system of equations and then solve:

A small jet can fly 1,325 miles in 5 hours with a tailwind but only 1,035 miles in 5 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

The speed of the jet is 235 mph and the speed of the wind is 30 mph.

Example 21.3.30

Translate to a system of equations and then solve:

A commercial jet can fly 1,728 miles in 4 hours with a tailwind but only 1,536 miles in 4 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

The speed of the jet is 408 mph and the speed of the wind is 24 mph.

Access this online resource for additional instruction and practice with systems of equations.

- Systems of Equations

Key Concepts

- **How To Solve Applications with Systems of Equations**
  1. **Read** the problem. Make sure all the words and ideas are understood.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose variables to represent those quantities.
  4. **Translate** into a system of equations.
  5. **Solve** the system of equations using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.

Glossary

complementary angles

Two angles are complementary if the sum of the measures of their angles is 90 degrees.

supplementary angles

Two angles are supplementary if the sum of the measures of their angles is 180 degrees.

21.3E: Exercises

Practice Makes Perfect

Direct Translation Applications

In the following exercises, translate to a system of equations and solve.

1. The sum of two number is 15. One number is 3 less than the other. Find the numbers.

2. The sum of two number is 30. One number is 4 less than the other. Find the numbers.

Answer

13 and 17

3. The sum of two number is −16. One number is 20 less than the other. Find the numbers.

4. The sum of two number is -26. One number is 12 less than the other. Find the numbers.

Answer

-7 and -19

5. The sum of two numbers is 65. Their difference is 25. Find the numbers.

6. The sum of two numbers is 37. Their difference is 9. Find the numbers.

Answer

14 and 23

7. The sum of two numbers is -27. Their difference is -59. Find the numbers.

8. The sum of two numbers is -45. Their difference is -89. Find the numbers.

Answer

22 and -67

9. Maxim has been offered positions by two car companies. The first company pays a salary of $10,000 plus a commission of $1000 for each car sold. The second pays a salary of $20,000 plus a commission of $500 for each car sold. How many cars would need to be sold to make the total pay the same?

10. Jackie has been offered positions by two cable companies. The first company pays a salary of $14,000 plus a commission of $100 for each cable package sold. The second pays a salary of $20,000 plus a commission of $25 for each cable package sold. How many cable packages would need to be sold to make the total pay the same?

Answer

Eighty cable packages would need to be sold to make the total pay the same.

11. Amara currently sells televisions for company A at a salary of $17,000 plus a $100 commission for each television she sells. Company B offers her a position with a salary of $29,000 plus a $20 commission for each television she sells. How televisions would Amara need to sell for the options to be equal?

12. Mitchell currently sells stoves for company A at a salary of $12,000 plus a $150 commission for each stove he sells. Company B offers him a position with a salary of $24,000 plus a $50 commission for each stove he sells. How many stoves would Mitchell need to sell for the options to be equal?

Answer

Mitchell would need to sell 120 stoves for the companies to be equal.

13. Two containers of gasoline hold a total of fifty gallons. The big container can hold ten gallons less than twice the small container. How many gallons does each container hold?

14. June needs 48 gallons of punch for a party and has two different coolers to carry it in. The bigger cooler is five times as large as the smaller cooler. How many gallons can each cooler hold?

Answer

8 and 40 gallons

15. Shelly spent 10 minutes jogging and 20 minutes cycling and burned 300 calories. The next day, Shelly swapped times, doing 20 minutes of jogging and 10 minutes of cycling and burned the same number of calories. How many calories were burned for each minute of jogging and how many for each minute of cycling?

16. Drew burned 1800 calories Friday playing one hour of basketball and canoeing for two hours. Saturday he spent two hours playing basketball and three hours canoeing and burned 3200 calories. How many calories did he burn per hour when playing basketball? How many calories did he burn per hour when canoeing?

Answer

1000 calories playing basketball and 400 calories canoeing

17. Troy and Lisa were shopping for school supplies. Each purchased different quantities of the same notebook and thumb drive. Troy bought four notebooks and five thumb drives for $116. Lisa bought two notebooks and three thumb dives for $68. Find the cost of each notebook and each thumb drive.

18. Nancy bought seven pounds of oranges and three pounds of bananas for $17. Her husband later bought three pounds of oranges and six pounds of bananas for $12. What was the cost per pound of the oranges and the bananas?

Answer

Oranges cost $2 per pound and bananas cost $1 per pound

19. Andrea is buying some new shirts and sweaters. She is able to buy 3 shirts and 2 sweaters for $114 or she is able to buy 2 shirts and 4 sweaters for $164. How much does a shirt cost? How much does a sweater cost?

20. Peter is buying office supplies. He is able to buy 3 packages of paper and 4 staplers for $40 or he is able to buy 5 packages of paper and 6 staplers for $62. How much does a package of paper cost? How much does a stapler cost?

Answer

Package of paper $4, stapler $7

21. The total amount of sodium in 2 hot dogs and 3 cups of cottage cheese is 4720 mg. The total amount of sodium in 5 hot dogs and 2 cups of cottage cheese is 6300 mg. How much sodium is in a hot dog? How much sodium is in a cup of cottage cheese?

22. The total number of calories in 2 hot dogs and 3 cups of cottage cheese is 960 calories. The total number of calories in 5 hot dogs and 2 cups of cottage cheese is 1190 calories. How many calories are in a hot dog? How many calories are in a cup of cottage cheese?

Answer

Hot dog 150 calories, cup of cottage cheese 220 calories

23. Molly is making strawberry infused water. For each ounce of strawberry juice, she uses three times as many ounces of water as juice. How many ounces of strawberry juice and how many ounces of water does she need to make 64 ounces of strawberry infused water?

24. Owen is making lemonade from concentrate. The number of quarts of water he needs is 4 times the number of quarts of concentrate. How many quarts of water and how many quarts of concentrate does Owen need to make 100 quarts of lemonade?

Answer

Owen will need 80 quarts of water and 20 quarts of concentrate to make 100 quarts of lemonade.

Solve Geometry Applications

In the following exercises, translate to a system of equations and solve.

25. The difference of two complementary angles is 55 degrees. Find the measures of the angles.

26. The difference of two complementary angles is 17 degrees. Find the measures of the angles.

Answer

53.5degrees and 36.5degree.

27. Two angles are complementary. The measure of the larger angle is twelve less than twice the measure of the smaller angle. Find the measures of both angles.

28. Two angles are complementary. The measure of the larger angle is ten more than four times the measure of the smaller angle. Find the measures of both angles.

Answer

16 degrees and 74 degrees

29. The difference of two supplementary angles is 8 degrees. Find the measures of the angles.

30. The difference of two supplementary angles is 88 degrees. Find the measures of the angles.

Answer

134 degrees and 46 degrees

31. Two angles are supplementary. The measure of the larger angle is four more than three times the measure of the smaller angle. Find the measures of both angles.

32. Two angles are supplementary. The measure of the larger angle is five less than four times the measure of the smaller angle. Find the measures of both angles.

Answer

37 degrees and 143 degrees

33. The measure of one of the small angles of a right triangle is 14 more than 3 times the measure of the other small angle. Find the measure of both angles.

34. The measure of one of the small angles of a right triangle is 26 more than 3 times the measure of the other small angle. Find the measure of both angles.

Answer

16° and 74°

35. The measure of one of the small angles of a right triangle is 15 less than twice the measure of the other small angle. Find the measure of both angles.

36. The measure of one of the small angles of a right triangle is 45 less than twice the measure of the other small angle. Find the measure of both angles.

Answer

45° and 45°

37. Wayne is hanging a string of lights 45 feet long around the three sides of his patio, which is adjacent to his house. The length of his patio, the side along the house, is five feet longer than twice its width. Find the length and width of the patio.

38. Darrin is hanging 200 feet of Christmas garland on the three sides of fencing that enclose his front yard. The length is five feet less than three times the width. Find the length and width of the fencing.

Answer

Width is 41 feet and length is 118 feet.

39. A frame around a family portrait has a perimeter of 90 inches. The length is fifteen less than twice the width. Find the length and width of the frame.

40. The perimeter of a toddler play area is 100 feet. The length is ten more than three times the width. Find the length and width of the play area.

Answer

Width is 10 feet and length is 40 feet.

Solve Uniform Motion Applications

In the following exercises, translate to a system of equations and solve.

41. Sarah left Minneapolis heading east on the interstate at a speed of 60 mph. Her sister followed her on the same route, leaving two hours later and driving at a rate of 70 mph. How long will it take for Sarah's sister to catch up to Sarah?

42. College roommates John and David were driving home to the same town for the holidays. John drove 55 mph, and David, who left an hour later, drove 60 mph. How long will it take for David to catch up to John?

Answer

11 hours

43. At the end of spring break, Lucy left the beach and drove back towards home, driving at a rate of 40 mph. Lucy's friend left the beach for home 30 minutes (half an hour) later, and drove 50 mph. How long did it take Lucy's friend to catch up to Lucy?

44. Felecia left her home to visit her daughter driving 45 mph. Her husband waited for the dog sitter to arrive and left home twenty minutes (1/3 hour) later. He drove 55 mph to catch up to Felecia. How long before he reaches her?

Answer

1.5 hour

45. The Jones family took a 12-mile canoe ride down the Indian River in two hours. After lunch, the return trip back up the river took three hours. Find the rate of the canoe in still water and the rate of the current.

46. A motor boat travels 60 miles down a river in three hours but takes five hours to return upstream. Find the rate of the boat in still water and the rate of the current.

Answer

Boat rate is 16 mph and current rate is 4 mph.

47. A motor boat traveled 18 miles down a river in two hours but going back upstream, it took 4.54.5 hours due to the current. Find the rate of the motor boat in still water and the rate of the current. (Round to the nearest hundredth.)

48. A river cruise boat sailed 80 miles down the Mississippi River for four hours. It took five hours to return. Find the rate of the cruise boat in still water and the rate of the current.

Answer

Boat rate is 18 mph and current rate is 2 mph.

49. A small jet can fly 1072 miles in 4 hours with a tailwind but only 848 miles in 4 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

50. A small jet can fly 1435 miles in 5 hours with a tailwind but only 1,215 miles in 5 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

Jet rate is 265 mph and wind speed is 22 mph.

51. A commercial jet can fly 868 miles in 2 hours with a tailwind but only 792 miles in 2 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

52. A commercial jet can fly 1,320 miles in 3 hours with a tailwind but only 1170 miles in 3 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

Jet rate is 415 mph and wind speed is 25 mph.

Writing Exercises

53. Write an application problem similar to Example. Then translate to a system of equations and solve it.\

54. Write a uniform motion problem similar to Example that relates to where you live with your friends or family members. Then translate to a system of equations and solve it.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve direct translation applications.			
solve geometry applications.			
solve uniform motion applications.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

21.4: Solve Mixture Applications with Systems of Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve mixture applications
- Solve interest applications
- Solve applications of cost and revenue functions

Before you get started, take this readiness quiz.

1. Multiply: $4.025(1,562)$
   If you missed this problem, review [link].
2. Write 8.2% as a decimal.
   If you missed this problem, review [link].
3. Earl's dinner bill came to $32.50 and he wanted to leave an 18% tip. How much should the tip be?
   If you missed this problem, review [link].

Solve Mixture Applications

Mixture application involve combining two or more quantities. When we solved mixture applications with coins and tickets earlier, we started by creating a table so we could organize the information. For a coin example with nickels and dimes, the table looked like this:

	Number •	Value =	Total Value
nickels			
dimes			

Using one variable meant that we had to relate the number of nickels and the number of dimes. We had to decide if we were going to let n be the number of nickels and then write the number of dimes in terms of n, or if we would let d be the number of dimes and write the number of nickels in terms of d.

Now that we know how to solve systems of equations with two variables, we'll just let n be the number of nickels and d be the number of dimes. We'll write one equation based on the total value column, like we did before, and the other equation will come from the number column.

For the first example, we'll do a ticket problem where the ticket prices are in whole dollars, so we won't need to use decimals just yet.

Example 21.4.1

Translate to a system of equations and solve:

A science center sold 1,363 tickets on a busy weekend. The receipts totaled $12,146. How many $12 adult tickets and how many $7 child tickets were sold?

Answer

Step 1. Read the problem.	We will create a table to organize the information.
Step 2. Identify what we are looking for.	We are looking for the number of adult tickets and the number of child tickets sold.
Step 3. Name what we are looking for.	Let $a =$ the number of adult tickets. $c =$ the number of child tickets
A table will help us organize the data. We have two types of tickets, adult and child.	Write in a and c for the number of tickets.

Write the total number of tickets sold at the bottom of the Number column.	Altogether 1,363 were sold.
Write the value of each type of ticket in the Value column.	The value of each adult ticket is \$12. The value of each child tickets is \$7.
The number times the value gives the total value, so the total value of adult tickets is $a \cdot 12 = 12a$, and the total value of child tickets is $c \cdot 7 = 7c$.	Fill in the Total Value column.
Altogether the total value of the tickets was \$12,146.	<table><tr><th>Type</th><th>Number</th><th>•</th><th>Value</th><th>=</th><th>Total Value</th></tr><tr><td>adult</td><td>a</td><td></td><td>12</td><td></td><td>$11a$</td></tr><tr><td>child</td><td>c</td><td></td><td>7</td><td></td><td>$8c$</td></tr><tr><td></td><td>1,363</td><td></td><td></td><td></td><td>12,146</td></tr></table>
Step 4. Translate into a system of equations.	
The Number column and the Total value column give us the system of equations.	$\begin{cases} a + c = 1{,}363 \\ 12a + 7c = 12{,}146 \end{cases}$
We will use the elimination method to solve this system. Multiply the first equation by -7.	$\begin{cases} -7(a + c) = -7(1{,}363) \\ 12a + 7c = 12{,}146 \end{cases}$
Simplify and add, then solve for a.	$\begin{cases} -7a - 7c = -9{,}541 \\ 12a + 7c = 12{,}146 \end{cases}$ $5a = 2{,}605$ $a = 521$
Substitute $a = 521$ into the first equation, then solve for c.	$a + c = 1{,}363$ $521 + c = 1{,}363$ $c = 842$
Step 6. Check the answer in the problem. 521 adult at \$12 per ticket makes \$ 6,252 842 child at \$7 per ticket makes \$58,994 The total receipts are \$12,146✓	
Step 7. Answer the question.	The science center sold 521 adult tickets and 842 child tickets.

Example 21.4.2

Translate to a system of equations and solve:

The ticket office at the zoo sold 553 tickets one day. The receipts totaled \$3,936. How many \$9 adult tickets and how many \$6 child tickets were sold?

Answer

206 adults, 347 children

Example 21.4.3

Translate to a system of equations and solve:

The box office at a movie theater sold 147 tickets for the evening show, and receipts totaled \$1,302. How many \$11 adult and how many \$8 child tickets were sold?

Answer

42 adults, 105 children

In the next example, we'll solve a coin problem. Now that we know how to work with systems of two variables, naming the variables in the 'number' column will be easy.

Example 21.4.4

Translate to a system of equations and solve:

Juan has a pocketful of nickels and dimes. The total value of the coins is \$8.10. The number of dimes is 9 less than twice the number of nickels. How many nickels and how many dimes does Juan have?

Answer

Step 1. Read the problem. We will create a table to organize the information.	
Step 2. Identify what we are looking for.	We are looking for the number of nickels and the number of dimes.
Step 3. Name what we are looking for.	Let $n =$ the number of nickels. $d =$ the number of dimes
A table will help us organize the data. We have two types of coins, nickels and dimes.	Write *n* and *d* for the number of each type of coin.
Fill in the Value column with the value of each type of coin.	The value of each nickel is \$0.05. The value of each dime is \$0.10.
The number times the value gives the total value, so, the total value of the nickels is $n(0.05) = 0.05n$ and the total value of dimes is $d(0.10) = 0.10d$. Altogether the total value of the coins is \$8.10.	**Type** | **Number** • **Value** = **Total Value** nickels | n | 0.05 | $0.05n$ dimes | d | 0.10 | $0.10d$ | | | 8.10
Step 4. Translate into a system of equations.	
The Total Value column gives one equation.	$0.05n + 0.10d = 8.10$
We also know the number of dimes is 9 less than twice the number of nickels.	
Translate to get the second equation.	$d = 2n - 9$
Now we have the system to solve.	$\begin{cases} 0.05n + 0.10d = 8.10 \\ d = 2n - 9 \end{cases}$
Step 5. Solve the system of equations We will use the substitution method.	
Substitute $d = 2n - 9$ into the first equation.	$0.05n + 0.10d = 8.10$ $0.05n + 0.10(2n - 9) = 8.10$
Simplify and solve for *n*.	$0.05n + 0.2n - 0.90 = 8.10$ $0.25n - 0.90 = 8.10$ $0.25n = 9.00$ $n = 36$
To find the number of dimes, substitute $n = 36$ into the second equation.	$d = 2n - 9$ $d = 2 \cdot 36 - 9$ $d = 63$

Step 6. Check the answer in the problem 63 dimes at $\$0.10 = \$6.30$ 36 nickels at $\$0.05 = \$1.80$ Total $= \$8.10$✓	
Step 7. Answer the question.	Juan has 36 nickels and 63 dimes.

? Example 21.4.5

Translate to a system of equations and solve:

Matilda has a handful of quarters and dimes, with a total value of $8.55. The number of quarters is 3 more than twice the number of dimes. How many dimes and how many quarters does she have?

Answer

13 dimes and 29 quarters

? Example 21.4.6

Translate to a system of equations and solve:

Priam has a collection of nickels and quarters, with a total value of $7.30. The number of nickels is six less than three times the number of quarters. How many nickels and how many quarters does he have?

Answer

19 quarters and 51 nickels

Some mixture applications involve combining foods or drinks. Example situations might include combining raisins and nuts to make a trail mix or using two types of coffee beans to make a blend.

? Example 21.4.7

Translate to a system of equations and solve:

Carson wants to make 20 pounds of trail mix using nuts and chocolate chips. His budget requires that the trail mix costs him $7.60. per pound. Nuts cost $9.00 per pound and chocolate chips cost $2.00 per pound. How many pounds of nuts and how many pounds of chocolate chips should he use?

Answer

Step 1. Read the problem. We will create a table to organize the information.	
Step 2. Identify what we are looking for.	We are looking for the number of pounds of nuts and the number of pounds of chocolate chips.
Step 3. Name what we are looking for.	Let $n =$ the number of pound of nuts. $c =$ the number of pounds of chips
Carson will mix nuts and chocolate chips to get trail mix. Write in n and c for the number of pounds of nuts and chocolate chips.	

Type	Number of pounds	• Value	= Total Value
Nuts	n	9.00	$9n$
Chocolate chips	c	2.00	$2c$
Trail mix	20	7.60	$7.60(20) = 152$

There will be 20 pounds of trail mix. Put the price per pound of each item in the Value column. Fill in the last column using $\text{Number} \bullet \text{Value} = \text{Total Value}$	
Step 4. Translate into a system of equations. We get the equations from the Number and Total Value columns.	$\begin{cases} n + c = 20 \\ 9n + 2c = 152 \end{cases}$
Step 5. Solve the system of equations We will use elimination to solve the system. Multiply the first equation by -2 to eliminate c.	$\begin{cases} -2(n + c) = -2(20) \\ 9n + 2c = 152 \end{cases}$
Simplify and add. Solve for n.	$\begin{cases} -2n - 2c = -40 \\ 9n + 2c = 152 \end{cases}$ $7n = 112$ $n = 16$
To find the number of pounds of chocolate chips, substitute $n = 16$ into the first equation, then solve for c.	$n + c = 20$ $16 + c = 20$ $c = 4$
Step 6. Check the answer in the problem. $16 + 4 = 20\checkmark$ $9 \cdot 16 + 2 \cdot 4 = 152\checkmark$	
Step 7. Answer the question.	Carson should mix 16 pounds of nuts with 4 pounds of chocolate chips to create the trail mix.

? Example 21.4.8

Translate to a system of equations and solve:

Greta wants to make 5 pounds of a nut mix using peanuts and cashews. Her budget requires the mixture to cost her \$6 per pound. Peanuts are \$4 per pound and cashews are \$9 per pound. How many pounds of peanuts and how many pounds of cashews should she use?

Answer

3 pounds peanuts and 2 pounds cashews

? Example 21.4.9

Translate to a system of equations and solve:

Sammy has most of the ingredients he needs to make a large batch of chili. The only items he lacks are beans and ground beef. He needs a total of 20 pounds combined of beans and ground beef and has a budget of \$3 per pound. The price of beans is \$1 per pound and the price of ground beef is \$5 per pound. How many pounds of beans and how many pounds of ground beef should he purchase?

Answer

10 pounds of beans, 10 pounds of ground beef

Another application of mixture problems relates to concentrated cleaning supplies, other chemicals, and mixed drinks. The concentration is given as a percent. For example, a 20% concentrated household cleanser means that 20% of the total amount is

cleanser, and the rest is water. To make 35 ounces of a 20% concentration, you mix 7 ounces (20% of 35) of the cleanser with 28 ounces of water.

For these kinds of mixture problems, we'll use "percent" instead of "value" for one of the columns in our table.

? Example 21.4.10

Translate to a system of equations and solve:

Sasheena is lab assistant at her community college. She needs to make 200 milliliters of a 40% solution of sulfuric acid for a lab experiment. The lab has only 25% and 50% solutions in the storeroom. How much should she mix of the 25% and the 50% solutions to make the 40% solution?

Answer

Step 1. Read the problem. A figure may help us visualize the situation, then we will create a table to organize the information.	Sasheena must mix some of the 25 solution and some of the 50 solution together to get 200 ml of the 40 solution.
	Step 2. Identify what we are looking for.	We are looking for how much of each solution she needs.
Step 3. Name what we are looking for.	Let $x =$ number of ml of 25 \(y= \text{number of }ml\text{ of }50%\text{ solution}\)
A table will help us organize the data. She will mix x ml of 25 with y ml of 50 to get 200 ml of 40 solution. We write the percents as decimals in the chart. We multiply the number of units times the concentration to get the total amount of sulfuric acid in each solution.	

Type	Number of units	• Concentration %	= Amount
25%	x	0.25	$0.25x$
50%	y	0.50	$0.50y$
40%	200	0.40	$0.40(200)$

Step 4. Translate into a system of equations. We get the equations from the Number column and the Amount column. Now we have the system.	$\begin{aligned} x + y &= 200 \\ 0.25x + 0.50y &= 0.40(200) \end{aligned}$
Step 5. Solve the system of equations We will solve the system by elimination. Multiply the first equation by -0.5 to eliminate y.	$\begin{aligned} -0.5(x + y) &= -0.5(200) \\ 0.25x + 0.50y &= 80 \end{aligned}$
Simplify and add to solve for x.	$\begin{array}{rcl} -0.5x - 0.5y &=& -100 \\ 0.25x + 0.5y &=& 80 \\ \hline -0.25x &=& -20 \\ x &=& 80 \end{array}$
To solve for y, substitute $x = 80$ into the first equation.	$\begin{aligned} x + y &= 200 \\ 80 + y &= 200 \\ y &= 120 \end{aligned}$

Step 6. Check the answer in the problem. $80+120 = 200$✓ $0.25(80)+0.50(120) = 200$✓ Yes!	
Step 7. Answer the question.	Sasheena should mix 80 ml of the 25 solution with 120 ml of the 50 solution to get the 200 ml of the 40 solution.

? Example 21.4.11

Translate to a system of equations and solve:

LeBron needs 150 milliliters of a 30% solution of sulfuric acid for a lab experiment but only has access to a 25% and a 50% solution. How much of the 25% and how much of the 50% solution should he mix to make the 30% solution?

Answer

120 ml of 25% solution and 30 ml of 50% solution

? Example 21.4.12

Translate to a system of equations and solve:

Anatole needs to make 250 milliliters of a 25% solution of hydrochloric acid for a lab experiment. The lab only has a 10% solution and a 40% solution in the storeroom. How much of the 10% and how much of the 40% solutions should he mix to make the 25% solution?

Answer

125 ml of 10% solution and 125 ml of 40% solution

Solve Interest Applications

The formula to model simple interest applications is $I = Prt$. Interest, I, is the product of the principal, P, the rate, r, and the time, t. In our work here, we will calculate the interest earned in one year, so t will be 1.

We modify the column titles in the mixture table to show the formula for interest, as you'll see in the next example.

Translate to a system of equations and solve:

Adnan has $40,000 to invest and hopes to earn 7.1 interest per year. He will put some of the money into a stock fund that earns 8% per year and the rest into bonds that earns 3% per year. How much money should he put into each fund?

Answer

Step 1. Read the problem.	A chart will help us organize the information.
Step 2. Identify what we are looking for.	We are looking for the amount to invest in each fund.
Step 3. Name what we are looking for.	Let $s =$ the amount invested in stocks. $b =$ the amount invested in stocks
Write the interest rate as a decimal for each fund. Multiply: Principal · Rate · Time	

Account	Principal •	Rate	• Time =	Interest
Stock fund	s	0.08	1	$0.08s$
Bonds	b	0.03	1	$0.03b$
Total	40,000	0.071		0.071(40,000)

Step 4. Translate into a system of equations. We get our system of equations from the Principal column and the Interest column.	$\begin{cases} s+b=40{,}000 \\ 0.08s+0.03b=0.071(40{,}000) \end{cases}$
Step 5. Solve the system of equations by elimination. Multiply the top equation by -0.03.	$\begin{cases} -0.03(s+b)=-0.03(40{,}000) \\ 0.08s+0.03b=2{,}840 \end{cases}$
Simplify and add to solve for s.	$\begin{cases} -0.03s-0.03b=-1{,}200 \\ 0.08s+0.03b=2{,}840 \end{cases}$ $0.05s=1{,}640$ $s=32{,}800$
To find b, substitute $s = 32{,}800$ into the first equation.	$s+b=40{,}000$ $32{,}800+b=40{,}000$ $b=7{,}200$
Step 6. Check the answer in the problem.	We leave the check to you.
Step 7. Answer the question.	Adnan should invest \$32,800 in stock and \$7,200 in bonds.

Did you notice that the Principal column represents the total amount of money invested while the Interest column represents only the interest earned? Likewise, the first equation in our system, $s+b=40,000$, represents the total amount of money invested and the second equation, $0.08s+0.03b=0.071(40,000)$represents the interest earned.

Example 21.4.14

Translate to a system of equations and solve:

Leon had \$50,000 to invest and hopes to earn 6.2 interest per year. He will put some of the money into a stock fund that earns 7% per year and the rest in to a savings account that earns 2% per year. How much money should he put into each fund?

Answer

\$42,000 in the stock fund and \$8000 in the savings account

Example 21.4.15

Translate to a system of equations and solve:

Julius invested \$7000 into two stock investments. One stock paid 11% interest and the other stock paid 13% interest. He earned 12.5 interest on the total investment. How much money did he put in each stock?

Answer

\$1750 at 11% and \$5250 at 13%

The next example requires that we find the principal given the amount of interest earned.

Example 21.4.16

Translate to a system of equations and solve:

Rosie owes \$21,540 on her two student loans. The interest rate on her bank loan is 10.5 and the interest rate on the federal loan is 5.9. The total amount of interest she paid last year was $\$1,669.68$ What was the principal for each loan?

Answer

Step 1. Read the problem.	A chart will help us organize the information.
Step 2. Identify what we are looking for.	We are looking for the principal of each loan.
Step 3. Name what we are looking for.	Let $b =$ the principal for the bank loan. $f =$ the principal on the federal loan
The total loans are $21,540.	
Record the interest rates as decimals in the chart. Multiply using the formula $I = Prt$ to get the Interest.	

Account	Principal	• Rate	• Time	= Interest
Bank	b	0.105	1	$0.105b$
Federal	f	0.059	1	$0.059f$
Total	21,540			1669.68

Step 4. Translate into a system of equations. The system of equations comes from the Principal column and the Interest column.	$b + f = 21{,}540$ $0.105b + 0.059f = 1669.68$
Step 5. Solve the system of equations We will use substitution to solve. Solve the first equation for b.	$b + f = 21{,}540$ $b = -f + 21{,}540$
	$0.105b + 0.059f = 1669.68$
Substitute $b = -f + 21.540$ into the second equation.	$0.105(-f + 21{,}540) + 0.059f = 1669.68$ $-0.105f + 2261.70 + 0.059f = 1669.68$
Simplify and solve for f.	$-0.046f + 2261.70 = 1669.68$ $-0.046f = -592.02$ $f = 12{,}870$
To find b, substitute $f = 12{,}870$ into the first equation.	$b + f = 21{,}540$ $b + 12{,}870 = 21{,}540$ $b = 8{,}670$
Step 6. Check the answer in the problem.	We leave the check to you.
Step 7. Answer the question.	The principal of the federal loan was $12,870 and the principal for the bank loan was $8,670.

Example 21.4.17

Translate to a system of equations and solve:

Laura owes $18,000 on her student loans. The interest rate on the bank loan is 2.5% and the interest rate on the federal loan is 6.9%. The total amount of interest she paid last year was $1,066. What was the principal for each loan?

Answer

Bank $4,000; Federal $14,000

Example 21.4.18

Translate to a system of equations and solve:

Jill's Sandwich Shoppe owes $65,200 on two business loans, one at 4.5% interest and the other at 7.2% interest. The total amount of interest owed last year was $3,582. What was the principal for each loan?

Answer

$41,200 at 4.5%, $24,000 at 7.2%

Solve applications of cost and revenue functions

Suppose a company makes and sells *x* units of a product. The cost to the company is the total costs to produce *x* units. This is the cost to manufacture for each unit times *x*, the number of units manufactured, plus the fixed costs.

The **revenue** is the money the company brings in as a result of selling *x* units. This is the selling price of each unit times the number of units sold.

When the costs equal the revenue we say the business has reached the **break-even point**.

COST AND REVENUE FUNCTIONS

The **cost function** is the cost to manufacture each unit times *x*, the number of units manufactured, plus the fixed costs.

$$C(x) = (\text{cost per unit}) \cdot x + \text{fixed costs}$$

The **revenue** function is the selling price of each unit times *x*, the number of units sold.

$$R(x) = (\text{selling price per unit}) \cdot x$$

The **break-even point** is when the revenue equals the costs.

$$C(x) = R(x)$$

Example 21.4.19

The manufacturer of a weight training bench spends $105 to build each bench and sells them for $245. The manufacturer also has fixed costs each month of $7,000.

ⓐ Find the cost function *C* when *x* benches are manufactured.

ⓑ Find the revenue function *R* when *x* benches are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ The manufacturer has $7,000 of fixed costs no matter how many weight training benches it produces. In addition to the fixed costs, the manufacturer also spends $105 to produce each bench. Suppose *x* benches are sold.

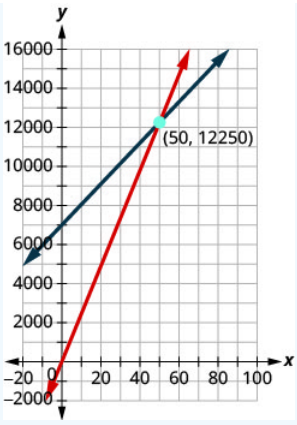
Write the general Cost function formula.	$C(x) = (\text{cost per unit}) \cdot x + \text{fixed costs}$
Substitute in the cost values.	$C(x) = 105x + 7000$

ⓑ The manufacturer sells each weight training bench for $245. We get the total revenue by multiplying the revenue per unit times the number of units sold.

Write the general Revenue function.	$C(x) = (\text{selling price per unit}) \cdot x$
Substitute in the revenue per unit.	$R(x) = 245x$

ⓒ Essentially we have a system of linear equations. We will show the graph of the system as this helps make the idea of a break-even point more visual.

$$\begin{cases} C(x) = 105x + 7000 \\ R(x) = 245x \end{cases} \quad \text{or} \quad \begin{cases} y = 105x + 7000 \\ y = 245x \end{cases}$$



ⓓ To find the actual value, we remember the break-even point occurs when costs equal revenue.

Write the break-even formula. $C(x) = R(x)$

Solve.
$$105x + 7000 = 245x$$
$$7000 = 140x$$
$$50 = x$$

When 50 benches are sold, the costs equal the revenue.

$C(x) = 105x + 7000$	$R(x) = 245x$
$C(50) = 105(50) + 7000$	$R(50) = 245 \cdot 50$
$C(50) = 12{,}250$	$R(50) = 12{,}250$

When 50 benches are sold, the revenue and costs are both $12,250. Notice this corresponds to the ordered pair $(50, 12250)$.

Example 21.4.20

The manufacturer of a weight training bench spends $15 to build each bench and sells them for $32. The manufacturer also has fixed costs each month of $25,500.

ⓐ Find the cost function C when x benches are manufactured.

ⓑ Find the revenue function R when x benches are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

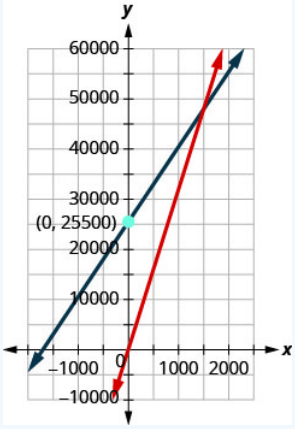
ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ $C(x) = 15x + 25,500$

ⓑ $R(x) = 32x$

ⓒ



ⓓ 1,5001,500; when 1,500 benches are sold, the cost and revenue will be both 48,000

Example 21.4.21

The manufacturer of a weight training bench spends $120 to build each bench and sells them for $170. The manufacturer also has fixed costs each month of $150,000.

ⓐ Find the cost function C when x benches are manufactured.

ⓑ Find the revenue function R when x benches are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

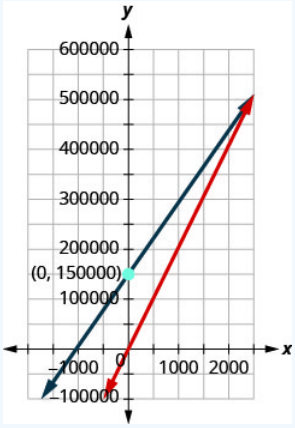
ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ $C(x) = 120x + 150,000$

ⓑ $R(x) = 170x$

ⓒ



ⓓ $3,000$; when 3,000 benches are sold, the revenue and costs are both $510,000

Access this online resource for additional instruction and practice with interest and mixtures.

- Interest and Mixtures

Key Concepts

- **Cost function:** The cost function is the cost to manufacture each unit times *x*, the number of units manufactured, plus the fixed costs.

  $C(x) = (\text{cost per unit}) \cdot x + \text{fixed costs}$

- **Revenue:** The revenue function is the selling price of each unit times *x*, the number of units sold.

  $R(x) = (\text{selling price per unit}) \cdot x$

- **Break-even point:** The break-even point is when the revenue equals the costs.

  $C(x) = R(x)$

Glossary

cost function

The cost function is the cost to manufacture each unit times xx, the number of units manufactured, plus the fixed costs; $C(x)$ = (cost per unit)x + fixed costs.

revenue

The revenue is the selling price of each unit times *x*, the number of units sold; $R(x)$ = (selling price per unit)x.

break-even point

The point at which the revenue equals the costs is the break-even point; C(x)=R(x).

21.4E: Exercises

Practice Makes Perfect

Solve Mixture Applications

In the following exercises, translate to a system of equations and solve.

1. Tickets to a Broadway show cost $35 for adults and $15 for children. The total receipts for 1650 tickets at one performance were $47,150. How many adult and how many child tickets were sold?

2. Tickets for the Cirque du Soleil show are $70 for adults and $50 for children. One evening performance had a total of 300 tickets sold and the receipts totaled $17,200. How many adult and how many child tickets were sold?

Answer

110 adult tickets, 190 child tickets

3. Tickets for an Amtrak train cost $10 for children and $22 for adults. Josie paid $1200 for a total of 72 tickets. How many children tickets and how many adult tickets did Josie buy?

4. Tickets for a Minnesota Twins baseball game are $69 for Main Level seats and $39 for Terrace Level seats. A group of sixteen friends went to the game and spent a total of $804 for the tickets. How many of Main Level and how many Terrace Level tickets did they buy?

Answer

6 good seats, 10 cheap seats

5. Tickets for a dance recital cost $15 for adults and $7 dollars for children. The dance company sold 253 tickets and the total receipts were $2771. How many adult tickets and how many child tickets were sold?

6. Tickets for the community fair cost $12 for adults and $5 dollars for children. On the first day of the fair, 312 tickets were sold for a total of $2204. How many adult tickets and how many child tickets were sold?

Answer

92 adult tickets, 220 children tickets

7. Brandon has a cup of quarters and dimes with a total value of $\$3.80$. The number of quarters is four less than twice the number of quarters. How many quarters and how many dimes does Brandon have?

8. Sherri saves nickels and dimes in a coin purse for her daughter. The total value of the coins in the purse is $\$0.95$. The number of nickels is two less than five times the number of dimes. How many nickels and how many dimes are in the coin purse?

Answer

13 nickels, 3 dimes

9. Peter has been saving his loose change for several days. When he counted his quarters and nickels, he found they had a total value $\$13.10$. The number of quarters was fifteen more than three times the number of dimes. How many quarters and how many dimes did Peter have?

10. Lucinda had a pocketful of dimes and quarters with a value of $6.20. The number of dimes is eighteen more than three times the number of quarters. How many dimes and how many quarters does Lucinda have?

Answer

42 dimes, 8 quarters

11. A cashier has 30 bills, all of which are $10 or $20 bills. The total value of the money is $460. How many of each type of bill does the cashier have?

12. A cashier has 54 bills, all of which are $10 or $20 bills. The total value of the money is $910. How many of each type of bill does the cashier have?

Answer

17 $10 bills, 37 $20 bills

13. Marissa wants to blend candy selling for $1.80 per pound with candy costing $1.20 per pound to get a mixture that costs her $1.40 per pound to make. She wants to make 90 pounds of the candy blend. How many pounds of each type of candy should she use?

14. How many pounds of nuts selling for $6 per pound and raisins selling for $3 per pound should Kurt combine to obtain 120 pounds of trail mix that cost him $5 per pound?

Answer

80 pounds nuts and 40 pounds raisins

15. Hannah has to make twenty-five gallons of punch for a potluck. The punch is made of soda and fruit drink. The cost of the soda is $1.79 per gallon and the cost of the fruit drink is $2.49 per gallon. Hannah's budget requires that the punch cost $2.21 per gallon. How many gallons of soda and how many gallons of fruit drink does she need?

16. Joseph would like to make twelve pounds of a coffee blend at a cost of $6 per pound. He blends Ground Chicory at $5 a pound with Jamaican Blue Mountain at $9 per pound. How much of each type of coffee should he use?

Answer

9 pounds of Chicory coffee, 3 pounds of Jamaican Blue Mountain coffee

17. Julia and her husband own a coffee shop. They experimented with mixing a City Roast Columbian coffee that cost $7.80 per pound with French Roast Columbian coffee that cost $8.10 per pound to make a twenty-pound blend. Their blend should cost them $7.92 per pound. How much of each type of coffee should they buy?

18. Twelve-year old Melody wants to sell bags of mixed candy at her lemonade stand. She will mix M&M's that cost $4.89 per bag and Reese's Pieces that cost $3.79 per bag to get a total of twenty-five bags of mixed candy. Melody wants the bags of mixed candy to cost her $4.23 a bag to make. How many bags of M&M's and how many bags of Reese's Pieces should she use?

Answer

10 bags of M&M's, 15 bags of Reese's Pieces

19. Jotham needs 70 liters of a 50% solution of an alcohol solution. He has a 30% and an 80% solution available. How many liters of the 30% and how many liters of the 80% solutions should he mix to make the 50% solution?

20. Joy is preparing 15 liters of a 25% saline solution. She only has 40% and 10% solution in her lab. How many liters of the 40% and how many liters of the 10% should she mix to make the 25% solution?

Answer

7.5 liters of each solution

21. A scientist needs 65 liters of a 15% alcohol solution. She has available a 25% and a 12% solution. How many liters of the 25% and how many liters of the 12% solutions should she mix to make the 15% solution?

22. A scientist needs 120 milliliters of a 20% acid solution for an experiment. The lab has available a 25% and a 10% solution. How many liters of the 25% and how many liters of the 10% solutions should the scientist mix to make the 20% solution?

Answer

80 liters of the 25% solution and 40 liters of the 10% solution

23. A 40% antifreeze solution is to be mixed with a 70% antifreeze solution to get 240 liters of a 50% solution. How many liters of the 40% and how many liters of the 70% solutions will be used?

24. A 90% antifreeze solution is to be mixed with a 75% antifreeze solution to get 360 liters of an 85% solution. How many liters of the 90% and how many liters of the 75% solutions will be used?

Answer

240 liters of the 90% solution and 120 liters of the 75% solution

Solve Interest Applications

In the following exercises, translate to a system of equations and solve.

25. Hattie had $3000 to invest and wants to earn 10.6% interest per year. She will put some of the money into an account that earns 12% per year and the rest into an account that earns 10% per year. How much money should she put into each account?

26. Carol invested $2560 into two accounts. One account paid 8% interest and the other paid 6% interest. She earned 7.25% interest on the total investment. How much money did she put in each account?

Answer

$1600 at 8%, 960 at 6%

27. Sam invested $48,000, some at 6% interest and the rest at 10%. How much did he invest at each rate if he received $4000 in interest in one year?

28. Arnold invested $64,000, some at 5.5% interest and the rest at 9%. How much did he invest at each rate if he received $4500 in interest in one year?

Answer

$28,000 at 9%, $36,000 at 5.5%

29. After four years in college, Josie owes $65, 800 in student loans. The interest rate on the federal loans is 4.5% and the rate on the private bank loans is 2%. The total interest she owes for one year was $2878.50 What is the amount of each loan?

30. Mark wants to invest $10,000 to pay for his daughter's wedding next year. He will invest some of the money in a short term CD that pays 12% interest and the rest in a money market savings account that pays 5% interest. How much should he

invest at each rate if he wants to earn $1095 in interest in one year?

Answer

$8500 CD, $1500 savings account

31. A trust fund worth $25,000 is invested in two different portfolios. This year, one portfolio is expected to earn 5.25% interest and the other is expected to earn 4%. Plans are for the total interest on the fund to be $1150 in one year. How much money should be invested at each rate?

32. A business has two loans totaling $85,000. One loan has a rate of 6% and the other has a rate of 4.5% This year, the business expects to pay $4,650 in interest on the two loans. How much is each loan?

Answer

$55,000 on loan at 6% and $30,000 on loan at 4.5%

Solve Applications of Cost and Revenue Functions

33. The manufacturer of an energy drink spends $1.20 to make each drink and sells them for $2. The manufacturer also has fixed costs each month of $8,000.

ⓐ Find the cost function C when x energy drinks are manufactured.

ⓑ Find the revenue function R when x drinks are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

ⓓ Find the break-even point. Interpret what the break-even point means.

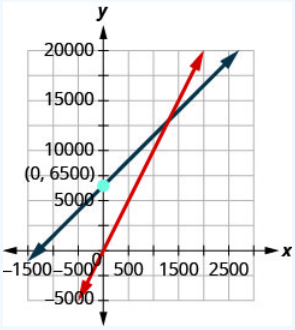
34. The manufacturer of a water bottle spends $5 to build each bottle and sells them for $10. The manufacturer also has fixed costs each month of $6500. ⓐ Find the cost function C when x bottles are manufactured. ⓑ Find the revenue function R when x bottles are sold. ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid. ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ $C(x) = 5x + 6500$

ⓑ $R(x) = 10x$

ⓒ



ⓓ 1,500; when 1,500 water bottles are sold, the cost and the revenue equal $15,000

Writing Exercises

35. Take a handful of two types of coins, and write a problem similar to Example relating the total number of coins and their total value. Set up a system of equations to describe your situation and then solve it.

36. In Example, we used elimination to solve the system of equations
$\begin{cases} s+b=40,000 \\ 0.08s+0.03b=0.071(40,000). \end{cases}$
Could you have used substitution or elimination to solve this system? Why?

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve mixture applications.			
solve interest applications.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

21.5: Solve Systems of Equations with Three Variables

Learning Objectives

By the end of this section, you will be able to:

- Determine whether an ordered triple is a solution of a system of three linear equations with three variables
- Solve a system of linear equations with three variables
- Solve applications using systems of linear equations with three variables

Before you get started, take this readiness quiz.

1. Evaluate $5x-2y+3z$ when $x=-2, y=-4$, and $z=3$.
   If you missed this problem, review [link].
2. Classify the equations as a conditional equation, an identity, or a contradiction and then state the solution.
   $\begin{cases} -2x+y=-11 \\ x+3y=9 \end{cases}$
   If you missed this problem, review [link].
3. Classify the equations as a conditional equation, an identity, or a contradiction and then state the solution. $\begin{cases} 7x+8y=4 \\ 3x-5y=27 \end{cases}$
   If you missed this problem, review [link].

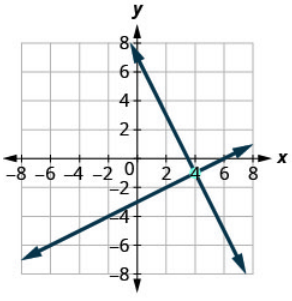
Determine Whether an Ordered Triple is a Solution of a System of Three Linear Equations with Three Variables

In this section, we will extend our work of solving a system of linear equations. So far we have worked with **systems of equations** with two equations and two variables. Now we will work with systems of three equations with three variables. But first let's review what we already know about solving equations and systems involving up to two variables.

We learned earlier that the graph of a **linear equation**, $ax+by=c$, is a line. Each point on the line, an ordered pair (x,y), is a solution to the equation. For a system of two equations with two variables, we graph two lines. Then we can see that all the points that are solutions to each equation form a line. And, by finding what the lines have in common, we'll find the solution to the system.

Most linear equations in one variable have one solution, but we saw that some equations, called contradictions, have no solutions and for other equations, called identities, all numbers are solutions

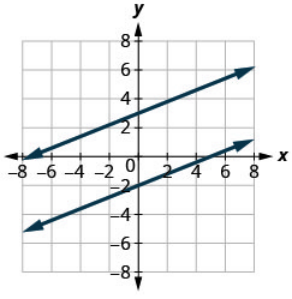
We know when we solve a system of two linear equations represented by a graph of two lines in the same plane, there are three possible cases, as shown.



One solution

The lines intersect.
Intersecting lines have one point in common.
There is one solution to this system.

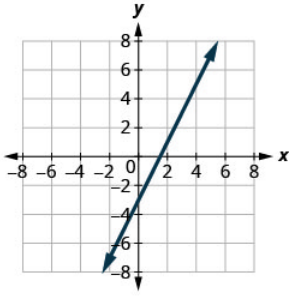
Consistent
Independent



No solution

The lines are parallel.
Parallel lines have no points in common.
There is no solution to this system.

Inconsistent



Infinitely many solutions

Both equations give the same line.
Because we have just one line, there are infinitely many solutions.

Consistent
Dependent

Similarly, for a linear equation with three variables ax+by+cz=d,ax+by+cz=d, every solution to the equation is an ordered triple, (x,y,z)(x,y,z)that makes the equation true.

LINEAR EQUATION IN THREE VARIABLES

A linear equation with three variables, where a, b, c, and d are real numbers and a, b, and c are not all 0, is of the form

$$ax + by + cz = d$$

Every solution to the equation is an ordered triple, (x, y, z) that makes the equation true.

All the points that are solutions to one equation form a plane in three-dimensional space. And, by finding what the planes have in common, we'll find the solution to the system.

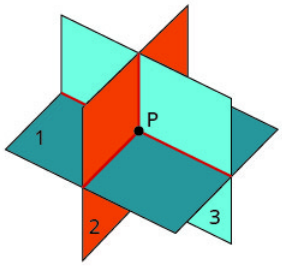
When we solve a system of three linear equations represented by a graph of three planes in space, there are three possible cases.

One solution

Consistent system and Independent equations

The 3 planes intersect.

The three intersecting planes have one point in common.

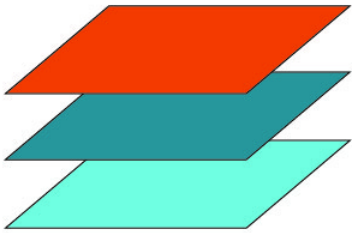


No solution

Inconsistent system

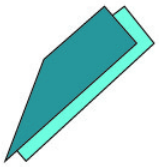
The planes are parallel.

Parallel planes have no points in common.



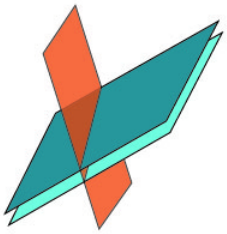
Two planes are coincident and parallel to the third plane.

The planes have no points in common.



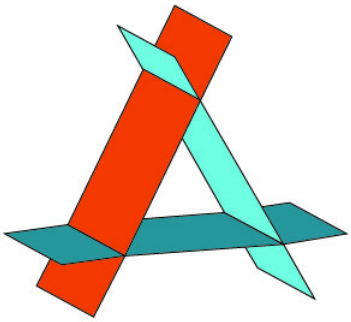
Two planes are parallel and each intersect the third plane.

The planes have no points in common.



Each plane intersects the other two, but all three share no points.

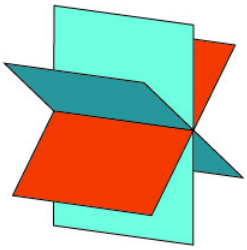
The planes have no points in common.



Infinitely many solutions
Consistent system and dependent equations

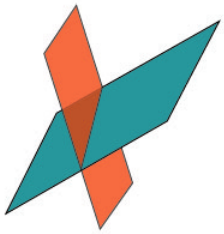
Three planes intersect in one line.

There is just one line, so there are infinitely many solutions.



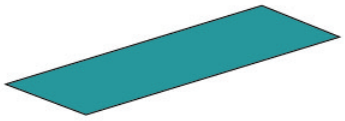
Two planes are coincident and intersect the third plane in a line.

There is just one line, so there are infinitely many solutions.



Three planes are coincident.

There is just one plane, so there are infinitely many solutions.



To solve a system of three linear equations, we want to find the values of the variables that are solutions to all three equations. In other words, we are looking for the ordered triple (x, y, z) that makes all three equations true. These are called the **solutions of the system of three linear equations with three variables**.

SolutionS OF A SYSTEM OF LINEAR EQUATIONS WITH THREE VARIABLES

Solutions of a system of equations are the values of the variables that make all the equations true. A solution is represented by an **ordered triple** (x, y, z).

To determine if an ordered triple is a solution to a system of three equations, we substitute the values of the variables into each equation. If the ordered triple makes all three equations true, it is a solution to the system.

Example 21.5.1

Determine whether the ordered triple is a solution to the system: $\begin{cases} x-y+z=2 \\ 2x-y-z=-6 \\ 2x+2y+z=-3 \end{cases}$

ⓐ $(-2,-1,3)$ ⓑ $(-4,-3,4)$

Answer

ⓐ

$$\begin{cases} x-y+z=2 \\ 2x-y-z=-6 \\ 2x+2y+z=-3 \end{cases}$$

We substitute $x=-2$ and $y=-1$ and $z=3$ into all three equations.

$x-y+z=2$	$2x-y-z=-6$	$2x+2y+z=-3$
$-2-(-1)+3 \stackrel{?}{=} 2$	$2\cdot(-2)-(-1)-3 \stackrel{?}{=} -6$	$2\cdot(-2)+2(-1)+3 \stackrel{?}{=} -3$
$2=2$ ✓	$-6=-6$ ✓	$-3=-3$ ✓
(–2, –1, 3) does make all three equations true.		(–2, –1, 3) is a solution.

ⓑ

$$\begin{cases} x - y + z = 2 \\ 2x - y - z = -6 \\ 2x + 2y + z = -3 \end{cases}$$

We substitute $x = -4$ and $y = -3$ and $z = 4$ into all three equations.

$x - y + z = 2$	$2x - y - z = -6$	$2x + 2y + z = -3$
$-4 - (-3) + 4 \stackrel{?}{=} 2$	$2 \cdot (-4) - (-3) - 4 \stackrel{?}{=} -6$	$2 \cdot (-4) + 2(-3) + 4 \stackrel{?}{=} -3$
$3 \neq 2$	$-9 \neq -6$	$-10 \neq -3$
$(-4, -3, 4)$ does not make all three equations true.		$(-4, -3, 4)$ is not a solution.

Example 21.5.2

Determine whether the ordered triple is a solution to the system: $\begin{cases} 3x + y + z = 2 \\ x + 2y + z = -3 \\ 3x + y + 2z = 4 \end{cases}$

ⓐ $(1, -3, 2)$ ⓑ $(4, -1, -5)$

Answer

ⓐ yes ⓑ no

Example 21.5.3

Determine whether the ordered triple is a solution to the system: $\begin{cases} x - 3y + z = -5 \\ -3x - y - z = 1 \\ 2x - 2y + 3z = 1 \end{cases}$

ⓐ $(2, -2, 3)$ ⓑ $(-2, 2, 3)$

Answer

ⓐ no ⓑ yes

Solve a System of Linear Equations with Three Variables

To solve a system of linear equations with three variables, we basically use the same techniques we used with systems that had two variables. We start with two pairs of equations and in each pair we eliminate the same variable. This will then give us a system of equations with only two variables and then we know how to solve that system!

Next, we use the values of the two variables we just found to go back to the original equation and find the third variable. We write our answer as an ordered triple and then check our results.

Example 21.5.4: How to Solve a System of Equations With Three Variables by Elimination

Solve the system by elimination: $\begin{cases} x - 2y + z = 3 \\ 2x + y + z = 4 \\ 3x + 4y + 3z = -1 \end{cases}$

Answer

Step 1. Write the equations in standard form. • If any coefficients are fractions, clear them.	The equations are in standard form. There are no fractions.	$\begin{cases} x-2y+z=3 & (1)\\ 2x+y+z=4 & (2)\\ 3x+4y+3z=-1 & (3)\end{cases}$
Step 2. Eliminate the same variable from two equations. • Decide which variable you will eliminate. • Work with a pair of equations to eliminate the chosen variable. • Multiply one or both equations so that the coefficients of that variable are opposites. • Add the equations to eliminate one variable.	We can eliminate the y's from equations (1) and (2) by multiplying equation (2) by 2. Multiply. We add the x's, y's, and constants. The new equation, (4), has only x and z.	$x-2y+z=3 \quad (1)$ $2(2x+y+z)=(4)2 \quad (2)$ $x-2y+z=3 \quad (1)$ $4x+2y+2z=8 \quad (2)$ $x-2y+z=3 \quad (1)$ $4x+2y+2z=8 \quad (2)$ $5x+3z=11 \quad (4)$
Step 3. Repeat Step 2 using two other equations and eliminate the same variable as in Step 2.	We can again eliminate the y's using the equations (1) and (3) by multiplying equation (1) by 2. Add the new equations and the result will be equation (5).	$2(x-2y+z)=(3)2 \quad (1)$ $3x+4y+3z=-1 \quad (3)$ $2x-4y+2z=6 \quad (1)$ $3x+4y+3z=-1 \quad (3)$ $5x+5z=5 \quad (5)$
Step 4. The two new equations form a system of two equations with two variables. Solve this system.	Use equations (4) and (5) to eliminate either x or z. Multiply (5) by -1. Use either (4) or (5) to solve for x using substitution.	$\begin{cases} 5x+3z=11 & (4)\\ 5x+5z=5 & (5)\end{cases}$ $5x+3z=11 \quad (4)$ $-1(5x+5z)=5(-1) \quad (5)$ $5x+3z=11 \quad (4)$ $-5x-5z=-5 \quad (5)$ $-2z=6$ $z=-3$ $5x+3z=11 \quad (4)$ $5x+3(-3)=11$ $5x-9=11$ $5x=20$ $x=4$
Step 5. Use the values of the two variables found in Step 4 to find the third variable.	Use an original equation to find y.	$2x+y+z=4 \quad (2)$ $2\cdot 4+y+z=4$ $8+y-3=4$ $y=-1$
Step 6. Write the solution as an ordered triple.	Write it as (x, y, z).	$(4, -1, -3)$
Step 7. Check that the ordered triple is a solution to **all three** original equations.	Substitute $x=4$, $y=-1$ and $z=-3$ into all three equations. Do they make the equations true?	We'll leave the checks to you. The solution is $(4, -1, -3)$.

Example 21.5.5

Solve the system by elimination: $\begin{cases} 3x+y-z=2 \\ 2x-3y-2z=1 \\ 4x-y-3z=0 \end{cases}$

Answer

$(2,-1,3)$

Example 21.5.6

Solve the system by elimination: $\begin{cases} 4x+y+z=-1 \\ -2x-2y+z=2 \\ 2x+3y-z=1 \end{cases}$

Answer

$(-2,3,4)$

The steps are summarized here.

SOLVE A SYSTEM OF LINEAR EQUATIONS WITH THREE VARIABLES.

1. Write the equations in standard form
   - If any coefficients are fractions, clear them.
2. Eliminate the same variable from two equations.
   - Decide which variable you will eliminate.
   - Work with a pair of equations to eliminate the chosen variable.
   - Multiply one or both equations so that the coefficients of that variable are opposites.
   - Add the equations resulting from Step 2 to eliminate one variable
3. Repeat Step 2 using two other equations and eliminate the same variable as in Step 2.
4. The two new equations form a system of two equations with two variables. Solve this system.
5. Use the values of the two variables found in Step 4 to find the third variable.
6. Write the solution as an ordered triple.
7. Check that the ordered triple is a solution to **all three** original equations.

Example 21.5.7

Solve: $\begin{cases} 3x-4z=0 \\ 3y+2z=-3 \\ 2x+3y=-5 \end{cases}$

Answer

$$\begin{cases} 3x-4z=0 & (1) \\ 3y+2z=-3 & (2) \\ 2x+3y=-5 & (3) \end{cases}$$

We can eliminate z from equations (1) and (2) by multiplying equation (2) by 2 and then adding the resulting equations.

$$\begin{array}{rl} 3x & -4z=0 \quad (1) \\ 3y+2z= & -3 \quad (2) \end{array} \rightarrow \begin{array}{rl} 3x & -4z=0 \\ 2(3y+2z)= & (-3)2 \end{array} \rightarrow \begin{array}{rl} 3x & -4z=0 \\ 6y+4z= & -6 \\ \hline 3x+6y & =-6 \quad (4) \end{array}$$

Notice that equations (3) and (4) both have the variables x and y. We will solve this new system for x and y.

$$\begin{array}{l} 2x+3y=-5 \quad (3) \\ 3x+6y=-6 \quad (4) \end{array} \longrightarrow \begin{array}{l} -2(2x+3y)=-2(-5) \\ 3x+6y=-6 \end{array} \longrightarrow \begin{array}{r} -4x-6y=10 \\ 3x+6y=-6 \\ \hline -x \quad = \quad 4 \\ x=-4 \end{array}$$

To solve for y, we substitute $x=-4$ into equation (3).

$$\begin{array}{r} 2x+3y=-5 \quad (3) \\ 2(-4)+3y=-5 \\ -8+3y=-5 \\ 3y=3 \\ y=1 \end{array}$$

We now have $x=-4$ and $y=1$. We need to solve for z. We can substitute $x=-4$ into equation (1) to find z.

$$\begin{array}{r} 3x-4z=0 \quad (1) \\ 3(-4)-4z=0 \\ -12-4z=0 \\ -4z=12 \\ z=-3 \end{array}$$

We write the solution as an ordered triple. $(-4,1,-3)$

We check that the solution makes all three equations true.

$$\begin{array}{lll} 3x-4z=0\ (1) & 3y+2z=-3\ (2) & 2x+3y=-5\ (3) \\ 3(-4)-4(-3)\stackrel{?}{=}0 & 3(1)+2(-3)\stackrel{?}{=}-3 & 2(-4)+3(1)\stackrel{?}{=}-5 \\ 0=0\checkmark & -3=-3\checkmark & -5=-5\checkmark \\ & & \text{The solution is } (-4,1,-3) \end{array}$$

Example 21.5.8

Solve: $\begin{cases} 3x-4z=-1 \\ 2y+3z=2 \\ 2x+3y=6 \end{cases}$

Answer

$(-3,4,-2)$

Example 21.5.9

Solve: $\begin{cases} 4x-3z=-5 \\ 3y+2z=7 \\ 3x+4y=6 \end{cases}$

Answer

$(-2,3,-1)$

When we solve a system and end up with no variables and a false statement, we know there are no solutions and that the system is inconsistent. The next example shows a system of equations that is inconsistent.

Example 21.5.10

Solve the system of equations: $\begin{cases} x+2y-3z=-1 \\ x-3y+z=1 \\ 2x-y-2z=2 \end{cases}$

Answer

$$\begin{cases} x+2y-3z=-1 & (1) \\ x-3y+z=1 & (2) \\ 2x-y-2z=2 & (3) \end{cases}$$

Use equation (1) and (2) to eliminate z.

$$\begin{array}{l} x+2y-3z=-1 \quad (1) \\ x-3y+\ z=\ 1 \quad (2) \end{array} \xrightarrow{\text{multiply by 3}} \begin{array}{r} x+2y-3z=-1 \\ 3x-9y+3z=\ 3 \\ \hline 4x-7y\ \ =\ 2 \quad (4) \end{array}$$

Use (2) and (3) to eliminate z again.

$$\begin{array}{l} x-3y+\ z=1 \quad (2) \\ 2x-\ y-2z=2 \quad (3) \end{array} \xrightarrow{\text{multiply by 2}} \begin{array}{r} 2x-6y+2z=2 \\ 2x-\ y-2z=2 \\ \hline 4x-7y\ \ =4 \quad (5) \end{array}$$

Use (4) and (5) to eliminate a variable.

$$\begin{array}{l} 4x-7y=2 \quad (4) \\ 4x-7y=4 \quad (5) \end{array} \xrightarrow{\text{multiply by } -1} \begin{array}{r} 4x-7y=2 \\ -4x+7y=-4 \\ \hline 0=-2\ \textit{false} \end{array}$$

There is no solution.

We are left with a false statement and this tells us the system is inconsistent and has no solution.

Example 21.5.11

Solve the system of equations: $\begin{cases} x+2y+6z=5 \\ -x+y-2z=3 \\ x-4y-2z=1 \end{cases}$

Answer

no solution

Example 21.5.12

Solve the system of equations: $\begin{cases} 2x-2y+3z=6 \\ 4x-3y+2z=0 \\ -2x+3y-7z=1 \end{cases}$

Answer

no solution

When we solve a system and end up with no variables but a true statement, we know there are infinitely many solutions. The system is consistent with dependent equations. Our solution will show how two of the variables depend on the third.

Example 21.5.13

Solve the system of equations: $\begin{cases} x+2y-z=1 \\ 2x+7y+4z=11 \\ x+3y+z=4 \end{cases}$

Answer

$$\begin{cases} x+2y-z=1 & (1) \\ 2x+7y+4z=11 & (2) \\ x+3y+z=4 & (3) \end{cases}$$

Use equation (1) and (3) to eliminate x.

$$\begin{array}{rl} x+2y-z=1 & (1) \\ x+3y+z=4 & (3) \end{array} \xrightarrow{\text{multiply by } -1} \begin{array}{rl} -x-2y+z=-1 & (1) \\ x+3y+z=4 & (3) \\ \hline y+2z=3 & (4) \end{array}$$

Use equation (1) and (2) to eliminate x again.

$$\begin{array}{rl} x+2y-z=1 & (1) \\ 2x+7y+4z=11 & (2) \end{array} \xrightarrow{\text{multiply by } -2} \begin{array}{rl} -2x-4y+2z=-2 & (1) \\ 2x+7y+4z=11 & (2) \\ \hline 3y+6z=9 & (5) \end{array}$$

Use equation (4) and (5) to eliminate y.

$$\begin{array}{rl} y+2z=3 & (4) \\ 3y+6z=9 & (5) \end{array} \xrightarrow{\text{multiply by } -3} \begin{array}{rl} -3y-6z=-9 & (4) \\ 3y+6z=9 & (5) \\ \hline 0=0 & \end{array}$$

	There are infinitely many solutions.
Solve equation (4) for y.	Represent the solution showing how x and y are dependent on z. $y+2z=3$ $y=-2z+3$
Use equation (1) to solve for x.	$x+2y-z=1$
Substitute $y=-2z+3$.	$x+2(-2z+3)-z=1$ $x-4z+6-z=1$ $x-5z+6=1$ $x=5z-5$

The true statement $0=0$ tells us that this is a dependent system that has infinitely many solutions. The solutions are of the form (x,y,z)(x,y,z) where $x=5z-5;\ y=-2z+3$ and z is any real number.

Example 21.5.14

Solve the system by equations: $\begin{cases} x+y-z=0 \\ 2x+4y-2z=6 \\ 3x+6y-3z=9 \end{cases}$

Answer

infinitely many solutions $(x,3,z)$ where $x=z-3;\ y=3;\ z$ is any real number

Example 21.5.15

Solve the system by equations: $\begin{cases} x-y-z=1 \\ -x+2y-3z=-4 \\ 3x-2y-7z=0 \end{cases}$

Answer

infinitely many solutions (x, y, z) where $x=5z-2;\ y=4z-3;\ z$ is any real number

Solve Applications using Systems of Linear Equations with Three Variables

Applications that are modeled by a systems of equations can be solved using the same techniques we used to solve the systems. Many of the application are just extensions to three variables of the types we have solved earlier.

Example 21.5.16

The community college theater department sold three kinds of tickets to its latest play production. The adult tickets sold for \$15, the student tickets for \$10 and the child tickets for \$8. The theater department was thrilled to have sold 250 tickets and brought in \$2,825 in one night. The number of student tickets sold is twice the number of adult tickets sold. How many of each type did the department sell?

Answer

We will use a chart to organize the information.

Type	Number	· Value	= Total Value
adult	x	15	$15x$
student	y	10	$10y$
child	z	8	$8z$
	250		2825

Number of students is twice number of adults.

Rewrite the equation in standard form.

$$y=2x$$
$$2x-y=0$$

Write the system of equations.

$$\begin{cases} x+y+z=250 & (1) \\ 15x+10y+8z=2825 & (2) \\ -2x+y=0 & (3) \end{cases}$$

Use equations (1) and (2) to eliminate z.

$$\begin{array}{rl} x+y+z=250 & (1) \\ 15x+10y+8z=2825 & (2) \end{array} \xrightarrow{\text{Multiply by } -8} \begin{array}{rl} -8x-8y-8z=250 & (1) \\ 15x+10y+8z=2825 & (2) \\ \hline 7x+2y=825 & (4) \end{array}$$

Use (3) and (4) to eliminate y.

$$\begin{array}{rl} -2x+y=0 & (3) \\ 7x+2y=825 & (4) \end{array} \xrightarrow{\text{Multiply by } -2} \begin{array}{rl} 4x-2y=0 & (3) \\ 7x+2y=825 & (4) \\ \hline 11x=825 & \end{array}$$

Solve for x. $x=75$ adult tickets

Use equation (3) to find y. $-2x+y=0$

Substitute $x=75$.

$$-2(75)+y=0$$
$$-150+y=0$$
$$y=150 \text{ student tickets}$$

Use equation (1) to find z. $x+y+z=250$

Substitute in the values $x = 75,\ y = 150$.	$\begin{aligned} 75 + 150 + z &= 250 \\ 225 + z &= 250 \\ z &= 25 \text{ child tickets} \end{aligned}$
Write the solution.	The theater department sold 75 adult tickets, 150 student tickets, and 25 child tickets.

Example 21.5.17

The community college fine arts department sold three kinds of tickets to its latest dance presentation. The adult tickets sold for $20, the student tickets for $12 and the child tickets for $10.The fine arts department was thrilled to have sold 350 tickets and brought in $4,650 in one night. The number of child tickets sold is the same as the number of adult tickets sold. How many of each type did the department sell?

Answer

The fine arts department sold 75 adult tickets, 200 student tickets, and 75 child tickets.

Example 21.5.18

The community college soccer team sold three kinds of tickets to its latest game. The adult tickets sold for $10, the student tickets for $8 and the child tickets for $5. The soccer team was thrilled to have sold 600 tickets and brought in $4,900 for one game. The number of adult tickets is twice the number of child tickets. How many of each type did the soccer team sell?

Answer

The soccer team sold 200 adult tickets, 300 student tickets, and 100 child tickets.

Access this online resource for additional instruction and practice with solving a linear system in three variables with no or infinite solutions.

- Solving a Linear System in Three Variables with No or Infinite Solutions
- 3 Variable Application

Key Concepts

- **Linear Equation in Three Variables:** A linear equation with three variables, where *a*, *b*, *c*, and *d* are real numbers and *a*, *b*,and *c* are not all 0, is of the form

$$ax + by + cz = d$$

  Every solution to the equation is an ordered triple, (x, y, z) that makes the equation true.
- **How to solve a system of linear equations with three variables.**
  1. Write the equations in standard form
     If any coefficients are fractions, clear them.
  2. Eliminate the same variable from two equations.
     Decide which variable you will eliminate.
     Work with a pair of equations to eliminate the chosen variable.
     Multiply one or both equations so that the coefficients of that variable are opposites.
     Add the equations resulting from Step 2 to eliminate one variable
  3. Repeat Step 2 using two other equations and eliminate the same variable as in Step 2.
  4. The two new equations form a system of two equations with two variables. Solve this system.
  5. Use the values of the two variables found in Step 4 to find the third variable.
  6. Write the solution as an ordered triple.

7. Check that the ordered triple is a solution to **all three** original equations.

Glossary

solutions of a system of linear equations with three variables

The solutions of a system of equations are the values of the variables that make all the equations true; a solution is represented by an ordered triple (x,y,z).

21.5E: Exercises

Practice Makes Perfect

Determine Whether an Ordered Triple is a Solution of a System of Three Linear Equations with Three Variables

In the following exercises, determine whether the ordered triple is a solution to the system.

1. $\begin{cases} 2x-6y+z=3 \\ 3x-4y-3z=2 \\ 2x+3y-2z=3 \end{cases}$

ⓐ $(3,1,3)$
ⓑ $(4,3,7)$

2. $\begin{cases} -3x+y+z=-4 \\ -x+2y-2z=1 \\ 2x-y-z=-1 \end{cases}$

ⓐ $(-5,-7,4)$
ⓑ $(5,7,4)$

Answer

ⓐ no ⓑ yes

3. $\begin{cases} y-10z=-8 \\ 2x-y=2 \\ x-5z=3 \end{cases}$

ⓐ $(7,12,2)$
ⓑ $(2,2,1)$

4. $\begin{cases} x+3y-z=1 \\ 5y=\frac{2}{3}x \\ -2x-3y+z=-2 \end{cases}$

ⓐ $(-6,5,12)$
ⓑ $(5,\frac{4}{3},-3)$

Answer

ⓐ no ⓑ yes

Solve a System of Linear Equations with Three Variables

In the following exercises, solve the system of equations.

5. $\begin{cases} 5x+2y+z=5 \\ -3x-y+2z=6 \\ 2x+3y-3z=5 \end{cases}$

6. $\begin{cases} 6x-5y+2z=3 \\ 2x+y-4z=5 \\ 3x-3y+z=-1 \end{cases}$

Answer

$(4, 5, 2)$

7. $\begin{cases} 2x - 5y + 3z = 8 \\ 3x - y + 4z = 7 \\ x + 3y + 2z = -3 \end{cases}$

8. $\begin{cases} 5x - 3y + 2z = -5 \\ 2x - y - z = 4 \\ 3x - 2y + 2z = -7 \end{cases}$

Answer

$(7, 12, -2)$

9. $\begin{cases} 3x - 5y + 4z = 5 \\ 5x + 2y + z = 0 \\ 2x + 3y - 2z = 3 \end{cases}$

10. $\begin{cases} 4x - 3y + z = 7 \\ 2x - 5y - 4z = 3 \\ 3x - 2y - 2z = -7 \end{cases}$

Answer

$(-3, -5, 4)$

11. $\begin{cases} 3x + 8y + 2z = -5 \\ 2x + 5y - 3z = 0 \\ x + 2y - 2z = -1 \end{cases}$

12. $\begin{cases} 11x + 9y + 2z = -9 \\ 7x + 5y + 3z = -7 \\ 4x + 3y + z = -3 \end{cases}$

Answer

$(2, -3, -2)$

13. $\begin{cases} \frac{1}{3}x - y - z = 1 \\ x + \frac{5}{2}y + z = -2 \\ 2x + 2y + \frac{1}{2}z = -4 \end{cases}$

14. $\begin{cases} x + \frac{1}{2}y + \frac{1}{2}z = 0 \\ \frac{1}{5}x - \frac{1}{5}y + z = 0 \\ \frac{1}{3}x - \frac{1}{3}y + 2z = -1 \end{cases}$

Answer

$(6, -9, -3)$

15. $\begin{cases} x+\frac{1}{3}y-2z=-1 \\ \frac{1}{3}x+y+\frac{1}{2}z=0 \\ \frac{1}{2}x+\frac{1}{3}y-\frac{1}{2}z=-1 \end{cases}$

16. $\begin{cases} \frac{1}{3}x-y+\frac{1}{2}z=4 \\ \frac{2}{3}x+\frac{5}{2}y-4z=0 \\ x-\frac{1}{2}y+\frac{3}{2}z=2 \end{cases}$

Answer

$(3,-4,-2)$

17. $\begin{cases} x+2z=0 \\ 4y+3z=-2 \\ 2x-5y=3 \end{cases}$

18. $\begin{cases} 2x+5y=4 \\ 3y-z=\frac{3}{4} \\ x+3z=-3 \end{cases}$

Answer

$(-3,2,3)$

19. $\begin{cases} 2y+3z=-1 \\ 5x+3y=-6 \\ 7x+z=1 \end{cases}$

20. $\begin{cases} 3x-z=-3 \\ 5y+2z=-6 \\ 4x+3y=-8 \end{cases}$

Answer

$(-2,0,-3)$

21. $\begin{cases} 4x-3y+2z=0 \\ -2x+3y-7z=1 \\ 2x-2y+3z=6 \end{cases}$

22. $\begin{cases} x-2y+2z=1 \\ -2x+y-z=2 \\ x-y+z=5 \end{cases}$

Answer

no solution

23. $\begin{cases} 2x+3y+z=1 \\ 2x+y+z=9 \\ 3x+4y+2z=20 \end{cases}$

24. $\begin{cases} x+4y+z=-8 \\ 4x-y+3z=9 \\ 2x+7y+z=0 \end{cases}$

Answer

$x=\frac{203}{16};\ y=-\frac{25}{16};\ z=-\frac{231}{16};$

25. $\begin{cases} x+2y+z=4 \\ x+y-2z=3 \\ -2x-3y+z=-7 \end{cases}$

26. $\begin{cases} x+y-2z=3 \\ -2x-3y+z=-7 \\ x+2y+z=4 \end{cases}$

Answer

(x,y,z) where $x=5z+2;\ y=-3z+1;\ z$ is any real number

27. $\begin{cases} x+y-3z=-1 \\ y-z=0 \\ -x+2y=1 \end{cases}$

28. $\begin{cases} x-2y+3z=1 \\ x+y-3z=7 \\ 3x-4y+5z=7 \end{cases}$

Answer

(x,y,z) where $x=5z-2;\ y=4z-3;\ z$ is any real number

Solve Applications using Systems of Linear Equations with Three Variables

In the following exercises, solve the given problem.

29. The sum of the measures of the angles of a triangle is 180. The sum of the measures of the second and third angles is twice the measure of the first angle. The third angle is twelve more than the second. Find the measures of the three angles.

30. The sum of the measures of the angles of a triangle is 180. The sum of the measures of the second and third angles is three times the measure of the first angle. The third angle is fifteen more than the second. Find the measures of the three angles.

Answer

42, 50, 58

31. After watching a major musical production at the theater, the patrons can purchase souvenirs. If a family purchases 4 t-shirts, the video, and 1 stuffed animal, their total is $135.

A couple buys 2 t-shirts, the video, and 3 stuffed animals for their nieces and spends $115. Another couple buys 2 t-shirts, the video, and 1 stuffed animal and their total is $85. What is the cost of each item?

32. The church youth group is selling snacks to raise money to attend their convention. Amy sold 2 pounds of candy, 3 boxes of cookies and 1 can of popcorn for a total sales of $65. Brian sold 4 pounds of candy, 6 boxes of cookies and 3 cans of popcorn for a total sales of $140. Paulina sold 8 pounds of candy, 8 boxes of cookies and 5 cans of popcorn for a total sales of $250. What is the cost of each item?

Answer

$20, $5, $10

Writing Exercises

33. In your own words explain the steps to solve a system of linear equations with three variables by elimination.

34. How can you tell when a system of three linear equations with three variables has no solution? Infinitely many solutions?

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether an ordered triple is a solution of a system of three linear equations with three variables.			
solve a system of linear equations with three variables.			
solve applications using systems of linear equations with three variables.			

ⓑ On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

21.6: Solve Systems of Equations Using Matrices

Learning Objectives

By the end of this section, you will be able to:

- Write the augmented matrix for a system of equations
- Use row operations on a matrix
- Solve systems of equations using matrices

Before you get started, take this readiness quiz.

1. Solve: $3(x+2)+4=4(2x-1)+9$.
   If you missed this problem, review [link].
2. Solve: $0.25p+0.25(x+4)=5.20$.
   If you missed this problem, review [link].
3. Evaluate when $x=-2$ and $y=3$: $2x^2-xy+3y^2$.
   If you missed this problem, review [link].

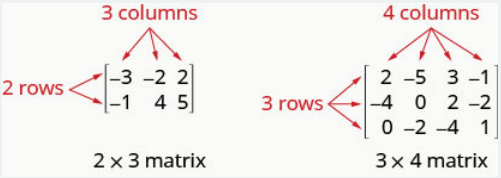
Write the Augmented Matrix for a System of Equations

Solving a system of equations can be a tedious operation where a simple mistake can wreak havoc on finding the solution. An alternative method which uses the basic procedures of elimination but with notation that is simpler is available. The method involves using a **matrix**. A matrix is a rectangular array of numbers arranged in rows and columns.

MATRIX

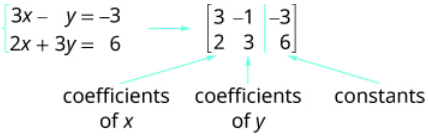
A **matrix** is a rectangular array of numbers arranged in rows and columns.

A matrix with *m* rows and *n* columns has order $m \times n$. The matrix on the left below has 2 rows and 3 columns and so it has order 2×3. We say it is a 2 by 3 matrix.



Each number in the matrix is called an element or entry in the matrix.

We will use a matrix to represent a system of linear equations. We write each equation in standard form and the coefficients of the variables and the constant of each equation becomes a row in the matrix. Each column then would be the coefficients of one of the variables in the system or the constants. A vertical line replaces the equal signs. We call the resulting matrix the augmented matrix for the system of equations.



Notice the first column is made up of all the coefficients of *x*, the second column is the all the coefficients of *y*, and the third column is all the constants.

Example 21.6.1

ⓐ $\begin{cases} 5x-3y=-1 \\ y=2x-2 \end{cases}$ ⓑ $\begin{cases} 6x-5y+2z=3 \\ 2x+y-4z=5 \\ 3x-3y+z=-1 \end{cases}$

Answer

ⓐ The second equation is not in standard form. We rewrite the second equation in standard form.

$$y=2x-2$$
$$-2x+y=-2$$

We replace the second equation with its standard form. In the augmented matrix, the first equation gives us the first row and the second equation gives us the second row. The vertical line replaces the equal signs.

$$\begin{array}{l} 5x-3y=-1 \\ 2x-\ \ y=\ \ 2 \end{array} \qquad \left[\begin{array}{cc|c} 5 & -3 & -1 \\ 2 & -1 & 2 \end{array}\right] \quad \begin{array}{cc} x & y \end{array}$$

ⓑ All three equations are in standard form. In the augmented matrix the first equation gives us the first row, the second equation gives us the second row, and the third equation gives us the third row. The vertical line replaces the equal signs.

$$\begin{array}{l} 6x-5y+2z=\ \ 3 \\ 2x+\ \ y-4z=\ \ 5 \\ 3x-3y+\ \ z=-1 \end{array} \qquad \left[\begin{array}{ccc|c} 6 & -5 & 2 & 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right] \quad \begin{array}{ccc} x & y & z \end{array}$$

Example 21.6.2

Write each system of linear equations as an augmented matrix:

ⓐ $\begin{cases} 3x+8y=-3 \\ 2x=-5y-3 \end{cases}$ ⓑ $\begin{cases} 2x-5y+3z=8 \\ 3x-y+4z=7 \\ x+3y+2z=-3 \end{cases}$

Answer

ⓐ $\left[\begin{array}{cc|c} 3 & 8 & -3 \\ 2 & 5 & -3 \end{array}\right]$

ⓑ $\left[\begin{array}{ccc|c} 2 & 5 & -3 & 8 \\ 3 & -1 & 4 & 7 \\ 1 & 3 & 2 & -3 \end{array}\right]$

Example 21.6.3

Write each system of linear equations as an augmented matrix:

ⓐ $\begin{cases} 11x=-9y-5 \\ 7x+5y=-1 \end{cases}$ ⓑ $\begin{cases} 5x-3y+2z=-5 \\ 2x-y-z=4 \\ 3x-2y+2z=-7 \end{cases}$

Answer

ⓐ $\left[\begin{array}{cc|c} 11 & 9 & -5 \\ 7 & 5 & -1 \end{array}\right]$

ⓑ $\left[\begin{array}{ccc|c} 5 & -3 & 2 & -5 \\ 2 & -1 & -1 & 4 \\ 3 & -2 & 2 & -7 \end{array}\right]$

It is important as we solve systems of equations using matrices to be able to go back and forth between the system and the matrix. The next example asks us to take the information in the matrix and write the system of equations.

? Example 21.6.4

Write the system of equations that corresponds to the augmented matrix:

$$\left[\begin{array}{ccc|c} 4 & -3 & 3 & -1 \\ 1 & 2 & -1 & 2 \\ -2 & -1 & 3 & -4 \end{array}\right].$$

Answer

We remember that each row corresponds to an equation and that each entry is a coefficient of a variable or the constant. The vertical line replaces the equal sign. Since this matrix is a 4×3, we know it will translate into a system of three equations with three variables.

$$\begin{array}{ccc} x & y & z \\ \left[\begin{array}{ccc|c} 4 & -3 & 3 & -1 \\ 1 & 2 & -1 & 2 \\ -2 & -1 & 3 & -4 \end{array}\right] & \longrightarrow & \begin{array}{r} 4x-3y+3z=-1 \\ x+2y-z=2 \\ -2x-y+3z=-4 \end{array} \end{array}$$

? Example 21.6.5

Write the system of equations that corresponds to the augmented matrix: $\left[\begin{array}{ccc|c} 1 & -1 & 2 & 3 \\ 2 & 1 & -2 & 1 \\ 4 & -1 & 2 & 0 \end{array}\right]$.

Answer

$$\begin{cases} x-y+2z=3 \\ 2x+y-2z=1 \\ 4x-y+2z=0 \end{cases}$$

? Example 21.6.6

Write the system of equations that corresponds to the augmented matrix: $\left[\begin{array}{ccc|c} 1 & 1 & 1 & 4 \\ 2 & 3 & -1 & 8 \\ 1 & 1 & -1 & 3 \end{array}\right]$.

Answer

$$\begin{cases} x+y+z=4 \\ 2x+3y-z=8 \\ x+y-z=3 \end{cases}$$

Use Row Operations on a Matrix

Once a system of equations is in its augmented matrix form, we will perform operations on the rows that will lead us to the solution.

To solve by elimination, it doesn't matter which order we place the equations in the system. Similarly, in the matrix we can interchange the rows.

When we solve by elimination, we often multiply one of the equations by a constant. Since each row represents an equation, and we can multiply each side of an equation by a constant, similarly we can multiply each entry in a row by any real number except 0.

In elimination, we often add a multiple of one row to another row. In the matrix we can replace a row with its sum with a multiple of another row.

These actions are called row operations and will help us use the matrix to solve a system of equations.

ROW OPERATIONS

In a matrix, the following operations can be performed on any row and the resulting matrix will be equivalent to the original matrix.

1. Interchange any two rows.
2. Multiply a row by any real number except 0.
3. Add a nonzero multiple of one row to another row.

Performing these operations is easy to do but all the arithmetic can result in a mistake. If we use a system to record the row operation in each step, it is much easier to go back and check our work.

We use capital letters with subscripts to represent each row. We then show the operation to the left of the new matrix. To show interchanging a row:

$$\begin{bmatrix} 5 & -3 & -1 \\ 2 & -1 & 2 \end{bmatrix} \xrightarrow[R_1]{R_2} \begin{bmatrix} 2 & -1 & 2 \\ 5 & -3 & -1 \end{bmatrix}$$

To multiply row 2 by -3:

$$\begin{bmatrix} 5 & -3 & -1 \\ 2 & -1 & 2 \end{bmatrix} \xrightarrow{-3R_2} \begin{bmatrix} 5 & -3 & -1 \\ -6 & 3 & -6 \end{bmatrix}$$

To multiply row 2 by -3 and add it to row 1:

$$\begin{bmatrix} 5 & -3 & -1 \\ 2 & -1 & 2 \end{bmatrix} \xrightarrow{-3R_2 + R_1} \begin{bmatrix} -1 & 0 & -7 \\ 2 & -1 & 2 \end{bmatrix}$$

Example 21.6.7

Perform the indicated operations on the augmented matrix:

ⓐ Interchange rows 2 and 3.

ⓑ Multiply row 2 by 5.

ⓒ Multiply row 3 by $-2-2$ and add to row 1.

$$\left[\begin{array}{ccc|c} 6 & -5 & 2 & 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right]$$

Answer

ⓐ We interchange rows 2 and 3.

$$\begin{bmatrix} 6 & -5 & 2 & 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{bmatrix} \xrightarrow[R_2]{R_3} \begin{bmatrix} 6 & -5 & 2 & 3 \\ 3 & -3 & 1 & -1 \\ 2 & 1 & -4 & 5 \end{bmatrix}$$

ⓑ We multiply row 2 by 5.

$$\left[\begin{array}{rrr|r} 6 & -5 & 2 & 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right] \xrightarrow{5R_2} \left[\begin{array}{rrr|r} 6 & -5 & 2 & 3 \\ 10 & 5 & -20 & 25 \\ 3 & -3 & 1 & -1 \end{array}\right]$$

ⓒ We multiply row 3 by -2 and add to row 1.

$$\left[\begin{array}{rrr|r} 6 & -5 & 2 & 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right] \xrightarrow{-2R_3 + R_1} \left[\begin{array}{rrr|r} (-2 \cdot 3) + 6 & (-2 \cdot (-3)) + (-5) & (-2 \cdot 1) + 2 & (-2 \cdot (-1)) + 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right]$$

$$\xrightarrow{-2R_3 + R_1} \left[\begin{array}{rrr|r} 0 & 1 & 0 & 5 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right]$$

Example 21.6.8

Perform the indicated operations on the augmented matrix:

ⓐ Interchange rows 1 and 3.

ⓑ Multiply row 3 by 3.

ⓒ Multiply row 1 by 2 and add to row 2.

$$\left[\begin{array}{rrr|r} 5 & -2 & -2 & -2 \\ 4 & -1 & -4 & 4 \\ -2 & 3 & 0 & -1 \end{array}\right]$$

Answer

ⓐ $\left[\begin{array}{rrr|r} -2 & 3 & 0 & -2 \\ 4 & -1 & -4 & 4 \\ 5 & -2 & -2 & -2 \end{array}\right]$

ⓑ $\left[\begin{array}{rrr|r} -2 & 3 & 0 & -2 \\ 4 & -1 & -4 & 4 \\ 15 & -6 & -6 & -6 \end{array}\right]$

ⓒ $\left[\begin{array}{rrr|r} -2 & 3 & 0 & 2 \\ 0 & 5 & -4 & 0 \\ 15 & -6 & -6 & -6 \end{array}\right]$

Example 21.6.9

Perform the indicated operations on the augmented matrix:

ⓐ Interchange rows 1 and 2,

ⓑ Multiply row 1 by 2,

ⓒ Multiply row 2 by 3 and add to row 1.

$$\left[\begin{array}{rrr|r} 2 & -3 & -2 & -4 \\ 4 & 1 & -3 & 2 \\ 5 & 0 & 4 & -1 \end{array}\right]$$

Answer

ⓐ $\left[\begin{array}{ccc|c} 4 & 1 & -3 & 2 \\ 2 & -3 & -2 & -4 \\ 5 & 0 & 4 & -1 \end{array}\right]$

ⓑ $\left[\begin{array}{ccc|c} 8 & 2 & -6 & 4 \\ 2 & -3 & -2 & -4 \\ 5 & 0 & 4 & -1 \end{array}\right]$

ⓒ $\left[\begin{array}{ccc|c} 14 & -7 & -12 & -8 \\ 2 & -3 & -2 & -4 \\ 5 & 0 & 4 & -1 \end{array}\right]$

Now that we have practiced the row operations, we will look at an augmented matrix and figure out what operation we will use to reach a goal. This is exactly what we did when we did elimination. We decided what number to multiply a row by in order that a variable would be eliminated when we added the rows together.

Given this system, what would you do to eliminate x?

$$\begin{cases} x - y = 2 \\ 4x - 8y = 0 \end{cases} \xrightarrow{\text{multiply the first equation by } -4} \begin{cases} -4x + 4y = -8 \\ 4x - 8y = 0 \end{cases} \xrightarrow{\text{then add}} \begin{array}{r} -4x + 4y = -8 \\ 4x - 8y = 0 \\ \hline -4y = -8 \end{array}$$

This next example essentially does the same thing, but to the matrix.

? Example 21.6.10

Perform the needed row operation that will get the first entry in row 2 to be zero in the augmented matrix: $\left[\begin{array}{cc|c} 1 & -1 & 2 \\ 4 & -8 & 0 \end{array}\right]$

Answer

To make the 4 a 0, we could multiply row 1 by -4 and then add it to row 2.

$$\left[\begin{array}{cc|c} 1 & -1 & 2 \\ 4 & -8 & 0 \end{array}\right] \xrightarrow{-4R_1 + R_2} \left[\begin{array}{cc|c} 1 & -1 & 2 \\ 0 & -4 & -8 \end{array}\right]$$

? Example 21.6.11

Perform the needed row operation that will get the first entry in row 2 to be zero in the augmented matrix: $\left[\begin{array}{cc|c} 1 & -1 & 2 \\ 3 & -6 & 2 \end{array}\right]$

Answer

$\left[\begin{array}{cc|c} 1 & -1 & 2 \\ 0 & -3 & -4 \end{array}\right]$

? Example 21.6.12

Perform the needed row operation that will get the first entry in row 2 to be zero in the augmented matrix: $\left[\begin{array}{cc|c} 1 & -1 & 3 \\ -2 & -3 & 2 \end{array}\right]$

Answer

$\left[\begin{array}{cc|c} 1 & -1 & 3 \\ 0 & -5 & 8 \end{array}\right]$

Solve Systems of Equations Using Matrices

To solve a system of equations using matrices, we transform the augmented matrix into a matrix in **row-echelon form** using row operations. For a consistent and independent system of equations, its **augmented matrix** is in row-echelon form when to the left of the vertical line, each entry on the diagonal is a 1 and all entries below the diagonal are zeros.

ROW-ECHELON FORM

For a consistent and independent system of equations, its augmented matrix is in **row-echelon form** when to the left of the vertical line, each entry on the diagonal is a 1 and all entries below the diagonal are zeros.

$\begin{bmatrix} 1 & a & b \\ 0 & 1 & c \end{bmatrix}$ $\begin{bmatrix} 1 & a & b & d \\ 0 & 1 & c & e \\ 0 & 0 & 1 & f \end{bmatrix}$ a, b, c, d, e, f are real numbers

Once we get the augmented matrix into row-echelon form, we can write the equivalent system of equations and read the value of at least one variable. We then substitute this value in another equation to continue to solve for the other variables. This process is illustrated in the next example.

How to Solve a System of Equations Using a Matrix

Solve the system of equations using a matrix: $\begin{cases} 3x+4y=5 \\ x+2y=1 \end{cases}$

Answer

Step 1. Write the augmented matrix for the system of equations.		$\begin{matrix} 3x+4y=5 \\ x+2y=1 \end{matrix}$ $\begin{bmatrix} 3 & 4 & 5 \\ 1 & 2 & 1 \end{bmatrix}$
Step 2. Using row operations get the entry in row 1, column 1 to be 1.	Interchange the rows, so 1 will be in row 1, column 1.	$\begin{matrix} R_2 \\ R_1 \end{matrix}\begin{bmatrix} 1 & 2 & 1 \\ 3 & 4 & 5 \end{bmatrix}$
Step 3. Using row operations, get zeros in column 1 below the 1.	Multiply row 1 by –3 and add it to row 2.	$\begin{matrix} \\ -3R_1+R_2 \end{matrix}\begin{bmatrix} 1 & 2 & 1 \\ 0 & -2 & 2 \end{bmatrix}$
Step 4. Using row operations, get the entry in row 2, column 2 to be 1.	Multiply row 2 by $-\frac{1}{2}$.	$\begin{matrix} \\ -\frac{1}{2}R_2 \end{matrix}\begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \end{bmatrix}$
Step 5. Continue the process until the matrix is in row-echelon form.	The matrix is now in row-echelon form.	$\begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \end{bmatrix}$
Step 6. Write the corresponding system of equations.	$\begin{matrix} x & y & \\ \end{matrix}$ $\begin{bmatrix} 1 & 2 & 1 \\ 0 & 1 & -1 \end{bmatrix}$	$\begin{matrix} x+2y=1 \\ y=-1 \end{matrix}$
Step 7. Use substitution to find the remaining variables.	Substitute $y=-1$ into $x+2y=1$.	$\begin{matrix} y=-1 \\ x+2y=1 \\ x+2(-1)=1 \\ x-2=1 \\ x=3 \end{matrix}$

Step 8. Write the solution as an ordered pair or triple.		(3, –1)
Step 9. Check that the solution makes the original equations true.		We leave the check to you.

? Example 21.6.14

Solve the system of equations using a matrix: $\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$

Answer

The solution is $(4,-1)$.

? Example 21.6.15

Solve the system of equations using a matrix: $\begin{cases} 2x+y=-4 \\ x-y=-2 \end{cases}$

Answer

The solution is $(-2,0)$.

The steps are summarized here.

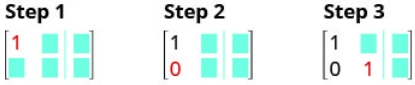
SOLVE A SYSTEM OF EQUATIONS USING MATRICES.

1. Write the augmented matrix for the system of equations.
2. Using row operations get the entry in row 1, column 1 to be 1.
3. Using row operations, get zeros in column 1 below the 1.
4. Using row operations, get the entry in row 2, column 2 to be 1.
5. Continue the process until the matrix is in row-echelon form.
6. Write the corresponding system of equations.
7. Use substitution to find the remaining variables.
8. Write the solution as an ordered pair or triple.
9. Check that the solution makes the original equations true.

Here is a visual to show the order for getting the 1's and 0's in the proper position for row-echelon form.

2 × 3 matrix

Step 1 **Step 2** **Step 3**



3 × 4 matrix

Step 1 **Step 2** **Step 3** **Step 4**

Step 5 **Step 6**

We use the same procedure when the system of equations has three equations.

Example 21.6.16

Solve the system of equations using a matrix: $\begin{cases} 3x+8y+2z=-5 \\ 2x+5y-3z=0 \\ x+2y-2z=-1 \end{cases}$

Answer

	$\begin{cases} 3x+8y+2z=-5 \\ 2x+5y-3z=0 \\ x+2y-2z=-1 \end{cases}$
Write the augmented matrix for the equations.	$\left[\begin{array}{rrr\|r} 3 & 8 & 2 & -5 \\ 2 & 5 & -3 & 0 \\ 1 & 2 & -2 & -1 \end{array}\right]$
Interchange row 1 and 3 to get the entry in row 1, column 1 to be 1.	$\begin{matrix} R_3 \\ \\ R_1 \end{matrix}\left[\begin{array}{rrr\|r} 1 & 2 & -2 & -1 \\ 2 & 5 & -3 & 0 \\ 3 & 8 & 2 & -5 \end{array}\right]$
Using row operations, get zeros in column 1 below the 1.	$\begin{matrix} \\ -2R_1+R_2 \\ \\ \end{matrix}\left[\begin{array}{rrr\|r} 1 & 2 & -2 & -1 \\ 0 & 1 & 1 & 2 \\ 3 & 8 & 2 & -5 \end{array}\right]$
	$\begin{matrix} \\ \\ -3R_1+R_3 \end{matrix}\left[\begin{array}{rrr\|r} 1 & 2 & -2 & -1 \\ 0 & 1 & 1 & 2 \\ 0 & 2 & 8 & -2 \end{array}\right]$
The entry in row 2, column 2 is now 1.	
Continue the process until the matrix is in row-echelon form.	$\begin{matrix} \\ \\ -2R_2+R_3 \end{matrix}\left[\begin{array}{rrr\|r} 1 & 2 & -2 & -1 \\ 0 & 1 & 1 & 2 \\ 0 & 0 & 6 & -6 \end{array}\right]$
	$\begin{matrix} \\ \\ \frac{1}{6}R_3 \end{matrix}\left[\begin{array}{rrr\|r} 1 & 2 & -2 & -1 \\ 0 & 1 & 1 & 2 \\ 0 & 0 & 1 & -1 \end{array}\right]$
The matrix is now in row-echelon form.	$\left[\begin{array}{rrr\|r} 1 & 2 & -2 & -1 \\ 0 & 1 & 1 & 2 \\ 0 & 0 & 1 & -1 \end{array}\right]$
Write the corresponding system of equations.	$\begin{cases} x+2y-2z=-1 \\ y+z=2 \\ z=-1 \end{cases}$
Use substitution to find the remaining variables.	$\begin{aligned} y+z&=2 \\ y+(-1)&=2 \\ y&=3 \end{aligned}$
	$\begin{aligned} x+2y-2z&=-1 \\ x+2(3)-2(-1)&=-1 \\ x+6+2&=-1 \\ x&=-9 \end{aligned}$
Write the solution as an ordered pair or triple.	$(-9, 3, -1)$
Check that the solution makes the original equations true.	We leave the check for you.

Example 21.6.17

Solve the system of equations using a matrix: $\begin{cases} 2x-5y+3z=8 \\ 3x-y+4z=7 \\ x+3y+2z=-3 \end{cases}$

Answer

$(6,-1,-3)$

Example 21.6.18

Solve the system of equations using a matrix: $\begin{cases} -3x+y+z=-4 \\ -x+2y-2z=1 \\ 2x-y-z=-1 \end{cases}$

Answer

$(5,7,4)$

So far our work with matrices has only been with systems that are consistent and independent, which means they have exactly one solution. Let's now look at what happens when we use a matrix for a dependent or inconsistent system.

Example 21.6.19

Solve the system of equations using a matrix: $\begin{cases} x+y+3z=0 \\ x+3y+5z=0 \\ 2x+4z=1 \end{cases}$

Answer

	$\begin{cases} x+y+3z=0 \\ x+3y+5z=0 \\ 2x+4z=1 \end{cases}$
Write the augmented matrix for the equations.	$\left[\begin{array}{ccc\|c} 1 & 1 & 3 & 0 \\ 1 & 3 & 5 & 0 \\ 2 & 0 & 4 & 1 \end{array}\right]$
The entry in row 1, column 1 is 1.	
Using row operations, get zeros in column 1 below the 1.	$\begin{matrix} \\ -1R_1+R_2 \\ \\ \end{matrix}\left[\begin{array}{ccc\|c} 1 & 1 & 3 & 0 \\ 0 & 2 & 2 & 0 \\ 2 & 0 & 4 & 1 \end{array}\right]$
	$\begin{matrix} \\ \\ -2R_1+R_3 \end{matrix}\left[\begin{array}{ccc\|c} 1 & 1 & 3 & 0 \\ 0 & 2 & 2 & 0 \\ 0 & -2 & -2 & 1 \end{array}\right]$
Continue the process until the matrix is in row-echelon form.	$\begin{matrix} \\ \frac{1}{2}R_2 \\ \\ \end{matrix}\left[\begin{array}{ccc\|c} 1 & 1 & 3 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & -2 & -2 & 1 \end{array}\right]$
Multiply row 2 by 2 and add it to row 3.	$\begin{matrix} \\ \\ 2R_2+R_3 \end{matrix}\left[\begin{array}{ccc\|c} 1 & 1 & 3 & 0 \\ 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{array}\right]$
At this point, we have all zeros on the left of row 3.	

Write the corresponding system of equations.	$\begin{cases} x+y+3z=0 \\ y+z=0 \\ 0\neq 1 \end{cases}$

Since $0 \neq 1$ we have a false statement. Just as when we solved a system using other methods, this tells us we have an inconsistent system. There is no solution.

Example 21.6.20

Solve the system of equations using a matrix: $\begin{cases} x-2y+2z=1 \\ -2x+y-z=2 \\ x-y+z=5 \end{cases}$

Answer

no solution

Example 21.6.21

Solve the system of equations using a matrix: $\begin{cases} 3x+4y-3z=-2 \\ -2x+3y-z=-1 \\ 2x+y-2z=6 \end{cases}$

Answer

no solution

The last system was inconsistent and so had no solutions. The next example is dependent and has infinitely many solutions.

Example 21.6.22

Solve the system of equations using a matrix: $\begin{cases} x-2y+3z=1 \\ x+y-3z=7 \\ 3x-4y+5z=7 \end{cases}$

Answer

	$\begin{cases} x-2y+3z=1 \\ x+y-3z=7 \\ 3x-4y+5z=7 \end{cases}$
Write the augmented matrix for the equations.	$\left[\begin{array}{ccc\|c} 1 & -2 & 3 & 1 \\ 1 & 1 & -3 & 7 \\ 3 & -4 & 5 & 7 \end{array}\right]$
The entry in row 1, column 1 is 1.	
Using row operations, get zeros in column 1 below the 1.	$\begin{matrix} \\ -1R_1+R_2 \\ \\ \end{matrix}\left[\begin{array}{ccc\|c} 1 & -2 & 3 & 1 \\ 0 & 3 & -6 & 6 \\ 3 & -4 & 5 & 7 \end{array}\right]$
	$\begin{matrix} \\ \\ -3R_1+R_3 \end{matrix}\left[\begin{array}{ccc\|c} 1 & -2 & 3 & 1 \\ 0 & 3 & -6 & 6 \\ 0 & 2 & -4 & 4 \end{array}\right]$

Continue the process until the matrix is in row-echelon form.	$\frac{1}{3}R_2 \begin{bmatrix} 1 & -2 & 3 & 1 \\ 0 & 1 & -2 & 2 \\ 0 & 2 & -4 & 4 \end{bmatrix}$
Multiply row 2 by -2 and add it to row 3.	$-2R_2 + R_3 \begin{bmatrix} 1 & -2 & 3 & 1 \\ 0 & 1 & -2 & 2 \\ 0 & 0 & 0 & 0 \end{bmatrix}$
At this point, we have all zeros in the bottom row.	
Write the corresponding system of equations.	$\begin{cases} x-2y+3z=1 \\ y-2z=2 \\ 0=0 \end{cases}$
Since $0=0$ we have a true statement. Just as when we solved by substitution, this tells us we have a dependent system. There are infinitely many solutions.	
Solve for y in terms of z in the second equation.	$\begin{aligned} y-2z&=2 \\ y&=2z+2 \end{aligned}$
Solve the first equation for x in terms of z.	$x-2y+3z=1$
Substitute $y=2z+2$.	$x-2(2z+2)+3z=1$
Simplify.	$x-4z-4+3z=1$
Simplify.	$x-z-4=1$
Simplify.	$x=z+5$
The system has infinitely many solutions (x,y,z), where $x=z+5;\ y=2z+2;\ z$ is any real number.	

Example 21.6.23

Solve the system of equations using a matrix: $\begin{cases} x+y-z=0 \\ 2x+4y-2z=6 \\ 3x+6y-3z=9 \end{cases}$

Answer

infinitely many solutions (x,y,z), where $x=z-3;\ y=3;\ z$ is any real number.

Example 21.6.24

Solve the system of equations using a matrix: $\begin{cases} x-y-z=1 \\ -x+2y-3z=-4 \\ 3x-2y-7z=0 \end{cases}$

Answer

infinitely many solutions (x,y,z), where $x=5z-2;\ y=4z-3;\ z$ is any real number.

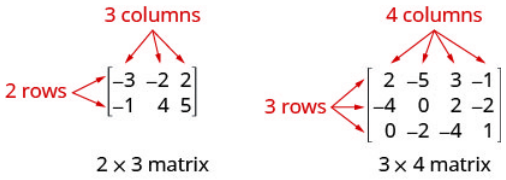
- Gaussian Elimination

Key Concepts

- **Matrix:** A matrix is a rectangular array of numbers arranged in rows and columns. A matrix with *m* rows and *n* columns has *order* $m \times n$. The matrix on the left below has 2 rows and 3 columns and so it has order 2×3. We say it is a 2 by 3 matrix.



Each number in the matrix is called an *element* or *entry* in the matrix.

- **Row Operations:** In a matrix, the following operations can be performed on any row and the resulting matrix will be equivalent to the original matrix.
  - Interchange any two rows
  - Multiply a row by any real number except 0
  - Add a nonzero multiple of one row to another row
- **Row-Echelon Form:** For a consistent and independent system of equations, its augmented matrix is in row-echelon form when to the left of the vertical line, each entry on the diagonal is a 1 and all entries below the diagonal are zeros.

$\begin{bmatrix} 1 & a & b \\ 0 & 1 & c \end{bmatrix}$ $\begin{bmatrix} 1 & a & b & d \\ 0 & 1 & c & e \\ 0 & 0 & 1 & f \end{bmatrix}$ a, b, c, d, e, f are real numbers

- **How to solve a system of equations using matrices.**
  1. Write the augmented matrix for the system of equations.
  2. Using row operations get the entry in row 1, column 1 to be 1.
  3. Using row operations, get zeros in column 1 below the 1.
  4. Using row operations, get the entry in row 2, column 2 to be 1.
  5. Continue the process until the matrix is in row-echelon form.
  6. Write the corresponding system of equations.
  7. Use substitution to find the remaining variables.
  8. Write the solution as an ordered pair or triple.
  9. Check that the solution makes the original equations true.

Glossary

matrix

A matrix is a rectangular array of numbers arranged in rows and columns.

row-echelon form

A matrix is in row-echelon form when to the left of the vertical line, each entry on the diagonal is a 1 and all entries below the diagonal are zeros.

21.6E: Exercises

Practice Makes Perfect

Write the Augmented Matrix for a System of Equations

In the following exercises, write each system of linear equations as an augmented matrix.

ⓐ $\begin{cases} 3x-y=-1 \\ 2y=2x+5 \end{cases}$

ⓑ $\begin{cases} 4x+3y=-2 \\ x-2y-3z=7 \\ 2x-y+2z=-6 \end{cases}$

ⓐ $\begin{cases} 2x+4y=-5 \\ 3x-2y=2 \end{cases}$

ⓑ $\begin{cases} 3x-2y-z=-2 \\ -2x+y=5 \\ 5x+4y+z=-1 \end{cases}$

Answer

ⓐ $\begin{bmatrix} 2 & 4 & -5 \\ 3 & -2 & 2 \end{bmatrix}$

ⓑ $\begin{bmatrix} 3 & -2 & -1 & -2 \\ -2 & 1 & 0 & 5 \\ 5 & 4 & 1 & -1 \end{bmatrix}$

ⓐ $\begin{cases} 3x-y=-4 \\ 2x=y+2 \end{cases}$

ⓑ $\begin{cases} x-3y-4z=-2 \\ 4x+2y+2z=5 \\ 2x-5y+7z=-8 \end{cases}$

ⓐ $\begin{cases} 2x-5y=-3 \\ 4x=3y-1 \end{cases}$

ⓑ $\begin{cases} 4x+3y-2z=-3 \\ -2x+y-3z=4 \\ -x-4y+5z=-2 \end{cases}$

Answer

ⓐ $\begin{bmatrix} 2 & -5 & -3 \\ 4 & -3 & -1 \end{bmatrix}$

ⓑ $\begin{bmatrix} 4 & 3 & -2 & -3 \\ -2 & 1 & -3 & 4 \\ -1 & -4 & 5 & -2 \end{bmatrix}$

Write the system of equations that corresponds to the augmented matrix.

$\left[\begin{array}{cc|c} 2 & -1 & 4 \\ 1 & -3 & 2 \end{array}\right]$

$$\left[\begin{array}{cc|c} 2 & -4 & -2 \\ 3 & -3 & -1 \end{array}\right]$$

Answer

$$\begin{cases} 2x-4y=-2 \\ 3x-3y=-1 \end{cases}$$

$$\left[\begin{array}{ccc|c} 1 & 0 & -3 & -1 \\ 1 & -2 & 0 & -2 \\ 0 & -1 & 2 & 3 \end{array}\right]$$

$$\left[\begin{array}{ccc|c} 2 & -2 & 0 & -1 \\ 0 & 2 & -1 & 2 \\ 3 & 0 & -1 & -2 \end{array}\right]$$

Answer

$$\begin{cases} 2x-2y=-1 \\ 2y-z=2 \\ 3x-z=-2 \end{cases}$$

Use Row Operations on a Matrix

In the following exercises, perform the indicated operations on the augmented matrices.

$$\left[\begin{array}{cc|c} 6 & -4 & 3 \\ 3 & -2 & 1 \end{array}\right]$$

ⓐ Interchange rows 1 and 2

ⓑ Multiply row 2 by 3

ⓒ Multiply row 2 by -2 and add row 1 to it.

$$\left[\begin{array}{cc|c} 4 & -6 & -3 \\ 3 & 2 & 1 \end{array}\right]$$

ⓐ Interchange rows 1 and 2

ⓑ Multiply row 1 by 4

ⓒ Multiply row 2 by 3 and add row 1 to it.

Answer

ⓐ $\left[\begin{array}{ccc} 3 & 2 & 1 \\ 4 & -6 & -3 \end{array}\right]$

ⓑ $\left[\begin{array}{ccc} 12 & 8 & 4 \\ 4 & -6 & -3 \end{array}\right]$

ⓒ $\left[\begin{array}{ccc} 12 & 8 & 4 \\ 24 & -10 & -5 \end{array}\right]$

$$\left[\begin{array}{ccc|c} 4 & -12 & -8 & 16 \\ 4 & -2 & -3 & -1 \\ -6 & 2 & -1 & -1 \end{array}\right]$$

$$\left[\begin{array}{ccc|c} 6 & -5 & 2 & 3 \\ 2 & 1 & -4 & 5 \\ 3 & -3 & 1 & -1 \end{array}\right]$$

Answer

ⓐ $\begin{bmatrix} 2 & 1 & -4 & 5 \\ 6 & -5 & 2 & 3 \\ 3 & -3 & 1 & -1 \end{bmatrix}$

ⓑ $\begin{bmatrix} 2 & 1 & -4 & 5 \\ 6 & -5 & 2 & 3 \\ 3 & -3 & 1 & -1 \end{bmatrix}$

ⓒ $\begin{bmatrix} 2 & 1 & -4 & 5 \\ 6 & -5 & 2 & 3 \\ -4 & 7 & -6 & 7 \end{bmatrix}$

Perform the needed row operation that will get the first entry in row 2 to be zero in the augmented matrix: $\left[\begin{array}{cc|c} 1 & 2 & 5 \\ -3 & -4 & -1 \end{array}\right]$

Perform the needed row operations that will get the first entry in both row 2 and row 3 to be zero in the augmented matrix: $\left[\begin{array}{ccc|c} 1 & -2 & 3 & -4 \\ 3 & -1 & -2 & 5 \\ 2 & -3 & -4 & 1 \end{array}\right]$

Answer

$\begin{bmatrix} 1 & -2 & 3 & -4 \\ 0 & 5 & -11 & 17 \\ 0 & 1 & -10 & 7 \end{bmatrix}$

Solve Systems of Equations Using Matrices

In the following exercises, solve each system of equations using a matrix.

$\begin{cases} 2x+y=2 \\ x-y=-2 \end{cases}$

$\begin{cases} 3x+y=2 \\ x-y=2 \end{cases}$

Answer

$(1,-1)$

$\begin{cases} -x+2y=-2 \\ x+y=-4 \end{cases}$

$\begin{cases} -2x+3y=3 \\ x+3y=12 \end{cases}$

Answer

$(3,3)$

In the following exercises, solve each system of equations using a matrix.

$$\begin{cases} 2x-3y+z=19 \\ -3x+y-2z=-1 \\ 5x+y+z=0 \end{cases}$$

$$\begin{cases} 2x-y+3z=-3 \\ -x+2y-z=10 \\ x+y+z=5 \end{cases}$$

Answer

$(-2,5,2)$

$$\begin{cases} 2x-6y+z=3 \\ 3x+2y-3z=2 \\ 2x+3y-2z=3 \end{cases}$$

$$\begin{cases} 4x-3y+z=7 \\ 2x-5y-4z=3 \\ 3x-2y-2z=-7 \end{cases}$$

Answer

$(-3,-5,4)$

$$\begin{cases} x+2z=0 \\ 4y+3z=-2 \\ 2x-5y=3 \end{cases}$$

$$\begin{cases} 2x+5y=4 \\ 3y-z=3 \\ 4x+3z=-3 \end{cases}$$

Answer

$(-3,2,3)$

$$\begin{cases} 2y+3z=-1 \\ 5x+3y=-6 \\ 7x+z=1 \end{cases}$$

$$\begin{cases} 3x-z=-3 \\ 5y+2z=-6 \\ 4x+3y=-8 \end{cases}$$

Answer

$(-2,0,-3)$

$$\begin{cases} 2x+3y+z=1 \\ 2x+y+z=9 \\ 3x+4y+2z=20 \end{cases}$$

$$\begin{cases} x+2y+6z=5 \\ -x+y-2z=3 \\ x-4y-2z=1 \end{cases}$$

Answer

no solution

$$\begin{cases} x+2y-3z=-1 \\ x-3y+z=1 \\ 2x-y-2z=2 \end{cases}$$

$$\begin{cases} 4x-3y+2z=0 \\ -2x+3y-7z=1 \\ 2x-2y+3z=6 \end{cases}$$

Answer

no solution

$$\begin{cases} x-y+2z=-4 \\ 2x+y+3z=2 \\ -3x+3y-6z=12 \end{cases}$$

$$\begin{cases} -x-3y+2z=14 \\ -x+2y-3z=-4 \\ 3x+y-2z=6 \end{cases}$$

Answer

infinitely many solutions (x, y, z) where $x=12z+4;\ y=12z-6;\ z$ is any real number

$$\begin{cases} x+y-3z=-1 \\ y-z=0 \\ -x+2y=1 \end{cases}$$

$$\begin{cases} x+2y+z=4 \\ x+y-2z=3 \\ -2x-3y+z=-7 \end{cases}$$

Answer

infinitely many solutions (x, y, z) where $x=5z+2;\ y=-3z+1;\ z$ is any real number

Writing Exercises

Solve the system of equations $\begin{cases} x+y=10 \\ x-y=6 \end{cases}$ ⓐ by graphing and ⓑ by substitution. ⓒ Which method do you prefer? Why?

Solve the system of equations $\begin{cases} 3x+y=1 \\ 2x=y-8 \end{cases}$ by substitution and explain all your steps in words.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
write the augmented matrix for a system of equations.			
use row operations on a matrix.			
solve systems of equations using matrices.			
write the augmented matrix for a system of equations.			
use row operations on a matrix.			

ⓑ After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

21.7: Solve Systems of Equations Using Determinants

Learning Objectives

By the end of this section, you will be able to:

- Evaluate the determinant of a 2×2 matrix
- Evaluate the determinant of a 3×3 matrix
- Use Cramer's Rule to solve systems of equations
- Solve applications using determinants

Before you get started, take this readiness quiz.

1. Simplify: $5(-2)-(-4)(1)$.
   If you missed this problem, review [link].
2. Simplify: $-3(8-10)+(-2)(6-3)-4(-3-(-4))$.
   If you missed this problem, review [link].
3. Simplify: $\frac{-12}{-8}$.
   If you missed this problem, review [link].

In this section we will learn of another method to solve systems of linear equations called Cramer's rule. Before we can begin to use the rule, we need to learn some new definitions and notation.

Evaluate the Determinant of a 2×2 Matrix

If a matrix has the same number of rows and columns, we call it a **square matrix**. Each square matrix has a real number associated with it called its **determinant**. To find the determinant of the square matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$, we first write it as $\begin{vmatrix} a & b \\ c & d \end{vmatrix}$. To get the real number value of the determinate we subtract the products of the diagonals, as shown.

$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$

DETERMINANT

The determinant of any square matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$, where a, b, c, and d are real numbers, is

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$$

Example 21.7.1

Evaluate the determinate of ⓐ $\begin{bmatrix} 4 & -2 \\ 3 & -1 \end{bmatrix}$ ⓑ $\begin{bmatrix} -3 & -4 \\ -2 & 0 \end{bmatrix}$.

Answer

ⓐ

	$\begin{vmatrix} 4 & -2 \\ 3 & -1 \end{vmatrix}$
Write the determinant.	$\begin{vmatrix} 4 & -2 \\ 3 & -1 \end{vmatrix}$
Subtract the products of the diagonals.	$4(-1) - 3(-2)$
Simplify.	$-4 + 6$

Simplify.	2

ⓑ

	$\begin{bmatrix} -3 & -4 \\ -2 & 0 \end{bmatrix}$
Write the determinant.	$\begin{vmatrix} -3 & -4 \\ -2 & 0 \end{vmatrix}$
Subtract the products of the diagonals.	$-3(0) - (-2)(-4)$
Simplify.	$0 - 8$
Simplify.	-8

Example 21.7.2

Evaluate the determinate of ⓐ $\begin{bmatrix} 5 & -3 \\ 2 & -4 \end{bmatrix}$ ⓑ $\begin{bmatrix} -4 & -6 \\ 0 & 7 \end{bmatrix}$.

Answer

ⓐ -14; ⓑ -28

Example 21.7.3

Evaluate the determinate of ⓐ $\begin{bmatrix} -1 & 3 \\ -2 & 4 \end{bmatrix}$ ⓑ $\begin{bmatrix} -7 & -3 \\ -5 & 0 \end{bmatrix}$.

Answer

ⓐ 2 ⓑ -15

Evaluate the Determinant of a 3×3 Matrix

To evaluate the determinant of a 3×3 matrix, we have to be able to evaluate the **minor of an entry** in the determinant. The minor of an entry is the 2×2 determinant found by eliminating the row and column in the 3×3 determinant that contains the entry.

MINOR OF AN ENTRY IN 3×3 A DETERMINANT

The **minor of an entry** in a 3×3 determinant is the 2×2 determinant found by eliminating the row and column in the 3×3 determinant that contains the entry.

To find the minor of entry a_1, we eliminate the row and column which contain it. So we eliminate the first row and first column. Then we write the 2×2 determinant that remains.

$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$ minor of a_1 $\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}$

To find the minor of entry b_2, we eliminate the row and column that contain it. So we eliminate the 2^{nd} row and 2^{nd} column. Then we write the 2×2 determinant that remains.

$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$ minor of b_2 $\begin{vmatrix} a_1 & c_1 \\ a_3 & c_3 \end{vmatrix}$

Example 21.7.4

For the determinant $\begin{vmatrix} 4 & -2 & 3 \\ 1 & 0 & -3 \\ -2 & -4 & 2 \end{vmatrix}$, find and then evaluate the minor of ⓐ a_1 ⓑ b_3 ⓒ c_2.

Answer

ⓐ

	$\begin{vmatrix} 4 & -2 & 3 \\ 1 & 0 & -3 \\ -2 & -4 & 2 \end{vmatrix}$
Eliminate the row and column that contains a_1.	$\begin{vmatrix} \cancel{4} & \cancel{-2} & \cancel{3} \\ \cancel{1} & 0 & -3 \\ \cancel{-2} & -4 & 2 \end{vmatrix}$
Write the 2×2 determinant that remains.	minor of $a_1 \begin{vmatrix} 0 & -3 \\ -4 & 2 \end{vmatrix}$
Evaluate.	$0(2) - (-3)(-4)$
Simplify.	-12

ⓑ

Eliminate the row and column that contains b_3.	$\begin{vmatrix} 4 & \cancel{-2} & 3 \\ 1 & \cancel{0} & -3 \\ \cancel{-2} & \cancel{-4} & \cancel{2} \end{vmatrix}$
Write the 2×2 determinant that remains.	minor of $b_3 \begin{vmatrix} 4 & 3 \\ 1 & -3 \end{vmatrix}$
Evaluate.	$4(-3) - (1)(3)$
Simplify.	-15

ⓒ

	$\begin{vmatrix} 4 & -2 & 3 \\ 1 & 0 & -3 \\ -2 & -4 & 2 \end{vmatrix}$
Eliminate the row and column that contains c_2.	$\begin{vmatrix} 4 & -2 & \cancel{3} \\ \cancel{1} & \cancel{0} & \cancel{-3} \\ -2 & -4 & \cancel{2} \end{vmatrix}$
Write the 2×2 determinant that remains.	minor of $c_2 \begin{vmatrix} 4 & -2 \\ -2 & 4 \end{vmatrix}$
Evaluate.	$4(4) - (-2)(-2)$
Simplify.	12

? Example 21.7.5

For the determinant $\begin{vmatrix} 1 & -1 & 4 \\ 0 & 2 & -1 \\ -2 & -3 & 3 \end{vmatrix}$, find and then evaluate the minor of ⓐ a_1 ⓑ b_2 ⓒ c_3.

Answer

ⓐ 3 ⓑ 11 ⓒ 2

? Example 21.7.6

For the determinant $\begin{vmatrix} -2 & -1 & 0 \\ 3 & 0 & -1 \\ -1 & -2 & 3 \end{vmatrix}$, find and then evaluate the minor of ⓐ a_2 ⓑ b_3 ⓒ c_2.

Answer

ⓐ -3 ⓑ 2 ⓒ 3

We are now ready to evaluate a 3×3 determinant. To do this we expand by minors, which allows us to evaluate the 3×3 determinant using 2×2 determinants—which we already know how to evaluate!

To evaluate a 3×3 determinant by expanding by minors along the first row, we use the following pattern:

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \underbrace{\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}}_{\text{minor of } a_1} - b_1 \underbrace{\begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix}}_{\text{minor of } b_1} + c_1 \underbrace{\begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}}_{\text{minor of } c_1}$$

Remember, to find the minor of an entry we eliminate the row and column that contains the entry.

EXPANDING BY MINORS ALONG THE FIRST ROW TO EVALUATE A 3×3 DETERMINANT

To evaluate a 3×3 determinant by **expanding by minors along the first row**, the following pattern:

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \underbrace{\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}}_{\text{minor of } a_1} - b_1 \underbrace{\begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix}}_{\text{minor of } b_1} + c_1 \underbrace{\begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}}_{\text{minor of } c_1}$$

? Example 21.7.7

Evaluate the determinant $\begin{vmatrix} 2 & -3 & -1 \\ 3 & 2 & 0 \\ -1 & -1 & -2 \end{vmatrix}$ by expanding by minors along the first row.

Answer

	$\begin{vmatrix} 2 & -3 & -1 \\ 3 & 2 & 0 \\ -1 & -1 & -2 \end{vmatrix}$
Expand by minors along the first row	$2\underbrace{\begin{vmatrix} 2 & 0 \\ -1 & -2 \end{vmatrix}}_{\text{minor of } 2} - (-3)\underbrace{\begin{vmatrix} 3 & 0 \\ -1 & -2 \end{vmatrix}}_{\text{minor of } -3} + (-1)\underbrace{\begin{vmatrix} 3 & 2 \\ -1 & -1 \end{vmatrix}}_{\text{minor of } -1}$
Evaluate each determinant.	$2(-4-0) + 3(-6-0) - 1(-3-(-2))$
Simplify.	$2(-4) + 3(-6) - 1(-1)$

Simplify.	$-8-18+1$
Simplify.	-25

Example 21.7.8

Evaluate the determinant $\begin{vmatrix} 3 & -2 & 4 \\ 0 & -1 & -2 \\ 2 & 3 & -1 \end{vmatrix}$, by expanding by minors along the first row.

Answer

37

Example 21.7.9

Evaluate the determinant $\begin{vmatrix} 3 & -2 & -2 \\ 2 & -1 & 4 \\ -1 & 0 & -3 \end{vmatrix}$, by expanding by minors along the first row.

Answer

7

To evaluate a 3×3 determinant we can expand by minors using any row or column. Choosing a row or column other than the first row sometimes makes the work easier.

When we expand by any row or column, we must be careful about the sign of the terms in the expansion. To determine the sign of the terms, we use the following sign pattern chart.

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$

SIGN PATTERN

When expanding by minors using a row or column, the sign of the terms in the expansion follow the following pattern.

$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$

Notice that the sign pattern in the first row matches the signs between the terms in the expansion by the first row.

$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - b_1 \begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix} + c_1 \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}$$

minor of a_1 minor of b_1 minor of c_1

Since we can expand by any row or column, how do we decide which row or column to use? Usually we try to pick a row or column that will make our calculation easier. If the determinant contains a 0, using the row or column that contains the 0 will make the calculations easier.

Example 21.7.10

Evaluate the determinant $\begin{vmatrix} 4 & -1 & -3 \\ 3 & 0 & 2 \\ 5 & -4 & -3 \end{vmatrix}$ by expanding by minors.

Answer

To expand by minors, we look for a row or column that will make our calculations easier. Since 0 is in the second row and second column, expanding by either of those is a good choice. Since the second row has fewer negatives than the second column, we will expand by the second row.

	$\begin{vmatrix} 4 & -1 & -3 \\ 3 & 0 & 2 \\ 5 & -4 & -3 \end{vmatrix}$
Expand using the second row.	
Be careful of the signs.	$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$ $-3\underbrace{\begin{vmatrix} -1 & -3 \\ -4 & -3 \end{vmatrix}}_{\text{minor of 3}} + (0)\underbrace{\begin{vmatrix} 4 & -3 \\ 5 & -3 \end{vmatrix}}_{\text{minor of 0}} - 2\underbrace{\begin{vmatrix} 4 & -1 \\ 5 & -4 \end{vmatrix}}_{\text{minor of 2}}$
Evaluate each determinant.	$-3(3-12)+0(-12-(-15))-2(-16-(-5))$
Simplify.	$-3(-9)+0-2(-11)$
Simplify.	$27+0+22$
Add.	49

Example 21.7.11

Evaluate the determinant $\begin{vmatrix} 2 & -1 & -3 \\ 0 & 3 & -4 \\ 3 & -4 & -3 \end{vmatrix}$ by expanding by minors.

Answer

-11

Example 21.7.12

Evaluate the determinant $\begin{vmatrix} -2 & -1 & -3 \\ -1 & 2 & 2 \\ 4 & -4 & 0 \end{vmatrix}$ by expanding by minors.

Answer

8

Use Cramer's Rule to Solve Systems of Equations

Cramer's Rule is a method of solving systems of equations using determinants. It can be derived by solving the general form of the systems of equations by elimination. Here we will demonstrate the rule for both systems of two equations with two variables and for systems of three equations with three variables.

Let's start with the systems of two equations with two variables.

CRAMER'S RULE FOR SOLVING A SYSTEM OF TWO EQUATIONS

For the system of equations $\begin{cases} a_1x+b_1y=k_1 \\ a_2x+b_2y=k_2 \end{cases}$, the solution (x, y) can be determined by

$$x=\frac{D_x}{D} \text{ and } y=\frac{D_y}{D}$$

where $D=\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$ use the coefficients of the variables.

$D_x=\begin{vmatrix} k_1 & b_1 \\ k_2 & b_2 \end{vmatrix}$ replace the x coefficients with the constants.

$D_y=\begin{vmatrix} a_1 & k_1 \\ a_2 & k_2 \end{vmatrix}$ replace the y coefficients with the constants.

Notice that to form the determinant D, we use take the coefficients of the variables.

$$\begin{cases} a_1x+b_1y=k_1 \\ a_2x+b_2y=k_2 \end{cases} \qquad D=\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$$

Coefficients — Coefficient of x — Coefficient of y

Notice that to form the determinant D_x and D_y, we substitute the constants for the coefficients of the variable we are finding.

$$\begin{cases} a_1x+b_1y=k_1 \\ a_2x+b_2y=k_2 \end{cases} \qquad D_x=\begin{vmatrix} k_1 & b_1 \\ k_2 & b_2 \end{vmatrix} \qquad \begin{cases} a_1x+b_1y=k_1 \\ a_2x+b_2y=k_2 \end{cases} \qquad D_y=\begin{vmatrix} a_1 & k_1 \\ a_2 & k_2 \end{vmatrix}$$

Constants — Coefficients of y — Coefficients of x — Constants

Example 21.7.13: How to Solve a System of Equations Using Cramer's Rule

Solve using Cramer's Rule: $\begin{cases} 2x+y=-4 \\ 3x-2y=-6 \end{cases}$

Answer

Step 1. Evaluate the determinant D, using the coefficients of the variables.		$\begin{cases} 2x+y=-4 \\ 3x-2y=-6 \end{cases}$ $D=\begin{vmatrix} 2 & 1 \\ 3 & -2 \end{vmatrix}$ $D=-4-3$ $D=-7$
Step 2. Evaluate the determinant D_x. Use the constants in place of the x coefficients.	We replace the coefficients of x, 2 and 3, with the constants, –4 and –6.	$D_x=\begin{vmatrix} -4 & 1 \\ -6 & -2 \end{vmatrix}$ $D_x=8-(-6)$ $D_x=14$
Step 3. Evaluate the determinant D_y. Use the constants in place of the y coefficients.	We replace the coefficients of y, 1 and 2, with the constants, –4 and –6.	$D_y=\begin{vmatrix} 2 & -4 \\ 3 & -6 \end{vmatrix}$ $D_y=-12-(-12)$ $D_y=0$
Step 4. Find x and y.	Substitute in the values of D, D_x and D_y.	$x=\frac{D_x}{D}$ and $y=\frac{D_y}{D}$ $x=\frac{14}{-7}$ and $y=\frac{0}{-7}$ $x=-2$ and $y=0$

Step 5. Write the solution as an ordered pair.	The ordered pair is (x, y).	$(-2, 0)$
Step 6. Check that the ordered pair is a solution to **both** original equations.	Substitute $x = -2$, $y = 0$ into both equations and make sure they are both true.	$(-2, 0)$ is the solution to the system.

? Example 21.7.14

Solve using Cramer's rule: $\begin{cases} 3x+y=-3 \\ 2x+3y=6 \end{cases}$

Answer

$(-\frac{15}{7}, \frac{24}{7})$

? Example 21.7.15

Solve using Cramer's rule: $\begin{cases} -x+y=2 \\ 2x+y=-4 \end{cases}$

Answer

$(-2, 0)$

SOLVE A SYSTEM OF TWO EQUATIONS USING CRAMER'S RULE.

1. Evaluate the determinant D, using the coefficients of the variables.
2. Evaluate the determinant D_x. Use the constants in place of the x coefficients.
3. Evaluate the determinant D_y. Use the constants in place of the y coefficients.
4. Find x and y. $x = \frac{D_x}{D}$, $y = \frac{D_y}{D}$
5. Write the solution as an ordered pair.
6. Check that the ordered pair is a solution to both original equations.

To solve a system of three equations with three variables with Cramer's Rule, we basically do what we did for a system of two equations. However, we now have to solve for three variables to get the solution. The determinants are also going to be 3×3 which will make our work more interesting!

CRAMER'S RULE FOR SOLVING A SYSTEM OF THREE EQUATIONS

For the system of equations $\begin{cases} a_1x+b_1y+c_1z=k_1 \\ a_2x+b_2y+c_2z=k_2 \\ a_3x+b_3y+c_3z=k_3 \end{cases}$, the solution (x, y, z) can be determined by

$$x = \frac{D_x}{D}, y = \frac{D_y}{D} \text{ and } z = \frac{D_z}{D}$$

where $D = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}$ use the coefficients of the variables.

$D_x = \begin{vmatrix} k_1 & b_1 & c_1 \\ k_2 & b_2 & c_2 \\ k_3 & b_3 & c_3 \end{vmatrix}$ replace the x coefficients with the constants.

$D_y = \begin{vmatrix} a_1 & k_1 & c_1 \\ a_2 & k_2 & c_2 \\ a_3 & k_3 & c_3 \end{vmatrix}$ replace the y coefficients with the constants.

$D_z = \begin{vmatrix} a_1 & b_1 & k_1 \\ a_2 & b_2 & k_2 \\ a_3 & b_3 & k_3 \end{vmatrix}$ replace the z coefficients with the constants.

Example 21.7.16

Solve the system of equations using Cramer's Rule: $\begin{cases} 3x - 5y + 4z = 5 \\ 5x + 2y + z = 0 \\ 2x + 3y - 2z = 3 \end{cases}$

Answer

Evaluate the determinant D.	$D = \begin{vmatrix} 3 & -5 & 4 \\ 5 & 2 & 1 \\ 2 & 3 & -2 \end{vmatrix}$
Expand by minors using column 1.	
Be careful of the signs. $\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$	$D = 3\begin{vmatrix} 2 & 1 \\ 3 & -2 \end{vmatrix} - 5\begin{vmatrix} -5 & 4 \\ 3 & -2 \end{vmatrix} + 2\begin{vmatrix} -5 & 4 \\ 2 & 1 \end{vmatrix}$
Evaluate the determinants.	$D = 3(-4-3) - 5(10-12) + 2(-5-8)$
Simplify.	$D = 3(-7) - 5(-2) + 2(-13)$
Simplify.	$D = -21 + 10 - 26$
Simplify.	$D = -37$
Evaluate the determinant D_x. Use the constants to replace the coefficients of x.	$D_x = \begin{vmatrix} 5 & -5 & 4 \\ 0 & 2 & 1 \\ 3 & 3 & -2 \end{vmatrix}$
Expand by minors using column 1.	$D_x = 5\begin{vmatrix} 2 & 1 \\ 3 & -2 \end{vmatrix} - 0\begin{vmatrix} -5 & 4 \\ 3 & -2 \end{vmatrix} + 3\begin{vmatrix} -5 & 4 \\ 2 & 1 \end{vmatrix}$
Evaluate the determinants.	$D_x = 5(-4-3) - 0(10-12) + 3(-5-8)$
Simplify.	$D_x = 5(-7) - 0 + 3(-13)$
Simplify.	$D_x = -74$
Evaluate the determinant Dy.Dy. Use the constants to replace the coefficients of y.	$D_y = \begin{vmatrix} 3 & 5 & 4 \\ 5 & 0 & 1 \\ 2 & 3 & -2 \end{vmatrix}$

Expand by minors using column 2. Be careful of the signs. $\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$	$D_y = -5\begin{vmatrix} 5 & 1 \\ 2 & -2 \end{vmatrix} + 0\begin{vmatrix} 5 & 4 \\ 3 & -2 \end{vmatrix} - 3\begin{vmatrix} 3 & 4 \\ 5 & 1 \end{vmatrix}$
Evaluate the determinants.	$D_y = -5(-10-2) + 0(-10-12) - 3(3-20)$
Simplify.	$D_y = -5(-12) + 0 - 3(-17)$
Simplify.	$D_y = 60 + 0 + 51$
Simplify.	$D_y = 111$
Evaluate the determinant Dz.Dz. Use the constants to replace the coefficients of z.	$D_z = \begin{vmatrix} 3 & -5 & 5 \\ 5 & 2 & 0 \\ 2 & 3 & 3 \end{vmatrix}$
Expand by minors using column 3. Be careful of the signs. $\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$	$D_z = 5\begin{vmatrix} 5 & 2 \\ 2 & 3 \end{vmatrix} - 0\begin{vmatrix} 3 & -5 \\ 2 & 3 \end{vmatrix} + 3\begin{vmatrix} 3 & -5 \\ 5 & 2 \end{vmatrix}$
Evaluate the determinants.	$D_z = 5(15-4) - 0(9-(-10)) + 3(6-(-25))$
Simplify.	$D_z = 5(11) - 0 + 3(31)$
Simplify.	$D_z = 55 - 0 + 93$
Simplify.	$D_z = 148$
Find x, y, and z.	$x = \frac{D_x}{D}, y = \frac{D_y}{D}$ and $z = \frac{D_z}{D}$
Substitute in the values.	$x = \frac{-74}{-37}, y = \frac{111}{-37}$ and $z = \frac{148}{-37}$
Simplify.	$x = 2, y = -3$ and $z = -4$
Write the solution as an ordered triple.	$(2, -3, -4)$
Check that the ordered triple is a solution to **all three** original equations.	We leave the check to you.
	The solution is $(2, -3, -4)$.

? Example 21.7.17

Solve the system of equations using Cramer's Rule: $\begin{cases} 3x+8y+2z=-5 \\ 2x+5y-3z=0 \\ x+2y-2z=-1 \end{cases}$

Answer

$(-9, 3, -1)$

? Example 21.7.18

Solve the system of equations using Cramer's Rule: $\begin{cases} 3x+y-6z=-3 \\ 2x+6y+3z=0 \\ 3x+2y-3z=-6 \end{cases}$

Answer

$(-6, 3, -2)$

Cramer's rule does not work when the value of the D determinant is 0, as this would mean we would be dividing by 0. But when $D = 0$, the system is either inconsistent or dependent.

When the value of $D = 0$ and D_x, D_y and D are all zero, the system is consistent and dependent and there are infinitely many solutions.

When the value of $D = 0$ and D_x, D_y and D_z are not all zero, the system is inconsistent and there is no solution.

DEPENDENT AND INCONSISTENT SYSTEMS OF EQUATIONS

For any system of equations, where the **value of the determinant** $D = 0$,

Value of determinants	**Type of system**	**Solution**
$D = 0$ and D_x, D_y and D_z are all zero	consistent and dependent	infinitely many solutions
$D = 0$ and D_x, D_y and D_z are not all zero	inconsistent	no solution

In the next example, we will use the values of the determinants to find the solution of the system.

Example 21.7.19

Solve the system of equations using Cramer's rule : $\begin{cases} x + 3y = 4 \\ -2x - 6y = 3 \end{cases}$

Answer

Evaluate the determinantD,using the coefficients of the variables.

$$\begin{cases} x + 3y = 4 \\ -2x - 6y = 3 \end{cases}$$

$$D = \begin{vmatrix} 1 & 3 \\ -2 & -6 \end{vmatrix}$$

$$D = -6 - (-6)$$

$$D = 0$$

We cannot use Cramer's Rule to solve this system. But by looking at the value of the determinants D_x and D_y, we can determine whether the system is dependent or inconsistent.

Evaluate the determinant D_x.

$$D_x = \begin{vmatrix} 4 & 3 \\ 3 & -6 \end{vmatrix}$$

$$D_x = -24 - 9$$

$$D_x = 15$$

Since all the determinants are not zero, the system is inconsistent. There is no solution.

Example 21.7.20

Solve the system of equations using Cramer's rule: $\begin{cases} 4x - 3y = 8 \\ 8x - 6y = 14 \end{cases}$

Answer

no solution

Example 21.7.21

Solve the system of equations using Cramer's rule: $\begin{cases} x = -3y + 4 \\ 2x + 6y = 8 \end{cases}$

Answer

infinite solutions

Solve Applications using Determinants

An interesting application of determinants allows us to test if points are collinear. Three points (x_1, y_1), (x_2, y_2) and (x_3, y_3) are collinear if and only if the determinant below is zero.

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

TEST FOR COLLINEAR POINTS

Three points (x_1, y_1), (x_2, y_2) and (x_3, y_3) are collinear if and only if

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

We will use this property in the next example.

Example 21.7.22

Determine whether the points $(5, -5)$, $(4, -3)$, and $(3, -1)$ are collinear.

Answer

	$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$
Substitute the values into the determinant. $(5, -5)$, $(4, -3)$, and $(3, -1)$	$\begin{vmatrix} 5 & -5 & 1 \\ 4 & -3 & 1 \\ 3 & -1 & 1 \end{vmatrix}$
Evaluate the determinant by expanding by minors using column 3.	$1\begin{vmatrix} 4 & -3 \\ 3 & -1 \end{vmatrix} - 1\begin{vmatrix} 5 & -5 \\ 3 & -1 \end{vmatrix} + 1\begin{vmatrix} 5 & -5 \\ 4 & -3 \end{vmatrix}$
Evaluate the determinants.	$1(-4-(-9)) - 1(-5-(-15)) + 1(-15-(-20))$
Simplify.	$1(5) - 1(10) + 1(5)$
Simplify.	0
	The value of the determinate is 0, so the points are collinear.

Example 21.7.23

Determine whether the points $(3, -2)$, $(5, -3)$, and $(1, -1)$ are collinear.

Answer

yes

Example 21.7.24

Determine whether the points $(-4,-1)$, $(-6,2)$, and $(-2,-4)$ are collinear.

Answer

yes

Access these online resources for additional instruction and practice with solving systems of linear inequalities by graphing.

- Solving Systems of Linear Inequalities by Graphing
- Systems of Linear Inequalities

Key Concepts

- **Determinant:** The determinant of any square matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$, where *a*, *b*, *c*, and *d* are real numbers, is
$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$$
- **Expanding by Minors along the First Row to Evaluate a 3 × 3 Determinant:** To evaluate a 3×3 determinant by expanding by minors along the first row, the following pattern:
$$\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \underbrace{\begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix}}_{\text{minor of } a_1} - b_1 \underbrace{\begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix}}_{\text{minor of } b_1} + c_1 \underbrace{\begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix}}_{\text{minor of } c_1}$$
- **Sign Pattern:** When expanding by minors using a row or column, the sign of the terms in the expansion follow the following pattern.
$$\begin{vmatrix} + & - & + \\ - & + & - \\ + & - & + \end{vmatrix}$$
- **Cramer's Rule:** For the system of equations $\begin{cases} a_1x + b_1y = k_1 \\ a_2x + b_2y = k_2 \end{cases}$, the solution (x, y) can be determined by
$$x = \frac{D_x}{D} \text{ and } y = \frac{D_y}{D}$$
where $D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$ use the coefficients of the variables.
$D_x = \begin{vmatrix} k_1 & b_1 \\ k_2 & b_2 \end{vmatrix}$ replace the *x* coefficients with the constants.
$D_y = \begin{vmatrix} a_1 & k_1 \\ a_2 & k_2 \end{vmatrix}$ replace the *y* coefficients with the constants.
Notice that to form the determinant *D*, we use take the coefficients of the variables.
- **How to solve a system of two equations using Cramer's rule.**
  1. Evaluate the determinant *D*, using the coefficients of the variables.
  2. Evaluate the determinant D_x. Use the constants in place of the *x* coefficients.
  3. Evaluate the determinant D_y. Use the constants in place of the *y* coefficients.
  4. Find *x* and *y*. $x = \frac{D_x}{D}$, $y = \frac{D_y}{D}$.
  5. Write the solution as an ordered pair.
  6. Check that the ordered pair is a solution to **both** original equations.
  7. **Dependent and Inconsistent Systems of Equations:** For any system of equations, where the **value of the determinant** $D = 0$,

Value of determinants	Type of system	Solution
$D=0$ and $D_x,\ D_y$ and D_z are all zero	consistent and dependent	infinitely many solutions
$D=0$ and $D_x,\ D_y$ and D_z are not all zero	inconsistent	no solution

8. **Test for Collinear Points:** Three points (x_1, y_1), (x_2, y_2), and (x_3, y_3) are collinear if and only if

$$\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = 0$$

Glossary

determinant

Each square matrix has a real number associated with it called its determinant.

minor of an entry in a 3×33×3 determinant

The minor of an entry in a 3×33×3 determinant is the 2×22×2 determinant found by eliminating the row and column in the 3×33×3determinant that contains the entry.

square matrix

A square matrix is a matrix with the same number of rows and columns.

21.7E: Exercises

Practice Makes Perfect

Evaluate the Determinant of a 2 × 2 Matrix

In the following exercises, evaluate the determinate of each square matrix.

$\begin{bmatrix} 6 & -2 \\ 3 & -1 \end{bmatrix}$

$\begin{bmatrix} -4 & 8 \\ -3 & 5 \end{bmatrix}$

Answer

4

$\begin{bmatrix} -3 & 5 \\ 0 & -4 \end{bmatrix}$

$\begin{bmatrix} -2 & 0 \\ 7 & -5 \end{bmatrix}$

Answer

10

Evaluate the Determinant of a 3 × 3 Matrix

In the following exercises, find and then evaluate the indicated minors.

$\begin{vmatrix} 3 & -1 & 4 \\ -1 & 0 & -2 \\ -4 & 1 & 5 \end{vmatrix}$

Find the minor ⓐ a_1 ⓑ b_2 ⓒ c_3

$\begin{vmatrix} -1 & -3 & 2 \\ 4 & -2 & -1 \\ -2 & 0 & -3 \end{vmatrix}$

Find the minor ⓐ a_1 ⓑ b_1 ⓒ c_2

Answer

ⓐ 6 ⓑ -14 ⓒ -6

$\begin{vmatrix} 2 & -3 & -4 \\ -1 & 2 & -3 \\ 0 & -1 & -2 \end{vmatrix}$

Find the minor ⓐ a_2 ⓑ b_2 ⓒ c_2

$\begin{vmatrix} -2 & -2 & 3 \\ 1 & -3 & 0 \\ -2 & 3 & -2 \end{vmatrix}$

Find the minor ⓐ a_3 ⓑ b_3 ⓒ c_3

Answer

ⓐ 9 ⓑ -3 ⓒ 8

In the following exercises, evaluate each determinant by expanding by minors along the first row.

$$\begin{vmatrix} -2 & 3 & -1 \\ -1 & 2 & -2 \\ 3 & 1 & -3 \end{vmatrix}$$

$$\begin{vmatrix} 4 & -1 & -2 \\ -3 & -2 & 1 \\ -2 & -5 & 7 \end{vmatrix}$$

Answer

-77

$$\begin{vmatrix} -2 & -3 & -4 \\ 5 & -6 & 7 \\ -1 & 2 & 0 \end{vmatrix}$$

$$\begin{vmatrix} 1 & 3 & -2 \\ 5 & -6 & 4 \\ 0 & -2 & -1 \end{vmatrix}$$

Answer

49

In the following exercises, evaluate each determinant by expanding by minors.

$$\begin{vmatrix} -5 & -1 & -4 \\ 4 & 0 & -3 \\ 2 & -2 & 6 \end{vmatrix}$$

$$\begin{vmatrix} 4 & -1 & 3 \\ 3 & -2 & 2 \\ -1 & 0 & 4 \end{vmatrix}$$

Answer

-24

$$\begin{vmatrix} 3 & 5 & 4 \\ -1 & 3 & 0 \\ -2 & 6 & 1 \end{vmatrix}$$

$$\begin{vmatrix} 2 & -4 & -3 \\ 5 & -1 & -4 \\ 3 & 2 & 0 \end{vmatrix}$$

Answer

25

Use Cramer's Rule to Solve Systems of Equations

In the following exercises, solve each system of equations using Cramer's Rule.

$$\begin{cases} -2x+3y=3 \\ x+3y=12 \end{cases}$$

$$\begin{cases} x-2y=-5 \\ 2x-3y=-4 \end{cases}$$

Answer

$(7,6)$

$$\begin{cases} x-3y=-9 \\ 2x+5y=4 \end{cases}$$

$$\begin{cases} 2x+y=-4 \\ 3x-2y=-6 \end{cases}$$

Answer

$(-2,0)$

$$\begin{cases} x-2y=-5 \\ 2x-3y=-4 \end{cases}$$

$$\begin{cases} x-3y=-9 \\ 2x+5y=4 \end{cases}$$

Answer

$(-3,2)$

$$\begin{cases} 5x-3y=-1 \\ 2x-y=2 \end{cases}$$

$$\begin{cases} 3x+8y=-3 \\ 2x+5y=-3 \end{cases}$$

Answer

$(-9,3)$

$$\begin{cases} 6x-5y+2z=3 \\ 2x+y-4z=5 \\ 3x-3y+z=-1 \end{cases}$$

$$\begin{cases} 4x-3y+z=7 \\ 2x-5y-4z=3 \\ 3x-2y-2z=-7 \end{cases}$$

Answer

$(-3,-5,4)$

$$\begin{cases} 2x-5y+3z=8 \\ 3x-y+4z=7 \\ x+3y+2z=-3 \end{cases}$$

$$\begin{cases} 11x+9y+2z=-9 \\ 7x+5y+3z=-7 \\ 4x+3y+z=-3 \end{cases}$$

Answer

$(2,-3,-2)$

$$\begin{cases} x+2z=0 \\ 4y+3z=-2 \\ 2x-5y=3 \end{cases}$$

$$\begin{cases} 2x+5y=4 \\ 3y-z=3 \\ 4x+3z=-3 \end{cases}$$

Answer

$(-3,2,3)$

$$\begin{cases} 2y+3z=-1 \\ 5x+3y=-6 \\ 7x+z=1 \end{cases}$$

$$\begin{cases} 3x-z=-3 \\ 5y+2z=-6 \\ 4x+3y=-8 \end{cases}$$

Answer

$(-2,0,-3)$

$$\begin{cases} 2x+y=3 \\ 6x+3y=9 \end{cases}$$

$$\begin{cases} x-4y=-1 \\ -3x+12y=3 \end{cases}$$

Answer

infinitely many solutions

$$\begin{cases} -3x-y=4 \\ 6x+2y=-16 \end{cases}$$

$$\begin{cases} 4x+3y=2 \\ 20x+15y=5 \end{cases}$$

Answer

inconsistent

$$\begin{cases} x+y-3z=-1 \\ y-z=0 \\ -x+2y=1 \end{cases}$$

$$\begin{cases} 2x+3y+z=1 \\ 2x+y+z=9 \\ 3x+4y+2z=20 \end{cases}$$

Answer

inconsistent

$$\begin{cases} 3x+4y-3z=-2 \\ 2x+3y-z=-1 \\ 2x+y-2z=6 \end{cases}$$

$$\begin{cases} x-2y+3z=1 \\ x+y-3z=7 \\ 3x-4y+5z=7 \end{cases}$$

Answer

infinitely many solutions

Solve Applications Using Determinants

In the following exercises, determine whether the given points are collinear.

$(0,1)$, $(2,0)$, and $(-2,2)$.

$(0,-5)$, $(-2,-2)$, and $(2,-8)$.

Answer

yes

$(4,-3)$, $(6,-4)$, and $(2,-2)$.

$(-2,1)$, $(-4,4)$, and $(0,-2)$.

Answer

no

Writing Exercises

Explain the difference between a square matrix and its determinant. Give an example of each.

Explain what is meant by the minor of an entry in a square matrix.

Answer

Answers will vary.

Explain how to decide which row or column you will use to expand a 3×3 determinant.

Explain the steps for solving a system of equations using Cramer's rule.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
evaluate the determinant of a 2×2 matrix.			
evaluate the determinant of a 3×3 matrix.			
use Cramer's rule to solve systems of equations.			
solve applications using determinants.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

21.8: Review Exercises

Chapter Review Exercises

Solve Systems of Linear Equations with Two Variables

Determine Whether an Ordered Pair is a Solution of a System of Equations.

In the following exercises, determine if the following points are solutions to the given system of equations.

1. $\begin{cases} x+3y=-9 \\ 2x-4y=12 \end{cases}$

ⓐ $(-3,-2)$
ⓑ $(0,-3)$

2. $\begin{cases} x+y=8 \\ y=x-4 \end{cases}$

ⓐ $(6,2)$
ⓑ $(9,-1)$

Answer

ⓐ yes ⓑ no

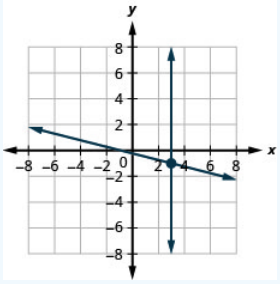
Solve a System of Linear Equations by Graphing

In the following exercises, solve the following systems of equations by graphing.

3. $\begin{cases} 3x+y=6 \\ x+3y=-6 \end{cases}$

4. $\begin{cases} x+4y=-1 \\ x=3 \end{cases}$

Answer

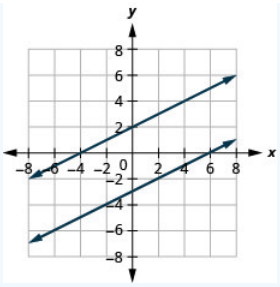


$(3,-1)$

5. $\begin{cases} 2x-y=5 \\ 4x-2y=10 \end{cases}$

6. $\begin{cases} -x+2y=4 \\ y=\frac{1}{2}x-3 \end{cases}$

Answer



no solution

In the following exercises, without graphing determine the number of solutions and then classify the system of equations.

7. $\begin{cases} y = \frac{2}{5}x + 2 \\ -2x + 5y = 10 \end{cases}$

8. $\begin{cases} 3x + 2y = 6 \\ y = -3x + 4 \end{cases}$

Answer

one solution, consistent system, independent equations

9. $\begin{cases} 5x - 4y = 0 \\ y = \frac{5}{4}x - 5 \end{cases}$

Solve a System of Equations by Substitution

In the following exercises, solve the systems of equations by substitution.

10. $\begin{cases} 3x - 2y = 2 \\ y = \frac{1}{2}x + 3 \end{cases}$

Answer

$(4, 5)$

11. $\begin{cases} x - y = 0 \\ 2x + 5y = -14 \end{cases}$

12. $\begin{cases} y = -2x + 7 \\ y = \frac{2}{3}x - 1 \end{cases}$

Answer

$(3, 1)$

13. $\begin{cases} y = -5x \\ 5x + y = 6 \end{cases}$

14. $\begin{cases} y = -\frac{1}{3}x + 2 \\ x + 3y = 6 \end{cases}$

Answer

infinitely many solutions

Solve a System of Equations by Elimination

In the following exercises, solve the systems of equations by elimination

15. $\begin{cases} x+y=12 \\ x-y=-10 \end{cases}$

16. $\begin{cases} 3x-8y=20 \\ x+3y=1 \end{cases}$

Answer

$(4,-1)$

17. $\begin{cases} 9x+4y=2 \\ 5x+3y=5 \end{cases}$

18. $\begin{cases} \frac{1}{3}x-\frac{1}{2}y=1 \\ \frac{3}{4}x-y=\frac{5}{2} \end{cases}$

Answer

$(6,2)$

19. $\begin{cases} -x+3y=8 \\ 2x-6y=-20 \end{cases}$

Choose the Most Convenient Method to Solve a System of Linear Equations

In the following exercises, decide whether it would be more convenient to solve the system of equations by substitution or elimination.

20. $\begin{cases} 6x-5y=27 \\ 3x+10y=-24 \end{cases}$

Answer

elimination

21. $\begin{cases} y=3x-9 \\ 4x-5y=23 \end{cases}$

Solve Applications with Systems of Equations

Solve Direct Translation Applications

In the following exercises, translate to a system of equations and solve.

22. Mollie wants to plant 200 bulbs in her garden, all irises and tulips. She wants to plant three times as many tulips as irises. How many irises and how many tulips should she plant?

Answer

50 irises and 150 tulips

23. Ashanti has been offered positions by two phone companies. The first company pays a salary of $22,000 plus a commission of $100 for each contract sold. The second pays a salary of $28,000 plus a commission of $25 for each contract sold. How many contract would need to be sold to make the total pay the same?

24. Leroy spent 20 minutes jogging and 40 minutes cycling and burned 600 calories. The next day, Leroy swapped times, doing 40 minutes of jogging and 20 minutes of cycling and burned the same number of calories. How many calories were burned for each minute of jogging and how many for each minute of cycling?

Answer

10 calories jogging and 10 calories cycling

25. Troy and Lisa were shopping for school supplies. Each purchased different quantities of the same notebook and calculator. Troy bought four notebooks and five calculators for $116. Lisa bought two notebooks and three calculators for $68. Find the cost of each notebook and each thumb drive.

Solve Geometry Applications

In the following exercises, translate to a system of equations and solve.

26. The difference of two supplementary angles is 58 degrees. Find the measures of the angles.

Answer

119, 61

27. Two angles are complementary. The measure of the larger angle is five more than four times the measure of the smaller angle. Find the measures of both angles.

28. The measure of one of the small angles of a right triangle is 15 less than twice the measure of the other small angle. Find the measure of both angles.

Answer

35° and 55°

29. Becca is hanging a 28 foot floral garland on the two sides and top of a pergola to prepare for a wedding. The height is four feet less than the width. Find the height and width of the pergola.

30. The perimeter of a city rectangular park is 1428 feet. The length is 78 feet more than twice the width. Find the length and width of the park.

Answer

the length is 450 feet, the width is 264 feet

Solve Uniform Motion Applications

In the following exercises, translate to a system of equations and solve.

31. Sheila and Lenore were driving to their grandmother's house. Lenore left one hour after Sheila. Sheila drove at a rate of 45 mph, and Lenore drove at a rate of 60 mph. How long will it take for Lenore to catch up to Sheila?

32. Bob left home, riding his bike at a rate of 10 miles per hour to go to the lake. Cheryl, his wife, left 45 minutes (34(34 hour) later, driving her car at a rate of 25 miles per hour. How long will it take Cheryl to catch up to Bob?

Answer

12 an hour

33. Marcus can drive his boat 36 miles down the river in three hours but takes four hours to return upstream. Find the rate of the boat in still water and the rate of the current.

34. A passenger jet can fly 804 miles in 2 hours with a tailwind but only 776 miles in 2 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

the rate of the jet is 395 mph, the rate of the wind is 7 mph

Solve Mixture Applications with Systems of Equations

Solve Mixture Applications with Systems of Equations

For the following exercises, translate to a system of equations and solve.

35. Lynn paid a total of $2,780 for 261 tickets to the theater. Student tickets cost $10 and adult tickets cost $15. How many student tickets and how many adult tickets did Lynn buy?

36. Priam has dimes and pennies in a cup holder in his car. The total value of the coins is $4.21. The number of dimes is three less than four times the number of pennies. How many dimes and how many pennies are in the cup?

Answer

41 dimes and 11 pennies

37. Yumi wants to make 12 cups of party mix using candies and nuts. Her budget requires the party mix to cost her $1.29 per cup. The candies are $2.49 per cup and the nuts are $0.69 per cup. How many cups of candies and how many cups of nuts should she use?

38. A scientist needs 70 liters of a 40% solution of alcohol. He has a 30% and a 60% solution available. How many liters of the 30% and how many liters of the 60% solutions should he mix to make the 40% solution?

Answer

$46\frac{2}{3}$ liters of 30% solution, $23\frac{1}{3}$ liters of 60% solution

Solve Interest Applications

For the following exercises, translate to a system of equations and solve.

39. Jack has $12,000 to invest and wants to earn 7.5% interest per year. He will put some of the money into a savings account that earns 4% per year and the rest into CD account that earns 9% per year. How much money should he put into each account?

40. When she graduates college, Linda will owe $43,000 in student loans. The interest rate on the federal loans is 4.5% and the rate on the private bank loans is 2%. The total interest she owes for one year was $1,585. What is the amount of each loan?

Answer

$29,000 for the federal loan, $14,000 for the private loan

Solve Systems of Equations with Three Variables

Solve Systems of Equations with Three Variables

In the following exercises, determine whether the ordered triple is a solution to the system.

41. $\begin{cases} 3x-4y-3z=2 \\ 2x-6y+z=3 \\ 2x+3y-2z=3 \end{cases}$

ⓐ $(2,3,-1)$
ⓑ $(3,1,3)$

42. $\begin{cases} y=\frac{2}{3}x-2 \\ x+3y-z=15 \\ x-3y+z=-2 \end{cases}$

ⓐ $(-6,5,\frac{1}{2})$
ⓑ $(5,\frac{4}{3},-3)$

Answer

ⓐ no ⓑ yes

Solve a System of Linear Equations with Three Variables

In the following exercises, solve the system of equations.

43. $\begin{cases} 3x-5y+4z=5 \\ 5x+2y+z=0 \\ 2x+3y-2z=3 \end{cases}$

44. $\begin{cases} x+\frac{5}{2}y+z=-2 \\ 2x+2y+\frac{1}{2}z=-4 \\ \frac{1}{3}x-y-z=1 \end{cases}$

Answer

$(-3,2,-4)$

45. $\begin{cases} 5x+3y=-6 \\ 2y+3z=-1 \\ 7x+z=1 \end{cases}$

46. $\begin{cases} 2x+3y+z=12 \\ x+y+z=9 \\ 3x+4y+2z=20 \end{cases}$

Answer

no solution

47. $\begin{cases} -x-3y+2z=14 \\ -x+2y-3z=-4 \\ 3x+y-2z=6 \end{cases}$

Solve Applications using Systems of Linear Equations with Three Variables

48. After attending a major league baseball game, the patrons often purchase souvenirs. If a family purchases 4 t-shirts, a cap and 1 stuffed animal their total is $135. A couple buys 2 t-shirts, a cap and 3 stuffed animals for their nieces and spends $115. Another couple buys 2 t-shirts, a cap and 1 stuffed animal and their total is $85. What is the cost of each item?

Answer

$25, 20, 15$

Solve Systems of Equations Using Matrices

Write the Augmented Matrix for a System of Equations.

Write each system of linear equations as an augmented matrix.

49. $\begin{cases} 3x - y = -1 \\ -2x + 2y = 5 \end{cases}$

50. $\begin{cases} 4x + 3y = -2 \\ x - 2y - 3z = 7 \\ 2x - y + 2z = -6 \end{cases}$

Answer

$$\begin{bmatrix} 4 & 3 & 0 & -2 \\ 1 & -2 & -3 & 7 \\ 2 & -1 & 2 & -6 \end{bmatrix}$$

Write the system of equations that that corresponds to the augmented matrix.

51. $\left[\begin{array}{cc|c} 2 & -4 & -2 \\ 3 & -3 & -1 \end{array}\right]$

52. $\left[\begin{array}{ccc|c} 1 & 0 & -3 & -1 \\ 1 & -2 & 0 & -2 \\ 0 & -1 & 2 & 3 \end{array}\right]$

Answer

$$\begin{cases} x - 3z = -1 \\ x - 2y = -27 \\ -y + 2z = 3 \end{cases}$$

In the following exercises, perform the indicated operations on the augmented matrices.

53. $\left[\begin{array}{cc|c} 4 & -6 & -3 \\ 3 & 2 & 1 \end{array}\right]$

ⓐ Interchange rows 2 and 1.
ⓑ Multiply row 1 by 4.
ⓒ Multiply row 2 by 3 and add to row 1.

54. $\left[\begin{array}{ccc|c} 1 & -3 & -2 & 4 \\ 2 & 2 & -1 & -3 \\ 4 & -2 & -3 & -1 \end{array}\right]$

ⓐ Interchange rows 2 and 3.
ⓑ Multiply row 1 by 2.
ⓒ Multiply row 3 by $-2-2$ and add to row 2.

Answer

ⓐ $\begin{bmatrix} 1 & -3 & -2 & 4 \\ 4 & -2 & -3 & -1 \\ 2 & 2 & -1 & -3 \end{bmatrix}$

ⓑ $\begin{bmatrix} 2 & -6 & -4 & 8 \\ 4 & -2 & -3 & -1 \\ 2 & 2 & -1 & -3 \end{bmatrix}$

ⓒ $\begin{bmatrix} 2 & -6 & -4 & 8 \\ 4 & -2 & -3 & -1 \\ 0 & -6 & -1 & 5 \end{bmatrix}$

Solve Systems of Equations Using Matrices

In the following exercises, solve each system of equations using a matrix.

55. $\begin{cases} 4x+y=6 \\ x-y=4 \end{cases}$

56. $\begin{cases} 2x-y+3z=-3 \\ -x+2y-z=10 \\ x+y+z=5 \end{cases}$

Answer

$(-2, 5, -2)$

57. $\begin{cases} 2y+3z=-1 \\ 5x+3y=-6 \\ 7x+z=1 \end{cases}$

58. $\begin{cases} x+2y-3z=-1 \\ x-3y+z=1 \\ 2x-y-2z=2 \end{cases}$

Answer

no solution

59. $\begin{cases} x+y-3z=-1 \\ y-z=0 \\ -x+2y=1 \end{cases}$

Solve Systems of Equations Using Determinants

Evaluate the Determinant of a 2 × 2 Matrix

In the following exercise, evaluate the determinate of the square matrix.

60. $\begin{bmatrix} 8 & -4 \\ 5 & -3 \end{bmatrix}$

Answer

-4

Evaluate the Determinant of a 3 × 3 Matrix

In the following exercise, find and then evaluate the indicated minors.

61. $\begin{vmatrix} -1 & -3 & 2 \\ 4 & -2 & -1 \\ -2 & 0 & -3 \end{vmatrix}$; Find the minor ⓐ a_1 ⓑ b_1 ⓒ c_2

In the following exercise, evaluate each determinant by expanding by minors along the first row.

62. $\begin{vmatrix} -2 & -3 & -4 \\ 5 & -6 & 7 \\ -1 & 2 & 0 \end{vmatrix}$

Answer

21In the following exercise, evaluate each determinant by expanding by minors.

63. $\begin{vmatrix} 3 & 5 & 4 \\ -1 & 3 & 0 \\ -2 & 6 & 1 \end{vmatrix}$

Use Cramer's Rule to Solve Systems of Equations

In the following exercises, solve each system of equations using Cramer's rule

64. $\begin{cases} x-3y=-9 \\ 2x+5y=4 \end{cases}$

Answer

$(-3, 2)$

65. $\begin{cases} 4x-3y+z=7 \\ 2x-5y-4z=3 \\ 3x-2y-2z=-7 \end{cases}$

66. $\begin{cases} 2x+5y=4 \\ 3y-z=3 \\ 4x+3z=-3 \end{cases}$

Answer

$(-3, 2, 3)$

67. $\begin{cases} x+y-3z=-1 \\ y-z=0 \\ -x+2y=1 \end{cases}$

68. $\begin{cases} 3x+4y-3z=-2 \\ 2x+3y-z=-1 \\ 2x+y-2z=6 \end{cases}$

Answer

inconsistent

Solve Applications Using Determinants

In the following exercises, determine whether the given points are collinear.

69. $(0, 2)$, $(-1, -1)$, and $(-2, 4)$

Graphing Systems of Linear Inequalities

Determine Whether an Ordered Pair is a Solution of a System of Linear Inequalities

In the following exercises, determine whether each ordered pair is a solution to the system.

70. $\begin{cases} 4x + y > 6 \\ 3x - y \leq 12 \end{cases}$

ⓐ $(2, -1)$
ⓑ $(3, -2)$

Answer

ⓐ yes ⓑ no

71. $\begin{cases} y > \frac{1}{3}x + 2 \\ x - \frac{1}{4}y \leq 10 \end{cases}$

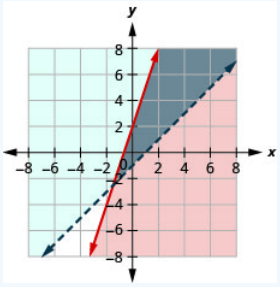
ⓐ $(6, 5)$
ⓑ $(15, 8)$

Solve a System of Linear Inequalities by Graphing

In the following exercises, solve each system by graphing.

72. $\begin{cases} y < 3x + 1 \\ y \geq -x - 2 \end{cases}$

Answer

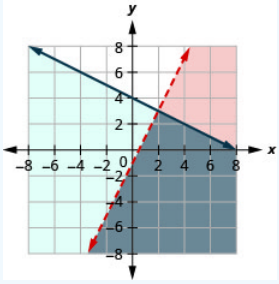


The solution is the grey region.

73. $\begin{cases} x - y > -1 \\ y < \frac{1}{3}x - 2 \end{cases}$

74. $\begin{cases} 2x - 3y < 6 \\ 3x + 4y \geq 12 \end{cases}$

Answer

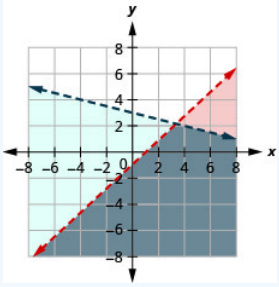


The solution is the grey region.

75. $\begin{cases} y \leq -\frac{3}{4}x + 1 \\ x \geq -5 \end{cases}$

76. $\begin{cases} x + 3y < 5 \\ y \geq -\frac{1}{3}x + 6 \end{cases}$

Answer



No solution.

77. $\begin{cases} y \geq 2x - 5 \\ -6x + 3y > -4 \end{cases}$

Solve Applications of Systems of Inequalities

In the following exercises, translate to a system of inequalities and solve.

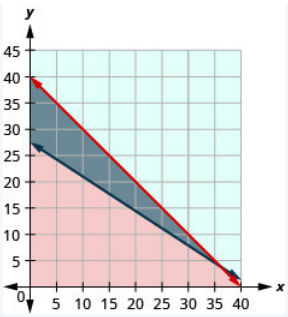
78. Roxana makes bracelets and necklaces and sells them at the farmers' market. She sells the bracelets for $12 each and the necklaces for $18 each. At the market next weekend she will have room to display no more than 40 pieces, and she needs to sell at least $500 worth in order to earn a profit.

ⓐ Write a system of inequalities to model this situation.
ⓑ Graph the system.
ⓒ Should she display 26 bracelets and 14 necklaces?
ⓓ Should she display 39 bracelets and 1 necklace?

Answer

ⓐ $\begin{cases} b \geq 0 \\ n \geq 0 \\ b + n \leq 40 \\ 12b + 18n \geq 500 \end{cases}$

ⓑ



ⓒ yes
ⓓ no

79. Annie has a budget of $600 to purchase paperback books and hardcover books for her classroom. She wants the number of hardcover to be at least 5 more than three times the number of paperback books. Paperback books cost $4 each and hardcover books cost $15 each.

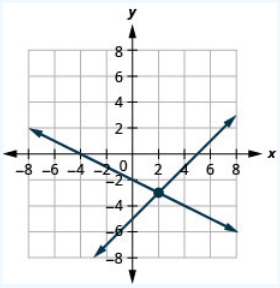
ⓐ Write a system of inequalities to model this situation.
ⓑ Graph the system.
ⓒ Can she buy 8 paperback books and 40 hardcover books?
ⓓ Can she buy 10 paperback books and 37 hardcover books?

Chapter Practice Test

In the following exercises, solve the following systems by graphing.

1. $\begin{cases} x-y=5 \\ x+2y=-4 \end{cases}$

Answer



$(2,-3)$

2. $\begin{cases} x-y>-2 \\ y\leq 3x+1 \end{cases}$

In the following exercises, solve each system of equations. Use either substitution or elimination.

3. $\begin{cases} x+4y=6 \\ -2x+y=-3 \end{cases}$

Answer

$(2,1)$

4. $\begin{cases} -3x+4y=2 \\ 5x-5y=-23 \end{cases}$

5. $\begin{cases} x+y-z=-1 \\ 2x-y+2z=8 \\ -3x+2y+z=-9 \end{cases}$

Answer

$(2,-2,1)$

Solve the system of equations using a matrix.

6. $\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$

7. $\begin{cases} -3x+y+z=-4 \\ -x+2y-2z=1 \\ 2x-y-z=-1 \end{cases}$

Answer

$(5,7,4)$

Solve using Cramer's rule.

8. $\begin{cases} 3x+y=-3 \\ 2x+3y=6 \end{cases}$

9. Evaluate the determinant by expanding by minors:

$$\begin{vmatrix} 3 & -2 & -2 \\ 2 & -1 & 4 \\ -1 & 0 & -3 \end{vmatrix}$$

Answer

99

In the following exercises, translate to a system of equations and solve.

10. Greg is paddling his canoe upstream, against the current, to a fishing spot 10 miles away. If he paddles upstream for 2.5 hours and his return trip takes 1.25 hours, find the speed of the current and his paddling speed in still water.

11. A pharmacist needs 20 liters of a 2% saline solution. He has a 1% and a 5% solution available. How many liters of the 1% and how many liters of the 5% solutions should she mix to make the 2% solution?

Answer

15 liters of 1% solution, 5 liters of 5% solution

12. Arnold invested $64,000, some at 5.5% interest and the rest at 9%. How much did he invest at each rate if he received $4,500 in interest in one year?

13. The church youth group is selling snacks to raise money to attend their convention. Amy sold 2 pounds of candy, 3 boxes of cookies and 1 can of popcorn for a total sales of $65. Brian sold 4 pounds of candy, 6 boxes of cookies and 3 cans of

popcorn for a total sales of $140. Paulina sold 8 pounds of candy, 8 boxes of cookies and 5 can of popcorn for a total sales of $250. What is the cost of each item?

Answer

The candy cost $20; the cookies cost $5; and the popcorn cost $10.

14. The manufacturer of a granola bar spends $1.20 to make each bar and sells them for $2. The manufacturer also has fixed costs each month of $8,000.

ⓐ Find the cost function C when x granola bars are manufactured
ⓑ Find the revenue function R when x granola bars are sold.
ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.
ⓓ Find the break-even point. Interpret what the break-even point means.

15. Translate to a system of inequalities and solve.

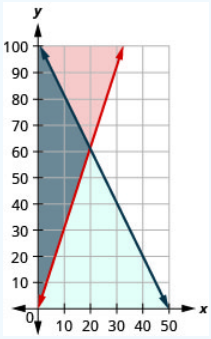
Andi wants to spend no more than $50 on Halloween treats. She wants to buy candy bars that cost $1 each and lollipops that cost $0.50 each, and she wants the number of lollipops to be at least three times the number of candy bars.

ⓐ Write a system of inequalities to model this situation.
ⓑ Graph the system.
ⓒ Can she buy 20 candy bars and 40 lollipops?

Answer

ⓐ $$\begin{cases} C \geq 0 \\ L \geq 0 \\ C + 0.5L \leq 50 \\ L \geq 3C \end{cases}$$

ⓑ



ⓒ no
ⓓ yes

22.1: Prelude to Conics

Five, Four. Three. Two. One. Lift off. The rocket launches off the ground headed toward space. Unmanned spaceships, and spaceships in general, are designed by aerospace engineers. These engineers are investigating reusable rockets that return safely to Earth to be used again. Someday, rockets may carry passengers to the International Space Station and beyond. One essential math concept for aerospace engineers is that of conics. In this chapter, you will learn about conics, including circles, parabolas, ellipses, and hyperbolas. Then you will use what you learn to investigate systems of nonlinear equations.

22.2: Distance and Midpoint Formulas and Circles

Learning Objectives

By the end of this section, you will be able to:

- Use the Distance Formula
- Use the Midpoint Formula
- Write the equation of a circle in standard form
- Graph a circle

Before you get started, take this readiness quiz.

1. Find the length of the hypotenuse of a right triangle whose legs are 12 and 16 inches.
   If you missed this problem, review Example 2.34.
2. Factor: $x^2-18x+81$.
   If you missed this problem, review Example 6.24.
3. Solve by completing the square: $x^2-12x-12=0$.
   If you missed this problem, review Example 9.22.

In this chapter we will be looking at the conic sections, usually called the conics, and their properties. The conics are curves that result from a plane intersecting a double cone—two cones placed point-to-point. Each half of a double cone is called a nappe.

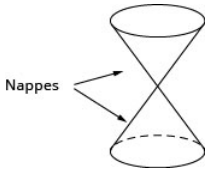

Figure 11.1.1

There are four conics—the **circle**, **parabola**, **ellipse**, and **hyperbola**. The next figure shows how the plane intersecting the double cone results in each curve.

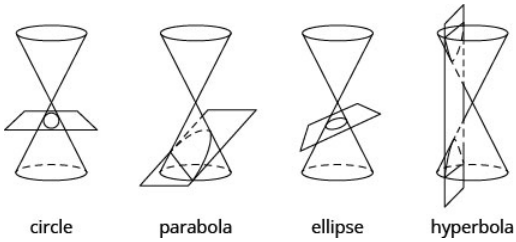

Figure 11.1.2

Each of the curves has many applications that affect your daily life, from your cell phone to acoustics and navigation systems. In this section we will look at the properties of a circle.

Use the Distance Formula

We have used the Pythagorean Theorem to find the lengths of the sides of a right triangle. Here we will use this theorem again to find distances on the rectangular coordinate system. By finding distance on the rectangular coordinate system, we can make a connection between the geometry of a conic and algebra—which opens up a world of opportunities for application.

Our first step is to develop a formula to find distances between points on the rectangular coordinate system. We will plot the points and create a right triangle much as we did when we found slope in Graphs and Functions. We then take it one step further and use the Pythagorean Theorem to find the length of the hypotenuse of the triangle—which is the distance between the points.

Example 22.2.1

Use the rectangular coordinate system to find the distance between the points $(6, 4)$ and $(2, 1)$.

Solution

Table 11.1.1

Plot the two points. Connect the two points with a line. Draw a right triangle as if you were going to find slope.	 Figure 11.1.3
Find the length of each leg.	 Figure 11.1.4
Use the Pythagorean Theorem to find d, the distance between the two points.	$a^2 + b^2 = c^2$
Substitute in the values.	$3^2 + 4^2 = d^2$
Simplify.	$9 + 16 = d^2$
	$25 = d^2$
Use the Square Root Property.	$d = 5 \quad d = \cancel{-5}$
Since distance, d is positive, we can eliminate $d = -5$.	The distance between the points $(6, 4)$ and $(2, 1)$ is 5.

Exercise 22.2.1

Use the rectangular coordinate system to find the distance between the points $(6, 1)$ and $(2, -2)$.

Answer

$d = 5$

Exercise 22.2.2

Use the rectangular coordinate system to find the distance between the points $(5, 3)$ and $(-3, -3)$.

Answer

$d = 10$

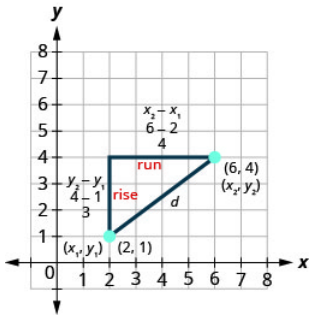

Figure 11.1.5

The method we used in the last example leads us to the formula to find the distance between the two points (x_1, y_1) and (x_2, y_2).

When we found the length of the horizontal leg we subtracted $6 - 2$ which is $x_2 - x_1$.

When we found the length of the vertical leg we subtracted $4 - 1$ which is $y_2 - y_1$.

If the triangle had been in a different position, we may have subtracted $x_1 - x_2$ or $y_1 - y_2$. The expressions $x_2 - x_1$ and $x_1 - x_2$ vary only in the sign of the resulting number. To get the positive value-since distance is positive- we can use absolute value. So to generalize we will say $|x_2 - x_1|$ and $|y_2 - y_1|$.

In the Pythagorean Theorem, we substitute the general expressions $|x_2 - x_1|$ and $|y_2 - y_1|$ rather than the numbers.

	$a^2 + b^2 = c^2$
Substitute in the values.	$(\|x_2 - x_1\|)^2 + (\|y_2 - y_1\|)^2 = d^2$
Squaring the expressions makes them positive, so we eliminate the absolute value bars.	$(x_2 - x_1)^2 + (y_2 - y_1)^2 = d^2$
Use the Square Root Property.	$d = \pm\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$
Distance is positive, so eliminate the negative value.	$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

This is the Distance Formula we use to find the distance d between the two points (x_1, y_1) and (x_2, y_2).

Definition 22.2.1

Distance Formula

The distance d between the two points (x_1, y_1) and (x_2, y_2) is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Example 22.2.2

Use the Distance Formula to find the distance between the points $(-5, -3)$ and $(7, 2)$.

Solution:

Write the Distance Formula.

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Label the points, $\begin{pmatrix} x_1, y_1 \\ -5, -3 \end{pmatrix}, \begin{pmatrix} x_2, y_2 \\ 7, 2 \end{pmatrix}$ and substitute.

$$d = \sqrt{(7 - (-5))^2 + (2 - (-3))^2}$$

Simplify.

$$d = \sqrt{12^2 + 5^2}$$
$$d = \sqrt{144 + 25}$$

$$d = \sqrt{169}$$
$$d = 13$$

Answer:

$d = 13$

Exercise 22.2.3

Use the Distance Formula to find the distance between the points $(-4, -5)$ and $(5, 7)$.

Answer

$d = 15$

Exercise 22.2.4

Use the Distance Formula to find the distance between the points $(-2, -5)$ and $(-14, -10)$.

Answer

$d = 13$

Example 22.2.3

Use the Distance Formula to find the distance between the points $(10, -4)$ and $(-1, 5)$. Write the answer in exact form and then find the decimal approximation, rounded to the nearest tenth if needed.

Solution:

Write the Distance Formula.

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Label the points, $\begin{pmatrix} x_1, y_1 \\ 10, -4 \end{pmatrix}$, $\begin{pmatrix} x_2, y_2 \\ -1, 5 \end{pmatrix}$ and substitute.

$$d = \sqrt{(-1 - 10)^2 + (5 - (-4))^2}$$

Simplify.

$$d = \sqrt{(-11)^2 + 9^2}$$
$$d = \sqrt{121 + 81}$$
$$d = \sqrt{202}$$

Since 202 is not a perfect square, we can leave the answer in exact form or find a decimal approximation.

$$d = \sqrt{202}$$
or
$$d \approx 14.2$$

Exercise 22.2.5

Use the Distance Formula to find the distance between the points $(-4, -5)$ and $(3, 4)$. Write the answer in exact form and then find the decimal approximation, rounded to the nearest tenth if needed.

Answer

$d = \sqrt{130}, d \approx 11.4$

Exercise 22.2.6

Use the Distance Formula to find the distance between the points $(-2,-5)$ and $(-3,-4)$. Write the answer in exact form and then find the decimal approximation, rounded to the nearest tenth if needed.

Answer

$d=\sqrt{2}, d \approx 1.4$

Use the Midpoint Formula

It is often useful to be able to find the midpoint of a segment. For example, if you have the endpoints of the diameter of a circle, you may want to find the center of the circle which is the midpoint of the diameter. To find the midpoint of a line segment, we find the average of the x-coordinates and the average of the y-coordinates of the endpoints.

Definition 22.2.2

Midpoint Formula

The midpoint of the line segment whose endpoints are the two points (x_1, y_1) and (x_2, y_2) is

$$\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$$

To find the midpoint of a line segment, we find the average of the x-coordinates and the average of the y-coordinates of the endpoints.

Example 22.2.4

Use the Midpoint Formula to find the midpoint of the line segments whose endpoints are $(-5,-4)$ and $(7,2)$. Plot the endpoints and the midpoint on a rectangular coordinate system.

Solution:

Table 11.1.2

Write the Midpoint Formula.	$\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$
Label the points, $\begin{pmatrix} x_1, y_1 \\ -5, -4 \end{pmatrix}, \begin{pmatrix} x_2, y_2 \\ 7, 2 \end{pmatrix}$ and substitute.	$\left(\frac{-5+7}{2}, \frac{-4+2}{2}\right)$
Simplify.	$\left(\frac{2}{2}, \frac{-2}{2}\right)$
	$(1,-1)$ The midpoint of the segment is the point $(1,-1)$.

Plot the endpoints and midpoint.

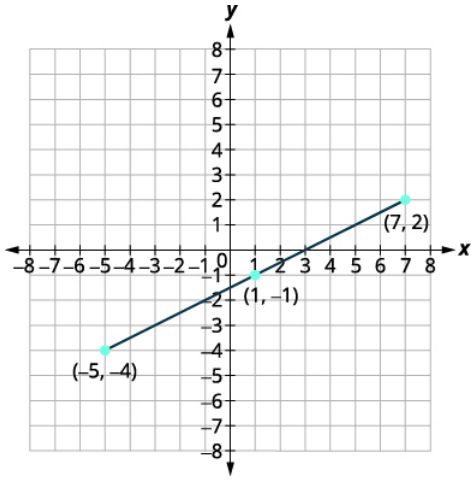

Figure 11.1.6

Exercise 22.2.7

Use the Midpoint Formula to find the midpoint of the line segments whose endpoints are $(-3,-5)$ and $(5,7)$. Plot the endpoints and the midpoint on a rectangular coordinate system.

Answer

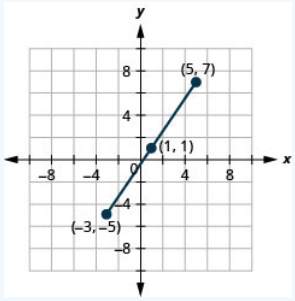

Figure 11.1.7

Exercise 22.2.8

Use the Midpoint Formula to find the midpoint of the line segments whose endpoints are $(-2,-5)$ and $(6,-1)$. Plot the endpoints and the midpoint on a rectangular coordinate system.

Answer

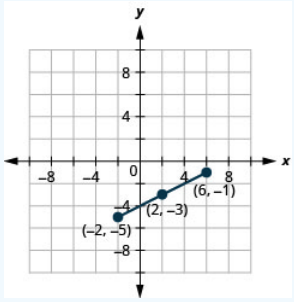

Figure 11.1.8

Both the Distance Formula and the Midpoint Formula depend on two points, (x_1, y_1) and (x_2, y_2). It is easy to confuse which formula requires addition and which subtraction of the coordinates. If we remember where the formulas come from, is may be easier to remember the formulas.

Distance Formula	Midpoint Formula
$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$	$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}\right)$
Subtract the coordinates.	Add the coordinates.

Figure 11.1.9

Write the Equation of a Circle in Standard Form

As we mentioned, our goal is to connect the geometry of a conic with algebra. By using the coordinate plane, we are able to do this easily.

Figure 11.1.10

We define a **circle** as all points in a plane that are a fixed distance from a given point in the plane. The given point is called the *center*, (h, k), and the fixed distance is called the *radius*, r, of the circle.

Definition 22.2.3

A circle is all points in a plane that are a fixed distance from a given point in the plane. The given point is called the **center**, (h, k), and the fixed distance is called the **radius**, r, of the circle.

Table 11.1.3

We look at a circle in the rectangular coordinate system. The radius is the distance from the center, (h, k),to a point on the circle, (x, y).	 Figure 11.1.11
To derive the equation of a circle, we can use the distance formula with the points (h, k), (x, y) and the distance, r.	$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$
Substitute the values.	$r = \sqrt{(x - h)^2 + (y - k)^2}$
Square both sides.	$r^2 = (x - h)^2 + (y - k)^2$

This is the standard form of the equation of a circle with center, (h, k), and radius, r.

Definition 22.2.4

The standard form of the equation of a circle with center, (h, k), and radius, r, is

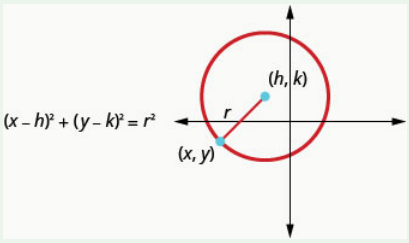

Figure 11.1.12

Example 22.2.5

Write the standard form of the equation of the circle with radius 3 and center $(0, 0)$.

Solution:

Table 11.1.4

Use the standard form of the equation of a circle	$(x-h)^2+(y-k)^2=r^2$
Substitute in the values $r=3$, $h=0$, and $k=0$.	$(x-0)^2+(y-0)^2=3^2$
Center: $\begin{pmatrix} h, & k \\ 0, & 0 \end{pmatrix}$	
Simplify.	$x^2+y^2=9$

Exercise 22.2.9

Write the standard form of the equation of the circle with a radius of 6 and center $(0, 0)$.

Answer

$x^2+y^2=36$

Exercise 22.2.10

Write the standard form of the equation of the circle with a radius of 8 and center $(0, 0)$.

Answer

$x^2+y^2=64$

In the last example, the center was $(0, 0)$. Notice what happened to the equation. Whenever the center is $(0, 0)$, the standard form becomes $x^2+y^2=r^2$.

Example 22.2.6

Write the standard form of the equation of the circle with radius 2 and center $(-1, 3)$.

Solution:

Table 11.1.5

Use the standard form of the equation of a circle.	$(x-h)^2+(y-k)^2=r^2$
Substitute in the values.	$(x-(-1))^2+(y-3)^2=2^2$

Center: $\begin{pmatrix} h, & k \\ -1, & 3 \end{pmatrix}$	
Simplify.	$(x+1)^2+(y-3)^2=4$

? Exercise 22.2.11

Write the standard form of the equation of the circle with a radius of 7 and center $(2,-4)$.

Answer

$(x-2)^2+(y+4)^2=49$

? Exercise 22.2.12

Write the standard form of the equation of the circle with a radius of 9 and center $(-3,-5)$.

Answer

$(x+3)^2+(y+5)^2=81$

In the next example, the radius is not given. To calculate the radius, we use the Distance Formula with the two given points.

✓ Example 22.2.7

Write the standard form of the equation of the circle with center $(2,4)$ that also contains the point $(-2,1)$.

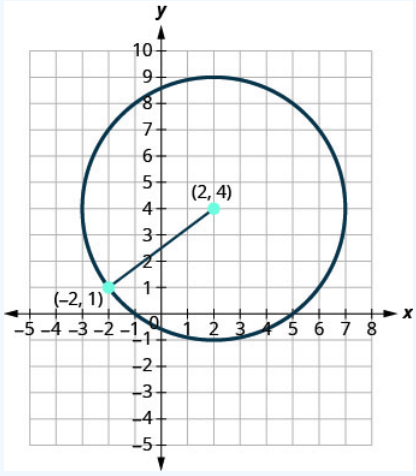

Figure 11.1.15

Solution:

The radius is the distance from the center to any point on the circle so we can use the distance formula to calculate it. We will use the center $(2,4)$ and point $(-2,1)$

Use the Distance Formula to find the radius.

$$r=\sqrt{\left(x_2-x_1\right)^2+\left(y_2-y_1\right)^2}$$

Substitute the values. $\begin{pmatrix} x_1, y_1 \\ 2, 4 \end{pmatrix}, \begin{pmatrix} x_2, y_2 \\ -2, 1 \end{pmatrix}$

$$r=\sqrt{(-2-2)^2+(1-4)^2}$$

Simplify.

$$r=\sqrt{(-4)^2+(-3)^2}$$
$$r=\sqrt{16+9}$$
$$r=\sqrt{25}$$
$$r=5$$

Now that we know the radius, $r=5$, and the center, $(2,4)$, we can use the standard form of the equation of a circle to find the equation.

Use the standard form of the equation of a circle.

$$(x-h)^2+(y-k)^2=r^2$$

Substitute in the values.

$$(x-2)^2+(y-4)^2=5^2$$

Simplify.

$$(x-2)^2+(y-4)^2=25$$

Exercise 22.2.13

Write the standard form of the equation of the circle with center $(2,1)$ that also contains the point $(-2,-2)$.

Answer

$(x-2)^2+(y-1)^2=25$

Exercise 22.2.14

Write the standard form of the equation of the circle with center $(7,1)$ that also contains the point $(-1,-5)$.

Answer

$(x-7)^2+(y-1)^2=100$

Graph a Circle

Any equation of the form $(x-h)^2+(y-k)^2=r^2$ is the standard form of the equation of a **circle** with center, (h,k), and radius, r. We can then graph the circle on a rectangular coordinate system.

Note that the standard form calls for subtraction from x and y. In the next example, the equation has $x+2$, so we need to rewrite the addition as subtraction of a negative.

Example 22.2.8

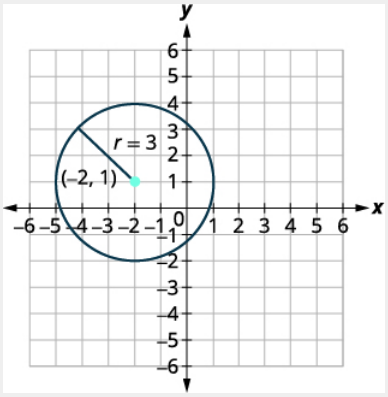
Find the center and radius, then graph the circle: $(x+2)^2+(y-1)^2=9$.

Solution:

Table 11.1.6

	$(x+2)^2+(y-1)^2=9$
Use the standard form of the equation of a circle. Identify the center, (h,k) and radius, r.	$(x-h)^2+(y-k)^2=r^2$ $(x-(-2))^2+(y-1)^2=3^2$
	Center: $(-2,1)$ radius: 3

Graph the circle.



Exercise 22.2.15

a. Find the center and radius, then
b. Graph the circle: $(x-3)^2+(y+4)^2=4$.

Answer

a. The circle is centered at $(3,-4)$ with a radius of 2.
b.

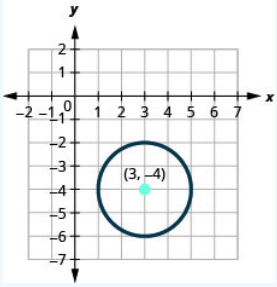


Figure 11.1.19

Exercise 22.2.16

a. Find the center and radius, then
b. Graph the circle: $(x-3)^2+(y-1)^2=16$.

Answer

a. The circle is centered at $(3,1)$ with a radius of 4.
b.

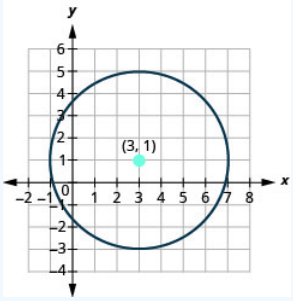

Figure 11.1.20

To find the center and radius, we must write the equation in standard form. In the next example, we must first get the coefficient of x^2, y^2 to be one.

Example 22.2.9

Find the center and radius and then graph the circle, $4x^2 + 4y^2 = 64$.

Solution:

Table 11.1.7

	$4x^2 + 4y^2 = 64$
Divide each side by 4.	$x^2 + y^2 = 16$
Use the standard form of the equation of a circle. Identify the center, (h, k) and radius, r.	$(x-h)^2 + (y-k)^2 = r^2$ $(x-0)^2 + (y-0)^2 = 4^2$
	Center: $(0, 0)$ radius: 4
Graph the circle.	
Exercise 22.2.17

a. Find the center and radius, then
b. Graph the circle: $3x^2 + 3y^2 = 27$

Answer

a. The circle is centered at $(0, 0)$ with a radius of 3.
b.

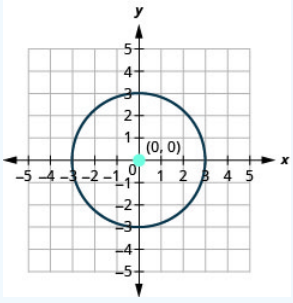

Figure 11.1.25

Exercise 22.2.18

a. Find the center and radius, then
b. Graph the circle: $5x^2+5y^2=125$

Answer

a. The circle is centered at $(0,0)$ with a radius of 5.
b.

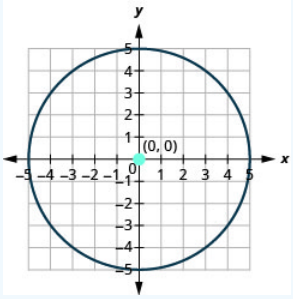

Figure 11.1.26

If we expand the equation from Example 11.1.8, $(x+2)^2+(y-1)^2=9$, the equation of the circle looks very different.

$$(x+2)^2+(y-1)^2=9$$

Square the binomials.

$$x^2+4x+4+y^2-2y+1=9$$

Arrange the terms in descending degree order, and get zero on the right

$$x^2+y^2+4x-2y-4=0$$

This form of the equation is called the general form of the equation of the **circle**.

Definition 22.2.5

The general form of the equation of a circle is

$$x^2+y^2+ax+by+c=0$$

If we are given an equation in general form, we can change it to standard form by completing the squares in both x and y. Then we can graph the circle using its center and radius.

Example 22.2.10

a. Find the center and radius, then
b. Graph the circle: $x^2+y^2-4x-6y+4=0$

Solution:

We need to rewrite this general form into standard form in order to find the center and radius.

Table 11.1.8

	$x^2+y^2-4x-6y+4=0$ Figure 11.1.27
Group the x-terms and y-terms. Collect the constants on the right side.	$x^2-4x+y^2-6y=-4$ Figure 11.1.28
Complete the squares.	$x^2-4x+4+y^2-6y+9=-4+4+9$ Figure 11.1.29

Rewrite as binomial squares.	$(x-2)^2+(y-3)^2=9$ Figure 11.1.30
Identify the center and radius.	Center: $(2,3)$ radius: 3
Graph the circle.	 Figure 11.1.31

Exercise 22.2.19

a. Find the center and radius, then
b. Graph the circle: $x^2+y^2-6x-8y+9=0$.

Answer

a. The circle is centered at $(3,4)$ with a radius of 4.
b.

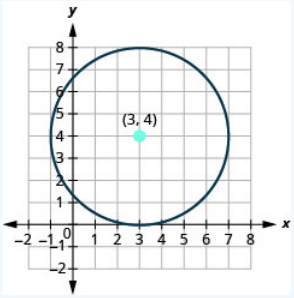

Figure 11.1.32

Exercise 22.2.20

a. Find the center and radius, then
b. Graph the circle: $x^2+y^2+6x-2y+1=0$

Answer

a. The circle is centered at $(-3,1)$ with a radius of 3.
b.

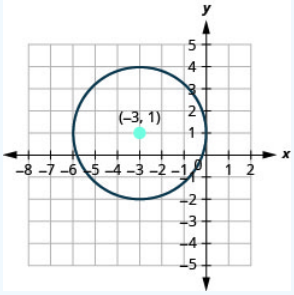

Figure 11.1.33

In the next example, there is a y-term and a y^2-term. But notice that there is no x-term, only an x^2-term. We have seen this before and know that it means h is 0. We will need to complete the square for the y terms, but not for the x terms.

Example 22.2.11

a. Find the center and radius, then
b. Graph the circle: $x^2 + y^2 + 8y = 0$

Solution:

We need to rewrite this general form into standard form in order to find the center and radius.

Table 11.1.9

	$x^2 + y^2 + 8y = 0$
Group the x-terms and y-terms.	$x^2 + y^2 + 8y = 0$
There are no constants to collect on the right side.	
Complete the square for $y^2 + 8y$.	$x^2 + y^2 + 8y + 16 = 0 + 16$
Rewrite as binomial squares.	$(x - 0)^2 + (y + 4)^2 = 16$
Identify the center and radius.	Center: $(0, -4)$ radius: 4
Graph the circle.	
Exercise 22.2.21

a. Find the center and radius, then
b. Graph the circle: $x^2 + y^2 - 2x - 3 = 0$.

Answer

a. The circle is centered at $(-1, 0)$ with a radius of 2.
b.

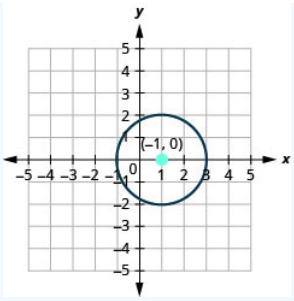

Figure 11.1.39

Exercise 22.2.22

a. Find the center and radius, then
b. Graph the circle: $x^2+y^2-12y+11=0$.

Answer

a. The circle is centered at $(0,6)$ with a radius of 5.
b.

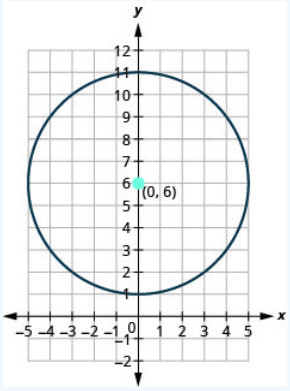

Figure 11.1.40

Access these online resources for additional instructions and practice with using the distance and midpoint formulas, and graphing circles.

- Distance-Midpoint Formulas and Circles
- Finding the Distance and Midpoint Between Two Points
- Completing the Square to Write Equation in Standard Form of a Circle

Key Concepts

- **Distance Formula:** The distance d between the two points (x_1, y_1) and (x_2, y_2) is

$$d=\sqrt{(x_2-x_1)^2+(y_2-y_1)^2}$$

- **Midpoint Formula:** The midpoint of the line segment whose endpoints are the two points (x_1, y_1) and (x_2, y_2) is

$$\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$$

  To find the midpoint of a line segment, we find the average of the x-coordinates and the average of the y-coordinates of the endpoints.
- **Circle:** A circle is all points in a plane that are a fixed distance from a fixed point in the plane. The given point is called the *center*, (h, k), and the fixed distance is called the *radius*, r, of the circle.
- **Standard Form of the Equation a Circle:** The standard form of the equation of a circle with center, (h, k), and radius, r, is

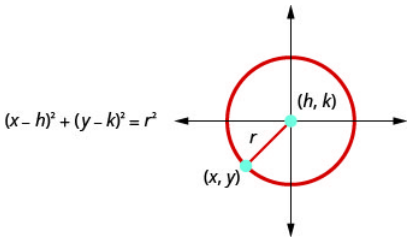

Figure 11.1.41

- **General Form of the Equation of a Circle:** The general form of the equation of a circle is

$$x^2+y^2+ax+by+c=0$$

Glossary

circle

A circle is all points in a plane that are a fixed distance from a fixed point in the plane.

22.2E: Exercises

Practice Makes Perfect

Exercise $22.2E.23$ Use the Distance Formula

In the following exercises, find the distance between the points. Write the answer in exact form and then find the decimal approximation, rounded to the nearest tenth if needed.

1. $(2, 0)$ and $(5, 4)$
2. $(-4, -3)$ and $(2, 5)$
3. $(-4, -3)$ and $(8, 2)$
4. $(-7, -3)$ and $(8, 5)$
5. $(-1, 4)$ and $(2, 0)$
6. $(-1, 3)$ and $(5, -5)$
7. $(1, -4)$ and $(6, 8)$
8. $(-8, -2)$ and $(7, 6)$
9. $(-3, -5)$ and $(0, 1)$
10. $(-1, -2)$ and $(-3, 4)$
11. $(3, -1)$ and $(1, 7)$
12. $(-4, -5)$ and $(7, 4)$

Answer

1. $d = 5$

3. 13

5. 5

7. 13

9. $d = 3\sqrt{5}, d \approx 6.7$

11. $d = \sqrt{68}, d \approx 8.2$

Exercise $22.2E.24$ Use the Midpoint Formula

In the following exercises,

a. find the midpoint of the line segments whose endpoints are given and
b. plot the endpoints and the midpoint on a rectangular coordinate system.

1. $(0, -5)$ and $(4, -3)$
2. $(-2, -6)$ and $(6, -2)$
3. $(3, -1)$ and $(4, -2)$
4. $(-3, -3)$ and $(6, -1)$

Answer

1.

a. Midpoint: $(2, -4)$
b.

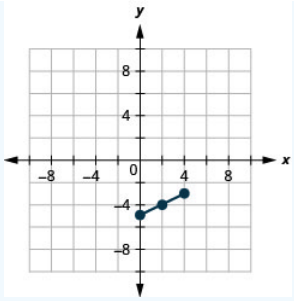

Figure 11.1.42

3.

a. Midpoint: $\left(3\frac{1}{2}, -1\frac{1}{2}\right)$

b.

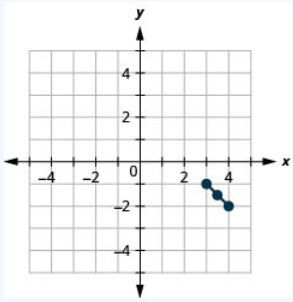

Figure 11.1.43

Exercise $22.2E.25$ Write the Equation of a Circle in Standard Form

In the following exercises, write the standard form of the equation of the circle with the given radius and center $(0, 0)$.

1. Radius: 7
2. Radius: 9
3. Radius: $\sqrt{2}$
4. Radius: $\sqrt{5}$

Answer

1. $x^2 + y^2 = 49$
3. $x^2 + y^2 = 2$

Exercise $22.2E.26$ Write the Equation of a Circle in Standard Form

In the following exercises, write the standard form of the equation of the circle with the given radius and center

1. Radius: 1, center: $(3, 5)$
2. Radius: 10, center: $(-2, 6)$
3. Radius: 2.5, center: $(1.5, -3.5)$
4. Radius: 1.5, center: $(-5.5, -6.5)$

Answer

1. $(x-3)^2 + (y-5)^2 = 1$
3. $(x-1.5)^2 + (y+3.5)^2 = 6.25$

Exercise $22.2E.27$ Write the Equation of a Circle in Standard Form

For the following exercises, write the standard form of the equation of the circle with the given center with point on the circle.

1. Center $(3,-2)$ with point $(3,6)$
2. Center $(6,-6)$ with point $(2,-3)$
3. Center $(4,4)$ with point $(2,2)$
4. Center $(-5,6)$ with point $(-2,3)$

Answer

1. $(x-3)^2+(y+2)^2=64$
3. $(x-4)^2+(y-4)^2=8$

Exercise $22.2E.28$ Graph a Circle

In the following exercises,

a. find the center and radius, then
b. graph each circle.

1. $(x+5)^2+(y+3)^2=1$
2. $(x-2)^2+(y-3)^2=9$
3. $(x-4)^2+(y+2)^2=16$
4. $(x+2)^2+(y-5)^2=4$
5. $x^2+(y+2)^2=25$
6. $(x-1)^2+y^2=36$
7. $(x-1.5)^2+(y+2.5)^2=0.25$
8. $(x-1)^2+(y-3)^2=\frac{9}{4}$
9. $x^2+y^2=64$
10. $x^2+y^2=49$
11. $2x^2+2y^2=8$
12. $6x^2+6y^2=216$

Answer

1.

a. The circle is centered at $(-5,-3)$ with a radius of 1.
b.

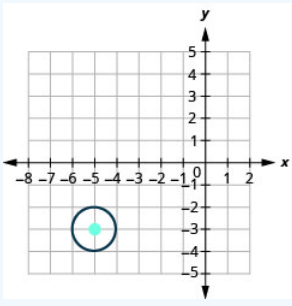

Figure 11.1.44

3.

a. The circle is centered at $(4,-2)$ with a radius of 4.
b.

Exercise $22.2E.29$ Graph a Circle

In the following exercises,

a. identify the center and radius and
b. graph.

1. $x^2 + y^2 + 2x + 6y + 9 = 0$
2. $x^2 + y^2 - 6x - 8y = 0$
3. $x^2 + y^2 - 4x + 10y - 7 = 0$
4. $x^2 + y^2 + 12x - 14y + 21 = 0$
5. $x^2 + y^2 + 6y + 5 = 0$
6. $x^2 + y^2 - 10y = 0$
7. $x^2 + y^2 + 4x = 0$
8. $x^2 + y^2 - 14x + 13 = 0$

Answer

Exercise $22.2E.30$ Writing Exercises

1. Explain the relationship between the distance formula and the equation of a circle.
2. Is a circle a function? Explain why or why not.
3. In your own words, state the definition of a circle.
4. In your own words, explain the steps you would take to change the general form of the equation of a circle to the standard form.

Answer

1. Answers will vary.

3. Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the distance formula.			
use the midpoint formula.			
write the equation of a circle in standard form.			
graph a circle.			

Figure 11.1.53

b. If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

22.3: Parabolas

Learning Objectives

By the end of this section, you will be able to:

- Graph vertical parabolas
- Graph horizontal parabolas
- Solve applications with parabolas

Be Prepared

Before you get started, take this readiness quiz.

1. Graph: $y = -3x^2 + 12x - 12$.
   If you missed this problem, review Example 9.47.
2. Solve by completing the square: $x^2 - 6x + 6 = 0$.
   If you missed this problem, review Example 9.12.
3. Write in standard form: $y = 3x^2 - 6x + 5$.
   If you missed this problem, review Example 9.59.

Graph Vertical Parabolas

The next conic section we will look at is a **parabola**. We define a parabola as all points in a plane that are the same distance from a fixed point and a fixed line. The fixed point is called the **focus,**and the fixed line is called the **directrix** of the parabola.

parabola

Figure 11.2.1

Definition 22.3.1: Parabola, Focus, and Directrix

A **parabola** is all points in a plane that are the same distance from a fixed point and a fixed line. The fixed point is called the **focus,** and the fixed line is called the **directrix** of the parabola.

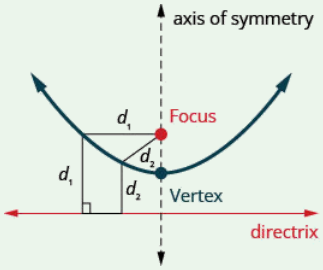

Figure 11.2.2

Previously, we learned to graph vertical parabolas from the general form or the standard form using properties. Those methods will also work here. We will summarize the properties here.

Vertical Parabolas

Table 11.2.1

	General form $y = ax^2 + bx + c$	Standard Form $y = a(x - h)^2 + k$

	General form $y = ax^2 + bx + c$	Standard Form $y = a(x - h)^2 + k$
Orientation	$a > 0$ up; $a < 0$ down	$a > 0$ up; $a < 0$ down
Axis of Symmetry	$x = -\dfrac{b}{2a}$	$x = h$
Vertex	Substitute $x = -\dfrac{b}{2a}$ and solve for y.	(h, k)
y-intercept	Let $x = 0$	Let $x = 0$
x-intercepts	Let $y = 0$	Let $y = 0$

The graphs show what the parabolas look like when they open up or down. Their position in relation to the x- or y-axis is merely an example.

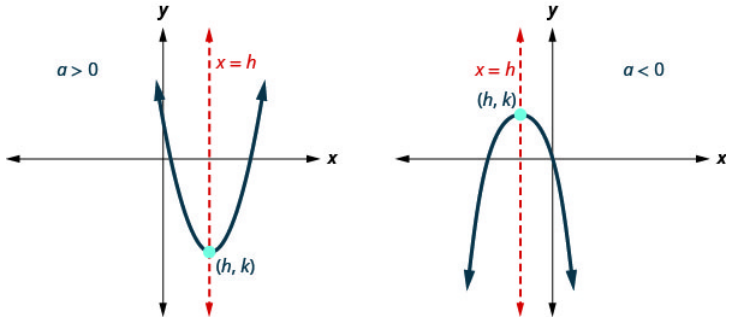

Figure 11.2.3

To graph a parabola from these forms, we used the following steps.

Graphing Vertical Parabolas

How to Graph Vertical Parabolas $y = ax^2 + bx + c$ or $f(x) = a(x - h)^2 + k$ using Properties.

- Step 1: Determine whether the parabola opens upward or downward.
- Step 2. Find the axis of symmetry.
- Step 3. Find the vertex.
- Step 4. Find the y-intercept. Find the point symmetric to the y-intercept across the axis of symmetry.
- Step 5. Find the x-intercepts.
- Step 6. Graph the parabola.

The next example reviews the method of graphing a parabola from the general form of its equation.

Example 22.3.1

Graph $y = -x^2 + 6x - 8$ by using properties.

Solution:

Table 11.2.2

	$y=ax^2 + bx + c$ $y = -x^2 + 6x - 8$
Since a is -1, the parabola opens downward.	

To find the axis of symmetry, find $x = -\frac{b}{2a}$.	$x = -\frac{b}{2a}$ $x = -\frac{6}{2(-1)}$ $x = 3$
	The axis of symmetry is $x = 3$.
	The vertex is on the line $x = 3$.	$y = -x^2 + 6x - 8$
Let $x = 3$.	$y = -3^2 + 6 \cdot 3 - 8$
	$y = -9 + 18 - 8$ $y = 1$
	The vertex is $(3, 1)$.
	The y-intercept occurs when $x = 0$.	$y = -x^2 + 6x - 8$
Substitute $x = 0$.	$y = -0^2 + 6 \cdot 0 - 8$
Simplify.	$y = -8$
	The y-intercept is $(0, -8)$.
The point $(0, -8)$ is three units to the left of the line of symmetry. The point three units to the right of the line of symmetry is $(6, -8)$.	Point symmetric to the y-intercept is $(6, -8)$.

	The x-intercept occurs when $y = 0$.	$y = -x^2 + 6x - 8$
Let $y = 0$.	$0 = -x^2 + 6x - 8$
Factor the GCF.	$0 = -\left(x^2 - 6x + 8\right)$
Factor the trinomial.	$0 = -(x - 4)(x - 2)$
Solve for x.	$x = 4, \quad x = 2$
	The x-intercepts are $(4, 0), (2, 0)$.
Graph the parabola.	
? Exercise 22.3.1

Graph $y = -x^2 + 5x - 6$ by using properties.

Answer

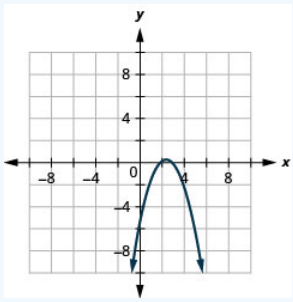

Figure 11.2.24

Exercise 22.3.2

Graph $y = -x^2 + 8x - 12$ by using properties.

Answer

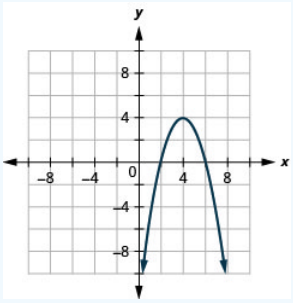

Figure 11.2.25

The next example reviews the method of graphing a **parabola** from the standard form of its equation, $y = a(x-h)^2 + k$.

Example 22.3.2

Write $y = 3x^2 - 6x + 5$ in standard form and then use properties of standard form to graph the equation.

Solution:

Table 11.2.3

Rewrite the function in $y = a(x-h)^2 + k$ form by completing the square.	$y = 3x^2 - 6x + 5$ $y = 3\left(x^2 - 2x\right) + 5$ $y = 3\left(x^2 - 2x + 1\right) + 5 - 3$ $y = 3(x-1)^2 + 2$
Identify the constants a, h, k.	$a = 3, h = 1, k = 2$
Since $a = 2$, the parabola opens upward.	
The axis of symmetry is $x = h$.	The axis of symmetry is $x = 1$.
The vertex is (h, k).	The vertex is $(1, 2)$.
Find the y-intercept by substituting $x = 0$,	$y = 3(x-1)^2 + 2$ $y = 3 \cdot 0^2 - 6 \cdot 0 + 5$ $y = 0$
	y-intercept $(0, 5)$
Find the point symmetric to $(0, 5)$ across the axis of symmetry.	$(2, 5)$
Find the x-intercepts.	$y = 3(x-1)^2 + 2$ $0 = 3(x-1)^2 + 2$ $-2 = 3(x-1)^2$ $-\frac{2}{3} = (x-1)^2$ $\pm\sqrt{-\frac{2}{3}} = x - 1$

	The square root of a negative number tells us the solutions are complex numbers. So there are no x-intercepts.
Graph the parabola.	
Exercise 22.3.3

a. Write $y = 2x^2 + 4x + 5$ in standard form and
b. use properties of standard form to graph the equation.

Answer

a. $y = 2(x+1)^2 + 3$
b.

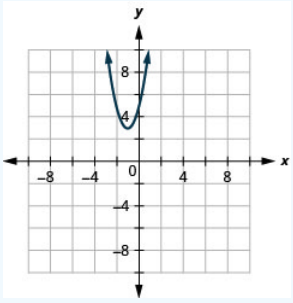

Figure 11.2.28

Exercise 22.3.4

a. Write $y = -2x^2 + 8x - 7$ in standard form and
b. use properties of standard form to graph the equation.

Answer

a. $y = -2(x-2)^2 + 1$
b.

https://math.libretexts.org/@go/page/46498

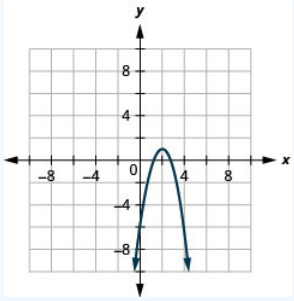

Figure 11.2.29

Graph Horizontal Parabolas

Our work so far has only dealt with parabolas that open up or down. We are now going to look at horizontal parabolas. These parabolas open either to the left or to the right. If we interchange the x and y in our previous equations for parabolas, we get the equations for the parabolas that open to the left or to the right.

Horizontal Parabolas

Table 11.2.4

	General form $x = ay^2 + by + c$	**Standard form** $x = a(y-k)^2 + h$
Orientation	$a > 0$ right; $a < 0$ left	$a > 0$ right; $a < 0$ left
Axis of Symmetry	$y = -\dfrac{b}{2a}$	$y = k$
Vertex	Substitute $y = -\dfrac{b}{2a}$ and solve for x.	(h, k)
x-intercepts	Let $x = 0$	Let $x = 0$
y-intercept	Let $y = 0$	Let $y = 0$

The graphs show what the parabolas look like when they to the left or to the right. Their position in relation to the x- or y-axis is merely an example.

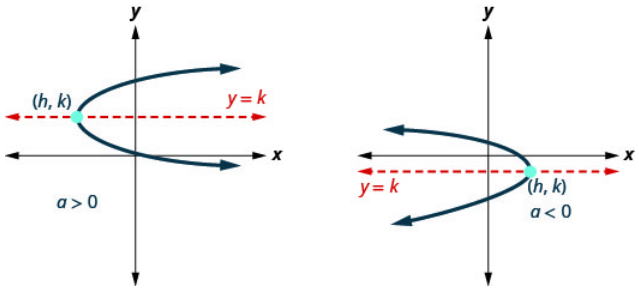

Figure 11.2.30

Looking at these parabolas, do their graphs represent a function? Since both graphs would fail the vertical line test, they do not represent a function.

To graph a **parabola** that opens to the left or to the right is basically the same as what we did for parabolas that open up or down, with the reversal of the x and y variables.

Howto: Graph Horizontal Parabolas $y = ax^2 + bx + c$ or $f(x) = a(x - h)^2 + k$ using Properties

- Step 1: Determine whether the parabola opens to the left or to the right.
- Step 2: Find the axis of symmetry.
- Step 3: Find the vertex.
- Step 4: Find the x-intercept. Find the point symmetric to the x-intercept across the axis of symmetry.
- Step 5: Find the y-intercepts.
- Step 6: Graph the parabola.

Example 22.3.3

Graph $x = 2y^2$ by using properties.

Solution:

Table 11.2.5

	$x = ay^2 + by + c$ $x = 2y^2$
Since $a = 2$, the parabola opens to the right.	
To find the axis of symmetry, find $y = -\frac{b}{2a}$	$y = -\frac{b}{2a}$
	$y = -\frac{0}{2(2)}$
	$y = 0$
	The axis of symmetry is $y = 0$.
The vertex is on the line $y = 0$.	$x = 2y^2$
Let $y = 0$.	$x = 2 \cdot 0^2$
	$x = 0$
	The vertex is $(0, 0)$.

Since the vertex is $(0, 0)$, both the x- and y-intercepts are the point $(0, 0)$. To graph the parabola we need more points. In this case it is easiest to choose values of y.

	$x = 2y^2$		$x = 2y^2$	x	y	
$y = 1$	$x = 2 \cdot 1^2$	$y = 2$	$x = 2 \cdot 2^2$	2	1	(2, 1)
	$x = 2$		$x = 8$	8	2	(8, 2)

Figure 11.2.38

We also plot the points symmetric to $(2, 1)$ and $(8, 2)$ across the y-axis, the points $(2, -1), (8, -2)$.

Graph the parabola.

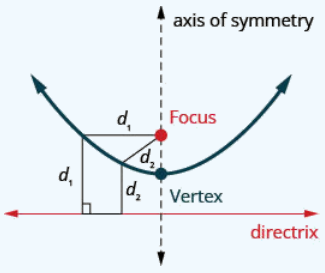

Figure 11.2.39

Exercise 22.3.5

Graph $x = y^2$ by using properties.

Answer

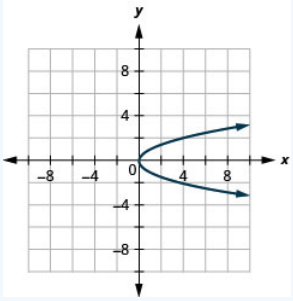

Figure 11.2.40

Exercise 22.3.6

Graph $x = -y^2$ by using properties.

Answer

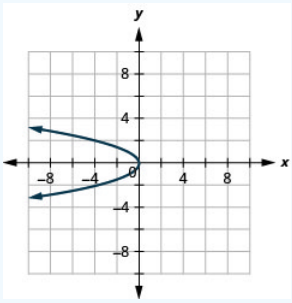

Figure 11.2.41

In the next example, the vertex is not the origin.

Example 22.3.4

Graph $x = -y^2 + 2y + 8$ by using properties.

Solution:

Table 11.2.6

	$x = ay^2 + by + c$ $x = -y^2 + 2y + 8$
Since $a = -1$, the parabola opens to the left.	
To find the axis of symmetry, find $y = -\frac{b}{2a}$	$y = -\frac{b}{2a}$
	$y = -\frac{2}{2(-1)}$
	$y = 1$

	The axis of symmetry is $y = 1$.
The vertex is on the line $y = 1$.	$x = -y^2 + 2y + 8$
Let $y = 1$.	$x = -1^2 + 2 \cdot 1 + 8$
	$x = 9$
	The vertex is $(9, 1)$.
The x-intercept occurs when $y = 0$.	$x = -y^2 + 2y + 8$
	$x = -0^2 + 2 \cdot 0 + 8$
	$x = 8$
	The x-intercept is $(8, 0)$.
The point $(8, 0)$ is one unit below the line of symmetry. The symmetric point one unit above the line of symmetry is $(8, 2)$	Symmetric point is $(8, 2)$.
The y-intercept occurs when $x = 0$.	$x = -y^2 + 2y + 8$
Substitute $x = 0$.	$0 = -y^2 + 2y + 8$
Solve.	$y^2 - 2y - 8 = 0$
	$(y - 4)(y + 2) = 0$
	$y = 4, \quad y = -2$
	The y -intercepts are $(0, 4)$ and $(0, -2)$.
Connect the points to graph the parabola.	
Exercise 22.3.7

Graph $x = -y^2 - 4y + 12$ by using properties.

Answer

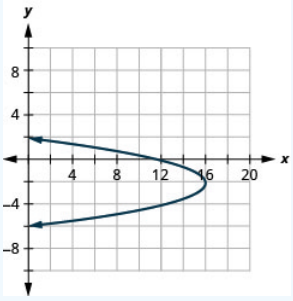

Figure 11.2.58

? Exercise 22.3.8

Graph $x = -y^2 + 2y - 3$ by using properties.

Answer

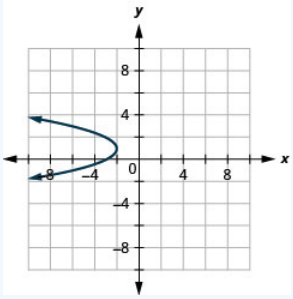

Figure 11.2.59

In Table 11.2.4, we see the relationship between the equation in standard form and the properties of the parabola. The How To box lists the steps for graphing a parabola in the standard form $x = a(y-k)^2 + h$. We will use this procedure in the next example.

✓ Example 22.3.5

Graph $x = 2(y-2)^2 + 1$ using properties.

Solution:

Table 11.2.7

	$x = a(y-k)^2 + h$ $x = 2(y-2)^2 + 1$
Identify the constants a, h, k.	$a = 2, h = 1, k = 2$
Since $a = 2$, the parabola opens to the right.	
The axis of symmetry is $y = k$.	The axis of symmetry is $y = 2$.
The vertex is (h, k).	The vertex is $(1, 2)$.
Find the x-intercept by substituting $y = 0$.	$x = 2(y-2)^2 + 1$ $x = 2(0-2)^2 + 1$ $x = 9$
	The x-intercept is $(9, 0)$.
Find the point symmetric to $(9, 0)$ across the axis of symmetry.	$(9, 4)$

Find the y-intercepts. Let $x = 0$.	$x = 2(y-2)^2 + 1$ $0 = 2(y-2)^2 + 1$ $-1 = 2(y-2)^2$
	A square cannot be negative, so there is no real solution. So there are no y-intercepts.
Graph the parabola.	
Exercise 22.3.9

Graph $x = 3(y-1)^2 + 2$ using properties.

Answer

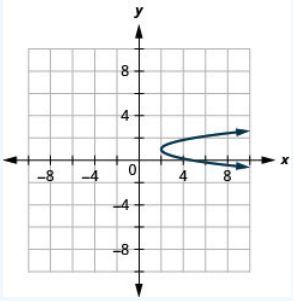

Figure 11.2.63

Exercise 22.3.10

Graph $x = 2(y-3)^2 + 2$ using properties.

Answer

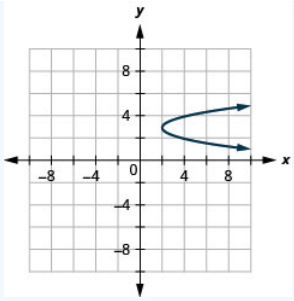

Figure 11.2.64

In the next example, we notice the a is negative and so the parabola opens to the left.

Example 22.3.6

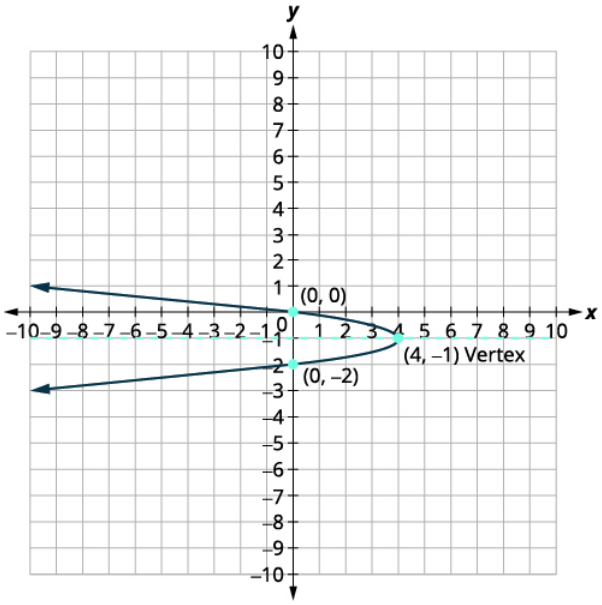
Graph $x = -4(y+1)^2 + 4$ using properties.

Solution:

Table 11.2.8

	$x = a(y-k)^2 + h$ $x = -4(y+1)^2 + 4$
Identify the constants a, h, k.	$a = -4, h = 4, k = -1$
Since $a = -4$, the parabola opens to the left.	
The axis of symmetry is $y = k$.	The axis of symmetry is $y = -1$.
The vertex is (h, k).	The vertex is $(4, -1)$.
Find the x-intercept by substituting $y = 0$.	$x = -4(y+1)^2 + 4$ $x = -4(0+1)^2 + 4$ $x = 0$
	The x-intercept is $(0, 0)$.
Find the point symmetric to $(0, 0)$ across the axis of symmetry.	$(0, -2)$
Find the y-intercepts.	$x = -4(y+1)^2 + 4$
Let $x = 0$.	$0 = -4(y+1)^2 + 4$ $-4 = -4(y+1)^2$ $1 = (y+1)^2$ $y+1 = \pm 1$
	$y = -1+1 \quad y = -1-1$
	$y = 0 \qquad y = -2$
	The y-intercepts are $(0, 0)$ and $(0, -2)$.

Graph the parabola.



Exercise 22.3.11

Graph $x = -4(y+2)^2 + 4$ using properties.

Answer

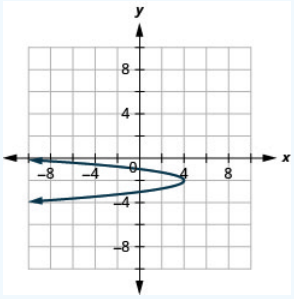


Figure 11.2.68

Exercise 22.3.12

Graph $x = -2(y+3)^2 + 2$ using properties.

Answer

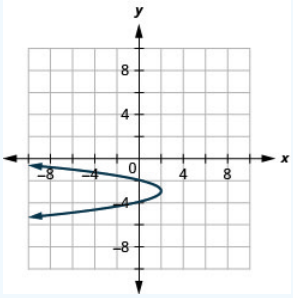

Figure 11.2.69

The next example requires that we first put the equation in standard form and then use the properties.

Example 22.3.7

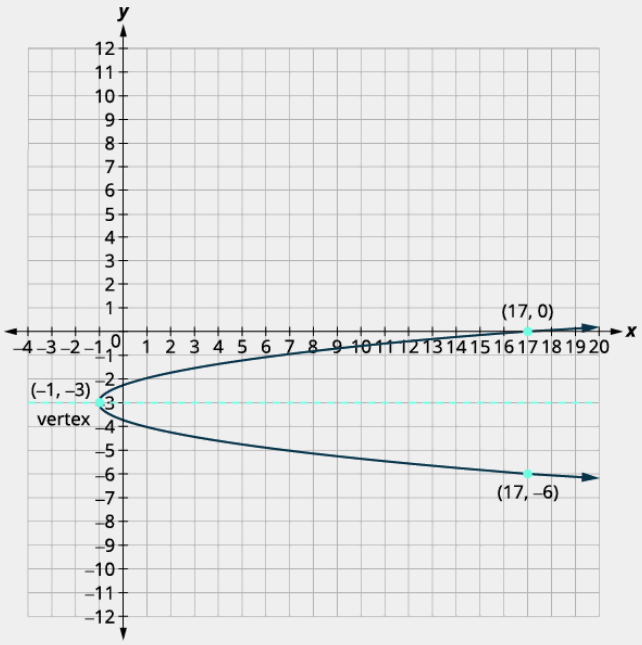
Write $x = 2y^2 + 12y + 17$ in standard form and then use the properties of the standard form to graph the equation.

Solution:

Table 11.2.9

	$x = 2y^2 + 12y + 17$
Rewrite the function in $x = a(y-k)^2 + h$ form by completing the square.	$x = 2\left(y^2 + 6y\right) + 17$
	$x = 2(y^2 + 6y + 9) + 17 - 18$
	$x = 2(y+3)^2 - 1$
	$x = a(y-k)^2 + h$ $x = 2(y+3)^2 - 1$
Identify the constants a, h, k.	$a = 2, h = -1, k = -3$
Since $a = 2$, the parabola opens to the right.	
The axis of symmetry is $y = k$.	The axis of symmetry is $y = -3$.
The vertex is (h, k).	The vertex is $(-1, -3)$.
Find the x-intercept by substituting $y = 0$.	$x = 2(y+3)^2 - 1$ $x = 2(0+3)^2 - 1$ $x = 17$
	The x-intercept is $(17, 0)$.
Find the point symmetric to $(17, 0)$ across the axis of symmetry.	$(17, -6)$
Find the y-intercepts. Let $x = 0$.	$x = 2(y+3)^2 - 1$ $0 = 2(y+3)^2 - 1$ $1 = 2(y+3)^2$ $\frac{1}{2} = (y+3)^2$ $y + 3 = \pm\sqrt{\frac{1}{2}}$ $y = -3 \pm \frac{\sqrt{2}}{2}$
	$y = -3 + \frac{\sqrt{2}}{2} \quad y = -3 - \frac{\sqrt{2}}{2}$
	$y \approx -2.3 \quad y \approx -3.7$
	The y-intercepts are $\left(0, -3 + \frac{\sqrt{2}}{2}\right), \left(0, -3 - \frac{\sqrt{2}}{2}\right)$.

Graph the parabola.



Exercise 22.3.13

a. Write $x = 3y^2 + 6y + 7$ in standard form and
b. Use properties of the standard form to graph the equation.

Answer

a. $x = 3(y+1)^2 + 4$
b.

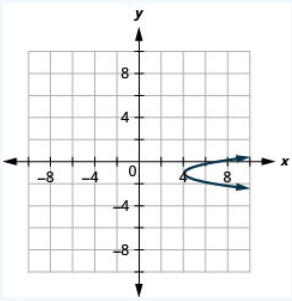


Figure 11.2.77

Exercise 22.3.14

a. Write $x = -4y^2 - 16y - 12$ in standard form and
b. Use properties of the standard form to graph the equation.

Answer

a. $x = -4(y+2)^2 + 4$
b.

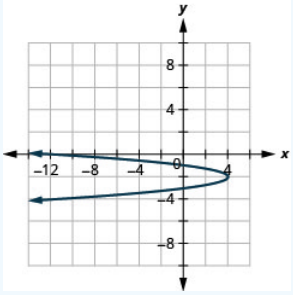

Figure 11.2.78

Solve Applications with Parabolas

Many architectural designs incorporate parabolas. It is not uncommon for bridges to be constructed using parabolas as we will see in the next example.

Example 22.3.8

Find the equation of the parabolic arch formed in the foundation of the bridge shown. Write the equation in standard form.

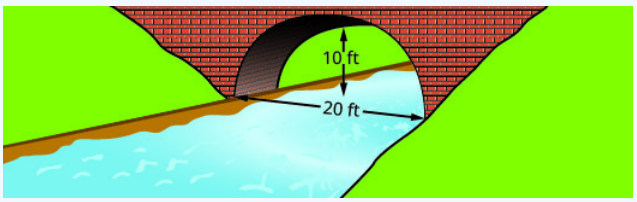

Figure 11.2.79

Solution:

We will first set up a coordinate system and draw the parabola. The graph will give us the information we need to write the equation of the graph in the standard form $y = a(x-h)^2 + k$.

Table 11.2.10

Let the lower left side of the bridge be the origin of the coordinate grid at the point $(0, 0)$. Since the base is 20 feet wide the point $(20, 0)$ represents the lower right side. The bridge is 10 feet high at the highest point. The highest point is the vertex of the parabola so the y-coordinate of the vertex will be 10. Since the bridge is symmetric, the vertex must fall halfway between the left most point, $(0, 0)$, and the rightmost point $(20, 0)$. From this we know that the x-coordinate of the vertex will also be 10.	Identify the vertex, (h, k).	$(h, k) = (10, 10)$
	$h = 10, \quad k = 10$
Substitute the values into the standard form. The value of a is still unknown. To find the value of a use one of the other points on the parabola.	$y = a(x-h)^2 + k$ $y = a(x-10)^2 + 10$ $(x, y) = (0, 0)$
Substitute the values of the other point into the equation.	$y = a(x-10)^2 + 10$ $0 = a(0-10)^2 + 10$

Solve for a.	$0 = a(0-10)^2 + 10$ $-10 = a(-10)^2$ $-10 = 100a$ $\frac{-10}{100} = a$ $a = -\frac{1}{10}$
	$y = a(x-10)^2 + 10$
Substitute the value for a into the equation.	$y = -\frac{1}{10}(x-10)^2 + 10$

? Exercise 22.3.15

Find the equation of the parabolic arch formed in the foundation of the bridge shown. Write the equation in standard form.

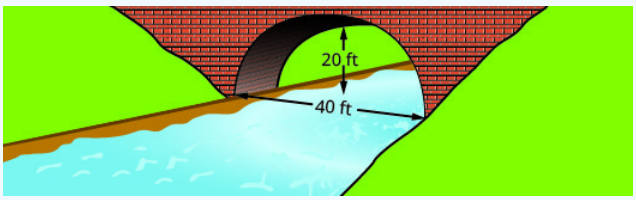

Figure 11.2.81

Answer

$$y = -\frac{1}{20}(x-20)^2 + 20$$

? Exercise 22.3.16

Find the equation of the parabolic arch formed in the foundation of the bridge shown. Write the equation in standard form.

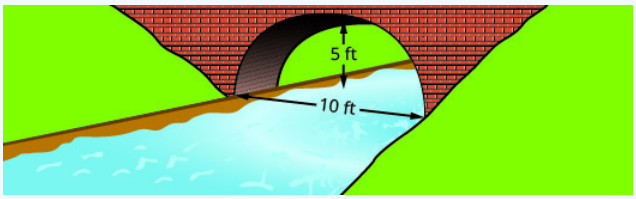

Figure 11.2.82

Answer

$$y = -\frac{1}{5}x^2 + 2xy = -\frac{1}{5}(x-5)^2 + 5$$

- Quadratic Functions
- Introduction to Conics and Graphing Horizontal Parabolas

Key Concepts

- **Parabola:** A **parabola** is all points in a plane that are the same distance from a fixed point and a fixed line. The fixed point is called the **focus,** and the fixed line is called the **directrix** of the parabola.

Vertical Parabolas

Table 11.2.1

	General form $y = ax^2 + bx + c$	**Standard Form** $y = a(x-h)^2 + k$
Orientation	$a > 0$ up; $a < 0$ down	$a > 0$ up; $a < 0$ down
Axis of Symmetry	$x = -\dfrac{b}{2a}$	$x = h$
Vertex	Substitute $x = -\dfrac{b}{2a}$ and solve for y.	(h, k)
y-intercept	Let $x = 0$	Let $x = 0$
x-intercepts	Let $y = 0$	Let $y = 0$

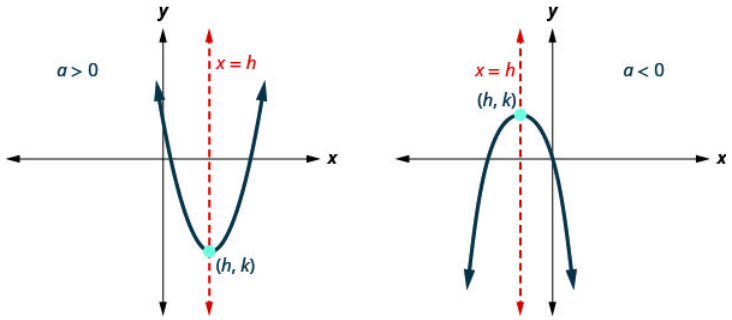

Figure 11.2.3

- **How to graph vertical parabolas $y = ax^2 + bx + c$ or $f(x) = a(x-h)^2 + k$ using properties.**

1. Determine whether the parabola opens upward or downward.
2. Find the axis of symmetry.
3. Find the vertex.
4. Find the y-intercept. Find the point symmetric to the y-intercept across the axis of symmetry.
5. Find the x-intercepts.
6. Graph the parabola.

Horizontal Parabolas

Table 11.2.4

	General form $x = ay^2 + by + c$	**Standard form** $x = a(y-k)^2 + h$
Orientation	$a > 0$ right; $a < 0$ left	$a > 0$ right; $a < 0$ left
Axis of Symmetry	$y = -\dfrac{b}{2a}$	$y = k$
Vertex	Substitute $y = -\dfrac{b}{2a}$ and solve for x.	(h, k)
x-intercepts	Let $x = 0$	Let $x = 0$
y-intercept	Let $y = 0$	Let $y = 0$

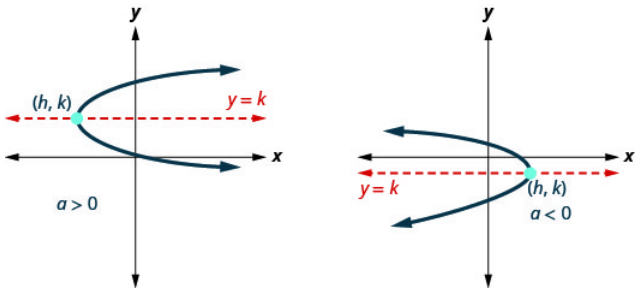

Figure 11.2.30

Graphing Horizontal Parabolas

How to graph horizontal parabolas $x = ay^2 + by + c$ or $x = a(y - k)^2 + h$ using properties.

1. Determine whether the parabola opens to the left or to the right.
2. Find the axis of symmetry.
3. Find the vertex.
4. Find the x-intercept. Find the point symmetric to the x-intercept across the axis of symmetry.
5. Find the y-intercepts.
6. Graph the parabola.

Glossary

parabola

A parabola is all points in a plane that are the same distance from a fixed point and a fixed line.

22.3E: Exercises

Practice Makes Perfect

Exercise 22.3E. 17 Graph Vertical Parabolas

In the following exercises, graph each equation by using properties.

1. $y = -x^2 + 4x - 3$
2. $y = -x^2 + 8x - 15$
3. $y = 6x^2 + 2x - 1$
4. $y = 8x^2 - 10x + 3$

Answer

1.

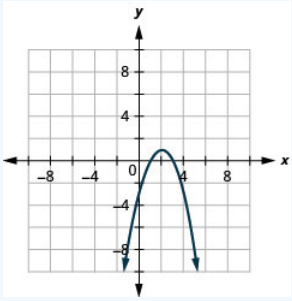

Figure 11.2.83

3.

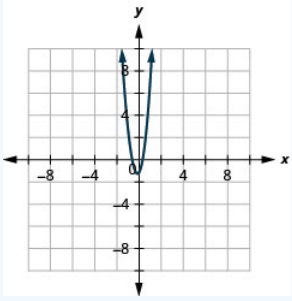

Figure 11.2.84

Exercise 22.3E. 18 Graph Vertical Parabolas

In the following exercises,

a. Write the equation in standard form and
b. Use properties of the standard form to graph the equation.

1. $y = -x^2 + 2x - 4$
2. $y = 2x^2 + 4x + 6$
3. $y = -2x^2 - 4x - 5$
4. $y = 3x^2 - 12x + 7$

Answer

1.

a. $y = -(x-1)^2 - 3$
b.

22.4: Ellipses

Learning Objectives

By the end of this section, you will be able to:

- Graph an ellipse with center at the origin
- Find the equation of an ellipse with center at the origin
- Graph an ellipse with center not at the origin
- Solve application with ellipses

Before you get started, take this readiness quiz.

1. Graph $y=(x-1)^2-2$ using transformations.
   If you missed this problem, review Example 9.57.
2. Complete the square: $x^2-8x=8$.
   If you missed this problem, review Example 9.12.
3. Write in standard form. $y=2x^2-12x+14$
   If you missed this problem, review Example 9.59.

Graph an Ellipse with Center at the Origin

The next conic section we will look at is an **ellipse**. We define an ellipse as all points in a plane where the sum of the distances from two fixed points is constant. Each of the given points is called a **focus** of the ellipse.

Definition 22.4.1

An **ellipse** is all points in a plane where the sum of the distances from two fixed points is constant. Each of the fixed points is called a **focus** of the ellipse.

Figure 11.3.1

We can draw an ellipse by taking some fixed length of flexible string and attaching the ends to two thumbtacks. We use a pen to pull the string taut and rotate it around the two thumbtacks. The figure that results is an ellipse.

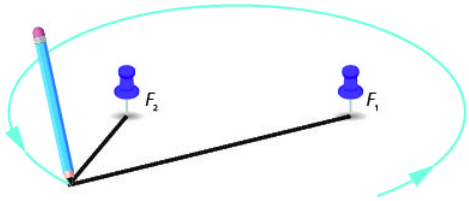

Figure 11.3.2

A line drawn through the foci intersect the ellipse in two points. Each point is called a **vertex** of the ellipse. The segment connecting the vertices is called the **major axis**. The midpoint of the segment is called the **center** of the ellipse. A segment perpendicular to the major axis that passes through the center and intersects the ellipse in two points is called the **minor axis**.

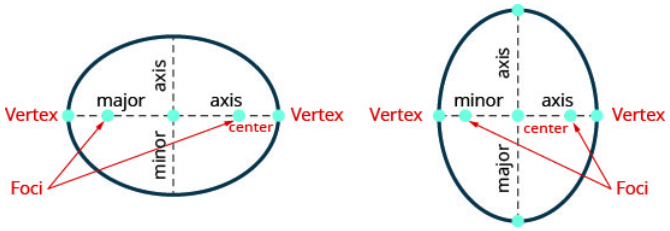

Figure 11.3.3

We mentioned earlier that our goal is to connect the geometry of a conic with algebra. Placing the ellipse on a rectangular coordinate system gives us that opportunity. In the figure, we placed the ellipse so the foci $((-c,0),(c,0))$ are on the x-axis and the center is the origin.

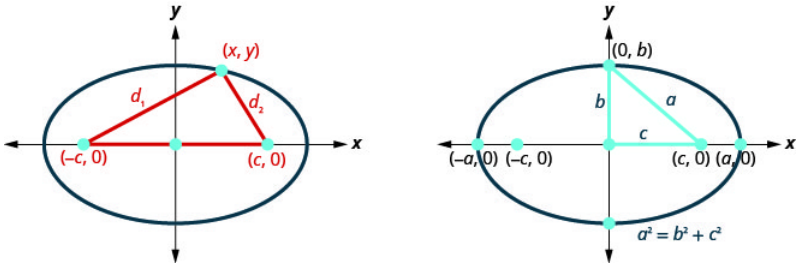

Figure 11.3.4

The definition states the sum of the distance from the foci to a point (x,y) is constant. So d_1+d_2 is a constant that we will call $2a$ so, $d_1+d_2=2a$. We will use the distance formula to lead us to an algebraic formula for an ellipse.

$$d_1 \quad + \quad d_2 \quad = \quad 2a$$

Use the distance formula to find d_1, d_2.

$$\sqrt{(x-(-c))^2+(y-0)^2}+\sqrt{(x-c)^2+(y-0)^2}=2a$$

After eliminating radicals and simplifying,we get:

$$\frac{x^2}{a^2}+\frac{y^2}{a^2-c^2}=1$$

To simplify the equation of the ellipse, we let $a^2-c^2=b^2$ .So, the equation of an ellipse centered at the origin in standard form is:

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

To graph the ellipse, it will be helpful to know the intercepts. We will find the x-intercepts and y-intercepts using the formula.

y-intercepts

Let $x=0$.

$$\begin{aligned}\frac{x^2}{a^2}+\frac{y^2}{b^2}&=1\\ \frac{0^2}{a^2}+\frac{y^2}{a^2}&=1\\ \frac{y^2}{b^2}&=1\\ y^2&=b^2\\ y&=\pm b\end{aligned}$$

The y-intercepts are $(0,b)$ and $(0,-b)$.

x-intercepts

Let $y=0$.

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$
$$\frac{x^2}{a^2}+\frac{0^2}{b^2}=1$$
$$\frac{x^2}{a^2}=1$$
$$x^2=a^2$$
$$x=\pm a$$

The x-intercepts are $(a,0)$ and $(-a,0)$.

Definition 22.4.2

Standard Form of the Equation an Ellipse with Center $(0,0)$

The standard form of the equation of an ellipse with center $(0,\ 0)$, is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

The x-intercepts are $(a,0)$ and $(-a,0)$.

The y-intercepts are $(0,b)$ and $(0,-b)$.

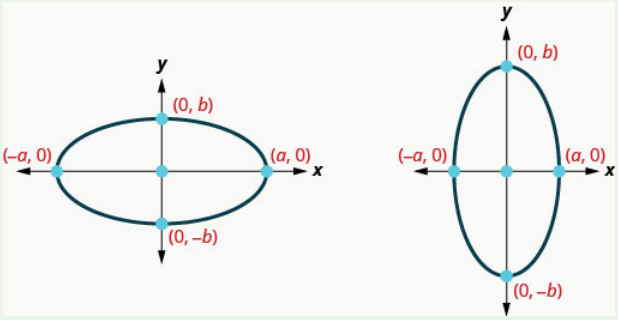

Figure 11.3.5

Notice that when the major axis is horizontal, the value of a will be greater than the value of b and when the major axis is vertical, the value of b will be greater than the value of a. We will use this information to graph an **ellipse** that is centered at the origin.

Ellipse with Center $(0,0)$

Table 11.3.1

$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$	$a>b$	$b>a$
Major axis	on the x-axis.	on the y-axis
x-intercepts	$(-a,0),(a,0)$	
y-intercepts	$(0,-b),(0,b)$	

Example 22.4.1

Graph: $\frac{x^2}{4}+\frac{y^2}{9}=1$.

Solution:

Table 11.3.2

Step 1. Write the equation in standard form.	It is in standard form.	$\frac{x^2}{4}+\frac{y^2}{9}=1$

Step 2. Determine whether the major axis is horizontal or vertical.	Since $9 > 4$ and 9 is in the y^2 term, the major axis is vertical.	Major axis is vertical.
Step 3. Find the endpoints of the major axis.	The endpoints will be the y-intercepts. Since $b^2 = 9$, then $b = \pm 3$. The endpoints of the major axis are $(0, 3), (0, -3)$.	The endpoints of the major axis are $(0, 3), (0, -3)$.
Step 4. Find the endpoints of the minor axis.	The endpoints will be the x-intercepts. Since $a^2 = 4$, then $a = \pm 2$. The endpoints of the major axis are $(2, 0), (-2, 0)$.	The endpoints of the major axis are $(2, 0), (-2, 0)$.
Step 5. Sketch the ellipse.		
? Exercise 22.4.1

Graph: $\frac{x^2}{4} + \frac{y^2}{16} = 1$.

Answer

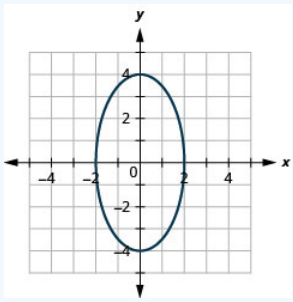

Figure 11.3.7

? Exercise 22.4.2

Graph: $\frac{x^2}{9} + \frac{y^2}{16} = 1$.

Answer

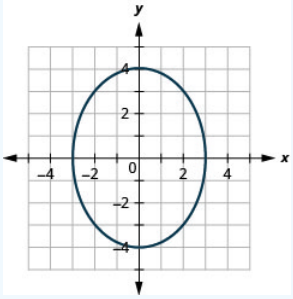

Figure 11.3.8

We summarize the steps for reference.

HOW TO GRAPH AN ELLIPSE WITH CENTER $(0,0)$.

1. Write the equation in standard form.
2. Determine whether the major axis is horizontal or vertical.
3. Find the endpoints of the major axis.
4. Find the endpoints of the minor axis
5. Sketch the ellipse.

Sometimes our equation will first need to be put in standard form.

Example 22.4.2

Graph $x^2+4y^2=16$.

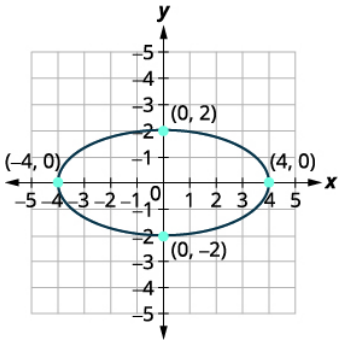
Solution:

Table 11.3.3

We recognize this as the equation of an ellipse since both the x and y terms are squared and have different coefficients.	$x^2+4y^2=16$
To get the equation in standard form, divide both sides by 16 so that the equation is equal to 1.	$\frac{x^2}{16}+\frac{4y^2}{16}=\frac{16}{16}$
Simplify.	$\frac{x^2}{16}+\frac{y^2}{4}=1$
The equation is in standard form. The ellipse is centered at the origin.	The center is $(0,0)$.
Since $16>4$ and 16 is in the x^2 term, the major axis is horizontal.	
$a^2=16, a=\pm 4$ $b^2=4, \quad b=\pm 2$	The vertices are $(4,0), (-4,0)$. The endpoints of the minor axis are $(0,2), (0,-2)$.

https://math.libretexts.org/@go/page/46500

Sketch the parabola.



Exercise 22.4.3

Graph $9x^2 + 16y^2 = 144$.

Answer

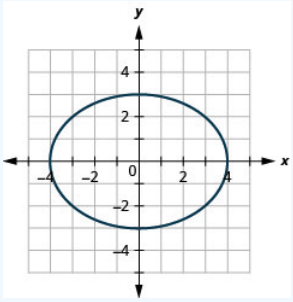


Figure 11.3.10

Exercise 22.4.4

Graph $16x^2 + 25y^2 = 400$.

Answer

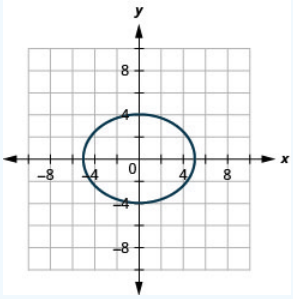

Figure 11.3.11

Find the Equation of an Ellipse with Center at the Origin

If we are given the graph of an **ellipse**, we can find the equation of the ellipse.

Example 22.4.3

Find the equation of the ellipse shown.

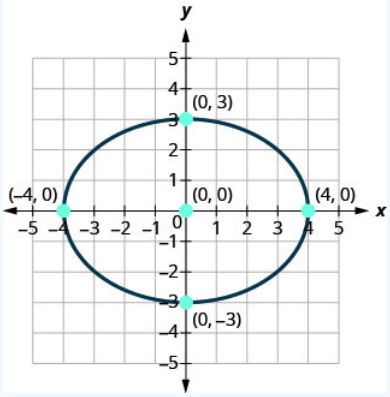

Figure 11.3.12

Solution:

We recognize this as an ellipse that is centered at the origin.

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

Since the major axis is horizontal and the distance from the center to the vertex is 4, we know $a=4$ and so $a^2=16$.

$$\frac{x^2}{16}+\frac{y^2}{b^2}=1$$

The minor axis is vertical and the distance from the center to the ellipse is 3, we know $b=3$ and so $b^2=9$.

$$\frac{x^2}{16}+\frac{y^2}{9}=1$$

Exercise 22.4.5

Find the equation of the ellipse shown.

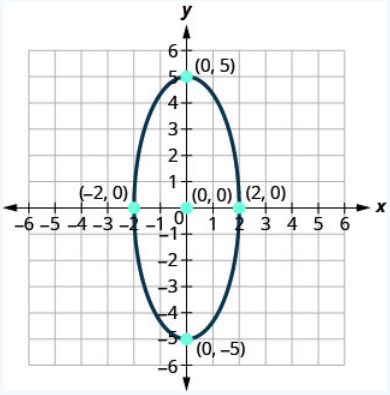

Figure 11.3.13

Answer

$\frac{x^2}{4}+\frac{y^2}{25}=1$

Exercise 22.4.6

Find the equation of the ellipse shown.

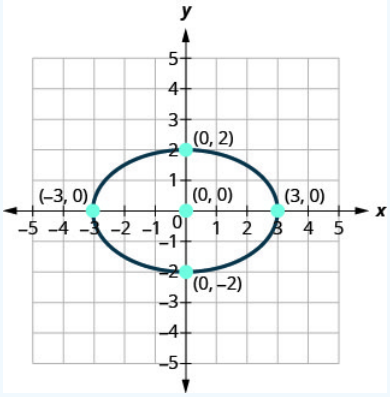

Figure 11.3.14

Answer

$\frac{x^2}{9}+\frac{y^2}{4}=1$

Graph an Ellipse with Center Not at the Origin

The ellipses we have looked at so far have all been centered at the origin. We will now look at ellipses whose center is (h,k).

The equation is $\frac{(x-h)^2}{a^2}+\frac{(y-k)^2}{b^2}=1$ and when $a>b$, the major axis is horizontal so the distance from the center to the vertex is a. When $b>a$, the major axis is vertical so the distance from the center to the vertex is b.

Definition 22.4.3

Standard Form of the Equation an Ellipse with Center (h,k)

The standard form of the equation of an ellipse with center (h,k), is

$$\frac{(x-h)^2}{a^2}+\frac{(y-k)^2}{b^2}=1$$

When $a>b$, the major axis is horizontal so the distance from the center to the vertex is a.

When $b>a$, the major axis is vertical so the distance from the center to the vertex is b.

Example 22.4.4

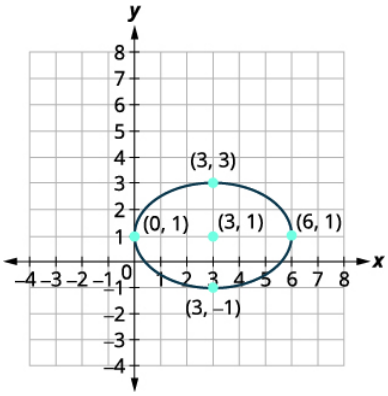
Graph: $\frac{(x-3)^2}{9}+\frac{(y-1)^2}{4}=1$.

Solution:

Table 11.3.4

The equation is in standard form, $\frac{(x-h)^2}{a^2}+\frac{(y-k)^2}{b^2}=1$.	$\frac{(x-3)^2}{9}+\frac{(y-1)^2}{4}=1$
The ellipse is centered at (h,k).	The center is $(3,1)$.
Since $9>4$ and 9 is in the x^2 term, the major axis is horizontal.	
$a^2=9, a=\pm 3$ $b^2=4, b=\pm 2$	The distance from the center to the vertices is 3. The distance from the center to the endpoints of the minor axis is 2.

Sketch the ellipse.



Exercise 22.4.7

Graph: $\frac{(x+3)^2}{4}+\frac{(y-5)^2}{16}=1$.

Answer

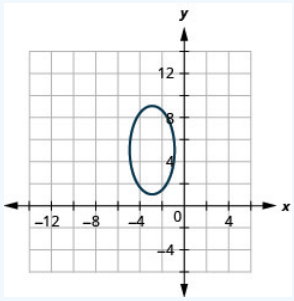


Figure 11.3.16

Exercise 22.4.8

Graph: $\frac{(x-1)^2}{25}+\frac{(y+3)^2}{16}=1$.

Answer

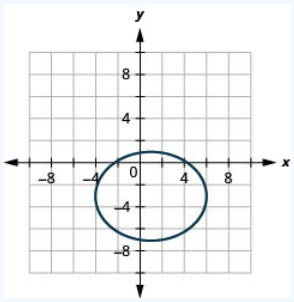

Figure 11.3.17

If we look at the equations of $\frac{x^2}{9}+\frac{y^2}{4}=1$ and $\frac{(x-3)^2}{9}+\frac{(y-1)^2}{4}=1$, we see that they are both ellipses with $a=3$ and $b=2$. So they will have the same size and shape. They are different in that they do not have the same center.

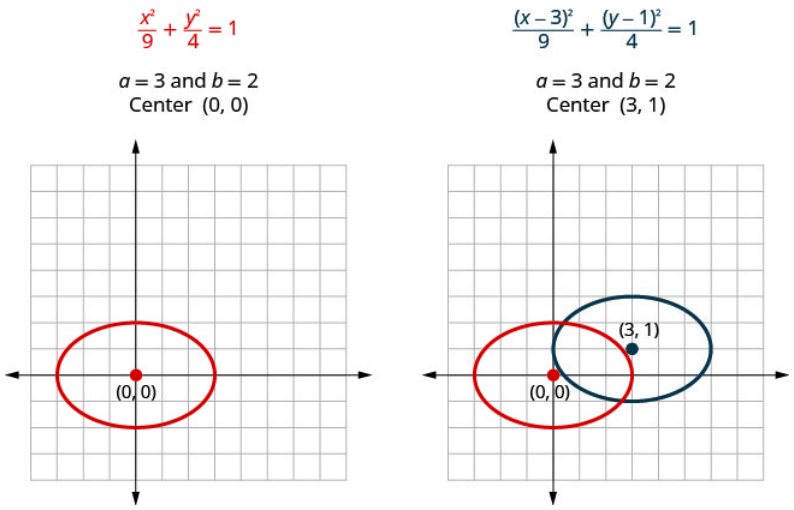

Figure 11.3.18

Notice in the graph above that we could have graphed $\frac{(x-3)^2}{9}+\frac{(y-1)^2}{4}=1$ by translations. We moved the original ellipse to the right 3 units and then up 1 unit.

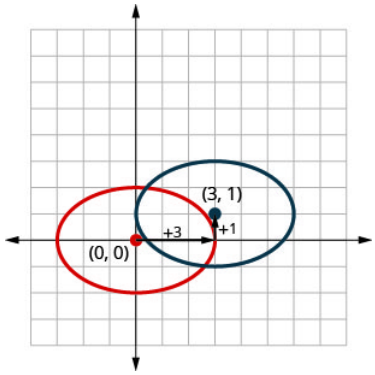

Figure 11.3.19

In the next example we will use the translation method to graph the ellipse.

Example 22.4.5

Graph $\frac{(x+4)^2}{16}+\frac{(y-6)^2}{9}=1$ by translation.

Solution:

This ellipse will have the same size and shape as $\frac{x^2}{16}+\frac{y^2}{9}=1$ whose center is $(0,0)$. We graph this ellipse first.

Table 11.3.5

The center is $(0,0)$.	Center $(0,0)$
Since $16>9$, the major axis is horizontal.	
$a^2=16, a=\pm 4$ $b^2=9, \quad b=\pm 3$	The vertices are $(4,0),(-4,0)$. The endpoints of the minor axis are $(0,3),(0,-3)$.

Sketch the ellipse.	The original equation is in standard form, $\frac{(x-h)^2}{a^2}+\frac{(y-k)^2}{b^2}=1$.	$\frac{(x-(-4))^2}{16}+\frac{(y-6)^2}{9}=1$
The ellipse is centered at (h, k).	The center is $(-4, 6)$.
We translate the graph of $\frac{x^2}{16}+\frac{y^2}{9}=1$ four units to the left and then up 6 units. Verify that the center is $(-4, 6)$. The new ellipse is the ellipse whose equation is $\frac{(x+4)^2}{16}+\frac{(y-6)^2}{9}=1$.	
? Exercise 22.4.9

Graph $\frac{(x-5)^2}{9}+\frac{(y+4)^2}{4}=1$ by translation.

Answer

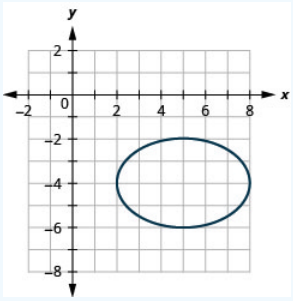

Figure 11.3.22

? Exercise 22.4.10

Graph $\frac{(x+6)^2}{16}+\frac{(y+2)^2}{25}=1$ by translation.

Answer

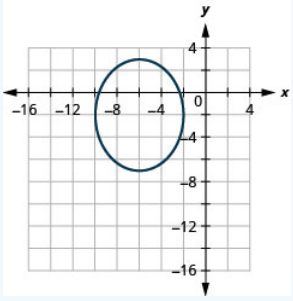

Figure 11.3.23

When an equation has both an x^2 and a y^2 with different coefficients, we verify that it is an ellipsis by putting it in standard form. We will then be able to graph the equation.

Example 22.4.6

Write the equation $x^2+4y^2-4x+24y+24=0$ in standard form and graph.

Solution:

We put the equation in standard form by completing the squares in both x and y.

Table 11.3.6

	$x^2+4y^2-4x+24y+24=0$
Rewrite grouping the x terms and y terms.	$(x^2-4x+\,)+(4y^2+24y+\,)=-24$
Make the coefficients of x^2 and y^2 equal 1.	$(x^2-4x+\,)+4(y^2+6y+\,)=-24$
Complete the squares.	$(x^2-4x+4)+4(y^2+6y+9)=-24+4+36$
Write as binomial squares.	$(x-2)^2+4(y+3)^2=16$
Divide both sides by 16 to get 1 on the right.	$\frac{(x-2)^2}{16}+\frac{4(y+3)^2}{16}=\frac{16}{16}$
Simplify.	$\frac{(x-2)^2}{16}+\frac{(y+3)^2}{4}=1$
The equation is in standard form, $\frac{(x-h)^2}{a^2}+\frac{(y-k)^2}{b^2}=1$	$\frac{(x-2)^2}{16}+\frac{(y+3)^2}{4}=1$
The ellipse is centered at (h,k).	The center is $(2,-3)$.
Since $16>4$ and 16 is in the x^2 term, the major axis is horizontal. $a^2=16, a=\pm 4$ $b^2=4, \quad b=\pm 2$	The distance from the center to the vertices is 4. The distance from the center to the endpoints of the minor axis is 2.
Sketch the ellipse.	
https://math.libretexts.org/@go/page/46500

Exercise 22.4.11

a. Write the equation $6x^2+4y^2+12x-32y+34=0$ in standard form and
b. Graph.

Answer

a. $\frac{(x+1)^2}{6}+\frac{(y-4)^2}{9}=1$
b.

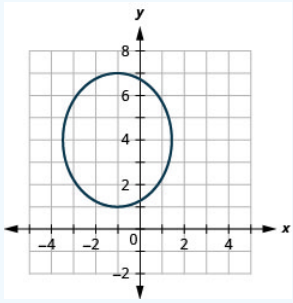

Figure 11.3.32

Exercise 22.4.12

a. Write the equation $4x^2+y^2-16x-6y+9=0$ in standard form and
b. Graph.

Answer

a. $\frac{(x-2)^2}{4}+\frac{(y-3)^2}{16}=1$
b.

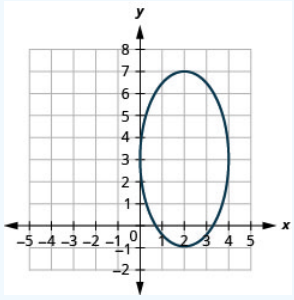

Figure 11.3.33

Solve Application with Ellipses

The orbits of the planets around the sun follow elliptical paths.

Example 22.4.7

Pluto (a dwarf planet) moves in an elliptical orbit around the Sun. The closest Pluto gets to the Sun is approximately 30 astronomical units (AU) and the furthest is approximately 50 AU. The Sun is one of the foci of the elliptical orbit. Letting the ellipse center at the origin and labeling the axes in AU, the orbit will look like the figure below. Use the graph to write an equation for the elliptical orbit of Pluto.

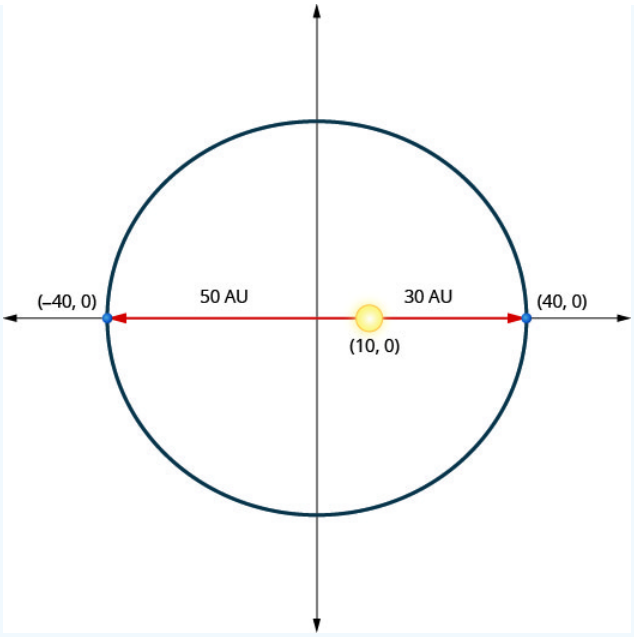

Figure 11.3.34

Solution:

We recognize this as an ellipse that is centered at the origin.

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

Since the major axis is horizontal and the distance from the center to the vertex is 40, we know $a=40$ and so $a^2=1600$.

$$\frac{x^2}{1600}+\frac{y^2}{b^2}=1$$

The minor axis is vertical but the end points aren't given.To find b we will use the location of the Sun. Since the Sun is a focus of the ellipse at the point $(10,0)$,we know $c=10$. Use this to solve for b^2.

$$\begin{aligned} b^2 &= a^2-c^2 \\ b^2 &= 40^2-10^2 \\ b^2 &= 1600-100 \\ b^2 &= 1500 \end{aligned}$$

Substitute a^2 and b^2 into the standard form of the ellipse.

$$\frac{x^2}{1600}+\frac{y^2}{1500}=1$$

Exercise 22.4.13

A planet moves in an elliptical orbit around its sun. The closest the planet gets to the sun is approximately 20 AU and the furthest is approximately 30 AU. The sun is one of the foci of the elliptical orbit. Letting the ellipse center at the origin and labeling the axes in AU, the orbit will look like the figure below. Use the graph to write an equation for the elliptical orbit of the planet.

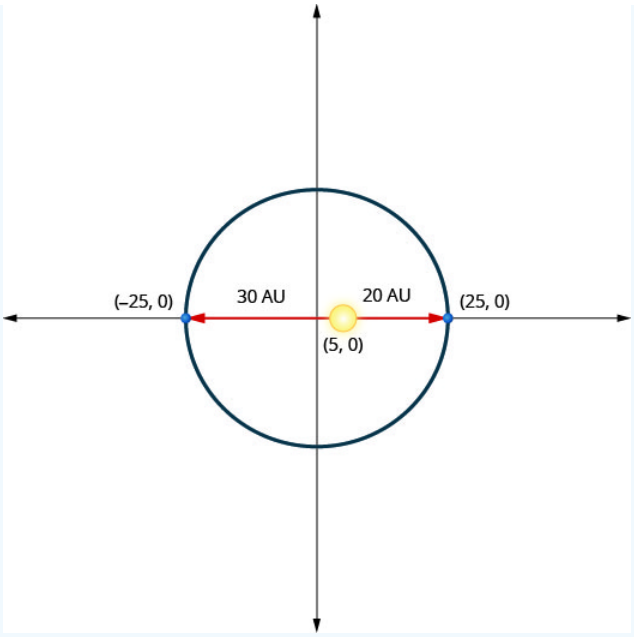

Figure 11.3.35

Answer

$\frac{x^2}{625} + \frac{y^2}{600} = 1$

Exercise 22.4.14

A planet moves in an elliptical orbit around its sun. The closest the planet gets to the sun is approximately 20 AU and the furthest is approximately 50 AU. The sun is one of the foci of the elliptical orbit. Letting the ellipse center at the origin and labeling the axes in AU, the orbit will look like the figure below. Use the graph to write an equation for the elliptical orbit of the planet.

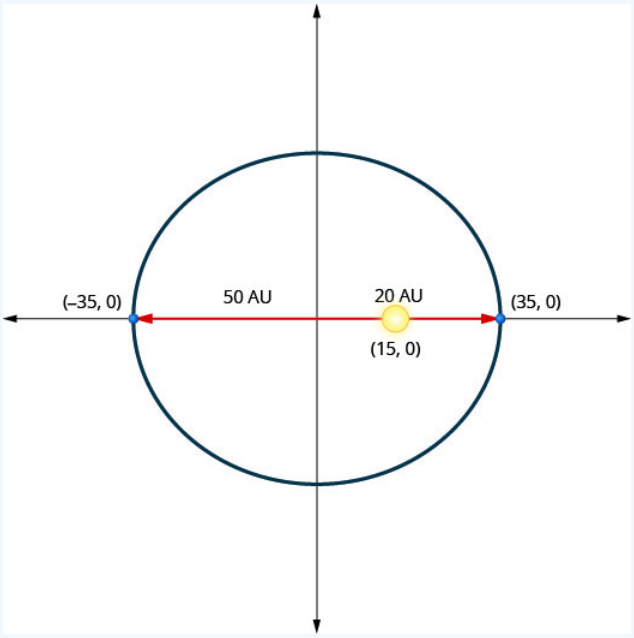

Figure 11.3.36

Answer

$\frac{x^2}{1225}+\frac{y^2}{1000}=1$

- Conic Sections: Graphing Ellipses Part 2
- Equation for Ellipse From Graph

Key Concepts

- **Ellipse:** An **ellipse** is all points in a plane where the sum of the distances from two fixed points is constant. Each of the fixed points is called a **focus** of the ellipse.

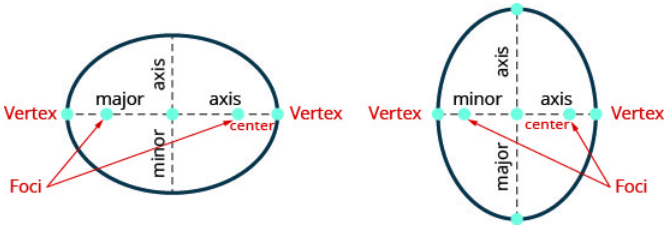

Figure 11.3.37

- If we draw a line through the foci intersects the ellipse in two points—each is called a **vertex** of the ellipse.
  The segment connecting the vertices is called the **major axis**.
  The midpoint of the segment is called the **center** of the ellipse.
  A segment perpendicular to the major axis that passes through the center and intersects the ellipse in two points is called the **minor axis**.
- **Standard Form of the Equation an Ellipse with Center** $(0,0)$: The standard form of the equation of an ellipse with center $(0,0)$, is

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

  The x-intercepts are $(a,0)$ and $(-a,0)$.
  The y-intercepts are $(0,b)$ and $(0,-b)$.
- **How to an Ellipse with Center** $(0,0)$
  1. Write the equation in standard form.
  2. Determine whether the major axis is horizontal or vertical.
  3. Find the endpoints of the major axis.
  4. Find the endpoints of the minor axis
  5. Sketch the ellipse.
- **Standard Form of the Equation an Ellipse with Center** (h,k): The standard form of the equation of an ellipse with center (h,k), is

$$\frac{(x-h)^2}{a^2}+\frac{(y-k)^2}{b^2}=1$$

  When $a>b$, the major axis is horizontal so the distance from the center to the vertex is a.
  When $b>a$, the major axis is vertical so the distance from the center to the vertex is b.

Glossary

ellipse

An ellipse is all points in a plane where the sum of the distances from two fixed points is constant.

22.5: Hyperbolas

Learning Objectives

By the end of this section, you will be able to:

- Graph a hyperbola with center at $(0, 0)$
- Graph a hyperbola with center at (h, k)
- Identify conic sections by their equations

Before you get started, take this readiness quiz.

1. Solve: $x^2 = 12$.
   If you missed this problem, review Example 9.1.
2. Expand: $(x - 4)^2$.
   If you missed this problem, review Example 5.32.
3. Graph $y = -\frac{2}{3}x$.
   If you missed this problem, review Example 3.4.

Graph a Hyperbola with Center at $(0, 0)$

The last conic section we will look at is called a **hyperbola**. We will see that the equation of a hyperbola looks the same as the equation of an ellipse, except it is a difference rather than a sum. While the equations of an ellipse and a hyperbola are very similar, their graphs are very different.

We define a **hyperbola** as all points in a plane where the difference of their distances from two fixed points is constant. Each of the fixed points is called a **focus** of the hyperbola.

Definition 22.5.1

A **hyperbola** is all points in a plane where the difference of their distances from two fixed points is constant. Each of the fixed points is called a **focus** of the hyperbola.

Figure 11.4.1

The line through the foci, is called the **transverse axis**. The two points where the transverse axis intersects the hyperbola are each a **vertex** of the hyperbola. The midpoint of the segment joining the foci is called the **center** of the hyperbola. The line perpendicular to the transverse axis that passes through the center is called the **conjugate axis**. Each piece of the graph is called a **branch** of the hyperbola.

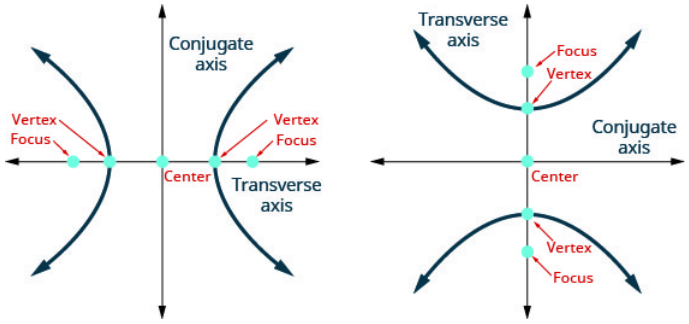

Figure 11.4.2

Again our goal is to connect the geometry of a conic with algebra. Placing the hyperbola on a rectangular coordinate system gives us that opportunity. In the figure, we placed the hyperbola so the foci $((-c,0),(c,0))$ are on the x-axis and the center is the origin.

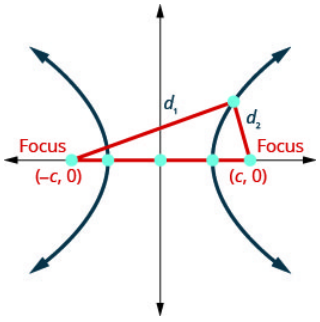

Figure 11.4.3

The definition states the difference of the distance from the foci to a point (x,y) is constant. So $|d_1-d_2|$ is a constant that we will call $2a$ so $|d_1-d_2|=2a$. We will use the distance formula to lead us to an algebraic formula for an ellipse.

$$|d_1-d_2|=2a$$

Use the distance formula to find d_1, d_2

$$\left|\sqrt{(x-(-c))^2+(y-0)^2}\ -\sqrt{(x-c)^2+(y-0)^2}\ \right|=2a$$

Eliminate the radicals. To simplify the equation of the ellipse, we let $c^2-a^2=b^2$.

$$\frac{x^2}{a^2}+\frac{y^2}{c^2-a^2}=1$$

So, the equation of a hyperbola centered at the origin in standard form is:

$$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

To graph the hyperbola, it will be helpful to know about the intercepts. We will find the x-intercepts and y-intercepts using the formula.

x-intercepts

Let $y=0$.

$$\begin{aligned}\frac{x^2}{a^2}-\frac{y^2}{b^2}&=1\\ \frac{x^2}{a^2}-\frac{0^2}{b^2}&=1\\ \frac{x^2}{a^2}&=1\\ x^2&=a^2\\ x&=\pm a\end{aligned}$$

The x-intercepts are $(a,0)$ and $(-a,0)$.

y-intercepts

Let $x = 0$.

$$\begin{aligned} \frac{x^2}{a^2} - \frac{y^2}{b^2} &= 1 \\ \frac{0^2}{a^2} - \frac{y^2}{b^2} &= 1 \\ -\frac{y^2}{b^2} &= 1 \\ y^2 &= -b^2 \\ y &= \pm\sqrt{-b^2} \end{aligned}$$

There are no y-intercepts.

The \(a, b\) values in the equation also help us find the asymptotes of the hyperbola. The asymptotes are intersecting straight lines that the branches of the graph approach but never intersect as the \(x, y\) values get larger and larger.

To find the asymptotes, we sketch a rectangle whose sides intersect the x-axis at the vertices $(-a, 0), (a, 0)$, and intersect the y-axis at $(0, -b), (0, b)$. The lines containing the diagonals of this rectangle are the asymptotes of the hyperbola. The rectangle and asymptotes are not part of the hyperbola, but they help us graph the hyperbola.

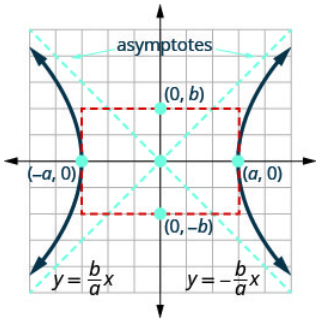

Figure 11.4.4

The asymptotes pass through the origin and we can evaluate their slope using the rectangle we sketched. They have equations $y = \frac{b}{a}x$ and $y = -\frac{b}{a}x$.

There are two equations for hyperbolas, depending whether the transverse axis is vertical or horizontal. We can tell whether the transverse axis is horizontal by looking at the equation. When the equation is in standard form, if the x^2-term is positive, the transverse axis is horizontal. When the equation is in standard form, if the y^2-term is positive, the transverse axis is vertical.

The second equations could be derived similarly to what we have done. We will summarize the results here.

Definition 22.5.2

Standard Form of the Equation a Hyperbola with Center $(0, 0)$

The standard form of the equation of a hyperbola with center $(0, 0)$, is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \text{or} \quad \frac{y^2}{a^2} - \frac{x^2}{b^2} = 1$$

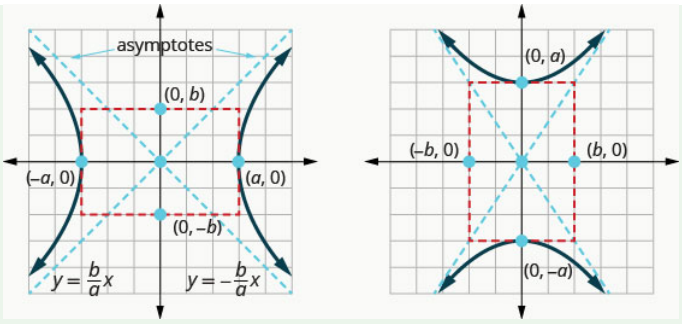

Figure 11.4.5

Notice that, unlike the equation of an ellipse, the denominator of x^2 is not always a^2 and the denominator of y^2 is not always b^2.

Notice that when the x^2-term is positive, the transverse axis is on the x-axis. When the y^2-term is positive, the transverse axis is on the y-axis.

Standard Forms of the Equation a Hyperbola with Center $(0,0)$

Table 11.4.1

	$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$	$\frac{y^2}{a^2}-\frac{x^2}{b^2}=1$
Orientation	Transverse axis on the x-axis. Opens left and right	Transverse axis on the y-axis. Opens up and down
Vertices	$(-a,0),(a,0)$	$(0,-a),(0,a)$
x-intercepts	$(-a,0),(a,0)$	none
y-intercepts	none	$(0,-a),(0,a)$
Rectangle	Use $(\pm a,0)(0,\pm b)$	Use $(0,\pm a)(\pm b,0)$
Asymptotes	$y=\frac{b}{a}x, y=-\frac{b}{a}x$	$y=\frac{a}{b}x, y=-\frac{a}{b}x$

We will use these properties to graph hyperbolas.

Example 22.5.1 How to Graph a Hyperbola with Center $(0,0)$

Graph $\frac{x^2}{25}-\frac{y^2}{4}=1$.

Solution:

Table 11.4.2

Step 1: Write the equation in standard form.	The equation is in standard form.	$\frac{x^2}{25}-\frac{y^2}{4}=1$
Step 2: Determine whether the transverse axis is horizontal or vertical.	Since the x^2-term is positive, the transverse axis is horizontal.	The transverse axis is horizontal.
Step 3: Find the vertices.	Since $a^2=25$ then $a=\pm 5$. The vertices are on the x-axis.	$(-5,0),(5,0)$

Step 4: Sketch the rectangle centered at the origin intersection one axis at $\pm a$ and the other at $\pm b$.	Since $a = \pm 5$, the rectangle will intersect the x-axis at the vertices. Since $b = \pm 2$, the rectangle will intersect the y-axis at $(0, -2)$ and $(0, 2)$.	Step 5: Sketch the asymptotes--the lines through the diagonals of the rectangle.	The asymptotes have the equations $y = \frac{5}{2}x, y = -\frac{5}{2}x$.	Step 6: Draw the two branches of the hyperbola.	Start at each vertex and use the asymptotes as a guide.	
? Exercise 22.5.1

Graph $\frac{x^2}{16} - \frac{y^2}{4} = 1$.

Answer

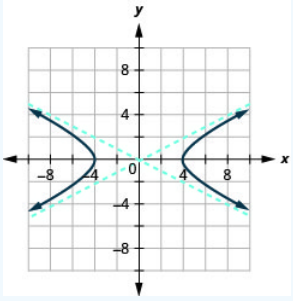

Figure 11.4.9

? Exercise 22.5.2

Graph $\frac{x^2}{9} - \frac{y^2}{16} = 1$.

Answer

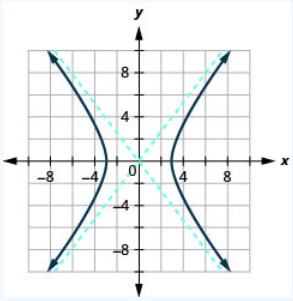

Figure 11.4.10

We summarize the steps for reference.

Graph a Hyperbola Centered at $(0,0)$

1. Write the equation in standard form.
2. Determine whether the transverse axis is horizontal or vertical.
3. Find the vertices.
4. Sketch the rectangle centered at the origin intersecting one axis at $\pm a$ and the other at $\pm b$.
5. Sketch the asymptotes—the lines through the diagonals of the rectangle.
6. Draw the two branches of the hyperbola.

Sometimes the equation for a hyperbola needs to be first placed in standard form before we graph it.

✓ Example 22.5.2

Graph $4y^2 - 16x^2 = 64$.

Solution:

Table 11.4.3

	$4y^2 - 16x^2 = 64$
To write the equation in standard form, divide each term by 64 to make the equation equal to 1.	$\frac{4y^2}{64} - \frac{16x^2}{64} = \frac{64}{64}$
Simplify.	$\frac{y^2}{16} - \frac{x^2}{4} = 1$
Since the y^2-term is positive, the transverse axis is vertical. Since $a^2 = 16$ then $a = \pm 4$.	

The vertices are on the y-axis, $(0, -a), (0, a)$. Since $b^2 = 4$ then $b = \pm 2$.	$(0, -4), (0, 4)$
Sketch the rectangle intersecting the x-axis at $(-2, 0), (2, 0)$ and the y-axis at the vertices. Sketch the asymptotes through the diagonals of the rectangle. Draw the two branches of the hyperbola.	
Exercise 22.5.3

Graph $4y^2 - 25x^2 = 100$.

Answer

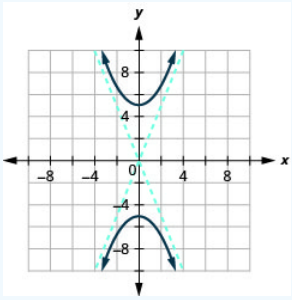

Figure 11.4.12

Exercise 22.5.4

Graph $25y^2 - 9x^2 = 225$.

Answer

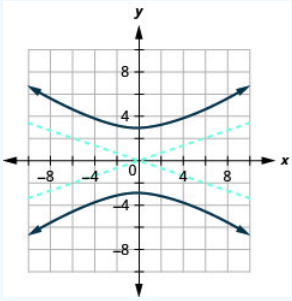

Figure 11.4.13

Graph a Hyperbola with Center at (h, k)

Hyperbolas are not always centered at the origin. When a hyperbola is centered at (h, k) the equations changes a bit as reflected in the table.

Standard Forms of the Equation a Hyperbola with Center (h, k)

Table 11.4.4

	$\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$	$\frac{(y-k)^2}{a^2} - \frac{(x-h)^2}{b^2} = 1$
Orientation	Transverse axis is horizontal. Opens left and right	Transverse axis is vertical. Opens up and down
Center	(h, k)	(h, k)
Vertices	a units to the left and right of the center	a units above and below the center
Rectangle	Use a units left/right of center b units above/below the center	Use a units above/below the center b units left/right of center

Example 22.5.3 How to Graph a Hyperbola with Center (h, k)

Graph $\frac{(x-1)^2}{9} - \frac{(y-2)^2}{16} = 1$

Solution:

Table 11.4.5

Step 1: Write the equation in standard form.	The equation is in standard form.	$\frac{(x-1)^2}{9} - \frac{(y-2)^2}{16} = 1$
Step 2: Determine whether the transverse axis is horizontal or vertical.	Since the x^2-term is positive, the hyperbola opens left and right.	The transverse axis is horizontal. The hyperbola opens left and right.
Step 3: Find the center and a, b.	$h = 1$ and $k = 2$ $a^2 = 9$ $b^2 = 16$	$\frac{\left(\overset{x-h}{x-1}\right)^2}{9} - \frac{\left(\overset{y-k}{y-2}\right)^2}{16} = 1$ Center: $(1, 2)$ $a = 3$ $b = 4$
Step 4: Sketch the rectangle centered at (h, k) using a, b.	Mark the center, $(1, 2)$. Sketch the rectangle that goes through the points 3 units to the left/right of the center and 4 units above and below the center.	
https://math.libretexts.org/@go/page/46502

Step 5: Sketch the asymptotes--the lines through the diagonals of the rectangle. Mark the vertices.	Sketch the diagonals. Mark the vertices, which are on the rectangle 3 units to the left and right of the center.	Step 6: Draw the two branches of the hyperbola.	Start at each vertex and use the asymptotes as a guide.	
? Exercise 22.5.5

Graph $\frac{(x-3)^2}{25}-\frac{(y-1)^2}{9}=1$.

Answer

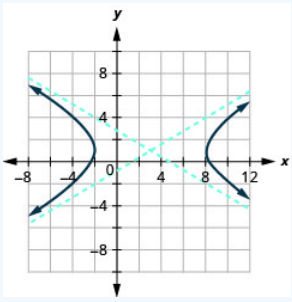

Figure 11.4.17

? Exercise 22.5.6

Graph $\frac{(x-2)^2}{4}-\frac{(y-2)^2}{9}=1$.

Answer

https://math.libretexts.org/@go/page/46502

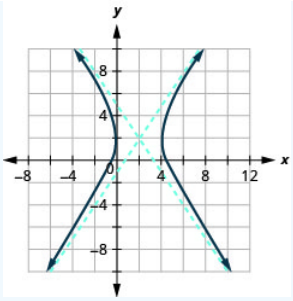

Figure 11.4.18

We summarize the steps for easy reference.

Graph a Hyperbola Centered at (h, k)

1. Write the equation in standard form.
2. Determine whether the transverse axis is horizontal or vertical.
3. Find the center and a, b.
4. Sketch the rectangle centered at (h, k) using a, b.
5. Sketch the asymptotes—the lines through the diagonals of the rectangle. Mark the vertices.
6. Draw the two branches of the hyperbola.

Be careful as you identify the center. The standard equation has $x-h$ and $y-k$ with the center as (h, k).

Example 22.5.4

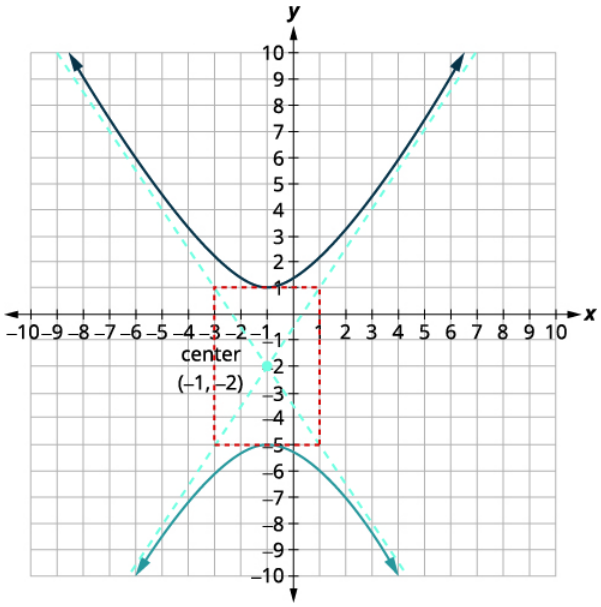
Graph $\frac{(y+2)^2}{9}-\frac{(x+1)^2}{4}=1$.

Solution:

Table 11.4.6

	$\frac{(y+2)^2}{9}-\frac{(x+1)^2}{4}=1$
Since the y^2-term is positive, the hyperbola opens up and down.	$\frac{\left(\frac{y-k}{y-(-2)}\right)^2}{9}-\frac{\left(\frac{x-h}{x-(-1)}\right)^2}{4}=1$
Find the center, (h, k).	Center: $(-1,-2)$
Find a, b.	$a=3 b=2$

Sketch the rectangle that goes through the points 3 units above and below the center and
2 units to the left/right of the center.
Sketch the asymptotes—the lines through the diagonals of the rectangle.
Mark the vertices.
Graph the branches.



Exercise 22.5.7

Graph $\frac{(y+3)^2}{16}-\frac{(x+2)^2}{9}=1$.

Answer

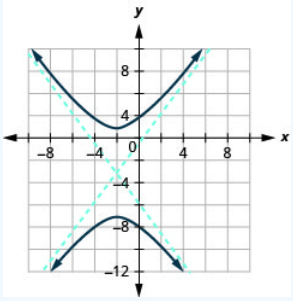


Figure 11.4.22

Exercise 22.5.8

Graph $\frac{(y+2)^2}{9}-\frac{(x+2)^2}{9}=1$.

Answer

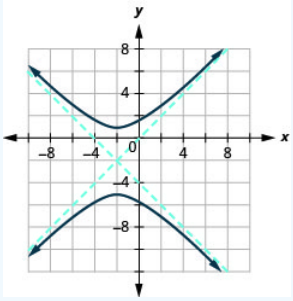

Figure 11.4.23

Again, sometimes we have to put the equation in standard form as our first step.

Example 22.5.5

Write the equation in standard form and graph $4x^2 - 9y^2 - 24x - 36y - 36 = 0$.

Solution:

Table 11.4.7

	$4x^2 - 9y^2 - 24x - 36y - 36 = 0$
To get to standard form, complete the squares.	$4(x^2 - 6x) - 9(y^2 + 4y) = 36$
	$4(x^2 - 6x + 9) - 9(y^2 + 4y + 4) = 36 + 36 - 36$
	$4(x-3)^2 - 9(y+2)^2 = 36$
Divide each term by 36 to get the constant to be 1.	$\frac{4(x-3)^2}{36} - \frac{9(y+2)^2}{36} = \frac{36}{36}$
	$\frac{(x-3)^2}{9} - \frac{(y+2)^2}{4} = 1$
Since the x^2-term is positive, the hyperbola opens left and right.	
Find the center, (h, k).	Center: $(3, -2)$
Find a, b.	$a = 3$ $b = 4$
Sketch the rectangle that goes through the points 3 units to the left/right of the center and 2 units above and below the center. Sketch the asymptotes—the lines through the diagonals of the rectangle. Mark the vertices. Graph the branches.	
Exercise 22.5.9

a. Write the equation in standard form and
b. Graph $9x^2 - 16y^2 + 18x + 64y - 199 = 0$.

Answer

a. $\frac{(x+1)^2}{16} - \frac{(y-2)^2}{9} = 1$
b.

https://math.libretexts.org/@go/page/46502

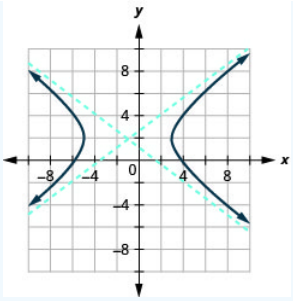

Figure 11.4.31

? Exercise 22.5.10

a. Write the equation in standard form and
b. Graph $16x^2 - 25y^2 + 96x - 50y - 281 = 0$.

Answer

a. $\frac{(x+3)^2}{25} - \frac{(y+1)^2}{16} = 1$
b.

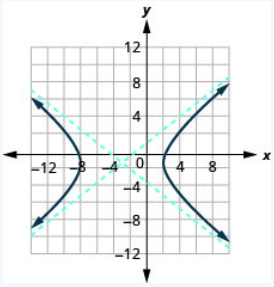

Figure 11.4.32

Identify Conic Sections by Their Equations

Now that we have completed our study of the conic sections, we will take a look at the different equations and recognize some ways to identify a conic by its equation. When we are given an equation to graph, it is helpful to identify the conic so we know what next steps to take.

To identify a conic from its equation, it is easier if we put the variable terms on one side of the equation and the constants on the other.

Table 11.4.8

Conic	Characteristics of x^2- and y^2-terms	Example
Parabola	Either x^2 OR y^2. Only one variable is squared.	$x = 3y^2 - 2y + 1$
Circle	x^2- and y^2- terms have the same coefficients.	$x^2 + y^2 = 49$
Ellipse	x^2- and y^2- terms have the **same** sign, different coefficients.	$4x^2 + 25y^2 = 100$
Hyperbola	x^2- and y^2- terms have the **different** signs, different coefficients.	$25y^2 - 4x^2 = 100$

Example 22.5.6

Identify the graph of each equation as a circle, parabola, ellipse, or hyperbola.

a. $9x^2+4y^2+56y+160=0$
b. $9x^2-16y^2+18x+64y-199=0$
c. $x^2+y^2-6x-8y=0$
d. $y=-2x^2-4x-5$

Solution:

a. The x^2- and y^2-terms have the same sign and different coefficients.

$$9x^2+4y^2+56y+160=0$$

Ellipse

b. The x^2- and y^2-terms have different signs and different coefficients.

$$9x^2-16y^2+18x+64y-199=0$$

Hyperbola

c. The x^2- and y^2-terms have the same coefficients.

$$x^2+y^2-6x-8y=0$$

Circle

d. Only one variable, x, is squared.

$$y=-2x^2-4x-5$$

Parabola

Exercise 22.5.11

Identify the graph of each equation as a circle, parabola, ellipse, or hyperbola.

a. $x^2+y^2-8x-6y=0$
b. $4x^2+25y^2=100$
c. $y=6x^2+2x-1$
d. $16y^2-9x^2=144$

Answer

a. Circle
b. Ellipse
c. Parabola
d. Hyperbola

Exercise 22.5.12

Identify the graph of each equation as a circle, parabola, ellipse, or hyperbola.

a. $16x^2+9y^2=144$
b. $y=2x^2+4x+6$
c. $x^2+y^2+2x+6y+9=0$
d. $4x^2-16y^2=64$

Answer

a. Ellipse
b. Parabola
c. Circle

d. Hyperbola

Access these online resources for additional instructions and practice with hyperbolas.

- Graph a Hyperbola with Center at the Origin
- Graph a Hyperbola with Center not at the Origin
- Graph a Hyperbola in General Form
- Identifying Conic Sections in General Form

Key Concepts

- **Hyperbola:** A **hyperbola** is all points in a plane where the difference of their distances from two fixed points is constant.

hyperbola

Figure 11.4.1

- Each of the fixed points is called a **focus** of the hyperbola.
  The line through the foci, is called the **transverse axis**.
  The two points where the transverse axis intersects the hyperbola are each a **vertex** of the hyperbola.
  The midpoint of the segment joining the foci is called the **center** of the hyperbola.
  The line perpendicular to the transverse axis that passes through the center is called the **conjugate axis**.
  Each piece of the graph is called a **branch** of the hyperbola.

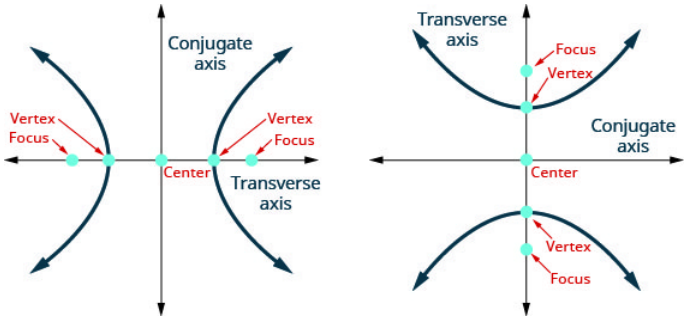

Figure 11.4.2

Standard Forms of the Equation a Hyperbola with Center $(0,0)$

Table 11.4.1

	$\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$	$\frac{y^2}{a^2}-\frac{x^2}{b^2}=1$
Orientation	Transverse axis on the x-axis. Opens left and right	Transverse axis on the y-axis. Opens up and down

22.6: Solving Systems of Nonlinear Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve a system of nonlinear equations using graphing
- Solve a system of nonlinear equations using substitution
- Solve a system of nonlinear equations using elimination
- Use a system of nonlinear equations to solve applications

Before you get started, take this readiness quiz.

1. Solve the system by graphing: $\begin{cases} x-3y=-3 \\ x+y=5 \end{cases}$.
   If you missed this problem, review Example 4.2.
2. Solve the system by substitution: $\begin{cases} x-4y=-4 \\ -3x+4y=0 \end{cases}$
   If you missed this problem, review Example 4.7.
3. Solve the system by elimination: $\begin{cases} 3x-4y=-9 \\ 5x+3y=14 \end{cases}$
   If you missed this problem, review Example 4.9.

Solve a System of Nonlinear Equations using Graphing

We learned how to solve systems of linear equations with two variables by graphing, substitution and elimination. We will be using these same methods as we look at nonlinear systems of equations with two equations and two variables. A **system of nonlinear equations** is a system where at least one of the equations is not linear.

For example each of the following systems is a **system of nonlinear equations**.

$$\begin{cases} x^2+y^2=9 \\ x^2-y=9 \end{cases} \quad \begin{cases} 9x^2+y^2=9 \\ y=3x-3 \end{cases} \quad \begin{cases} x+y=4 \\ y=x^2+2 \end{cases}$$

Definition 22.6.1

A **system of nonlinear equations** is a system where at least one of the equations is not linear.

Just as with systems of linear equations, a solution of a nonlinear system is an ordered pair that makes both equations true. In a nonlinear system, there may be more than one solution. We will see this as we solve a system of nonlinear equations by graphing.

When we solved systems of linear equations, the solution of the system was the point of intersection of the two lines. With systems of nonlinear equations, the graphs may be circles, parabolas or hyperbolas and there may be several points of intersection, and so several solutions. Once you identify the graphs, visualize the different ways the graphs could intersect and so how many solutions there might be.

To solve systems of nonlinear equations by graphing, we use basically the same steps as with systems of linear equations modified slightly for nonlinear equations. The steps are listed below for reference.

Solve a System of Nonlinear Equations by Graphing.

1. Identify the graph of each equation. Sketch the possible options for intersection.
2. Graph the first equation.
3. Graph the second equation on the same rectangular coordinate system.
4. Determine whether the graphs intersect.
5. Identify the points of intersection.
6. Check that each ordered pair is a solution to both original equations.

Example 22.6.1

Solve the system by graphing: $\begin{cases} x-y=-2 \\ y=x^2 \end{cases}$

Solution:

Table 11.5.1

Identify each graph.	$\begin{cases} x-y=-2 & \text{line} \\ y=x^2 & \text{parabola} \end{cases}$
Sketch the possible options for intersection of a parabola and a line.	Graph the line, $x-y=-2$. Slope-intercept form $y=x+2$. Graph the parabola, $y=x^2$.	Identify the points of intersection.	The points of intersection appear to be $(2,3)$ and $(-1,1)$.
Check to make sure each solution makes both equations true. $(2,4)$ $x-y=-2 \quad y=x^2$ $2-4\stackrel{?}{=}-2 \quad 4\stackrel{?}{=}2^2$ $-2=-2 \quad 4=4$ $(-1,1)$ $x-y=-2 \quad y=x^2$ $-1-1\stackrel{?}{=}-2 \quad 1\stackrel{?}{=}(-1)^2$ $-2=-2 \quad 1=1$	
	The solutions are $(2,4)$ and $(-1,1)$.

Exercise 22.6.1

Solve the system by graphing: $\begin{cases} x+y=4 \\ y=x^2+2 \end{cases}$.

Answer

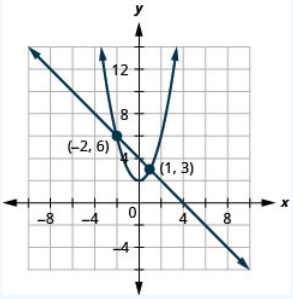

Figure 11.5.3

? Exercise 22.6.2

Solve the system by graphing: $\begin{cases} x-y=-1 \\ y=-x^2+3 \end{cases}$

Answer

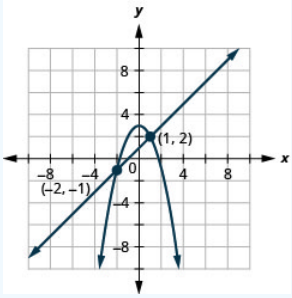

Figure 11.5.4

To identify the graph of each equation, keep in mind the characteristics of the x^2 and y^2 terms of each conic.

✓ Example 22.6.2

Solve the system by graphing: $\begin{cases} y=-1 \\ (x-2)^2+(y+3)^2=4 \end{cases}$.

Solution:

Table 11.5.2

Identify each graph.	$\begin{cases} y=-1 & \text{line} \\ (x-2)^2+(y+3)^2=4 & \text{circle} \end{cases}$
Sketch the possible options for the intersection of a circle and a line.	

Graph the circle, $(x-2)^2+(y+3)^2=4$ Center: $(2,-3)$ radius: 2 Graph the line, $y=-1$. It is a horizontal line.	Identify the points of intersection.	The point of intersection appears to be$(2,-1)$.
Check to make sure the solution makes both equations true. $(2,-1)$ $(x-2)^2+(y+3)^2=4 \quad y=-1$ $(2-2)^2+(-1+3)^2 \stackrel{?}{=} 4 \quad -1=-1$ $(0)^2+(2)^2 \stackrel{?}{=} 4$ $4=4$	
	The solution is $(2,-1)$

Exercise 22.6.3

Solve the system by graphing: $\begin{cases} x=-6 \\ (x+3)^2+(y-1)^2=9 \end{cases}$

Answer

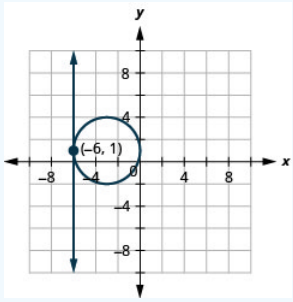

Figure 11.5.7

Exercise 22.6.4

Solve the system by graphing: $\begin{cases} y=4 \\ (x-2)^2+(y+3)^2=4 \end{cases}$

Answer

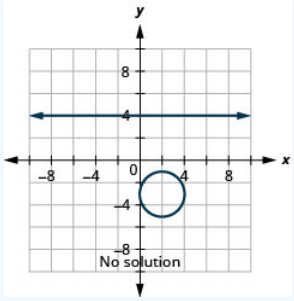

Figure 11.5.8

Solve a System of Nonlinear Equations Using Substitution

The graphing method works well when the points of intersection are integers and so easy to read off the graph. But more often it is difficult to read the coordinates of the points of intersection. The substitution method is an algebraic method that will work well in many situations. It works especially well when it is easy to solve one of the equations for one of the variables.

The substitution method is very similar to the substitution method that we used for systems of linear equations. The steps are listed below for reference.

Solve a System of Nonlinear Equations by Substitution

1. Identify the graph of each equation. Sketch the possible options for intersection.
2. Solve one of the equations for either variable.
3. Substitute the expression from Step 2 into the other equation.
4. Solve the resulting equation.
5. Substitute each solution in Step 4 into one of the original equations to find the other variable.
6. Write each solution as an ordered pair.
7. Check that each ordered pair is a solution to **both** original equations.

Example 22.6.3

Solve the system by using substitution: $\begin{cases} 9x^2+y^2=9 \\ y=3x-3 \end{cases}$

Solution:

Table 11.5.3

Identify each graph.	$\begin{cases} 9x^2+y^2=9 & \text{ellipse} \\ y=3x-3 & \text{line} \end{cases}$
Sketch the possible options for intersection of an ellipse and a line.	
The equation $y=3x-3$ is solved for y.	$y=3x-3$
	$9x^2+y^2=9$
Substitute $3x-3$ for y in the first equation.	$9x^2+(3x-3)^2=9$
Solve the equation for x.	$9x^2+9x^2-18x+9=9$
	$18x^2-18x=0$ $18x(x-1)=0$ $x=0 \quad x=1$
Substitute $x=0$ and $x=1$ into $y=3x-3$ to find y-.	$y=3x-3 \qquad y=3x-3$
	$y=3\cdot 0-3 \qquad y=3\cdot 1-3$ $y=-3 \qquad y=0$

	The ordered pairs are $(0,-3),(1,0)$.
Check **both** ordered pairs in **both** equations. $(0,-3)$ $9x^2+y^2=9 \quad y=3x-3$ $9\cdot 0^2+(-3)^2 \stackrel{?}{=} 9 \quad -3 \stackrel{?}{=} 3\cdot 0-3$ $0+9 \stackrel{?}{=} 9 \quad -3 \stackrel{?}{=} 0-3$ $9=9 \quad -3=-3$ $(1,0)$ $9x^2+y^2=9 \quad y=3x-3$ $9\cdot 1^2+(0)^2 \stackrel{?}{=} 9 \quad 0 \stackrel{?}{=} 3\cdot 1-3$ $9+0 \stackrel{?}{=} 9 \quad 0 \stackrel{?}{=} 3-3$ $9=9 \quad 0=0$	
	The solutions are $(0,-3),(1,0)$.

? Exercise 22.6.5

Solve the system by using substitution: $\begin{cases} x^2+9y^2=9 \\ y=\frac{1}{3}x-3 \end{cases}$

Answer

No solution

? Exercise 22.6.6

Solve the system by using substitution: $\begin{cases} 4x^2+y^2=4 \\ y=x+2 \end{cases}$

Answer

$\left(-\frac{4}{5},\frac{6}{5}\right),(0,2)$

So far, each system of nonlinear equations has had at least one solution. The next example will show another option.

✓ Example 22.6.4

Solve the system by using substitution: $\begin{cases} x^2-y=0 \\ y=x-2 \end{cases}$

Solution:

Table 11.5.4

Identify each graph.	$\begin{cases} x^2-y=0 & \text{parabola} \\ y=x-2 & \text{line} \end{cases}$
Sketch the possible options for intersection of a parabola and a line.	The equation $y=x-2$ is solved for y.	$y=x-2$

	$x^2 - y = 0$
Substitute $x - 2$ for y in the first equation.	$x^2 - (x - 2) = 0$
Solve the equation for x.	$x^2 - x + 2 = 0$
This doesn't factor easily, so we can check the discriminant.	
$b^2 - 4ac$ $(-1)^2 - 4 \cdot 1 \cdot 2$ -7	The discriminant is negative, so there is no real solution. The system has no solution.

Exercise 22.6.7

Solve the system by using substitution: $\begin{cases} x^2 - y = 0 \\ y = 2x - 3 \end{cases}$

Answer

No solution

Exercise 22.6.8

Solve the system by using substitution: $\begin{cases} y^2 - x = 0 \\ y = 3x - 2 \end{cases}$

Answer

$\left(\frac{4}{9}, -\frac{2}{3}\right), (1, 1)$

Solve a System of Nonlinear Equations Using Elimination

When we studied systems of linear equations, we used the method of elimination to solve the system. We can also use elimination to solve systems of nonlinear equations. It works well when the equations have both variables squared. When using elimination, we try to make the coefficients of one variable to be opposites, so when we add the equations together, that variable is eliminated.

The elimination method is very similar to the elimination method that we used for systems of linear equations. The steps are listed for reference.

Solve a System of Equations by Elimination

1. Identify the graph of each equation. Sketch the possible options for intersection.
2. Write both equations in standard form.
3. Make the coefficients of one variable opposites.
   Decide which variable you will eliminate.
   Multiply one or both equations so that the coefficients of that variable are opposites.
4. Add the equations resulting from Step 3 to eliminate one variable.
5. Solve for the remaining variable.
6. Substitute each solution from Step 5 into one of the original equations. Then solve for the other variable.
7. Write each solution as an ordered pair.
8. Check that each ordered pair is a solution to **both** original equations.

Example 22.6.5

Solve the system by elimination: $\begin{cases} x^2 + y^2 = 4 \\ x^2 - y = 4 \end{cases}$

Solution:

Table 11.5.5

Identify each graph.	$\begin{cases} x^2+y^2=4 & \text{circle} \\ x^2-y=4 & \text{parabola} \end{cases}$
Sketch the possible options for intersection of a circle and a parabola.	Both equations are in standard form.	$\begin{cases} x^2+y^2=4 \\ x^2-y=4 \end{cases}$
To get opposite coefficients of x^2, we will multiply the second equation by -1.	$\begin{cases} x^2+y^2=4 \\ -1(x^2-y)=-1(4) \end{cases}$
Simplify.	$\begin{cases} x^2+y^2=4 \\ -x^2+y=4 \end{cases}$
Add the two equation to eliminate x^2/	$\begin{cases} x^2+y^2=4 \\ -x^2+y=4 \\ \hline y^2+y=0 \end{cases}$
Solve for y.	$y(y+1)=0$
	$y=0 \quad y+1=0$ $y=-1$
Substitute $y=0$ and $y=-1$ into one of the original equations. Then solve for x.	$y=0 \quad y=-1$
	$x^2-y=4$ $x^2-0=4$ $x^2=4$ $x=\pm 2$ $x^2-y=4$ $x^2-(-1)=4$ $x^2=3$ $x=\pm\sqrt{3}$
Write each solution as an ordered pair.	The ordered pairs are $(-2,0)(2,0).\ (\sqrt{3},-1)(-\sqrt{3},-1)$
Check that each ordered pair is a solution to **both** original equations.	
We will leave the checks for each of the four solutions to you.	The solutions are $(-2,0)$, $(2,0)$, $(\sqrt{3},-1)$, and $(-\sqrt{3},-1)$.

Exercise 22.6.9

Solve the system by elimination: $\begin{cases} x^2+y^2=9 \\ x^2-y=9 \end{cases}$

Answer

$(-3,0),(3,0),(-2\sqrt{2},-1),(2\sqrt{2},-1)$

Exercise 22.6.10

Solve the system by elimination: $\begin{cases} x^2+y^2=1 \\ -x+y^2=1 \end{cases}$

Answer

$(-1,0),(0,1),(0,-1)$

There are also four options when we consider a circle and a hyperbola.

Example 22.6.6

Solve the system by elimination: $\begin{cases} x^2+y^2=7 \\ x^2-y^2=1 \end{cases}$

Solution:

Table 11.5.6

Identify each graph.	$\begin{cases} x^2+y^2=7 & \text{circle} \\ x^2-y^2=1 & \text{hyperbola} \end{cases}$
Sketch the possible options for intersection of a circle and hyperbola.	Both equations are in standard form.	$\begin{cases} x^2+y^2=7 \\ x^2-y^2=1 \end{cases}$
The coefficients of y^2 are opposite, so we will add the equations.	$\begin{cases} x^2+y^2=7 \\ x^2-y^2=1 \end{cases}$ $2x^2=8$
Simplify.	$x^2=4$ $x=\pm 2$ $x=2 \quad x=-2$
Substitue $x=2$ and $x=-2$ into one of the original equations. Then solve for y.	$x^2+y^2=7$ $2^2+y^2=7$ $4+y^2=7$ $y^2=3$ $y=\pm\sqrt{3}$ $x^2+y^2=7$ $(-2)^2+y^2=7$ $4+y^2=7$ $y^2=3$ $y=\pm\sqrt{3}$
Write each solution as an ordered pair.	The ordered pairs are $(-2,\sqrt{3})$, $(-2,-\sqrt{3})$, $(2,\sqrt{3})$, and $(2,-\sqrt{3})$.
Check that the ordered pair is a solution to **both** original equations.	
We will leave the checks for each of the four solutions to you.	The solutions are $(-2,\sqrt{3})$, $(-2,-\sqrt{3})$, $(2,\sqrt{3})$, and $(2,-\sqrt{3})$.

Exercise 22.6.11

Solve the system by elimination: $\begin{cases} x^2+y^2=25 \\ y^2-x^2=7 \end{cases}$

Answer

$(-3,-4),(-3,4),(3,-4),(3,4)$

Exercise 22.6.12

Solve the system by elimination: $\begin{cases} x^2+y^2=4 \\ x^2-y^2=4 \end{cases}$

Answer

$(-2,0),(2,0)$

Use a System of Nonlinear Equations to Solve Applications

Systems of nonlinear equations can be used to model and solve many applications. We will look at an everyday geometric situation as our example.

Example 22.6.7

The difference of the squares of two numbers is 15. The sum of the numbers is 5. Find the numbers.

Solution:

Table 11.5.7

Identify what we are looking for.	Two different numbers.
Define the variables.	x=first number y=second number
Translate the information into a system of equations.	
First sentence.	The difference of the squares of two numbers is 15.
	$x^2-y^2=15$
Second sentence.	The sum of the numbers is 5.
	$x+y=5$
Solve the system by substitution.	$\begin{cases} x^2-y^2=15 \\ x+y=5 \end{cases}$
Solve the second equation for x.	$x=5-y$
Substitute x into the first equation.	$x^2-y^2=15$
	$(5-y)^2-y^2=15$
Expand and simplify.	$(25-10y+y^2)-y^2=15$
	$25-10y+y^2-y^2=15$ $25-10y=15$
Solve for y.	$-10y=-10$
	$y=1$
Substitute back into the second equation.	$x+y=5$

	$x+(1)=5$ $x=4$
	The numbers are 1 and 4.

Exercise 22.6.13

The difference of the squares of two numbers is -20. The sum of the numbers is 10. Find the numbers.

Answer

4 and 6

Exercise 22.6.14

The difference of the squares of two numbers is 35. The sum of the numbers is -1. Find the numbers.

Answer

-18 and 17

Example 22.6.8

Myra purchased a small 25” TV for her kitchen. The size of a TV is measured on the diagonal of the screen. The screen also has an area of 300 square inches. What are the length and width of the TV screen?

Solution:

Table 11.5.8

Identify what we are looking for.	The length and width of the rectangle.
Define the variables.	Let x= width of the rectangle y=length of the rectangle
Draw a diagram to help visualize the situation.		Area is 300 square inches.
Translate the information into a system of equations.	The diagonal of the right triangle is 25 inches.
	$x^2+y^2=25^2$ $x^2+y^2=625$
	The area of the rectangle is 300 square inches.
	$x \cdot y=300$ $x^2+y^2=625$ $x \cdot y=300$
Solve the system using substitution.	$x \cdot y=300$
Solve the second equation for x.	$x=\frac{300}{y}$
Substitute x into the first equation.	$x^2+y^2=625$

	$\left(\frac{300}{y}\right)^2 + y^2 = 625$
Simplify.	$\frac{90000}{y^2} + y^2 = 625$
Multiply by y^2 to clear the fractions.	$90000 + y^4 = 625y^2$
Put in standard form.	$y^4 - 625y^2 + 90000 = 0$
Solve by factoring.	$(y^2 - 225)(y^2 - 400) = 0$
	$y^2 - 225 = 0 \quad y^2 - 400 = 0$
	$y^2 = 225 \quad y^2 = 400$ $y = \pm 15 \quad y = \pm 20$
Since y is a side of the rectangle, we discard the negative values.	$y = 15 \quad y = 20$
Substitute back into the second equation.	$x \cdot y = 300 \quad x \cdot y = 300$
	$x \cdot 15 = 300 \quad x \cdot 20 = 300$ $x = 20 \quad x = 15$
	If the length is 15 inches, the width is 20 inches.
	If the length is 20 inches, the width is 15 inches.

? Exercise 22.6.15

Edgar purchased a small 20” TV for his garage. The size of a TV is measured on the diagonal of the screen. The screen also has an area of 192 square inches. What are the length and width of the TV screen?

Answer

If the length is 12 inches, the width is 16 inches. If the length is 16 inches, the width is 12 inches.

? Exercise 22.6.16

The Harper family purchased a small microwave for their family room. The diagonal of the door measures 15 inches. The door also has an area of 108 square inches. What are the length and width of the microwave door?

Answer

If the length is 12 inches, the width is 9 inches. If the length is 9 inches, the width is 12 inches.

22.6E: Exercises

Practice Makes Perfect

Exercise 22.6E.17 Solve a System of Nonlinear Equations Using Graphing

In the following exercises, solve the system of equations by using graphing.

1. $\begin{cases} y = 2x + 2 \\ y = -x^2 + 2 \end{cases}$
2. $\begin{cases} y = 6x - 4 \\ y = 2x^2 \end{cases}$
3. $\begin{cases} x + y = 2 \\ x = y^2 \end{cases}$
4. $\begin{cases} x - y = -2 \\ x = y^2 \end{cases}$
5. $\begin{cases} y = \frac{3}{2}x + 3 \\ y = -x^2 + 2 \end{cases}$
6. $\begin{cases} y = x - 1 \\ y = x^2 + 1 \end{cases}$
7. $\begin{cases} x = -2 \\ x^2 + y^2 = 4 \end{cases}$
8. $\begin{cases} y = -4 \\ x^2 + y^2 = 16 \end{cases}$
9. $\begin{cases} x = 2 \\ (x+2)^2 + (y+3)^2 = 16 \end{cases}$
10. $\begin{cases} y = -1 \\ (x-2)^2 + (y-4)^2 = 25 \end{cases}$
11. $\begin{cases} y = -2x + 4 \\ y = \sqrt{x} + 1 \end{cases}$
12. $\begin{cases} y = -\frac{1}{2}x + 2 \\ y = \sqrt{x} - 2 \end{cases}$

10. $(-4,0),(4,0)$
12. $(-\sqrt{3},0),(\sqrt{3},0)$
14. $(-2,-3),(-2,3),(2,-3),(2,3)$
16. $(-1,-3),(-1,3),(1,-3),(1,3)$

Exercise $22.6E.20$ Use a System of Nonlinear Equations to Solve Applications

In the following exercises, solve the problem using a system of equations.

1. The sum of two numbers is -6 and the product is 8. Find the numbers.
2. The sum of two numbers is 11 and the product is -42. Find the numbers.
3. The sum of the squares of two numbers is 65. The difference of the number is 3. Find the numbers.
4. The sum of the squares of two numbers is 113. The difference of the number is 1. Find the numbers.
5. The difference of the squares of two numbers is 15. The difference of twice the square of the first number and the square of the second number is 30. Find the numbers.
6. The difference of the squares of two numbers is 20. The difference of the square of the first number and twice the square of the second number is 4. Find the numbers.
7. The perimeter of a rectangle is 32 inches and its area is 63 square inches. Find the length and width of the rectangle.
8. The perimeter of a rectangle is 52 cm and its area is $165\,\text{cm}^2$. Find the length and width of the rectangle.
9. Dion purchased a new microwave. The diagonal of the door measures 17 inches. The door also has an area of 120 square inches. What are the length and width of the microwave door?
10. Jules purchased a microwave for his kitchen. The diagonal of the front of the microwave measures 26 inches. The front also has an area of 240 square inches. What are the length and width of the microwave?
11. Roman found a widescreen TV on sale, but isn't sure if it will fit his entertainment center. The TV is 60". The size of a TV is measured on the diagonal of the screen and a widescreen has a length that is larger than the width. The screen also has an area of 1728 square inches. His entertainment center has an insert for the TV with a length of 50 inches and width of 40 inches. What are the length and width of the TV screen and will it fit Roman's entertainment center?
12. Donnette found a widescreen TV at a garage sale, but isn't sure if it will fit her entertainment center. The TV is 50". The size of a TV is measured on the diagonal of the screen and a widescreen has a length that is larger than the width. The screen also has an area of 1200 square inches. Her entertainment center has an insert for the TV with a length of 38 inches and width of 27 inches. What are the length and width of the TV screen and will it fit Donnette's entertainment center?

Answer

2. -3 and 14

4. -7 and -8 or 8 and 7

6. -6 and -4 or -6 and 4 or 6 and -4 or 6 and 4

8. If the length is 11 cm, the width is 15 cm. If the length is 15 cm, the width is 11 cm.

10. If the length is 10 inches, the width is 24 inches. If the length is 24 inches, the width is 10 inches.

12. The length is 40 inches and the width is 30 inches. The TV will not fit Donnette's entertainment center.

Exercise $22.6E.21$ Writing Exercises

1. In your own words, explain the advantages and disadvantages of solving a system of equations by graphing.
2. Explain in your own words how to solve a system of equations using substitution.
3. Explain in your own words how to solve a system of equations using elimination.
4. A circle and a parabola can intersect in ways that would result in $0, 1, 2, 3,$ or 4 solutions. Draw a sketch of each of the possibilities.

Answer

2. Answers may vary

4. Answers may vary

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve a system of nonlinear equations using graphing.			
solve a system of nonlinear equations using substitution.			
solve a system of nonlinear equations using elimination.			
use a system of nonlinear equations to solve applications.			

Figure 11.5.67

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

22.7: Review Exercises

Chapter Review Exercises

Distance and Midpoint Formulas; Circles

Exercise 22.7.1 Use the Distance Formula

In the following exercises, find the distance between the points. Round to the nearest tenth if needed.

1. $(-5, 1)$ and $(-1, 4)$
2. $(-2, 5)$ and $(1, 5)$
3. $(8, 2)$ and $(-7, -3)$
4. $(1, -4)$ and $(5, -5)$

Answer

2. $d = 3$
4. $d = \sqrt{17}, d \approx 4.1$

Exercise 22.7.2 Use the Midpoint Formula

In the following exercises, find the midpoint of the line segments whose endpoints are given.

1. $(-2, -6)$ and $(-4, -2)$
2. $(3, 7)$ and $(5, 1)$
3. $(-8, -10)$ and $(9, 5)$
4. $(-3, 2)$ and $(6, -9)$

Answer

2. $(4, 4)$
4. $\left(\frac{3}{2}, -\frac{7}{2}\right)$

Exercise 22.7.3 Write the Equation of a Circle in Standard Form

In the following exercises, write the standard form of the equation of the circle with the given information.

1. radius is 15 and center is $(0, 0)$
2. radius is $\sqrt{7}$ and center is $(0, 0)$
3. radius is 9 and center is $(-3, 5)$
4. radius is 7 and center is $(-2, -5)$
5. center is $(3, 6)$ and a point on the circle is $(3, -2)$
6. center is $(2, 2)$ and a point on the circle is $(4, 4)$

Answer

2. $x^2 + y^2 = 7$
4. $(x + 2)^2 + (y + 5)^2 = 49$
6. $(x - 2)^2 + (y - 2)^2 = 8$

Exercise 22.7.4 Graph a Circle

In the following exercises,

a. Find the center and radius, then
b. Graph each circle.

1. $2x^2+2y^2=450$
2. $3x^2+3y^2=432$
3. $(x+3)^2+(y-5)^2=81$
4. $(x+2)^2+(y+5)^2=49$
5. $x^2+y^2-6x-12y-19=0$
6. $x^2+y^2-4y-60=0$

Answer

2.

a. radius: 12, center: $(0,0)$
b.

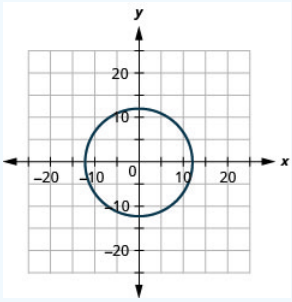

Figure 11.E.1

4.

a. radius: 7, center: $(-2,-5)$
b.

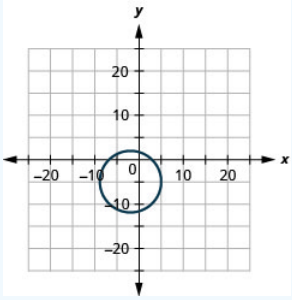

Figure 11.E.2

6.

a. radius: 8, center: $(0,2)$
b.

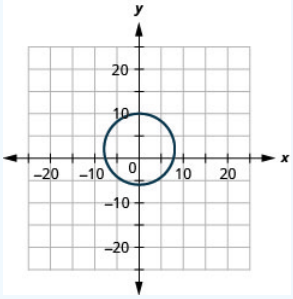

Figure 11.E.3

Parabolas

Exercise 22.7.5 Graph Vertical Parabolas

In the following exercises, graph each equation by using its properties.

1. $y = x^2 + 4x - 3$
2. $y = 2x^2 + 10x + 7$
3. $y = -6x^2 + 12x - 1$
4. $y = -x^2 + 10x$

Answer

2.

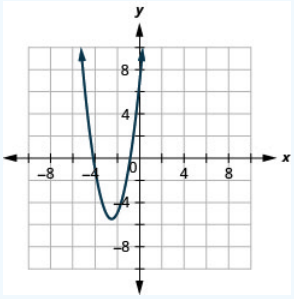

Figure 11.E.4

4.

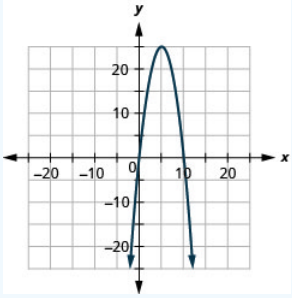

Figure 11.E.5

Exercise 22.7.6 Graph Vertical Parabolas

In the following exercises,

a. Write the equation in standard form, then
b. Use properties of the standard form to graph the equation.

1. $y = x^2 + 4x + 7$

2. $y = 2x^2 - 4x - 2$
3. $y = -3x^2 - 18x - 29$
4. $y = -x^2 + 12x - 35$

Answer

2.

a. $y = 2(x-1)^2 - 4$

b.

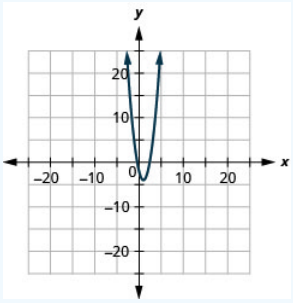

Figure 11.E.6

4.

a. $y = -(x-6)^2 + 1$

b.

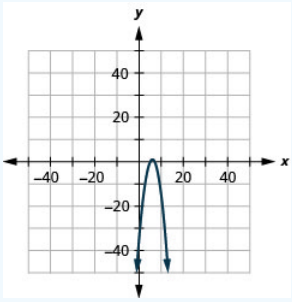

Figure 11.E.7

Exercise 22.7.7 Graph Horizontal Parabolas

In the following exercises, graph each equation by using its properties.

1. $x = 2y^2$
2. $x = 2y^2 + 4y + 6$
3. $x = -y^2 + 2y - 4$
4. $x = -3y^2$

Answer

2.

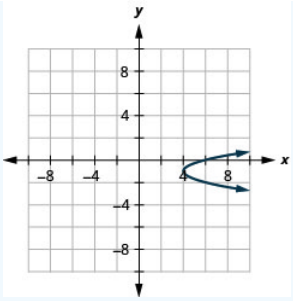

Figure 11.E.8

4.

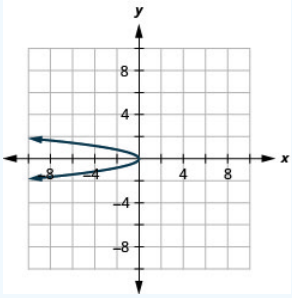

Figure 11.E.9

Exercise 22.7.8 Graph Horizontal Parabolas

In the following exercises,

a. Write the equation in standard form, then
b. Use properties of the standard form to graph the equation.

1. $x = 4y^2 + 8y$
2. $x = y^2 + 4y + 5$
3. $x = -y^2 - 6y - 7$
4. $x = -2y^2 + 4y$

Answer

2.

a. $x = (y+2)^2 + 1$
b.

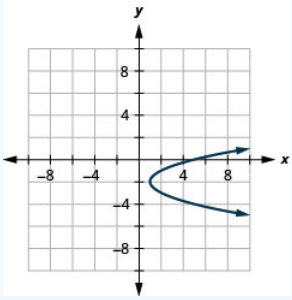

Figure 11.E.10

4.

a. $x = -2(y-1)^2 + 2$
b.

https://math.libretexts.org/@go/page/46506

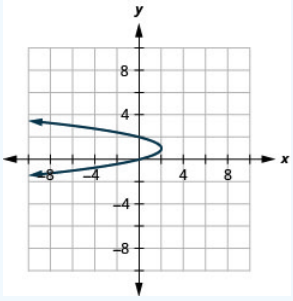

Figure 11.E.11

Exercise 22.7.9 Solve Applications with Parabolas

In the following exercises, create the equation of the parabolic arch formed in the foundation of the bridge shown. Give the answer in standard form.

1.

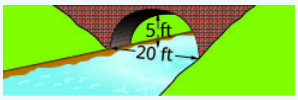

Figure 11.E.12

2.

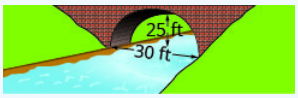

Figure 11.E.13

Answer

2. $y=-\frac{1}{9}x^2+\frac{10}{3}x$

Ellipses

Exercise 22.7.10 Graph an Ellipse with Center at the Origin

In the following exercises, graph each ellipse.

1. $\frac{x^2}{36}+\frac{y^2}{25}=1$
2. $\frac{x^2}{4}+\frac{y^2}{81}=1$
3. $49x^2+64y^2=3136$
4. $9x^2+y^2=9$

Answer

2.

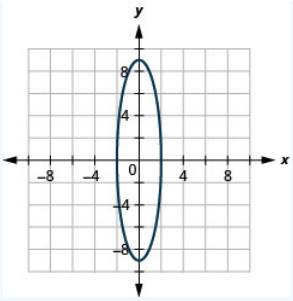

Figure 11.E.14

4.

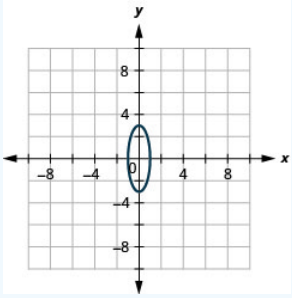

Figure 11.E.15

Exercise 22.7.11 Find the Equation of an Ellipse with Center at the Origin

In the following exercises, find the equation of the ellipse shown in the graph.

1.

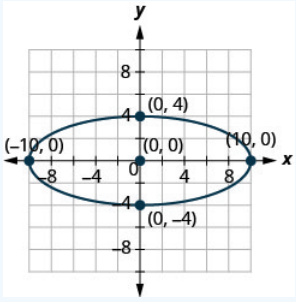

Figure 11.E.16

2.

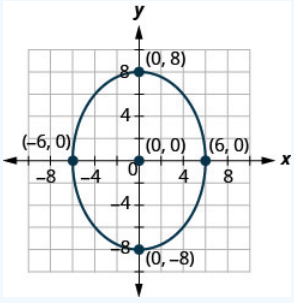

Figure 11.E.17

Answer

2. $\frac{x^2}{36}+\frac{y^2}{64}=1$

Exercise 22.7.12 Graph an Ellipse with Center Not at the Origin

In the following exercises, graph each ellipse.

1. $\frac{(x-1)^2}{25}+\frac{(y-6)^2}{4}=1$
2. $\frac{(x+4)^2}{16}+\frac{(y+1)^2}{9}=1$
3. $\frac{(x-5)^2}{16}+\frac{(y+3)^2}{36}=1$
4. $\frac{(x+3)^2}{9}+\frac{(y-2)^2}{25}=1$

Answer

2.

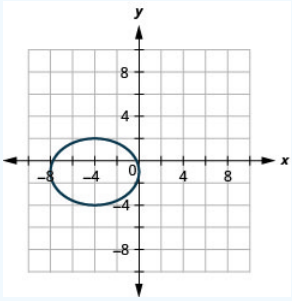

Figure 11.E.18

4.

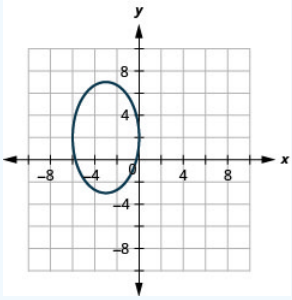

Figure 11.E.19

Exercise 22.7.13 Graph an Ellipse with Center Not at the Origin

In the following exercises,

a. Write the equation in standard form and
b. Graph.

1. $x^2+y^2+12x+40y+120=0$
2. $25x^2+4y^2-150x-56y+321=0$
3. $25x^2+4y^2+150x+125=0$
4. $4x^2+9y^2-126x+405=0$

Answer

2.

a. $\frac{(x-3)^2}{4}+\frac{(y-7)^2}{25}=1$

b.

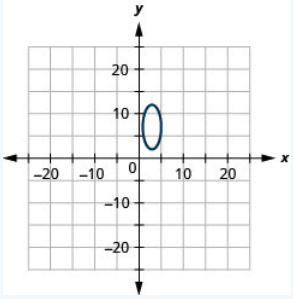

Figure 11.E.20

4.

a. $\frac{x^2}{9}+\frac{(y-7)^2}{4}=1$

b.

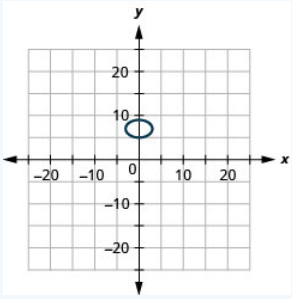

Figure 11.E.21

Exercise 22.7.14 Solve Applications with Ellipses

In the following exercises, write the equation of the ellipse described.

1. A comet moves in an elliptical orbit around a sun. The closest the comet gets to the sun is approximately 10 AU and the furthest is approximately 90 AU. The sun is one of the foci of the elliptical orbit. Letting the ellipse center at the origin and labeling the axes in AU, the orbit will look like the figure below. Use the graph to write an equation for the elliptical orbit of the comet.

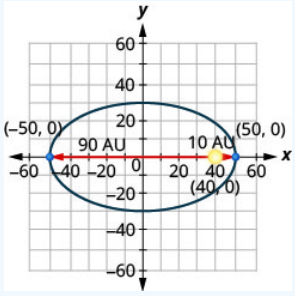

Figure 11.E.22

Answer

1. Solve

Hyperbolas

https://math.libretexts.org/@go/page/46506

Exercise 22.7.15 Graph a Hyperbola with Center at $(0,0)$

In the following exercises, graph.

1. $\frac{x^2}{25}-\frac{y^2}{9}=1$
2. $\frac{y^2}{49}-\frac{x^2}{16}=1$
3. $9y^2-16x^2=144$
4. $16x^2-4y^2=64$

Answer

1.

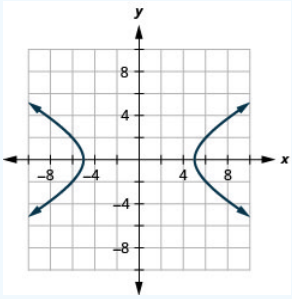

Figure 11.E.23

3.

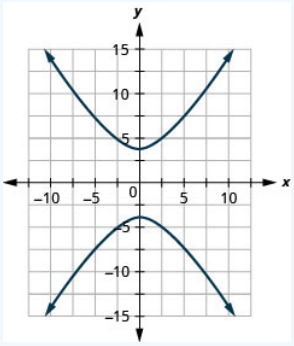

Figure 11.E.24

Exercise 22.7.16 Graph a Hyperbola with Center at (h,k)

In the following exercises, graph.

1. $\frac{(x+1)^2}{4}-\frac{(y+1)^2}{9}=1$
2. $\frac{(x-2)^2}{4}-\frac{(y-3)^2}{16}=1$
3. $\frac{(y+2)^2}{9}-\frac{(x+1)^2}{9}=1$
4. $\frac{(y-1)^2}{25}-\frac{(x-2)^2}{9}=1$

Answer

1.

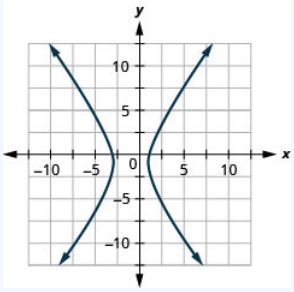

Figure 11.E.25

3.

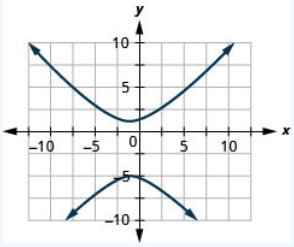

Figure 11.E.26

Exercise 22.7.17 Graph a Hyperbola with Center at (h, k)

In the following exercises,

a. Write the equation in standard form and
b. Graph.

1. $4x^2 - 16y^2 + 8x + 96y - 204 = 0$
2. $16x^2 - 4y^2 - 64x - 24y - 36 = 0$
3. $4y^2 - 16x^2 + 32x - 8y - 76 = 0$
4. $36y^2 - 16x^2 - 96x + 216y - 396 = 0$

Answer

1.

a. $\frac{(x+1)^2}{16} - \frac{(y-3)^2}{4} = 1$

b.

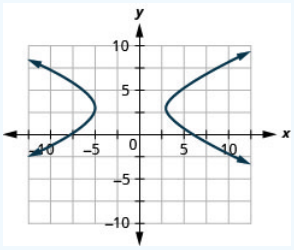

Figure 11.E.27

3.

a. $\frac{(y-1)^2}{16} - \frac{(x-1)^2}{4} = 1$

b.

https://math.libretexts.org/@go/page/46506

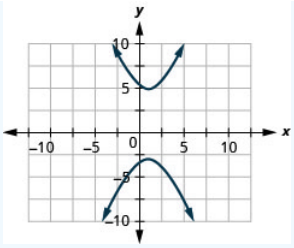

Figure 11.E.28

Exercise 22.7.18 Identify the Graph of Each Equation as a Circle, Parabola, Ellipse, or Hyperbola

In the following exercises, identify the type of graph.

1. a. $16y^2-9x^2-36x-96y-36=0$
   b. $x^2+y^2-4x+10y-7=0$
   c. $y=x^2-2x+3$
   d. $25x^2+9y^2=225$
2. a. $x^2+y^2+4x-10y+25=0$
   b. $y^2-x^2-4y+2x-6=0$
   c. $x=-y^2-2y+3$
   d. $16x^2+9y^2=144$

Answer

1.

a. Hyperbola
b. Circle
c. Parabola
d. Ellipse

Solve Systems of Nonlinear Equations

Exercise 22.7.19 Solve a System of Nonlinear Equations Using Graphing

In the following exercises, solve the system of equations by using graphing.

1. $\begin{cases} 3x^2-y=0 \\ y=2x-1 \end{cases}$
2. $\begin{cases} y=x^2-4 \\ y=x-4 \end{cases}$
3. $\begin{cases} x^2+y^2=169 \\ x=12 \end{cases}$
4. $\begin{cases} x^2+y^2=25 \\ y=-5 \end{cases}$

Answer

1.

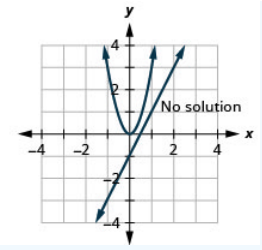

Figure 11.E.29

3.

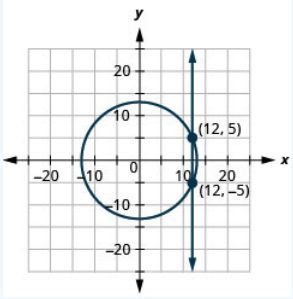

Figure 11.E.30

Exercise 22.7.20 Solve a System of Nonlinear Equations Using Substitution

In the following exercises, solve the system of equations by using substitution.

1. $\begin{cases} y = x^2 + 3 \\ y = -2x + 2 \end{cases}$
2. $\begin{cases} x^2 + y^2 = 4 \\ x - y = 4 \end{cases}$
3. $\begin{cases} 9x^2 + 4y^2 = 36 \\ y - x = 5 \end{cases}$
4. $\begin{cases} x^2 + 4y^2 = 4 \\ 2x - y = 1 \end{cases}$

Answer

1. $(-1, 4)$
3. No solution

Exercise 22.7.21 Solve a System of Nonlinear Equations Using Elimination

In the following exercises, solve the system of equations by using elimination.

1. $\begin{cases} x^2 + y^2 = 16 \\ x^2 - 2y - 1 = 0 \end{cases}$
2. $\begin{cases} x^2 - y^2 = 5 \\ -2x^2 - 3y^2 = -30 \end{cases}$
3. $\begin{cases} 4x^2 + 9y^2 = 36 \\ 3y^2 - 4x = 12 \end{cases}$
4. $\begin{cases} x^2 + y^2 = 14 \\ x^2 - y^2 = 16 \end{cases}$

Answer

1. $(-\sqrt{7}, 3), (\sqrt{7}, 3)$

3. $(-3, 0), (0, -2), (0, 2)$

Exercise 22.7.22 Use a System of Nonlinear Equations to Solve Applications

In the following exercises, solve the problem using a system of equations.

1. The sum of the squares of two numbers is 25. The difference of the numbers is 1. Find the numbers.
2. The difference of the squares of two numbers is 45. The difference of the square of the first number and twice the square of the second number is 9. Find the numbers.
3. The perimeter of a rectangle is 58 meters and its area is 210 square meters. Find the length and width of the rectangle.
4. Colton purchased a larger microwave for his kitchen. The diagonal of the front of the microwave measures 34 inches. The front also has an area of 480 square inches. What are the length and width of the microwave?

Answer

1. -3 and -4 or 4 and 3

3. If the length is 14 inches, the width is 15 inches. If the length is 15 inches, the width is 14 inches.

Practice Test

Exercise 22.7.23

In the following exercises, find the distance between the points and the midpoint of the line segment with the given endpoints. Round to the nearest tenth as needed.

1. $(-4, -3)$ and $(-10, -11)$
2. $(6, 8)$ and $(-5, -3)$

Answer

1. distance: 10, midpoint: $(-7, -7)$

Exercise 22.7.24

In the following exercises, write the standard form of the equation of the circle with the given information.

1. radius is 11 and center is $(0, 0)$
2. radius is 12 and center is $(10, -2)$
3. center is $(-2, 3)$ and a point on the circle is $(2, -3)$
4. Find the equation of the ellipse shown in the graph.

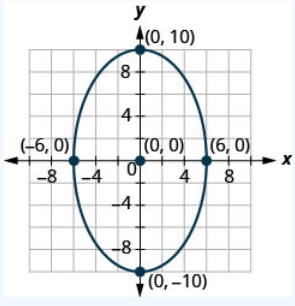

Figure 11.E.31

Answer

1. $x^2 + y^2 = 121$

3. $(x + 2)^2 + (y - 3)^2 = 52$

Exercise 22.7.25

In the following exercises,

a. Identify the type of graph of each equation as a circle, parabola, ellipse, or hyperbola, and
b. Graph the equation.

1. $4x^2+49y^2=196$
2. $y=3(x-2)^2-2$
3. $3x^2+3y^2=27$
4. $\frac{y^2}{100}-\frac{x^2}{36}=1$
5. $\frac{x^2}{16}+\frac{y^2}{81}=1$
6. $x=2y^2+10y+7$
7. $64x^2-9y^2=576$

Answer

1.

a. Ellipse
b.

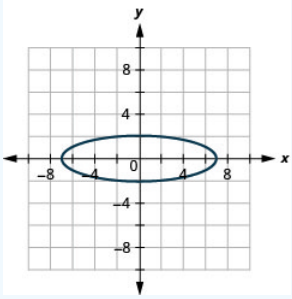

Figure 11.E.32

3.

a. Circle
b.

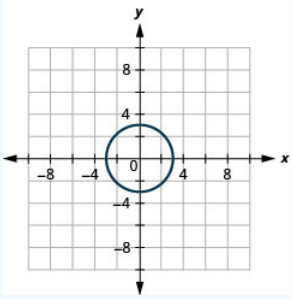

Figure 11.E.33

5.

a. Ellipse
b.

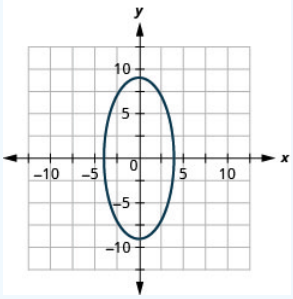

Figure 11.E.34

7.

a. Hyperbola
b.

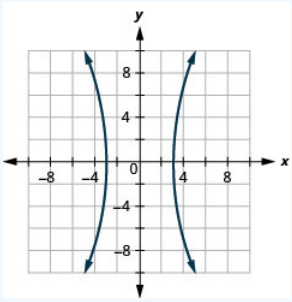

Figure 11.E.35

Exercise 22.7.26

In the following exercises,

a. Identify the type of graph of each equation as a circle, parabola, ellipse, or hyperbola,
b. Write the equation in standard form, and
c. Graph the equation.

1. $25x^2+64y^2+200x-256y-944=0$
2. $x^2+y^2+10x+6y+30=0$
3. $x=-y^2+2y-4$
4. $9x^2-25y^2-36x-50y-214=0$
5. $y=x^2+6x+8$
6. Solve the nonlinear system of equations by graphing: $\begin{cases} 3y^2-x=0 \\ y=-2x-1 \end{cases}$.
7. Solve the nonlinear system of equations using substitution: $\begin{cases} x^2+y^2=8 \\ y=-x-4 \end{cases}$.
8. Solve the nonlinear system of equations using elimination: $\begin{cases} x^2+9y^2=9 \\ 2x^2-9y^2=18 \end{cases}$
9. Create the equation of the parabolic arch formed in the foundation of the bridge shown. Give the answer in $y=ax^2+bx+c$ form.

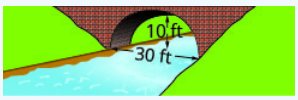

Figure 11.E.36

10. A comet moves in an elliptical orbit around a sun. The closest the comet gets to the sun is approximately 20 AU and the furthest is approximately 70 AU. The sun is one of the foci of the elliptical orbit. Letting the ellipse center at the origin and

labeling the axes in AU, the orbit will look like the figure below. Use the graph to write an equation for the elliptical orbit of the comet.

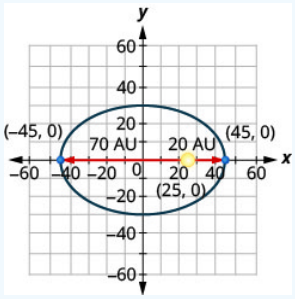

Figure 11.E.37

11. The sum of two numbers is 22 and the product is -240. Find the numbers.

12. For her birthday, Olive's grandparents bought her a new widescreen TV. Before opening it she wants to make sure it will fit her entertainment center. The TV is 55". The size of a TV is measured on the diagonal of the screen and a widescreen has a length that is larger than the width. The screen also has an area of 1452 square inches. Her entertainment center has an insert for the TV with a length of 50 inches and width of 40 inches. What are the length and width of the TV screen and will it fit Olive's entertainment center?

Answer

2.

a. Circle
b. $(x+5)^2+(y+3)^2=4$
c.

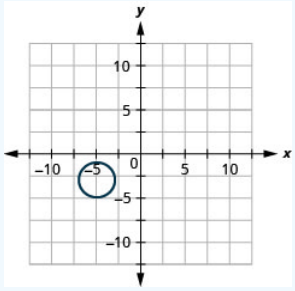

Figure 11.E.38

4.

a. Hyperbola
b. $\frac{(x-2)^2}{25}-\frac{(y+1)^2}{9}=1$
c.

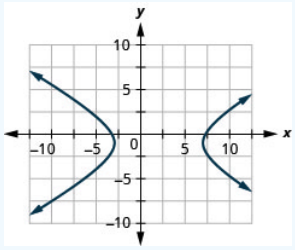

Figure 11.E.39

6. No solution

8. $(0,-3),(0,3)$

10. $\frac{x^2}{2025} + \frac{y^2}{1400} = 1$

12. The length is 44 inches and the width is 33 inches. The TV will fit Olive's entertainment center.

Glossary

system of nonlinear equations

A system of nonlinear equations is a system where at least one of the equations is not linear.

13.7.3: Integers

intercept of the line
8.9: Graphing with Intercepts (Part 1)

interest
7.4: Solve Simple Interest Applications

Interval Notation
16.3.1: Domain and Range
19.1: Review- Solve Linear Inequalities

inverse property of addition
13.7.6: Properties of Real Numbers

L

ladder method
4.8: Prime Factorization and the Least Common Multiple (Part 1)

leading coefficient
16.2.4: Power Functions and Polynomial Functions

linear equations
19: Equations and Inequalities

linear function
16.2: Basic Classes of Functions
16.2.2: Equations of Lines

Logarithmic Function
16.2: Basic Classes of Functions

M

mathematical model
16.2: Basic Classes of Functions

metric system
6.5: Unit Conversion- Metric System

Multiplication of Whole Numbers
1.3: Multiplication and Division of Whole Numbers

Multiply Mixed Numbers
4.10: Multiply and Divide Mixed Numbers and Complex Fractions (Part 1)

Multiplying Integers
2.7: Multiply and Divide Integers (Part 1)

N

Number Line
1.1: An Introduction to the Whole Numbers

number problems
13.6.1: Use a Problem-Solving Strategy

O

odd function
16.5: Transformation of Functions

order of operations
1.9: Use the Language of Algebra (Part 2)
3.2: Use the Language of Algebra (Part 2)

P

parabola
22.3: Parabolas
percent
7.1: Understand Percent
percent problems
7.2: Solve General Applications of Percent
percent proportion
7.8: Solve Proportions and their Applications (Part 2)
perfect square trinomial
14.4: Factor Special Products
piecewise function
16.3.1: Domain and Range
polynomial function
16.2: Basic Classes of Functions
16.2.4: Power Functions and Polynomial Functions
polynomials
12: Polynomials
power function
16.2: Basic Classes of Functions
16.2.4: Power Functions and Polynomial Functions
prime factorization
1.4: Prime Factorization
prime factorizaton
4.8: Prime Factorization and the Least Common Multiple (Part 1)
prime numbers
4.7: Find Multiples and Factors (Part 2)
probability
5.8: Averages and Probability (Part 1)
proportion
6.3: Introduction to Proportion
7.7: Solve Proportions and their Applications (Part 1)
Pythagorean Theorem
13.4.3: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 2)
13.6.4: Triangles, Rectangles, and the Pythagorean Theorem

Q

quadrants
8.8: Use the Rectangular Coordinate System
quadratic formula
18.4: Solve Quadratic Equations Using the Quadratic Formula
quadratic function
16.2: Basic Classes of Functions

R

radical function
2.9: Square Roots
17.8: Use Radicals in Functions
radicals
17.2: Simplify Expressions with Roots
17.8: Use Radicals in Functions
radicand
2.9: Square Roots
17.2: Simplify Expressions with Roots
radius
5.6: Decimals and Fractions (Part 2)
rate
6.2: Introduction to Ratios and Rates
ratio
6.2: Introduction to Ratios and Rates
Rational Exponents
13.8.8: Rational Exponents
17.4: Simplify Rational Exponents
rational function
16.2: Basic Classes of Functions
rational function's end behavior
16.2.3: Rational Functions
reciprocal
4.5: Multiply and Divide Fractions (Part 2)
Rectangles
13.6.4: Triangles, Rectangles, and the Pythagorean Theorem
Rectangular Coordinate System
8.8: Use the Rectangular Coordinate System
removable discontinuity
16.2.3: Rational Functions
right triangles
13.6.4: Triangles, Rectangles, and the Pythagorean Theorem
root function
16.2: Basic Classes of Functions
Rules Guiding Order of Operations
1.5: Order of Operations

S

sales
7.3: Solve Sales Tax, Commission, and Discount Applications
Simplify Fractions
4.4: Multiply and Divide Fractions (Part 1)
slope
8.13: Understand Slope of a Line (Part 1)
16.2: Basic Classes of Functions
16.2.1: Linear Functions and Slope
smooth curve
16.2.4: Power Functions and Polynomial Functions
Solve Equations with a Fraction Coefficient
4.19: Solve Equations with Fractions (Part 2)
square root
2.9: Square Roots
square root function
5.12: Simplify and Use Square Roots (Part 1)
standard form of a line
16.2.2: Equations of Lines
Subtract Fractions with Different Denominators
4.14: Add and Subtract Fractions with Different Denominators (Part 2)
Subtracting Whole Numbers
1.2: Adding and Subtracting Whole Numbers
supplementary angle
13.4.2: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 1)
surface area
8.3: Solve Geometry Applications- Volume and Surface Area (Part 1)

T

tax
7.3: Solve Sales Tax, Commission, and Discount Applications
term of a polynomial function
16.2.4: Power Functions and Polynomial Functions
transcendental function
16.2: Basic Classes of Functions
transformation of a function
16.2: Basic Classes of Functions
trapezoid
13.4.4: Use Properties of Rectangles, Triangles, and Trapezoids (Part 1)
triangles
13.6.4: Triangles, Rectangles, and the Pythagorean Theorem
turning point
16.2.4: Power Functions and Polynomial Functions

U

Uniform Motion Problem
15.6.1: More Examples of Applications
unit rate
6.2: Introduction to Ratios and Rates
Units of Length
6.4: Unit Conversion - American System

V

variable
1.6: Solving Equations by Addition and Subtraction
vertical asymptotes
16.2.3: Rational Functions
vertical compression
16.5: Transformation of Functions
vertical line
16.2.2: Equations of Lines
vertical reflection
16.5: Transformation of Functions
vertical shift
16.5: Transformation of Functions
vertical stretch
16.5: Transformation of Functions
volume
8.3: Solve Geometry Applications- Volume and Surface Area (Part 1)

W

whole numbers
1: The Whole Numbers
1.1: An Introduction to the Whole Numbers
word problems
13.6.1: Use a Problem-Solving Strategy
