
Solve Inequalities using the Division and Multiplication Properties of Inequality

The Division and Multiplication Properties of Equality state that if two quantities are equal, when we divide or multiply both quantities by the same amount, the results will also be equal (provided we don't divide by 0).

PROPERTIES OF EQUALITY

Division Property of Equality	**MUltiplication Property of Equality**
For any numbers a, b, c, and $c \neq 0$	For any numbers a, b, c
if $a = b$	if $a = b$
then $\frac{a}{c} = \frac{b}{c}$	then $ac = bc$

(9.7.4)

Are there similar properties for inequalities? What happens to an inequality when we divide or multiply both sides by a constant?

Consider some numerical examples.

Table 9.7.2

	$10 < 15$		$10 < 15$
Divide both sides by 5.	$\frac{10}{5} \,?\, \frac{15}{5}$	Multiply both sides by 5.	$10(5) \,?\, 15(5)$
Simplify.	$2 \,?\, 3$		$50 \,?\, 75$
Fill in the inequality signs.	$2 < 3$		$50 < 75$

The inequality signs stayed the same.

Does the inequality stay the same when we divide or multiply by a negative number?

Table 9.7.3

	$10 < 15$		$10 < 15$

Divide both sides by -5.	$\frac{10}{-5} \stackrel{?}{} \frac{15}{-5}$	Multiply both sides by -5.	$10(-5) \stackrel{?}{} 15(-5)$
Simplify.	$-2 \stackrel{?}{} -3$		$-50 \stackrel{?}{} -75$
Fill in the inequality signs.	$-2 > -3$		$-50 > -75$

The inequality signs reversed their direction.

When we divide or multiply an inequality by a positive number, the inequality sign stays the same. When we divide or multiply an inequality by a negative number, the inequality sign reverses.

Here are the Division and Multiplication Properties of Inequality for easy reference.

DIVISION AND MULTIPLICATION PROPERTIES OF INEQUALITY

For any real numbers a,b,c

$$\begin{aligned} &\text{if } a<b \text{ and } c>0, \text{ then } && \tfrac{a}{c}<\tfrac{b}{c} \text{ and } ac<bc \\ &\text{if } a>b \text{ and } c>0, \text{ then } && \tfrac{a}{c}>\tfrac{b}{c} \text{ and } ac>bc \\ &\text{if } a<b \text{ and } c<0, \text{ then } && \tfrac{a}{c}>\tfrac{b}{c} \text{ and } ac>bc \\ &\text{if } a>b \text{ and } c<0, \text{ then } && \tfrac{a}{c}<\tfrac{b}{c} \text{ and } ac<bc \end{aligned} \tag{9.7.5}$$

When we **divide or multiply** an inequality by a:

- **positive** number, the inequality stays the **same**.
- **negative** number, the inequality **reverses**.

Exercise 9.7.10

Solve the inequality $7y < 42$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$7y < 42$
Divide both sides of the inequality by 7. Since $7 > 0$, the inequality stays the same.	$\frac{7y}{7} < \frac{42}{7}$
Simplify.	$y < 6$
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty, 6)$

Exercise 9.7.11

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$9c > 72$

Answer

$c > 8$

$(8, \infty)$

Exercise 9.7.12

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$12d \leq 60$

Answer

$d \leq 5$

$(-\infty, 5]$

Exercise 9.7.13

Solve the inequality $-10a \geq 50$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$-10a \geq 50$
Divide both sides of the inequality by -10. Since $-10 < 0$, the inequality reverses.	$\frac{-10a}{-10} \leq \frac{50}{-10}$
Simplify.	$a \leq -5$
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty, -5]$

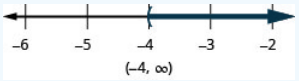
Exercise 9.7.14

Solve each inequality, graph the solution on the number line, and write the solution in interval notation.

$-8q < 32$

Answer

$q > -4$

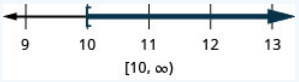


Exercise 9.7.15

Solve each inequality, graph the solution on the number line, and write the solution in interval notation.

$-7r \leq -70$

Answer



https://math.libretexts.org/@go/page/46259

SOLVING INEQUALITIES

Sometimes when solving an inequality, the variable ends up on the right. We can rewrite the inequality in reverse to get the variable to the left.

$$x > a \text{ has the same meaning as } a < x \tag{9.7.6}$$

Think about it as "If Xavier is taller than Alex, then Alex is shorter than Xavier."

Exercise 9.7.16

Solve the inequality $-20 < \frac{4}{5}u$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$-20 < \frac{4}{5}u$
Multiply both sides of the inequality by $\frac{5}{4}$. Since $\frac{5}{4} > 0$, the inequality stays the same.	$\frac{5}{4}(-20) < \frac{5}{4}\left(\frac{4}{5}u\right)$
Simplify.	$-25 < u$
Rewrite the variable on the left.	$u > -25$
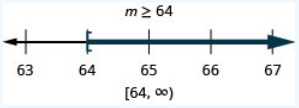
Graph the solution on the number line.	Write the solution in interval notation.	$(-25, \infty)$

Exercise 9.7.17

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$24 \leq \frac{3}{8}m$

Answer

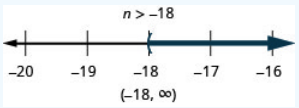


Exercise 9.7.18

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$-24 < \frac{4}{3}n$

Answer



Exercise 9.7.19

Solve the inequality $\frac{t}{-2} \geq 8$, graph the solution on the number line, and write the solution in interval notation.

Answer

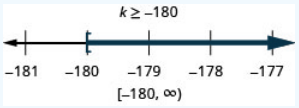
	$\frac{t}{-2} \geq 8$
Multiply both sides of the inequality by -2. Since $-2 < 0$, the inequality reverses.	$-2\left(\frac{t}{-2}\right) \leq -2(8)$
Simplify.	$t \leq -16$
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty, -16]$

Exercise 9.7.20

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$\frac{k}{-12} \leq 15$

Answer

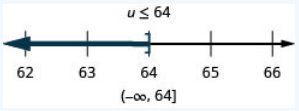


Exercise 9.7.21

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$\frac{u}{-4} \geq -16$

Answer



Solve Inequalities That Require Simplification

Most inequalities will take more than one step to solve. We follow the same steps we used in the general strategy for solving linear equations, but be sure to pay close attention during multiplication or division.

Exercise 9.7.22

Solve the inequality $4m \leq 9m + 17$, graph the solution on the number line, and write the solution in interval notation.

Answer

	$4m \leq 9m + 17$
Subtract 9m from both sides to collect the variables on the left.	$4m - 9m \leq 9m - 9m + 17$
Simplify.	$-5m \leq 17$
Divide both sides of the inequality by -5, and reverse the inequality.	$\frac{-5m}{-5} \geq \frac{17}{-5}$

Simplify.	$m \geq -\frac{17}{5}$
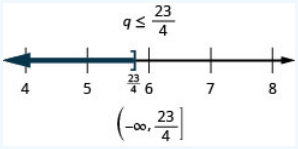
Graph the solution on the number line.	Write the solution in interval notation.	$\left[-\frac{17}{5}, \infty\right)$

Exercise 9.7.23

Solve the inequality $3q \geq 7q - 23$, graph the solution on the number line, and write the solution in interval notation.

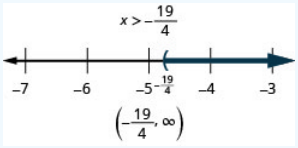
Answer



Exercise 9.7.24

Solve the inequality $6x < 10x + 19$, graph the solution on the number line, and write the solution in interval notation.

Answer



Exercise 9.7.25

Solve the inequality $8p + 3(p - 12) > 7p - 28$ graph the solution on the number line, and write the solution in interval notation.

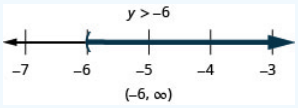
Answer

Simplify each side as much as possible.	8p+3(p−12)>7p−28
Distribute.	8p+3p−36>7p−28
Combine like terms.	11p−36>7p−28
Subtract 7p from both sides to collect the variables on the left.	11p−36−7p>7p−28−7p
Simplify.	4p−36>−28
Add 36 to both sides to collect the constants on the right.	4p−36+36>−28+36
Simplify.	4p>8
Divide both sides of the inequality by 4; the inequality stays the same.	$\frac{4p}{4} > 84$
Simplify.	$p > 2$
Graph the solution on the number line.	
Write the solution in interval notation.	$(2, \infty)$

Exercise 9.7.26

Solve the inequality $9y+2(y+6)>5y-24$, graph the solution on the number line, and write the solution in interval notation.

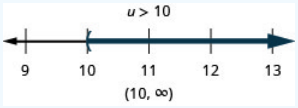
Answer



Exercise 9.7.27

Solve the inequality $6u+8(u-1)>10u+32$, graph the solution on the number line, and write the solution in interval notation.

Answer



Just like some equations are identities and some are contradictions, inequalities may be identities or contradictions, too. We recognize these forms when we are left with only constants as we solve the inequality. If the result is a true statement, we have an identity. If the result is a false statement, we have a contradiction.

Exercise 9.7.28

Solve the inequality $8x-2(5-x)<4(x+9)+6x$, graph the solution on the number line, and write the solution in interval notation.

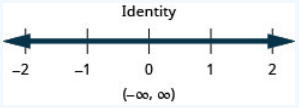
Answer

Simplify each side as much as possible.	8x−2(5−x)<4(x+9)+6x
Distribute.	8x−10+2x<4x+36+6x
Combine like terms.	10x−10<10x+36
Subtract 10x from both sides to collect the variables on the left.	10x−10−10x<10x+36−10x
Simplify.	−10<36
The xx's are gone, and we have a true statement.	The inequality is an identity. The solution is all real numbers.
Graph the solution on the number line.	
Write the solution in interval notation.	$(-\infty,\infty)$

Exercise 9.7.29

Solve the inequality $4b-3(3-b)>5(b-6)+2b$, graph the solution on the number line, and write the solution in interval notation.

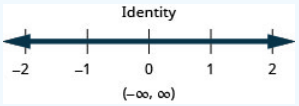
Answer



Exercise 9.7.30

Solve the inequality $9h-7(2-h)<8(h+11)+8h$, graph the solution on the number line, and write the solution in interval notation.

Answer



Exercise 9.7.31

Solve the inequality $\frac{1}{3}a-\frac{1}{8}a>\frac{5}{24}a+\frac{3}{4}$, graph the solution on the number line, and write the solution in interval notation.

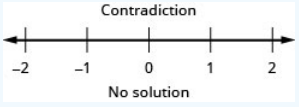
Answer

	$\frac{1}{3}a-\frac{1}{8}a>\frac{5}{24}a+\frac{3}{4}$
Multiply both sides by the LCD, 24, to clear the fractions.	$24\left(\frac{1}{3}a-\frac{1}{8}a\right)>24\left(\frac{5}{24}a+\frac{3}{4}\right)$
Simplify.	$8a-3a>5a+18$
Combine like terms.	$5a>5a+18$
Subtract 5a from both sides to collect the variables on the left.	$5a-5a>5a-5a+18$
Simplify.	$0>18$
The statement is false!	The inequality is a contradiction.
	There is no solution.
Graph the solution on the number line.	
Write the solution in interval notation.	There is no solution.

Exercise 9.7.32

Solve the inequality $\frac{1}{4}x-\frac{1}{12}x>\frac{1}{6}x+\frac{7}{8}$, graph the solution on the number line, and write the solution in interval notation.

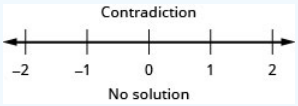
Answer



Exercise 9.7.33

Solve the inequality $\frac{2}{5}z - \frac{1}{3}z < \frac{1}{15}z - \frac{3}{5}$, graph the solution on the number line, and write the solution in interval notation.

Answer



Translate to an Inequality and Solve

To translate English sentences into inequalities, we need to recognize the phrases that indicate the inequality. Some words are easy, like ‘more than’ and ‘less than’. But others are not as obvious.

Think about the phrase ‘at least’ – what does it mean to be ‘at least 21 years old’? It means 21 or more. The phrase ‘at least’ is the same as ‘greater than or equal to’.

Table 9.7.4 shows some common phrases that indicate inequalities.

Table 9.7.4

>	≥	<	≤
" data-valign="middle" class="lt-math-15134">is greater than	is greater than or equal to	is less than	is less than or equal to
" data-valign="middle" class="lt-math-15134">is more than	is at least	is smaller than	is at most
" data-valign="middle" class="lt-math-15134">is larger than	is no less than	has fewer than	is no more than
" data-valign="middle" class="lt-math-15134">exceeds	is the minimum	is lower than	is the maximum

Exercise 9.7.34

Translate and solve. Then write the solution in interval notation and graph on the number line.

Twelve times c is no more than 96.

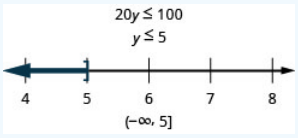
Answer

Translate.	Twelve times c is no more than 96 $12c \leq 96$
Solve—divide both sides by 12.	$\frac{12c}{12} \leq \frac{96}{12}$
Simplify.	$c \leq 8$
Write in interval notation.	$(-\infty, -8]$
Graph on the number line.	
Exercise 9.7.35

Translate and solve. Then write the solution in interval notation and graph on the number line.

Twenty times y is at most 100

Answer

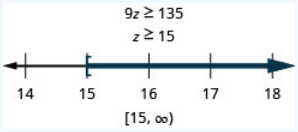


Exercise 9.7.36

Translate and solve. Then write the solution in interval notation and graph on the number line.

Nine times z is no less than 135

Answer



Exercise 9.7.37

Translate and solve. Then write the solution in interval notation and graph on the number line.

Thirty less than x is at least 45.

Answer

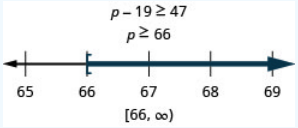
Translate.	Thirty less than x is at least 45. $x - 30 \ge 45$
Solve—add 30 to both sides.	$x - 30 + 30 \ge 45 + 30$
Simplify.	$x \ge 75$
Write in interval notation.	$[75, \infty)$
Graph on the number line.	

Exercise 9.7.38

Translate and solve. Then write the solution in interval notation and graph on the number line.

Nineteen less than p is no less than 47

Answer



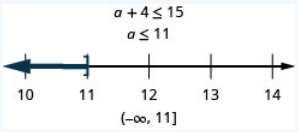
https://math.libretexts.org/@go/page/46259

Exercise 9.7.39

Translate and solve. Then write the solution in interval notation and graph on the number line.

Four more than a is at most 15.

Answer



Key Concepts

- **Subtraction Property of Inequality**
  For any numbers a, b, and c,
  if a<b then a−c<b−c and
  if a>b then a−c>b−c.
- **Addition Property of Inequality**
  For any numbers a, b, and c,
  if a<b then a+c<b+c and
  if a>b then a+c>b+c.
- **Division and Multiplication Properties of Inequality**
  For any numbers a, b, and c,
  if a<b and c>0, then ac<bc and ac>bc.
  if a>b and c>0, then ac>bc and ac>bc.
  if a<b and c<0, then ac>bc and ac>bc.
  if a>b and c<0, then ac<bc and ac<bc.
- When we **divide or multiply** an inequality by a:
  - **positive** number, the inequality stays the **same**.
  - **negative** number, the inequality **reverses**.

9.7E: Exercises

Practice Makes Perfect

Graph Inequalities on the Number Line

In the following exercises, graph each inequality on the number line

Exercise 9.7E.1

1. $x \leq 2$
2. x>−1
3. x<0

Exercise 9.7E.2

1. x>1
2. x<−2
3. $x \geq -3$

Answer

1. 
2. 
3. 
Exercise 9.7E.3

1. $x \geq -3$
2. x<4
3. $x \leq -2$

Exercise 9.7E.4

1. $x \leq 0$
2. x>−4
3. $x \geq -1$

Answer

1. 
2. 
3. 
In the following exercises, graph each inequality on the number line and write in interval notation.

Exercise 9.7E.5

1. x<−2
2. $x \geq -3.5$
3. $x \leq \frac{2}{3}$

Exercise 9.7E.6

1. $x > 3$
2. $x \leq -0.5$
3. $x \geq \frac{1}{3}$

Answer

1. 
2. 
3. 
Exercise 9.7E.7

1. $x \geq -4$
2. x<2.5
3. $x > -\frac{3}{2}$

Exercise 9.7E.8

1. $x \leq 5$
2. $x \geq -1.5x$
3. x<−73

Answer

1. 
2. 
3. 
Solve Inequalities using the Subtraction and Addition Properties of Inequality

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

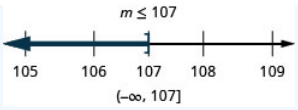
Exercise 9.7E.9

$n - 11 < 33$

Exercise 9.7E.10

$m - 45 \leq 62$

Answer



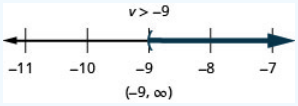
Exercise 9.7E.11

$u+25>21$

Exercise 9.7E.12

$v+12>3$

Answer



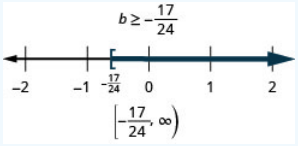
Exercise 9.7E.13

$a+\frac{3}{4}\geq\frac{7}{10}$

Exercise 9.7E.14

$b+\frac{7}{8}\geq\frac{1}{6}$

Answer



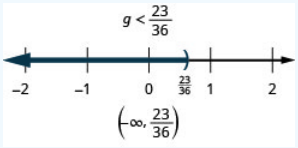
Exercise 9.7E.15

$f-\frac{13}{20}<-\frac{5}{12}$

Exercise 9.7E.16

$g-\frac{11}{12}<-\frac{5}{18}$

Answer



Solve Inequalities using the Division and Multiplication Properties of Inequality

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

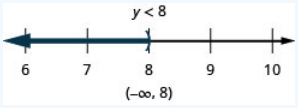
Exercise 9.7E.17

$8x > 72$

Exercise 9.7E.18

$6y < 48$

Answer



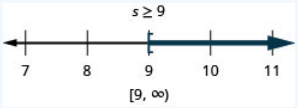
Exercise 9.7E.19

$7r \leq 56$

Exercise 9.7E.20

$9s \geq 81$

Answer



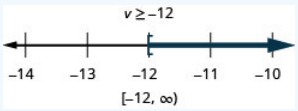
Exercise 9.7E.21

$-5u \geq 65$

Exercise 9.7E.22

$-8v \leq 96$

Answer



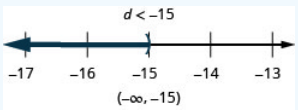
Exercise 9.7E.23

$-9c < 126$

Exercise 9.7E.24

$-7d > 105$

Answer



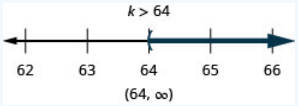
Exercise 9.7E.25

$20 > \frac{2}{5}h$

Exercise 9.7E.26

$40 < \frac{5}{8}k$

Answer



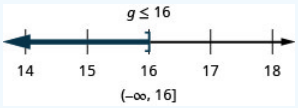
Exercise 9.7E.27

$\frac{7}{6}j \geq 42$

Exercise 9.7E.28

$\frac{9}{4}g \leq 36$

Answer



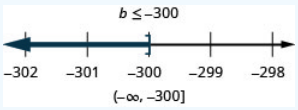
Exercise 9.7E.29

$\frac{a}{-3} \leq 9$

Exercise 9.7E.30

$\frac{b}{-10} \geq 30$

Answer



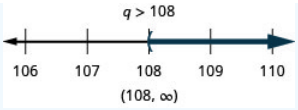
Exercise 9.7E.31

$-25 < \frac{p}{-5}$

Exercise 9.7E.32

$-18 > \frac{q}{-6}$

Answer



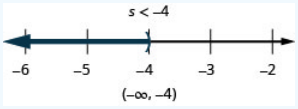
Exercise 9.7E.33

$9t \geq -27$

Exercise 9.7E.34

$7s < -28$

Answer



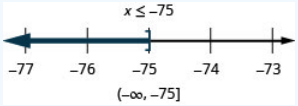
Exercise 9.7E.35

$\frac{2}{3}y > -36$

Exercise 9.7E.36

$\frac{3}{5}x \leq -45$

Answer



Solve Inequalities That Require Simplification

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

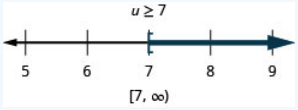
Exercise 9.7E.37

$4v \geq 9v - 40$

Exercise 9.7E.38

$5u \leq 8u - 21$

Answer



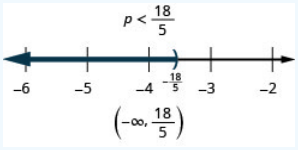
Exercise 9.7E.39

$13q < 7q - 29$

Exercise 9.7E.40

$9p > 14p - 18$

Answer



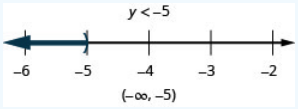
Exercise 9.7E.41

$12x + 3(x + 7) > 10x - 24$

Exercise 9.7E.42

$9y + 5(y + 3) < 4y - 35$

Answer



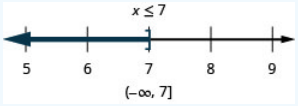
Exercise 9.7E.43

$6h - 4(h - 1) \leq 7h - 11$

Exercise 9.7E.44

$4k - (k - 2) \geq 7k - 26$

Answer



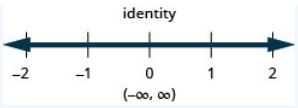
Exercise 9.7E.45

$8m - 2(14 - m) \geq 7(m - 4) + 3m$

Exercise 9.7E.46

$6n - 12(3 - n) \leq 9(n - 4) + 9n$

Answer



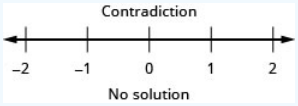
Exercise 9.7E.47

$\frac{3}{4}b-\frac{1}{3}b<\frac{5}{12}b-\frac{1}{2}$

Exercise 9.7E.48

$9u+5(2u-5)\geq 12(u-1)+7u$

Answer



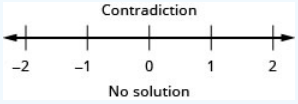
Exercise 9.7E.49

$\frac{2}{3}g-\frac{1}{2}(g-14)\leq \frac{1}{6}(g+42)$

Exercise 9.7E.50

$\frac{5}{6}a-\frac{1}{4}a>\frac{7}{12}a+\frac{2}{3}$

Answer



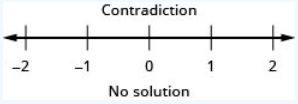
Exercise 9.7E.51

$\frac{4}{5}h-\frac{2}{3}(h-9)\geq \frac{1}{15}(2h+90)$

Exercise 9.7E.52

$12v+3(4v-1)\leq 19(v-2)+5v$

Answer



Mixed practice

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

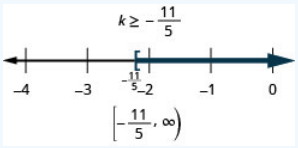
Exercise 9.7E.53

$15k\leq -40$

Exercise 9.7E.54

$35k \geq -77$

Answer



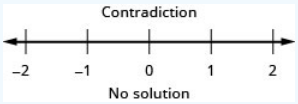
Exercise 9.7E.55

$23p - 2(6 - 5p) > 3(11p - 4)$

Exercise 9.7E.56

$18q - 4(10 - 3q) < 5(6q - 8)$

Answer



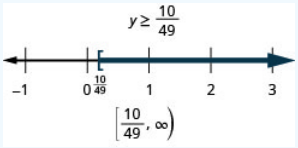
Exercise 9.7E.57

$-\frac{9}{4}x \geq -\frac{5}{12}$

Exercise 9.7E.58

$-\frac{21}{8}y \leq -\frac{15}{28}$

Answer



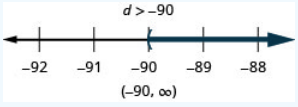
Exercise 9.7E.59

$c + 34 < -99$

Exercise 9.7E.60

$d + 29 > -61$

Answer



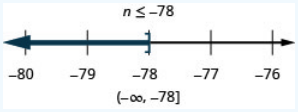
Exercise 9.7E.61

$\frac{m}{18} \geq -4$

Exercise 9.7E.62

$\frac{n}{13} \leq -6$

Answer



Translate to an Inequality and Solve

In the following exercises, translate and solve .Then write the solution in interval notation and graph on the number line.

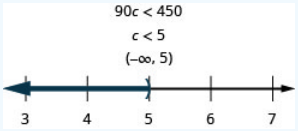
Exercise 9.7E.63

Fourteen times d is greater than 56.

Exercise 9.7E.64

Ninety times c is less than 450.

Answer



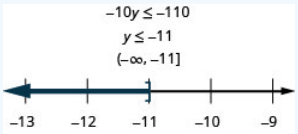
Exercise 9.7E.65

Eight times z is smaller than -40

Exercise 9.7E.66

Ten times y is at most -110

Answer



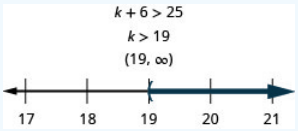
Exercise 9.7E.67

Three more than h is no less than 25

Exercise 9.7E.68

Six more than k exceeds 25

Answer



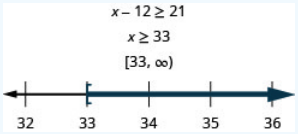
Exercise 9.7E.69

Ten less than w is at least 39.

Exercise 9.7E.70

Twelve less than x is no less than 21

Answer



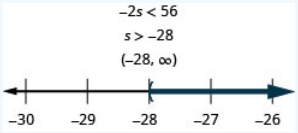
Exercise 9.7E.71

Negative five times r is no more than 95.

Exercise 9.7E.72

Negative two times s is lower than 56

Answer



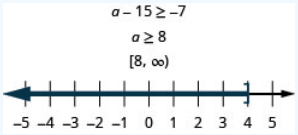
Exercise 9.7E.73

Nineteen less than b is at most -22

Exercise 9.7E.74

Fifteen less than a is at least -7

Answer



Everyday Math

Exercise 9.7E.75

Safety A child's height, *h*, must be at least 57 inches for the child to safely ride in the front seat of a car. Write this as an inequality.

Exercise 9.7E.76

Fighter pilots The maximum height, *h*, of a fighter pilot is 77 inches. Write this as an inequality.

Answer

$h \leq 77$

Exercise 9.7E.77

Elevators The total weight, *w*, of an elevator's passengers can be no more than 1,200 pounds. Write this as an inequality.

Exercise 9.7E.78

Shopping The number of items, *n*, a shopper can have in the express check-out lane is at most 8. Write this as an inequality.

Answer

$n \leq 8$

Writing Exercises

Exercise 9.7E.79

Give an example from your life using the phrase 'at least'.

Exercise 9.7E.80

Give an example from your life using the phrase 'at most'.

Answer

Answers will vary.

Exercise 9.7E.81

Explain why it is necessary to reverse the inequality when solving $-5x > 10$

Exercise 9.7E.82

Explain why it is necessary to reverse the inequality when solving $\frac{n}{-3} < 12$

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
graph inequalities on the number line.			
solve inequalities using the Subtraction and Addition Properties of Inequality.			
solve inequalities using the Division and Multiplication Properties of Inequality.			
solve inequalities that require simplification.			
translate to an inequality and solve.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

9.8: Chapter 2 Review Exercises

Chapter 2 Review Exercises

Solve Equations using the Subtraction and Addition Properties of Equality

Verify a Solution of an Equation

In the following exercises, determine whether each number is a solution to the equation.

Exercise 9.8.1

$10x-1=5x; x=\frac{1}{5}$

Exercise 9.8.2

$w+2=\frac{5}{8}; w=\frac{3}{8}$

Answer

no

Exercise 9.8.3

$-12n+5=8n; n=-\frac{5}{4}$

Exercise 9.8.4

$6a-3=-7a, a=\frac{3}{13}$

Answer

yes

Solve Equations using the Subtraction and Addition Properties of Equality

In the following exercises, solve each equation using the Subtraction Property of Equality.

Exercise 9.8.5

$x+7=19$

Exercise 9.8.6

$y+2=-6$

Answer

$y=-8$

Exercise 9.8.7

$a+\frac{1}{3}=\frac{5}{3}$

Exercise 9.8.8

$n+3.6=5.1$

Answer

$n=1.5$

In the following exercises, solve each equation using the Addition Property of Equality.

Exercise 9.8.9

$u-7=10$

Exercise 9.8.10

$x-9=-4$

Answer

$x=5$

Exercise 9.8.11

$c-\frac{3}{11}=\frac{9}{11}$

Exercise 9.8.12

$p-4.8=14$

Answer

$p=18.8$

In the following exercises, solve each equation.

Exercise 9.8.13

$n-12=32$

Exercise 9.8.14

$y+16=-9$

Answer

$y=-25$

Exercise 9.8.15

$f+\frac{2}{3}=4$

Exercise 9.8.16

$d-3.9=8.2$

Answer

$d = 12.1$

Solve Equations That Require Simplification

In the following exercises, solve each equation.

Exercise 9.8.17

$y + 8 - 15 = -3$

Exercise 9.8.18

$7x + 10 - 6x + 3 = 5$

Answer

$x = -8$

Exercise 9.8.19

$6(n - 1) - 5n = -14$

Exercise 9.8.20

$8(3p + 5) - 23(p - 1) = 35$

Answer

$p = -28$

Translate to an Equation and Solve

In the following exercises, translate each English sentence into an algebraic equation and then solve it.

Exercise 9.8.21

The sum of -6 and m is 25

Exercise 9.8.22

Four less than n is 13

Answer

$n - 4 = 13; n = 17$

Translate and Solve Applications

In the following exercises, translate into an algebraic equation and solve.

Exercise 9.8.23

Rochelle's daughter is 11 years old. Her son is 3 years younger. How old is her son?

Exercise 9.8.24

Tan weighs 146 pounds. Minh weighs 15 pounds more than Tan. How much does Minh weigh?

Answer

161 pounds

Exercise 9.8.25

Peter paid $9.75 to go to the movies, which was $46.25 less than he paid to go to a concert. How much did he pay for the concert?

Exercise 9.8.26

Elissa earned $\$152.84$this week, which was $\$2. .65$more than she earned last week. How much did she earn last week?

Answer

$\$131.19$

Solve Equations using the Division and Multiplication Properties of Equality

Solve Equations Using the Division and Multiplication Properties of Equality

In the following exercises, solve each equation using the division and multiplication properties of equality and check the solution.

Exercise 9.8.27

$8x = 72$

Exercise 9.8.28

$13a = -65$

Answer

$a = -5$

Exercise 9.8.29

$0.25p = 5.25$

Exercise 9.8.30

$-y = 4$

Answer

$y = -4$

Exercise 9.8.31

$\frac{n}{6} = 18$

Exercise 9.8.32

$\frac{y}{-10} = 30$

Answer

$y = -300$

Exercise 9.8.33

$36 = \frac{3}{4}x$

Exercise 9.8.34

$\frac{5}{8}u = \frac{15}{16}$

Answer

$u = \frac{3}{2}$

Exercise 9.8.35

$-18m = -72$

Exercise 9.8.36

$\frac{c}{9} = 36$

Answer

$c = 324$

Exercise 9.8.37

$0.45x = 6.75$

Exercise 9.8.38

$\frac{11}{12} = \frac{2}{3}y$

Answer

$y = \frac{11}{8}$

Solve Equations That Require Simplification

In the following exercises, solve each equation requiring simplification.

Exercise 9.8.39

$5r - 3r + 9r = 35 - 2$

Exercise 9.8.40

$24x + 8x - 11x = -7 - 14$

Answer

$x = -1$

Exercise 9.8.41

$\frac{11}{12}n - \frac{5}{6}n = 9 - 5$

Exercise 9.8.42

$-9(d-2) - 15 = -24$

Answer

$d = 3$

Translate to an Equation and Solve

In the following exercises, translate to an equation and then solve.

Exercise 9.8.43

143 is the product of -11 and y

Exercise 9.8.44

The quotient of b and and 9 is -27

Answer

$\frac{b}{9} = -27; b = -243$

Exercise 9.8.45

The sum of q and one-fourth is one.

Exercise 9.8.46

The difference of s and one-twelfth is one fourth.

Answer

$s - \frac{1}{12} = \frac{1}{4}; s = \frac{1}{3}$

Translate and Solve Applications

In the following exercises, translate into an equation and solve.

Exercise 9.8.47

Ray paid $21 for 12 tickets at the county fair. What was the price of each ticket?

Exercise 9.8.48

Janet gets paid $\$24$ per hour. She heard that this is $\frac{3}{4}$ of what Adam is paid. How much is Adam paid per hour?

Answer

$\$32$

Solve Equations with Variables and Constants on Both Sides

Solve an Equation with Constants on Both Sides

In the following exercises, solve the following equations with constants on both sides.

Exercise 9.8.49

$8p+7=47$

Exercise 9.8.50

$10w-5=65$

Answer

$w=7$

Exercise 9.8.51

$3x+19=-47$

Exercise 9.8.52

$32=-4-9n$

Answer

$n=-4$

Solve an Equation with Variables on Both Sides

In the following exercises, solve the following equations with variables on both sides.

Exercise 9.8.53

$7y=6y-13$

Exercise 9.8.54

$5a+21=2a$

Answer

$a=-7$

Exercise 9.8.55

$k=-6k-35$

Exercise 9.8.56

$4x - \frac{3}{8} = 3x$

Answer

$x = \frac{3}{8}$

Solve an Equation with Variables and Constants on Both Sides

In the following exercises, solve the following equations with variables and constants on both sides.

Exercise 9.8.57

$12x - 9 = 3x + 45$

Exercise 9.8.58

$5n - 20 = -7n - 80$

Answer

$n = -5$

Exercise 9.8.59

$4u + 16 = -19 - u$

Exercise 9.8.60

$\frac{5}{8}c - 4 = \frac{3}{8}c + 4$

Answer

$c = 32$

Use a General Strategy for Solving Linear Equations

Solve Equations Using the General Strategy for Solving Linear Equations

In the following exercises, solve each linear equation.

Exercise 9.8.61

$6(x + 6) = 24$

Exercise 9.8.62

$9(2p - 5) = 72$

Answer

$p = \frac{13}{2}$

Exercise 9.8.63

$-(s+4)=18$

Exercise 9.8.64

$8+3(n-9)=17$

Answer

$n=12$

Exercise 9.8.65

$23-3(y-7)=8$

Exercise 9.8.66

$\frac{1}{3}(6m+21)=m-7$

Answer

$m=-14$

Exercise 9.8.67

$4(3.5y+0.25)=365$

Exercise 9.8.68

$0.25(q-8)=0.1(q+7)$

Answer

$q=18$

Exercise 9.8.69

$8(r-2)=6(r+10)$

Exercise 9.8.70

$5+7(2-5x)=2(9x+1)$
$-(13x-57)$

Answer

$x=-1$

Exercise 9.8.71

$(9n+5)-(3n-7)$
$=20-(4n-2)$

Exercise 9.8.72

$2[-16+5(8k-6)]$
$=8(3-4k)-32$

Answer

$k=\frac{3}{4}$

Classify Equations

In the following exercises, classify each equation as a conditional equation, an identity, or a contradiction and then state the solution.

Exercise 9.8.73

$17y-3(4-2y)=11(y-1)$
$+12y-1$

Exercise 9.8.74

$9u+32=15(u-4)$
$-3(2u+21)$

Answer

contradiction; no solution

Exercise 9.8.75

$-8(7m+4)=-6(8m+9)$

Exercise 9.8.76

$21(c-1)-19(c+1)$
$=2(c-20)$

Answer

identity; all real numbers

Solve Equations with Fractions and Decimals

Solve Equations with Fraction Coefficients

In the following exercises, solve each equation with fraction coefficients.

Exercise 9.8.77

$\frac{2}{5}n-\frac{1}{10}=\frac{7}{10}$

Exercise 9.8.78

$\frac{1}{3}x+\frac{1}{5}x=8$

Answer

$x=15$

Exercise 9.8.79

$\frac{3}{4}a-\frac{1}{3}=\frac{1}{2}a-\frac{5}{6}$

Exercise 9.8.80

$\frac{1}{2}(k-3)=\frac{1}{3}(k+16)$

Answer

$k=41$

Exercise 9.8.81

$\frac{3x-2}{5}=\frac{3x+4}{8}$

Exercise 9.8.82

$\frac{5y-1}{3}+4=\frac{-8y+4}{6}$

Answer

$y=-1$

Solve Equations with Decimal Coefficients

In the following exercises, solve each equation with decimal coefficients.

Exercise 9.8.83

$0.8x-0.3=0.7x+0.2$

Exercise 9.8.84

$0.36u+2.55=0.41u+6.8$

Answer

$u=-85$

Exercise 9.8.85

$0.6p-1.9=0.78p+1.7$

Exercise 9.8.86

$0.6p-1.9=0.78p+1.7$

Answer

$d=-20$

Solve a Formula for a Specific Variable

Use the Distance, Rate, and Time Formula

In the following exercises, solve.

Exercise 9.8.87

Natalie drove for $7\frac{1}{2}$ hours at 60 miles per hour. How much distance did she travel?

Exercise 9.8.88

Mallory is taking the bus from St. Louis to Chicago. The distance is 300 miles and the bus travels at a steady rate of 60 miles per hour. How long will the bus ride be?

Answer

5 hours

Exercise 9.8.89

Aaron's friend drove him from Buffalo to Cleveland. The distance is 187 miles and the trip took 2.75 hours. How fast was Aaron's friend driving?

Exercise 9.8.90

Link rode his bike at a steady rate of 15 miles per hour for $2\frac{1}{2}$ hours. How much distance did he travel?

Answer

37.5 miles

Solve a Formula for a Specific Variable

In the following exercises, solve.

Exercise 9.8.91

Use the formula. d=rt to solve for t

1. when d=510 and r=60
2. in general

Exercise 9.8.92

Use the formula. d=rt to solve for r

1. when when d=451 and t=5.5
2. in general

Answer

1. r=82mph
2. $r = \frac{D}{t}$

Exercise 9.8.93

Use the formula $A = \frac{1}{2}bh$ to solve for b

1. when A=390 and h=26
2. in general

Exercise 9.8.94

Use the formula $A = \frac{1}{2}bh$ to solve for b

1. when A=153 and b=18
2. in general

Answer

1. $h = 17$
2. $h = \frac{2A}{b}$

Exercise 9.8.95

Use the formula I=Prt to solve for the principal, *P* for

1. I=$2,501,r=4.1%, t=5 years
2. in general

Exercise 9.8.96

Solve the formula 4x+3y=6 for *y*

1. when x=−2
2. in general

Answer

ⓐ $y = \frac{14}{3}$ ⓑ $y = \frac{6-4x}{3}$

Exercise 9.8.97

Solve $180 = a + b + c$ for c

Exercise 9.8.98

Solve the formula $V = LWH$ for H

Answer

$H = \frac{V}{LW}$

Solve Linear Inequalities

Graph Inequalities on the Number Line

In the following exercises, graph each inequality on the number line.

Exercise 9.8.99

1. $x \leq 4$
2. x>−2
3. x<1

Exercise 9.8.100

1. x>0
2. x<−3
3. $x \geq -1$

Answer

1.

2. 
3.

In the following exercises, graph each inequality on the number line and write in interval notation.

Exercise 9.8.101

1. $x < -1$
2. $x \geq -2.5$
3. $x \leq \frac{5}{4}$

Exercise 9.8.102

1. $x > 2$
2. $x \leq -1.5$
3. $x \geq \frac{5}{3}$

Answer

1. 
2. 
3. 
Solve Inequalities using the Subtraction and Addition Properties of Inequality

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

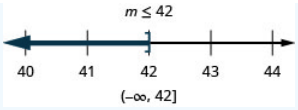
Exercise 9.8.103

$n - 12 \leq 23$

Exercise 9.8.104

$m + 14 \leq 56$

Answer



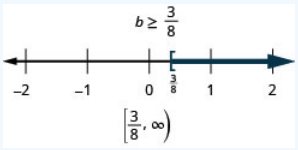
Exercise 9.8.105

$a+\frac{2}{3} \geq \frac{7}{12}$

Exercise 9.8.106

$b-\frac{7}{8} \geq -\frac{1}{2}$

Answer



Solve Inequalities using the Division and Multiplication Properties of Inequality

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

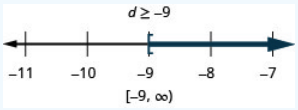
Exercise 9.8.107

$9x > 54$

Exercise 9.8.108

$-12d \leq 108$

Answer



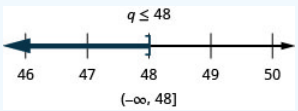
Exercise 9.8.109

$\frac{5}{2}j < -60$

Exercise 9.8.110

$\frac{q}{-2} \geq -24$

Answer



Solve Inequalities That Require Simplification

In the following exercises, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

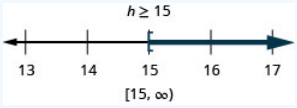
Exercise 9.8.111

$6p > 15p - 30$

Exercise 9.8.112

$9h - 7(h-1) \leq 4h - 23$

Answer



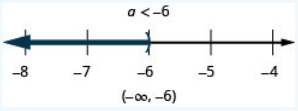
Exercise 9.8.113

$5n - 15(4-n) < 10(n-6) + 10n$

Exercise 9.8.114

$\frac{3}{8}a - \frac{1}{12}a > \frac{5}{12}a + \frac{3}{4}$

Answer



Translate to an Inequality and Solve

In the following exercises, translate and solve. Then write the solution in interval notation and graph on the number line.

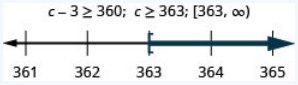
Exercise 9.8.115

Five more than z is at most 19.

Exercise 9.8.116

Three less than c is at least 360.

Answer



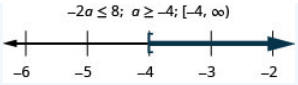
Exercise 9.8.117

Nine times n exceeds 42.

Exercise 9.8.118

Negative two times a is no more than 8.

Answer



Everyday Math

Exercise 9.8.119

Describe how you have used two topics from this chapter in your life outside of your math class during the past month.

Chapter 2 Practice Test

Exercise 9.8.1

Determine whether each number is a solution to the equation $6x - 3 = x + 20$

1. 5
2. $\frac{23}{5}$

Answer

1. no
2. yes

In the following exercises, solve each equation.

Exercise 9.8.2

$n - \frac{2}{3} = \frac{1}{4}$

Exercise 9.8.3

$\frac{9}{2}c = 144$

Answer

c=32

Exercise 9.8.4

$4y - 8 = 16$

Exercise 9.8.5

$-8x - 15 + 9x - 1 = -21$

Answer

$x = -5$

Exercise 9.8.6

$-15a = 120$

https://math.libretexts.org/@go/page/46261

Exercise 9.8.7

$\frac{2}{3}x = 6$

Answer

$x = 9$

Exercise 9.8.8

$x - 3.8 = 8.2$

Exercise 9.8.9

$10y = -5y - 60$

Answer

$y = -4$

Exercise 9.8.10

$8n - 2 = 6n - 12$

Exercise 9.8.11

$9m - 2 - 4m - m = 42 - 8$

Answer

$m = 9$

Exercise 9.8.12

$-5(2x - 1) = 45$

Exercise 9.8.13

$-(d - 9) = 23$

Answer

$d = -14$

Exercise 9.8.14

$\frac{1}{4}(12m - 28) = 6 - 2(3m - 1)$

Exercise 9.8.15

$2(6x - 5) - 8 = -22$

Answer

$x = -\frac{1}{3}$

Exercise 9.8.16

$8(3a-5)-7(4a-3)=20-3a$

Exercise 9.8.17

$\frac{1}{4}p-\frac{1}{3}=\frac{1}{2}$

Answer

$p=\frac{10}{3}$

Exercise 9.8.18

$0.1d+0.25(d+8)=4.1$

Exercise 9.8.19

$14n-3(4n+5)=-9+2(n-8)$

Answer

contradiction; no solution

Exercise 9.8.20

$9(3u-2)-4[6-8(u-1)]=3(u-2)$

Exercise 9.8.21

Solve the formula x−2y=5 for *y*

1. when x=−3
2. in general

Answer

1. y=4
2. $y=\frac{5-x}{2}$

In the following exercises, graph on the number line and write in interval notation.

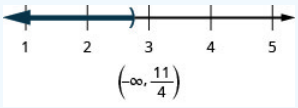
Exercise 9.8.22

$x\geq -3.5$

Exercise 9.8.23

$x<\frac{11}{4}$

Answer



https://math.libretexts.org/@go/page/46261

In the following exercises,, solve each inequality, graph the solution on the number line, and write the solution in interval notation.

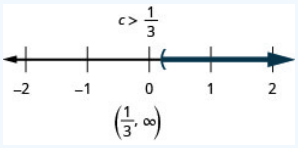
Exercise 9.8.24

$8k \geq 5k - 120$

Exercise 9.8.25

$3c - 10(c-2) < 5c + 16$

Answer



In the following exercises, translate to an equation or inequality and solve.

Exercise 9.8.26

4 less than twice *x* is 16.

Exercise 9.8.27

Fifteen more than *n* is at least 48.

Answer

$n + 15 \geq 48; n \geq 33$

Exercise 9.8.28

Samuel paid $25.82 for gas this week, which was $3.47 less than he paid last week. How much had he paid last week?

Exercise 9.8.29

Jenna bought a coat on sale for $\$120$, which was $\frac{2}{3}$ of the original price. What was the original price of the coat?

Answer

$120 = \frac{2}{3}p$; The original price was $\$180$

Exercise 9.8.30

Sean took the bus from Seattle to Boise, a distance of 506 miles. If the trip took $7\frac{2}{3}$ hours, what was the speed of the bus?

CHAPTER OVERVIEW

10: Graphs

10.1: Understanding the Slope of a Line

10.1E: Exercises

10.2: Use the Slope–Intercept Form of an Equation of a Line

10.2E: Exercises

10.3: Find the Equation of a Line

10.3E: Exercises

This page titled 10: Graphs is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

10.1: Understanding the Slope of a Line

Learning Objectives

- By the end of this section, you will be able to:
- Use geoboards to model slope
- Use $m = \frac{\text{rise}}{\text{run}}$ to find the slope of a line from its graph
- Find the slope of horizontal and vertical lines
- Use the slope formula to find the slope of a line between two points
- Graph a line given a point and the slope
- Solve slope applications

Note

Before you get started, take this readiness quiz.

1. Simplify: $\frac{1-4}{8-2}$.
   If you missed this problem, review Exercise 1.6.31
2. Divide: $\frac{0}{4}, \frac{4}{0}$.
   If you missed this problem, review Exercise 1.10.16.
3. Simplify: $\frac{15}{-3}, \frac{-15}{3}, \frac{-15}{-3}$.
   If you missed this problem, review Exercise 1.6.4.

When you graph linear equations, you may notice that some lines tilt up as they go from left to right and some lines tilt down. Some lines are very steep and some lines are flatter. What determines whether a line tilts up or down or if it is steep or flat?

In mathematics, the 'tilt' of a line is called the *slope* of the line. The concept of slope has many applications in the real world. The pitch of a roof, grade of a highway, and a ramp for a wheelchair are some examples where you literally see slopes. And when you ride a bicycle, you feel the slope as you pump uphill or coast downhill.

In this section, we will explore the concept of slope.

Use Geoboards to Model Slope

A **geoboard** is a board with a grid of pegs on it. Using rubber bands on a geoboard gives us a concrete way to model lines on a coordinate grid. By stretching a rubber band between two pegs on a geoboard, we can discover how to find the slope of a line.

Doing the Manipulative Mathematics activity "Exploring Slope" will help you develop a better understanding of the slope of a line. (Graph paper can be used instead of a geoboard, if needed.)

We'll start by stretching a rubber band between two pegs as shown in Figure 10.1.1.

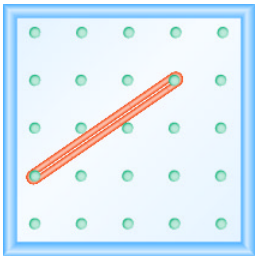

Figure 10.1.1

Doesn't it look like a line?

Now we stretch one part of the rubber band straight up from the left peg and around a third peg to make the sides of a right triangle, as shown in Figure 10.1.2

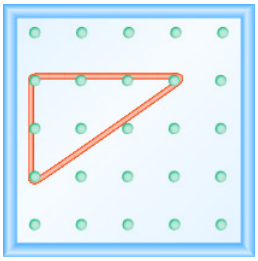

Figure 10.1.2

We carefully make a 90º angle around the third peg, so one of the newly formed lines is vertical and the other is horizontal.

To find the slope of the line, we measure the distance along the vertical and horizontal sides of the triangle. The vertical distance is called the **rise** and the horizontal distance is called the **run**, as shown in Figure 10.1.3.

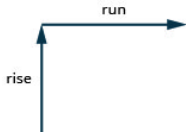

Figure 10.1.3

If our **geoboard** and rubber band look just like the one shown in Figure 10.1.4, the rise is 2. The rubber band goes up 2 units. (Each space is one unit.)

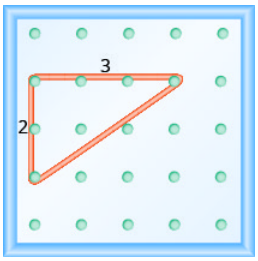

Figure 10.1.4

The rise on this geoboard is 2, as the rubber band goes up two units.

What is the run?

The rubber band goes across 3 units. The run is 3 (see Figure 10.1.4).

The slope of a line is the ratio of the rise to the run. In mathematics, it is always referred to with the letter m.

SLOPE OF A LINE

The **slope of a line** of a line is $m = \frac{\text{rise}}{\text{run}}$.

The **rise** measures the vertical change and the **run** measures the horizontal change between two points on the line.

What is the slope of the line on the geoboard in Figure 10.1.4?

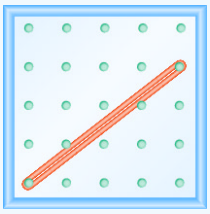
$$m = \frac{\text{rise}}{\text{run}}$$
$$m = \frac{2}{3}$$

The line has slope $\frac{2}{3}$. This means that the line rises 2 units for every 3 units of run.

When we work with geoboards, it is a good idea to get in the habit of starting at a peg on the left and connecting to a peg to the right. If the rise goes up it is positive and if it goes down it is negative. The run will go from left to right and be positive.

Example 10.1.1

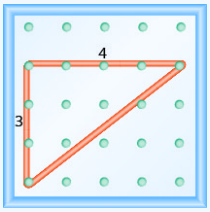
What is the slope of the line on the geoboard shown?



Solution

Use the definition of slope: $m = \frac{\text{rise}}{\text{run}}$.

Start at the left peg and count the spaces up and to the right to reach the second peg.

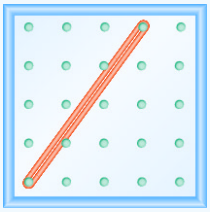


$$\begin{aligned} &\text{The rise is } 3. && m = \tfrac{3}{\text{run}} \\ &\text{The run is } 4. && m = \tfrac{3}{4} \\ & && \text{The slope is } \tfrac{3}{4}. \end{aligned} \tag{10.1.1}$$

This means that the line rises 3 units for every 4 units of run.

Try It 10.1.2

What is the slope of the line on the geoboard shown?

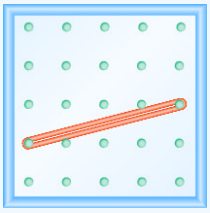


Answer

$\frac{4}{3}$

Try It 10.1.3

What is the slope of the line on the geoboard shown?

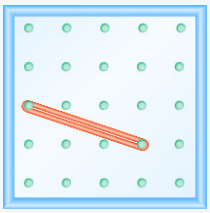


Answer

$\frac{1}{4}$

Example 10.1.4

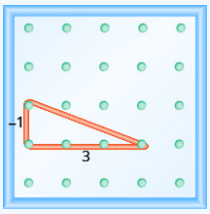
What is the slope of the line on the geoboard shown?



Solution

Use the definition of slope: $m = \frac{\text{rise}}{\text{run}}$.

Start at the left peg and count the units down and to the right to reach the second peg.

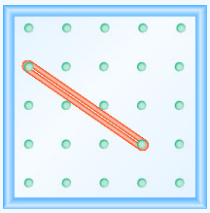


$$\begin{aligned} &\text{The rise is } -1. && m = \frac{-1}{\text{run}} \\ &\text{The run is } 3. && m = \frac{-1}{3} \\ & && m = -\frac{1}{3} \\ & && \text{The slope is } -\frac{1}{3} \end{aligned} \tag{10.1.2}$$

This means that the line drops 1 unit for every 3 units of run.

Try It 10.1.5

What is the slope of the line on the geoboard?

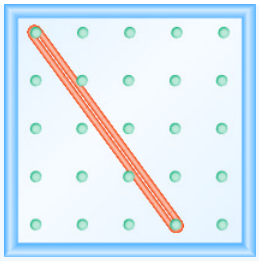


Answer

$-\frac{2}{3}$

Try It 10.1.6

What is the slope of the line on the geoboard?



Answer

$-\frac{4}{3}$

Notice that in Exercise 10.1.1 the slope is positive and in Exercise 10.1.4 the slope is negative. Do you notice any difference in the two lines shown in Figure(a) and Figure(b)?

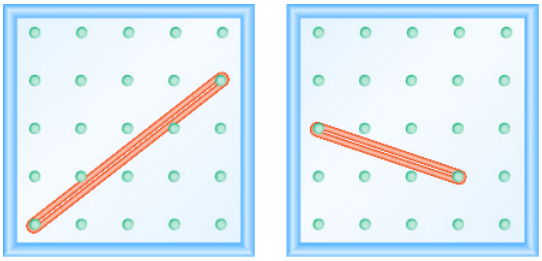


Figure 10.1.5

We 'read' a line from left to right just like we read words in English. As you read from left to right, the line in Figure(a) is going up; it has **positive slope**. The line in Figure(b) is going down; it has **negative slope**.

POSITIVE AND NEGATIVE SLOPES

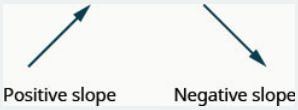

Figure 10.1.6

Example 10.1.7

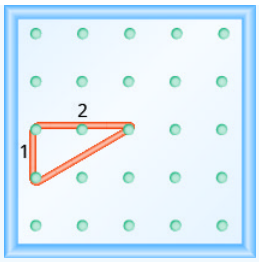
Use a geoboard to model a line with slope $\frac{1}{2}$.

Solution

To model a line on a geoboard, we need the rise and the run.

Use the slope formula.	$m = \frac{\text{rise}}{\text{run}}$
Replace m with $\frac{1}{2}$.	$\frac{1}{2} = \frac{\text{rise}}{\text{run}}$

So, the rise is 1 and the run is 2 .
Start at a peg in the lower left of the geoboard.
Stretch the rubber band up 1 unit, and then right 2 units.

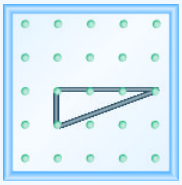


The hypotenuse of the right triangle formed by the rubber band represents a line whose slope is $\frac{1}{2}$.

Try It 10.1.8

Model the slope $m = \frac{1}{3}$. Draw a picture to show your results.

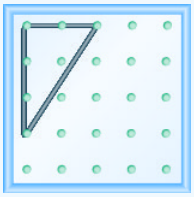
Answer



Try It 10.1.9

Model the slope $m = \frac{3}{2}$. Draw a picture to show your results.

Answer

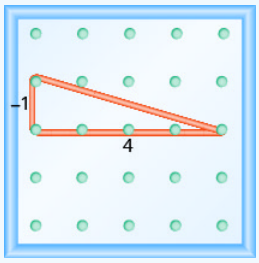


Example 10.1.10

Use a geoboard to model a line with slope $\frac{-1}{4}$.

Solution

Use the slope formula. m = $\frac{\text{rise}}{\text{run}}$.
Replace m with $\frac{-1}{4}$.
So, the rise is -1 and the run is 4.
Since the rise is negative, we choose a starting peg on the upper left that will give us room to count down.
We stretch the rubber band down 1 unit, and then right 4 units.

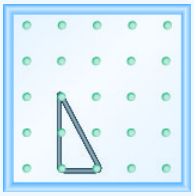


The hypotenuse of the right triangle formed by the rubber band represents a line whose slope is $\frac{-1}{4}$.

Try It 10.1.11

Model the slope $m = -2 = \frac{-2}{1}$. Draw a picture to show your results.

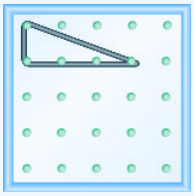
Answer



Try It 10.1.12

Model the slope $m = \frac{-1}{3}$. Draw a picture to show your results.

Answer



Use $m = \frac{\text{rise}}{\text{run}}$ to Find the Slope of a Line from its Graph

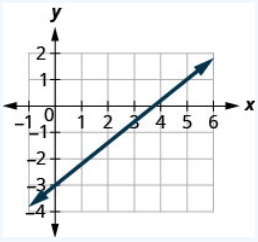
Now, we'll look at some graphs on the xy-coordinate plane and see how to find their slopes. The method will be very similar to what we just modeled on our geoboards.

To find the slope, we must count out the rise and the run. But where do we start?

We locate two points on the line whose coordinates are integers. We then start with the point on the left and sketch a right triangle, so we can count the rise and run.

Example 10.1.13:

Find the slope of the line shown.



Solution

Step 1. Locate two points on the graph whose coordinates are integers.	Mark (0, –3) and (5, 1).	Step 2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.	Starting at (0, –3), sketch a right triangle to (5, 1).	Step 3. Count the rise and the run on the legs of the triangle.	Count the rise. Count the run.	 The rise is 4. The run is 5.
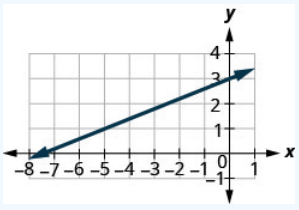
Step 4. Take the ratio of rise to run to find the slope. $m = \frac{\text{rise}}{\text{run}}$	Use the slope formula. Substitute the values of the rise and run.	$m = \frac{\text{rise}}{\text{run}}$ $m = \frac{4}{5}$ The slope of the line is $\frac{4}{5}$. This means that y increases 4 units as x increases 5 units.

Try It 10.1.14

Find the slope of the line shown.

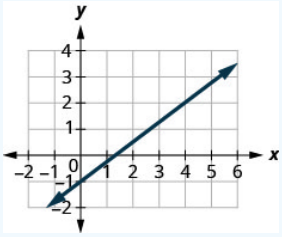


Answer

$\frac{2}{5}$

Try It 10.1.15

Find the slope of the line shown.



Answer

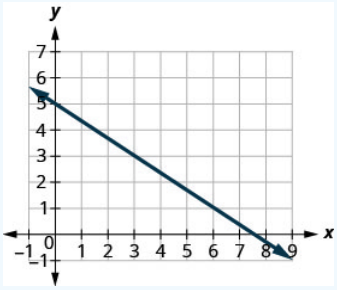
$\frac{3}{4}$

FIND THE SLOPE OF A LINE FROM ITS GRAPH

1. Locate two points on the line whose coordinates are integers.
2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.
3. Count the rise and the run on the legs of the triangle.
4. Take the ratio of rise to run to find the slope, $m = \frac{\text{rise}}{\text{run}}$.

Example 10.1.16

Find the slope of the line shown.



Solution

Locate two points on the graph whose coordinates are integers.	(0,5) and (3,3)
Which point is on the left?	(0,5)
Starting at (0,5), sketch a right triangle to (3,3).	Count the rise—it is negative.	The rise is −2.
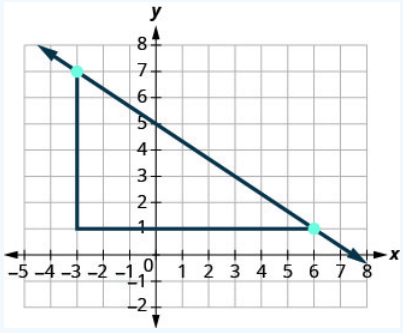
Count the run.	The run is 3.

Use the slope formula.	$m = \frac{\text{rise}}{\text{run}}$
Substitute the values of the rise and run.	$m = \frac{-2}{3}$
Simplify.	$m = -\frac{2}{3}$
	The slope of the line is $-\frac{2}{3}$.

So y increases by 3 units as x decreases by 2 units.

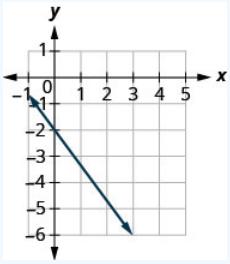
What if we used the points (−3,7) and (6,1) to find the slope of the line?



The rise would be −6 and the run would be 9. Then $m = \frac{-6}{9}$, and that simplifies to $m = -\frac{2}{3}$. Remember, it does not matter which points you use—the slope of the line is always the same.

Try It 10.1.17

Find the slope of the line shown.

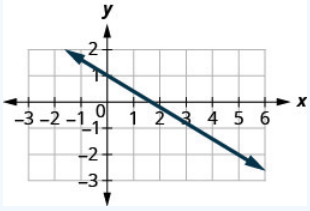


Answer

$-\frac{4}{3}$

Try It 10.1.18

Find the slope of the line shown.



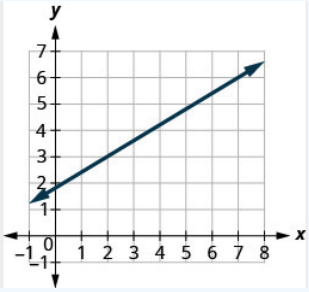
Answer

$-\frac{3}{5}$

In the last two examples, the lines had *y*-intercepts with integer values, so it was convenient to use the *y*-intercept as one of the points to find the slope. In the next example, the *y*-intercept is a fraction. Instead of using that point, we'll look for two other points whose coordinates are integers. This will make the slope calculations easier.

Example 10.1.19

Find the slope of the line shown.



Solution

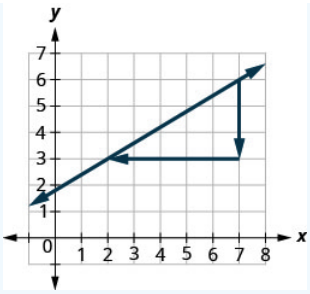
Locate two points on the graph whose coordinates are integers.	(2,3) and (7,6)
Which point is on the left?	(2,3)
Starting at (2,3), sketch a right triangle to (7,6).	
Count the rise.	The rise is 3.
Count the run.	The run is 5.
Use the slope formula.	$m = \frac{\text{rise}}{\text{run}}$
Substitute the values of the rise and run.	$m = \frac{3}{5}$
	The slope of the line is $\frac{3}{5}$.

This means that y increases 5 units as x increases 3 units.

When we used geoboards to introduce the concept of slope, we said that we would always start with the point on the left and count the rise and the run to get to the point on the right. That way the run was always positive and the rise determined whether the slope was positive or negative.

What would happen if we started with the point on the right?

Let's use the points (2,3) and (7,6) again, but now we'll start at (7,6).

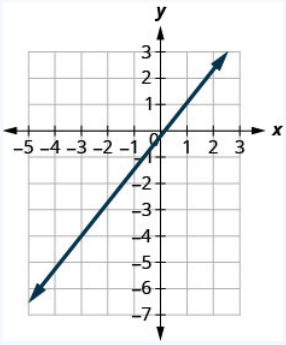


Count the rise.	The rise is -3.
Count the run. It goes from right to left, so it is negative.	The run is -5.
Use the slope formula.	$m = \frac{\text{rise}}{\text{run}}$
Substitute the values of the rise and run.	$m = \frac{-3}{-5}$
	The slope of the line is $\frac{3}{5}$

It does not matter where you start—the slope of the line is always the same.

Try It 10.1.20

Find the slope of the line shown.

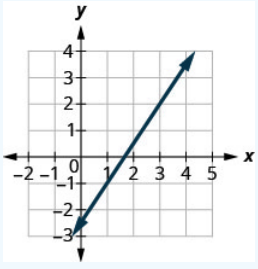


Answer

$\frac{5}{4}$

Try It 10.1.21

Find the slope of the line shown.



Answer

$\frac{3}{2}$

Find the Slope of Horizontal and Vertical Lines

Do you remember what was special about horizontal and vertical lines? Their equations had just one variable.

Horizontal line $y = b$	**Vertical line** $x = a$
y -coordinates are the same.	x -coordinates are the same.

(10.1.3)

So how do we find the slope of the horizontal line y=4? One approach would be to graph the horizontal line, find two points on it, and count the rise and the run. Let's see what happens when we do this.

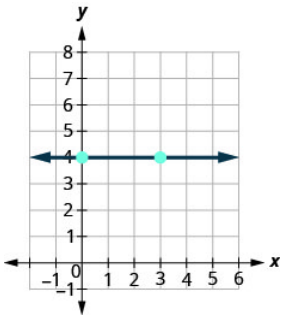


Figure 10.1.7

What is the rise?	The rise is 0.
What is the run?	The run is 3.
	$m = \frac{\text{rise}}{\text{run}}$
	$m = \frac{0}{3}$
What is the slope?	$m = 0$
	The slope of the horizontal line y = 4 is 0.

All horizontal lines have slope 0. When the *y*-coordinates are the same, the rise is 0.

SLOPE OF A HORIZONTAL LINE

The slope of a horizontal line, y=b, is 0.

The floor of your room is horizontal. Its slope is 0. If you carefully placed a ball on the floor, it would not roll away.

Now, we'll consider a vertical line, the line.

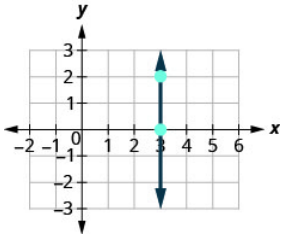

Figure 10.1.8

What is the rise?	The rise is 2.
What is the run?	The run is 0.
	$m = \frac{\text{rise}}{\text{run}}$
What is the slope?	$m = \frac{2}{0}$

But we can't divide by 0. Division by 0 is not defined. So we say that the slope of the vertical line x=3 is undefined.

The slope of any vertical line is undefined. When the *x*-coordinates of a line are all the same, the run is 0.

SLOPE OF A VERTICAL LINE

The slope of a vertical line, x=a, is undefined.

Example 10.1.22

Find the slope of each line:

(a) x=8 (b) y=−5.

Solution

(a) x=8
This is a vertical line.
Its slope is undefined.

(b) y=−5
This is a horizontal line.
It has slope 0.

Try It 10.1.23

Find the slope of the line: x=−4.

Answer

undefined

Try It 10.1.24

Find the slope of the line: y=7.

Answer

0

QUICK GUIDE TO THE SLOPES OF LINES

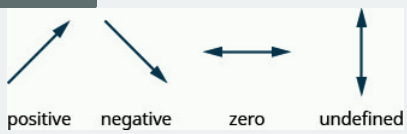

Figure 10.1.9

Remember, we ‘read’ a line from left to right, just like we read written words in English.

Use the Slope Formula to find the Slope of a Line Between Two Points

Doing the Manipulative Mathematics activity “Slope of Lines Between Two Points” will help you develop a better understanding of how to find the slope of a line between two points.

Sometimes we’ll need to find the slope of a line between two points when we don’t have a graph to count out the rise and the run. We could plot the points on grid paper, then count out the rise and the run, but as we’ll see, there is a way to find the slope without graphing. Before we get to it, we need to introduce some algebraic notation.

We have seen that an ordered pair (x,y) gives the coordinates of a point. But when we work with slopes, we use two points. How can the same symbol (x,y) be used to represent two different points? Mathematicians use subscripts to distinguish the points.

$$\begin{aligned} (x_1, y_1) \quad & \text{read } `x \text{ sub } 1, y \text{ sub } 1' \\ (x_2, y_2) \quad & \text{read } `x \text{ sub } 2, y \text{ sub } 2' \end{aligned} \tag{10.1.4}$$

The use of subscripts in math is very much like the use of last name initials in elementary school. Maybe you remember Laura C. and Laura M. in your third grade class?

We will use (x_1, y_1) to identify the first point and (x_2, y_2) to identify the second point.

If we had more than two points, we could use (x_3, y_3), (x_4, y_4), and so on.

Let's see how the rise and run relate to the coordinates of the two points by taking another look at the slope of the line between the points (2,3) and (7,6).

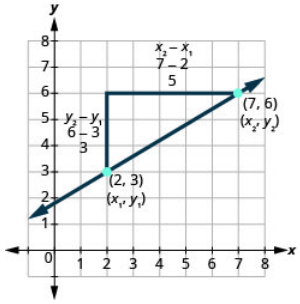

Figure 10.1.10

Since we have two points, we will use subscript notation, $\begin{pmatrix} x_1, y_1 \\ 2, 3 \end{pmatrix} \begin{pmatrix} x_2, y_2 \\ 7, 6 \end{pmatrix}$.

On the graph, we counted the rise of 3 and the run of 5.

Notice that the rise of 3 can be found by subtracting the *y*-coordinates 6 and 3.

$$3 = 6 - 3 \tag{10.1.5}$$

And the run of 5 can be found by subtracting the *x*-coordinates 7 and 2.

$$5 = 7 - 2 \tag{10.1.6}$$

We know $m = \frac{\text{rise}}{\text{run}}$. So $m = \frac{3}{5}$.

We rewrite the rise and run by putting in the coordinates $m = \frac{6-3}{7-2}$

But 6 is y_2, the *y*-coordinate of the second point and 3 is y_1, the *y*-coordinate of the first point.

So we can rewrite the slope using subscript notation. $m = \frac{y2-y1}{7-2}$

Also, 7 is x_2, the *x*-coordinate of the second point and 2 is x_1, the *x*-coordinate of the first point.

So, again, we rewrite the slope using subscript notation. $m = \frac{y2-y1}{x2-x1}$

We've shown that $m = \frac{y2-y1}{x2-x1}$ is really another version of $m = \frac{\text{rise}}{\text{run}}$. We can use this formula to find the slope of a line when we have two points on the line.

SLOPE FORMULA

The slope of the line between two points (x_1, y_1) and (x_2, y_2) is

$$m = \frac{y_2 - y_1}{x_2 - x_1} \tag{10.1.7}$$

This is the **slope formula**.

The slope is:

$$\begin{array}{c} y \text{ of the second point minus } y \text{ of the first point} \\ \text{over} \\ x \text{ of the second point minus } x \text{ of the first point.} \end{array} \tag{10.1.8}$$

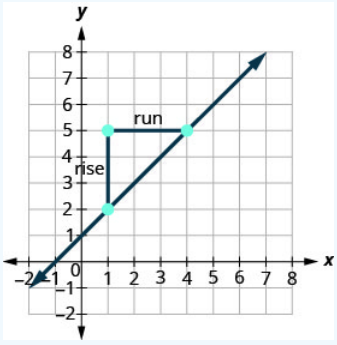
Example 10.1.25

Use the **slope formula** to find the slope of the line between the points (1,2) and (4,5).

Solution

We'll call (1,2) point #1 and (4,5) point #2.	$\begin{pmatrix} x_1, y_1 \\ 1, 2 \end{pmatrix} \begin{pmatrix} x_2, y_2 \\ 4, 5 \end{pmatrix}$
Use the slope formula.	$m = \frac{y_2 - y_1}{x_2 - x_1}$
Substitute the values.	
y of the second point minus y of the first point	$m = \frac{5-2}{x_2 - x_1}$
x of the second point minus x of the first point	$m = \frac{5-2}{4-1}$
Simplify the numerator and the denominator.	$m = \frac{3}{3}$
Simplify.	$m = 1$

Let's confirm this by counting out the slope on a graph using $m = \frac{\text{rise}}{\text{run}}$.



It doesn't matter which point you call point #1 and which one you call point #2. The slope will be the same. Try the calculation yourself.

Try It 10.1.26

Use the slope formula to find the slope of the line through the points: (8,5) and (6,3).

Answer

1

Try It 10.1.27

Use the slope formula to find the slope of the line through the points: (1,5) and (5,9).

Answer

1

Example 10.1.28

Use the slope formula to find the slope of the line through the points (−2,−3) and (−7,4).

Solution

We'll call (-2, -3) point #1 and (-7,4) point #2. $\begin{pmatrix} x_1, y_1 \\ -2, -3 \end{pmatrix} \begin{pmatrix} x_2, y_2 \\ -7, 4 \end{pmatrix}$

Use the slope formula. $m = \frac{y_2 - y_1}{x_2 - x_1}$

Substitute the values.

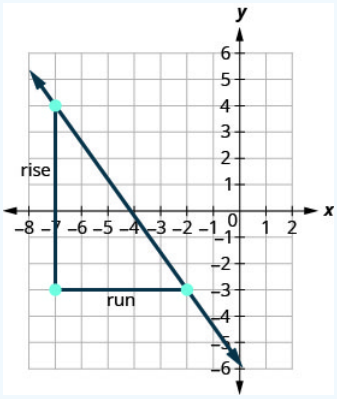
y of the second point minus y of the first point $m = \frac{4-(-3)}{x_2 - x_1}$

x of the second point minus x of the first point $m = \frac{4-(-3)}{-7-(-2)}$

Simplify the numerator and the denominator. $m = \frac{7}{-5}$

Simplify. $m = -\frac{7}{5}$

Let's verify this slope on the graph shown.



$$m = \frac{\text{rise}}{\text{run}}$$
$$m = \frac{-7}{5}$$
$$m = -\frac{7}{5}$$

Try It 10.1.29

Use the slope formula to find the slope of the line through the points: (−3,4) and (2,−1).

Answer

-1

Try It 10.1.30

Use the slope formula to find the slope of the line through the pair of points: (−2,6) and (−3,−4).

Answer

10

Graph a Line Given a Point and the Slope

Up to now, in this chapter, we have graphed lines by plotting points, by using intercepts, and by recognizing horizontal and vertical lines.

One other method we can use to graph lines is called the **point–slope method**. We will use this method when we know one point and the slope of the line. We will start by plotting the point and then use the definition of slope to draw the graph of the line.

Example 10.1.31

Graph the line passing through the point $(1,-1)$ whose slope is $m = \frac{3}{4}$.

Solution

Step 1. Plot the given point.	Plot (1, –1).	Step 2. Use the slope formula $m = \frac{\text{rise}}{\text{run}}$ to identify the rise and the run.	Identify the rise and the run.	$m = \frac{3}{4}$ $\frac{\text{rise}}{\text{run}} = \frac{3}{4}$ rise = 3 run = 4
Step 3. Starting at the given point, count out the rise and run to mark the second point.	Start at (1, –1) and count the rise and the run. Up 3 units, right 4 units.	Step 4. Connect the points with a line.	Connect the two points with a line.	
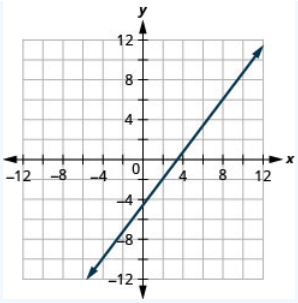
Try It 10.1.32

Graph the line passing through the point $(2,-2)$ with the slope $m = \frac{4}{3}$.

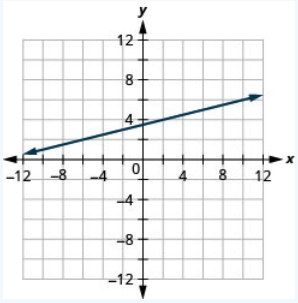
Answer



Try It 10.1.33

Graph the line passing through the point (−2,3) with the slope $m = \frac{1}{4}$.

Answer



GRAPH A LINE GIVEN A POINT AND THE SLOPE.

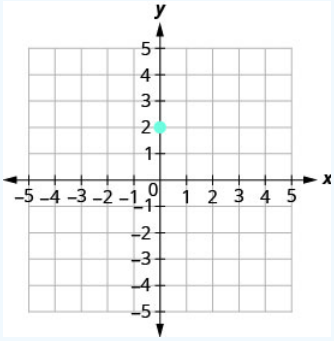
1. Plot the given point.
2. Use the slope formula $m = \frac{\text{rise}}{\text{rise}}$ to identify the rise and the run.
3. Starting at the given point, count out the rise and run to mark the second point.
4. Connect the points with a line.

Example 10.1.34

Graph the line with *y*-intercept 2 whose slope is $m = -\frac{2}{3}$.

Solution

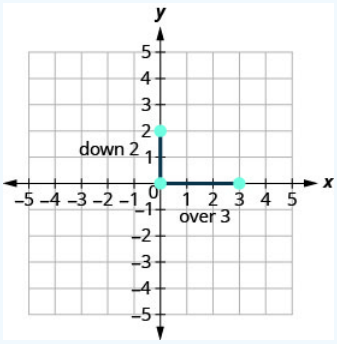
Plot the given point, the *y*-intercept, (0,2).



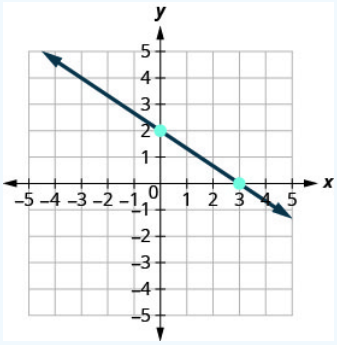
Identify the rise and the run. $m = -\frac{2}{3}$

$$\frac{\text{rise}}{\text{run}} = \frac{-2}{3}$$
$$\text{rise} = -2$$
$$\text{run} = 3$$

Count the rise and the run. Mark the second point.



Connect the two points with a line.

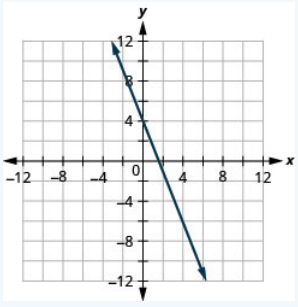


You can check your work by finding a third point. Since the slope is $m = -\frac{2}{3}$, it can be written as $m = \frac{2}{-3}$. Go back to (0,2) and count out the rise, 2, and the run, −3.

? Try It 10.1.35

Graph the line with the *y*-intercept 4 and slope $m = -\frac{5}{2}$.

Answer

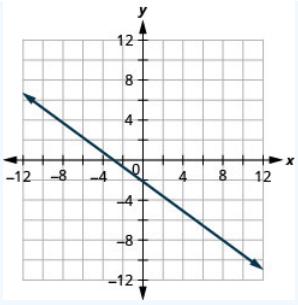


? Try It 10.1.36

Graph the line with the *x*-intercept −3 and slope $m = -\frac{3}{4}$.

Answer

https://math.libretexts.org/@go/page/46283

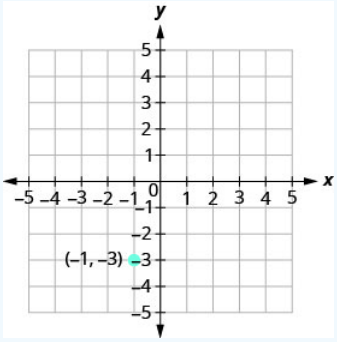


Example 10.1.37

Graph the line passing through the point $(-1,-3)$ whose slope is $m=4$.

Solution

Plot the given point.

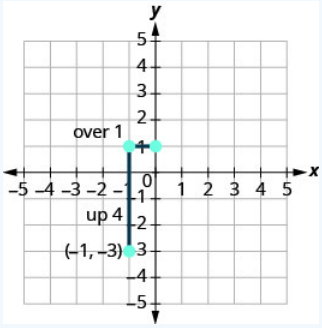


Identify the rise and the run. $m = 4$

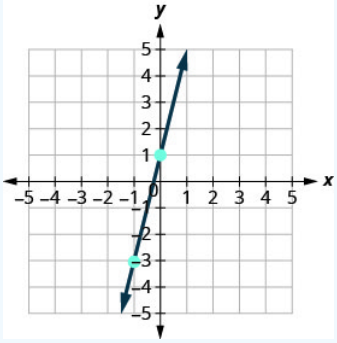
Write 4 as a fraction. $\frac{\text{rise}}{\text{run}} = \frac{4}{1}$

$\text{rise} = 4 \quad \text{run} = 1$

Count the rise and run and mark the second point.



Connect the two points with a line.

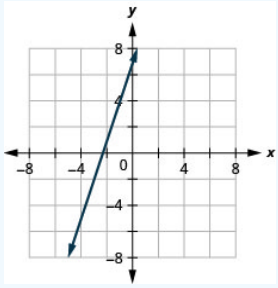


You can check your work by finding a third point. Since the slope is m=4, it can be written as $m = \frac{-4}{-1}$. Go back to (−1,−3) and count out the rise, −4, and the run, −1.

Try It 10.1.38

Graph the line with the point (−2,1) and slope m=3.

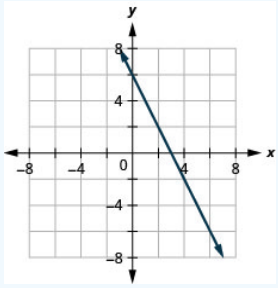
Answer



Try It 10.1.39

Graph the line with the point (4,−2) and slope m=−2.

Answer

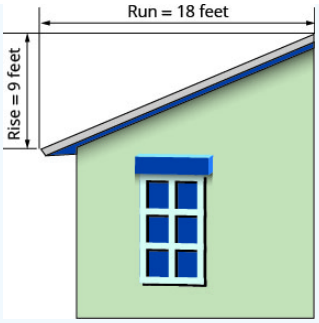


Solve Slope Applications

At the beginning of this section, we said there are many applications of slope in the real world. Let's look at a few now.

Example 10.1.40

The 'pitch' of a building's roof is the slope of the roof. Knowing the pitch is important in climates where there is heavy snowfall. If the roof is too flat, the weight of the snow may cause it to collapse. What is the slope of the roof shown?



Solution

Use the slope formula.	$m = \frac{\text{rise}}{\text{rise}}$
Substitute the values for rise and run.	$m = \frac{9}{18}$
Simplify.	$m = \frac{1}{2}$

The slope of the roof is $\frac{1}{2}$.

The roof rises 1 foot for every 2 feet of horizontal run.

Try It 10.1.41

Use Exercise 10.1.40, substituting the rise = 14 and run = 24.

Answer

$\frac{7}{12}$

Try It 10.1.42

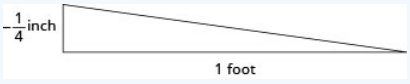
Use Exercise 10.1.40, substituting rise = 15 and run = 36.

Answer

$\frac{5}{12}$

Example 10.1.43

Have you ever thought about the sewage pipes going from your house to the street? They must slope down $\frac{1}{4}$ inch per foot in order to drain properly. What is the required slope?



Solution

Use the slope formula.	$m = \frac{\text{rise}}{\text{run}}$
	$m = \frac{-\frac{1}{4}\text{inch}}{1\text{ foot}}$
	$m = \frac{-\frac{1}{4}\text{ inch}}{12\text{ inches}}$
Simplify.	$m = -\frac{1}{48}$

The slope of the pipe is $-\frac{1}{48}$

The pipe drops 1 inch for every 48 inches of horizontal run.

? Try It 10.1.44

Find the slope of a pipe that slopes down $\frac{1}{3}$ inch per foot.

Answer

$-\frac{1}{36}$

? Try It 10.1.45

Find the slope of a pipe that slopes down $\frac{3}{4}$ inch per yard.

Answer

$-\frac{1}{48}$

Access these online resources for additional instruction and practice with understanding slope of a line.

Key Concepts

- **Find the Slope of a Line from its Graph using $m = \frac{\text{rise}}{\text{run}}$**
  1. Locate two points on the line whose coordinates are integers.
  2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.
  3. Count the rise and the run on the legs of the triangle.
  4. Take the ratio of rise to run to find the slope.
- **Graph a Line Given a Point and the Slope**
  1. Plot the given point.
  2. Use the slope formula $m = \frac{\text{rise}}{\text{run}}$ to identify the rise and the run.
  3. Starting at the given point, count out the rise and run to mark the second point.
  4. Connect the points with a line.
- **Slope of a Horizontal Line**
  - The slope of a horizontal line, y=b, is 0.
- **Slope of a vertical line**
  - The slope of a vertical line, x=a, is undefined

Answer

Exercise 10.1E.68

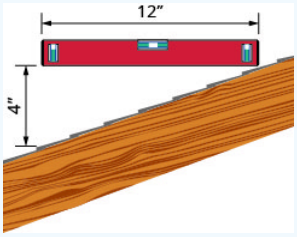
$(2, 3); m = -1$

Everyday Math

Exercise 10.1E.69

Slope of a roof. An easy way to determine the slope of a roof is to set one end of a 12 inch level on the roof surface and hold it level. Then take a tape measure or ruler and measure from the other end of the level down to the roof surface. This will give you the slope of the roof. Builders, sometimes, refer to this as pitch and state it as an "x 12 pitch" meaning $\frac{x}{12}$, where x is the measurement from the roof to the level—the rise. It is also sometimes stated as an "x-in-12 pitch".

1. What is the slope of the roof in this picture?
2. What is the pitch in construction terms?

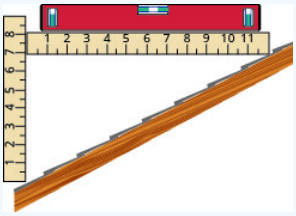


Answer

1. $\frac{1}{3}$
2. 4 12 pitch or 4-in-12 pitch

Exercise 10.1E.70

The slope of the roof shown here is measured with a 12” level and a ruler. What is the slope of this roof?



Exercise 10.1E.71

Road grade. A local road has a grade of 6%. The grade of a road is its slope expressed as a percent. Find the slope of the road as a fraction and then simplify. What rise and run would reflect this slope or grade?

Answer

$\frac{3}{50}$; rise $= 3$, run $= 50$

Exercise 10.1E.72

Highway grade. A local road rises 2 feet for every 50 feet of highway.

1. What is the slope of the highway?
2. The grade of a highway is its slope expressed as a percent. What is the grade of this highway?

Exercise 10.1E.73

Wheelchair ramp. The rules for wheelchair ramps require a maximum 1-inch rise for a 12-inch run.

1. How long must the ramp be to accommodate a 24-inch rise to the door?
2. Create a model of this ramp.

Answer

1. 288 inches (24 feet)
2. Models will vary.

Exercise 10.1E.74

Wheelchair ramp. A 1-inch rise for a 16-inch run makes it easier for the wheelchair rider to ascend a ramp.

1. How long must a ramp be to easily accommodate a 24-inch rise to the door?
2. Create a model of this ramp.

Writing Exercises

Exercise 10.1E.75

What does the sign of the slope tell you about a line?

Answer

When the slope is a positive number the line goes up from left to right. When the slope is a negative number the line goes down from left to right.

Exercise 10.1E.76

How does the graph of a line with slope $m = \frac{1}{2}$ differ from the graph of a line with slope $m = 2$?

Exercise 10.1E.77

Why is the slope of a vertical line “undefined”?

Answer

A vertical line has 0 run and since division by 0 is undefined the slope is undefined.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it
use geoboards to model slope.			
use $m = \frac{rise}{run}$ to find the slope of a line from its graph.			
find the slope of horizontal and vertical lines.			
use the slope formula to find the slope of a line between two points.			
graph a line given a point and the slope.			
solve slope applications.			

ⓑ On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

Glossary

geoboard

A geoboard is a board with a grid of pegs on it.

negative slope

A negative slope of a line goes down as you read from left to right.

positive slope

A positive slope of a line goes up as you read from left to right.

rise

The rise of a line is its vertical change.

run

The run of a line is its horizontal change.

slope formula

The slope of the line between two points (x_1, y_1) and (x_2, y_2) is $m = \frac{y_2 - y_1}{x_2 - x_1}$.

slope of a line

The slope of a line is $m = \frac{\text{rise}}{\text{run}}$. The rise measures the vertical change and the run measures the horizontal change.

10.2: Use the Slope–Intercept Form of an Equation of a Line

Learning Objectives

By the end of this section, you will be able to:

- Recognize the relation between the graph and the slope–intercept form of an equation of a line
- Identify the slope and y-intercept form of an equation of a line
- Graph a line using its slope and intercept
- Choose the most convenient method to graph a line
- Graph and interpret applications of slope–intercept
- Use slopes to identify parallel lines
- Use slopes to identify perpendicular lines

Note

Before you get started, take this readiness quiz.

1. Add: $\frac{x}{4}+\frac{1}{4}$.
   If you missed this problem, review Exercise 1.7.1.
2. Find the reciprocal of $\frac{3}{7}$.
   If you missed this problem, review Exercise 1.6.19.
3. Solve $2x-3y=12$ for y.
   If you missed this problem, review Exercise 2.6.16.

Recognize the Relation Between the Graph and the Slope–Intercept Form of an Equation of a Line

We have graphed linear equations by plotting points, using intercepts, recognizing horizontal and vertical lines, and using the point–slope method. Once we see how an equation in slope–intercept form and its graph are related, we'll have one more method we can use to graph lines.

In **Graph Linear Equations in Two Variables**, we graphed the line of the equation $y=12x+3$ by plotting points. See Figure 10.2.1. Let's find the slope of this line.

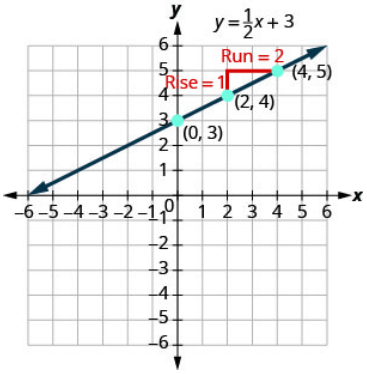

Figure 10.2.1

The red lines show us the rise is 1 and the run is 2. Substituting into the slope formula:

$$m=\frac{\text{rise}}{\text{run}}$$
$$m=\frac{1}{2}$$

What is the y-intercept of the line? The y-intercept is where the line crosses the y-axis, so y-intercept is $(0,3)$. The equation of this line is:

$y = \frac{1}{2}x + 3$

Notice, the line has:

slope $m = \frac{1}{2}$ and y-intercept $(0, 3)$

When a linear equation is solved for y, the coefficient of the x-term is the slope and the constant term is the y-coordinate of the y-intercept. We say that the equation $y = \frac{1}{2}x + 3$ is in slope–intercept form.

$m = \frac{1}{2}$; y-intercept is $(0, 3)$

$y = \frac{1}{2}x + 3$

$y = mx + b$

SLOPE-INTERCEPT FORM OF AN EQUATION OF A LINE

The **slope–intercept form** of an equation of a line with slope m and y-intercept, $(0, b)$ is,

$$y = mx + b \tag{10.2.1}$$

Sometimes the slope–intercept form is called the "y-form."

Example 10.2.1

Use the graph to find the slope and y-intercept of the line, $y = 2x + 1$.

Compare these values to the equation $y = mx + b$.

Solution

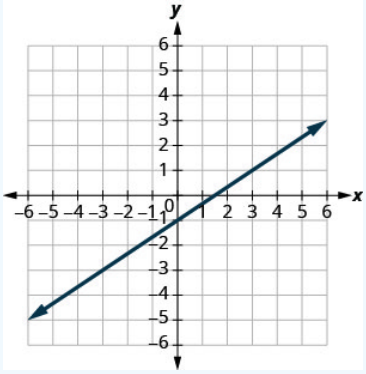
To find the slope of the line, we need to choose two points on the line. We'll use the points $(0, 1)$ and $(1, 3)$.

	Find the rise and run.	$m = \frac{\text{rise}}{\text{run}}$
	$m = \frac{2}{1}$
	$m = 2$
Find the y-intercept of the line.	The y-intercept is the point $(0, 1)$.
We found slope $m = 2$ and y-intercept $(0, 1)$.	$y = 2x + 1$ $y = mx + b$

The slope is the same as the coefficient of x and the y-coordinate of the y-intercept is the same as the constant term.

Try It 10.2.2

Use the graph to find the slope and y-intercept of the line $y = \frac{2}{3}x - 1$. Compare these values to the equation $y = mx + b$.

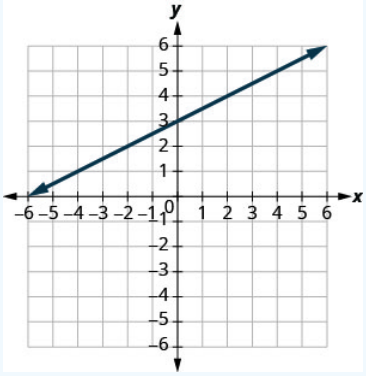


Answer

slope $m = \frac{2}{3}$ and y-intercept $(0, -1)$

Try It 10.2.3

Use the graph to find the slope and y-intercept of the line $y = \frac{1}{2}x + 3$. Compare these values to the equation $y = mx + b$.



Answer

slope $m = \frac{1}{2}$ and y-intercept $(0, 3)$

Identify the Slope and y-Intercept From an Equation of a Line

In **Understand Slope of a Line**, we graphed a line using the slope and a point. When we are given an equation in slope–intercept form, we can use the y-intercept as the point, and then count out the slope from there. Let's practice finding the values of the slope and y-intercept from the equation of a line.

Example 10.2.4

Identify the slope and y-intercept of the line with equation $y = -3x + 5$.

Solution

We compare our equation to the slope–intercept form of the equation.

	$y = mx + b$
Write the equation of the line.	$y = -3x + 5$
Identify the slope.	$m = -3$
Identify the y-intercept.	y-intercept is $(0, 5)$

Try It 10.2.5

Identify the slope and y-intercept of the line $y = \frac{2}{5}x - 1$.

Answer

slope $\frac{2}{5}$; y-intercept $(0,-1)$

Try It 10.2.6

Identify the slope and y-intercept of the line $y = -\frac{4}{3}x + 1$.

Answer

slope $-\frac{4}{3}$; y-intercept $(0,1)$

When an equation of a line is not given in slope–intercept form, our first step will be to solve the equation for y.

Example 10.2.7

Identify the slope and y-intercept of the line with equation $x + 2y = 6$.

Solution

This equation is not in slope–intercept form. In order to compare it to the slope–intercept form we must first solve the equation for y.

Solve for y.	$x + 2y = 6$
Subtract x from each side.	$2y = -x + 6$
Divide both sides by 2.	$\frac{2y}{2} = \frac{-x+6}{2}$
Simplify.	$\frac{2y}{2} = \frac{-x}{2} + \frac{6}{2}$
(Remember: $\frac{a+b}{c} = \frac{a}{c} + \frac{b}{c}$)	
Simplify.	$y = -\frac{1}{2}x + 3$
Write the slope–intercept form of the equation of the line.	$y = mx + b$
Write the equation of the line.	$y = -\frac{1}{2}x + 3$
Identify the slope.	$m = -\frac{1}{2}$
Identify the y-intercept.	y-intercept is $(0, 3)$

Try It 10.2.8

Identify the slope and y-intercept of the line $x + 4y = 8$.

Answer

slope $-\frac{1}{4}$; y-intercept $(0,2)$

Try It 10.2.9

Identify the slope and y-intercept of the line $3x + 2y = 12$.

Answer

slope $-\frac{3}{2}$; y-intercept (0,6)

Graph a Line Using its Slope and Intercept

Now that we know how to find the slope and y-intercept of a line from its equation, we can graph the line by plotting the y-intercept and then using the slope to find another point.

Example 10.2.10: How to Graph a Line Using its Slope and Intercept

Graph the line of the equation $y = 4x - 2$ using its slope and y-intercept.

Solution

Step 1. Find the slope–intercept form of the equation.	This equation is in slope–intercept form.	$y = 4x - 2$
Step 2. Identify the slope and y-intercept.	Use $y = mx + b$ Find the slope. Find the y-intercept.	$y = mx + b$ $y = 4x + (-2)$ $m = 4$ $b = -2$, $(0, -2)$
Step 3. Plot the y-intercept.	Plot $(0, -2)$.	Step 4. Use the slope formula $m = \frac{\text{rise}}{\text{run}}$ to identify the rise and the run.	Identify the rise and the run.	$m = 4$ $\frac{\text{rise}}{\text{run}} = \frac{4}{1}$ rise $= 4$ run $= 1$

Step 5. Starting at the *y*-intercept, count out the rise and run to mark the second point.	Start at (0, –2) and count the rise and the run. Up 4, right 1.	Step 6. Connect the points with a line.	Connect the two points with a line.	
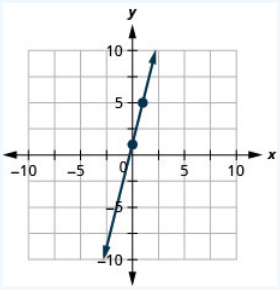
? Try It 10.2.11

Graph the line of the equation $y = 4x + 1$ using its slope and y-intercept.

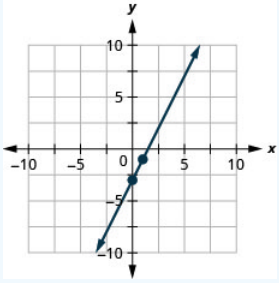
Answer



? Try It 10.2.12

Graph the line of the equation $y = 2x - 3$ using its slope and y-intercept.

Answer



GRAPH A LINE USING ITS SLOPE AND y-INTERCEPT.

1. Find the slope-intercept form of the equation of the line.
2. Identify the slope and y-intercept.
3. Plot the y-intercept.
4. Use the slope formula $\frac{\text{rise}}{\text{run}}$ to identify the rise and the run.
5. Starting at the y-intercept, count out the rise and run to mark the second point.
6. Connect the points with a line.

Example 10.2.13

Graph the line of the equation $y = -x + 4$ using its slope and y-intercept.

Solution

	$y = mx + b$
The equation is in slope–intercept form.	$y = -x + 4$
Identify the slope and y-intercept.	$m = -1$
	y-intercept is $(0, 4)$
Plot the y-intercept.	See graph below.
Identify the rise and the run.	$m = \frac{-1}{1}$
Count out the rise and run to mark the second point.	rise -1, run 1
Draw the line.	To check your work, you can find another point on the line and make sure it is a solution of the equation. In the graph we see the line goes through $(4, 0)$.	

check.

$y = -x + 4$

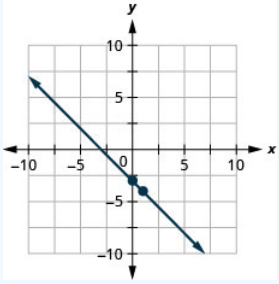
$0 \stackrel{?}{=} -4 + 4$

$0 = 0 \checkmark$

Try It 10.2.14

Graph the line of the equation $y = -x - 3$ using its slope and y-intercept.

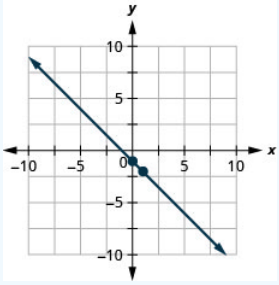
Answer



Try It 10.2.15

Graph the line of the equation $y = -x - 1$ using its slope and y-intercept.

Answer



Example 10.2.16

Graph the line of the equation $y = -\frac{2}{3}x - 3$ using its slope and y-intercept.

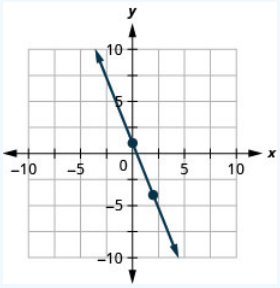
Solution

	$y = mx + b$
The equation is in slope–intercept form.	$y = -\frac{2}{3}x - 3$
Identify the slope and y-intercept.	$m = -\frac{2}{3}$; y-intercept is $(0, -3)$
Plot the y-intercept.	See graph below.
Identify the rise and the run.	
Count out the rise and run to mark the second point.	

Draw the line.	
Try It 10.2.17

Graph the line of the equation $y = -\frac{5}{2}x + 1$ using its slope and y-intercept.

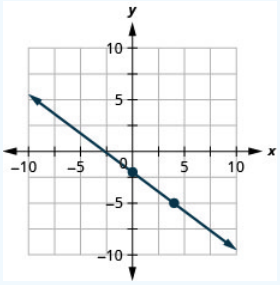
Answer



Try It 10.2.18

Graph the line of the equation $y = -\frac{3}{4}x - 2$ using its slope and y-intercept.

Answer



Example 10.2.19

Graph the line of the equation $4x - 3y = 12$ using its slope and y-intercept.

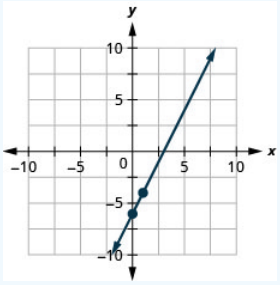
Solution

	$4x - 3y = 12$
Find the slope–intercept form of the equation.	$-3y = -4x + 12$
	$-\frac{3y}{3} = \frac{-4x+12}{-3}$

The equation is now in slope–intercept form.	$y = \frac{4}{3}x - 4$
Identify the slope and y-intercept.	$m = \frac{4}{3}$
	y-ntercept is $(0, -4)$
Plot the y-intercept.	See graph below.
Identify the rise and the run; count out the rise and run to mark the second point.	
Draw the line.	
Try It 10.2.20

Graph the line of the equation $2x - y = 6$ using its slope and y-intercept.

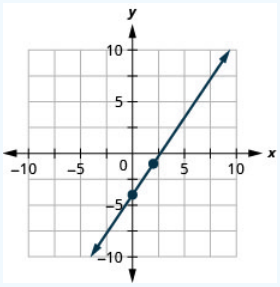
Answer



Try It 10.2.21

Graph the line of the equation $3x - 2y = 8$ using its slope and y-intercept.

Answer



We have used a grid with x and y both going from about -10 to 10 for all the equations we've graphed so far. Not all linear equations can be graphed on this small grid. Often, especially in applications with real-world data, we'll need to extend the axes to bigger positive or smaller negative numbers.

Example 10.2.22

Graph the line of the equation $y = 0.2x + 45$ using its slope and y-intercept.

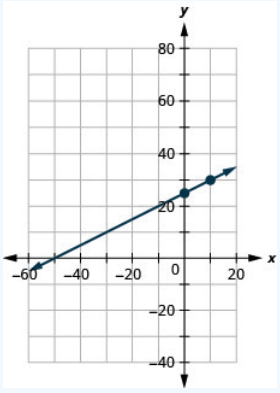
Solution

We'll use a grid with the axes going from about -80 to 80.

	$y = mx + b$
The equation is in slope–intercept form.	$y = 0.2x + 45$
Identify the slope and y-intercept.	$m = 0.2$
	The y-intercept is $(0, 45)$
Plot the y-intercept.	See graph below.
Count out the rise and run to mark the second point. The slope is $m = 0.2$; in fraction form this means $m = \frac{2}{10}$. Given the scale of our graph, it would be easier to use the equivalent fraction $m = \frac{10}{50}$.	
Draw the line.	
Try It 10.2.23

Graph the line of the equation $y = 0.5x + 25$ using its slope and y-intercept.

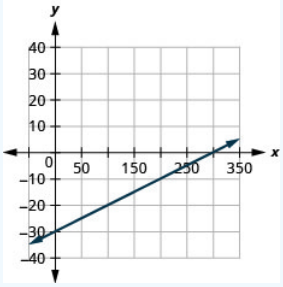
Answer



? Try It 10.2.24

Graph the line of the equation $y = 0.1x - 30$ using its slope and y-intercept.

Answer



Now that we have graphed lines by using the slope and y-intercept, let's summarize all the methods we have used to graph lines. See Figure 10.2.2

Methods to Graph Lines			
Point Plotting	**Slope–Intercept**	**Intercepts**	**Recognize Vertical and Horizontal Lines**
x | y	$y = mx + b$	x | y 0 | | 0	
Find three points. Plot the points, make sure they line up, then draw the line.	Find the slope and *y*-intercept. Start at the *y*-intercept, then count the slope to get a second point.	Find the intercepts and a third point. Plot the points, make sure they line up, then draw the line.	The equation has only one variable. $x = a$ vertical $y = b$ horizontal

Figure 10.2.2

Choose the Most Convenient Method to Graph a Line

Now that we have seen several methods we can use to graph lines, how do we know which method to use for a given equation?

While we could plot points, use the slope–intercept form, or find the intercepts for *any* equation, if we recognize the most convenient way to graph a certain type of equation, our work will be easier. Generally, plotting points is not the most efficient way to graph a line. We saw better methods in sections 4.3, 4.4, and earlier in this section. Let's look for some patterns to help determine the most convenient method to graph a line.

Here are six equations we graphed in this chapter, and the method we used to graph each of them.

$$\begin{array}{lll} \#1 & \text{Equation} & \text{Method} \\ \#2 & x = 2 & \text{Vertical line} \\ \#3 & y = 4 & \text{Horizontal line} \\ \#4 & -x + 2y = 6 & \text{Intercepts} \\ \#5 & 4x - 3y = 12 & \text{Intercepts} \\ \#6 & y = 4x - 2 & \text{Slope-intercept} \\ \#7 & y = -x + 4 & \text{Slope-intercept} \end{array} \tag{10.2.2}$$

Equations #1 and #2 each have just one variable. Remember, in equations of this form the value of that one variable is constant; it does not depend on the value of the other variable. Equations of this form have graphs that are vertical or horizontal lines.

In equations #3 and #4, both x and y are on the same side of the equation. These two equations are of the form $Ax + By = C$. We substituted $y = 0$ to find the x-intercept and $x = 0$ to find the y-intercept, and then found a third point by choosing another value for x or y.

Equations #5 and #6 are written in slope–intercept form. After identifying the slope and y-intercept from the equation we used them to graph the line.

This leads to the following strategy.

STRATEGY FOR CHOOSING THE MOST CONVENIENT METHOD TO GRAPH A LINE

Consider the form of the equation.

- If it only has one variable, it is a vertical or horizontal line.
  - $x = a$ is a vertical line passing through the x-axis at a.
  - $y = b$ is a horizontal line passing through the y-axis at b.
- If y is isolated on one side of the equation, in the form $y = mx + b$, graph by using the slope and y-intercept.
  - Identify the slope and y-intercept and then graph.
- If the equation is of the form $Ax + By = C$, find the intercepts.
  - Find the x- and y-intercepts, a third point, and then graph.

Example 10.2.25

Determine the most convenient method to graph each line.

1. $y = -6$
2. $5x - 3y = 15$
3. $x = 7$
4. $y = \frac{2}{5}x - 1$.

Solution

1. $y = -6$
This equation has only one variable, y. Its graph is a horizontal line crossing the y-axis at -6.

2. $5x - 3y = 15$
This equation is of the form $Ax + By = C$. The easiest way to graph it will be to find the intercepts and one more point.

3. $x = 7$
There is only one variable, x. The graph is a vertical line crossing the x-axis at 7.

4. $y = \frac{2}{5}x - 1$
Since this equation is in $y = mx + b$ form, it will be easiest to graph this line by using the slope and y-intercept.

Try It 10.2.26

Determine the most convenient method to graph each line:

1. $3x + 2y = 12$
2. $y = 4$
3. $y = \frac{1}{5}x - 4$
4. $x = -7$

Answer

1. intercepts
2. horizontal line
3. slope–intercept
4. vertical line

Try It 10.2.27

Determine the most convenient method to graph each line:

1. $x = 6$
2. $y = -\frac{3}{4}x + 1$
3. $y = -8$
4. $4x - 3y = -1$

Answer

1. vertical line
2. slope–intercept
3. horizontal line
4. intercepts

Graph and Interpret Applications of Slope–Intercept

Many real-world applications are modeled by linear equations. We will take a look at a few applications here so you can see how equations written in slope–intercept form relate to real-world situations.

Usually when a linear equation models a real-world situation, different letters are used for the variables, instead of x and y. The variable names remind us of what quantities are being measured.

Example 10.2.28

The equation $F = \frac{9}{5}C + 32$ is used to convert temperatures, C, on the Celsius scale to temperatures, F, on the Fahrenheit scale.

1. Find the Fahrenheit temperature for a Celsius temperature of 0.
2. Find the Fahrenheit temperature for a Celsius temperature of 20.
3. Interpret the slope and F-intercept of the equation.
4. Graph the equation.

Solution

1.

Find the Fahrenheit temperature for a Celsius temperature of 0.	$F = \frac{9}{5}C + 32$
Find F when $C = 0$.	$F = \frac{9}{5}(0) + 32$
Simplify.	$F = 32$

2.

$$\begin{array}{ll} \text{Find the Fahrenheit temperature for a Celsius temperature of } 20. & F = \frac{9}{5}C + 32 \\ \text{Find } F \text{ when } C = 20. & F = \frac{9}{5}(20) + 32 \\ \text{Simplify.} & F = 36 + 32 \\ \text{Simplify.} & F = 68 \end{array} \tag{10.2.3}$$

3. Interpret the slope and F-intercept of the equation.

Even though this equation uses F and C, it is still in slope–intercept form.

$y = mx + b$

$F = mC + b$

$F = \frac{9}{5}C + 32$

The slope, $\frac{9}{5}$, means that the temperature Fahrenheit (F) increases 9 degrees when the temperature Celsius (C) increases 5 degrees.

The F-intercept means that when the temperature is 0° on the Celsius scale, it is 32° on the Fahrenheit scale.

4. Graph the equation.

We'll need to use a larger scale than our usual. Start at the F-intercept $(0, 32)$ then count out the rise of 9 and the run of 5 to get a second point. See Figure $10.2.3$

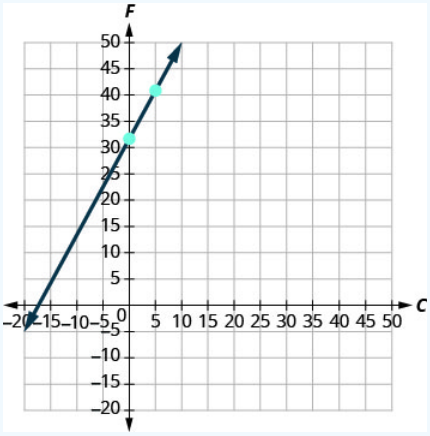


Figure 10.2.3

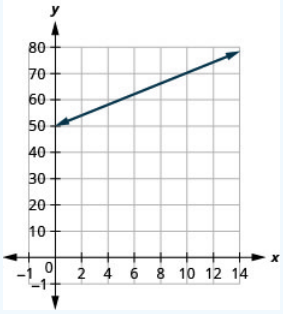
Try It 10.2.29

The equation $h = 2s + 50$ is used to estimate a woman's height in inches, h, based on her shoe size, s.

1. Estimate the height of a child who wears women's shoe size 0.
2. Estimate the height of a woman with shoe size 8.
3. Interpret the slope and h-intercept of the equation.
4. Graph the equation.

Answer

1. 50 inches
2. 66 inches
3. The slope, 2, means that the height, h, increases by 2 inches when the shoe size, s, increases by 1. The h-intercept means that when the shoe size is 0, the height is 50 inches.
4.



Try It 10.2.30

The equation $T = \frac{1}{4}n + 40$ is used to estimate the temperature in degrees Fahrenheit, T, based on the number of cricket chirps, n, in one minute.

1. Estimate the temperature when there are no chirps.
2. Estimate the temperature when the number of chirps in one minute is 100.
3. Interpret the slope and T-intercept of the equation.
4. Graph the equation.

Answer

1. 40 degrees
2. 65 degrees
3. The slope, $\frac{1}{4}$, means that the temperature Fahrenheit (F) increases 1 degree when the number of chirps, n, increases by 4. The T-intercept means that when the number of chirps is 0, the temperature is 40°.
4. 
The cost of running some types business has two components—a *fixed cost* and a *variable cost*. The fixed cost is always the same regardless of how many units are produced. This is the cost of rent, insurance, equipment, advertising, and other items that must be paid regularly. The variable cost depends on the number of units produced. It is for the material and labor needed to produce each item.

Example 10.2.31

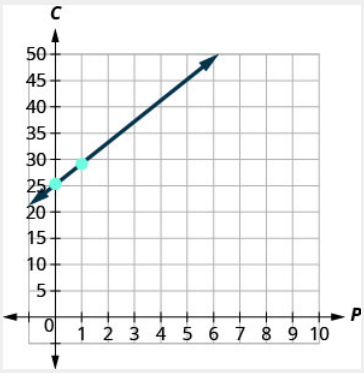
Stella has a home business selling gourmet pizzas. The equation $C = 4p + 25$ models the relation between her weekly cost, C, in dollars and the number of pizzas, p, that she sells.

1. Find Stella's cost for a week when she sells no pizzas.
2. Find the cost for a week when she sells 15 pizzas.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Solution

1. Find Stella's cost for a week when she sells no pizzas.	$C = 4p + 25$
Find C when $p = 0$.	$C = 4(0) + 25$
Simplify.	$C = 25$
	Stella's fixed cost is \$25 when she sells no pizzas.
2. Find the cost for a week when she sells 15 pizzas.	$C = 4p + 25$
Find C when $p = 15$.	$C = 4(15) + 25$
Simplify.	$C = 60 + 25$
	$C = 85$
	Stella's costs are \$85 when she sells 15 pizzas.
3. Interpret the slope and C-intercept of the equation.	$y = mx + b$ $C = 4p + 25$
	The slope, 4, means that the cost increases by \$4 for each pizza Stella sells. The C-intercept means that even when Stella sells no pizzas, her costs for the week are \$25.

4. Graph the equation. We'll need to use a larger scale than our usual. Start at the C-intercept $(0, 25)$ then count out the rise of 4 and the run of 1 to get a second point.



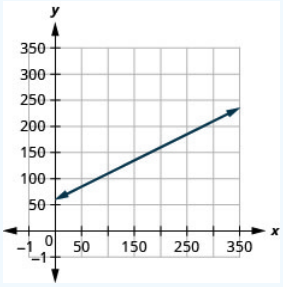
Try It 10.2.32

Sam drives a delivery van. The equation $C = 0.5m + 60$ models the relation between his weekly cost, C, in dollars and the number of miles, m, that he drives.

1. Find Sam's cost for a week when he drives 0 miles.
2. Find the cost for a week when he drives 250 miles.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Answer

1. $\$60$
2. $\$185$
3. The slope, 0.5, means that the weekly cost, C, increases by $\$0.50$ when the number of miles driven, n, increases by 1. The C-intercept means that when the number of miles driven is 0, the weekly cost is $\$60$.
4.



Try It 10.2.33

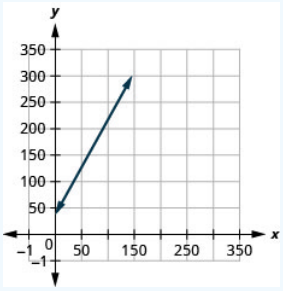
Loreen has a calligraphy business. The equation $C = 1.8n + 35$ models the relation between her weekly cost, C, in dollars and the number of wedding invitations, n, that she writes.

1. Find Loreen's cost for a week when she writes no invitations.
2. Find the cost for a week when she writes 75 invitations.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Answer

1. $\$35$
2. $\$170$
3. The slope, 1.8, means that the weekly cost, C, increases by $\$1.80$ when the number of invitations, n, increases by 1. The C-intercept means that when the number of invitations is 0, the weekly cost is $\$35$.

4.



Use Slopes to Identify Parallel Lines

The slope of a line indicates how steep the line is and whether it rises or falls as we read it from left to right. Two lines that have the same slope are called parallel lines. Parallel lines never intersect.

Figure 10.2.4.

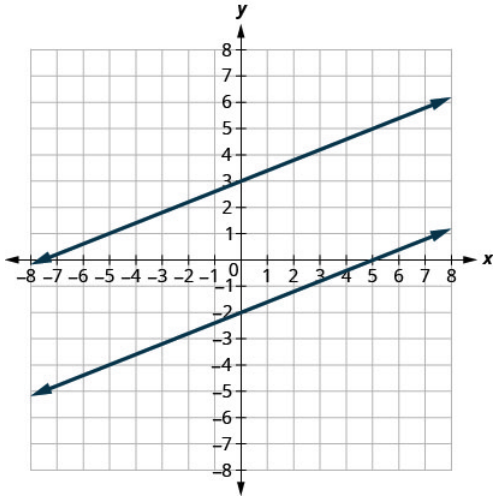


Figure 10.2.4: Verify that both lines have the same slope, $m = \frac{2}{5}$, and different y-intercepts.

What about vertical lines? The slope of a vertical line is undefined, so vertical lines don't fit in the definition above. We say that vertical lines that have different x-intercepts are parallel. See Figure $10.2.5$

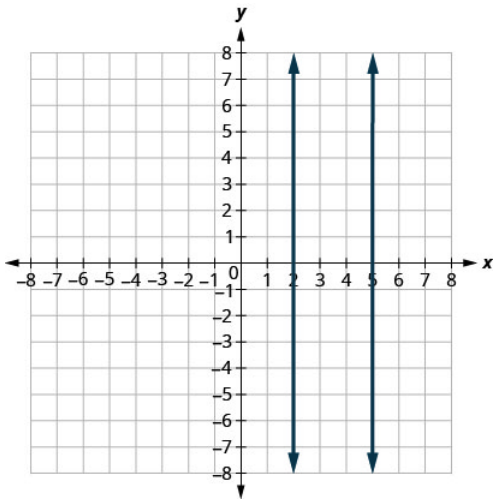

Figure 10.2.5: Vertical lines with different x-intercepts are parallel.

PARALLEL LINES

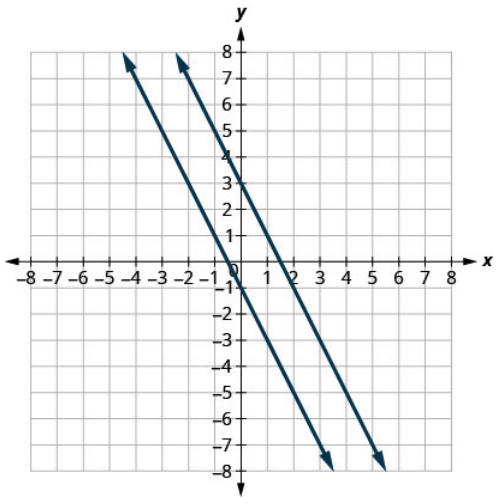
Parallel lines are lines in the same plane that do not intersect.

- Parallel lines have the same slope and different y-intercepts.
- If m_1 and m_2 are the slopes of two parallel lines then $m_1 = m_2$.
- Parallel vertical lines have different x-intercepts.

Let's graph the equations $y = -2x + 3$ and $2x + y = -1$ on the same grid. The first equation is already in slope–intercept form: $y = -2x + 3$. We solve the second equation for y:

$$\begin{aligned} 2x + y &= -1 \\ y &= -2x - 1 \end{aligned}$$

Graph the lines.



Notice the lines look parallel. What is the slope of each line? What is the y-intercept of each line?

$$\begin{array}{llll} y & = mx + b & y = mx + b \\ y & = -2x + 3 & y = -2x - 1 \\ m & = -2 & m = -2 \\ b & = 3, (0, 3) & b = -1, (0, -1) \end{array} \tag{10.2.4}$$

The slopes of the lines are the same and the y-intercept of each line is different. So we know these lines are parallel.

Since parallel lines have the same slope and different y-intercepts, we can now just look at the slope–intercept form of the equations of lines and decide if the lines are parallel.

Example 10.2.34

Use slopes and y-intercepts to determine if the lines $3x-2y=6$ and $y=\frac{3}{2}x+1$ are parallel.

Solution

Solve the first equation for y.

$$\begin{aligned} 3x-2y &= 6 \\ -2y &= -3x+6 \\ \frac{-2y}{-2} &= \frac{-3x+6}{-2} \\ y &= \frac{3}{2}x-3 \end{aligned}$$

The equation is now in slope–intercept form.

The equation of the second line is already in slope–intercept form.

Identify the slope and y-intercept of both lines.

$y=\frac{3}{2}x+1$	$y=\frac{3}{2}x-3$
$y=mx+b$	$y=mx+b$
$m=\frac{3}{2}$	$m=\frac{3}{2}$
y-intercept is $(0,1)$	y-intercept is $(0,-3)$

The lines have the same slope and different y-intercepts and so they are parallel. You may want to graph the lines to confirm whether they are parallel.

Try It 10.2.35

Use slopes and y-intercepts to determine if the lines $2x+5y=5$ and $y=-\frac{2}{5}x-4$ are parallel.

Answer

parallel

Try It 10.2.36

Use slopes and y-intercepts to determine if the lines $4x-3y=6$ and $y=\frac{4}{3}x-1$ are parallel.

Answer

parallel

Example 10.2.37

Use slopes and y-intercepts to determine if the lines $y=-4$ and $y=3$ are parallel.

Solution

Write each equation in slope-intercept form.	$y=-4$	and	$y=3$
Since there is no x term we write $0x$.	$y=0x-4$		$y=0x+3$
Identify the slope and y-intercept of both lines.	$y=mx+b$		$y=mx+b$
	$m=0$		$m=0$
	y-intercept is $(0,4)$		y-intercept is $(0,3)$

The lines have the same slope and different y-intercepts and so they are parallel.

There is another way you can look at this example. If you recognize right away from the equations that these are horizontal lines, you know their slopes are both 0. Since the horizontal lines cross the y-axis at $y=-4$ and at $y=3$, we know the y-intercepts are $(0,-4)$ and $(0,3)$. The lines have the same slope and different y-intercepts and so they are parallel.

Try It 10.2.38

Use slopes and y-intercepts to determine if the lines $y=8$ and $y=-6$ are parallel.

Answer

parallel

Try It 10.2.39

Use slopes and y-intercepts to determine if the lines $y=1$ and $y=-5$ are parallel.

Answer

parallel

Example 10.2.40

Use slopes and y-intercepts to determine if the lines $x=-2$ and $x=-5$ are parallel.

Solution

$$x=-2 \text{ and } x=-5 \tag{10.2.5}$$

Since there is no y, the equations cannot be put in slope–intercept form. But we recognize them as equations of vertical lines. Their x-intercepts are -2 and -5. Since their x-intercepts are different, the vertical lines are parallel.

Try It 10.2.41

Use slopes and y-intercepts to determine if the lines $x=1$ and $x=-5$ are parallel.

Answer

parallel

Try It 10.2.42

Use slopes and y-intercepts to determine if the lines $x=8$ and $x=-6$ are parallel.

Answer

parallel

Example 10.2.43

Use slopes and y-intercepts to determine if the lines $y=2x-3$ and $-6x+3y=-9$ are parallel. You may want to graph these lines, too, to see what they look like.

Solution

The first equation is already in slope-intercept form. $y = 2x - 3$

Solve the second equation for y

$$\begin{aligned} -6x + 3y &= -9 \\ 3y &= 6x - 9 \\ \tfrac{3y}{3} &= \tfrac{6x-9}{3} \\ y &= 2x - 3 \end{aligned}$$

The second equation is now in slope–intercept form as well.

Identify the slope and y-intercept of both lines.

$y = 2x - 3$	$y = 2x - 3$
$y = mx + b$	$y = mx + b$
$m = 2$	$m = 2$
The y-intercept is $(0, -3)$	The y-intercept is $(0, -3)$

The lines have the same slope, but they also have the same y-intercepts. Their equations represent the same line. They are not parallel; they are the same line.

Try It 10.2.44

Use slopes and y-intercepts to determine if the lines $y = -\frac{1}{2}x + 1$ and $x + 2y = 2$ are parallel.

Answer

not parallel; same line

Try It 10.2.45

Use slopes and y-intercepts to determine if the lines $y = \frac{3}{4}x - 3$ and $3x - 4y = 12$ are parallel.

Answer

not parallel; same line

Use Slopes to Identify Perpendicular Lines

Let's look at the lines whose equations are $y = \frac{1}{4}x - 1$ and $y = -4x + 2$, shown in Figure 10.2.5

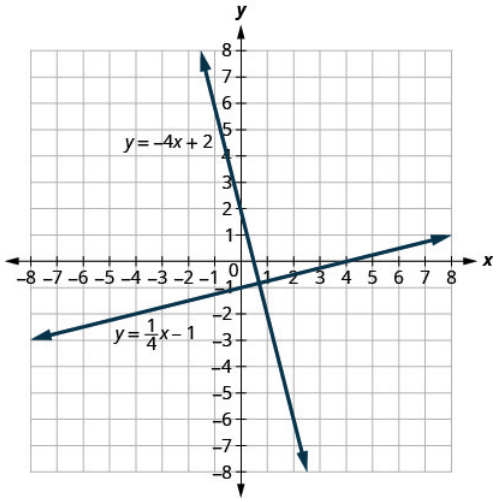


Figure 10.2.5

These lines lie in the same plane and intersect in right angles. We call these lines **perpendicular**.

What do you notice about the slopes of these two lines? As we read from left to right, the line $y = \frac{1}{4}x - 1$ rises, so its slope is positive. The line $y = -4x + 2$ drops from left to right, so it has a negative slope. Does it make sense to you that the slopes of two perpendicular lines will have opposite signs?

If we look at the slope of the first line, $m_1 = \frac{1}{4}$, and the slope of the second line, $m_2 = -4$, we can see that they are *negative reciprocals* of each other. If we multiply them, their product is -1.

$$\begin{array}{c} m_1 \cdot m_2 \\ \frac{1}{4}(-4) \\ -1 \end{array} \tag{10.2.6}$$

This is always true for **perpendicular lines** and leads us to this definition.

PERPENDICULAR LINES

Perpendicular lines are lines in the same plane that form a right angle.

If m_1 and m_2 are the slopes of two perpendicular lines, then:

$$m_1 \cdot m_2 = -1 \text{ and } m_1 = \frac{-1}{m_2} \tag{10.2.7}$$

Vertical lines and horizontal lines are always perpendicular to each other.

We were able to look at the slope–intercept form of linear equations and determine whether or not the lines were parallel. We can do the same thing for perpendicular lines.

We find the slope–intercept form of the equation, and then see if the slopes are negative reciprocals. If the product of the slopes is -1, the lines are perpendicular. Perpendicular lines may have the same y-intercepts.

Example 10.2.46

Use slopes to determine if the lines, $y = -5x - 4$ and $x - 5y = 5$ are perpendicular.

Solution

The first equation is already in slope–intercept form: $y = -5x - 4$

Solve the second equation for y.

$$\begin{array}{rcl} x - 5y & = & 5 \\ -5y & = & -x + 5 \\ \frac{-5y}{-5} & = & \frac{-x+5}{-5} \\ y & = & \frac{1}{5}x - 1 \end{array}$$

The second equation is now in slope-intercept form as well.

Identify the slope of each line.

$$\begin{array}{rclrcl} y & = & -5x - 4 & y & = & \frac{1}{5}x - 1 \\ y & = & mx + b & y & = & mx + b \\ m_1 & = & -5 & m_2 & = & \frac{1}{5} \end{array}$$

The slopes are negative reciprocals of each other, so the lines are perpendicular. We check by multiplying the slopes,

$$\begin{array}{c} m_1 \cdot m_2 \\ -5\left(\frac{1}{5}\right) \\ -1\checkmark \end{array} \tag{10.2.8}$$

Try It 10.2.47

Use slopes to determine if the lines $y = -3x + 2$ and $x - 3y = 4$ are perpendicular.

Answer

perpendicular

Try It 10.2.48

Use slopes to determine if the lines $y = 2x - 5$ and $x + 2y = -6$ are perpendicular.

Answer

perpendicular

Example 10.2.49

Use slopes to determine if the lines, $7x + 2y = 3$ and $2x + 7y = 5$ are perpendicular.

Solution

Solve the equations for y.

$$\begin{aligned} 7x + 2y &= 3 \\ 2y &= -7x + 3 \\ \frac{2y}{2} &= \frac{-7x+3}{2} \\ y &= -\frac{7}{2}x + \frac{3}{2} \end{aligned} \qquad \begin{aligned} 2x + 7y &= 5 \\ 7y &= -2x + 5 \\ \frac{7y}{7} &= \frac{-2x+5}{7} \\ y &= \frac{-2}{7}x + \frac{5}{7} \end{aligned}$$

Identify the slope of each line.

$$\begin{aligned} y &= mx + b \\ m_1 &= -\frac{7}{2} \end{aligned} \qquad \begin{aligned} y &= mx + b \\ m_2 &= -\frac{2}{7} \end{aligned}$$

The slopes are reciprocals of each other, but they have the same sign. Since they are not negative reciprocals, the lines are not perpendicular.

Try It 10.2.50

Use slopes to determine if the lines $5x + 4y = 1$ and $4x + 5y = 3$ are perpendicular.

Answer

not perpendicular

Try It 10.2.51

Use slopes to determine if the lines $2x - 9y = 3$ and $9x - 2y = 1$ are perpendicular.

Answer

not perpendicular

Note

Access this online resource for additional instruction and practice with graphs.

- Explore the Relation Between a Graph and the Slope–Intercept Form of an Equation of a Line

Key Concepts

- The slope–intercept form of an equation of a line with slope mm and y-intercept, $(0, b)$ is, $y = mx + b$.
- **Graph a Line Using its Slope and y-Intercept**
  1. Find the slope-intercept form of the equation of the line.
  2. Identify the slope and y-intercept.
  3. Plot the y-intercept.
  4. Use the slope formula $m = \frac{\text{rise}}{\text{run}}$ to identify the rise and the run.
  5. Starting at the y-intercept, count out the rise and run to mark the second point.
  6. Connect the points with a line.
- **Strategy for Choosing the Most Convenient Method to Graph a Line:** Consider the form of the equation.
  - If it only has one variable, it is a vertical or horizontal line.
    $x = a$ is a vertical line passing through the x-axis at a.
    $y = b$ is a horizontal line passing through the y-axis at b.
  - If y is isolated on one side of the equation, in the form $y = mx + b$, graph by using the slope and y-intercept.
    Identify the slope and y-intercept and then graph.
  - If the equation is of the form $Ax + By = C$, find the intercepts.
    Find the x- and y-intercepts, a third point, and then graph.
- Parallel lines are lines in the same plane that do not intersect.
  - Parallel lines have the same slope and different y-intercepts.
  - If m_1 and m_2 are the slopes of two parallel lines then $m_1 = m_2$.
  - Parallel vertical lines have different x-intercepts.
- Perpendicular lines are lines in the same plane that form a right angle.
  - If m_1 and m_2 are the slopes of two perpendicular lines, then $m_1 \cdot m_2 = -1$ and $m_1 = \frac{-1}{m_2}$.
  - Vertical lines and horizontal lines are always perpendicular to each other.

Glossary

parallel lines

Lines in the same plane that do not intersect.

perpendicular lines

Lines in the same plane that form a right angle.

slope-intercept form of an equation of a line

The slope–intercept form of an equation of a line with slope mm and y-intercept, $(0, b)$ is, $y = mx + b$.

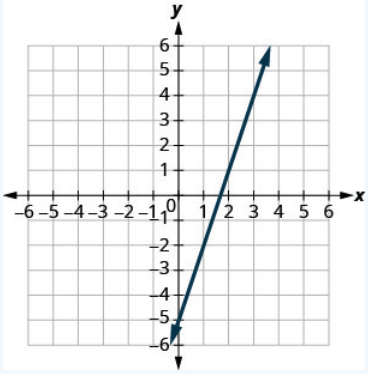
10.2E: Exercises

Practice Makes Perfect

Recognize the Relation Between the Graph and the Slope–Intercept Form of an Equation of a Line

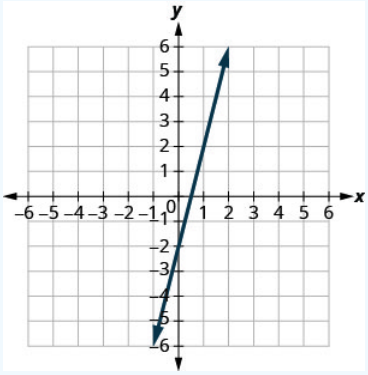
In the following exercises, use the graph to find the slope and y-intercept of each line. Compare the values to the equation $y = mx + b$.

Exercise $10.2E.1$



$y = 3x - 5$

Exercise $10.2E.2$

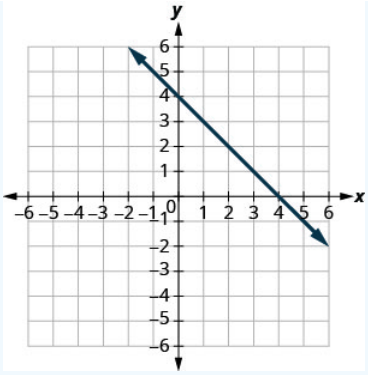


$y = 4x - 2$

Answer

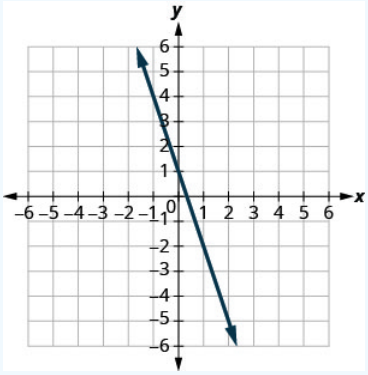
slope $m = 4$ and y-intercept $(0, -2)$

Exercise $10.2E.3$



$y = -x + 4$

Exercise $10.2E.4$

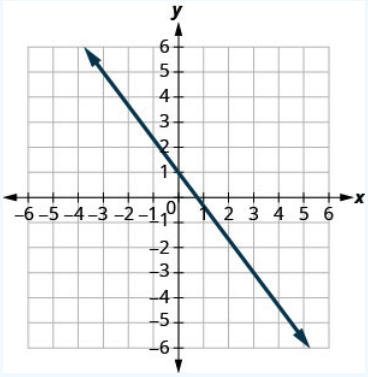


$y = -3x + 1$

Answer

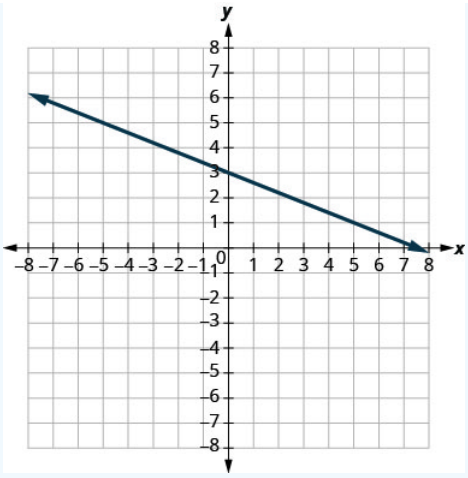
slope $m = -3$ and y-intercept $(0, 1)$

Exercise $10.2E.5$



$y = -\frac{4}{3}x + 1$

Exercise $10.2E.6$



$y = -\frac{2}{5}x + 3$

Answer

slope $m = -\frac{2}{5}$ and y -intercept $(0, 3)$

Identify the Slope and y-Intercept From an Equation of a Line

In the following exercises, identify the slope and y-intercept of each line.

Exercise $10.2E.7$

$y = -7x + 3$

Exercise $10.2E.8$

$y = -9x + 7$

Answer

$m = -9$; y-intercept: $(0, 7)$

Exercise $10.2E.9$

$y = 6x - 8$

Exercise $10.2E.10$

$y = 4x - 10$

Answer

$m = 4$; y-intercept: $(0, -10)$

Exercise $10.2E.11$

$3x + y = 5$

Exercise 10.2E.12

$4x + y = 8$

Answer

$m = -4 \backslash 0$; \(y-intercept: $(0, 8)$

Exercise 10.2E.13

$6x + 4y = 12$

Exercise 10.2E.14

$8x + 3y = 12$

Answer

$m = -\frac{8}{3}$; y-intercept: $(0, 4)$

Exercise 10.2E.15

$5x - 2y = 6$

Exercise 10.2E.16

$7x - 3y = 9$

Answer

$m = \frac{7}{3}$; y-intercept: $(0, -3)$

Graph a Line Using Its Slope and Intercept

In the following exercises, graph the line of each equation using its slope and y-intercept.

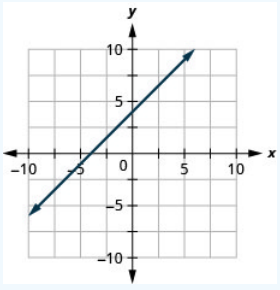
Exercise 10.2E.17

$y = x + 3$

Exercise 10.2E.18

$y = x + 4$

Answer



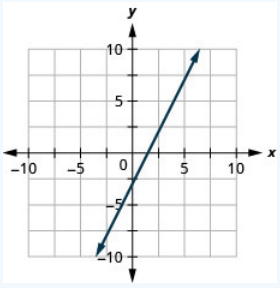
Exercise 10.2E.19

$y = 3x - 1$

Exercise 10.2E.20

$y = 2x - 3$

Answer



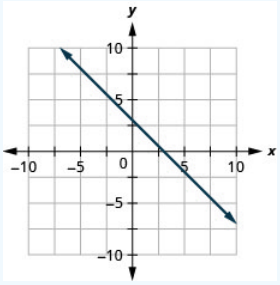
Exercise 10.2E.21

$y = -x + 2$

Exercise 10.2E.22

$y = -x + 3$

Answer



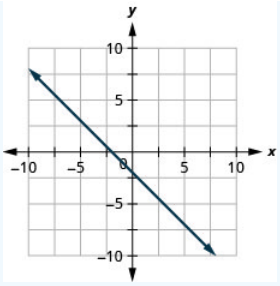
Exercise 10.2E.23

$y = -x - 4$

Exercise 10.2E.24

$y = -x - 2$

Answer



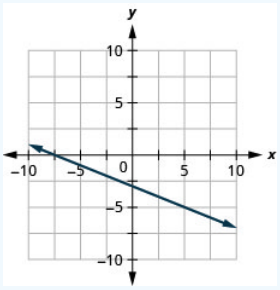
Exercise 10.2E.25

$y = -\frac{3}{4}x - 1$

Exercise 10.2E.26

$y = -\frac{2}{5}x - 3$

Answer



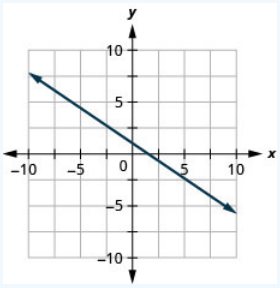
Exercise 10.2E.27

$y = -\frac{3}{5}x + 2$

Exercise 10.2E.28

$y = -\frac{2}{3}x + 1$

Answer



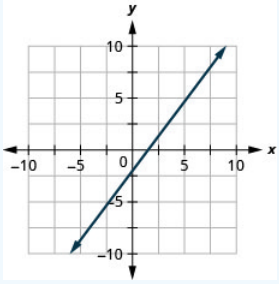
Exercise 10.2E.29

$3x - 4y = 8$

Exercise 10.2E.30

$4x - 3y = 6$

Answer



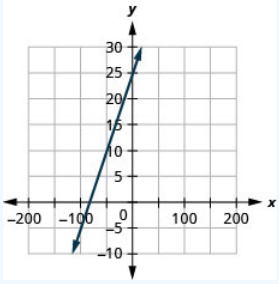
Exercise 10.2E.31

$y = 0.1x + 15$

Exercise 10.2E.32

$y = 0.3x + 25$

Answer



Choose the Most Convenient Method to Graph a Line

In the following exercises, determine the most convenient method to graph each line.

Exercise 10.2E.33

$x = 2$

Exercise 10.2E.34

$y = 4$

Answer

horizontal line

Exercise 10.2E.35

$y = 5$

Exercise 10.2E.36

$x = -3$

Answer

vertical line

Exercise 10.2E.37

$y = -3x + 4$

Exercise 10.2E.38

$y = -5x + 2$

Answer

slope–intercept

Exercise 10.2E.39

$x - y = 5$

Exercise 10.2E.40

$x - y = 1$

Answer

intercepts

Exercise 10.2E.41

$y = \frac{2}{3}x - 1$

Exercise 10.2E.42

$y = \frac{4}{5}x - 3$

Answer

slope–intercept

Exercise 10.2E.43

$y = -3$

Exercise 10.2E.44

$y = -1$

Answer

horizontal line

Exercise 10.2E.45

$3x - 2y = -12$

Exercise 10.2E.46

$2x - 5y = -10$

Answer

intercepts

Exercise 10.2E.47

$y = -\frac{1}{4}x + 3$

Exercise 10.2E.48

$y = -\frac{1}{3}x + 5$

Answer

slope–intercept

Graph and Interpret Applications of Slope–Intercept

Exercise 10.2E.49

The equation $P = 31 + 1.75w$ models the relation between the amount of Tuyet's monthly water bill payment, P, in dollars, and the number of units of water, w, used.

1. Find Tuyet's payment for a month when 0 units of water are used.
2. Find Tuyet's payment for a month when 12 units of water are used.
3. Interpret the slope and P-intercept of the equation.
4. Graph the equation.

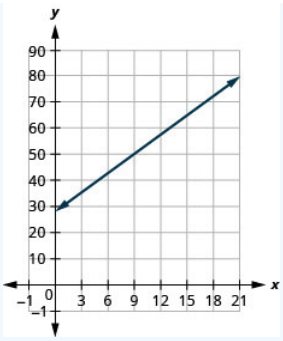
Exercise 10.2E.50

The equation $P = 28 + 2.54w$ models the relation between the amount of Randy's monthly water bill payment, P, in dollars, and the number of units of water, w, used.

1. Find the payment for a month when Randy used 0 units of water.
2. Find the payment for a month when Randy used 15 units of water.
3. Interpret the slope and P-intercept of the equation.
4. Graph the equation.

Answer

1. $28
2. $66.10
3. The slope, 2.54, means that Randy's payment, P, increases by $2.54 when the number of units of water he used, w, ncreases by 1. The P-intercept means that if the number units of water Randy used was 0, the payment would be $28
4.



Exercise $10.2E.51$

Bruce drives his car for his job. The equation $R = 0.575m + 42$ models the relation between the amount in dollars, R, that he is reimbursed and the number of miles, m, he drives in one day.

1. Find the amount Bruce is reimbursed on a day when he drives 0 miles.
2. Find the amount Bruce is reimbursed on a day when he drives 220 miles.
3. Interpret the slope and R-intercept of the equation.
4. Graph the equation.

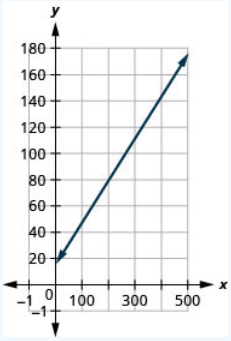
Exercise $10.2E.52$

Janelle is planning to rent a car while on vacation. The equation $C = 0.32m + 15$ models the relation between the cost in dollars, C, per day and the number of miles, m, she drives in one day.

1. Find the cost if Janelle drives the car 0 miles one day.
2. Find the cost on a day when Janelle drives the car 400 miles.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Answer

1. $\$15$
2. $\$143$
3. The slope, 0.32, means that the cost, C, increases by $\$0.32$ when the number of miles driven, m, increases by 1. The C-intercept means that if Janelle drives 0 miles one day, the cost would be $\$15$.
4.



Exercise $10.2E.53$

Cherie works in retail and her weekly salary includes commission for the amount she sells. The equation $S = 400 + 0.15c$ models the relation between her weekly salary, S, in dollars and the amount of her sales, c, in dollars.

1. Find Cherie's salary for a week when her sales were 0.
2. Find Cherie's salary for a week when her sales were 3600.
3. Interpret the slope and S-intercept of the equation.
4. Graph the equation.

Exercise $10.2E.54$

Patel's weekly salary includes a base pay plus commission on his sales. The equation $S = 750 + 0.09c$ models the relation between his weekly salary, S, in dollars and the amount of his sales, c, in dollars.

1. Find Patel's salary for a week when his sales were 0.
2. Find Patel's salary for a week when his sales were $18,540$.
3. Interpret the slope and S-intercept of the equation.
4. Graph the equation.

Answer

1. $\$750$
2. $\$2418.60$
3. The slope, 0.09, means that Patel's salary, S, increases by $\$0.09$ for every $\$1$ increase in his sales. The S-intercept means that when his sales are $\$0$, his salary is $\$750$
4. 
Exercise $10.2E.55$

Costa is planning a lunch banquet. The equation $C = 450 + 28g$ models the relation between the cost in dollars, C, of the banquet and the number of guests, g.

1. Find the cost if the number of guests is 40.
2. Find the cost if the number of guests is 80.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Exercise $10.2E.56$

Margie is planning a dinner banquet. The equation $C = 750 + 42g$ models the relation between the cost in dollars, C, of the banquet and the number of guests, g.

1. Find the cost if the number of guests is 50.
2. Find the cost if the number of guests is 100.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Answer

1. $\$2850$
2. $\$4950$

3. The slope, 42, means that the cost, C, increases by $\$42$ for when the number of guests increases by 1. The C-intercept means that when the number of guests is 0, the cost would be $\$750$
4. 
Use Slopes to Identify Parallel Lines

In the following exercises, use slopes and y-intercepts to determine if the lines are parallel.

Exercise 10.2E.57

$y = \frac{3}{4}x - 3; \quad 3x - 4y = -2$

Exercise 10.2E.58

$y = \frac{2}{3}x - 1; \quad 2x - 3y = -2$

Answer

parallel

Exercise 10.2E.59

$2x - 5y = -3; \quad y = \frac{2}{5}x + 1$

Exercise 10.2E.60

$3x - 4y = -2; \quad y = \frac{3}{4}x - 3$

Answer

parallel

Exercise 10.2E.61

$2x - 4y = 6; \quad x - 2y = 3$

Exercise 10.2E.62

$6x - 3y = 9; \quad 2x - y = 3$

Answer

not parallel

Exercise 10.2E.63

$4x+2y=6; \quad 6x+3y=3$

Exercise 10.2E.64

$8x+6y=6; \quad 12x+9y=12$

Answer

parallel

Exercise 10.2E.65

$x=5; \quad x=-6$

Exercise 10.2E.66

$x=7; \quad x=-8$

Answer

parallel

Exercise 10.2E.67

$x=-4; \quad x=-1$

Exercise 10.2E.68

$x=-3; \quad x=-2$

Answer

parallel

Exercise 10.2E.69

$y=2; \quad y=6$

Exercise 10.2E.70

$y=5; \quad y=1$

Answer

parallel

Exercise 10.2E.71

$y=-4; \quad y=3$

Exercise 10.2E.72

$y = -1; \quad y = 2$

Answer

parallel

Exercise 10.2E.73

$x - y = 2; \quad 2x - 2y = 4$

Exercise 10.2E.74

$4x + 4y = 8; \quad x + y = 2$

Answer

not parallel

Exercise 10.2E.75

$x - 3y = 6; \quad 2x - 6y = 12$

Exercise 10.2E.76

$5x - 2y = 11; \quad 5x - y = 7$

Answer

not parallel

Exercise 10.2E.77

$3x - 6y = 12; \quad 6x - 3y = 3$

Exercise 10.2E.78

$4x - 8y = 16; \quad x - 2y = 4$

Answer

not parallel

Exercise 10.2E.79

$9x - 3y = 6; \quad 3x - y = 2$

Exercise 10.2E.80

$x - 5y = 10; \quad 5x - y = -10$

Answer

not parallel

Exercise 10.2E.81

$7x-4y=8; \quad 4x+7y=14$

Exercise 10.2E.82

$9x-5y=4; \quad 5x+9y=-1$

Answer

not parallel

Use Slopes to Identify Perpendicular Lines

In the following exercises, use slopes and y-intercepts to determine if the lines are perpendicular.

Exercise 10.2E.83

$3x-2y=8; \quad 2x+3y=6$

Exercise 10.2E.84

$x-4y=8; \quad 4x+y=2$

Answer

perpendicular

Exercise 10.2E.85

$2x+5y=3; \quad 5x-2y=6$

Exercise 10.2E.86

$2x+3y=5; \quad 3x-2y=7$

Answer

perpendicular

Exercise 10.2E.87

$3x-2y=1; \quad 2x-3y=2$

Exercise 10.2E.88

$3x-4y=8; \quad 4x-3y=6$

Answer

not perpendicular

Exercise 10.2E.89

$5x+2y=6; \quad 2x+5y=8$

Exercise 10.2E.90

$2x+4y=3; \quad 6x+3y=2$

Answer

not perpendicular

Exercise 10.2E.91

$4x-2y=5; \quad 3x+6y=8$

Exercise 10.2E.92

$2x-6y=4; \quad 12x+4y=9$

Answer

perpendicular

Exercise 10.2E.93

$6x-4y=5; \quad 8x+12y=3$

Exercise 10.2E.94

$8x-2y=7; \quad 3x+12y=9$

Answer

perpendicular

Everyday Math

Exercise 10.2E.95

The equation $C=\frac{5}{9}F-17.8$ can be used to convert temperatures, F, on the Fahrenheit scale to temperatures, C, on the Celsius scale.

1. Explain what the slope of the equation means.
2. Explain what the C-intercept of the equation means.

Exercise 10.2E.96

The equation $n=4T-160$ is used to estimate the number of cricket chirps, n, in one minute based on the temperature in degrees Fahrenheit, T.

1. Explain what the slope of the equation means.
2. Explain what the n-intercept of the equation means. Is this a realistic situation?

Answer

1. For every increase of one degree Fahrenheit, the number of chirps increases by four.
2. There would be -160 chirps when the Fahrenheit temperature is 0°. (Notice that this does not make sense; this model cannot be used for all possible temperatures.)

Writing Exercises

Exercise $10.2E.97$

Explain in your own words how to decide which method to use to graph a line.

Exercise $10.2E.98$

Why are all horizontal lines parallel?

Answer

Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
recognize the relation between the graph and the slope-intercept form of an equation of a line.			
identify the slope and *y*-intercept from an equation of a line.			
graph a line using its slope and intercept.			
choose the most convenient method to graph a line.			
graph and interpret applications of slope-intercept.			
use slopes to identify parallel lines.			

b. After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

10.3: Find the Equation of a Line

Learning Objectives

By the end of this section, you will be able to:

- Find an equation of the line given the slope and y-intercept
- Find an equation of the line given the slope and a point
- Find an equation of the line given two points
- Find an equation of a line parallel to a given line
- Find an equation of a line perpendicular to a given line

Note

Before you get started, take this readiness quiz.

1. Solve: $\frac{2}{3} = \frac{x}{5}$.
   If you missed this problem, review Exercise 2.2.4.
2. Simplify: $-\frac{2}{5}(x - 15)$.
   If you missed this problem, review Exercise 1.10.34.

How do online retailers know that 'you may also like' a particular item based on something you just ordered? How can economists know how a rise in the minimum wage will affect the unemployment rate? How do medical researchers create drugs to target cancer cells? How can traffic engineers predict the effect on your commuting time of an increase or decrease in gas prices? It's all mathematics.

You are at an exciting point in your mathematical journey as the mathematics you are studying has interesting applications in the real world.

The physical sciences, social sciences, and the business world are full of situations that can be modeled with linear equations relating two variables. Data is collected and graphed. If the data points appear to form a straight line, an equation of that line can be used to predict the value of one variable based on the value of the other variable.

To create a mathematical model of a linear relation between two variables, we must be able to find the equation of the line. In this section we will look at several ways to write the equation of a line. The specific method we use will be determined by what information we are given.

Find an Equation of the Line Given the Slope and *y*-Intercept

We can easily determine the slope and intercept of a line if the equation was written in slope–intercept form, y=mx+b. Now, we will do the reverse—we will start with the slope and *y*-intercept and use them to find the equation of the line.

Example 10.3.1

Find an equation of a line with slope −7 and *y*-intercept (0,−1).

Solution

Since we are given the slope and *y*-intercept of the line, we can substitute the needed values into the slope–intercept form, y=mx+b.

Name the slope.	$m = -7$
Name the *y*-intercept.	*y*-intercept (0, −1)
Substitute the values into y=mx+b.	$y = mx + b$
	$y = -7x + (-1)$
	$y = -7x + -1$

Try It 10.3.2

Find an equation of a line with slope $\frac{2}{5}$ and y-intercept (0,4).

Answer

$y = \frac{2}{5}x + 4$

Try It 10.3.3

Find an equation of a line with slope −1 and y-intercept (0,−3).

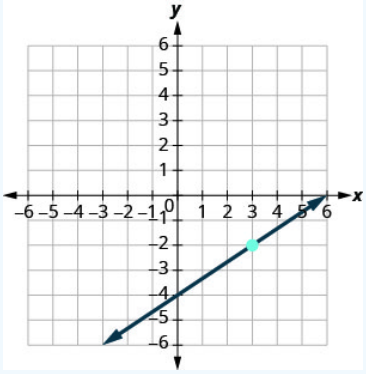
Answer

$y = -x - 3$

Sometimes, the slope and intercept need to be determined from the graph.

Example 10.3.4

Find the equation of the line shown.



Solution

We need to find the slope and y-intercept of the line from the graph so we can substitute the needed values into the slope–intercept form, $y = mx + b$.

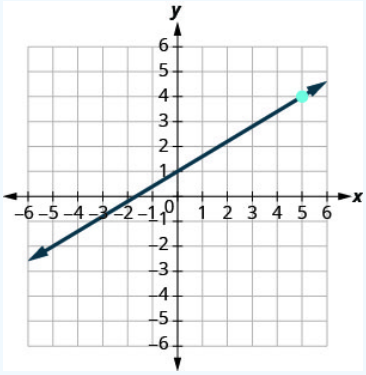
To find the slope, we choose two points on the graph.

The y-intercept is (0,−4) and the graph passes through (3,−2).

Find the slope by counting the rise and run.	$m = \frac{\text{rise}}{\text{run}}$
	$m = \frac{2}{3}$
Find the y-intercept.	y-intercept (0, −4)
Substitute the values into y=mx+b.	$y = mx + b$
	$y = \frac{2}{3}x - 4$

Try It 10.3.5

Find the equation of the line shown in the graph.

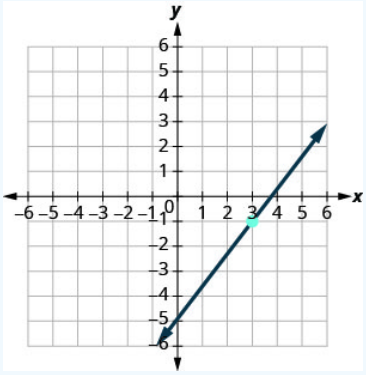


Answer

$y = \frac{3}{5}x + 1$

Try It 10.3.6

Find the equation of the line shown in the graph.



Answer

$y = \frac{4}{3}x - 5$

Find an Equation of the Line Given the Slope and a Point

Finding an equation of a line using the slope–intercept form of the equation works well when you are given the slope and *y*-intercept or when you read them off a graph. But what happens when you have another point instead of the *y*-intercept?

We are going to use the slope formula to derive another form of an equation of the line. Suppose we have a line that has slope mm and that contains some specific point (x_1, y_1) and some other point, which we will just call (x,y). We can write the slope of this line and then change it to a different form.

	m	$= \frac{y-y_1}{x-x_1}$
Multiply both sides of the equation by $x - x_1$.	$m(x-x_1)$	$= \left(\frac{y-y_1}{x-x_1}\right)(x-x_1)$
Simplify.	$m(x-x_1)$	$= y - y_1$
Rewrite the equation with the y terms on the left.	$y - y_1$	$= m(x-x_1)$

This format is called the point–slope form of an equation of a line.

POINT–SLOPE FORM OF AN EQUATION OF A LINE

The **point–slope form** of an equation of a line with slope m and containing the point (x_1, y_1) is

$$y - y_1 = m(x - x_1)$$

We can use the point–slope form of an equation to find an equation of a line when we are given the slope and one point. Then we will rewrite the equation in slope–intercept form. Most applications of linear equations use the the slope–intercept form.

Example 10.3.7: Find an Equation of a Line Given the Slope and a Point

Find an equation of a line with slope $m = \frac{2}{5}$ that contains the point (10,3). Write the equation in slope–intercept form.

Solution

Step 1. Identify the slope.	The slope is given.	$m = \frac{2}{5}$
Step 2. Identify the point.	The point is given.	(x_1, y_1) $(10, 3)$
Step 3. Substitute the values into the point–slope form, $y - y_1 = m(x - x_1)$.		$y - y_1 = m(x - x_1)$
		$y - 3 = \frac{2}{5}(x - 10)$
	Simplify.	$y - 3 = \frac{2}{5}x - 4$
Step 4. Write the equation in slope–intercept form.		$y = \frac{2}{5}x - 1$

Try It 10.3.8

Find an equation of a line with slope $m = \frac{5}{6}$ and containing the point (6,3).

Answer

$y = \frac{5}{6}x - 2$

Try It 10.3.9

Find an equation of a line with slope $m = \frac{2}{3}$ and containing the point (9,2).

Answer

$y = \frac{2}{3}x - 4$

FIND AN EQUATION OF A LINE GIVEN THE SLOPE AND A POINT.

1. Identify the slope.
2. Identify the point.
3. Substitute the values into the point-slope form, $y - y_1 = m(x - x_1)$.
4. Write the equation in slope–intercept form.

Example 10.3.10

Find an equation of a line with slope $m = -\frac{1}{3}$ that contains the point (6,−4). Write the equation in slope–intercept form.

Solution

Since we are given a point and the slope of the line, we can substitute the needed values into the point–slope form, $y - y_1 = m(x - x_1)$.

Identify the slope.	$m = -\frac{1}{3}$
Identify the point.	$\begin{matrix} x_1, & y_1 \\ 6, & -4 \end{matrix}$
Substitute the values into $y - y_1 = m(x - x_1)$.	$y - y_1 = m(x - x_1)$
	$y - (-4) = -\frac{1}{3}(x - 6)$
Simplify.	$y + 4 = -\frac{1}{3}x + 2$
Write in slope–intercept form.	$y = -\frac{1}{3}x - 2$

Try It 10.3.11

Find an equation of a line with slope $m = -\frac{2}{5}$ and containing the point (10,−5).

Answer

$y = -\frac{2}{5}x - 1$

Try It 10.3.12

Find an equation of a line with slope $m = -\frac{3}{4}$, and containing the point (4,−7).

Answer

$y = -\frac{3}{4}x - 4$

Example 10.3.13

Find an equation of a horizontal line that contains the point (−1,2). Write the equation in slope–intercept form.

Solution

Every horizontal line has slope 0. We can substitute the slope and points into the point–slope form, $y - y_1 = m(x - x_1)$.

Identify the slope.	$m = 0$
Identify the point.	$\begin{matrix} x_1, & y_1 \\ -1, & 2 \end{matrix}$
Substitute the values into $y - y_1 = m(x - x_1)$.	$y - y_1 = m(x - x_1)$
	$y - 2 = 0(x - (-1))$
Simplify.	$y - 2 = 0(x + 1)$
	$y - 2 = 0$
	$y = 2$

Write in slope–intercept form.	It is in *y*-form, but could be written y=0x+2.

Did we end up with the form of a horizontal line, y=a?

? Try It 10.3.14

Find an equation of a horizontal line containing the point (−3,8).

Answer

y = 8

? Try It 10.3.15

Find an equation of a horizontal line containing the point (−1,4).

Answer

y = 4

Find an Equation of the Line Given Two Points

When real-world data is collected, a linear model can be created from two data points. In the next example we'll see how to find an equation of a line when just two points are given.

We have two options so far for finding an equation of a line: slope–intercept or point–slope. Since we will know two points, it will make more sense to use the point–slope form.

But then we need the slope. Can we find the slope with just two points? Yes. Then, once we have the slope, we can use it and one of the given points to find the equation.

✓ Example 10.3.16: Find an Equation of a Line Given Two Points

Find an equation of a line that contains the points (5,4) and (3,6). Write the equation in slope–intercept form.

Solution

Step 1. Find the slope using the given points.	To use the point-slope form, we first find the slope.	$m=\frac{y_2-y_1}{x_2-x_1}$ $m=\frac{6-4}{3-5}$ $m=\frac{2}{-2}$ $m=-1$
Step 2. Choose one point.	Choose either point.	$(\overset{x_1}{5},\ \overset{y_1}{4})$
Step 3. Substitute the values into the point-slope form, $y-y_1=m(x-x_1)$.	Simplify.	$y-y_1=m(x-x_1)$ $y-4=-1(x-5)$ $y-4=-1x+5$
Step 4. Write the equation in slope–intercept form.		$y=-1x+9$

Use the point (3,6) and see that you get the same equation.

Try It 10.3.17

Find an equation of a line containing the points (3,1) and (5,6).

Answer

$y = \frac{5}{2}x - \frac{13}{2}$

Try It 10.3.18

Find an equation of a line containing the points (1,4) and (6,2).

Answer

$y = -\frac{2}{5}x + \frac{22}{5}$

FIND AN EQUATION OF A LINE GIVEN TWO POINTS.

1. Find the slope using the given points.
2. Choose one point.
3. Substitute the values into the point-slope form, $y - y_1 = m(x - x_1)$.
4. Write the equation in slope–intercept form.

Example 10.3.19

Find an equation of a line that contains the points (−3,−1) and (2,−2). Write the equation in slope–intercept form.

Solution

Since we have two points, we will find an equation of the line using the point–slope form. The first step will be to find the slope.

Find the slope of the line through (−3, −1) and (2, −2).	$m = \frac{y_2 - y_1}{x_2 - x_1}$
	$m = \frac{-2-(-1)}{2-(-3)}$
	$m = \frac{-1}{5}$
	$m = -\frac{1}{5}$
Choose either point.	$(2, -2)$
Substitute the values into $y - y_1 = m(x - x_1)$.	$y - y_1 = m(x - x_1)$
	$y-(-2) = -\frac{1}{5}(x-2)$
	$y + 2 = -\frac{1}{5}x + \frac{2}{5}$
Write in slope–intercept form.	$y = -\frac{1}{5}x - \frac{8}{5}$

Try It 10.3.20

Find an equation of a line containing the points (−2,−4) and (1,−3).

Answer

$y = \frac{1}{3}x - \frac{10}{3}$

Try It 10.3.21

Find an equation of a line containing the points (−4,−3) and (1,−5).

Answer

$y = -\frac{2}{5}x - \frac{23}{5}$

Example 10.3.22

Find an equation of a line that contains the points (−2,4) and (−2,−3). Write the equation in slope–intercept form.

Solution

Again, the first step will be to find the slope.

Find the slope of the line through $(-2, 4)$ and $(-2, -3)$

$$\begin{aligned} m &= \frac{y_2 - x_1}{x_2 - x_1} \\ m &= \frac{-3-4}{-2-(-2)} \\ m &= \frac{-7}{0} \end{aligned}$$

The slope is undefined.

This tells us it is a vertical line. Both of our points have an *x*-coordinate of −2. So our equation of the line is x=−2. Since there is no yy, we cannot write it in slope–intercept form.

You may want to sketch a graph using the two given points. Does the graph agree with our conclusion that this is a vertical line?

Try It 10.3.23

Find an equation of a line containing the points (5,1) and (5,−4).

Answer

x = 5

Try It 10.3.24

Find an equation of a line containing the points (−4,4) and (−4,3).

Answer

x=−4

We have seen that we can use either the slope–intercept form or the point–slope form to find an equation of a line. Which form we use will depend on the information we are given. This is summarized in Table 10.3.1.

Table 10.3.1

To Write an Equation of a Line		
If given:	Use:	Form:
Slope and *y*-intercept	slope–intercept	y=mx+b

Slope and a point	point–slope	$y - y_1 = m(x - x_1)$
Two points	point–slope	$y - y_1 = m(x - x_1)$

Find an Equation of a Line Parallel to a Given Line

Suppose we need to find an equation of a line that passes through a specific point and is parallel to a given line. We can use the fact that parallel lines have the same slope. So we will have a point and the slope—just what we need to use the point–slope equation.

First let's look at this graphically.

The graph shows the graph of y=2x−3. We want to graph a line parallel to this line and passing through the point (−2,1).

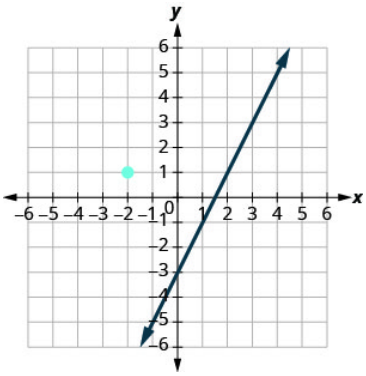


Figure 10.3.1

We know that parallel lines have the same slope. So the second line will have the same slope as y=2x−3. That slope is $m_{\parallel} = 2$. We'll use the notation $m_{\parallel}$ to represent the slope of a line parallel to a line with slope m. (Notice that the subscript ∥ looks like two parallel lines.)

The second line will pass through (−2,1) and have m=2. To graph the line, we start at (−2,1) and count out the rise and run. With m=2 (or $m = \frac{2}{1}$), we count out the rise 2 and the run 1. We draw the line.

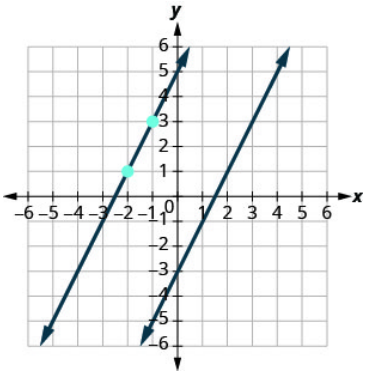

Figure 10.3.2

Do the lines appear parallel? Does the second line pass through (−2,1)?

Now, let's see how to do this algebraically.

We can use either the slope–intercept form or the point–slope form to find an equation of a line. Here we know one point and can find the slope. So we will use the point–slope form.

Example 10.3.25: How to Find an Equation of a Line Parallel to a Given Line

Find an equation of a line parallel to y=2x−3 that contains the point (−2,1). Write the equation in slope–intercept form.

Solution

Step 1. Find the slope of the given line.	The line is in slope–intercept form, $y = 2x - 3$.	$m = 2$
Step 2. Find the slope of the parallel line.	Parallel lines have the same slope.	$m_{\parallel} = 2$
Step 3. Identify the point.	The given point is, (–2, 1).	$\begin{pmatrix} x_1 & y_1 \\ -2, & 1 \end{pmatrix}$
Step 4. Substitute the values into the point–slope form, $y - y_1 = m(x - x_1)$.	Simplify.	$y - y_1 = m(x - x_1)$ $y - 1 = 2(x - (-2))$ $y - 1 = 2(x + 2)$ $y - 1 = 2x + 4$
Step 5. Write the equation in slope–intercept form.		$y = 2x + 5$

Does this equation make sense? What is the *y*-intercept of the line? What is the slope?

? Try It 10.3.26

Find an equation of a line parallel to the line y=3x+1 that contains the point (4,2). Write the equation in slope–intercept form.

Answer

y=3x−10

? Try It 10.3.27

Find an equation of a line parallel to the line $y = \frac{1}{2}x - 3$ that contains the point (6,4).

Answer

$y = \frac{1}{2}x + 1$

FIND AN EQUATION OF A LINE PARALLEL TO A GIVEN LINE.

1. Find the slope of the given line.
2. Find the slope of the parallel line.
3. Identify the point.
4. Substitute the values into the point–slope form, $y - y_1 = m(x - x_1)$.
5. Write the equation in slope–intercept form.

Find an Equation of a Line Perpendicular to a Given Line

Now, let's consider perpendicular lines. Suppose we need to find a line passing through a specific point and which is perpendicular to a given line. We can use the fact that perpendicular lines have slopes that are negative reciprocals. We will again use the point–slope equation, like we did with parallel lines.

The graph shows the graph of y=2x−3. Now, we want to graph a line perpendicular to this line and passing through (−2,1).

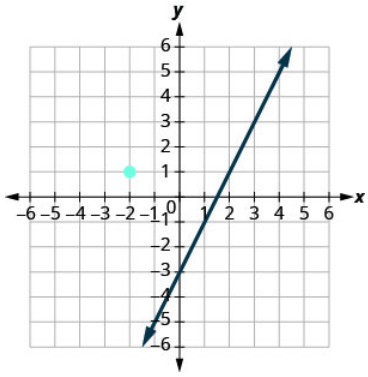

Figure 10.3.3

We know that perpendicular lines have slopes that are negative reciprocals. We'll use the notation $m_{\perp}$ to represent the slope of a line perpendicular to a line with slope m. (Notice that the subscript $_{\perp}$ looks like the right angles made by two perpendicular lines.)

$$\begin{aligned} y &= 2x - 3 \quad \text{perpendicular line} \\ m &= 2 \qquad m_{\perp} = -\tfrac{1}{2} \end{aligned} \tag{10.3.1}$$

We now know the perpendicular line will pass through (−2,1) with $m_{\perp} = -\frac{1}{2}$.

To graph the line, we will start at (−2,1) and count out the rise −1 and the run 2. Then we draw the line.

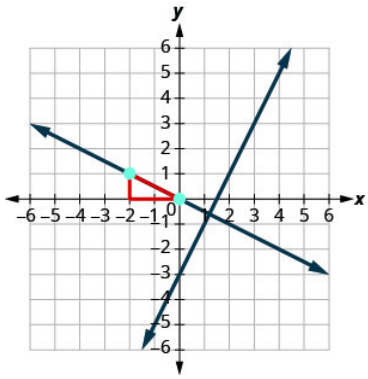

Figure 10.3.4

Do the lines appear perpendicular? Does the second line pass through (−2,1)?

Now, let's see how to do this algebraically. We can use either the slope–intercept form or the point–slope form to find an equation of a line. In this example we know one point, and can find the slope, so we will use the point–slope form.

Example 10.3.28

Find an equation of a line perpendicular to y=2x−3 that contains the point (−2,1). Write the equation in slope–intercept form.

Solution

Step 1. Find the slope of the given line.	The line is in slope–intercept form, $y = 2x - 3$.	$m = 2$
Step 2. Find the slope of the perpendicular line.	The slopes of perpendicular lines are negative reciprocals.	$m_{\perp} = -\frac{1}{2}$
Step 3. Identify the point.	The given point is, (–2, 1)	$\begin{pmatrix} x_1 & y_1 \\ -2, & 1 \end{pmatrix}$

Step 4. Substitute the values into the point–slope form, $y-y_1=m(x-x_1)$.	Simplify.	$y-y_1=m(x-x_1)$ $y-1=-\frac{1}{2}(x-(-2))$ $y-1=-\frac{1}{2}(x+2)$ $y-1=-\frac{1}{2}x-1$
Step 5. Write the equation in slope–intercept form.		$y=-\frac{1}{2}x$

Try It 10.3.29

Find an equation of a line perpendicular to the line y=3x+1 that contains the point (4,2). Write the equation in slope–intercept form.

Answer

$y=-\frac{1}{3}x+\frac{10}{3}$

Try It 10.3.30

Find an equation of a line perpendicular to the line $y=\frac{1}{2}x-3$ that contains the point (6,4).

Answer

y=−2x+16

FIND AN EQUATION OF A LINE PERPENDICULAR TO A GIVEN LINE.

1. Find the slope of the given line.
2. Find the slope of the perpendicular line.
3. Identify the point.
4. Substitute the values into the point–slope form, $y-y_1=m(x-x_1)$.
5. Write the equation in slope–intercept form.

Example 10.3.31

Find an equation of a line perpendicular to x=5 that contains the point (3,−2). Write the equation in slope–intercept form.

Solution

Again, since we know one point, the point–slope option seems more promising than the slope–intercept option. We need the slope to use this form, and we know the new line will be perpendicular to x=5. This line is vertical, so its perpendicular will be horizontal. This tells us the $m_\perp=0$.

Identify the point.	$(3$	,	$-2)$
Identify the slope of the perpendicular line.	$m_\perp$	$=$	0
Substitute the values into $y-y_1=m\,(x-x_1)$.	$y-y_1$	$=$	$m\,(x-x_1)$
	$y-(-2)$	$=$	$0(x-3)$
Simplify.	$y+2$	$=$	0
	y	$=$	-2

Sketch the graph of both lines. Do they appear to be perpendicular?

Try It 10.3.32

Find an equation of a line that is perpendicular to the line $x=4$ that contains the point $(4,-5)$. Write the equation in slope–intercept form.

Answer

$y=-5$

Try It 10.3.33

Find an equation of a line that is perpendicular to the line $x=2$ that contains the point $(2,-1)$. Write the equation in slope–intercept form.

Answer

$y=-1$

In Example 10.3.31, we used the point–slope form to find the equation. We could have looked at this in a different way.

We want to find a line that is perpendicular to $x=5$ that contains the point $(3,-2)$. The graph shows us the line $x=5$ and the point $(3,-2)$.

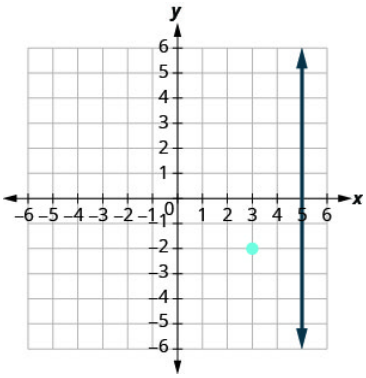

Figure 10.3.5

We know every line perpendicular to a vertical line is horizontal, so we will sketch the horizontal line through $(3,-2)$.

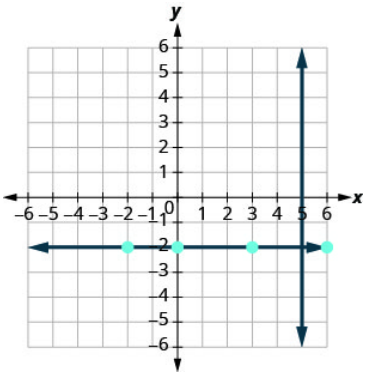

Figure 10.3.6

Do the lines appear perpendicular?

If we look at a few points on this horizontal line, we notice they all have *y*-coordinates of -2. So, the equation of the line perpendicular to the vertical line $x=5$ is $y=-2$.

Example 10.3.34

Find an equation of a line that is perpendicular to y=−4 that contains the point (−4,2). Write the equation in slope–intercept form.

Solution

The line y=−4 is a horizontal line. Any line perpendicular to it must be vertical, in the form x=a. Since the perpendicular line is vertical and passes through (−4,2), every point on it has an *x*-coordinate of −4. The equation of the perpendicular line is x=−4. You may want to sketch the lines. Do they appear perpendicular?

Try It 10.3.35

Find an equation of a line that is perpendicular to the line y=1 that contains the point (−5,1). Write the equation in slope–intercept form.

Answer

x=−5

Try It 10.3.36

Find an equation of a line that is perpendicular to the line y=−5 that contains the point (−4,−5).

Answer

x=−4

Note

Access this online resource for additional instruction and practice with finding the equation of a line.

- Use the Point-Slope Form of an Equation of a Line

Key Concepts

- **To Find an Equation of a Line Given the Slope and a Point**
  1. Identify the slope.
  2. Identify the point.
  3. Substitute the values into the point-slope form, $y-y_1=m(x-x_1)$.
  4. Write the equation in slope-intercept form.
- **To Find an Equation of a Line Given Two Points**
  1. Find the slope using the given points.
  2. Choose one point.
  3. Substitute the values into the point-slope form, $y-y_1=m(x-x_1)$.
  4. Write the equation in slope-intercept form.
- **To Write an Equation of a Line**
  - If given slope and y-intercept, use slope–intercept form $y=mx+b$.
  - If given slope and a point, use point–slope form $y-y_1=m(x-x_1)$.
  - If given two points, use point–slope form $y-y_1=m(x-x_1)$.
- **To Find an Equation of a Line Parallel to a Given Line**
  1. Find the slope of the given line.
  2. Find the slope of the parallel line.
  3. Identify the point.
  4. Substitute the values into the point-slope form, $y-y_1=m(x-x_1)$.

5. Write the equation in slope-intercept form.

- **To Find an Equation of a Line Perpendicular to a Given Line**
  1. Find the slope of the given line.
  2. Find the slope of the perpendicular line.
  3. Identify the point.
  4. Substitute the values into the point-slope form, $y - y_1 = m(x - x_1)$.
  5. Write the equation in slope-intercept form.

Glossary

point–slope form

The point–slope form of an equation of a line with slope mm and containing the point (x_1, y_1) is $y - y_1 = m\,(x - x_1)$.

10.3E: Exercises

Practice Makes Perfect

Find an Equation of the Line Given the Slope and y-Intercept

In the following exercises, find the equation of a line with given slope and y-intercept. Write the equation in slope–intercept form.

Exercise 10.3E.1

slope 3 and y-intercept $(0, 5)$

Exercise 10.3E.2

slope 4 and y-intercept $(0, 1)$

Answer

$y = 4x + 1$

Exercise 10.3E.3

slope 6 and y-intercept $(0, -4)$

Exercise 10.3E.4

slope 8 and y-intercept $(0, -6)$

Answer

$y = 8x - 6$

Exercise 10.3E.5

slope -1 and y-intercept $(0, 3)$

Exercise 10.3E.6

slope -1 and y-intercept $(0, 7)$

Answer

$y = -x + 7$

Exercise 10.3E.7

slope -2 and y-intercept $(0, -3)$

Exercise 10.3E.8

slope -3 and y-intercept $(0, -1)$

Answer

$y = -3x - 1$

Exercise 10.3E.9

slope $\frac{3}{5}$ and y-intercept $(0, -1)$

Exercise 10.3E.10

slope $\frac{1}{5}$ and y-intercept $(0, -5)$

Answer

$y = \frac{1}{5}x - 5$

Exercise 10.3E.11

slope $-\frac{3}{4}$ and y-intercept $(0, -2)$

Exercise 10.3E.12

slope $-\frac{2}{3}$ and y-intercept $(0, -3)$

Answer

$y = -\frac{2}{3}x - 3$

Exercise 10.3E.13

slope 0 and y-intercept $(0, -1)$

Exercise 10.3E.14

slope 0 and y-intercept $(0, 2)$

Answer

$y = 2$

Exercise 10.3E.15

slope -3 and y-intercept $(0, 0)$

Exercise 10.3E.16

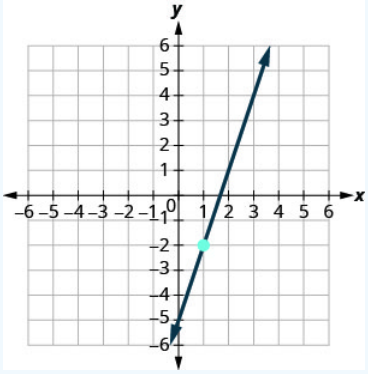
slope -4 and y-intercept $(0, 0)$

Answer

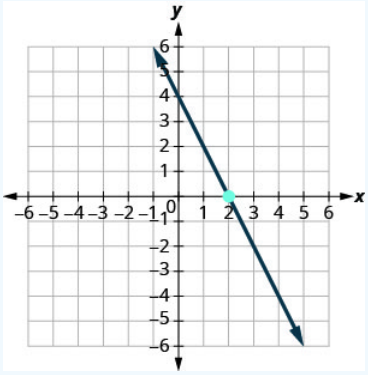
$y = -4x$

In the following exercises, find the equation of the line shown in each graph. Write the equation in slope–intercept form.

Exercise 10.3E.17



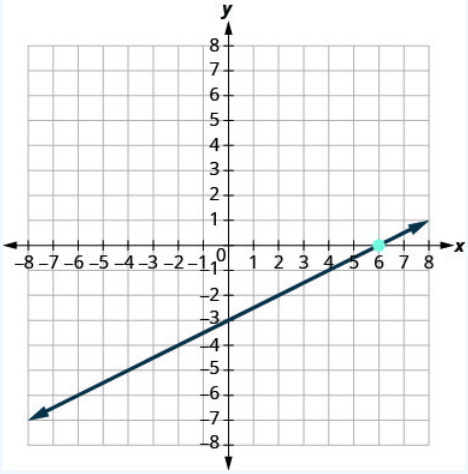
Exercise $10.3E.18$



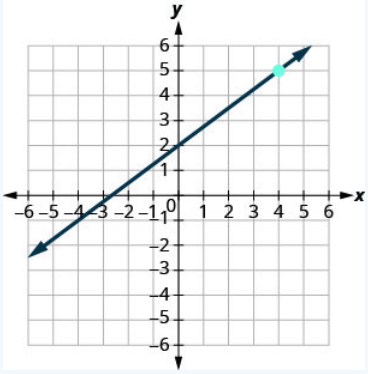
Answer

$y = -2x + 4$

Exercise $10.3E.19$



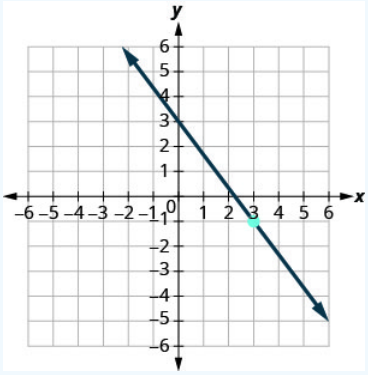
Exercise $10.3E.20$



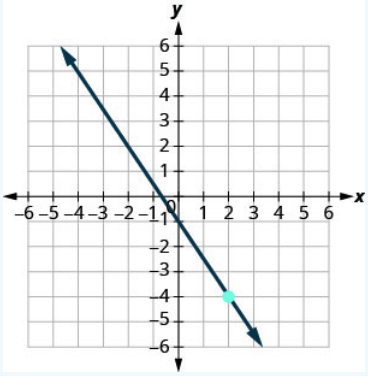
Answer

$y = \frac{3}{4}x + 2$

Exercise $10.3E.21$



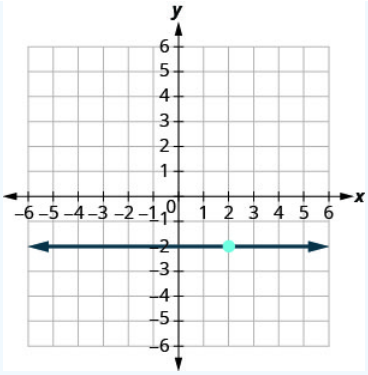
Exercise $10.3E.22$



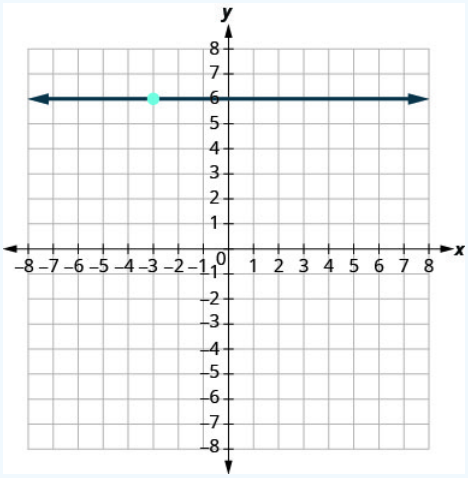
Answer

$y = -\frac{3}{2}x - 1$

Exercise $10.3E.23$



Exercise 10.3E.24



Answer

$y = 6$

Find an Equation of the Line Given the Slope and a Point

In the following exercises, find the equation of a line with given slope and containing the given point. Write the equation in slope–intercept form.

Exercise 10.3E.25

$m = \frac{5}{8}$, point $(8, 3)$

Exercise 10.3E.26

$m = \frac{3}{8}$, point $(8, 2)$

Answer

$y = \frac{3}{8}x - 1$

Exercise 10.3E.27

$m = \frac{1}{6}$, point $(6, 1)$

Exercise 10.3E.28

$m = \frac{5}{6}$, point $(6, 7)$

Answer

$y = \frac{5}{6}x + 2$

Exercise 10.3E.29

$m = -\frac{3}{4}$, point $(8, -5)$

Exercise 10.3E.30

$m = -\frac{3}{5}$, point $(10, -5)$

Answer

$y = -\frac{3}{5}x + 1$

Exercise 10.3E.31

$m = -\frac{1}{4}$, point $(-12, -6)$

Exercise 10.3E.32

$m = -\frac{1}{3}$, point $(-9, -8)$

Answer

$y = -\frac{1}{3}x - 11$

Exercise 10.3E.33

Horizontal line containing $(-2, 5)$

Exercise 10.3E.34

Horizontal line containing $(-1, 4)$

Answer

$y = 4$

Exercise 10.3E.35

Horizontal line containing $(-2, -3)$

Exercise 10.3E.36

Horizontal line containing $(-1, -7)$

Answer

$y = -7$

Exercise 10.3E.37

$m = -\frac{3}{2}$, point $(-4, -3)$

Exercise 10.3E.38

$m = -\frac{5}{2}$, point $(-8, -2)$

Answer

$y = -\frac{5}{2}x - 22$

Exercise 10.3E.39

$m = -7$, point $(-1, -3)$

Exercise 10.3E.40

$m = -4$, point $(-2, -3)$

Answer

$y = -4x - 11$

Exercise 10.3E.41

Horizontal line containing $(2, -3)$

Exercise 10.3E.42

Horizontal line containing $(4, -8)$

Answer

$y = -8$

Find an Equation of the Line Given Two Points

In the following exercises, find the equation of a line containing the given points. Write the equation in slope–intercept form.

Exercise 10.3E.43

$(2, 6)$ and $(5, 3)$

Exercise 10.3E.44

$(3, 1)$ and $(2, 5)$

Answer

$y = -4x + 13$

Exercise 10.3E.45

$(4, 3)$ and $(8, 1)$

Exercise 10.3E.46

$(2, 7)$ and $(3, 8)$

Answer

$y = x + 5$

Exercise 10.3E.47

$(-3, -4)$ and $(5, -2)$

Exercise 10.3E.48

$(-5, -3)$ and $(4, -6)$

Answer

$y = -\frac{1}{3}x - \frac{14}{3}$

Exercise 10.3E.49

$(-1, 3)$ and $(-6, -7)$

Exercise 10.3E.50

$(-2, 8)$ and $(-4, -6)$

Answer

$y = 7x + 22$

Exercise 10.3E.51

$(6, -4)$ and $(-2, 5)$

Exercise 10.3E.52

$(3, -2)$ and $(-4, 4)$

Answer

$y = -\frac{6}{7}x + \frac{4}{7}$

Exercise 10.3E.53

$(0, 4)$ and $(2, -3)$

Exercise 10.3E.54

$(0, -2)$ and $(-5, -3)$

Answer

$y = \frac{1}{5}x - 2$

Exercise 10.3E.55

$(7, 2)$ and $(7, -2)$

Exercise 10.3E.56

$(4, 2)$ and $(4, -3)$

Answer

$x = 4$

Exercise 10.3E.57

$(-7, -1)$ and $(-7, -4)$

Exercise 10.3E.58

$(-2, 1)$ and $(-2, -4)$

Answer

$x = -2$

Exercise 10.3E.59

$(6, 1)$ and $(0, 1)$

Exercise 10.3E.60

$(6, 2)$ and $(-3, 2)$

Answer

$y = 2$

Exercise 10.3E.61

$(3, -4)$ and $(5, -4)$

Exercise 10.3E.62

$(-6, -3)$ and $(-1, -3)$

Answer

$y = -3$

Exercise 10.3E.63

$(4, 3)$ and $(8, 0)$

Exercise 10.3E.64

$(0, 0)$ and $(1, 4)$

Answer

$y = 4x$

Exercise 10.3E.65

$(-2, -3)$ and $(-5, -6)$

Exercise 10.3E.66

$(-3, 0)$ and $(-7, -2)$

Answer

$y = \frac{1}{2}x + \frac{3}{2}$

Exercise 10.3E.67

$(8, -1)$ and $(8, -5)$

Exercise 10.3E.68

$(3, 5)$ and $(-7, 5)$

Answer

$y = 5$

Find an Equation of a Line Parallel to a Given Line

In the following exercises, find an equation of a line parallel to the given line and contains the given point. Write the equation in slope–intercept form.

Exercise 10.3E.69

line $y = 4x + 2$, point $(1, 2)$

Exercise 10.3E.70

line $y = 3x + 4$, point $(2, 5)$

Answer

$y = 3x - 1$

Exercise 10.3E.71

line $y = -2x - 3$, point $(-1, 3)$

Exercise 10.3E.72

line $y = -3x - 1$, point $(2, -3)$

Answer

$y = -3x + 3$

Exercise 10.3E.73

line $3x - y = 4$, point $(3, 1)$

Exercise 10.3E.74

line $2x - y = 6$, point $(3, 0)$

Answer

$y = 2x - 6$

Exercise 10.3E.75

line $4x + 3y = 6$, point $(0, -3)$

Exercise 10.3E.76

line $2x + 3y = 6$, point $(0, 5)$

Answer

$y = -\frac{2}{3}x + 5$

Exercise 10.3E.77

line $x = -3$, point $(-2, -1)$

Exercise 10.3E.78

line $x = -4$, point $(-3, -5)$

Answer

$x = -3$

Exercise 10.3E.79

line $x - 2 = 0$, point $(1, -2)$

Exercise 10.3E.80

line $x-6=0$, point $(4,-3)$

Answer

$x=4$

Exercise 10.3E.81

line $y=5$, point $(2,-2)$

Exercise 10.3E.82

line $y=1$, point $(3,-4)$

Answer

$y=-4$

Exercise 10.3E.83

line $y+2=0$, point $(3,-3)$

Exercise 10.3E.84

line $y+7=0$, point $(1,-1)$

Answer

$y=-1$

Find an Equation of a Line Perpendicular to a Given Line

In the following exercises, find an equation of a line perpendicular to the given line and contains the given point. Write the equation in slope–intercept form.

Exercise 10.3E.85

line $y=-2x+3$, point $(2,2)$

Exercise 10.3E.86

line $y=-x+5$, point $(3,3)$

Answer

$y=x$

Exercise 10.3E.87

line $y=\frac{3}{4}x-2$, point $(-3,4)$

Exercise 10.3E.88

line $y = \frac{2}{3}x - 4$, point $(2, -4)$

Answer

$y = -\frac{3}{2}x - 1$

Exercise 10.3E.89

line $2x - 3y = 8$, point $(4, -1)$

Exercise 10.3E.90

line $4x - 3y = 5$, point $(-3, 2)$

Answer

$y = -\frac{3}{4}x - \frac{1}{4}$

Exercise 10.3E.91

line $2x + 5y = 6$, point $(0, 0)$

Exercise 10.3E.92

line $4x + 5y = -3$, point $(0, 0)$

Answer

$y = \frac{5}{4}x$

Exercise 10.3E.93

line $y - 3 = 0$, point $(-2, -4)$

Exercise 10.3E.94

line $y - 6 = 0$, point $(-5, -3)$

Answer

$x = -5$

Exercise 10.3E.95

line y-axis, point $(3, 4)$

Exercise 10.3E.96

line y-axis, point $(2, 1)$

Answer

$y = 1$

Mixed Practice

In the following exercises, find the equation of each line. Write the equation in slope–intercept form.

Exercise 10.3E.97

Containing the points $(4, 3)$ and $(8, 1)$

Exercise 10.3E.98

Containing the points $(2, 7)$ and $(3, 8)$

Answer

$y = x + 5$

Exercise 10.3E.99

$m = \frac{1}{6}$, containing point $(6, 1)$

Exercise 10.3E.100

$m = \frac{5}{6}$, containing point $(6, 7)$

Answer

$y = \frac{5}{6}x + 2$

Exercise 10.3E.101

Parallel to the line $4x + 3y = 6$, containing point $(0, -3)$

Exercise 10.3E.102

Parallel to the line $2x + 3y = 6$, containing point $(0, 5)$

Answer

$y = -\frac{2}{3}x + 5$

Exercise 10.3E.103

$m = -\frac{3}{4}$, containing point $(8, -5)$

Exercise 10.3E.104

$m = -\frac{3}{5}$, containing point $(10, -5)$

Answer

$y = -\frac{3}{5}x + 1$

Exercise 10.3E.105

Perpendicular to the line $y-1=0,$ point $(-2,6)$

Exercise 10.3E.106

Perpendicular to the line y-axis, point $(-6,2)$

Answer

$y=2$

Exercise 10.3E.107

Containing the points $(4,3)$ and $(8,1)$

Exercise 10.3E.108

Containing the points $(-2,0)$ and $(-3,-2)$

Answer

$y=x+2$

Exercise 10.3E.109

Parallel to the line $x=-3,$ containing point $(-2,-1)$

Exercise 10.3E.110

Parallel to the line $x=-4,$ containing point $(-3,-5)$

Answer

$x=-3$

Exercise 10.3E.111

Containing the points $(-3,-4)$ and $(2,-5)$

Exercise 10.3E.112

Containing the points $(-5,-3)$ and $(4,-6)$

Answer

$y=-\frac{1}{3}x-\frac{14}{3}$

Exercise 10.3E.113

Perpendicular to the line $x-2y=5,$ containing point $(-2,2)$

Exercise 10.3E.114

Perpendicular to the line $4x+3y=1$, containing point $(0,0)$

Answer

$y=\frac{3}{4}x$

Everyday Math

Exercise 10.3E.115

Cholesterol. The age, x, and LDL cholesterol evel, y, of two men are given by the points $(18,68)$ and $(27,122)$. Find a linear equation that models the relationship between age and LDL cholesterol level.

Exercise 10.3E.116

Fuel consumption. The city mpg, x, and highway mpg, y, of two cars are given by the points $(29,40)$ and $(19,28)$. Find a linear equation that models the relationship between city mpg and highway mpg.

Answer

$y=1.2x+5.2$

Writing Exercises

Exercise 10.3E.117

Why are all horizontal lines parallel?

Exercise 10.3E.118

Explain in your own words why the slopes of two perpendicular lines must have opposite signs.

Answer

Answers will vary.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find the equation of the line given the slope and *y*-intercept.			
find an equation of the line given the slope and a point.			
find an equation of the line given two points.			
find an equation of a line parallel to a given line.			
find an equation of a line perpendicular to a given line.			

b. On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

11.1: Solve Systems of Linear Equations with Two Variables

Learning Objectives

By the end of this section, you will be able to:

- Determine whether an ordered pair is a solution of a system of equations
- Solve a system of linear equations by graphing
- Solve a system of equations by substitution
- Solve a system of equations by elimination
- Choose the most convenient method to solve a system of linear equations

Before you get started, take this readiness quiz.

1. For the equation $y = \frac{2}{3}x - 4$,
   ⓐ Is $(6, 0)$ a solution? ⓑ Is $(-3, -2)$ a solution?
   If you missed this problem, review [link].
2. Find the slope and y-intercept of the line $3x - y = 12$.
   If you missed this problem, review [link].
3. Find the x- and y-intercepts of the line $2x - 3y = 12$.
   If you missed this problem, review [link].

Determine Whether an Ordered Pair is a Solution of a System of Equations

In Solving Linear Equations, we learned how to solve linear equations with one variable. Now we will work with two or more linear equations grouped together, which is known as a **system of linear equations**.

SYSTEM OF LINEAR EQUATIONS

When two or more linear equations are grouped together, they form a **system of linear equations**.

In this section, we will focus our work on systems of two linear equations in two unknowns. We will solve larger systems of equations later in this chapter.

An example of a system of two linear equations is shown below. We use a brace to show the two equations are grouped together to form a system of equations.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

A linear equation in two variables, such as $2x + y = 7$, has an infinite number of solutions. Its graph is a line. Remember, every point on the line is a solution to the equation and every solution to the equation is a point on the line.

To solve a system of two linear equations, we want to find the values of the variables that are solutions to *both* equations. In other words, we are looking for the ordered pairs (x, y) that make both equations true. These are called the **solutions of a system of equations**.

SolutionS OF A SYSTEM OF EQUATIONS

The **solutions of a system of equations** are the values of the variables that make *all* the equations true. A solution of a system of two linear equations is represented by an ordered pair (x, y).

To determine if an ordered pair is a solution to a system of two equations, we substitute the values of the variables into each equation. If the ordered pair makes both equations true, it is a solution to the system.

Example 11.1.1

Determine whether the ordered pair is a solution to the system $\begin{cases} x - y = -1 \\ 2x - y = -5 \end{cases}$.

ⓐ $(-2, -1)$ ⓑ $(-4, -3)$

Answer

ⓐ

$$\begin{cases} x-y=-1 \\ 2x-y=-5 \end{cases}$$

We substitute $x=-2$ and $y=-1$ into both equations.

$x-y=-1$	$2x-y=-5$
$-2-(-1)\stackrel{?}{=}-1$	$2\cdot -2-(-1)\stackrel{?}{=}-5$
$-1=-1$ ✓	$5\neq -5$
$(-2,-1)$ does not make both equations true.	$(-2,-1)$ is not a solution.

ⓑ

We substitute $x=-4$ and $y=-3$ into both equations.

$x-y=-1$	$2x-y=-5$
$-4-(-3)\stackrel{?}{=}-1$	$2\cdot(-4)-(-3)\stackrel{?}{=}-5$
$-1=-1$ ✓	$-5=-5$ ✓
$(-4,-3)$ does make both equations true.	$(-4,-3)$ is a solution.

? Example 11.1.2

Determine whether the ordered pair is a solution to the system $\begin{cases} x+y=0 \\ x+2y=-5 \end{cases}$.

ⓐ $(1,-3)$ ⓑ $(0,0)$

Answer

ⓐ yes ⓑ no

? Example 11.1.3

Determine whether the ordered pair is a solution to the system $\begin{cases} -3y=-8 \\ -3x-y=4 \end{cases}$.

ⓐ $(2,-2)$ ⓑ $(-2,2)$

Answer

ⓐ no ⓑ yes

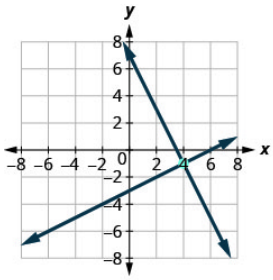
Solve a System of Linear Equations by Graphing

In this section, we will use three methods to solve a system of linear equations. The first method we'll use is graphing.

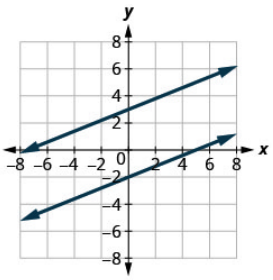
The graph of a linear equation is a line. Each point on the line is a solution to the equation. For a system of two equations, we will graph two lines. Then we can see all the points that are solutions to each equation. And, by finding what the lines have in common, we'll find the solution to the system.

Most linear equations in one variable have one solution, but we saw that some equations, called contradictions, have no solutions and for other equations, called identities, all numbers are solutions.

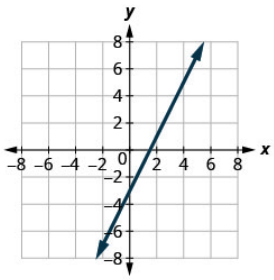
Similarly, when we solve a system of two linear equations represented by a graph of two lines in the same plane, there are three possible cases, as shown.



The lines intersect.
Intersecting lines have one point in common.
There is one solution to this system.



The lines are parallel.
Parallel lines have no points in common.
There is no solution to this system.



Both equations give the same line.
Because we have just one line, there are infinitely many solutions.

Figure 11.1.1

Each time we demonstrate a new method, we will use it on the same system of linear equations. At the end of the section you'll decide which method was the most convenient way to solve this system.

Example 11.1.4: How to Solve a System of Equations by Graphing

Solve the system by graphing $\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$.

Answer

Step 1. Graph the first equation.	To graph the first line, write the equation in slope–intercept form. $2x+y=7$ $y=-2x+7$ $m=-2 \quad b=7$	$\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$ Step 2. Graph the second equation on the same rectangular coordinate system.	To graph the second line, use intercepts. $x-2y=6$ $(0,-3) \quad (6,0)$	
Step 3. Determine whether the lines intersect, are parallel, or are the same line.	Look at the graph of the lines.	The lines intersect.
Step 4. Identify the solution to the system. • If the lines intersect, identify the point of intersection. Check to make sure it is a solution to both equations. This is the solution to the system. • If the lines are parallel, the system has no solution. • If the lines are the same, the system has an infinite number of solutions.	Since the lines intersect, find the point of intersection. Check the point in both equations.	The lines intersect at (4, –1). $2x + y = 7$ $2(4) + (-1) \stackrel{?}{=} 7$ $8 - 1 \stackrel{?}{=} 7$ $7 = 7$ ✓ $x - 2y = 6$ $4 - 2(-1) \stackrel{?}{=} 6$ $6 = 6$ ✓ The solution is (4, –1).

Example 11.1.5

Solve the system by graphing: $\begin{cases} x - 3y = -3 \\ x + y = 5 \end{cases}$.

Answer

$(3, 2)$

Example 11.1.6

Solve the system by graphing: $\begin{cases} -x + y = 1 \\ 3x + 2y = 12 \end{cases}$

Answer

$(2, 3)$

The steps to use to solve a system of linear equations by graphing are shown here.

SOLVE A SYSTEM OF LINEAR EQUATIONS BY GRAPHING.

1. Graph the first equation.
2. Graph the second equation on the same rectangular coordinate system.
3. Determine whether the lines intersect, are parallel, or are the same line.
4. Identify the solution to the system.
   - If the lines intersect, identify the point of intersection. This is the solution to the system.
   - If the lines are parallel, the system has no solution.
   - If the lines are the same, the system has an infinite number of solutions.
5. Check the solution in both equations.

In the next example, we'll first re-write the equations into slope–intercept form as this will make it easy for us to quickly graph the lines.

Example 11.1.7

Solve the system by graphing: $\begin{cases} 3x + y = -1 \\ 2x + y = 0 \end{cases}$

Answer

We'll solve both of these equations for y so that we can easily graph them using their slopes and y-intercepts.

	$\begin{cases} 3x+y=-1 \\ 2x+y=0 \end{cases}$
Solve the first equation for y.	$\begin{aligned} 3x+y&=-1 \\ y&=-3x-1 \end{aligned}$
Find the slope and y-intercept.	$\begin{aligned} m&=-3 \\ b&=-1 \end{aligned}$
Solve the second equation for y.	$\begin{aligned} 2x+y&=0 \\ y&=-2x \end{aligned}$
Find the slope and y-intercept.	$\begin{aligned} m&=-2 \\ b&=0 \end{aligned}$
Graph the lines.	Determine the point of intersection.	The lines intersect at $(-1, 2)$.
Check the solution in both equations. $\begin{aligned} 3x+y&=-1 \\ 3(-1)+2&\stackrel{?}{=}-1 \\ -1&=-1\ \checkmark \end{aligned}$ $\begin{aligned} 2x+y&=0 \\ 2(-1)+2&\stackrel{?}{=}0 \\ 0&=0\ \checkmark \end{aligned}$	
	The solution is $(-1, 2)$.

? Example 11.1.8

Solve the system by graphing: $\begin{cases} -x+y=1 \\ 2x+y=10 \end{cases}$.

Answer

$(3, 4)$

? Example 11.1.9

Solve the system by graphing: $\begin{cases} 2x+y=6 \\ x+y=1 \end{cases}$.

Answer

$(5, -4)$

In all the systems of linear equations so far, the lines intersected and the solution was one point. In the next two examples, we'll look at a system of equations that has no solution and at a system of equations that has an infinite number of solutions.

? Example 11.1.10

Solve the system by graphing: $\begin{cases} y=\frac{1}{2}x-3 \\ x-2y=4 \end{cases}$.

Answer

	$\begin{cases} y = \frac{1}{2}x - 3 \\ x - 2y = 4 \end{cases}$
To graph the first equation, we will use its slope and y-intercept.	$y = \frac{1}{2}x - 3$ $m = \frac{1}{2}$ $b = -3$
To graph the second equation, we will use the intercepts.	$x - 2y = 4$
	x | y 0 | −2 4 | 0
Graph the lines.	Determine the points of intersection.	The lines are parallel. Since no point is on both lines, there is no ordered pair that makes both equations true. There is no solution to this system.

? Example 11.1.11

Solve the system by graphing: $\begin{cases} y = -\frac{1}{4}x + 2 \\ x + 4y = 4 \end{cases}$.

Answer

no solution

? Example 11.1.12

Solve the system by graphing: $\begin{cases} y = 3x - 1 \\ 6x - 2y = 6 \end{cases}$.

Answer

no solution

Sometimes the equations in a system represent the same line. Since every point on the line makes both equations true, there are infinitely many ordered pairs that make both equations true. There are infinitely many solutions to the system.

Example 11.1.13

Solve the system by graphing: $\begin{cases} y = 2x - 3 \\ -6x + 3y = 9 \end{cases}$.

Answer

	$\begin{cases} y = 2x - 3 \\ -6x + 3y = -9 \end{cases}$
Find the slope and y-intercept of the first equation.	$y = 2x - 3$ $m = 2$ $b = -3$
Find the intercepts of the second equation.	$-6x + 3y = -9$
	x | y 0 | -3 $\frac{3}{2}$ | 0
Graph the lines.		The lines are the same! Since every point on the line makes both equations true, there are infinitely many ordered pairs that make both equations true. There are infinitely many solutions to this system.

If you write the second equation in slope-intercept form, you may recognize that the equations have the same slope and same y-intercept.

Example 11.1.14

Solve the system by graphing: $\begin{cases} y = -3x - 6 \\ 6x + 2y = -12 \end{cases}$.

Answer

infinitely many solutions

Example 11.1.15

Solve the system by graphing: $\begin{cases} y = \frac{1}{2}x - 4 \\ 2x - 4y = 16 \end{cases}$.

Answer

infinitely many solutions

When we graphed the second line in the last example, we drew it right over the first line. We say the two lines are **coincident**. Coincident lines have the same slope and same *y*-intercept.

COINCIDENT LINES

Coincident lines have the same slope and same *y*-intercept.

The systems of equations in Example and Example each had two intersecting lines. Each system had one solution.

In Example, the equations gave coincident lines, and so the system had infinitely many solutions.

The systems in those three examples had at least one solution. A system of equations that has at least one solution is called a *consistent* system.

A system with parallel lines, like Example, has no solution. We call a system of equations like this *inconsistent*. It has no solution.

CONSISTENT AND INCONSISTENT SYSTEMS

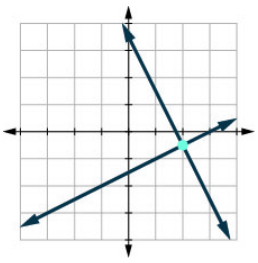
A **consistent system of equations** is a system of equations with at least one solution.

An **inconsistent system of equations** is a system of equations with no solution.

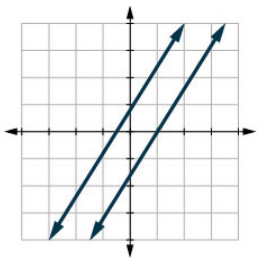
We also categorize the equations in a system of equations by calling the equations *independent* or *dependent*. If two equations are independent, they each have their own set of solutions. Intersecting lines and parallel lines are independent.

If two equations are dependent, all the solutions of one equation are also solutions of the other equation. When we graph two dependent equations, we get coincident lines.

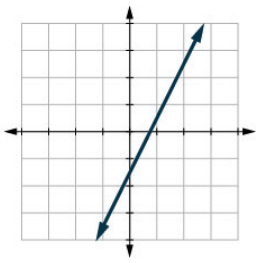
Let's sum this up by looking at the graphs of the three types of systems. See below and Table.



Intersecting



Parallel



Coincident

Lines	Intersecting	Parallel	Coincident
Number of solutions	1 point	No solution	Infinitely many
Consistent/inconsistent	Consistent	Inconsistent	Consistent
Dependent/ independent	Independent	Independent	Dependent

? Example 11.1.16

Without graphing, determine the number of solutions and then classify the system of equations.

ⓐ $\begin{cases} y = 3x - 1 \\ 6x - 2y = 12 \end{cases}$ ⓑ $\begin{cases} 2x + y = -3 \\ x - 5y = 5 \end{cases}$

Answer

ⓐ We will compare the slopes and intercepts of the two lines.

$$\begin{cases} y = 3x - 1 \\ 6x - 2y = 12 \end{cases}$$

$y = 3x - 1$

The first equation is already in slope-intercept form.
Write the second equation in slope-intercept form.

$$\begin{aligned} 6x - 2y &= 12 \\ -2y &= -6x + 12 \\ \tfrac{-2y}{-2} &= \tfrac{-6x+12}{-2} \\ y &= 3x - 6 \end{aligned}$$

$$\begin{aligned} y &= 3x - 1 \\ m &= 3 \\ b &= -1 \end{aligned} \qquad \begin{aligned} y &= 3x - 6 \\ m &= 3 \\ b &= -6 \end{aligned}$$

Find the slope and intercept of each line.

Since the slopes are the same andy-intercepts are different, the lines are parallel.

ⓑ We will compare the slope and intercepts of the two lines.

$$\begin{cases} 2x + y = -3 \\ x - 5y = 5 \end{cases}$$

Write both equations in slope–intercept form.

$$\begin{aligned} 2x + y &= -3 \\ y &= -2x - 3 \end{aligned} \qquad \begin{aligned} x - 5y &= 5 \\ -5y &= -x + 5 \\ \tfrac{-5y}{-5} &= \tfrac{-x+5}{-5} \\ y &= \tfrac{1}{5} - 1 \end{aligned}$$

Find the slope and intercept of each line.

$$\begin{aligned} y &= -2x - 3 \\ m &= -2 \\ b &= -3 \end{aligned} \qquad \begin{aligned} y &= \tfrac{1}{5} - 1 \\ m &= \tfrac{1}{5} \\ b &= -1 \end{aligned}$$

Since the slopes are different, the lines intersect.

A system of equations whose graphs are intersect has 1 solution and is consistent and independent.

? Example 11.1.17

Without graphing, determine the number of solutions and then classify the system of equations.

ⓐ $\begin{cases} y = -2x - 4 \\ 4x + 2y = 9 \end{cases}$ ⓑ $\begin{cases} 3x + 2y = 2 \\ 2x + y = 1 \end{cases}$

Answer

ⓐ no solution, inconsistent, independent ⓑ one solution, consistent, independent

? Example 11.1.18

Without graphing, determine the number of solutions and then classify the system of equations.

ⓐ $\begin{cases} y = \frac{1}{3}x - 5 \\ x - 3y = 6 \end{cases}$ ⓑ $\begin{cases} x + 4y = 12 \\ -x + y = 3 \end{cases}$

Answer

ⓐ no solution, inconsistent, independent ⓑ one solution, consistent, independent

Solving systems of linear equations by graphing is a good way to visualize the types of solutions that may result. However, there are many cases where solving a system by graphing is inconvenient or imprecise. If the graphs extend beyond the small grid with x and y both between -10 and 10, graphing the lines may be cumbersome. And if the solutions to the system are not integers, it can be hard to read their values precisely from a graph.

Solve a System of Equations by Substitution

We will now solve systems of linear equations by the substitution method.

We will use the same system we used first for graphing.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

We will first solve one of the equations for either x or y. We can choose either equation and solve for either variable—but we'll try to make a choice that will keep the work easy.

Then we substitute that expression into the other equation. The result is an equation with just one variable—and we know how to solve those!

After we find the value of one variable, we will substitute that value into one of the original equations and solve for the other variable. Finally, we check our solution and make sure it makes both equations true.

? Example 11.1.19: How to Solve a System of Equations by Substitution

Solve the system by substitution: $\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$

Answer

Step 1. Solve one of the equations for either variable.	We'll solve the first equation for y.	$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$ $2x + y = 7$ $y = 7 - 2x$
Step 2. Substitute the expression from Step 1 into the other equation.	We replace y in the second equation with the expression $7 - 2x$.	$x - 2y = 6$ $x - 2(7 - 2x) = 6$

Step 3. Solve the resulting equation.	Now we have an equation with just 1 variable. We know how to solve this!	$x-2(7-2x)=6$ $x-14+4x=6$ $5x=20$ $x=4$
Step 4. Substitute the solution from Step 3 into one of the original equations to find the other variable.	We'll use the first equation and replace x with 4.	$2x+y=7$ $2(4)+y=7$ $8+y=7$ $y=-1$
Step 5. Write the solution as an ordered pair.	The ordered pair is (x, y).	$(4, -1)$
Step 6. Check that the ordered pair is a solution to **both** original equations.	Substitute $x=4$, $y=-1$ into both equations and make sure they are both true.	$2x+y=7$ $\quad$ $x-2y=6$ $2(4)+(-1)\stackrel{?}{=}7$ $\quad$ $4-2(-1)\stackrel{?}{=}6$ $7=7$ ✓ $\quad$ $6=6$ ✓ Both equations are true. $(4, -1)$ is the solution to the system.

Example 11.1.20

Solve the system by substitution: $\begin{cases} -2x+y=-11 \\ x+3y=9 \end{cases}$

Answer

$(6, 1)$

Example 11.1.21

Solve the system by substitution: $\begin{cases} 2x+y=-1 \\ 4x+3y=3 \end{cases}$

Answer

$(-3, 5)$

SOLVE A SYSTEM OF EQUATIONS BY SUBSTITUTION.

1. Solve one of the equations for either variable.
2. Substitute the expression from Step 1 into the other equation.
3. Solve the resulting equation.
4. Substitute the solution in Step 3 into either of the original equations to find the other variable.
5. Write the solution as an ordered pair.
6. Check that the ordered pair is a solution to **both** original equations.

Be very careful with the signs in the next example.

Example 11.1.22

Solve the system by substitution: $\begin{cases} 4x+2y=4 \\ 6x-y=8 \end{cases}$

Answer

We need to solve one equation for one variable. We will solve the first equation for y.

	$\begin{cases} 4x+2y=4 \\ 6x-y=8 \end{cases}$
Solve the first equation for y. Substitute $-2x+2$ for y in the second equation.	$4x+2y=4$ $2y=-4x+4$ $y=-2x+2$ $6x-y=8$
Replace the y with $-2x+2$.	$6x-(-2x+2)=8$
Solve the equation for x.	$6x+2x-2=8$ $8x-2=8$ $8x=10$ $x=\frac{5}{4}$
Substitute $x=54$ into $4x+2y=4$ to find y.	$4x+2y=4$ $4\left(\frac{5}{4}\right)+2y=4$ $5+2y=4$ $2y=-1$ $y=-\frac{1}{2}$
	The ordered pair is $(54,-12)$.
Check the ordered pair in both equations. $4x+2y=4$ $4\left(\frac{5}{4}\right)+2\left(-\frac{1}{2}\right)\stackrel{?}{=}4$ $5-1\stackrel{?}{=}4$ $4=4$ ✓ $6x-y=8$ $6\left(\frac{5}{4}\right)-\left(-\frac{1}{2}\right)\stackrel{?}{=}8$ $\frac{15}{4}-\left(-\frac{1}{2}\right)\stackrel{?}{=}8$ $\frac{16}{2}\stackrel{?}{=}8$ $8=8$ ✓	
	The solution is $(54,-12)$.

? Example 11.1.23

Solve the system by substitution: $\begin{cases} x-4y=-4 \\ -3x+4y=0 \end{cases}$

Answer

$(2,32)$

? Example 11.1.24

Solve the system by substitution: $\begin{cases} 4x-y=0 \\ 2x-3y=5 \end{cases}$

Answer

$(-12,-2)$

Solve a System of Equations by Elimination

We have solved systems of linear equations by graphing and by substitution. Graphing works well when the variable coefficients are small and the solution has integer values. Substitution works well when we can easily solve one equation for one of the variables and not have too many fractions in the resulting expression.

The third method of solving systems of linear equations is called the Elimination Method. When we solved a system by substitution, we started with two equations and two variables and reduced it to one equation with one variable. This is what we'll do with the elimination

method, too, but we'll have a different way to get there.

The Elimination Method is based on the Addition Property of Equality. The Addition Property of Equality says that when you add the same quantity to both sides of an equation, you still have equality. We will extend the Addition Property of Equality to say that when you add equal quantities to both sides of an equation, the results are equal.

For any expressions *a*, *b*, *c*, and *d*.

$$\begin{aligned} &\text{if} && a=b \\ &\text{and} && c=d \\ &\text{then} && a+c=b+d. \end{aligned}$$

To solve a system of equations by elimination, we start with both equations in standard form. Then we decide which variable will be easiest to eliminate. How do we decide? We want to have the coefficients of one variable be opposites, so that we can add the equations together and eliminate that variable.

Notice how that works when we add these two equations together:

$$\begin{cases} 3x+y=5 \\ 2x-y=0 \end{cases}$$
$$5x=5$$

The *y*'s add to zero and we have one equation with one variable.

Let's try another one:

$$\begin{cases} +4y=2 \\ 2x+5y=-2 \end{cases}$$

This time we don't see a variable that can be immediately eliminated if we add the equations.

But if we multiply the first equation by -2, we will make the coefficients of *x* opposites. We must multiply every term on both sides of the equation by -2.

$$\begin{aligned} -2(x+4y) &= -2(2) \\ 2x+5y &= -2 \end{aligned}$$

Then rewrite the system of equations.

$$\begin{aligned} -2x-8y &= -4 \\ 2x+5y &= -2 \end{aligned}$$

Now we see that the coefficients of the *x* terms are opposites, so *x* will be eliminated when we add these two equations.

$$\begin{array}{r} -2x-8y=-4 \\ 2x+5y=-2 \\ \hline -3y=-6 \end{array}$$

Once we get an equation with just one variable, we solve it. Then we substitute that value into one of the original equations to solve for the remaining variable. And, as always, we check our answer to make sure it is a solution to both of the original equations.

Now we'll see how to use elimination to solve the same system of equations we solved by graphing and by substitution.

? Exercise 11.1.25: How to Solve a System of Equations by Elimination

Solve the system by elimination: $\begin{cases} 2x+y=7 \\ x-2y=6 \end{cases}$

Answer

Step 1. Write both equations in standard form. • If any coefficients are fractions, clear them.	Both equations are in standard form, $Ax + By = C$. There are no fractions.	$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$
Step 2. Make the coefficients of one variable opposites. • Decide which variable you will eliminate. • Multiply one or both equations so that the coefficients of that variable are opposites.	We can eliminate the y's by multiplying the first equation by 2. Multiply both sides of $2x + y = 7$ by 2.	$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$ $\begin{cases} 2(2x + y) = 2(7) \\ x - 2y = 6 \end{cases}$
Step 3. Add the equations resulting from Step 2 to eliminate one variable.	We add the x's, y's, and constants.	$\begin{array}{r} 4x + 2y = 14 \\ x - 2y = 6 \\ \hline 5x \quad\quad = 20 \end{array}$
Step 4. Solve for the remaining variable.	Solve for x.	$x = 4$
Step 5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.	Substitute $x = 4$ into the second equation, $x - 2y = 6$. Then solve for y.	$x - 2y = 6$ $4 - 2y = 6$ $-2y = 2$ $y = -1$
Step 6. Write the solution as an ordered pair.	Write it as (x, y).	$(4, -1)$
Step 7. Check that the ordered pair is a solution to **both** original equations.	Substitute $x = 4$, $y = -1$ into $2x + y = 7$ and $x - 2y = 6$. Do they make both equations true? Yes!	$2x + y = 7$ $2(4) + (-1) \stackrel{?}{=} 7$ $7 = 7$ ✓ $x - 2y = 6$ $4 - 2(-1) \stackrel{?}{=} 6$ $6 = 6$ ✓ The solution is $(4, -1)$.

? Exercise 11.1.26

Solve the system by elimination: $\begin{cases} 3x + y = 5 \\ 2x - 3y = 7 \end{cases}$

Answer

$(2, -1)$

? Exercise 11.1.27

Solve the system by elimination: $\begin{cases} 4x + y = -5 \\ -2x - 2y = -2 \end{cases}$

Answer

$(-2, 3)$

The steps are listed here for easy reference.

SOLVE A SYSTEM OF EQUATIONS BY ELIMINATION.

1. Write both equations in standard form. If any coefficients are fractions, clear them.
2. Make the coefficients of one variable opposites.
   - Decide which variable you will eliminate.

- Multiply one or both equations so that the coefficients of that variable are opposites.

3. Add the equations resulting from Step 2 to eliminate one variable.
4. Solve for the remaining variable.
5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.
6. Write the solution as an ordered pair.
7. Check that the ordered pair is a solution to **both** original equations.

Now we'll do an example where we need to multiply both equations by constants in order to make the coefficients of one variable opposites.

Exercise 11.1.28

Solve the system by elimination: $\begin{cases} 4x-3y=9 \\ 7x+2y=-6 \end{cases}$

Answer

In this example, we cannot multiply just one equation by any constant to get opposite coefficients. So we will strategically multiply both equations by different constants to get the opposites.

	$\begin{aligned} 4x-3y&=9 \\ 7x+2y&=-6 \end{aligned}$
Both equations are in standard form. To get opposite coefficients of y, we will multiply the first equation by 2 and the second equation by 3.	$\begin{aligned} 2(4x-3y)&=2(9) \\ 3(7x+2y)&=3(-6) \end{aligned}$
Simplify.	$\begin{aligned} 8x-6y&=18 \\ 21x+6y&=-18 \end{aligned}$
Add the two equations to eliminate y.	$\begin{aligned} 8x-6y&=18 \\ 21x+6y&=-18 \\ \hline 29x&=0 \end{aligned}$
Solve for x.	$\begin{aligned} x&=0 \\ 7x+2y&=-6 \end{aligned}$
Substitute x=0x=0 into one of the original equations.	$7\cdot 0+2y=-6$
Solve for y.	$\begin{aligned} 2y&=-6 \\ y&=-3 \end{aligned}$
Write the solution as an ordered pair.	The ordered pair is $(0,-3)$.
Check that the ordered pair is a solution to **both** original equations. $\begin{aligned} 4x-3y&=9 \\ 4(0)-3(-3)&\stackrel{?}{=}9 \\ 9&=9\checkmark \end{aligned}$ $\begin{aligned} 7x+2y&=-6 \\ 7(0)+2(-3)&\stackrel{?}{=}-6 \\ -6&=-6\checkmark \end{aligned}$	
	The solution is $(0,-3)$.

Exercise 11.1.29

Solve the system by elimination: $\begin{cases} 3x-4y=-9 \\ 5x+3y=14 \end{cases}$

Answer

$(1,3)$

Exercise 11.1.30

Solve each system by elimination: $\begin{cases} 7x+8y=4 \\ 3x-5y=27 \end{cases}$

Answer

$(4,-3)$

When the system of equations contains fractions, we will first clear the fractions by multiplying each equation by the LCD of all the fractions in the equation.

Exercise 11.1.31

Solve the system by elimination: $\begin{cases} x+\frac{1}{2}y=6 \\ \frac{3}{2}x+\frac{2}{3}y=\frac{17}{2} \end{cases}$

Answer

In this example, both equations have fractions. Our first step will be to multiply each equation by the LCD of all the fractions in the equation to clear the fractions.

	$\begin{aligned} x+\tfrac{1}{2}y&=6 \\ \tfrac{3}{2}x+\tfrac{2}{3}y&=\tfrac{17}{2} \end{aligned}$
To clear the fractions, multiply each equation by its LCD.	$\begin{aligned} 2\left(x+\tfrac{1}{2}y\right)&=2(6) \\ 6\left(\tfrac{3}{2}x+\tfrac{2}{3}y\right)&=6\left(\tfrac{17}{2}\right) \end{aligned}$
Simplify.	$\begin{aligned} 2x+\ y&=12 \\ 9x+4y&=51 \end{aligned}$
Now we are ready to eliminate one of the variables. Notice that both equations are in standard form.	
We can eliminate y by multiplying the top equation by -4.	$\begin{aligned} -4(2x+\ y)&=-4(12) \\ 9x+4y\ &=51 \end{aligned}$
Simplify and add. Substitute $x=3$ into one of the original equations.	$\begin{aligned} -8x-4y&=-48 \\ 9x+4y\ &=\ 51 \\ \hline x\quad &=\ 3 \end{aligned}$ $x+\frac{1}{2}y=6$
Solve for y.	$\begin{aligned} 3+\tfrac{1}{2}y&=6 \\ \tfrac{1}{2}y&=3 \\ y&=6 \end{aligned}$
Write the solution as an ordered pair.	The ordered pair is $(3,6)$.
Check that the ordered pair is a solution to both original equations.	$\begin{aligned} x+\tfrac{1}{2}y&=6 \\ 3+\tfrac{1}{2}(6)&\stackrel{?}{=}6 \\ 3+3&\stackrel{?}{=}6 \\ 6&=6\ \checkmark \end{aligned}$ $\begin{aligned} \tfrac{3}{2}x+\tfrac{2}{3}y&=\tfrac{17}{2} \\ \tfrac{3}{2}(3)+\tfrac{2}{3}(6)&\stackrel{?}{=}\tfrac{17}{2} \\ \tfrac{9}{2}+4&\stackrel{?}{=}\tfrac{17}{2} \\ \tfrac{9}{2}+\tfrac{8}{2}&\stackrel{?}{=}\tfrac{17}{2} \\ \tfrac{17}{2}&=\tfrac{17}{2}\ \checkmark \end{aligned}$
	The solution is $(3,6)$.

Exercise 11.1.32

Solve each system by elimination: $\begin{cases} \frac{1}{3}x - \frac{1}{2}y = 1 \\ \frac{3}{4}x - y = \frac{5}{2} \end{cases}$

Answer

$(6, 2)$

Exercise 11.1.33

Solve each system by elimination: $\begin{cases} x + \frac{3}{5}y = -\frac{1}{5} \\ -\frac{1}{2}x - \frac{2}{3}y = \frac{5}{6} \end{cases}$

Answer

$(1, -2)$

When we solved the system by graphing, we saw that not all systems of linear equations have a single ordered pair as a solution. When the two equations were really the same line, there were infinitely many solutions. We called that a consistent system. When the two equations described parallel lines, there was no solution. We called that an inconsistent system.

The same is true using substitution or elimination. If the equation at the end of substitution or elimination is a true statement, we have a consistent but dependent system and the system of equations has infinitely many solutions. If the equation at the end of substitution or elimination is a false statement, we have an inconsistent system and the system of equations has no solution.

Exercise 11.1.34

Solve the system by elimination: $\begin{cases} 3x + 4y = 12 \\ y = 3 - \frac{3}{4}x \end{cases}$

Answer

$$\begin{cases} 3x + 4y = 12 \\ y = 3 - \frac{3}{4}x \end{cases}$$

Write the second equation in standard form.

$$\begin{cases} 3x + 4y = 12 \\ \frac{3}{4}x + y = 3 \end{cases}$$

Clear the fractions by multiplying the second equation by 4.

$$\begin{cases} 3x + 4y = 12 \\ 4(\frac{3}{4}x + y) = 4(3) \end{cases}$$

Simplify.

$$\begin{cases} 3x + 4y = 12 \\ 3x + 4y = 12 \end{cases}$$

To eliminate a variable, we multiply the second equation by -1. Simplify and add.

$$\begin{cases} 3x + 4y = 12 \\ \underline{-3x - 4y = -12} \end{cases}$$
$$0 = 0$$

This is a true statement. The equations are consistent but dependent. Their graphs would be the same line. The system has infinitely many solutions.

After we cleared the fractions in the second equation, did you notice that the two equations were the same? That means we have coincident lines.

? Exercise 11.1.35

Solve the system by elimination: $\begin{cases} 5x-3y=15 \\ 5y=-5+\frac{5}{3}x \end{cases}$

Answer

infinitely many solutions

? Exercise 11.1.36

Solve the system by elimination: $\begin{cases} x+2y=6 \\ y=-\frac{1}{2}x+3 \end{cases}$

Answer

infinitely many solutions

Choose the Most Convenient Method to Solve a System of Linear Equations

When you solve a system of linear equations in in an application, you will not be told which method to use. You will need to make that decision yourself. So you'll want to choose the method that is easiest to do and minimizes your chance of making mistakes.

Choose the Most Convenient Method to Solve a System of Linear Equations

Graphing	Substitution	Elimination
Use when you need a picture of the situation.	Use when one equation is already solved or can be easily solved for one variable.	Use when the equations a rein standard form.

? Example 11.1.37

For each system of linear equations, decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

ⓐ $\begin{cases} 3x+8y=40 \\ 7x-4y=-32 \end{cases}$ ⓑ $\begin{cases} 5x+6y=12 \\ y=\frac{2}{3}x-1 \end{cases}$

Answer

ⓐ

$$\begin{cases} 3x+8y=40 \\ 7x-4y=-32 \end{cases}$$

Since both equations are in standard form, using elimination will be most convenient.

ⓑ

$$\begin{cases} 5x+6y=12 \\ y=\frac{2}{3}x-1 \end{cases}$$

Since one equation is already solved for y, using substitution will be most convenient.

? Example 11.1.38

For each system of linear equations decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

ⓐ $\begin{cases} 4x-5y=-32 \\ 3x+2y=-1 \end{cases}$ ⓑ $\begin{cases} x=2y-1 \\ 3x-5y=-7 \end{cases}$

Answer

ⓐ Since both equations are in standard form, using elimination will be most convenient. ⓑ Since one equation is already solved for x, using substitution will be most convenient.

Example 11.1.39

For each system of linear equations decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

ⓐ $\begin{cases} y = 2x - 1 \\ 3x - 4y = -6 \end{cases}$ ⓑ $\begin{cases} 6x - 2y = 12 \\ 3x + 7y = -13 \end{cases}$

Answer

ⓐ Since one equation is already solved for y, using substitution will be most convenient. ⓑ Since both equations are in standard form, using elimination will be most convenient.

Key Concepts

- **How to solve a system of linear equations by graphing.**
  1. Graph the first equation.
  2. Graph the second equation on the same rectangular coordinate system.
  3. Determine whether the lines intersect, are parallel, or are the same line.
  4. Identify the solution to the system.
     If the lines intersect, identify the point of intersection. This is the solution to the system.
     If the lines are parallel, the system has no solution.
     If the lines are the same, the system has an infinite number of solutions.
  5. Check the solution in both equations.
- **How to solve a system of equations by substitution.**
  1. Solve one of the equations for either variable.
  2. Substitute the expression from Step 1 into the other equation.
  3. Solve the resulting equation.
  4. Substitute the solution in Step 3 into either of the original equations to find the other variable.
  5. Write the solution as an ordered pair.
  6. Check that the ordered pair is a solution to **both** original equations.
- **How to solve a system of equations by elimination.**
  1. Write both equations in standard form. If any coefficients are fractions, clear them.
  2. Make the coefficients of one variable opposites.
     Decide which variable you will eliminate.
     Multiply one or both equations so that the coefficients of that variable are opposites.
  3. Add the equations resulting from Step 2 to eliminate one variable.
  4. Solve for the remaining variable.
  5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.
  6. Write the solution as an ordered pair.
  7. Check that the ordered pair is a solution to **both** original equations.

Choose the Most Convenient Method to Solve a System of Linear Equations

Graphing	Substitution	Elimination
Use when you need a picture of the situation.	Use when one equation is already solved or can be easily solved for one variable.	Use when the equations a rein standard form.

Glossary

coincident lines

Coincident lines have the same slope and same y-intercept.

consistent and inconsistent systems

Consistent system of equations is a system of equations with at least one solution; inconsistent system of equations is a system of equations with no solution.

solutions of a system of equations

Solutions of a system of equations are the values of the variables that make *all* the equations true; solution is represented by an ordered pair (x,y).(x,y).

system of linear equations

When two or more linear equations are grouped together, they form a system of linear equations.

11.1E: Exercises

Practice Makes Perfect

Determine Whether an Ordered Pair is a Solution of a System of Equations

In the following exercises, determine if the following points are solutions to the given system of equations.

1. $\begin{cases} 2x-6y=0 \\ 3x-4y=5 \end{cases}$

ⓐ $(3,1)$
ⓑ $(-3,4)$

Answer

ⓐ yes ⓑ no

2. $\begin{cases} -3x+y=8 \\ -x+2y=-9 \end{cases}$

ⓐ $(-5,-7)$
ⓑ $(-5,7)$

3. $\begin{cases} x+y=2 \\ y=\frac{3}{4}x \end{cases}$

ⓐ $(87,67)$
ⓑ $(1,34)$

Answer

ⓐ yes ⓑ no

4. $\begin{cases} 2x+3y=6 \\ y=\frac{2}{3}x+2 \end{cases}$

ⓐ $(-6,2)$
ⓑ $(-3,4)$

Solve a System of Linear Equations by Graphing

In the following exercises, solve the following systems of equations by graphing.

5. $\begin{cases} 3x+y=-3 \\ 2x+3y=5 \end{cases}$

Answer

$(-3,2)$

6. $\begin{cases} -x+y=2 \\ 2x+y=-4 \end{cases}$

7. $\begin{cases} y=x+2 \\ y=-2x+2 \end{cases}$

Answer

$(0, 2)$

8. $\begin{cases} y = x - 2 \\ y = -3x + 2 \end{cases}$

9. $\begin{cases} y = \frac{3}{2}x + 1 \\ y = -\frac{1}{2}x + 5 \end{cases}$

Answer

$(2, 4)$

10. $\begin{cases} y = \frac{2}{3}x - 2 \\ y = -\frac{1}{3}x - 5 \end{cases}$

11. $\begin{cases} x + y = -4 \\ -x + 2y = -2 \end{cases}$

Answer

$(-2, 2)$

12. $\begin{cases} -x + 3y = 3 \\ x + 3y = 3 \end{cases}$

13. $\begin{cases} -2x + 3y = 3 \\ x + 3y = 12 \end{cases}$

Answer

$(3, 3)$

14. $\begin{cases} 2x - y = 4 \\ 2x + 3y = 12 \end{cases}$

15. $\begin{cases} x + 3y = -6 \\ y = -\frac{4}{3}x + 4 \end{cases}$

Answer

$(6, -4)$

16. $\begin{cases} -x + 2y = -6 \\ y = -\frac{1}{2}x - 1 \end{cases}$

17. $\begin{cases} -2x + 4y = 4 \\ y = \frac{1}{2}x \end{cases}$

Answer

no solution

18. $\begin{cases} 3x+5y=10 \\ y=-\frac{3}{5}x+1 \end{cases}$

19. $\begin{cases} 4x-3y=8 \\ 8x-6y=14 \end{cases}$

Answer

no solution

20. $\begin{cases} x+3y=4 \\ -2x-6y=3 \end{cases}$

21. $\begin{cases} x=-3y+4 \\ 2x+6y=8 \end{cases}$

Answer

infinite solutions with solution set: $\{(x,y)|2x+6y=8\}$

22. $\begin{cases} 4x=3y+7 \\ 8x-6y=14 \end{cases}$

23. $\begin{cases} 2x+y=6 \\ -8x-4y=-24 \end{cases}$

Answer

infinite solutions with solution set: $\{(x,y)|2x+y=6\}$

24. $\begin{cases} 5x+2y=7 \\ -10x-4y=-14 \end{cases}$

Without graphing, determine the number of solutions and then classify the system of equations.

25. $\begin{cases} y=\frac{2}{3}x+1 \\ -2x+3y=5 \end{cases}$

Answer

1 point, consistent and independent

26. $\begin{cases} y=\frac{3}{2}x+1 \\ 2x-3y=7 \end{cases}$

27. $\begin{cases} 5x+3y=4 \\ 2x-3y=5 \end{cases}$

Answer

1 point, consistent and independent

28. $\begin{cases} y=-12x+5 \\ x+2y=10 \end{cases}$

29. $\begin{cases} 5x-2y=10 \\ y=52x-5 \end{cases}$

Answer

infinite solutions, consistent, dependent

Solve a System of Equations by Substitution

In the following exercises, solve the systems of equations by substitution.

30. $\begin{cases} 2x+y=-4 \\ 3x-2y=-6 \end{cases}$

31. $\begin{cases} 2x+y=-2 \\ 3x-y=7 \end{cases}$

Answer

$(1,-4)$

32. $\begin{cases} x-2y=-5 \\ 2x-3y=-4 \end{cases}$

33. $\begin{cases} x-3y=-9 \\ 2x+5y=4 \end{cases}$

Answer

$(-3,2)$

34. $\begin{cases} 5x-2y=-6 \\ y=3x+3 \end{cases}$

35. $\begin{cases} -2x+2y=6 \\ y=-3x+1 \end{cases}$

Answer

$(-1/2,5/2)$

36. $\begin{cases} 2x+5y=1 \\ y=\frac{1}{3}x-2 \end{cases}$

37. $\begin{cases} 3x+4y=1 \\ y=-\frac{2}{5}x+2 \end{cases}$

Answer

$(-5,4)$

38. $\begin{cases} 2x+y=5 \\ x-2y=-15 \end{cases}$

39. $\begin{cases} 4x+y=10 \\ x-2y=-20 \end{cases}$

Answer

$(0, 10)$

40. $\begin{cases} y=-2x-1 \\ y=-\frac{1}{3}x+4 \end{cases}$

41. $\begin{cases} y=x-6 \\ y=-\frac{3}{2}x+4 \end{cases}$

Answer

$(4, -2)$

42. $\begin{cases} x=2y \\ 4x-8y=0 \end{cases}$

43. $\begin{cases} 2x-16y=8 \\ -x-8y=-4 \end{cases}$

Answer

$(4, 0)$

44. $\begin{cases} y=\frac{7}{8}x+4 \\ -7x+8y=6 \end{cases}$

45. $\begin{cases} y=-\frac{2}{3}x+5 \\ 2x+3y=11 \end{cases}$

Answer

no solution

Solve a System of Equations by Elimination

In the following exercises, solve the systems of equations by elimination.

46. $\begin{cases} 5x+2y=2 \\ -3x-y=0 \end{cases}$

47. $\begin{cases} 6x-5y=-1 \\ 2x+y=13 \end{cases}$

Answer

$(4, 5)$

48. $\begin{cases} 2x-5y=7 \\ 3x-y=17 \end{cases}$

49. $\begin{cases} 5x-3y=-1 \\ 2x-y=2 \end{cases}$

Answer

$(7,12)$

50. $\begin{cases} 3x-5y=-9 \\ 5x+2y=16 \end{cases}$

51. $\begin{cases} 4x-3y=3 \\ 2x+5y=-31 \end{cases}$

Answer

$(-3,-5)$

52. $\begin{cases} 3x+8y=-3 \\ 2x+5y=-3 \end{cases}$

53. $\begin{cases} 11x+9y=-5 \\ 7x+5y=-1 \end{cases}$

Answer

$(2,-3)$

54. $\begin{cases} 3x+8y=67 \\ 5x+3y=60 \end{cases}$

55. $\begin{cases} 2x+9y=-4 \\ 3x+13y=-7 \end{cases}$

Answer

$(-11,2)$

56. $\begin{cases} \frac{1}{3}x-y=-3 \\ x+\frac{5}{2}y=2 \end{cases}$

57. $\begin{cases} x+\frac{1}{2}y=\frac{3}{2} \\ \frac{1}{5}x-\frac{1}{5}y=3 \end{cases}$

Answer

$(6/-9,24/7)$

58. $\begin{cases} x+\frac{1}{3}y=-1 \\ \frac{1}{3}x+\frac{1}{2}y=1 \end{cases}$

59. $\begin{cases} \frac{1}{3}x-y=-3 \\ \frac{2}{3}x+\frac{5}{2}y=3 \end{cases}$

Answer

$(-3, 2)$

60. $\begin{cases} 2x+y=3 \\ 6x+3y=9 \end{cases}$

61. $\begin{cases} x-4y=-1 \\ -3x+12y=3 \end{cases}$

Answer

infinitely many solutions with solution set: $\{(x, y)|x-4y=-1\}$

62. $\begin{cases} -3x-y=8 \\ 6x+2y=-16 \end{cases}$

63. $\begin{cases} 4x+3y=2 \\ 20x+15y=10 \end{cases}$

Answer

infinitely many solutions with solution set: $\{(x, y)|4x+3y=2\}$

Choose the Most Convenient Method to Solve a System of Linear Equations

In the following exercises, decide whether it would be more convenient to solve the system of equations by substitution or elimination.

64.

ⓐ $\begin{cases} 8x-15y=-32 \\ 6x+3y=-5 \end{cases}$

ⓑ $\begin{cases} x=4y-3 \\ 4x-2y=-6 \end{cases}$

65.

ⓐ $\begin{cases} y=7x-5 \\ 3x-2y=16 \end{cases}$

ⓑ $\begin{cases} 12x-5y=-42 \\ 3x+7y=-15 \end{cases}$

Answer

ⓐ substitution ⓑ elimination

66.

ⓐ $\begin{cases} y=4x+95 \\ x-2y=-21 \end{cases}$

ⓑ $\begin{cases} 9x-4y=24 \\ 3x+5y=-14 \end{cases}$

67.

ⓐ $\begin{cases} 14x-15y=-30 \\ 7x+2y=10 \end{cases}$

ⓑ $\begin{cases} x = 9y - 11 \\ 2x - 7y = -27 \end{cases}$

Answer

ⓐ elimination ⓑ substitution

Writing Exercises

68. In a system of linear equations, the two equations have the same intercepts. Describe the possible solutions to the system.

69. Solve the system of equations by substitution and explain all your steps in words: $\begin{cases} 3x + y = 1 \\ 2x = y - 8 \end{cases}$

Answer

Answers will vary.

70. Solve the system of equations by elimination and explain all your steps in words: $\begin{cases} 5x + 4y = 10 \\ 2x = 3y + 27 \end{cases}$

71. Solve the system of equations $\begin{cases} x + y = 10 \\ x - y = 6 \end{cases}$

ⓐ by graphing ⓑ by substitution
ⓒ Which method do you prefer? Why?

Answer

Answers will vary.

Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether an ordered pair is a solution of a system of equations.			
solve a system of linear equations by graphing.			
solve a system of equations by substitution.			
solve a system of equations by elimination.			
choose the most convenient method to solve a system of linear equations.			

If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

11.2: Solve Applications with Systems of Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve direct translation applications
- Solve geometry applications
- Solve uniform motion applications

Before you get started, take this readiness quiz.

1. The sum of twice a number and nine is 31. Find the number.
   If you missed this problem, review [link].
2. Twins Jon and Ron together earned $96,000 last year. Ron earned $8000 more than three times what Jon earned. How much did each of the twins earn?
   If you missed this problem, review [link].
3. An express train and a local train leave Pittsburgh to travel to Washington, D.C. The express train can make the trip in four hours and the local train takes five hours for the trip. The speed of the express train is 12 miles per hour faster than the speed of the local train. Find the speed of both trains.
   If you missed this problem, review [link].

Solve Direct Translation Applications

Systems of linear equations are very useful for solving applications. Some people find setting up word problems with two variables easier than setting them up with just one variable. To solve an application, we'll first translate the words into a system of linear equations. Then we will decide the most convenient method to use, and then solve the system.

SOLVE APPLICATIONS WITH SYSTEMS OF EQUATIONS.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose variables to represent those quantities.
4. **Translate** into a system of equations.
5. **Solve** the system of equations using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

We solved number problems with one variable earlier. Let's see how differently it works using two variables.

?

The sum of two numbers is zero. One number is nine less than the other. Find the numbers.

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for two numbers.
Step 3. Name what we are looking for.	Let $n =$ the first number. $m =$ the second number
Step 4. Translate into a system of equations.	The sum of two numbers is zero.
	$n + m = 0$
	One number is nine less than the other.

	$n = m - 9$
The system is:	$n + m = 0$ $n = m - 9$
Step 5. Solve the system of equations. We will use substitution since the second equation is solved for n.	
Substitute $m - 9$ for n in the first equation.	$n = (m - 9)$ $n + m = 0$
Solve for m.	$m - 9 + m = 0$
	$2m - 9 = 0$
	$2m = 9$
Substitute $m = \frac{9}{2}$ into the second equation and then solve for n.	$m = \frac{9}{2}$ $n = m - 9$
	$m = \frac{9}{2} - 9$ $m = \frac{9}{2} - \frac{18}{2}$
	$n = -\frac{9}{2}$
Step 6. Check the answer in the problem.	Do these numbers make sense in the problem? We will leave this to you!
Step 7. Answer the question.	The numbers are $\frac{9}{2}$ and $-\frac{9}{2}$.

? Example 11.2.2

The sum of two numbers is 10. One number is 4 less than the other. Find the numbers.

Answer

$3, 7$

? Example 11.2.3

The sum of two numbers is -6. One number is 10 less than the other. Find the numbers.

Answer

$2, -8$

?

Heather has been offered two options for her salary as a trainer at the gym. Option A would pay her \$25,000 plus \$15 for each training session. Option B would pay her $\$10,000 + \$40$ for each training session. How many training sessions would make the salary options equal?

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for the number of training sessions that would make the pay equal.
Step 3. Name what we are looking for.	Let s=s= Heather's salary. n=n= the number of training sessions
Step 4. Translate into a system of equations.	Option A would pay her $25,000 plus $15 for each training session.
	$s = 25{,}000 + 15n$
	Option B would pay her $10,000 + $40 for each training session.
	$s = 10{,}000 + 40n$
The system is shown.	$s = 25{,}000 + 15n$ $s = 10{,}000 + 40n$
Step 5. Solve the system of equations. We will use substitution.	$s = 25{,}000 + 15n$ $s = 10{,}000 + 40n$
Substitute 25,000 +15n for s in the second equation.	$25{,}000 + 15n = 10{,}000 + 40n$
Solve for n.	$25{,}000 = 10{,}000 + 25n$ $15{,}000 = 25n$ $600 = n$
Step 6. Check the answer.	Are 600 training sessions a year reasonable? Are the two options equal when n = 600?
Step 7. Answer the question.	The salary options would be equal for 600 training sessions.

Example 11.2.5

Geraldine has been offered positions by two insurance companies. The first company pays a salary of $12,000 plus a commission of $100 for each policy sold. The second pays a salary of $20,000 plus a commission of $50 for each policy sold. How many policies would need to be sold to make the total pay the same?

Answer

160 policies

Example 11.2.6

Kenneth currently sells suits for company A at a salary of $22,000 plus a $10 commission for each suit sold. Company B offers him a position with a salary of $28,000 plus a $4 commission for each suit sold. How many suits would Kenneth need to sell for the options to be equal?

Answer

1000 suits

As you solve each application, remember to analyze which method of solving the system of equations would be most convenient.

Example 11.2.7

Translate to a system of equations and then solve:

When Jenna spent 10 minutes on the elliptical trainer and then did circuit training for 20 minutes, her fitness app says she burned 278 calories. When she spent 20 minutes on the elliptical trainer and 30 minutes circuit training she burned 473 calories. How many calories does she burn for each minute on the elliptical trainer? How many calories for each minute of circuit training?

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for the number of calories burned each minute on the elliptical trainer and each minute of circuit training.
Step 3. Name what we are looking for.	Let e=e= number of calories burned per minute on the elliptical trainer. c=c= number of calories burned per minute while circuit training
Step 4. Translate into a system of equations.	10 minutes on the elliptical and circuit training for 20 minutes, burned 278 calories
	$10e + 20c = 278$
	20 minutes on the elliptical and 30 minutes of circuit training burned 473 calories
	$20e + 30c = 473$
The system is:	$\begin{cases} 10e + 20c = 278 \\ 20e + 30c = 473 \end{cases}$
Step 5. Solve the system of equations.	
Multiply the first equation by −2 to get opposite coefficients of e.	$\begin{cases} -2(10e + 20c) = -2(278) \\ 20e + 30c = 473 \end{cases}$
Simplify and add the equations. Solve for c.	$\begin{cases} -20e - 40c = -556 \\ 20e + 30c = 473 \end{cases}$ $-10c = -83$ $c = 8.3$
Substitute $c = 8.3$ into one of the original equations to solve for e.	$10e + 20c = 278$ $10e + 20(8.3) = 278$ $10e + 166 = 278$ $10e = 112$ $e = 11.2$
Step 6. Check the answer in the problem.	Check the math on your own.
	$\begin{cases} 10(11.2) + 20(8.3) \stackrel{?}{=} 278 \\ 20(11.2) + 30(8.3) \stackrel{?}{=} 473 \end{cases}$
Step 7. Answer the question.	Jenna burns 8.3 calories per minute circuit training and 11.2 calories per minute while on the elliptical trainer.

Example 11.2.8

Translate to a system of equations and then solve:

Mark went to the gym and did 40 minutes of Bikram hot yoga and 10 minutes of jumping jacks. He burned 510 calories. The next time he went to the gym, he did 30 minutes of Bikram hot yoga and 20 minutes of jumping jacks burning 470 calories. How many calories were burned for each minute of yoga? How many calories were burned for each minute of jumping jacks?

Answer

Mark burned 11 calories for each minute of yoga and 7 calories for each minute of jumping jacks.

Example 11.2.9

Translate to a system of equations and then solve:

Erin spent 30 minutes on the rowing machine and 20 minutes lifting weights at the gym and burned 430 calories. During her next visit to the gym she spent 50 minutes on the rowing machine and 10 minutes lifting weights and burned 600 calories. How many calories did she burn for each minutes on the rowing machine? How many calories did she burn for each minute of weight lifting?

Answer

Erin burned 11 calories for each minute on the rowing machine and 5 calories for each minute of weight lifting.

Solve Geometry Applications

We will now solve geometry applications using systems of linear equations. We will need to add complementary angles and supplementary angles to our list some properties of angles.

The measures of two **complementary angles** add to 90 degrees. The measures of two **supplementary angles** add to 180 degrees.

COMPLEMENTARY AND SUPPLEMENTARY ANGLES

Two angles are complementary if the sum of the measures of their angles is 90 degrees.

Two angles are supplementary if the sum of the measures of their angles is 180 degrees

If two angles are complementary, we say that *one angle is the complement of the other.*

If two angles are supplementary, we say that *one angle is the supplement of the other.*

Example 11.2.10

Translate to a system of equations and then solve.

The difference of two complementary angles is 26 degrees. Find the measures of the angles.

Answer

Step 1. Read the problem.

Step 2. Identify what we are looking for. We are looking for the measure of each angle.

Step 3. Name what we are looking for. Let $x =$ the measure of the first angle.
$y =$ the measure of the second angle

Step 4. Translate into a system of equations. The angles are complementary.

$$x + y = 90$$

The difference of the two angles is 26 degrees.

$$x - y = 26$$

The system is shown.

$$\begin{cases} x + y = 90 \\ x - y = 26 \end{cases}$$

Step 5. Solve the system of equations by elimination.

$$\begin{cases} x + y = 90 \\ \underline{x - y = 26} \end{cases}$$
$$2x = 116$$
$$x = 58$$

Substitute $x = 58$ into the first equation.

$$x + y = 90$$
$$58 + y = 90$$
$$y = 32$$

Step 6. Check the answer in the problem.

$58 + 32 = 90$✓
$58 - 32 = 26$✓

Step 7. Answer the question. The angle measures are 58 and 32 degrees.

Example 11.2.11

Translate to a system of equations and then solve:

The difference of two complementary angles is 20 degrees. Find the measures of the angles.

Answer

The angle measures are 55 and 35.

Example 11.2.12

Translate to a system of equations and then solve:

The difference of two complementary angles is 80 degrees. Find the measures of the angles.

Answer

The angle measures are 5 and 85.

In the next example, we remember that the measures of supplementary angles add to 180.

Example 11.2.13

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is twelve degrees less than five times the measure of the smaller angle. Find the measures of both angles.

Answer

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	We are looking for measure of each angle.
Step 3. Name what we are looking for.	Let x=x= the measure of the first angle. y=y= the measure of the second angle
Step 4. Translate into a system of equations.	The angles are supplementary.
	$x+y=180$
	The larger angle is twelve less than five times the smaller angle.
	$y=5x-12$
The system is shown: **Step 5. Solve** the system of equations substitution.	$\begin{cases} x+y=180 \\ y=5x-12 \end{cases}$ $x+y=180$
Substitute $5x-12$ for y in the first equation. Solve for x.	$x+5x-12=180$ $6x-12=180$
Substitute 32 for x in the second equation, then solve for y.	$6x=192$ $x=32$ $y=5x-12$ $y=5\cdot 32-12$ $y=160-12$ $y=148$
Step 6. Check the answer in the problem.	$32+148=180$ ✓ $5\cdot 32-12=148$ ✓
Step 7. Answer the question.	The angle measures are 148 and 32 degrees.

Example 11.2.14

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is 12 degrees more than three times the smaller angle. Find the measures of the angles.

Answer

The angle measures are 42 and 138.

Example 11.2.15

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is 18 less than twice the measure of the smaller angle. Find the measures of the angles.

Answer

The angle measures are 66 and 114.

Recall that the angles of a triangle add up to 180 degrees. A right triangle has one angle that is 90 degrees. What does that tell us about the other two angles? In the next example we will be finding the measures of the other two angles.

Example 11.2.16

The measure of one of the small angles of a right triangle is ten more than three times the measure of the other small angle. Find the measures of both angles.

Answer

We will draw and label a figure.

Step 1. Read the problem.	Step 2. Identify what you are looking for.	We are looking for the measures of the angles.
Step 3. Name what we are looking for.	Let a=a= the measure of the first angle. b=b= the measure of the second angle
Step 4. Translate into a system of equations.	The measure of one of the small angles of a right triangle is ten more than three times the measure of the other small angle.
	$a = 3b + 10$
	The sum of the measures of the angles of a triangle is 180.
	$a + b + 90 = 180$
The system is shown.	$a = 3b + 10$ $a + b + 90 = 180$
Step 5. Solve the system of equations. We will use substitution since the first equation is solved for a.	$a = 3b + 10$ $a + b + 90 = 180$
Substitute 3b+103b+10 for a in the second equation.	$(3b + 10) + b + 90 = 180$
Solve for b.	$4b + 100 = 180$ $4b = 80$ $b = 20$ $a = 3b + 10$
Substitute b=20b=20 into the first equation and then solve for a.	$a = 3 \cdot 20 + 10$ $a = 70$
Step 6. Check the answer in the problem.	We will leave this to you!
Step 7. Answer the question.	The measures of the small angles are 20 and 70 degrees.

Example 11.2.17

The measure of one of the small angles of a right triangle is 2 more than 3 times the measure of the other small angle. Find the measure of both angles.

Answer

$22, 68$

Example 11.2.18

The measure of one of the small angles of a right triangle is 18 less than twice the measure of the other small angle. Find the measure of both angles.

Answer

$36, 54$

Often it is helpful when solving geometry applications to draw a picture to visualize the situation.

Example 11.2.19

Translate to a system of equations and then solve:

Randall has 125 feet of fencing to enclose the part of his backyard adjacent to his house. He will only need to fence around three sides, because the fourth side will be the wall of the house. He wants the length of the fenced yard (parallel to the house wall) to be 5 feet more than four times as long as the width. Find the length and the width.

Answer

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	We are looking for the length and width.
Step 3. Name what we are looking for.	Let L=L= the length of the fenced yard. W=W= the width of the fenced yard
Step 4. Translate into a system of equations.	One lenth and two widths equal 125.
	$L + 2W = 125$
	The length will be 5 feet more than four times the width.
	$L = 4W + 5$
The system is shown. **Step 5. Solve** The system of equations by substitution.	$\begin{cases} L + 2W = 125 \\ L = 4W + 5 \end{cases}$ $L + 2W = 125$
Substitute $L = 4W + 5$ into the first equation, then solve for W.	$4W + 5 + 2W = 125$

	$6W + 5 = 125$ $6W = 120$ $W = 20$
Substitute 20 for W in the second equation, then solve for L.	$L = 4W + 5$ $L = 4 \cdot 20 + 5$ $L = 80 + 5$ $L = 85$
Step 6. Check the answer in the problem.	$20 + 85 + 20 = 125$ $85 = 4 \cdot 20 + 5$ $85 = 85$ ✓
Step 7. Answer the equation.	The length is 85 feet and the width is 20 feet.

? Example 11.2.20

Translate to a system of equations and then solve:

Mario wants to put a fence around the pool in his backyard. Since one side is adjacent to the house, he will only need to fence three sides. There are two long sides and the one shorter side is parallel to the house. He needs 155 feet of fencing to enclose the pool. The length of the long side is 10 feet less than twice the width. Find the length and width of the pool area to be enclosed.

Answer

The length is 60 feet and the width is 35 feet.

? Example 11.2.21

Translate to a system of equations and then solve:

Alexis wants to build a rectangular dog run in her yard adjacent to her neighbor's fence. She will use 136 feet of fencing to completely enclose the rectangular dog run. The length of the dog run along the neighbor's fence will be 16 feet less than twice the width. Find the length and width of the dog run.

Answer

The length is 60 feet and the width is 38 feet.

Solve uniform motion applications

We used a table to organize the information in uniform motion problems when we introduced them earlier. We'll continue using the table here. The basic equation was $D = rt$ where D is the distance traveled, r is the rate, and t is the time.

Our first example of a uniform motion application will be for a situation similar to some we have already seen, but now we can use two variables and two equations.

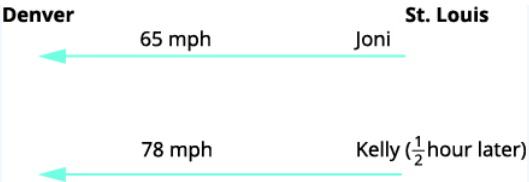
? Example 11.2.22

Translate to a system of equations and then solve:

Joni left St. Louis on the interstate, driving west towards Denver at a speed of 65 miles per hour. Half an hour later, Kelly left St. Louis on the same route as Joni, driving 78 miles per hour. How long will it take Kelly to catch up to Joni?

Answer

A diagram is useful in helping us visualize the situation.



Identify and name what we are looking for. A chart will help us organize the data. We know the rates of both Joni and Kelly, and so we enter them in the chart. We are looking for the length of time Kelly, *k*, and Joni, *j*, will each drive.

	Rate · Time = Distance		
Joni	65	j	$65j$
Kelly	78	k	$78k$

Since $D = r \cdot t$ we can fill in the Distance column.

Translate into a system of equations.

To make the system of equations, we must recognize that Kelly and Joni will drive the same distance. So,

$$65j = 78k$$

Also, since Kelly left later, her time will be $\frac{1}{2}$ hour less than Joni's time. So,

$$k = j - \tfrac{1}{2}$$

Now we have the system.

$$\begin{cases} k = j - \frac{1}{2} \\ 65j = 78k \end{cases}$$

Solve the system of equations by substitution.

Substitute $k = j - 12$ into the second equation, then solve for j.

$$\begin{aligned} 65j &= 78k \\ 65j &= 78(j - \tfrac{1}{2}) \\ 65j &= 78j - 39 \\ -13j &= -39 \\ j &= 3 \end{aligned}$$

To find Kelly's time, substitute $j = 3$ into the first equation, then solve for k.

$$\begin{aligned} k &= j - \tfrac{1}{2} \\ k &= 3 - \tfrac{1}{2} \\ k &= \tfrac{5}{2} \text{ or } k = 2\tfrac{1}{2} \end{aligned}$$

Check the answer in the problem.

Joni 3 hours (65 mph) = 195 miles

Kelly $2\frac{1}{2}$ hours (78 mph) = 195 miles

Yes, they will have traveled the same distance when they meet.

Answer the question.

Kelly will catch up to Joni in $2\frac{1}{2}$ hours. By then, Joni will have traveled 3 hours.

Example 11.2.23

Translate to a system of equations and then solve:

Mitchell left Detroit on the interstate driving south towards Orlando at a speed of 60 miles per hour. Clark left Detroit 1 hour later traveling at a speed of 75 miles per hour, following the same route as Mitchell. How long will it take Clark to catch Mitchell?

Answer

It will take Clark 4 hours to catch Mitchell.

Example 11.2.24

Translate to a system of equations and then solve:

Charlie left his mother's house traveling at an average speed of 36 miles per hour. His sister Sally left 15 minutes ($\frac{1}{4}$ hour) later traveling the same route at an average speed of 42 miles per hour. How long before Sally catches up to Charlie?

Answer

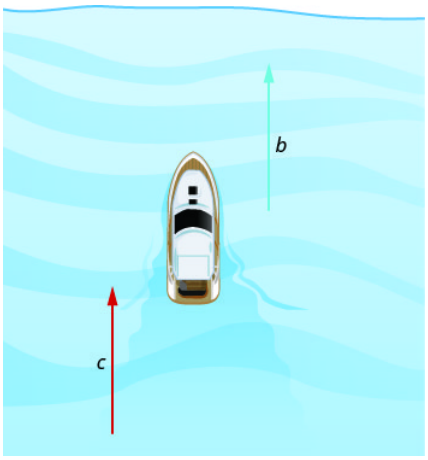
It will take Sally 112 hours to catch up to Charlie.

Many real-world applications of uniform motion arise because of the effects of currents—of water or air—on the actual speed of a vehicle. Cross-country airplane flights in the United States generally take longer going west than going east because of the prevailing wind currents.

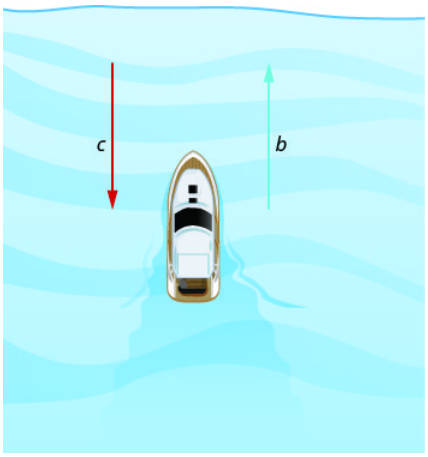
Let's take a look at a boat travelling on a river. Depending on which way the boat is going, the current of the water is either slowing it down or speeding it up.

The images below show how a river current affects the speed at which a boat is actually travelling. We'll call the speed of the boat in still water b and the speed of the river current c.

The boat is going downstream, in the same direction as the river current. The current helps push the boat, so the boat's actual speed is faster than its speed in still water. The actual speed at which the boat is moving is $b+c$.



Now, the boat is going upstream, opposite to the river current. The current is going against the boat, so the boat's actual speed is slower than its speed in still water. The actual speed of the boat is $b-c$.



We'll put some numbers to this situation in the next example.

? Example 11.2.25

Translate to a system of equations and then solve.

A river cruise ship sailed 60 miles downstream for 4 hours and then took 5 hours sailing upstream to return to the dock. Find the speed of the ship in still water and the speed of the river current.

Answer

Read the problem.	This is a uniform motion problem and a picture will help us visualize the situation.
	Identify what we are looking for.	We are looking for the speed of the ship in still water and the speed of the current.
Name what we are looking for.	Let $s =$ the rate of the ship in still water. $c =$ the rate of the current
A chart will help us organize the information. The ship goes downstream and then upstream. Going downstream, the current helps the ship and so the ship's actual rate is $s + c$. Going upstream, the current slows the ship and so the actual rate is $s - c$.	<table><tr><th></th><th colspan="3">Rate • Time = Distance</th></tr><tr><td>downstream</td><td>$s + c$</td><td>4</td><td>60</td></tr><tr><td>upstream</td><td>$s - c$</td><td>5</td><td>60</td></tr></table>
Downstream it takes 4 hours. Upstream it takes 5 hours. Each way the distance is 60 miles.	
Translate into a system of equations. Since rate times time is distance, we can write the system of equations.	$\begin{cases} 4(s + c) = 60 \\ 5(s - c) = 60 \end{cases}$
Solve the system of equations. Distribute to put both equations in standard form, then solve by elimination.	$\begin{cases} 4s + 4c = 60 \\ 5s - 5c = 60 \end{cases}$

Multiply the top equation by 5 and the bottom equation by 4. Add the equations, then solve for s.	$20s + 20c = 300$ $20s - 20c = 240$ $40s = 540$ $s = 13.5$ $4(s + c) = 60$
Substitute $s = 13.5$ into of the original equations.	$4(13.5 + c) = 60$ $54 + 4c = 60$ $4c = 6$ $c = 1.5$
Check the answer in the problem. The downstream rate would be $13.5 + 1.5 = 15$ mph. In 4 hours the ship would travel $15 \cdot 4 = 60$ miles. The upstream rate would be $13.5 - 1.5 = 12$ mph. In 5 hours the ship would travel $12 \cdot 5 = 60$ miles.	
Answer the question.	The rate of the ship is 13.5 mph and the rate of the current is 1.5 mph.

Example 11.2.26

Translate to a system of equations and then solve:

A Mississippi river boat cruise sailed 120 miles upstream for 12 hours and then took 10 hours to return to the dock. Find the speed of the river boat in still water and the speed of the river current.

Answer

The rate of the boat is 11 mph and the rate of the current is 1 mph.

Example 11.2.27

Translate to a system of equations and then solve:

Jason paddled his canoe 24 miles upstream for 4 hours. It took him 3 hours to paddle back. Find the speed of the canoe in still water and the speed of the river current.

Answer

The speed of the canoe is 7 mph and the speed of the current is 1 mph.

Wind currents affect airplane speeds in the same way as water currents affect boat speeds. We'll see this in the next example. A wind current in the same direction as the plane is flying is called a *tailwind*. A wind current blowing against the direction of the plane is called a *headwind*.

Example 11.2.28

Translate to a system of equations and then solve:

A private jet can fly 1,095 miles in three hours with a tailwind but only 987 miles in three hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

Read the problem.	This is a uniform motion problem and a picture will help us visualize.
	Identify what we are looking for.	We are looking for the speed of the jet in still air and the speed of the wind.
Name what we are looking for.	Let j=j= the speed of the jet in still air. w=w= the speed of the wind.
A chart will help us organize the information. The jet makes two trips—one in a tailwind and one in a headwind. In a tailwind, the wind helps the jet and so the rate is $j + w$. In a headwind, the wind slows the jet and so the rate is $j - w$.	
Each trip takes 3 hours. In a tailwind the jet flies 1,095 miles. In a headwind the jet flies 987 miles.	
Translate into a system of equations. Since rate times time is distance, we get the system of equations.	$3(j + w) = 1095$ $3(j - w) = 987$
Solve the system of equations. Distribute, then solve by elimination. Add, and solve for j.	$3j + 3w = 1095$ $3j - 3w = 987$ $6j = 2082$ $j = 347$ $4(j + w) = 1095$
Substitute $j = 347$ into one of the original equations, then solve for w.	$3(347 + w) = 1095$ $1041 + 3w = 1095$ $3w = 54$ $w = 18$
Check the answer in the problem. With the tailwind, the actual rate of the jet would be $347 + 18 = 365$ mph. In 3 hours the jet would travel $365 \cdot 3 = 1,095$ miles Going into the headwind, the jet's actual rate would be $347 - 18 = 329$ mph. In 3 hours the jet would travel $329 \cdot 3 = 987$ miles.	
Answer the question.	The rate of the jet is 347 mph and the rate of the wind is 18 mph.

	Rate • Time = Distance		
tailwind	$j + w$	3	1095
headwind	$j - w$	3	987

? Example 11.2.29

Translate to a system of equations and then solve:

A small jet can fly 1,325 miles in 5 hours with a tailwind but only 1,035 miles in 5 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

The speed of the jet is 235 mph and the speed of the wind is 30 mph.

? Example 11.2.30

Translate to a system of equations and then solve:

A commercial jet can fly 1,728 miles in 4 hours with a tailwind but only 1,536 miles in 4 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

The speed of the jet is 408 mph and the speed of the wind is 24 mph.

- Systems of Equations

Key Concepts

- **How To Solve Applications with Systems of Equations**
  1. **Read** the problem. Make sure all the words and ideas are understood.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose variables to represent those quantities.
  4. **Translate** into a system of equations.
  5. **Solve** the system of equations using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.

Glossary

complementary angles

Two angles are complementary if the sum of the measures of their angles is 90 degrees.

supplementary angles

Two angles are supplementary if the sum of the measures of their angles is 180 degrees.

11.2E: Exercises

Practice Makes Perfect

Direct Translation Applications

In the following exercises, translate to a system of equations and solve.

1. The sum of two number is 15. One number is 3 less than the other. Find the numbers.

2. The sum of two number is 30. One number is 4 less than the other. Find the numbers.

Answer

13 and 17

3. The sum of two number is −16. One number is 20 less than the other. Find the numbers.

4. The sum of two number is -26. One number is 12 less than the other. Find the numbers.

Answer

-7 and -19

5. The sum of two numbers is 65. Their difference is 25. Find the numbers.

6. The sum of two numbers is 37. Their difference is 9. Find the numbers.

Answer

14 and 23

7. The sum of two numbers is -27. Their difference is -59. Find the numbers.

8. The sum of two numbers is -45. Their difference is -89. Find the numbers.

Answer

22 and -67

9. Maxim has been offered positions by two car companies. The first company pays a salary of $10,000 plus a commission of $1000 for each car sold. The second pays a salary of $20,000 plus a commission of $500 for each car sold. How many cars would need to be sold to make the total pay the same?

10. Jackie has been offered positions by two cable companies. The first company pays a salary of $14,000 plus a commission of $100 for each cable package sold. The second pays a salary of $20,000 plus a commission of $25 for each cable package sold. How many cable packages would need to be sold to make the total pay the same?

Answer

Eighty cable packages would need to be sold to make the total pay the same.

11. Amara currently sells televisions for company A at a salary of $17,000 plus a $100 commission for each television she sells. Company B offers her a position with a salary of $29,000 plus a $20 commission for each television she sells. How televisions would Amara need to sell for the options to be equal?

12. Mitchell currently sells stoves for company A at a salary of $12,000 plus a $150 commission for each stove he sells. Company B offers him a position with a salary of $24,000 plus a $50 commission for each stove he sells. How many stoves would Mitchell need to sell for the options to be equal?

Answer

Mitchell would need to sell 120 stoves for the companies to be equal.

13. Two containers of gasoline hold a total of fifty gallons. The big container can hold ten gallons less than twice the small container. How many gallons does each container hold?

14. June needs 48 gallons of punch for a party and has two different coolers to carry it in. The bigger cooler is five times as large as the smaller cooler. How many gallons can each cooler hold?

Answer

8 and 40 gallons

15. Shelly spent 10 minutes jogging and 20 minutes cycling and burned 300 calories. The next day, Shelly swapped times, doing 20 minutes of jogging and 10 minutes of cycling and burned the same number of calories. How many calories were burned for each minute of jogging and how many for each minute of cycling?

16. Drew burned 1800 calories Friday playing one hour of basketball and canoeing for two hours. Saturday he spent two hours playing basketball and three hours canoeing and burned 3200 calories. How many calories did he burn per hour when playing basketball? How many calories did he burn per hour when canoeing?

Answer

1000 calories playing basketball and 400 calories canoeing

17. Troy and Lisa were shopping for school supplies. Each purchased different quantities of the same notebook and thumb drive. Troy bought four notebooks and five thumb drives for $116. Lisa bought two notebooks and three thumb dives for $68. Find the cost of each notebook and each thumb drive.

18. Nancy bought seven pounds of oranges and three pounds of bananas for $17. Her husband later bought three pounds of oranges and six pounds of bananas for $12. What was the cost per pound of the oranges and the bananas?

Answer

Oranges cost $2 per pound and bananas cost $1 per pound

19. Andrea is buying some new shirts and sweaters. She is able to buy 3 shirts and 2 sweaters for $114 or she is able to buy 2 shirts and 4 sweaters for $164. How much does a shirt cost? How much does a sweater cost?

20. Peter is buying office supplies. He is able to buy 3 packages of paper and 4 staplers for $40 or he is able to buy 5 packages of paper and 6 staplers for $62. How much does a package of paper cost? How much does a stapler cost?

Answer

Package of paper $4, stapler $7

21. The total amount of sodium in 2 hot dogs and 3 cups of cottage cheese is 4720 mg. The total amount of sodium in 5 hot dogs and 2 cups of cottage cheese is 6300 mg. How much sodium is in a hot dog? How much sodium is in a cup of cottage cheese?

22. The total number of calories in 2 hot dogs and 3 cups of cottage cheese is 960 calories. The total number of calories in 5 hot dogs and 2 cups of cottage cheese is 1190 calories. How many calories are in a hot dog? How many calories are in a cup of cottage cheese?

Answer

Hot dog 150 calories, cup of cottage cheese 220 calories

23. Molly is making strawberry infused water. For each ounce of strawberry juice, she uses three times as many ounces of water as juice. How many ounces of strawberry juice and how many ounces of water does she need to make 64 ounces of strawberry infused water?

24. Owen is making lemonade from concentrate. The number of quarts of water he needs is 4 times the number of quarts of concentrate. How many quarts of water and how many quarts of concentrate does Owen need to make 100 quarts of lemonade?

Answer

Owen will need 80 quarts of water and 20 quarts of concentrate to make 100 quarts of lemonade.

Solve Geometry Applications

In the following exercises, translate to a system of equations and solve.

25. The difference of two complementary angles is 55 degrees. Find the measures of the angles.

26. The difference of two complementary angles is 17 degrees. Find the measures of the angles.

Answer

53.5degrees and 36.5degree.

27. Two angles are complementary. The measure of the larger angle is twelve less than twice the measure of the smaller angle. Find the measures of both angles.

28. Two angles are complementary. The measure of the larger angle is ten more than four times the measure of the smaller angle. Find the measures of both angles.

Answer

16 degrees and 74 degrees

29. The difference of two supplementary angles is 8 degrees. Find the measures of the angles.

30. The difference of two supplementary angles is 88 degrees. Find the measures of the angles.

Answer

134 degrees and 46 degrees

31. Two angles are supplementary. The measure of the larger angle is four more than three times the measure of the smaller angle. Find the measures of both angles.

32. Two angles are supplementary. The measure of the larger angle is five less than four times the measure of the smaller angle. Find the measures of both angles.

Answer

37 degrees and 143 degrees

33. The measure of one of the small angles of a right triangle is 14 more than 3 times the measure of the other small angle. Find the measure of both angles.

34. The measure of one of the small angles of a right triangle is 26 more than 3 times the measure of the other small angle. Find the measure of both angles.

Answer

16° and 74°

35. The measure of one of the small angles of a right triangle is 15 less than twice the measure of the other small angle. Find the measure of both angles.

36. The measure of one of the small angles of a right triangle is 45 less than twice the measure of the other small angle. Find the measure of both angles.

Answer

45° and 45°

37. Wayne is hanging a string of lights 45 feet long around the three sides of his patio, which is adjacent to his house. The length of his patio, the side along the house, is five feet longer than twice its width. Find the length and width of the patio.

38. Darrin is hanging 200 feet of Christmas garland on the three sides of fencing that enclose his front yard. The length is five feet less than three times the width. Find the length and width of the fencing.

Answer

Width is 41 feet and length is 118 feet.

39. A frame around a family portrait has a perimeter of 90 inches. The length is fifteen less than twice the width. Find the length and width of the frame.

40. The perimeter of a toddler play area is 100 feet. The length is ten more than three times the width. Find the length and width of the play area.

Answer

Width is 10 feet and length is 40 feet.

Solve Uniform Motion Applications

In the following exercises, translate to a system of equations and solve.

41. Sarah left Minneapolis heading east on the interstate at a speed of 60 mph. Her sister followed her on the same route, leaving two hours later and driving at a rate of 70 mph. How long will it take for Sarah's sister to catch up to Sarah?

42. College roommates John and David were driving home to the same town for the holidays. John drove 55 mph, and David, who left an hour later, drove 60 mph. How long will it take for David to catch up to John?

Answer

11 hours

43. At the end of spring break, Lucy left the beach and drove back towards home, driving at a rate of 40 mph. Lucy's friend left the beach for home 30 minutes (half an hour) later, and drove 50 mph. How long did it take Lucy's friend to catch up to Lucy?

44. Felecia left her home to visit her daughter driving 45 mph. Her husband waited for the dog sitter to arrive and left home twenty minutes (1/3 hour) later. He drove 55 mph to catch up to Felecia. How long before he reaches her?

Answer

1.5 hour

45. The Jones family took a 12-mile canoe ride down the Indian River in two hours. After lunch, the return trip back up the river took three hours. Find the rate of the canoe in still water and the rate of the current.

46. A motor boat travels 60 miles down a river in three hours but takes five hours to return upstream. Find the rate of the boat in still water and the rate of the current.

Answer

Boat rate is 16 mph and current rate is 4 mph.

47. A motor boat traveled 18 miles down a river in two hours but going back upstream, it took 4.54.5 hours due to the current. Find the rate of the motor boat in still water and the rate of the current. (Round to the nearest hundredth.)

48. A river cruise boat sailed 80 miles down the Mississippi River for four hours. It took five hours to return. Find the rate of the cruise boat in still water and the rate of the current.

Answer

Boat rate is 18 mph and current rate is 2 mph.

49. A small jet can fly 1072 miles in 4 hours with a tailwind but only 848 miles in 4 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

50. A small jet can fly 1435 miles in 5 hours with a tailwind but only 1,215 miles in 5 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

Jet rate is 265 mph and wind speed is 22 mph.

51. A commercial jet can fly 868 miles in 2 hours with a tailwind but only 792 miles in 2 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

52. A commercial jet can fly 1,320 miles in 3 hours with a tailwind but only 1170 miles in 3 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

Answer

Jet rate is 415 mph and wind speed is 25 mph.

Writing Exercises

53. Write an application problem similar to Example. Then translate to a system of equations and solve it.\

54. Write a uniform motion problem similar to Example that relates to where you live with your friends or family members. Then translate to a system of equations and solve it.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve direct translation applications.			
solve geometry applications.			
solve uniform motion applications.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 11.2E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

11.3: Solve Mixture Applications with Systems of Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve mixture applications
- Solve interest applications
- Solve applications of cost and revenue functions

Before you get started, take this readiness quiz.

1. Multiply: $4.025(1,562)$
   If you missed this problem, review [link].
2. Write 8.2% as a decimal.
   If you missed this problem, review [link].
3. Earl's dinner bill came to $32.50 and he wanted to leave an 18% tip. How much should the tip be?
   If you missed this problem, review [link].

Solve Mixture Applications

Mixture application involve combining two or more quantities. When we solved mixture applications with coins and tickets earlier, we started by creating a table so we could organize the information. For a coin example with nickels and dimes, the table looked like this:

	Number •	Value =	Total Value
nickels			
dimes			

Using one variable meant that we had to relate the number of nickels and the number of dimes. We had to decide if we were going to let n be the number of nickels and then write the number of dimes in terms of n, or if we would let d be the number of dimes and write the number of nickels in terms of d.

Now that we know how to solve systems of equations with two variables, we'll just let n be the number of nickels and d be the number of dimes. We'll write one equation based on the total value column, like we did before, and the other equation will come from the number column.

For the first example, we'll do a ticket problem where the ticket prices are in whole dollars, so we won't need to use decimals just yet.

Example 11.3.1

Translate to a system of equations and solve:

A science center sold 1,363 tickets on a busy weekend. The receipts totaled $12,146. How many $12 adult tickets and how many $7 child tickets were sold?

Answer

Step 1. Read the problem.	We will create a table to organize the information.
Step 2. Identify what we are looking for.	We are looking for the number of adult tickets and the number of child tickets sold.
Step 3. Name what we are looking for.	Let $a =$ the number of adult tickets. $c =$ the number of child tickets
A table will help us organize the data. We have two types of tickets, adult and child.	Write in a and c for the number of tickets.

Write the total number of tickets sold at the bottom of the Number column.	Altogether 1,363 were sold.
Write the value of each type of ticket in the Value column.	The value of each adult ticket is \$12. The value of each child tickets is \$7.
The number times the value gives the total value, so the total value of adult tickets is $a \cdot 12 = 12a$, and the total value of child tickets is $c \cdot 7 = 7c$.	Fill in the Total Value column.
Altogether the total value of the tickets was \$12,146.	<table><tr><th>Type</th><th>Number</th><th>•</th><th>Value</th><th>=</th><th>Total Value</th></tr><tr><td>adult</td><td>a</td><td></td><td>12</td><td></td><td>$11a$</td></tr><tr><td>child</td><td>c</td><td></td><td>7</td><td></td><td>$8c$</td></tr><tr><td></td><td>1,363</td><td></td><td></td><td></td><td>12,146</td></tr></table>
Step 4. Translate into a system of equations.	
The Number column and the Total value column give us the system of equations.	$\begin{cases} a + c = 1{,}363 \\ 12a + 7c = 12{,}146 \end{cases}$
We will use the elimination method to solve this system. Multiply the first equation by -7.	$\begin{cases} -7(a + c) = -7(1{,}363) \\ 12a + 7c = 12{,}146 \end{cases}$
Simplify and add, then solve for a.	$\begin{array}{rl} -7a - 7c = & -9{,}541 \\ 12a + 7c = & 12{,}146 \\ \hline 5a = & 2{,}605 \\ a = & 521 \end{array}$
Substitute $a = 521$ into the first equation, then solve for c.	$\begin{aligned} a + c &= 1{,}363 \\ 521 + c &= 1{,}363 \\ c &= 842 \end{aligned}$
Step 6. Check the answer in the problem. 521 adult at \$12 per ticket makes \$ 6,252 842 child at \$7 per ticket makes \$58,994 The total receipts are \$12,146✓	
Step 7. Answer the question.	The science center sold 521 adult tickets and 842 child tickets.

Example 11.3.2

Translate to a system of equations and solve:

The ticket office at the zoo sold 553 tickets one day. The receipts totaled \$3,936. How many \$9 adult tickets and how many \$6 child tickets were sold?

Answer

206 adults, 347 children

Example 11.3.3

Translate to a system of equations and solve:

The box office at a movie theater sold 147 tickets for the evening show, and receipts totaled \$1,302. How many \$11 adult and how many \$8 child tickets were sold?

Answer

42 adults, 105 children

In the next example, we'll solve a coin problem. Now that we know how to work with systems of two variables, naming the variables in the 'number' column will be easy.

Example 11.3.4

Translate to a system of equations and solve:

Juan has a pocketful of nickels and dimes. The total value of the coins is \$8.10. The number of dimes is 9 less than twice the number of nickels. How many nickels and how many dimes does Juan have?

Answer

Step 1. Read the problem. We will create a table to organize the information.	
Step 2. Identify what we are looking for.	We are looking for the number of nickels and the number of dimes.
Step 3. Name what we are looking for.	Let $n =$ the number of nickels. $d =$ the number of dimes
A table will help us organize the data. We have two types of coins, nickels and dimes.	Write *n* and *d* for the number of each type of coin.
Fill in the Value column with the value of each type of coin.	The value of each nickel is \$0.05. The value of each dime is \$0.10.
The number times the value gives the total value, so, the total value of the nickels is $n(0.05) = 0.05n$ and the total value of dimes is $d(0.10) = 0.10d$. Altogether the total value of the coins is \$8.10.	**Type** | **Number** • **Value** = **Total Value** nickels | n | 0.05 | $0.05n$ dimes | d | 0.10 | $0.10d$ | | | 8.10
Step 4. Translate into a system of equations.	
The Total Value column gives one equation.	$0.05n + 0.10d = 8.10$
We also know the number of dimes is 9 less than twice the number of nickels.	
Translate to get the second equation.	$d = 2n - 9$
Now we have the system to solve.	$\begin{cases} 0.05n + 0.10d = 8.10 \\ d = 2n - 9 \end{cases}$
Step 5. Solve the system of equations We will use the substitution method.	
Substitute $d = 2n - 9$ into the first equation.	$0.05n + 0.10d = 8.10$ $0.05n + 0.10(2n - 9) = 8.10$
Simplify and solve for *n*.	$0.05n + 0.2n - 0.90 = 8.10$ $0.25n - 0.90 = 8.10$ $0.25n = 9.00$ $n = 36$
To find the number of dimes, substitute $n = 36$ into the second equation.	$d = 2n - 9$ $d = 2 \cdot 36 - 9$ $d = 63$

Step 6. Check the answer in the problem 63 dimes at $\$0.10 = \$6.30$ 36 nickels at $\$0.05 = \$1.80$ Total $= \$8.10$✓	
Step 7. Answer the question.	Juan has 36 nickels and 63 dimes.

Example 11.3.5

Translate to a system of equations and solve:

Matilda has a handful of quarters and dimes, with a total value of $8.55. The number of quarters is 3 more than twice the number of dimes. How many dimes and how many quarters does she have?

Answer

13 dimes and 29 quarters

Example 11.3.6

Translate to a system of equations and solve:

Priam has a collection of nickels and quarters, with a total value of $7.30. The number of nickels is six less than three times the number of quarters. How many nickels and how many quarters does he have?

Answer

19 quarters and 51 nickels

Some mixture applications involve combining foods or drinks. Example situations might include combining raisins and nuts to make a trail mix or using two types of coffee beans to make a blend.

Example 11.3.7

Translate to a system of equations and solve:

Carson wants to make 20 pounds of trail mix using nuts and chocolate chips. His budget requires that the trail mix costs him $7.60. per pound. Nuts cost $9.00 per pound and chocolate chips cost $2.00 per pound. How many pounds of nuts and how many pounds of chocolate chips should he use?

Answer

Step 1. Read the problem. We will create a table to organize the information.	
Step 2. Identify what we are looking for.	We are looking for the number of pounds of nuts and the number of pounds of chocolate chips.
Step 3. Name what we are looking for.	Let $n =$ the number of pound of nuts. $c =$ the number of pounds of chips
Carson will mix nuts and chocolate chips to get trail mix. Write in n and c for the number of pounds of nuts and chocolate chips.	

Type	Number of pounds	• Value	= Total Value
Nuts	n	9.00	$9n$
Chocolate chips	c	2.00	$2c$
Trail mix	20	7.60	$7.60(20) = 152$

There will be 20 pounds of trail mix. Put the price per pound of each item in the Value column. Fill in the last column using $\text{Number} \bullet \text{Value} = \text{Total Value}$	
Step 4. Translate into a system of equations. We get the equations from the Number and Total Value columns.	$\begin{cases} n + c = 20 \\ 9n + 2c = 152 \end{cases}$
Step 5. Solve the system of equations We will use elimination to solve the system. Multiply the first equation by -2 to eliminate c.	$\begin{cases} -2(n + c) = -2(20) \\ 9n + 2c = 152 \end{cases}$
Simplify and add. Solve for n.	$\begin{cases} -2n - 2c = -40 \\ 9n + 2c = 152 \end{cases}$ $7n = 112$ $n = 16$
To find the number of pounds of chocolate chips, substitute $n = 16$ into the first equation, then solve for c.	$n + c = 20$ $16 + c = 20$ $c = 4$
Step 6. Check the answer in the problem. $16 + 4 = 20\checkmark$ $9 \cdot 16 + 2 \cdot 4 = 152\checkmark$	
Step 7. Answer the question.	Carson should mix 16 pounds of nuts with 4 pounds of chocolate chips to create the trail mix.

Example 11.3.8

Translate to a system of equations and solve:

Greta wants to make 5 pounds of a nut mix using peanuts and cashews. Her budget requires the mixture to cost her \$6 per pound. Peanuts are \$4 per pound and cashews are \$9 per pound. How many pounds of peanuts and how many pounds of cashews should she use?

Answer

3 pounds peanuts and 2 pounds cashews

Example 11.3.9

Translate to a system of equations and solve:

Sammy has most of the ingredients he needs to make a large batch of chili. The only items he lacks are beans and ground beef. He needs a total of 20 pounds combined of beans and ground beef and has a budget of \$3 per pound. The price of beans is \$1 per pound and the price of ground beef is \$5 per pound. How many pounds of beans and how many pounds of ground beef should he purchase?

Answer

10 pounds of beans, 10 pounds of ground beef

Another application of mixture problems relates to concentrated cleaning supplies, other chemicals, and mixed drinks. The concentration is given as a percent. For example, a 20% concentrated household cleanser means that 20% of the total amount is

cleanser, and the rest is water. To make 35 ounces of a 20% concentration, you mix 7 ounces (20% of 35) of the cleanser with 28 ounces of water.

For these kinds of mixture problems, we'll use "percent" instead of "value" for one of the columns in our table.

? Example 11.3.10

Translate to a system of equations and solve:

Sasheena is lab assistant at her community college. She needs to make 200 milliliters of a 40% solution of sulfuric acid for a lab experiment. The lab has only 25% and 50% solutions in the storeroom. How much should she mix of the 25% and the 50% solutions to make the 40% solution?

Answer

Step 1. Read the problem. A figure may help us visualize the situation, then we will create a table to organize the information.	Sasheena must mix some of the 25 solution and some of the 50 solution together to get 200 ml of the 40 solution.
	Step 2. Identify what we are looking for.	We are looking for how much of each solution she needs.
Step 3. Name what we are looking for.	Let $x =$ number of ml of 25 \(y= \text{number of }ml\text{ of }50%\text{ solution}\)
A table will help us organize the data. She will mix x ml of 25 with y ml of 50 to get 200 ml of 40 solution. We write the percents as decimals in the chart. We multiply the number of units times the concentration to get the total amount of sulfuric acid in each solution.	

Type	Number of units	• Concentration %	= Amount
25%	x	0.25	$0.25x$
50%	y	0.50	$0.50y$
40%	200	0.40	$0.40(200)$

Step 4. Translate into a system of equations. We get the equations from the Number column and the Amount column. Now we have the system.	$\begin{cases} x + y = 200 \\ 0.25x + 0.50y = 0.40(200) \end{cases}$
Step 5. Solve the system of equations We will solve the system by elimination. Multiply the first equation by -0.5 to eliminate y.	$\begin{cases} -0.5(x + y) = -0.5(200) \\ 0.25x + 0.50y = 80 \end{cases}$
Simplify and add to solve for x.	$\begin{array}{rcl} -0.5x - 0.5y &=& -100 \\ 0.25x + 0.5y &=& 80 \\ \hline -0.25x &=& -20 \\ x &=& 80 \end{array}$
To solve for y, substitute $x = 80$ into the first equation.	$\begin{aligned} x + y &= 200 \\ 80 + y &= 200 \\ y &= 120 \end{aligned}$

Step 6. Check the answer in the problem. $80+120 = 200$✓ $0.25(80)+0.50(120) = 200$✓ Yes!	
Step 7. Answer the question.	Sasheena should mix 80 ml of the 25 solution with 120 ml of the 50 solution to get the 200 ml of the 40 solution.

? Example 11.3.11

Translate to a system of equations and solve:

LeBron needs 150 milliliters of a 30% solution of sulfuric acid for a lab experiment but only has access to a 25% and a 50% solution. How much of the 25% and how much of the 50% solution should he mix to make the 30% solution?

Answer

120 ml of 25% solution and 30 ml of 50% solution

? Example 11.3.12

Translate to a system of equations and solve:

Anatole needs to make 250 milliliters of a 25% solution of hydrochloric acid for a lab experiment. The lab only has a 10% solution and a 40% solution in the storeroom. How much of the 10% and how much of the 40% solutions should he mix to make the 25% solution?

Answer

125 ml of 10% solution and 125 ml of 40% solution

Solve Interest Applications

The formula to model simple interest applications is $I = Prt$. Interest, I, is the product of the principal, P, the rate, r, and the time, t. In our work here, we will calculate the interest earned in one year, so t will be 1.

We modify the column titles in the mixture table to show the formula for interest, as you'll see in the next example.

Translate to a system of equations and solve:

Adnan has $40,000 to invest and hopes to earn 7.1 interest per year. He will put some of the money into a stock fund that earns 8% per year and the rest into bonds that earns 3% per year. How much money should he put into each fund?

Answer

Step 1. Read the problem.	A chart will help us organize the information.
Step 2. Identify what we are looking for.	We are looking for the amount to invest in each fund.
Step 3. Name what we are looking for.	Let $s =$ the amount invested in stocks. $b =$ the amount invested in stocks
Write the interest rate as a decimal for each fund. Multiply: Principal · Rate · Time	

Account	Principal •	Rate •	Time =	Interest
Stock fund	s	0.08	1	$0.08s$
Bonds	b	0.03	1	$0.03b$
Total	40,000	0.071		$0.071(40{,}000)$

Step 4. Translate into a system of equations. We get our system of equations from the Principal column and the Interest column.	$\begin{cases} s+b=40{,}000 \\ 0.08s+0.03b=0.071(40{,}000) \end{cases}$
Step 5. Solve the system of equations by elimination. Multiply the top equation by -0.03.	$\begin{cases} -0.03(s+b)=-0.03(40{,}000) \\ 0.08s+0.03b=2{,}840 \end{cases}$
Simplify and add to solve for s.	$\begin{cases} -0.03s-0.03b=-1{,}200 \\ 0.08s+0.03b=2{,}840 \end{cases}$ $0.05s=1{,}640$ $s=32{,}800$
To find b, substitute $s = 32{,}800$ into the first equation.	$s+b=40{,}000$ $32{,}800+b=40{,}000$ $b=7{,}200$
Step 6. Check the answer in the problem.	We leave the check to you.
Step 7. Answer the question.	Adnan should invest \$32,800 in stock and \$7,200 in bonds.

Did you notice that the Principal column represents the total amount of money invested while the Interest column represents only the interest earned? Likewise, the first equation in our system, $s+b=40,000$, represents the total amount of money invested and the second equation, $0.08s+0.03b=0.071(40,000)$represents the interest earned.

Example 11.3.14

Translate to a system of equations and solve:

Leon had \$50,000 to invest and hopes to earn 6.2 interest per year. He will put some of the money into a stock fund that earns 7% per year and the rest in to a savings account that earns 2% per year. How much money should he put into each fund?

Answer

\$42,000 in the stock fund and \$8000 in the savings account

Example 11.3.15

Translate to a system of equations and solve:

Julius invested \$7000 into two stock investments. One stock paid 11% interest and the other stock paid 13% interest. He earned 12.5 interest on the total investment. How much money did he put in each stock?

Answer

\$1750 at 11% and \$5250 at 13%

The next example requires that we find the principal given the amount of interest earned.

Example 11.3.16

Translate to a system of equations and solve:

Rosie owes \$21,540 on her two student loans. The interest rate on her bank loan is 10.5 and the interest rate on the federal loan is 5.9. The total amount of interest she paid last year was $\$1,669.68$ What was the principal for each loan?

Answer

Step 1. Read the problem.	A chart will help us organize the information.
Step 2. Identify what we are looking for.	We are looking for the principal of each loan.
Step 3. Name what we are looking for.	Let $b =$ the principal for the bank loan. $f =$ the principal on the federal loan
The total loans are $21,540.	
Record the interest rates as decimals in the chart. Multiply using the formula $I = Prt$ to get the Interest.	

Account	Principal	• Rate	• Time	= Interest
Bank	b	0.105	1	$0.105b$
Federal	f	0.059	1	$0.059f$
Total	21,540			1669.68

Step 4. Translate into a system of equations. The system of equations comes from the Principal column and the Interest column.	$b + f = 21{,}540$ $0.105b + 0.059f = 1669.68$
Step 5. Solve the system of equations We will use substitution to solve. Solve the first equation for b.	$b + f = 21{,}540$ $b = -f + 21{,}540$
	$0.105b + 0.059f = 1669.68$
Substitute $b = -f + 21.540$ into the second equation.	$0.105(-f + 21{,}540) + 0.059f = 1669.68$ $-0.105f + 2261.70 + 0.059f = 1669.68$
Simplify and solve for f.	$-0.046f + 2261.70 = 1669.68$ $-0.046f = -592.02$ $f = 12{,}870$
To find b, substitute $f = 12{,}870$ into the first equation.	$b + f = 21{,}540$ $b + 12{,}870 = 21{,}540$ $b = 8{,}670$
Step 6. Check the answer in the problem.	We leave the check to you.
Step 7. Answer the question.	The principal of the federal loan was $12,870 and the principal for the bank loan was $8,670.

Example 11.3.17

Translate to a system of equations and solve:

Laura owes $18,000 on her student loans. The interest rate on the bank loan is 2.5% and the interest rate on the federal loan is 6.9%. The total amount of interest she paid last year was $1,066. What was the principal for each loan?

Answer

Bank $4,000; Federal $14,000

Example 11.3.18

Translate to a system of equations and solve:

Jill's Sandwich Shoppe owes $65,200 on two business loans, one at 4.5% interest and the other at 7.2% interest. The total amount of interest owed last year was $3,582. What was the principal for each loan?

Answer

$41,200 at 4.5%, $24,000 at 7.2%

Solve applications of cost and revenue functions

Suppose a company makes and sells *x* units of a product. The cost to the company is the total costs to produce *x* units. This is the cost to manufacture for each unit times *x*, the number of units manufactured, plus the fixed costs.

The **revenue** is the money the company brings in as a result of selling *x* units. This is the selling price of each unit times the number of units sold.

When the costs equal the revenue we say the business has reached the **break-even point**.

COST AND REVENUE FUNCTIONS

The **cost function** is the cost to manufacture each unit times *x*, the number of units manufactured, plus the fixed costs.

$$C(x) = (\text{cost per unit}) \cdot x + \text{fixed costs}$$

The **revenue** function is the selling price of each unit times *x*, the number of units sold.

$$R(x) = (\text{selling price per unit}) \cdot x$$

The **break-even point** is when the revenue equals the costs.

$$C(x) = R(x)$$

Example 11.3.19

The manufacturer of a weight training bench spends $105 to build each bench and sells them for $245. The manufacturer also has fixed costs each month of $7,000.

ⓐ Find the cost function *C* when *x* benches are manufactured.

ⓑ Find the revenue function *R* when *x* benches are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ The manufacturer has $7,000 of fixed costs no matter how many weight training benches it produces. In addition to the fixed costs, the manufacturer also spends $105 to produce each bench. Suppose *x* benches are sold.

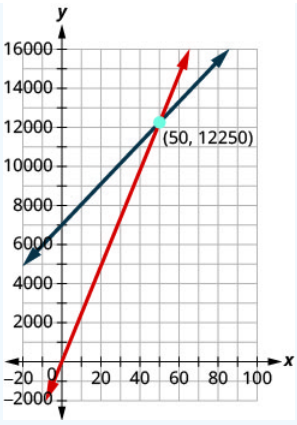
Write the general Cost function formula.	$C(x) = (\text{cost per unit}) \cdot x + \text{fixed costs}$
Substitute in the cost values.	$C(x) = 105x + 7000$

ⓑ The manufacturer sells each weight training bench for $245. We get the total revenue by multiplying the revenue per unit times the number of units sold.

Write the general Revenue function.	$C(x) = (\text{selling price per unit}) \cdot x$
Substitute in the revenue per unit.	$R(x) = 245x$

ⓒ Essentially we have a system of linear equations. We will show the graph of the system as this helps make the idea of a break-even point more visual.

$$\begin{cases} C(x) = 105x + 7000 \\ R(x) = 245x \end{cases} \quad \text{or} \quad \begin{cases} y = 105x + 7000 \\ y = 245x \end{cases}$$



ⓓ To find the actual value, we remember the break-even point occurs when costs equal revenue.

Write the break-even formula. $C(x) = R(x)$

Solve.
$$105x + 7000 = 245x$$
$$7000 = 140x$$
$$50 = x$$

When 50 benches are sold, the costs equal the revenue.

$C(x) = 105x + 7000$	$R(x) = 245x$
$C(50) = 105(50) + 7000$	$R(50) = 245 \cdot 50$
$C(50) = 12{,}250$	$R(50) = 12{,}250$

When 50 benches are sold, the revenue and costs are both \$12,250. Notice this corresponds to the ordered pair $(50, 12250)$

Example 11.3.20

The manufacturer of a weight training bench spends \$15 to build each bench and sells them for \$32. The manufacturer also has fixed costs each month of \$25,500.

ⓐ Find the cost function C when x benches are manufactured.

ⓑ Find the revenue function R when x benches are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

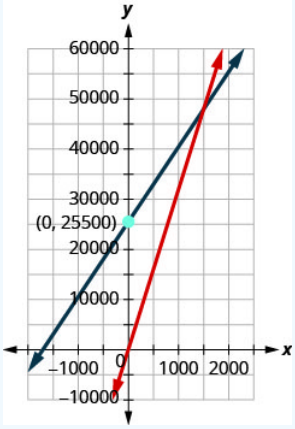
ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ $C(x) = 15x + 25,500$

ⓑ $R(x) = 32x$

ⓒ



ⓓ 1,5001,500; when 1,500 benches are sold, the cost and revenue will be both 48,000

Example 11.3.21

The manufacturer of a weight training bench spends $120 to build each bench and sells them for $170. The manufacturer also has fixed costs each month of $150,000.

ⓐ Find the cost function C when x benches are manufactured.

ⓑ Find the revenue function R when x benches are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

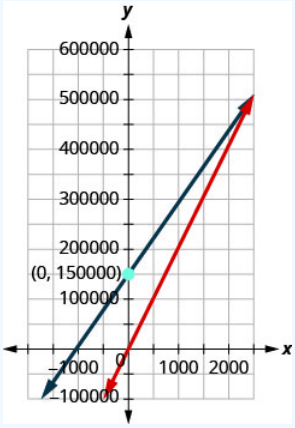
ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ $C(x) = 120x + 150,000$

ⓑ $R(x) = 170x$

ⓒ



ⓓ $3,000$; when 3,000 benches are sold, the revenue and costs are both $510,000

Access this online resource for additional instruction and practice with interest and mixtures.

- Interest and Mixtures

Key Concepts

- **Cost function:** The cost function is the cost to manufacture each unit times *x*, the number of units manufactured, plus the fixed costs.

  $C(x) = (\text{cost per unit}) \cdot x + \text{fixed costs}$

- **Revenue:** The revenue function is the selling price of each unit times *x*, the number of units sold.

  $R(x) = (\text{selling price per unit}) \cdot x$

- **Break-even point:** The break-even point is when the revenue equals the costs.

  $C(x) = R(x)$

Glossary

cost function

The cost function is the cost to manufacture each unit times xx, the number of units manufactured, plus the fixed costs; $C(x)$ = (cost per unit)x + fixed costs.

revenue

The revenue is the selling price of each unit times *x*, the number of units sold; $R(x)$ = (selling price per unit)x.

break-even point

The point at which the revenue equals the costs is the break-even point; C(x)=R(x).

11.3E: Exercises

Practice Makes Perfect

Solve Mixture Applications

In the following exercises, translate to a system of equations and solve.

1. Tickets to a Broadway show cost $35 for adults and $15 for children. The total receipts for 1650 tickets at one performance were $47,150. How many adult and how many child tickets were sold?

2. Tickets for the Cirque du Soleil show are $70 for adults and $50 for children. One evening performance had a total of 300 tickets sold and the receipts totaled $17,200. How many adult and how many child tickets were sold?

Answer

110 adult tickets, 190 child tickets

3. Tickets for an Amtrak train cost $10 for children and $22 for adults. Josie paid $1200 for a total of 72 tickets. How many children tickets and how many adult tickets did Josie buy?

4. Tickets for a Minnesota Twins baseball game are $69 for Main Level seats and $39 for Terrace Level seats. A group of sixteen friends went to the game and spent a total of $804 for the tickets. How many of Main Level and how many Terrace Level tickets did they buy?

Answer

6 good seats, 10 cheap seats

5. Tickets for a dance recital cost $15 for adults and $7 dollars for children. The dance company sold 253 tickets and the total receipts were $2771. How many adult tickets and how many child tickets were sold?

6. Tickets for the community fair cost $12 for adults and $5 dollars for children. On the first day of the fair, 312 tickets were sold for a total of $2204. How many adult tickets and how many child tickets were sold?

Answer

92 adult tickets, 220 children tickets

7. Brandon has a cup of quarters and dimes with a total value of $\$3.80$. The number of quarters is four less than twice the number of quarters. How many quarters and how many dimes does Brandon have?

8. Sherri saves nickels and dimes in a coin purse for her daughter. The total value of the coins in the purse is $\$0.95$. The number of nickels is two less than five times the number of dimes. How many nickels and how many dimes are in the coin purse?

Answer

13 nickels, 3 dimes

9. Peter has been saving his loose change for several days. When he counted his quarters and nickels, he found they had a total value $\$13.10$. The number of quarters was fifteen more than three times the number of dimes. How many quarters and how many dimes did Peter have?

10. Lucinda had a pocketful of dimes and quarters with a value of $6.20. The number of dimes is eighteen more than three times the number of quarters. How many dimes and how many quarters does Lucinda have?

Answer

42 dimes, 8 quarters

11. A cashier has 30 bills, all of which are $10 or $20 bills. The total value of the money is $460. How many of each type of bill does the cashier have?

12. A cashier has 54 bills, all of which are $10 or $20 bills. The total value of the money is $910. How many of each type of bill does the cashier have?

Answer

17 $10 bills, 37 $20 bills

13. Marissa wants to blend candy selling for $1.80 per pound with candy costing $1.20 per pound to get a mixture that costs her $1.40 per pound to make. She wants to make 90 pounds of the candy blend. How many pounds of each type of candy should she use?

14. How many pounds of nuts selling for $6 per pound and raisins selling for $3 per pound should Kurt combine to obtain 120 pounds of trail mix that cost him $5 per pound?

Answer

80 pounds nuts and 40 pounds raisins

15. Hannah has to make twenty-five gallons of punch for a potluck. The punch is made of soda and fruit drink. The cost of the soda is $1.79 per gallon and the cost of the fruit drink is $2.49 per gallon. Hannah's budget requires that the punch cost $2.21 per gallon. How many gallons of soda and how many gallons of fruit drink does she need?

16. Joseph would like to make twelve pounds of a coffee blend at a cost of $6 per pound. He blends Ground Chicory at $5 a pound with Jamaican Blue Mountain at $9 per pound. How much of each type of coffee should he use?

Answer

9 pounds of Chicory coffee, 3 pounds of Jamaican Blue Mountain coffee

17. Julia and her husband own a coffee shop. They experimented with mixing a City Roast Columbian coffee that cost $7.80 per pound with French Roast Columbian coffee that cost $8.10 per pound to make a twenty-pound blend. Their blend should cost them $7.92 per pound. How much of each type of coffee should they buy?

18. Twelve-year old Melody wants to sell bags of mixed candy at her lemonade stand. She will mix M&M's that cost $4.89 per bag and Reese's Pieces that cost $3.79 per bag to get a total of twenty-five bags of mixed candy. Melody wants the bags of mixed candy to cost her $4.23 a bag to make. How many bags of M&M's and how many bags of Reese's Pieces should she use?

Answer

10 bags of M&M's, 15 bags of Reese's Pieces

19. Jotham needs 70 liters of a 50% solution of an alcohol solution. He has a 30% and an 80% solution available. How many liters of the 30% and how many liters of the 80% solutions should he mix to make the 50% solution?

20. Joy is preparing 15 liters of a 25% saline solution. She only has 40% and 10% solution in her lab. How many liters of the 40% and how many liters of the 10% should she mix to make the 25% solution?

Answer

7.5 liters of each solution

21. A scientist needs 65 liters of a 15% alcohol solution. She has available a 25% and a 12% solution. How many liters of the 25% and how many liters of the 12% solutions should she mix to make the 15% solution?

22. A scientist needs 120 milliliters of a 20% acid solution for an experiment. The lab has available a 25% and a 10% solution. How many liters of the 25% and how many liters of the 10% solutions should the scientist mix to make the 20% solution?

Answer

80 liters of the 25% solution and 40 liters of the 10% solution

23. A 40% antifreeze solution is to be mixed with a 70% antifreeze solution to get 240 liters of a 50% solution. How many liters of the 40% and how many liters of the 70% solutions will be used?

24. A 90% antifreeze solution is to be mixed with a 75% antifreeze solution to get 360 liters of an 85% solution. How many liters of the 90% and how many liters of the 75% solutions will be used?

Answer

240 liters of the 90% solution and 120 liters of the 75% solution

Solve Interest Applications

In the following exercises, translate to a system of equations and solve.

25. Hattie had $3000 to invest and wants to earn 10.6% interest per year. She will put some of the money into an account that earns 12% per year and the rest into an account that earns 10% per year. How much money should she put into each account?

26. Carol invested $2560 into two accounts. One account paid 8% interest and the other paid 6% interest. She earned 7.25% interest on the total investment. How much money did she put in each account?

Answer

$1600 at 8%, 960 at 6%

27. Sam invested $48,000, some at 6% interest and the rest at 10%. How much did he invest at each rate if he received $4000 in interest in one year?

28. Arnold invested $64,000, some at 5.5% interest and the rest at 9%. How much did he invest at each rate if he received $4500 in interest in one year?

Answer

$28,000 at 9%, $36,000 at 5.5%

29. After four years in college, Josie owes $65, 800 in student loans. The interest rate on the federal loans is 4.5% and the rate on the private bank loans is 2%. The total interest she owes for one year was $2878.50 What is the amount of each loan?

30. Mark wants to invest $10,000 to pay for his daughter's wedding next year. He will invest some of the money in a short term CD that pays 12% interest and the rest in a money market savings account that pays 5% interest. How much should he

invest at each rate if he wants to earn $1095 in interest in one year?

Answer

$8500 CD, $1500 savings account

31. A trust fund worth $25,000 is invested in two different portfolios. This year, one portfolio is expected to earn 5.25% interest and the other is expected to earn 4%. Plans are for the total interest on the fund to be $1150 in one year. How much money should be invested at each rate?

32. A business has two loans totaling $85,000. One loan has a rate of 6% and the other has a rate of 4.5% This year, the business expects to pay $4,650 in interest on the two loans. How much is each loan?

Answer

$55,000 on loan at 6% and $30,000 on loan at 4.5%

Solve Applications of Cost and Revenue Functions

33. The manufacturer of an energy drink spends $1.20 to make each drink and sells them for $2. The manufacturer also has fixed costs each month of $8,000.

ⓐ Find the cost function C when x energy drinks are manufactured.

ⓑ Find the revenue function R when x drinks are sold.

ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid.

ⓓ Find the break-even point. Interpret what the break-even point means.

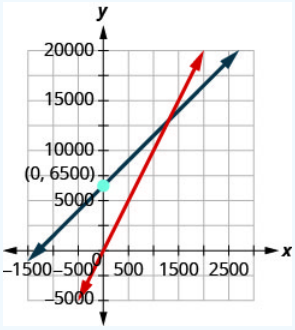
34. The manufacturer of a water bottle spends $5 to build each bottle and sells them for $10. The manufacturer also has fixed costs each month of $6500. ⓐ Find the cost function C when x bottles are manufactured. ⓑ Find the revenue function R when x bottles are sold. ⓒ Show the break-even point by graphing both the Revenue and Cost functions on the same grid. ⓓ Find the break-even point. Interpret what the break-even point means.

Answer

ⓐ $C(x) = 5x + 6500$

ⓑ $R(x) = 10x$

ⓒ



ⓓ 1,500; when 1,500 water bottles are sold, the cost and the revenue equal $15,000

Writing Exercises

35. Take a handful of two types of coins, and write a problem similar to Example relating the total number of coins and their total value. Set up a system of equations to describe your situation and then solve it.

36. In Example, we used elimination to solve the system of equations
$\begin{cases} s+b=40,000 \\ 0.08s+0.03b=0.071(40,000). \end{cases}$
Could you have used substitution or elimination to solve this system? Why?

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve mixture applications.			
solve interest applications.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

11.4: Graphs of Linear Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Verify solutions to an inequality in two variables
- Recognize the relation between the solutions of an inequality and its graph
- Graph linear inequalities

Note

Before you get started, take this readiness quiz.

1. Solve: $4x+3>23$.
   If you missed this problem, review Exercise 2.7.22.
2. Translate from algebra to English: $x<5$.
   If you missed this problem, review Exercise 1.3.1.
3. Evaluate $3x-2y$ when $x=1,\ y=-2$.
   If you missed this problem, review Exercise 1.5.28.

Verify Solutions to an Inequality in Two Variables

We have learned how to solve inequalities in one variable. Now, we will look at inequalities in two variables. Inequalities in two variables have many applications. If you ran a business, for example, you would want your revenue to be greater than your costs—so that your business would make a profit.

LINEAR INEQUALITY

A **linear inequality** is an inequality that can be written in one of the following forms:

$$Ax+By>C \quad Ax+By\geq C \quad Ax+By<C \quad Ax+By\leq C$$

where A and B are not both zero.

Do you remember that an inequality with one variable had many solutions? The solution to the inequality $x>3$ is any number greater than 3. We showed this on the number line by shading in the number line to the right of 3, and putting an open parenthesis at 3. See Figure 11.4.1.

Figure 11.4.1

Similarly, inequalities in two variables have many solutions. Any ordered pair (x,y) that makes the inequality true when we substitute in the values is a solution of the inequality.

Solution OF A LINEAR INEQUALITY

An ordered pair (x,y) is a **solution of a linear inequality** if the inequality is true when we substitute the values of x and y.

Example 11.4.1

Determine whether each ordered pair is a solution to the inequality $y>x+4$:

1. $(0,0)$
2. $(1,6)$
3. $(2,6)$
4. $(-5,-15)$

5. $(-8, 12)$

Solution

1.

$(0, 0)$	$y > x + 4$
Substitute 0 for x and 0 for y.	$0 \stackrel{?}{>} 0 + 4$
Simplify.	$0 \not> 4$ So, $(0, 0)$ is not a solution to $y > x + 4$.

2.

$(1, 6)$	$y > x + 4$
Substitute 1 for x and 6 for y.	$6 \stackrel{?}{>} 1 + 4$
Simplify.	$6 > 5$ So, $(1, 6)$ is a solution to $y > x + 4$.

3.

$(2, 6)$	$y > x + 4$
Substitute 2 for x and 6 for y.	$6 \stackrel{?}{>} 2 + 4$
Simplify.	$6 \not> 6$ So, $(2, 6)$ is not a solution to $y > x + 4$.

4.

$(-5, -15)$	$y > x + 4$
Substitute –5 for x and –15 for y.	$-15 \stackrel{?}{>} -5 + 4$
Simplify.	$-15 \not> -1$ So, $(-5, -15)$ is not a solution to $y > x + 4$.

5.

$(-8,12)$	$y > x + 4$
Substitute –8 for x and 12 for y.	$12 \stackrel{?}{>} -8 + 4$
Simplify.	$12 > -4$ So, $(-8, 12)$ is a solution to $y > x + 4$.

? Try It 11.4.2

Determine whether each ordered pair is a solution to the inequality $y > x - 3$:

1. $(0, 0)$
2. $(4, 9)$
3. $(-2, 1)$
4. $(-5, -3)$
5. $(5, 1)$

Answer

1. yes

2. yes
3. yes
4. yes
5. no

Try It 11.4.3

Determine whether each ordered pair is a solution to the inequality $y < x + 1$:

1. $(0, 0)$
2. $(8, 6)$
3. $(-2, -1)$
4. $(3, 4)$
5. $(-1, -4)$

Answer

1. yes
2. yes
3. no
4. no
5. yes

Recognize the Relation Between the Solutions of an Inequality and its Graph

Now, we will look at how the solutions of an inequality relate to its graph.

Let's think about the number line in Figure 11.4.1 again. The point $x = 3$ separated that number line into two parts. On one side of 3 are all the numbers less than 3. On the other side of 3 all the numbers are greater than 3. See Figure 11.4.2

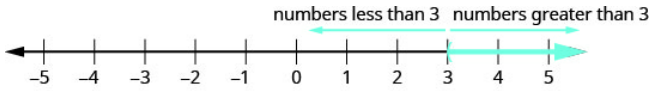

Figure 11.4.2

The solution to $x > 3$ is the shaded part of the number line to the right of $x = 3$.

Similarly, the line $y = x + 4$ separates the plane into two regions. On one side of the line are points with $y < x + 4$. On the other side of the line are the points with $y > x + 4$. We call the line $y = x + 4$ a boundary line.

BOUNDARY LINE

The line with equation $Ax + By = C$ is the **boundary line** that separates the region where $Ax + By > C$ from the region where $Ax + By < C$.

For an inequality in one variable, the endpoint is shown with a parenthesis or a bracket depending on whether or not aa is included in the solution:

Similarly, for an inequality in two variables, the boundary line is shown with a solid or dashed line to indicate whether or not it the line is included in the solution. This is summarized in Table 11.4.1.

Table 11.4.1

$Ax + By < C$	$Ax + By \leq C$
$Ax + By > C$	$Ax + By \geq C$
Boundary line is not included in solution.	Boundary line is included in solution.

Boundary line is dashed.	Boundary line is solid.

Now, let's take a look at what we found in Example 11.4.1. We'll start by graphing the line $y = x + 4$, and then we'll plot the five points we tested. See Figure 11.4.3.

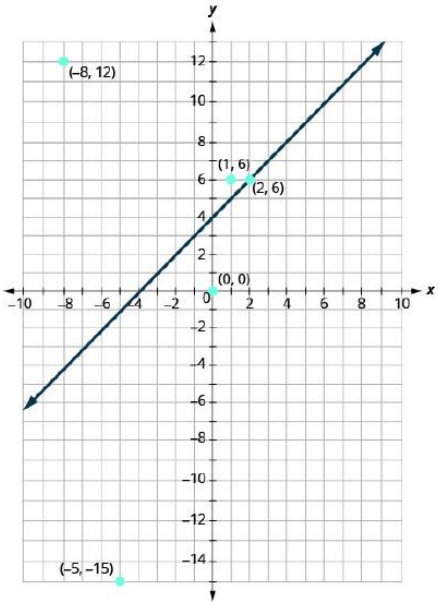

Figure 11.4.3

In Example 11.4.1 we found that some of the points were solutions to the inequality $y > x + 4$ and some were not.

Which of the points we plotted are solutions to the inequality $y > x + 4$? The points $(1, 6)$ and $(-8, 12)$ are solutions to the inequality $y > x + 4$. Notice that they are both on the same side of the boundary line $y = x + 4$.

The two points $(0, 0)$ and $(-5, -15)$ are on the other side of the **boundary line** $y = x + 4$, and they are not solutions to the inequality $y > x + 4$. For those two points, $y < x + 4$.

What about the point $(2, 6)$? Because $6 = 2 + 4$, the point is a solution to the equation $y = x + 4$. So the point $(2, 6)$ is on the boundary line.

Let's take another point on the left side of the boundary line and test whether or not it is a solution to the inequality $y > x + 4$. The point $(0, 10)$ clearly looks to be to the left of the boundary line, doesn't it? Is it a solution to the inequality?

$$\begin{aligned} &y > x + 4 \\ &10 \overset{?}{>} 0 + 4 \\ &10 > 4 \qquad \text{So, } (0, 10) \text{ is a solution to } y > x + 4. \end{aligned} \tag{11.4.1}$$

Any point you choose on the left side of the boundary line is a solution to the inequality $y > x + 4$. All points on the left are solutions.

Similarly, all points on the right side of the boundary line, the side with $(0, 0)$ and $(-5, -15)$, are not solutions to $y > x + 4$. See Figure 11.4.4

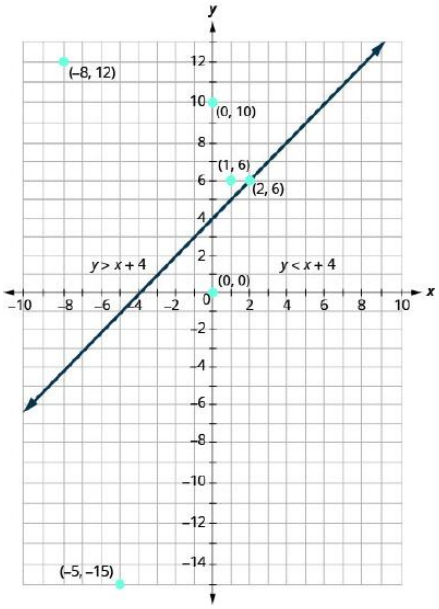

Figure 11.4.4

The graph of the inequality $y > x + 4$ is shown in Figure $11.4.5$ below. The line $y = x + 4$ divides the plane into two regions. The shaded side shows the solutions to the inequality $y > x + 4$.

The points on the boundary line, those where $y = x + 4$, are not solutions to the inequality $y > x + 4$, so the line itself is not part of the solution. We show that by making the line dashed, not solid.

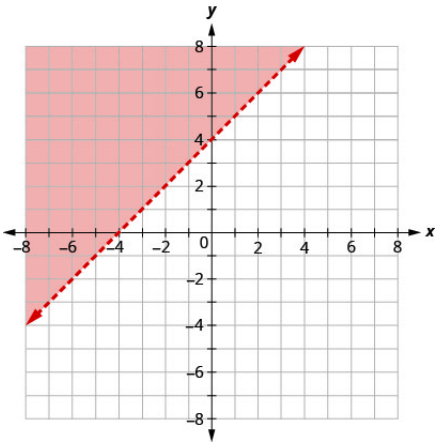

Figure 11.4.5: The graph of the inequality y>x+4.

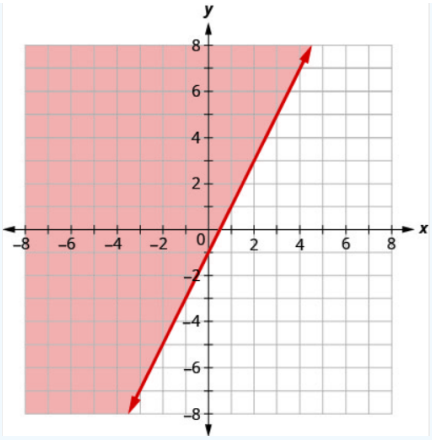
Example 11.4.4

The boundary line shown is $y = 2x - 1$. Write the inequality shown by the graph.

https://math.libretexts.org/@go/page/46289



Solution

The line $y = 2x - 1$ is the boundary line. On one side of the line are the points with $y > 2x - 1$ and on the other side of the line are the points with $y < 2x - 1$.

Let's test the point $(0, 0)$ and see which inequality describes its side of the boundary line.

At $(0, 0)$, which inequality is true:

$$\begin{array}{lll} y > 2x - 1 & \text{or} & y < 2x - 1? \\ y > 2x - 1 & & y < 2x - 1 \\ 0 > 2 \cdot 0 - 1 & & 0 < 2 \cdot 0 - 1 \\ 0 > -1 \text{ True} & & 0 < -1 \text{ False} \end{array} \tag{11.4.2}$$

Since $y > 2x - 1$ is true, the side of the line with $(0, 0)$, is the solution. The shaded region shows the solution of the inequality $y > 2x - 1$.

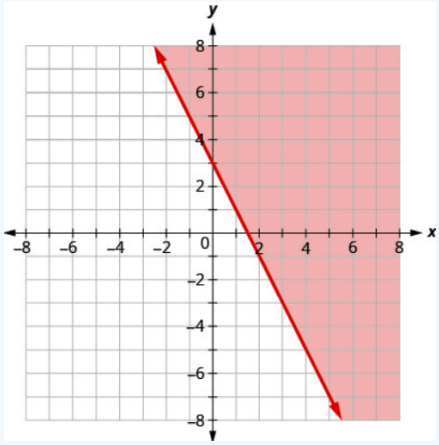
Since the boundary line is graphed with a solid line, the inequality includes the equal sign.

The graph shows the inequality $y \geq 2x - 1$.

We could use any point as a test point, provided it is not on the line. Why did we choose $(0, 0)$? Because it's the easiest to evaluate. You may want to pick a point on the other side of the boundary line and check that $y < 2x - 1$.

? Try It 11.4.5

Write the inequality shown by the graph with the boundary line $y = -2x + 3$.

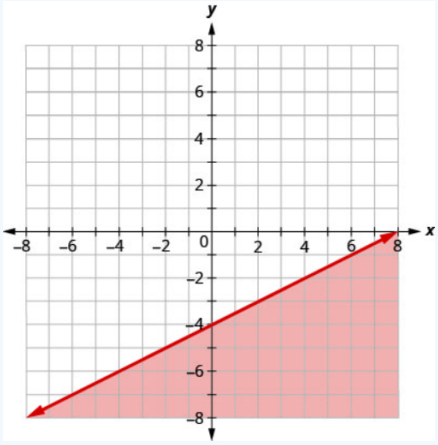


Answer

$y \geq -2x + 3$

Try It 11.4.6

Write the inequality shown by the graph with the boundary line $y = \frac{1}{2}x - 4$.

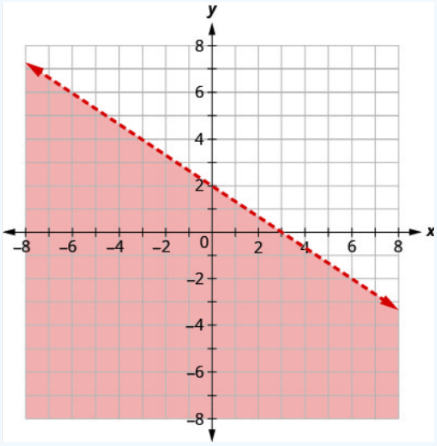


Answer

$y \leq \frac{1}{2}x - 4$

Example 11.4.7

The boundary line shown is $2x + 3y = 6$. Write the inequality shown by the graph.



Solution

The line $2x + 3y = 6$ is the boundary line. On one side of the line are the points with $2x + 3y > 6$ and on the other side of the line are the points with $2x + 3y < 6$.

Let's test the point $(0, 0)$ and see which inequality describes its side of the boundary line.

At $(0, 0)$, which inequality is true:

$$\begin{aligned} 2x + 3y &> 6 \quad \text{or} \quad 2x + 3y < 6? \\ 2x + 3y &> 6 \qquad\quad 2x + 3y < 6 \\ 2(0) + 3(0) &> 6 \qquad\quad 2(0) + 3(0) < 6 \\ 0 &> 6 \quad \text{False} \qquad\quad 0 < 6 \quad \text{True} \end{aligned} \tag{11.4.3}$$

So the side with $(0, 0)$ is the side where $2x + 3y < 6$.

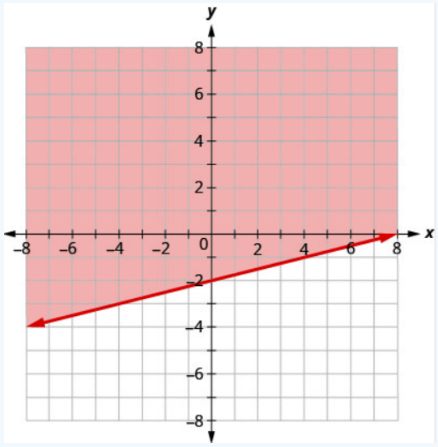
(You may want to pick a point on the other side of the boundary line and check that $2x + 3y > 6$.)

Since the boundary line is graphed as a dashed line, the inequality does not include an equal sign.

The graph shows the solution to the inequality $2x + 3y < 6$.

Try It 11.4.8

Write the inequality shown by the shaded region in the graph with the boundary line $x - 4y = 8$.

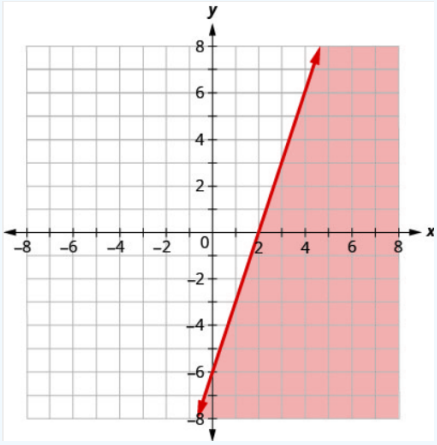


Answer

$x - 4y \leq 8$

Try It 11.4.9

Write the inequality shown by the shaded region in the graph with the boundary line $3x - y = 6$.



Answer

$3x - y \leq 6$

Graph Linear Inequalities

Now, we're ready to put all this together to graph linear inequalities.

Example 11.4.10: How to Graph Linear Inequalities

Graph the **linear inequality** $y \geq \frac{3}{4}x - 2$.

Solution

Step 1. Identify and graph the boundary line. • If the inequality is ≤ or ≥, the boundary line is solid. • If the inequality is < or >, the boundary line is dashed.	Replace the inequality sign with an equal sign to find the boundary line. Graph the boundary line $y = \frac{3}{4}x - 2$. The inequality sign is ≥, so we draw a solid line.	Step 2. Test a point that is not on the boundary line. Is it a solution of the inequality?	We'll test (0, 0). Is it a solution of the inequality?	At (0, 0), is $y \geq \frac{3}{4}x - 2$? $0 \stackrel{?}{\geq} \frac{3}{4}(0) - 2$ $0 \geq -2$ So, (0, 0) is a solution.
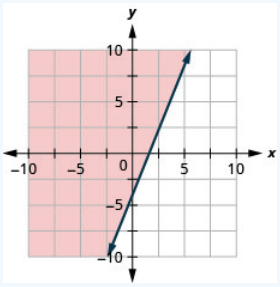
Step 3. Shade in one side of the boundary line. • If the test point is a solution, shade in the side that includes the point. • If the test point is not a solution, shade in the opposite side.	The test point (0, 0), is a solution to $y \geq \frac{3}{4}x - 2$. So we shade in that side.	
Try It 11.4.11

Graph the linear inequality $y \geq \frac{5}{2}x - 4$.

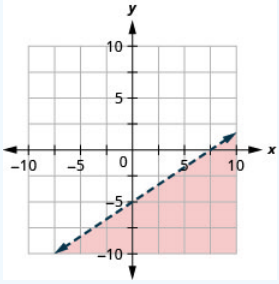
Answer



Try It 11.4.12

Graph the linear inequality $y < \frac{2}{3}x - 5$.

Answer



The steps we take to graph a linear inequality are summarized here.

GRAPH A LINEAR INEQUALITY.

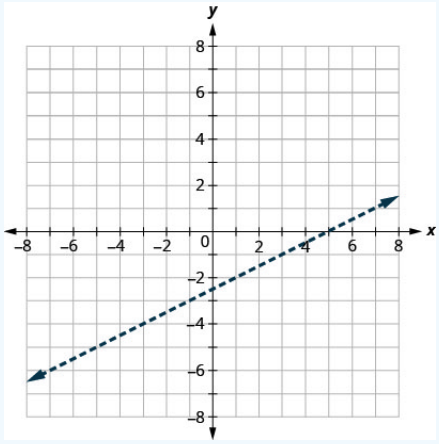
1. Identify and graph the boundary line.
   - If the inequality is $\leq$ or $\geq$, the boundary line is solid.
   - If the inequality is $<$ or $>$, the boundary line is dashed.
2. Test a point that is not on the boundary line. Is it a solution of the inequality?
3. Shade in one side of the boundary line.
   - If the test point is a solution, shade in the side that includes the point.
   - If the test point is not a solution, shade in the opposite side.

Example 11.4.13

Graph the linear inequality $x - 2y < 5$.

Solution

First we graph the boundary line $x - 2y = 5$. The inequality is $<$ so we draw a dashed line.



Then we test a point. We'll use $(0, 0)$ again because it is easy to evaluate and it is not on the boundary line.

Is $(0, 0)$ a solution of $x - 2y < 5$?

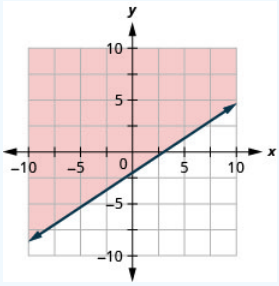
$$0 - 2(0) \stackrel{?}{<} 5$$
$$0 - 0 \stackrel{?}{<} 5$$
$$0 < 5$$

The point $(0, 0)$ is a solution of $x - 2y < 5$, so we shade in that side of the boundary line.

Try It 11.4.14

Graph the linear inequality $2x - 3y \leq 6$.

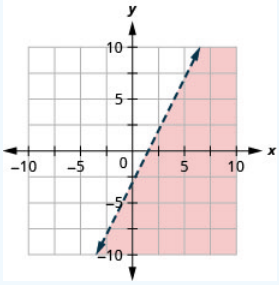
Answer



Try It 11.4.15

Graph the linear inequality $2x - y > 3$.

Answer



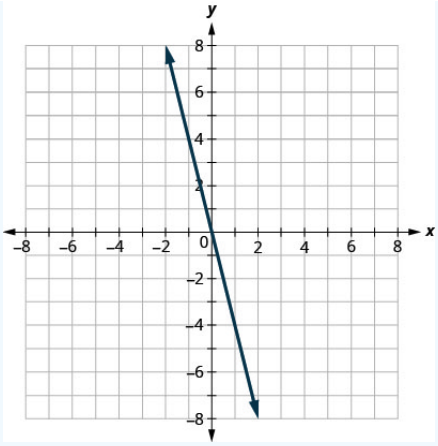
What if the boundary line goes through the origin? Then we won't be able to use $(0, 0)$ as a test point. No problem—we'll just choose some other point that is not on the boundary line.

Example 11.4.16

Graph the linear inequality $y \leq -4x$.

Solution

First we graph the boundary line $y = -4x$. It is in slope–intercept form, with $m = -4$ and $b = 0$. The inequality is $\leq$ so we draw a solid line.



Now, we need a test point. We can see that the point $(1, 0)$ is not on the boundary line.

Is $(1, 0)$ a solution of $y \leq -4x$?

$0 \stackrel{?}{\leq} -4(1)$

$0 \not\leq -4$

The point $(1, 0)$ is not a solution to $y \leq -4x$, so we shade in the opposite side of the boundary line. See Figure 11.4.6

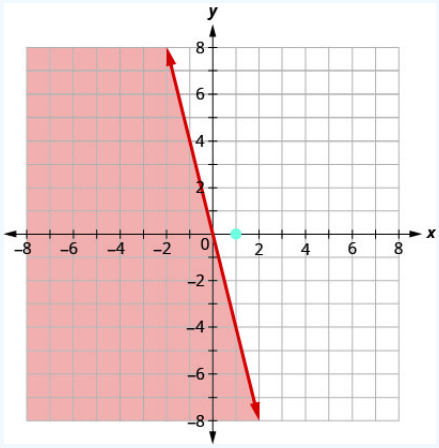


Figure 11.4.6

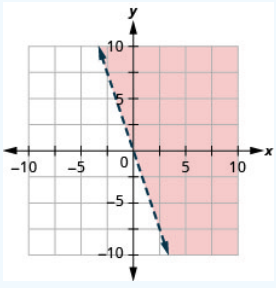
Try It 11.4.17

Graph the linear inequality $y > -3x$.

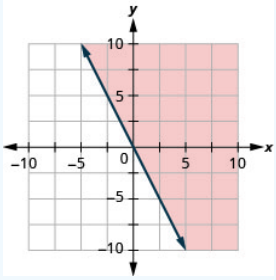
Answer



Try It 11.4.18

Graph the linear inequality $y \geq -2x$.

Answer



Some linear inequalities have only one variable. They may have an x but no y, or a y but no x. In these cases, the boundary line will be either a vertical or a horizontal line. Do you remember?

$x = a$ vertical line
$y = b$ horizontal line

Example 11.4.19

Graph the linear inequality $y > 3$.

Solution

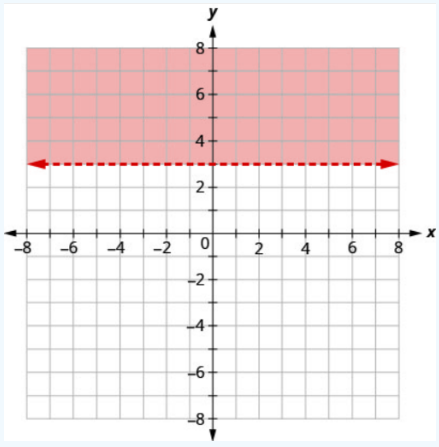
First we graph the boundary line $y = 3$. It is a horizontal line. The inequality is $>$ so we draw a dashed line.

We test the point $(0, 0)$.

$$\begin{aligned} y &> 3 \\ 0 &\not> 3 \end{aligned} \tag{11.4.4}$$

$(0, 0)$ is not a solution to $y > 3$.

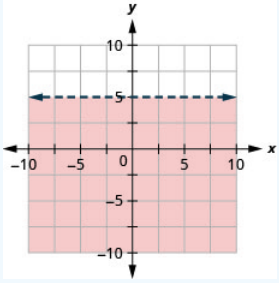
So we shade the side that does not include $(0, 0)$.



Try It 11.4.20

Graph the linear inequality $y < 5$.

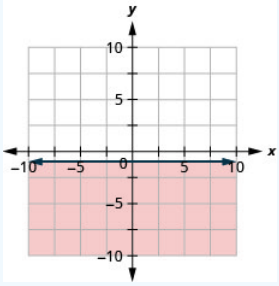
Answer



Try It 11.4.21

Graph the linear inequality $y \leq -1$.

Answer



Key Concepts

- **To Graph a Linear Inequality**
  1. Identify and graph the boundary line.
     If the inequality is $\leq$ or $\geq$, the boundary line is solid.
     If the inequality is $<$ or $>$, the boundary line is dashed.
  2. Test a point that is not on the boundary line. Is it a solution of the inequality?
  3. Shade in one side of the boundary line.
     If the test point is a solution, shade in the side that includes the point.
     If the test point is not a solution, shade in the opposite side.

Glossary

boundary line

The line with equation $Ax + By = C$ that separates the region where $Ax + By > C$ from the region where $Ax + By < C$.

linear inequality

An inequality that can be written in one of the following forms:

$$Ax + By > C \quad Ax + By \geq C \quad Ax + By < C \quad Ax + By \leq C \tag{11.4.5}$$

where A and B are not both zero.

solution of a linear inequality

An ordered pair $(x,\ y)$ is a solution to a linear inequality the inequality is true when we substitute the values of x and y.

11.4E: Exercises

Practice Makes Perfect

Verify Solutions to an Inequality in Two Variables

In the following exercises, determine whether each ordered pair is a solution to the given inequality.

Exercise 11.4E.1

Determine whether each ordered pair is a solution to the inequality $y > x - 1$:

1. $(0, 1)$
2. $(-4, -1)$
3. $(4, 2)$
4. $(3, 0)$
5. $(-2, -3)$

Exercise 11.4E.2

Determine whether each ordered pair is a solution to the inequality $y > x - 3$:

1. $(0, 0)$
2. $(2, 1)$
3. $(-1, -5)$
4. $(-6, -3)$
5. $(1, 0)$

Answer

1. yes
2. no
3. no
4. yes
5. no

Exercise 11.4E.3

Determine whether each ordered pair is a solution to the inequality $y < x + 2$:

1. $(0, 3)$
2. $(-3, -2)$
3. $(-2, 0)$
4. $(0, 0)$
5. $(-1, 4)$

Exercise 11.4E.4

Determine whether each ordered pair is a solution to the inequality $y < x + 5$:

1. $(-3, 0)$
2. $(1, 6)$
3. $(-6, -2)$
4. $(0, 1)$
5. $(5, -4)$

Answer

1. yes
2. no
3. no
4. yes
5. yes

Exercise 11.4E.5

Determine whether each ordered pair is a solution to the inequality $x+y>4$:

1. $(5,1)$
2. $(-2,6)$
3. $(3,2)$
4. $(10,-5)$
5. $(0,0)$

Exercise 11.4E.6

Determine whether each ordered pair is a solution to the inequality $x+y>2$:

1. $(1,1)$
2. $(4,-3)$
3. $(0,0)$
4. $(-8,12)$
5. $(3,0)$

Answer

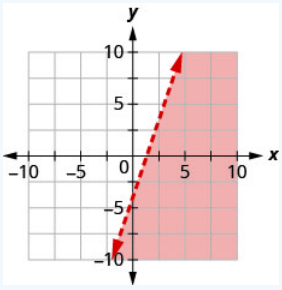
1. no
2. no
3. no
4. yes
5. yes

Recognize the Relation Between the Solutions of an Inequality and its Graph

In the following exercises, write the inequality shown by the shaded region.

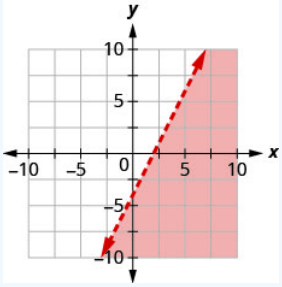
Exercise 11.4E.7

Write the inequality shown by the graph with the boundary line $y=3x-4$.



Exercise 11.4E. 8

Write the inequality shown by the graph with the boundary line $y = 2x - 4$.

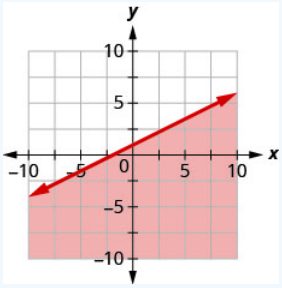


Answer

$y < 2x - 4$

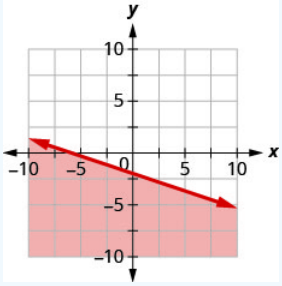
Exercise 11.4E. 9

Write the inequality shown by the graph with the boundary line $y = \frac{1}{2}x + 1$



Exercise 11.4E. 10

Write the inequality shown by the graph with the boundary line $y = -\frac{1}{3}x - 2$



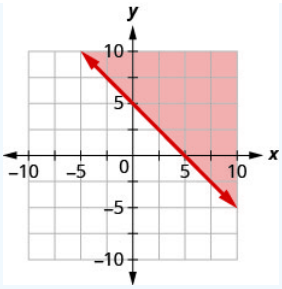
Answer

$y \leq -\frac{1}{3}x - 2$

Exercise 11.4E. 11

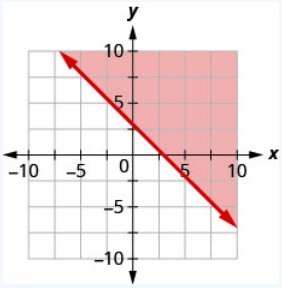
Write the inequality shown by the shaded region in the graph with the boundary line $x + y = 5$.

https://math.libretexts.org/@go/page/46290



Exercise 11.4E.12

Write the inequality shown by the shaded region in the graph with the boundary line $x + y = 3$.

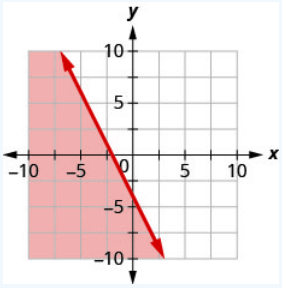


Answer

$x + y \geq 3$

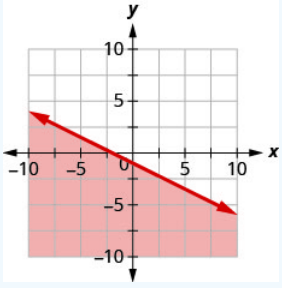
Exercise 11.4E.13

Write the inequality shown by the shaded region in the graph with the boundary line $2x + y = -4$.



Exercise 11.4E.14

Write the inequality shown by the shaded region in the graph with the boundary line $x + 2y = -2$.



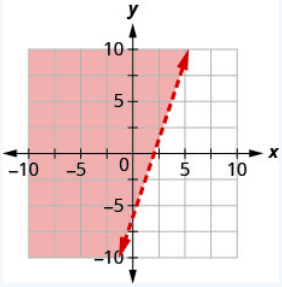
https://math.libretexts.org/@go/page/46290

Answer

$x + 2y \geq -2$

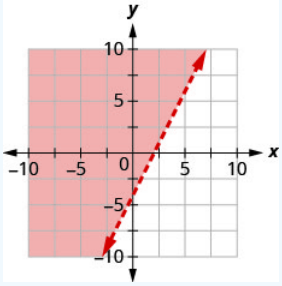
Exercise 11.4E. 15

Write the inequality shown by the shaded region in the graph with the boundary line $3x - y = 6$.



Exercise 11.4E. 16

Write the inequality shown by the shaded region in the graph with the boundary line $2x - y = 4$.

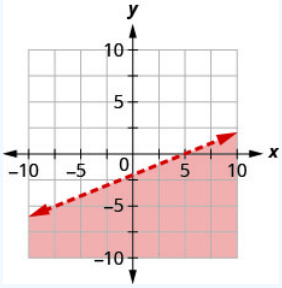


Answer

$2x - y < 4$

Exercise 11.4E. 17

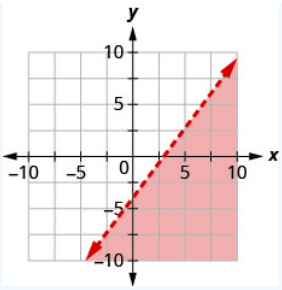
Write the inequality shown by the shaded region in the graph with the boundary line $2x - 5y = 10$.



Exercise 11.4E. 18

Write the inequality shown by the shaded region in the graph with the boundary line $4x - 3y = 12$.

https://math.libretexts.org/@go/page/46290



Answer

$4x - 3y > 12$

Graph Linear Inequalities

In the following exercises, graph each linear inequality.

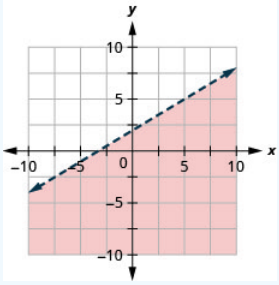
Exercise 11.4E. 19

Graph the linear inequality $y > \frac{2}{3}x - 1$

Exercise 11.4E. 20

Graph the linear inequality $y < \frac{3}{5}x + 2$

Answer



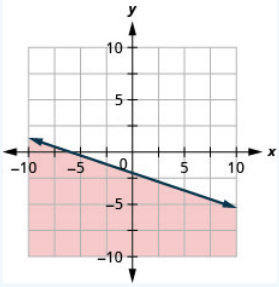
Exercise 11.4E. 21

Graph the linear inequality $y \leq -\frac{1}{2}x + 4$

Exercise 11.4E. 22

Graph the linear inequality $y \geq -\frac{1}{3}x - 2$

Answer



https://math.libretexts.org/@go/page/46290

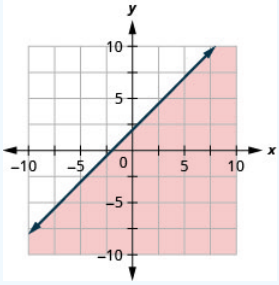
Exercise 11.4E. 23

Graph the linear inequality $x - y \leq 3$

Exercise 11.4E. 24

Graph the linear inequality $x - y \geq -2$

Answer



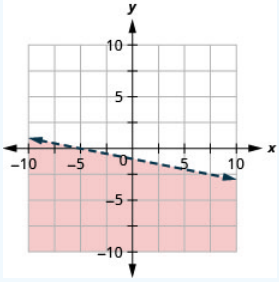
Exercise 11.4E. 25

Graph the linear inequality $4x + y > -4$

Exercise 11.4E. 26

Graph the linear inequality $x + 5y < -5$

Answer



Exercise 11.4E. 27

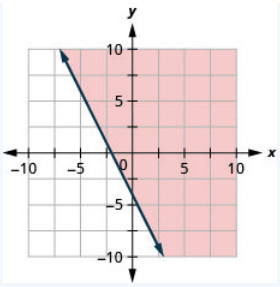
Graph the linear inequality $3x + 2y \geq -6$

Exercise 11.4E. 28

Graph the linear inequality $4x + 2y \geq -8$

Answer

https://math.libretexts.org/@go/page/46290



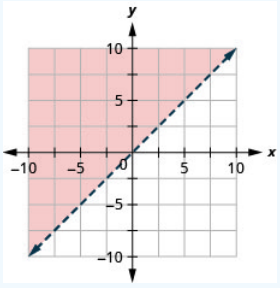
Exercise 11.4E.29

Graph the linear inequality $y > 4x$

Exercise 11.4E.30

Graph the linear inequality $y > x$

Answer



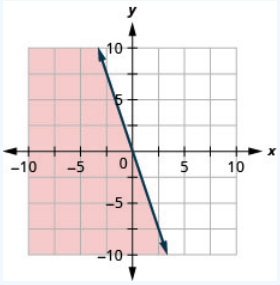
Exercise 11.4E.31

Graph the linear inequality $y \leq -x$

Exercise 11.4E.32

Graph the linear inequality $y \leq -3x$

Answer



Exercise 11.4E.33

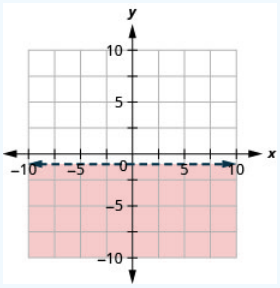
Graph the linear inequality $y \geq -2$

https://math.libretexts.org/@go/page/46290

Exercise $11.4E.34$

Graph the linear inequality $y < -1$

Answer



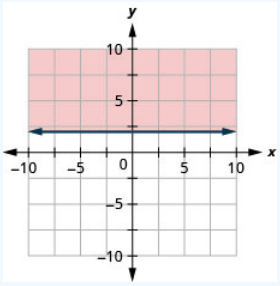
Exercise $11.4E.35$

Graph the linear inequality $y < 4$

Exercise $11.4E.36$

Graph the linear inequality $y \geq 2$

Answer



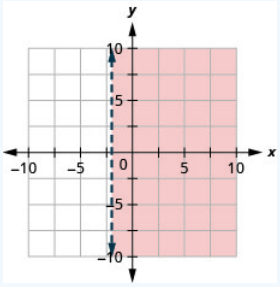
Exercise $11.4E.37$

Graph the linear inequality $x \leq 5$

Exercise $11.4E.38$

Graph the linear inequality $x > -2$

Answer



https://math.libretexts.org/@go/page/46290

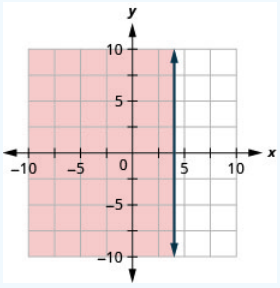
Exercise 11.4E. 39

Graph the linear inequality $x > -3$

Exercise 11.4E. 40

Graph the linear inequality $x \leq 4$

Answer



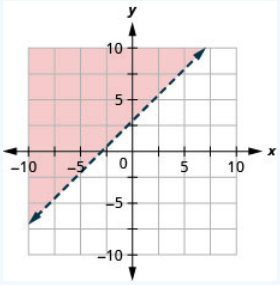
Exercise 11.4E. 41

Graph the linear inequality $x - y < 4$

Exercise 11.4E. 42

Graph the linear inequality $x - y < -3$

Answer



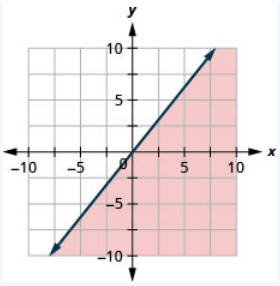
Exercise 11.4E. 43

Graph the linear inequality $y \geq \frac{3}{2}x$

Exercise 11.4E. 44

Graph the linear inequality $y \leq \frac{5}{4}x$

Answer



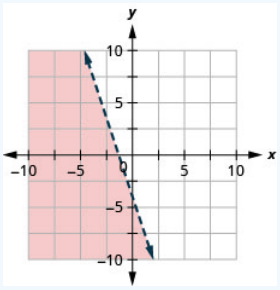
Exercise 11.4E. 45

Graph the linear inequality $y > -2x + 1$

Exercise 11.4E. 46

Graph the linear inequality $y < -3x - 4$

Answer



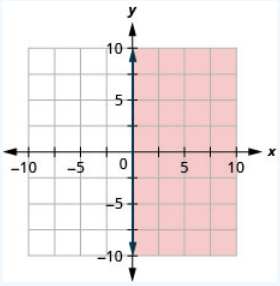
Exercise 11.4E. 47

Graph the linear inequality $x \leq -1$

Exercise 11.4E. 48

Graph the linear inequality $x \geq 0$

Answer



Everyday Math

https://math.libretexts.org/@go/page/46290

Exercise 11.4E.49

Money. Gerry wants to have a maximum of \$100 cash at the ticket booth when his church carnival opens. He will have \$1 bills and \$5 bills. If x is the number of \$1 bills and y is the number of \$5 bills, the inequality $x+5y \leq 100$ models the situation.

1. Graph the inequality.
2. List three solutions to the inequality $x+5y \leq 100$ where both x and y are integers.

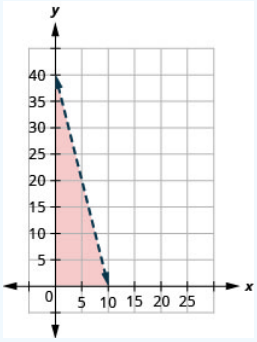
Exercise 11.4E.50

Shopping. Tula has \$20 to spend at the used book sale. Hardcover books cost \$2 each and paperback books cost \$0.50 each. If x is the number of hardcover books Tula can buy and y is the number of paperback books she can buy, the inequality $2x+\frac{1}{2}y \leq 20$ models the situation.

1. Graph the inequality.
2. List three solutions to the inequality $2x+\frac{1}{2}y \leq 20$ where both x and y are whole numbers.

Answer

1.



2. Answers will vary.

Writing Exercises

Exercise 11.4E.51

Lester thinks that the solution of any inequality with a $>$ sign is the region above the line and the solution of any inequality with a $<$ sign is the region below the line. Is Lester correct? Explain why or why not.

Exercise 11.4E.52

Explain why in some graphs of linear inequalities the boundary line is solid but in other graphs it is dashed.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
verify solutions to an inequality in two variables.			
recognize the relation between the solutions of an inequality and its graph.			
graph linear inequalities.			

b. What does this checklist tell you about your mastery of this section? What steps will you take to improve?

CHAPTER OVERVIEW

12: Polynomials

Expressions known as polynomials are used widely in algebra. Applications of these expressions are essential to many careers, including economists, engineers, and scientists. In this chapter, we will find out what polynomials are and how to manipulate them through basic mathematical operations.

12.1: Add and Subtract Polynomials
12.2: Use Multiplication Properties of Exponents (Part 1)
12.3: Use Multiplication Properties of Exponents (Part 2)
12.4: Multiply Polynomials (Part 1)

12.1: Add and Subtract Polynomials

Learning Objectives

- Identify polynomials, monomials, binomials, and trinomials
- Determine the degree of polynomials
- Add and subtract monomials
- Add and subtract polynomials
- Evaluate a polynomial for a given value

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: 8x + 3x. If you missed this problem, review Example 2.3.10.
2. Subtract: (5n + 8) − (2n − 1). If you missed this problem, review Example 7.4.13.
3. Evaluate: $4y^2$ when y = 5 If you missed this problem, review Example 2.3.6.

Identify Polynomials, Monomials, Binomials, and Trinomials

In Evaluate, Simplify, and Translate Expressions, you learned that a term is a constant or the product of a constant and one or more variables. When it is of the form ax^m, where a is a constant and m is a whole number, it is called a monomial. A monomial, or a sum and/or difference of monomials, is called a polynomial.

Definition: Polynomials

polynomial — A monomial, or two or more monomials, combined by addition or subtraction

monomial — A polynomial with exactly one term

binomial — A polynomial with exactly two terms

trinomial — A polynomial with exactly three terms

Notice the roots:

- *poly-* means many
- *mono-* means one
- *bi-* means two
- *tri-* means three

Here are some examples of polynomials:

Polynomial	b + 1	$4y^2 - 7y + 2$	$5x^5 - 4x^4 + x^3 + 8x^2 - 9x + 1$
Monomial	5	$4b^2$	$-9x^3$
Binomial	3a - 7	$y^2 - 9$	$17x^3 + 14x^2$
Trinomial	$x^2 - 5x + 6$	$4y^2 - 7y + 2$	$5a^4 - 3a^3 + a$

Notice that every monomial, binomial, and trinomial is also a polynomial. They are special members of the family of polynomials and so they have special names. We use the words ‘monomial’, ‘binomial’, and ‘trinomial’ when referring to these special polynomials and just call all the rest ‘polynomials’.

Example 12.1.1:

Determine whether each polynomial is a monomial, binomial, trinomial, or other polynomial: (a) $8x^2 - 7x - 9$ (b) $-5a^4$ (c) $x^4 - 7x^3 - 6x^2 + 5x + 2$ (d) $11 - 4y^3$ (e) n

Solution

Polynomial	Number of terms	Type
(a) $8x^2 - 7x - 9$	3	Trinomial
(b) $-5a^4$	1	Monomial
(c) $x^4 - 7x^3 - 6x^2 + 5x + 2$	5	Polynomial
(d) $11 - 4y^3$	2	Binomial
(e) n	1	Monomial

Exercise 12.1.1:

Determine whether each polynomial is a monomial, binomial, trinomial, or other polynomial. (a) z (b) $2x^3 - 4x^2 - x - 8$ (c) $6x^2 - 4x + 1$ (d) $9 - 4y^2$ (e) $3x^7$

Answer a

monomial

Answer b

polynomial

Answer c

trinomial

Answer d

binomial

Answer e

monomial

Exercise 12.1.2:

Determine whether each polynomial is a monomial, binomial, trinomial, or other polynomial. (a) $y^3 - 8$ (b) $9x^3 - 5x^2 - x$ (c) $x^4 - 3x^2 - 4x - 7$ (d) $-y^4$ (e) w

Answer a

binomial

Answer b

trinomial

Answer c

polynomial

Answer d

monomial

Answer e

monomial

Determine the Degree of Polynomials

In this section, we will work with polynomials that have only one variable in each term. The degree of a polynomial and the degree of its terms are determined by the exponents of the variable.

A monomial that has no variable, just a constant, is a special case. The degree of a constant is 0 —it has no variable.

Definition: Degree of a Polynomial

The degree of a term is the exponent of its variable.

The degree of a constant is 0.

The degree of a polynomial is the highest degree of all its terms.

Let's see how this works by looking at several polynomials. We'll take it step by step, starting with monomials, and then progressing to polynomials with more terms.

Remember: Any base written without an exponent has an implied exponent of 1.

Monomials	5	$4b^2$	$-9x^3$	-18
Degree	0	2	3	0
Binomial	$b+1$	$3a-7$	y^2-9	$17x^3+14x^2$
Degree of each term	1 0	1 0	2 0	3 2
Degree of polynomial	1	1	2	3
Trinomial	x^2-5x+6	$4y^2-7y+2$	$5a^4-3a^3+a$	x^4+2x^2-5
Degree of each term	2 1 0	2 1 0	4 3 1	4 2 0
Degree of polynomial	2	2	4	4
Polynomial	$b+1$	$4y^2-7y+2$	$4x^4+x^3+8x^2-9x+1$	
Degree of each term	1 0	2 1 0	4 3 2 1 0	
Degree of polynomial	1	2	4	

Example 12.1.2:

Find the degree of the following polynomials: (a) 4x (b) $3x^3 - 5x + 7$ (c) −11 (d) $-6x^2 + 9x - 3$ (e) $8x + 2$

Solution

(a) 4x

The exponent of x is one. $x = x^1$	The degree is 1.

(b) $3x^3 - 5x + 7$

The highest degree of all the terms is 3.	The degree is 3.

(c) −11

The degree of a constant is 0.	The degree is 0.

(d) $-6x^2 + 9x - 3$

The highest degree of all the terms is 2.	The degree is 2.

(e) $8x + 2$

The highest degree of all the terms is 1.	The degree is 1.

? Exercise 12.1.3:

Find the degree of the following polynomials: (a) −6y (b) $4x - 1$ (c) $3x^4 + 4x^2 - 8$ (d) $2y^2 + 3y + 9$ (e) −18

Answer a

Answer e

0

? Exercise 12.1.4:

Find the degree of the following polynomials: (a) 47 (b) $2x^2 - 8x + 2$ (c) $x^4 - 16$ (d) $y^5 - 5y^3 + y$ (e) $9a^3$

Answer a

0

Answer b

2

Answer c

4

Answer d

5

Answer e

3

Working with polynomials is easier when you list the terms in descending order of degrees. When a polynomial is written this way, it is said to be in **standard form**. Look back at the polynomials in Example 10.2. Notice that they are all written in standard form. Get in the habit of writing the term with the highest degree first.

Add and Subtract Monomials

In The Language of Algebra, you simplified expressions by combining like terms. Adding and subtracting monomials is the same as combining like terms. Like terms must have the same variable with the same exponent. Recall that when combining like terms only the coefficients are combined, never the exponents.

Example 12.1.3:

Add: $17x^2 + 6x^2$.

Solution

Combine like terms.	$23x^2$

Exercise 12.1.5:

Add: $12x^2 + 5x^2$.

Answer

$17x^2$

Exercise 12.1.6:

Add: $-11y^2 + 8y^2$.

Answer

$-3y^2$

Example 12.1.4:

Subtract: $11n - (-8n)$.

Solution

Combine like terms.	$19n$

Exercise 12.1.7:

Subtract: $9n - (-5n)$.

Answer

$14n$

Exercise 12.1.8:

Subtract: $-7a^3 - (-5a^3)$.

Answer

$-2a^3$

Example 12.1.5:

Simplify: $a^2 + 4b^2 - 7a^2$.

Solution

Combine like terms.	$-6a^2 + 4b^2$

Remember, $-6a^2$ and $4b^2$ are not like terms. The variables are not the same.

Exercise 12.1.9:

Add: $3x^2 + 3y^2 - 5x^2$.

Answer

$-2x^2 + 3y^2$

Exercise 12.1.10:

Add: $2a^2 + b^2 - 4a^2$.

Answer

$-2a^2 + b^2$

Add and Subtract Polynomials

Adding and subtracting polynomials can be thought of as just adding and subtracting like terms. Look for like terms—those with the same variables with the same exponent. The Commutative Property allows us to rearrange the terms to put like terms together. It may also be helpful to underline, circle, or box like terms.

Example 12.1.6:

Find the sum: $(4x^2 - 5x + 1) + (3x^2 - 8x - 9)$

Solution

Identify like terms.	$\underline{4x^2} - \underline{5x} + \boxed{1} + \underline{3x^2} - \underline{8x} - \boxed{9}$
Rearrange to get the like terms together.	$\underline{4x^2 + 3x^2} - \underline{5x - 8x} + \boxed{1} - \boxed{9}$
Combine like terms.	$7x^2 - 13x - 8$

Exercise 12.1.11:

Find the sum: $(3x^2 - 2x + 8) + (x^2 - 6x + 2)$.

Answer

$4x^2 - 8x + 10$

Exercise 12.1.12:

Find the sum: $(7y^2 + 4y - 6) + (4y^2 + 5y + 1)$

Answer

$11y^2 + 9y - 5$

Parentheses are grouping symbols. When we add polynomials as we did in Example 10.6, we can rewrite the expression without parentheses and then combine like terms. But when we subtract polynomials, we must be very careful with the signs.

Example 12.1.7:

Find the difference: $(7u^2 - 5u + 3) - (4u^2 - 2)$.

Solution

Distribute and identify like terms.	$7u^2 - 5u + 3 - 4u^2 + 2$
Rearrange the terms.	$7u^2 - 4u^2 - 5u + 3 + 2$
Combine like terms.	$3u^2 - 5u + 5$

Exercise 12.1.13:

Find the difference: $(6y^2 + 3y - 1) - (3y^2 - 4)$.

Answer

$3y^2 + 3y + 3$

Exercise 12.1.14:

Find the difference: $(8u^2 - 7u - 2) - (5u^2 - 6u - 4)$.

Answer

$3u^2 - u + 2$

Example 12.1.8:

Subtract: $(m^2 - 3m + 8)$ from $(9m^2 - 7m + 4)$.

Solution

Distribute and identify like terms.	$9m^2 - 7m + 4 - m^2 + 3m - 8$
Rearrange the terms.	$9m^2 - m^2 - 7m + 3m + 4 - 8$
Combine like terms.	$8m^2 - 4m - 4$

Exercise 12.1.15:

Subtract: $(4n^2 - 7n - 3)$ from $(8n^2 + 5n - 3)$.

Answer

$4n^2 + 12n$

Exercise 12.1.16:

Subtract: $(a^2 - 4a - 9)$ from $(6a^2 + 4a - 1)$.

Answer

$5a^2 + 8a + 8$

Evaluate a Polynomial for a Given Value

In The Language of Algebra we evaluated expressions. Since polynomials are expressions, we'll follow the same procedures to evaluate polynomials—substitute the given value for the variable into the polynomial, and then simplify.

Example 12.1.9:

Evaluate $3x\ 2 - 9x + 7$ when (a) $x = 3$ (b) $x = -1$

Solution

(a) $x = 3$

Substitute 3 for x.	$3(3)^2 - 9(3) + 7$
Simplify the expression with the exponent.	$3 \cdot 9 - 9(3) + 7$
Multiply.	$27 - 27 + 7$
Simplify.	7

(b) $x = -1$

Substitute -1 for x.	$3(-1)^2 - 9(-1) + 7$
Simplify the expression with the exponent.	$3 \cdot 1 - 9(-1) + 7$
Multiply.	$3 + 9 + 7$
Simplify.	19

Exercise 12.1.17:

Evaluate: $2x^2 + 4x - 3$ when (a) $x = 2$ (b) $x = -3$

Answer a

13

Answer b

3

Exercise 12.1.18:

Evaluate: $7y^2 - y - 2$ when (a) $y = -4$ (b) $y = 0$

Answer a

114

Answer b

-2

Example 12.1.10:

The polynomial $-16t\ 2 + 300$ gives the height of an object t seconds after it is dropped from a 300 foot tall bridge. Find the height after t = 3 seconds.

Solution

Substitute 3 for t.	$-16(3)^2 + 300$
Simplify the expression with the exponent.	$-16 \cdot 9 + 300$
Multiply.	$-144 + 300$
Simplify.	156

Exercise 12.1.19:

The polynomial $-8t^2 + 24t + 4$ gives the height, in feet, of a ball t seconds after it is tossed into the air, from an initial height of 4 feet. Find the height after t = 3 seconds.

Answer

4 feet

Exercise 12.1.20:

The polynomial $-8t^2 + 24t + 4$ gives the height, in feet, of a ball x seconds after it is tossed into the air, from an initial height of 4 feet. Find the height after t = 2 seconds.

Answer

20 feet

Adding Polynomials

Subtracting Polynomials

Practice Makes Perfect

Identify Polynomials, Monomials, Binomials and Trinomials

In the following exercises, determine if each of the polynomials is a monomial, binomial, trinomial, or other polynomial.

1. $5x + 2$
2. $z^2 - 5z - 6$
3. $a^2 + 9a + 18$
4. $-12p^4$
5. $y^3 - 8y^2 + 2y - 16$
6. $10 - 9x$
7. $23y^2$
8. $m^4 + 4m^3 + 6m^2 + 4m + 1$

Determine the Degree of Polynomials

In the following exercises, determine the degree of each polynomial.

9. $8a^5 - 2a^3 + 1$
10. $5c^3 + 11c^2 - c - 8$

11. $3x - 12$
12. $4y + 17$
13. -13
14. -22

Add and Subtract Monomials

In the following exercises, add or subtract the monomials.

15. $6x^2 + 9x^2$
16. $4y^3 + 6y^3$
17. $-12u + 4u$
18. $-3m + 9m$
19. $5a + 7b$
20. $8y + 6z$
21. Add: $4a, -3b, -8a$
22. Add: $4x, 3y, -3x$
23. $18x - 2x$
24. $13a - 3a$
25. Subtract $5x^6$ from $-12x^6$
26. Subtract $2p^4$ from $-7p^4$

Add and Subtract Polynomials

In the following exercises, add or subtract the polynomials.

27. $(4y^2 + 10y + 3) + (8y^2 - 6y + 5)$
28. $(7x^2 - 9x + 2) + (6x^2 - 4x + 3)$
29. $(x^2 + 6x + 8) + (-4x^2 + 11x - 9)$
30. $(y^2 + 9y + 4) + (-2y^2 - 5y - 1)$
31. $(3a^2 + 7) + (a^2 - 7a - 18)$
32. $(p^2 - 5p - 11) + (3p^2 + 9)$
33. $(6m^2 - 9m - 3) - (2m^2 + m - 5)$
34. $(3n^2 - 4n + 1) - (4n^2 - n - 2)$
35. $(z^2 + 8z + 9) - (z^2 - 3z + 1)$
36. $(z^2 - 7z + 5) - (z^2 - 8z + 6)$
37. $(12s^2 - 15s) - (s - 9)$
38. $(10r^2 - 20r) - (r - 8)$
39. Find the sum of $(2p^3 - 8)$ and $(p^2 + 9p + 18)$
40. Find the sum of $(q^2 + 4q + 13)$ and $(7q^3 - 3)$
41. Subtract $(7x^2 - 4x + 2)$ from $(8x^2 - x + 6)$
42. Subtract $(5x^2 - x + 12)$ from $(9x^2 - 6x - 20)$
43. Find the difference of $(w^2 + w - 42)$ and $(w^2 - 10w + 24)$
44. Find the difference of $(z^2 - 3z - 18)$ and $(z^2 + 5z - 20)$

Evaluate a Polynomial for a Given Value

In the following exercises, evaluate each polynomial for the given value.

45. Evaluate $8y^2 - 3y + 2$
    a. $y = 5$
    b. $y = -2$
    c. $y = 0$
46. Evaluate $5y^2 - y - 7$ when:
    a. $y = -4$
    b. $y = 1$
    c. $y = 0$

47. Evaluate $4 - 36x$ when:
    a. $x = 3$
    b. $x = 0$
    c. $x = -1$
48. Evaluate $16 - 36x^2$ when:
    a. $x = -1$
    b. $x = 0$
    c. $x = 2$
49. A window washer drops a squeegee from a platform 275 feet high. The polynomial $-16t^2 + 275$ gives the height of the squeegee t seconds after it was dropped. Find the height after $t = 4$ seconds.
50. A manufacturer of microwave ovens has found that the revenue received from selling microwaves at a cost of p dollars each is given by the polynomial $-5p^2 + 350p$. Find the revenue received when $p = 50$ dollars.

Everyday Math

51. **Fuel Efficiency** The fuel efficiency (in miles per gallon) of a bus going at a speed of x miles per hour is given by the polynomial $-\frac{1}{160}x^2 + \frac{1}{2}x$. Find the fuel efficiency when $x = 40$ mph.
52. **Stopping Distance** The number of feet it takes for a car traveling at x miles per hour to stop on dry, level concrete is given by the polynomial $0.06x^2 + 1.1x$. Find the stopping distance when $x = 60$ mph.

Writing Exercises

53. Using your own words, explain the difference between a monomial, a binomial, and a trinomial.
54. Eloise thinks the sum $5x^2 + 3x^4$ is $8x^6$. What is wrong with her reasoning?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
identify polynomials, monomials, binomials, and trinomials.			
determine the degree of polynomials.			
add and subtract monomials.			
add and subtract polynomials.			
evaluate a polynomial for a given value.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on.

Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

12.2: Use Multiplication Properties of Exponents (Part 1)

Learning Objectives

- Simplify expressions with exponents
- Simplify expressions using the Product Property of Exponents
- Simplify expressions using the Power Property of Exponents
- Simplify expressions using the Product to a Power Property
- Simplify expressions by applying several properties
- Multiply monomials

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $\frac{3}{4} \cdot \frac{3}{4}$. If you missed the problem, review Example 4.3.7.
2. Simplify: $(-2)(-2)(-2)$. If you missed the problem, review Example 3.7.6.

Simplify Expressions with Exponents

Remember that an exponent indicates repeated multiplication of the same quantity. For example, 2^4 means to multiply four factors of 2, so 2^4 means $2 \cdot 2 \cdot 2 \cdot 2$. This format is known as **exponential notation**.

Definition: Exponential Notation

a^m ← m ← exponent; a ← base

a^m means multiply m factors of a

$$a^m = \underbrace{a \cdot a \cdot a \cdot \ldots \cdot a}_{m \text{ factors}}$$

This is read a to the m^{th} power.

In the expression a^m, the exponent tells us how many times we use the base a as a factor.

$$7^3 \qquad (-8)^5$$

$$\underbrace{7 \cdot 7 \cdot 7}_{3 \text{ factors}} \qquad \underbrace{(-8)(-8)(-8)(-8)(-8)}_{5 \text{ factors}}$$

Before we begin working with variable expressions containing exponents, let's simplify a few expressions involving only numbers.

Example 12.2.1:

Simplify: (a) 5^3 (b) 9^1

Solution

(a) 5^3

Multiply 3 factors of 5.	$5 \cdot 5 \cdot 5$
Simplify.	125

(b) 9^1

Multiply 1 factor of 9.	9

Exercise 12.2.1:

Simplify: (a) 4^3 (b) 11^1

Answer a

64

Answer b

11

Exercise 12.2.2:

Simplify: (a) 3^4 (b) 21^1

Answer a

81

Answer b

21

Example 12.2.2:

Simplify: (a) $\left(\frac{7}{8}\right)^2$ (b) $(0.74)^2$

Solution

(a) $\left(\frac{7}{8}\right)^2$

Multiply two factors.	$\left(\frac{7}{8}\right)\left(\frac{7}{8}\right)$	(12.2.1)
Simplify.	$\frac{49}{64}$	(12.2.2)

(b) $(0.74)^2$

Multiply two factors.	(0.74)(0.74)
Simplify.	0.5476

Exercise 12.2.3:

Simplify: (a) $\left(\frac{5}{8}\right)^2$ (b) $(0.67)^2$

Answer a

$\frac{25}{64}$

Answer b

0.4489

Exercise 12.2.4:

Simplify: (a) $\left(\frac{2}{5}\right)^3$ (b) $(0.127)^2$

Answer a

$\frac{8}{125}$

Answer b

0.016129

Example 12.2.3:

Simplify: (a) $(-3)^4$ (b) -3^4

Solution

(a) $(-3)^4$

Multiply four factors of −3.	$(-3)(-3)(-3)(-3)$
Simplify.	81

(b) -3^4

Multiply two factors.	$-(3 \cdot 3 \cdot 3 \cdot 3)$
Simplify.	−81

Notice the similarities and differences in parts (a) and (b). Why are the answers different? In part (a) the parentheses tell us to raise the (−3) to the 4^{th} power. In part (b) we raise only the 3 to the 4^{th} power and then find the opposite.

Exercise 12.2.5:

Simplify: (a) $(-2)^4$ (b) -2^4

Answer a

16

Answer b

-16

Exercise 12.2.6:

Simplify: (a) $(-8)^2$ (b) -8^2

Answer a

64

Answer b

-64

Simplify Expressions Using the Product Property of Exponents

You have seen that when you combine like terms by adding and subtracting, you need to have the same base with the same exponent. But when you multiply and divide, the exponents may be different, and sometimes the bases may be different, too. We'll derive the properties of exponents by looking for patterns in several examples. All the exponent properties hold true for any real numbers, but right now we will only use whole number exponents.

First, we will look at an example that leads to the Product Property.

	$x^2 \cdot x^2$	(12.2.3)
What does this mean? How many factors altogether?	$\underbrace{x \cdot x}_{2 \text{ factors}} \cdot \underbrace{x \cdot x \cdot x}_{3 \text{ factors}}$ 5 factors	
So, we have	x^5	(12.2.4)
Notice that 5 is the sum of the exponents, 2 and 3.	$x^2 \cdot x^3 \text{ is } x^{2+3}, \text{ or } x^5$	(12.2.5)
We write:	$x^2 \cdot x^3$ x^{2+3} x^5	

The base stayed the same and we added the exponents. This leads to the Product Property for Exponents.

Definition: Product Property of Exponents

If a is a real number and m, n are counting numbers, then

$$a^m \cdot a^n = a^{m+n} \tag{12.2.6}$$

To multiply with like bases, add the exponents.

An example with numbers helps to verify this property.

$$\begin{aligned} 2^2 \cdot 2^3 &\stackrel{?}{=} 2^{2+3} \\ 4 \cdot 8 &\stackrel{?}{=} 2^5 \\ 32 &= 32 \checkmark \end{aligned}$$

Example 12.2.4:

Simplify: $x^5 \cdot x^7$.

Solution

Use the product property, $a^m \cdot a^n = a^{m+n}$.	x^{5+7}	(12.2.7)
Simplify.	x^{12}	(12.2.8)

Exercise 12.2.7:

Simplify: $x^7 \cdot x^8$.

Answer

x^{15}

Exercise 12.2.8:

Simplify: $x^5 \cdot x^{11}$.

Answer

x^{16}

Example 12.2.5:

Simplify: $b^4 \cdot b$.

Solution

Rewrite, $b = b^1$.	$b^4 \cdot b^1$	(12.2.9)
Use the product property, $a^m \cdot a^n = a^{m+n}$.	b^{4+1}	(12.2.10)
Simplify.	b^5	(12.2.11)

Exercise 12.2.9:

Simplify: $p^9 \cdot p$.

Answer

p^{10}

Exercise 12.2.10:

Simplify: $m \cdot m^7$.

Answer

m^8

Example 12.2.6:

Simplify: $2^7 \cdot 2^9$.

Solution

Use the product property, $a^m \cdot a^n = a^{m+n}$.	2^{7+9}	(12.2.12)
Simplify.	2^{16}	(12.2.13)

Exercise 12.2.11:

Simplify: $6 \cdot 6^9$.

Answer

6^{10}

Exercise 12.2.12:

Simplify: $9^6 \cdot 9^9$.

Answer

9^{15}

Example 12.2.7:

Simplify: $y^{17} \cdot y^{23}$.

Solution

Notice, the bases are the same, so add the exponents.	y^{17+23}	(12.2.14)
Simplify.	y^{40}	(12.2.15)

Exercise 12.2.13:

Simplify: $y^{24} \cdot y^{19}$.

Answer

y^{43}

Exercise 12.2.14:

Simplify: $z^{15} \cdot z^{24}$.

Answer

z^{39}

We can extend the Product Property of Exponents to more than two factors.

Example 12.2.8:

Simplify: $x^3 \cdot x^4 \cdot x^2$.

Solution

Add the exponents, since the bases are the same.	x^{3+4+2}	(12.2.16)
Simplify.	x^9	(12.2.17)

Exercise 12.2.15:

Simplify: $x^7 \cdot x^5 \cdot x^9$.

Answer

x^{21}

Exercise 12.2.16:

Simplify: $y^3 \cdot y^8 \cdot y^4$.

Answer

y^{15}

Simplify Expressions Using the Power Property of Exponents

Now let's look at an exponential expression that contains a power raised to a power. See if you can discover a general property.

	$(x^2)^3$	(12.2.18)
What does this mean?	$x^2 \cdot x^2 \cdot x^2$	(12.2.19)
How many factors altogether?	$\underbrace{x \cdot x}_{2\ factors} \cdot \underbrace{x \cdot x}_{2\ factors} \cdot \underbrace{x \cdot x}_{2\ factors}$ $6\ factors$	
So, we have	x^6	(12.2.20)
Notice that 6 is the product of the exponents, 2 and 3.	$(x^2)^3\ is\ x^{2 \cdot 3}\ or\ x^6$	(12.2.21)
We write:	$(x^2)^3$ $x^{2 \cdot 3}$ x^6	

We multiplied the exponents. This leads to the Power Property for Exponents.

Definition: Power Property of Exponents

If a is a real number and m, n are whole numbers, then

$$(a^m)^n = a^{m \cdot n} \quad (12.2.22)$$

To raise a power to a power, multiply the exponents.

An example with numbers helps to verify this property.

$$(5^2)^3 \stackrel{?}{=} 5^{2 \cdot 3}$$
$$(25)^3 \stackrel{?}{=} 5^6$$
$$15,625 = 15,625\ \checkmark$$

Example 12.2.9:

Simplify: (a) $(x^5)^7$ (b) $(3^6)^8$

Solution

(a) $(x^5)^7$

Use the Power Property, $(a^m)^n = a^{m \cdot n}$.	$x^{5 \cdot 7}$	(12.2.23)
Simplify.	x^{35}	(12.2.24)

(b) $(3^6)^8$

Use the Power Property, $(a^m)^n = a^{m \cdot n}$.	$3^{6 \cdot 8}$	(12.2.25)
Simplify.	x^{48}	(12.2.26)

Exercise 12.2.17:

Simplify: (a) $(x^7)^4$ (b) $(7^4)^8$

Answer a

x^{28}

Answer b

7^{32}

Exercise 12.2.18:

Simplify: (a) $(x^6)^9$ (b) $(8^6)^7$

Answer a

y^{54}

Answer b

8^{42}

This page titled 12.2: Use Multiplication Properties of Exponents (Part 1) is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

12.3: Use Multiplication Properties of Exponents (Part 2)

Simplify Expressions Using the Product to a Power Property

We will now look at an expression containing a product that is raised to a power. Look for a pattern.

	$(2x)^3$
What does this mean?	2x • 2x • 2x
We group the like factors together.	2 • 2 • 2 • x • x • x
How many factors of 2 and of x?	$2^3 \cdot x^3$
Notice that each factor was raised to the power.	$(2x)^3$ is $2^3 \cdot x^3$
We write:	$(2x)^3$ $2^3 \cdot x^3$

The exponent applies to each of the factors. This leads to the Product to a Power Property for Exponents.

Definition: Product to a Power Property of Exponents

If a and b are real numbers and m is a whole number, then

$$(ab)^m = a^m b^m \tag{10.2.27}$$

To raise a product to a power, raise each factor to that power.

An example with numbers helps to verify this property:

$$(2 \cdot 3)^2 \stackrel{?}{=} 2^2 \cdot 3^2$$
$$6^2 \stackrel{?}{=} 4 \cdot 9$$
$$36 \stackrel{?}{=} 36 \checkmark$$

Example 12.3.10:

Simplify: $(-11x)^2$.

Solution

Use the Power of a Product Property, $(ab)^m = a^m b^m$.	$(-11)^2 x^2$	(10.2.28)
Simplify.	$121x^2$	(10.2.29)

Exercise 12.3.19:

Simplify: $(-14x)^2$.

Answer

$196x^2$

Exercise 12.3.20:

Simplify: $(-12a)^2$.

Answer

$144a^2$

Example 12.3.11:

Simplify: $(3xy)^3$.

Solution

Raise each factor to the third power.	$3^3x^3y^3$	(10.2.30)
Simplify.	$27x^3y^3$	(10.2.31)

Exercise 12.3.21:

Simplify: $(-4xy)^4$.

Answer

$256x^4y^4$

Exercise 12.3.22:

Simplify: $(6xy)^3$.

Answer

$216x^3y^3$

Simplify Expressions by Applying Several Properties

We now have three properties for multiplying expressions with exponents. Let's summarize them and then we'll do some examples that use more than one of the properties.

Definition: Properties of Exponents

If a, b are real numbers and m, n are whole numbers, then

Product Property	$a^m \cdot a^n = a^{m+n}$
Power Property	$(a^m)^n = a^{m \cdot n}$
Product to a Power Property	$(ab)^m = a^m b^m$

Example 12.3.12:

Simplify: $(x^2)^6(x^5)^4$.

Solution

Use the Power Property.	$x^{12} \cdot x^{20}$

Add the exponents.	x^{32}

Exercise 12.3.23:

Simplify: $(x^4)^3(x^7)^4$.

Answer

x^{40}

Exercise 12.3.24:

Simplify: $(y^9)^2(y^8)^3$.

Answer

y^{42}

Example 12.3.13:

Simplify: $(-7x^3y^4)^2$.

Solution

Take each factor to the second power.	$(-7)^2(x^3)^2(y^4)^2$
Use the Power Property.	$49x^6y^8$

Exercise 12.3.25:

Simplify: $(-8x^4y^7)^3$.

Answer

$-512x^{12}y^{21}$

Exercise 12.3.26:

Simplify: $(-3a^5b^6)^4$.

Answer

$81a^{20}b^{24}$

Example 12.3.14:

Simplify: $(6n)^2(4n^3)$.

Solution

Raise 6n to the second power.	$6^2n^2 \cdot 4n^3$
Simplify.	$36n^2 \cdot 4n^3$
Use the Commutative Property.	$36 \cdot 4 \cdot n^2 \cdot n^3$
Multiply the constants and add the exponents.	$144n^5$

Notice that in the first monomial, the exponent was outside the parentheses and it applied to both factors inside. In the second monomial, the exponent was inside the parentheses and so it only applied to the n.

Exercise 12.3.27:

Simplify: $(7n)^2\ (2n^{12})$.

Answer

$98n^{14}$

Exercise 12.3.28:

Simplify: $(4m)^2(3m^3)$.

Answer

$48m^5$

Example 12.3.15:

Simplify: $(3p^2q)^4(2pq^2)^3$.

Solution

Use the Power of a Product Property.	$3^4(p^2)^4q^4 \cdot 2^3p^3(q^2)^3$
Use the Power Property.	$81p^8q^4 \cdot 8p^3q^6$
Use the Commutative Property.	$81 \cdot 8 \cdot p^8 \cdot p^3 \cdot q^4 \cdot q^6$
Multiply the constants and add the exponents for each variable.	$648p^{11}q^{10}$

Exercise 12.3.29:

Simplify: $(u^3v^2)^5(4uv^4)^3$.

Answer

$64u^{18}v^{22}$

Exercise 12.3.30:

Simplify: $(5x^2y^3)^2(3xy^4)^3$.

Answer

$675x^7y^{18}$

Multiply Monomials

Since a monomial is an algebraic expression, we can use the properties for simplifying expressions with exponents to multiply the monomials.

Example 12.3.16:

Multiply: $(4x^2)(-5x^3)$.

Solution

Use the Commutative Property to rearrange the factors.	$4 \cdot (-5) \cdot x^2 \cdot x^3$
Multiply.	$-20x^5$

Exercise 12.3.31:

Multiply: $(7x^7)(-8x^4)$.

Answer

$-56x^{11}$

Exercise 12.3.32:

Multiply: $(-9y^4)(-6y^5)$.

Answer

$54y^9$

Example 12.3.17:

Multiply: $\left(\frac{3}{4}c^3d\right)(12cd^2)$.

Solution

Use the Commutative Property to rearrange the factors.	$\frac{3}{4} \cdot 12 \cdot c^3 \cdot c \cdot d \cdot d^2$
Multiply.	$9c^4d^3$

Exercise 12.3.33:

Multiply: $\left(\frac{4}{5}m^4n^3d\right)(15mn^3)$.

Answer

$12m^5n^6$

Exercise 12.3.34:

Multiply: $\left(\frac{2}{3}p^5qd\right)(18p^6q^7)$.

Answer

$12p^{11}q^8$

Exponent Properties 2

Practice Makes Perfect

Simplify Expressions with Exponents

In the following exercises, simplify each expression with exponents.

55. 4^5
56. 10^3
57. $\left(\frac{1}{2}\right)^2$
58. $\left(\frac{3}{5}\right)^2$
59. $(0.2)^3$
60. $(0.4)^3$
61. $(-5)^4$
62. $(-3)^5$
63. -5^4
64. -3^5
65. -10^4
66. -2^6
67. $-\left(\frac{2}{3}\right)^3$
68. $-\left(\frac{1}{4}\right)^4$
69. -0.5^2
70. -0.1^4

Simplify Expressions Using the Product Property of Exponents

In the following exercises, simplify each expression using the Product Property of Exponents.

71. $x^3 \cdot x^6$
72. $m^4 \cdot m^2$
73. $a \cdot a^4$
74. $y^{12} \cdot y$
75. $3^5 \cdot 3^9$
76. $5^{10} \cdot 5^6$
77. $z \cdot z^2 \cdot z^3$
78. $a \cdot a^3 \cdot a^5$
79. $x^a \cdot x^2$
80. $y^p \cdot y^3$
81. $y^a \cdot y^b$
82. $x^p \cdot x^q$

Simplify Expressions Using the Power Property of Exponents

In the following exercises, simplify each expression using the Power Property of Exponents.

83. $(u^4)^2$
84. $(x^2)^7$
85. $(y^5)^4$
86. $(a^3)^2$

87. $(10^2)^6$
88. $(2^8)^3$
89. $(x^{15})^6$
90. $(y^{12})^8$
91. $(x^2)^y$
92. $(y^3)^x$
93. $(5^x)^y$
94. $(7^a)^b$

Simplify Expressions Using the Product to a Power Property

In the following exercises, simplify each expression using the Product to a Power Property.

95. $(5a)^2$
96. $(7x)^2$
97. $(-6m)^3$
98. $(-9n)^3$
99. $(4rs)^2$
100. $(5ab)^3$
101. $(4xyz)^4$
102. $(-5abc)^3$

Simplify Expressions by Applying Several Properties

In the following exercises, simplify each expression.

103. $(x^2)^4 \cdot (x^3)^2$
104. $(y^4)^3 \cdot (y^5)^2$
105. $(a^2)^6 \cdot (a^3)^8$
106. $(b^7)^5 \cdot (b^2)^6$
107. $(3x)^2(5x)$
108. $(2y)^3\,(6y)$
109. $(5a)^2(2a)^3$
110. $(4b)^2(3b)^3$
111. $(2m^6)^3$
112. $(3y^2)^4$
113. $(10x^2y)^3$
114. $(2mn^4)^5$
115. $(-2a^3b^2)^4$
116. $(-10u^2v^4)^3$
117. $\left(\frac{2}{3}x^2y\right)^3$
118. $\left(\frac{7}{9}pq^4\right)^2$
119. $(8a^3)^2(2a)^4$
120. $(5r^2)^3(3r)^2$
121. $(10p^4)^3(5p^6)^2$
122. $(4x^3)^3(2x^5)^4$
123. $\left(\frac{1}{2}x^2y^3\right)^4\,(4x^5y^3)^2$
124. $\left(\frac{1}{3}m^3n^2\right)^4\,(9m^8n^3)^2$
125. $(3m^2n)^2(2mn^5)^4$
126. $(2pq^4)^3(5p^6q)^2$

Multiply Monomials

In the following exercises, multiply the following monomials.

127. $(12x^2)(-5x^4)$
128. $(-10y^3)(7y^2)$
129. $(-8u^6)(-9u)$
130. $(-6c^4)(-12c)$
131. $\left(\frac{1}{5}r^8\right)(20r^3)$
132. $\left(\frac{1}{4}a^5\right)(36a^2)$
133. $(4a^3b)(9a^2b^6)$
134. $(6m^4n^3)(7mn^5)$
135. $\left(\frac{4}{7}xy^2\right)(14xy^3)$
136. $\left(\frac{5}{8}u^3v\right)^3(24u^5v)$
137. $\left(\frac{2}{3}x^2y\right)\left(\frac{3}{4}xy^2\right)$
138. $\left(\frac{3}{5}m^3n^2\right)\left(\frac{5}{9}m^2n^3\right)$

Everyday Math

139. **Email** Janet emails a joke to six of her friends and tells them to forward it to six of their friends, who forward it to six of their friends, and so on. The number of people who receive the email on the second round is 6^2, on the third round is 6^3, as shown in the table. How many people will receive the email on the eighth round? Simplify the expression to show the number of people who receive the email.

Round	Number of people
1	6
2	6^2
3	6^3
…	…
8	?

140. **Salary** Raul's boss gives him a 5% raise every year on his birthday. This means that each year, Raul's salary is 1.05 times his last year's salary. If his original salary was \$40,000, his salary after 1 year was \$40,000(1.05), after 2 years was $\$40,000(1.05)^2$, after 3 years was $\$40,000(1.05)^3$, as shown in the table below. What will Raul's salary be after 10 years? Simplify the expression, to show Raul's salary in dollars.

Year	Salary
1	\$40,000(1.05)
2	$\$40,000(1.05)^2$
3	$\$40,000(1.05)^3$
…	…
10	?

Writing Exercises

141. Use the Product Property for Exponents to explain why $x \cdot x = x^2$.
142. Explain why $-5^3 = (-5)^3$ but $-5^4 \neq (-5)^4$.
143. Jorge thinks $\left(\frac{1}{2}\right)^2$ is 1. What is wrong with his reasoning?
144. Explain why $x^3 \cdot x^5$ is x^8, and not x^{15}.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with exponents.			
simplify expressions using the Product Property for Exponents.			
simplify expressions using the Power Property for Exponents.			
simplify expressions using the Product to a Power Property.			
simplify expressions by applying several properties.			
multiply monomials.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

12.4: Multiply Polynomials (Part 1)

Learning Objectives

- Multiply a polynomial by a monomial
- Multiply a binomial by a binomial
- Multiply a trinomial by a binomial

be prepared!

Before you get started, take this readiness quiz.

1. Distribute: 2(x + 3). If you missed the problem, review Example 7.4.1.
2. Distribute: −11(4 − 3a). If you missed the problem, review Example 7.4.10.
3. Combine like terms: x^2 + 9x + 7x + 63. If you missed the problem, review Example 2.3.9.

Multiply a Polynomial by a Monomial

In Distributive Property you learned to use the Distributive Property to simplify expressions such as 2(x − 3). You multiplied both terms in the parentheses, x and 3, by 2, to get 2x − 6. With this chapter's new vocabulary, you can say you were multiplying a binomial, x − 3, by a monomial, 2. Multiplying a binomial by a monomial is nothing new for you!

Example 12.4.1:

Multiply: 3(x + 7).

Solution

Distribute.	$3(x+7)$
	3 • x + 3 • 7
Simplify.	3x + 21

Exercise 12.4.1:

Multiply: 6(x + 8).

Answer

6x + 48

Exercise 12.4.2:

Multiply: 2(y + 12).

Answer

2y + 24

Example 12.4.2:

Multiply: x(x − 8).

Solution

Distribute.	$x(x-8)$
	x^2 - 8x
Simplify.	x^2 - 8x

Exercise 12.4.3:

Multiply: y(y − 9).

Answer

$y^2 - 9y$

Exercise 12.4.4:

Multiply: p(p − 13).

Answer

$p^2 - 13p$

Example 12.4.3:

Multiply: 10x(4x + y).

Solution

Distribute.	$10x(4x+y)$
	10x • 4x + 10x • y
Simplify.	$40x^2$ + 10xy

Exercise 12.4.5:

Multiply: 8x(x + 3y).

Answer

$8x^2 + 24xy$

Exercise 12.4.6:

Multiply: 3r(6r + s).

Answer

$18r^2 + 3rs$

Multiplying a monomial by a trinomial works in much the same way.

Example 12.4.4:

Multiply: $-2x(5x^2 + 7x - 3)$.

Solution

Distribute.		$-2x \cdot 5x^2 + (-2x) \cdot 7x - (-2x) \cdot 3$
Simplify.	$-10x^3 - 14x^2 + 6x$

Exercise 12.4.7:

Multiply: $-4y(8y^2 + 5y - 9)$.

Answer

$-32y^3 - 20y^2 + 36y$

Exercise 12.4.8:

Multiply: $-6x(9x^2 + x - 1)$.

Answer

$-54x^3 - 6x^2 + 6x$

Example 12.4.5:

Multiply: $4y^3(y^2 - 8y + 1)$.

Solution

Distribute.		$4y^3 \cdot y^2 - 4y^3 \cdot 8y + 4y^3 \cdot 1$
Simplify.	$4y^5 - 32y^4 + 4y^3$

Exercise 12.4.9:

Multiply: $3x^2(4x^2 - 3x + 9)$.

Answer

$12x^4 - 9x^3 + 27x^2$

Exercise 12.4.10:

Multiply: $8y^2(3y^2 - 2y - 4)$.

Answer

$24y^4 - 16y^3 - 32y^2$

Now we will have the monomial as the second factor.

Example 12.4.6:

Multiply: (x + 3)p.

Solution

Distribute.	$(x+3)p$
	x • p + 3 • p
Simplify.	xp + 3p

Exercise 12.4.11:

Multiply: (x + 8)p.

Answer

$xp+8p$

Exercise 12.4.12:

Multiply: (a + 4)p.

Answer

$ap+4p$

Multiply a Binomial by a Binomial

Just like there are different ways to represent multiplication of numbers, there are several methods that can be used to multiply a binomial times a binomial.

Using the Distributive Property

We will start by using the Distributive Property. Look again at Example 12.4.6

	$(x+3)p$
We distributed the p to get	$xp+3\,p$
What if we have (x + 7) instead of p? Think of the (x + 7) as the p above.	$(x+3)(x+7)$
Distribute (x + 7).	$x(x+7)+3(x+7)$
Distribute again.	$x^2 + 7x + 3x + 21$
Combine like terms.	$x^2 + 10x + 21$

Notice that before combining like terms, we had four terms. We multiplied the two terms of the first binomial by the two terms of the second binomial—four multiplications.

Be careful to distinguish between a sum and a product.

Sum	Product
$x+x$	$x \cdot x$
$2x$	x^2
combine like terms	*add exponents of like bases*

Example 12.4.7:

Multiply: (x + 6)(x + 8).

Solution

	$(x+6)(x+8)$
Distribute (x + 8).	$x(x+8)+6(x+8)$
Distribute again.	$x^2 + 8x + 6x + 48$
Simplify.	$x^2 + 14x + 48$

Exercise 12.4.13:

Multiply: (x + 8)(x + 9).

Answer

$x^2+17x+72$

Exercise 12.4.14:

Multiply: (a + 4)(a + 5).

Answer

$a^2+9a+20$

Now we'll see how to multiply binomials where the variable has a coefficient.

Example 12.4.8:

Multiply: (2x + 9)(3x + 4).

Solution

Distribute (3x + 4).	$2x(3x+4)+9(3x+4)$
Distribute again.	$6x^2 + 8x + 27x + 36$
Simplify.	$6x^2 + 35x + 36$

Exercise 12.4.15:

Multiply: (5x + 9)(4x + 3).

Answer

$20x^2+51x+27$

Exercise 12.4.16:

Multiply: (10m + 9)(8m + 7).

Answer

$80m^2 + 142m + 63$

In the previous examples, the binomials were sums. When there are differences, we pay special attention to make sure the signs of the product are correct.

Example 12.4.9:

Multiply: (4y + 3)(6y − 5).

Solution

Distribute.	$4y(6y - 5) + 3(6y - 5)$
Distribute again.	$24y^2 - 20y + 18y - 15$
Simplify.	$24y^2 - 2y - 15$

Exercise 12.4.17:

Multiply: (7y + 1)(8y − 3).

Answer

$56y^2 - 13y - 3$

Exercise 12.4.18:

Multiply: (3x + 2)(5x − 8).

Answer

$15x^2 - 14x - 16$

Up to this point, the product of two binomials has been a trinomial. This is not always the case.

Example 12.4.10:

Multiply: (x + 2)(x − y).

Solution

Distribute.	$x(x - y) + 2(x - y)$
Distribute again.	x^2 - xy + 2x - 2y
Simplify.	There are no like terms to combine.

Exercise 12.4.19:

Multiply: (x + 5)(x − y).

Answer

$$x^2 - xy + 5x - 5y$$

Exercise 12.4.20:

Multiply: (x + 2y)(x − 1).

Answer

$$x^2 - x + 2xy - 2y$$

12.5: Multiply Polynomials (Part 2)

Using the FOIL Method

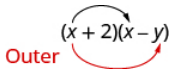
Remember that when you multiply a binomial by a binomial you get four terms. Sometimes you can combine like terms to get a trinomial, but sometimes there are no like terms to combine. Let's look at the last example again and pay particular attention to how we got the four terms.

$$(x+2)(x-y)$$
$$x^2 - xy + 2x - 2y$$

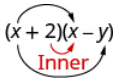
Where did the first term, x^2, come from?

It is the product of x and x, the **first** terms in (x + 2) and (x − y).

The next term, −xy, is the product of x and − y, the two **outer** terms.

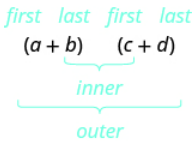


The third term, +2x, is the product of 2 and x, the two **inner** terms.



And the last term, −2y, came from multiplying the two **last** terms.

We abbreviate “First, Outer, Inner, Last” as FOIL. The letters stand for ‘First, Outer, Inner, Last’. The word FOIL is easy to remember and ensures we find all four products. We might say we use the FOIL method to multiply two binomials.



Let's look at (x + 3)(x + 7) again. Now we will work through an example where we use the FOIL pattern to multiply two binomials.

Distributive Property	FOIL
$(x + 3)(x + 7)$	$(x + 3)(x + 7)$
$x(x + 7) + 3(x + 7)$	
$x^2 + 7x + 3x + 21$	$x^2 + 7x + 3x + 21$
$F \quad O \quad I \quad L$	$F \quad O \quad I \quad L$
$x^2 + 10x + 21$	$x^2 + 10x + 21$

Example 12.5.11:

Multiply using the FOIL method: (x + 6)(x + 9).

Solution

Step 1: Multiply the **First** terms.	$(x+6)(x+9)$ $x^2+__+__+__$ F O I L
Step 2: Multiply the **Outer** terms.	$(x+6)(x+9)$ $x^2+9x+__+__$ F O I L
Step 3: Multiply the **Inner** terms.	$(x+6)(x+9)$ $x^2+9x+6x+__$ F O I L
Step 4: Multiply the **Last** terms.	$(x+6)(x+9)$ $x^2+9x+6x+54$ F O I L
Step 5: Combine like terms, when possible.	$x^2 + 15x + 54$

Exercise 12.5.21:

Multiply using the FOIL method: (x + 7)(x + 8).

Answer

$x^2+15x+56$

Exercise 12.5.22:

Multiply using the FOIL method: (y + 14)(y + 2).

Answer

$y^2+16y+28$

We summarize the steps of the FOIL method below. The FOIL method only applies to multiplying binomials, not other polynomials!

HOW TO: USE THE FOIL METHOD FOR MULTIPLYING TWO BINOMIALS

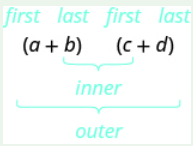
Step 1. Multiply the **First** terms.

Step 2. Multiply the **Outer** terms.

Step 3. Multiply the **Inner** terms.

Step 4. Multiply the **Last** terms.

Step 5. Combine like terms, when possible.



Example 12.5.12:

Multiply: (y − 8)(y + 6).

Solution

Step 1: Multiply the **First** terms.	$(y-8)(y+6)$ $y^2+__+__+__$ F O I L

Step 2: Multiply the **Outer** terms.	$(y-8)(y+6)$ $y^2+6y+__+__$ F O I L
Step 3: Multiply the **Inner** terms.	$(y-8)(y+6)$ $y^2+6y-8y+__$ F O I L
Step 4: Multiply the **Last** terms.	$(y-8)(y+6)$ $y^2+6y-8y-48$ F O I L
Step 5: Combine like terms, when possible.	$y^2 - 2y - 48$

? Exercise 12.5.23:

Multiply: (y − 3)(y + 8).

Answer

$y^2+5y-24$

? Exercise 12.5.24:

Multiply: (q − 4)(q + 5).

Answer

q^2+q-20

✓ Example 12.5.13:

Multiply: (2a + 3)(3a − 1).

Solution

	$(2a+3)(3a-1)$
Multiply the **First** terms.	$2a \cdot 3a$ $6a^2+__+__+__$ F O I L
Multiply the **Outer** terms.	$2a \cdot (-1)$ $6a^2-2a+__+__$ F O I L
Multiply the **Inner** terms.	$3 \cdot 3a$ $6a^2-2a+9a+__$ F O I L
Multiply the **Last** terms.	$3 \cdot (-1)$ $6a^2-2a+9a-3$ F O I L
Combine like terms.	$6a^2 + 7a - 3$

? Exercise 12.5.25:

Multiply: (4a + 9)(5a − 2).

Answer

$20a^2 + 37a - 18$

Exercise 12.5.26:

Multiply: (7x + 4)(7x − 8).

Answer

$49x^2 - 28x - 32$

Example 12.5.14:

Multiply: (5x − y)(2x − 7).

Solution

Multiply the **First** terms.	$10x^2 + __ + __ + __$ F O I L
Multiply the **Outer** terms.	$10x^2 - 35x + __ + __$ F O I L
Multiply the **Inner** terms.	$10x^2 - 35x - 2xy + __$ F O I L
Multiply the **Last** terms.	$10x^2 - 35x - 2xy + 7y$ F O I L
Combine like terms. There are none.	$10x^2$ - 35x - 2xy + 7y

Exercise 12.5.27:

Multiply: (12x − y)(x − 5).

Answer

$12x^2 - 60x - xy + 5y$

Exercise 12.5.28:

Multiply: (6a − b)(2a − 9).

Answer

$12a^2 - 54a - 2ab + 9b$

Using the Vertical Method

The FOIL method is usually the quickest method for multiplying two binomials, but it works only for binomials. You can use the Distributive Property to find the product of any two polynomials. Another method that works for all polynomials is the Vertical Method. It is very much like the method you use to multiply whole numbers. Look carefully at this example of multiplying two-digit numbers.

23	
×46	
138	partial product
92	partial product
1058	product

You start by multiplying 23 by 6 to get 138. Then you multiply 23 by 4, lining up the partial product in the correct columns. Last, you add the partial products. Now we'll apply this same method to multiply two binomials.

Example 12.5.15:

Multiply using the vertical method: (5x − 1)(2x − 7).

Solution

It does not matter which binomial goes on the top. Line up the columns when you multiply as we did when we multiplied 23(46).

	$2x-7$ $\times\ 5x-1$
Multiply 2x − 7 by −1.	$-2x+7$ partial product
Multiply 2x − 7 by 5x.	$10x^2-35x$ partial product
Add like terms.	$10x^2-37x+7$ product

Notice the partial products are the same as the terms in the FOIL method.

$(5x-1)(2x-7)$	$2x-7$ $\times\ 5x-1$
$10x^2-35x-2x+7$	$-2x+7$
$10x^2-37x+7$	$10x^2-35x$ $10x^2-37x+7$

Exercise 12.5.29:

Multiply using the vertical method: (4m − 9)(3m − 7).

Answer

$12m^2-55m+63$

Exercise 12.5.30:

Multiply using the vertical method: (6n − 5)(7n − 2).

Answer

$42n^2-47n+10$

We have now used three methods for multiplying binomials. Be sure to practice each method, and try to decide which one you prefer. The three methods are listed here to help you remember them.

Definition: Multiplying Two Binomials

To multiply binomials, use the:

- Distributive Property
- FOIL Method
- Vertical Method

Remember, FOIL only works when multiplying two binomials.

Multiply a Trinomial by a Binomial

We have multiplied monomials by monomials, monomials by polynomials, and binomials by binomials. Now we're ready to multiply a trinomial by a binomial. Remember, the FOIL method will not work in this case, but we can use either the Distributive Property or the Vertical Method. We first look at an example using the Distributive Property.

Example 12.5.16:

Multiply using the Distributive Property: $(x + 3)(2x^2 - 5x + 8)$.

Solution

	$(x + 3)(2x^2 - 5x + 8)$
Distribute.	$x(2x^2 - 5x + 8) + 3(2x^2 - 5x + 8)$
Multiply.	$2x^3 - 5x^2 + 8x + 6x^2 - 15x + 24$
Combine like terms.	$2x^3 + x^2 - 7x + 24$

Exercise 12.5.31:

Multiply using the Distributive Property: $(y - 1)(y^2 - 7y + 2)$.

Answer

$y^3 - 8y^2 + 9y - 2$

Exercise 12.5.32:

Multiply using the Distributive Property: $(x + 2)(3x^2 - 4x + 5)$.

Answer

$3x^3 + 2x^2 - 3x + 10$

Now let's do this same multiplication using the Vertical Method.

Example 12.5.17:

Multiply using the Vertical Method: $(x + 3)(2x^2 - 5x + 8)$.

Solution

It is easier to put the polynomial with fewer terms on the bottom because we get fewer partial products this way.

	$2x^2 - 5x + 8$ $\times \quad x + 3$
Multiply $(2x^2 - 5x + 8)$ by 3.	$6x^2 - 15x + 24$
Multiply $(2x^2 - 5x + 8)$ by x.	$2x^3 - 5x^2 + 8x$
Add like terms.	$2x^3 + x^2 - 7x + 24$

Exercise 12.5.33:

Multiply using the Vertical Method: $(y - 1)(y^2 - 7y + 2)$.

Answer

$y^3 - 8y^2 + 9y - 2$

Exercise 12.5.34:

Multiply using the Vertical Method: $(x + 2)(3x^2 - 4x + 5)$.

Answer

$3x^3 + 2x^2 - 3x + 10$

Practice Makes Perfect

Multiply a Polynomial by a Monomial

In the following exercises, multiply.

145. $4(x + 10)$
146. $6(y + 8)$
147. $15(r - 24)$
148. $12(v - 30)$
149. $-3(m + 11)$
150. $-4(p + 15)$
151. $-8(z - 5)$
152. $-3(x - 9)$
153. $u(u + 5)$
154. $q(q + 7)$
155. $n(n^2 - 3n)$
156. $s(s^2 - 6s)$
157. $12x(x - 10)$
158. $9m(m - 11)$
159. $-9a(3a + 5)$
160. $-4p(2p + 7)$
161. $6x(4x + y)$
162. $5a(9a + b)$
163. $5p(11p - 5q)$
164. $12u(3u - 4v)$
165. $3(v^2 + 10v + 25)$
166. $6(x^2 + 8x + 16)$
167. $2n(4n^2 - 4n + 1)$

168. $3r(2r^2 - 6r + 2)$
169. $-8y(y^2 + 2y - 15)$
170. $-5m(m^2 + 3m - 18)$
171. $5q^3(q^2 - 2q + 6)$
172. $9r^3(r^2 - 3r + 5)$
173. $-4z^2(3z^2 + 12z - 1)$
174. $-3x^2(7x^2 + 10x - 1)$
175. $(2y - 9)y$
176. $(8b - 1)b$
177. $(w - 6) \cdot 8$
178. $(k - 4) \cdot 5$

Multiply a Binomial by a Binomial

In the following exercises, multiply the following binomials using: (a) the Distributive Property (b) the FOIL method (c) the Vertical method

179. $(x + 4)(x + 6)$
180. $(u + 8)(u + 2)$
181. $(n + 12)(n - 3)$
182. $(y + 3)(y - 9)$

In the following exercises, multiply the following binomials. Use any method.

183. $(y + 8)(y + 3)$
184. $(x + 5)(x + 9)$
185. $(a + 6)(a + 16)$
186. $(q + 8)(q + 12)$
187. $(u - 5)(u - 9)$
188. $(r - 6)(r - 2)$
189. $(z - 10)(z - 22)$
190. $(b - 5)(b - 24)$
191. $(x - 4)(x + 7)$
192. $(s - 3)(s + 8)$
193. $(v + 12)(v - 5)$
194. $(d + 15)(d - 4)$
195. $(6n + 5)(n + 1)$
196. $(7y + 1)(y + 3)$
197. $(2m - 9)(10m + 1)$
198. $(5r - 4)(12r + 1)$
199. $(4c - 1)(4c + 1)$
200. $(8n - 1)(8n + 1)$
201. $(3u - 8)(5u - 14)$
202. $(2q - 5)(7q - 11)$
203. $(a + b)(2a + 3b)$
204. $(r + s)(3r + 2s)$
205. $(5x - y)(x - 4)$
206. $(4z - y)(z - 6)$

Multiply a Trinomial by a Binomial

In the following exercises, multiply using (a) the Distributive Property and (b) the Vertical Method.

207. $(u + 4)(u^2 + 3u + 2)$
208. $(x + 5)(x^2 + 8x + 3)$
209. $(a + 10)(3a^2 + a - 5)$
210. $(n + 8)(4n^2 + n - 7)$

In the following exercises, multiply. Use either method.

211. $(y - 6)(y^2 - 10y + 9)$
212. $(k - 3)(k^2 - 8k + 7)$
213. $(2x + 1)(x^2 - 5x - 6)$
214. $(5v + 1)(v^2 - 6v - 10)$

Everyday Math

215. **Mental math** You can use binomial multiplication to multiply numbers without a calculator. Say you need to multiply 13 times 15. Think of 13 as 10 + 3 and 15 as 10 + 5.
    a. Multiply (10 + 3)(10 + 5) by the FOIL method.
    b. Multiply 13 • 15 without using a calculator.
    c. Which way is easier for you? Why?
216. **Mental math** You can use binomial multiplication to multiply numbers without a calculator. Say you need to multiply 18 times 17. Think of 18 as 20 − 2 and 17 as 20 − 3.
    a. Multiply (20 − 2)(20 − 3) by the FOIL method.
    b. Multiply 18 • 17 without using a calculator.
    c. Which way is easier for you? Why?

Writing Exercises

217. Which method do you prefer to use when multiplying two binomials—the Distributive Property, the FOIL method, or the Vertical Method? Why?
218. Which method do you prefer to use when multiplying a trinomial by a binomial—the Distributive Property or the Vertical Method? Why?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
multiply a polynomial by a monomial.			
multiply a binomial by a binomial.			
multiply a trinomial by a binomial.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

12.6: Divide Monomials (Part 1)

Learning Objectives

- Simplify expressions using the Quotient Property of Exponents
- Simplify expressions with zero exponents
- Simplify expressions using the Quotient to a Power Property
- Simplify expressions by applying several properties
- Divide monomials

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $\frac{8}{24}$. If you missed the problem, review Example 4.3.1.
2. Simplify:$(2m^3)^5$. If you missed the problem, review Example 10.3.13.
3. Simplify: $\frac{12x}{12y}$. If you missed the problem, review Example 4.3.5.

Simplify Expressions Using the Quotient Property of Exponents

Earlier in this chapter, we developed the properties of exponents for multiplication. We summarize these properties here.

Summary of Exponent Properties for Multiplication

If a, b are real numbers and m, n are whole numbers, then

Product Property	$a^m \cdot a^n = a^{m+n}$
Power Property	$(a^m)^n = a^{m \cdot n}$
Product to a Power	$(ab)^m = a^m b^m$

Now we will look at the exponent properties for division. A quick memory refresher may help before we get started. In Fractions you learned that fractions may be simplified by dividing out common factors from the numerator and denominator using the Equivalent Fractions Property. This property will also help us work with algebraic fractions—which are also quotients.

Definition: Equivalent Fractions Property

If a, b, c are whole numbers where $b \neq 0$, $c \neq 0$, then

$$\frac{a}{b} = \frac{a \cdot c}{b \cdot c} \quad and \quad \frac{a \cdot c}{b \cdot c} = \frac{a}{b} \tag{12.6.1}$$

As before, we'll try to discover a property by looking at some examples.

Consider	$\frac{x^5}{x^2}$ (12.6.2)	and	$\frac{x^2}{x^3}$ (12.6.3)
What do they mean?	$\frac{x \cdot x \cdot x \cdot x \cdot x}{x \cdot x}$ (12.6.4)		$\frac{x \cdot x}{x \cdot x \cdot x}$ (12.6.5)
Use the Equivalent Fractions Property	$\frac{\cancel{x} \cdot \cancel{x} \cdot x \cdot x \cdot x}{\cancel{x} \cdot \cancel{x} \cdot 1}$ (12.6.6)		$\frac{\cancel{x} \cdot \cancel{x} \cdot 1}{\cancel{x} \cdot \cancel{x} \cdot x}$ (12.6.7)

Simplify.	x^3 (12.6.8)		$\frac{1}{x}$ (12.6.9)

Notice that in each case the bases were the same and we subtracted the exponents.

- When the larger exponent was in the numerator, we were left with factors in the numerator and 1 in the denominator, which we simplified.
- When the larger exponent was in the denominator, we were left with factors in the denominator, and 1 in the numerator, which could not be simplified.

We write:

$$\begin{array}{ll} \frac{x^5}{x^2} & \frac{x^2}{x^3} \\ x^{5-2} & \frac{1}{x^{3-2}} \\ x^3 & \frac{1}{x} \end{array}$$

Definition: Quotient Property of Exponents

If a is a real number, a ≠ 0, and m, n are whole numbers, then

$$\frac{a^m}{a^n} = a^{m-n},\ m > n \quad and \quad \frac{a^m}{a^n} = \frac{1}{a^{n-m}},\ n > m \tag{12.6.10}$$

A couple of examples with numbers may help to verify this property.

$$\begin{array}{ll} \frac{3^4}{3^2} \stackrel{?}{=} 3^{4-2} & \frac{5^2}{5^3} \stackrel{?}{=} \frac{1}{5^{3-2}} \\ \frac{81}{9} \stackrel{?}{=} 3^2 & \frac{25}{125} \stackrel{?}{=} \frac{1}{5^1} \\ 9 = 9\ \checkmark & \frac{1}{5} = \frac{1}{5}\ \checkmark \end{array}$$

When we work with numbers and the exponent is less than or equal to 3, we will apply the exponent. When the exponent is greater than 3, we leave the answer in exponential form.

Example 12.6.1:

Simplify: (a) $\frac{x^{10}}{x^8}$ (b) $\frac{2^9}{2^2}$

Solution

To simplify an expression with a quotient, we need to first compare the exponents in the numerator and denominator.

(a)

Since 10 > 8, there are more factors of x in the numerator.	$\frac{x^{10}}{x^8}$	(12.6.11)
Use the quotient property with m > n, $\frac{a^m}{a^n} = a^{m-n}$.	x^{10-8}	(12.6.12)
Simplify.	x^2	(12.6.13)

(b)

Since 9 > 2, there are more factors of 2 in the numerator.	$\frac{2^9}{2^2}$	(12.6.14)
Use the quotient property with m > n, $\frac{a^m}{a^n} = a^{m-n}$.	2^{9-2}	(12.6.15)
Simplify.	2^7	(12.6.16)

Notice that when the larger exponent is in the numerator, we are left with factors in the numerator.

? Exercise 12.6.1:

Simplify: (a) $\frac{x^{12}}{x^9}$ (b) $\frac{7^{14}}{7^5}$

Answer a

x^3

Answer b

7^9

? Exercise 12.6.2:

Simplify: (a) $\frac{y^{23}}{y^{17}}$ (b) $\frac{8^{15}}{8^7}$

Answer a

y^6

Answer b

8^8

✓ Example 12.6.2:

Simplify: (a) $\frac{b^{10}}{b^{15}}$ (b) $\frac{3^3}{3^5}$

Solution

To simplify an expression with a quotient, we need to first compare the exponents in the numerator and denominator.

(a)

Since 15 > 10, there are more factors of b in the denominator.	$\frac{b^{10}}{b^{15}}$	(12.6.17)
Use the quotient property with n > m, $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$.	$\frac{1}{b^{15-10}}$	(12.6.18)
Simplify.	$\frac{1}{b^5}$	(12.6.19)

(b)

Since 5 > 3, there are more factors of 3 in the denominator.	$\frac{3^3}{3^5}$	(12.6.20)
Use the quotient property with n > m, $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$.	$\frac{1}{3^{5-3}}$	(12.6.21)
Simplify.	$\frac{1}{3^2}$	(12.6.22)
Apply the exponent.	$\frac{1}{9}$	(12.6.23)

Notice that when the larger exponent is in the denominator, we are left with factors in the denominator and 1 in the numerator.

? Exercise 12.6.3:

Simplify: (a) $\frac{x^8}{x^{15}}$ (b) $\frac{12^{11}}{12^{21}}$

Answer a

$\frac{1}{x^7}$

Answer b

$\frac{1}{12^10}$

? Exercise 12.6.4:

Simplify: (a) $\frac{m^{17}}{m^{26}}$ (b) $\frac{7^8}{7^{14}}$

Answer a

$\frac{1}{m^9}$

Answer b

$\frac{1}{7^6}$

✓ Example 12.6.3:

Simplify: (a) $\frac{a^5}{a^9}$ (b) $\frac{x^{11}}{x^7}$

Solution

(a)

Since 9 > 5, there are more a's in the denominator and so we will end up with factors in the denominator.	$\frac{a^5}{a^9}$	(12.6.24)

Use the quotient property with n > m, $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$.	$\frac{1}{a^{9-5}}$	(12.6.25)
Simplify.	$\frac{1}{a^4}$	(12.6.26)

(b)

Notice there are more factors of x in the numerator, since 11 > 7. So we will end up with factors in the numerator.	$\frac{x^{11}}{x^{97}}$	(12.6.27)
Use the quotient property with m > n, $\frac{a^m}{a^n} = a^{m-n}$.	a^{11-7}	(12.6.28)
Simplify.	x^4	(12.6.29)

? Exercise 12.6.5:

Simplify: (a) $\frac{b^{19}}{b^{11}}$ (b) $\frac{z^5}{z^{11}}$

Answer a

b^8

Answer b

$\frac{1}{z^6}$

? Exercise 12.6.6:

Simplify: (a) $\frac{p^9}{p^{17}}$ (b) $\frac{w^{13}}{w^9}$

Answer a

$\frac{1}{p^8}$

Answer b

w^4

Simplify Expressions with Zero Exponents

A special case of the Quotient Property is when the exponents of the numerator and denominator are equal, such as an expression like $\frac{a^m}{a^m}$. From earlier work with fractions, we know that

$$\frac{2}{2} = 1 \qquad \frac{17}{17} = 1 \qquad \frac{-43}{-43} = 1 \tag{12.6.30}$$

In words, a number divided by itself is 1. So $\frac{x}{x}$ = 1, for any x (x ≠ 0), since any number divided by itself is 1.

The Quotient Property of Exponents shows us how to simplify $\frac{a^m}{a^n}$ when m > n and when n < m by subtracting exponents. What if m = n?

Now we will simplify $\frac{a^m}{a^m}$ in two ways to lead us to the definition of the **zero exponent**. Consider first $\frac{8}{8}$, which we know is 1.

	$\frac{8}{8}=1$	(12.6.31)
Write 8 as 2^3.	$\frac{2^3}{2^3}=1$	(12.6.32)
Subtract exponents.	$2^{3-3}=1$	(12.6.33)
Simplify.	$2^0=1$	(12.6.34)

In general, for $a \neq 0$:

$\frac{a^m}{a^m}$	$\frac{a^m}{a^m}$
a^{m-m}	$\frac{\overbrace{a \cdot a \cdot \ldots \cdot a}^{m \text{ factors}}}{\underbrace{a \cdot a \cdot \ldots \cdot a}_{m \text{ factors}}}$
a^0	1

We see $\frac{a^m}{a^n}$ simplifies to a^0 and to 1. So $a^0 = 1$.

Definition: Zero Exponent

If a is a non-zero number, then $a^0 = 1$. Any nonzero number raised to the zero power is 1.

In this text, we assume any variable that we raise to the zero power is not zero.

Example 12.6.4:

Simplify: (a) 12^0 (b) y^0

Solution

The definition says any non-zero number raised to the zero power is 1.

(a) 12^0

Use the definition of the zero exponent.	1

(b) y^0

Use the definition of the zero exponent.	1

Exercise 12.6.7:

Simplify: (a) 17^0 (b) m^0

Answer a

1

Answer b

1

Exercise 12.6.8:

Simplify: (a) k^0 (b) 29^0

Answer a

1

Answer b

1

Now that we have defined the zero exponent, we can expand all the Properties of Exponents to include whole number exponents.

What about raising an expression to the zero power? Let's look at $(2x)^0$. We can use the product to a power rule to rewrite this expression.

	$(2x)^0$
Use the Product to a Power Rule.	2^0x^0
Use the Zero Exponent Property.	$1 \cdot 1$
Simplify.	1

This tells us that any non-zero expression raised to the zero power is one.

Example 12.6.5:

Simplify: $(7z)^0$.

Solution

Use the definition of the zero exponent.	1

Exercise 12.6.9:

Simplify: $(-4y)^0$.

Answer

1

Exercise 12.6.10:

Simplify: $\left(\frac{2}{3}x\right)^0$.

Answer

1

Example 12.6.6:

Simplify: (a) $(-3x^2y)^0$ (b) $-3x^2y^0$

Solution

(a) $(-3x^2y)^0$

The product is raised to the zero power.	$(-3x^2y)^0$
Use the definition of the zero exponent.	1

(b) $-3x^2y^0$

Notice that only the variable y is being raised to the zero power.	$-3x^2y^0$
Use the definition of the zero exponent.	$-3x^2 \cdot 1$
Simplify.	$-3x^2$

Exercise 12.6.11:

Simplify: (a) $(7x^2y)^0$ (b) $7x^2y^0$

Answer a

1

Answer b

$7x^2$

Exercise 12.6.12:

Simplify: (a) $-23x^2y^0$ (b) $(-23x^2y)^0$

Answer a

$-23x^2$

Answer b

1

Simplify Expressions Using the Quotient to a Power Property

Now we will look at an example that will lead us to the Quotient to a Power Property.

	$\left(\frac{x}{y}\right)^3$	(12.6.35)
This means	$\frac{x}{y} \cdot \frac{x}{y} \cdot \frac{x}{y}$	(12.6.36)
Multiply the fractions.	$\frac{x \cdot x \cdot x}{y \cdot y \cdot y}$	(12.6.37)

Write with exponents.	$\frac{x^3}{y^3}$	(12.6.38)

Notice that the exponent applies to both the numerator and the denominator. We see that $\left(\frac{x}{y}\right)^3$ is $\frac{x^3}{y^3}$. We write:

$$\left(\frac{x}{y}\right)^3 = \frac{x^3}{y^3} \tag{12.6.39}$$

This leads to the Quotient to a Power Property for Exponents.

Definition: Quotient to a Power Property of Exponents

If a and b are real numbers, $b \neq 0$, and m is a counting number, then

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m} \tag{12.6.40}$$

To raise a fraction to a power, raise the numerator and denominator to that power.

An example with numbers may help you understand this property:

$$\left(\frac{2}{3}\right)^3 \stackrel{?}{=} \frac{2^3}{3^3}$$
$$\frac{2}{3}\cdot\frac{2}{3}\cdot\frac{2}{3} \stackrel{?}{=} \frac{8}{27}$$
$$\frac{8}{27} = \frac{8}{27} \checkmark$$

Example 12.6.7:

Simplify: (a) $\left(\frac{5}{8}\right)^2$ (b) $\left(\frac{x}{3}\right)^4$ (c) $\left(\frac{y}{m}\right)^3$

Solution

(a) $\left(\frac{5}{8}\right)^2$

Use the Quotient to a Power Property, $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$.	$\frac{5^2}{8^2}$	(12.6.41)
Simplify.	$\frac{25}{64}$	(12.6.42)

(b) $\left(\frac{x}{3}\right)^4$

Use the Quotient to a Power Property, $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$.	$\frac{x^4}{3^4}$	(12.6.43)
Simplify.	$\frac{x^4}{81}$	(12.6.44)

(c) $\left(\frac{y}{m}\right)^3$

Raise the numerator and denominator to the third power.	$\frac{y^3}{m^3}$	(12.6.45)

? Exercise 12.6.13:

Simplify: (a) $\left(\frac{7}{9}\right)^2$ (b) $\left(\frac{y}{8}\right)^3$ (c) $\left(\frac{p}{q}\right)^6$

Answer a

$\frac{49}{81}$

Answer b

$\frac{y^3}{512}$

Answer c

$\frac{p^6}{q^6}$

? Exercise 12.6.14:

Simplify: (a) $\left(\frac{1}{8}\right)^2$ (b) $\left(\frac{-5}{m}\right)^3$ (c) $\left(\frac{r}{s}\right)^4$

Answer a

$\frac{1}{64}$

Answer b

$-\frac{125}{m^3}$

Answer c

$\frac{r^4}{s^4}$

12.7: Divide Monomials (Part 2)

Simplify Expressions by Applying Several Properties

We'll now summarize all the properties of exponents so they are all together to refer to as we simplify expressions using several properties. Notice that they are now defined for whole number exponents.

Summary of Exponent Properties

If a, b are real numbers and m, n are whole numbers, then

Product Property	$a^m \bullet a^n = a^{m+n}$
Power Property	$(a^m)^n = a^{m \bullet n}$
Product to a Power Property	$(ab)^m = a^m b^m$
Quotient Property	$\frac{a^m}{a^n} = a^{m-n}, \quad a \neq 0,\ m > n$
	$\frac{a^m}{a^n} = \frac{1}{a^{n-m}}, \quad a \neq 0,\ n > m$
Zero Exponent Property	$a^0 = 1, \quad a \neq 0$
Quotient to a Power Property	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$

Example 12.7.8:

Simplify: $\frac{(x^2)^3}{x^5}$.

Solution

Multiply the exponents in the numerator, using the Power Property.	$\frac{x^6}{x^5}$
Subtract the exponents.	x

Exercise 12.7.15:

Simplify: $\frac{(a^4)^5}{a^9}$.

Answer

a^{11}

Exercise 12.7.16:

Simplify: $\frac{(b^5)^6}{b^{11}}$.

Answer

b^{19}

Example 12.7.9:

Simplify: $\frac{(m^8)}{(m^2)^4}$.

Solution

Multiply the exponents in the numerator, using the Power Property.	$\frac{m^8}{m^8}$
Subtract the exponents.	m^0
Zero power property	1

Exercise 12.7.17:

Simplify: $\frac{(k^{11}}{(k^3)^3}$.

Answer

k^2

Exercise 12.7.18:

Simplify: $\frac{(d^{23}}{(d^4)^6}$.

Answer

$\frac{1}{d}$

Example 12.7.10:

Simplify: $\left(\frac{x^7}{x^3}\right)^2$.

Solution

Remember parentheses come before exponents, and the bases are the same so we can simplify inside the parentheses. Subtract the exponents.	$(x^{7-3})^2$
Simplify.	$(x^4)^2$
Multiply the exponents.	x^8

Exercise 12.7.19:

Simplify: $\left(\frac{f^{14}}{f^8}\right)^2$.

Answer

f^{12}

Exercise 12.7.20:

Simplify: $\left(\frac{b^6}{b^{11}}\right)^2$.

Answer

$\frac{1}{b^{10}}$

Example 12.7.11:

Simplify: $\left(\frac{p^2}{q^5}\right)^3$.

Solution

Here we cannot simplify inside the parentheses first, since the bases are not the same.

Raise the numerator and denominator to the third power using the Quotient to a Power Property, $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$	$\frac{(p^2)^3}{(q^5)^3}$
Use the Power Property, $(a^m)^n = a^{m \cdot n}$.	$\frac{p^6}{q^{15}}$

Exercise 12.7.21:

Simplify: $\left(\frac{m^3}{n^8}\right)^5$.

Answer

$\frac{m^{15}}{n^{40}}$

Exercise 12.7.22:

Simplify: $\left(\frac{t^{10}}{u^7}\right)^2$.

Answer

$\frac{t^{20}}{u^{14}}$

Example 12.7.12:

Simplify: $\left(\frac{2x^3}{3y}\right)^4$.

Solution

Raise the numerator and denominator to the fourth power using the Quotient to a Power Property.	$\frac{(2x^3)^4}{(3y)^4}$
Raise each factor to the fourth power, using the Power to a Power Property.	$\frac{2^4(x^3)^4}{3^4y^4}$

Use the Power Property and simplify.	$\frac{16x^{12}}{81y^4}$

? Exercise 12.7.23:

Simplify: $\left(\frac{5b}{9c^3}\right)^2$.

Answer

$\frac{25b^2}{81c^6}$

? Exercise 12.7.24:

Simplify: $\left(\frac{4p^4}{7q^5}\right)^3$.

Answer

$\frac{64p^{12}}{343q^{15}}$

✓ Example 12.7.13:

Simplify: $\frac{(y^2)^3(y^2)^4}{(y^5)^4}$.

Solution

Use the Power Property.	$\frac{(y^6)(y^8)}{y^{20}}$
Add the exponents in the numerator, using the Product Property.	$\frac{y^{14}}{y^{20}}$
Use the Quotient Property.	$\frac{1}{y^6}$

? Exercise 12.7.25

Simplify: $\frac{(y^4)^4(y^3)^5}{(y^7)^6}$.

Answer

$\frac{1}{y^{11}}$

? Exercise 12.7.26

Simplify: $\frac{(3x^4)^2(x^3)^4}{(x^5)^3}$.

Answer

$9x^5$

Divide Monomials

We have now seen all the properties of exponents. We'll use them to divide monomials. Later, you'll use them to divide polynomials.

Example 12.7.14:

Find the quotient: $56x^5 \div 7x^2$.

Solution

Rewrite as a fraction.	$\frac{56x^5}{7x^2}$
Use fraction multiplication to separate the number part from the variable part.	$\frac{56}{7} \cdot \frac{x^5}{x^2}$
Use the Quotient Property.	$8x^3$

Exercise 12.7.27:

Find the quotient: $63x^8 \div 9x^4$.

Answer

$7x^4$

Exercise 12.7.28:

Find the quotient: $96y^{11} \div 6y^8$.

Answer

$16y^3$

When we divide monomials with more than one variable, we write one fraction for each variable.

Example 12.7.15:

Find the quotient: $\frac{42x^2y^3}{-7xy^5}$.

Solution

Use fraction multiplication.	$\frac{42}{-7} \cdot \frac{x^2}{x} \cdot \frac{y^3}{y^5}$
Simplify and use the Quotient Property.	$-6 \cdot x \cdot \frac{1}{y^2}$
Multiply.	$-\frac{6x}{y^2}$

Exercise 12.7.29:

Find the quotient: $\frac{-84x^8y^3}{7x^{10}y^2}$.

Answer

$-\frac{12y}{x^2}$

Exercise 12.7.30:

Find the quotient: $\frac{-72a^4b^5}{-8a^9b^5}$.

Answer

$\frac{9}{a^5}$

Example 12.7.16:

Find the quotient: $\frac{24a^5b^3}{48ab^4}$.

Solution

Use fraction multiplication.	$\frac{24}{48} \cdot \frac{a^5}{a} \cdot \frac{b^3}{b^4}$
Simplify and use the Quotient Property.	$\frac{1}{2} \cdot a^4 \cdot \frac{1}{b}$
Multiply.	$\frac{a^4}{2b}$

Exercise 12.7.31:

Find the quotient: $\frac{16a^7b^6}{24ab^8}$.

Answer

$\frac{2a^6}{3b^2}$

Exercise 12.7.32:

Find the quotient: $\frac{27p^4q^7}{-45p^{12}q}$.

Answer

$-\frac{3q^6}{5p^8}$

Once you become familiar with the process and have practiced it step by step several times, you may be able to simplify a fraction in one step.

Example 12.7.17:

Find the quotient: $\frac{14x^7y^{12}}{21x^{11}y^6}$.

Solution

Simplify and use the Quotient Property.	$\frac{2y^6}{3x^4}$

Be very careful to simplify $\frac{14}{21}$ by dividing out a common factor, and to simplify the variables by subtracting their exponents.

Exercise 12.7.33:

Find the quotient: $\frac{28x^5y^{14}}{49x^9y^{12}}$.

Answer

$\frac{4y^2}{7x^4}$

Exercise 12.7.34:

Find the quotient: $\frac{30m^5n^{11}}{48m^{10}n^{14}}$.

Answer

$\frac{5}{8m^5n^3}$

In all examples so far, there was no work to do in the numerator or denominator before simplifying the fraction. In the next example, we'll first find the product of two monomials in the numerator before we simplify the fraction.

Example 12.7.18:

Find the quotient: $\frac{(3x^3y^2)(10x^2y^3)}{6x^4y^5}$.

Solution

Remember, the fraction bar is a grouping symbol. We will simplify the numerator first.

Simplify the numerator.	$\frac{30x^5y^5}{6x^4y^5}$
Simplify, using the Quotient Rule.	$5x$

Exercise 12.7.35:

Find the quotient: $\frac{(3x^4y^5)(8x^2y^5)}{12x^5y^8}$.

Answer

$2xy^2$

Exercise 12.7.36:

Find the quotient: $\frac{(-6a^6b^9)(-8a^5b^8)}{-12a^{10}b^{12}}$.

Answer

$-4ab^5$

Practice Makes Perfect

Simplify Expressions Using the Quotient Property of Exponents

In the following exercises, simplify.

219. $\frac{4^8}{4^2}$
220. $\frac{3^{12}}{3^4}$
221. $\frac{x^{12}}{x^3}$
222. $\frac{u^9}{u^3}$
223. $\frac{r^5}{r}$
224. $\frac{y^4}{y}$
225. $\frac{y^4}{y^{20}}$
226. $\frac{x^{10}}{x^{30}}$
227. $\frac{10^3}{10^{15}}$
228. $\frac{r^2}{r^8}$
229. $\frac{a}{a^9}$
230. $\frac{2}{2^5}$

Simplify Expressions with Zero Exponents

In the following exercises, simplify.

231. 5^0
232. 10^0
233. a^0
234. x^0
235. -7^0
236. -4^0
237. (a) $(10p)^0$ (b) $10p^0$
238. (a) $(3a)^0$ (b) $3a^0$
239. (a) $(-27x^5y)^0$ (b) $-27x^5y^0$
240. (a) $(-92y^8z)^0$ (b) $-92y^8z^0$
241. (a) 15^0 (b) 15^1
242. (a) -6^0 (b) -6^1
243. $2 \cdot x^0 + 5 \cdot y^0$

244. $8 \cdot m^0 - 4 \cdot n^0$

Simplify Expressions Using the Quotient to a Power Property

In the following exercises, simplify.

245. $\left(\frac{3}{2}\right)^5$

246. $\left(\frac{4}{5}\right)^3$

247. $\left(\frac{m}{6}\right)^3$

248. $\left(\frac{p}{2}\right)^5$

249. $\left(\frac{x}{y}\right)^{10}$

250. $\left(\frac{a}{b}\right)^8$

251. $\left(\frac{a}{3b}\right)^2$

252. $\left(\frac{2x}{y}\right)^4$

Simplify Expressions by Applying Several Properties

In the following exercises, simplify.

253. $\frac{(x^2)^4}{x^5}$

254. $\frac{(y^4)^3}{y^7}$

255. $\frac{(u^3)^4}{u^{10}}$

256. $\frac{(y^2)^5}{y^6}$

257. $\frac{y^8}{(y^5)^2}$

258. $\frac{p^{11}}{(p^5)^3}$

259. $\frac{r^5}{(r^4 \cdot r}$

260. $\frac{a^3 \cdot a^4}{(a^7}$

261. $\left(\frac{x^2}{x^8}\right)^3$

262. $\left(\frac{u}{u^{10}}\right)^2$

263. $\left(\frac{a^4 \cdot a^6}{a^3}\right)^2$

264. $\left(\frac{x^{3 \cdot x^8}}{x^4}\right)^3$

265. $\frac{(y^3)^5}{(y^4)^3}$

266. $\frac{(z^6)^2}{(z^2)^4}$

267. $\frac{(x^3)^6}{(x^4)^7}$
268. $\frac{(x^4)^8}{(x^5)^7}$
269. $\left(\frac{2r^3}{5s}\right)^4$
270. $\left(\frac{3m^2}{4n}\right)^3$
271. $\left(\frac{3y^2 \cdot y^5}{y^{15} \cdot y^8}\right)^0$
272. $\left(\frac{15z^4 \cdot z^9}{0.3z^2}\right)^0$
273. $\frac{(r^2)^5(r^4)^2}{(r^3)^7}$
274. $\frac{(p^4)^2(p^3)^5}{(p^2)^9}$
275. $\frac{(3x^4)^3(2x^3)^2}{(6x^5)^2}$
276. $\frac{(-2y^3)^4(3y^4)^2}{(-6y^3)^2}$

Divide Monomials

In the following exercises, divide the monomials.

277. $48b^8 \div 6b^2$
278. $42a^{14} \div 6a^2$
279. $36x^3 \div (-2x^9)$
280. $20u^8 \div (-4u^6)$
281. $\frac{18x^3}{9x^2}$
282. $\frac{36y^9}{4y^7}$
283. $\frac{-35x^7}{-42x^{13}}$
284. $\frac{18x^5}{-27x^9}$
285. $\frac{18r^5s}{3r^3s^9}$
286. $\frac{24p^7q}{6p^2q^5}$
287. $\frac{8mn^{10}}{64mn^4}$
288. $\frac{10a^4b}{50a^2b^6}$
289. $\frac{-12x^4y^9}{15x^6y^3}$
290. $\frac{48x^{11}y^9z^3}{36x^6y^8z^5}$
291. $\frac{64x^5y^9z^7}{48x^7y^{12}z^6}$
292. $\frac{(10u^2v)(4u^3v^6)}{5u^9v^2}$

293. $\frac{(6m^2n)(5m^4n^3)}{3m^{10}n^2}$
294. $\frac{(6a^4b^3)(4ab^5)}{(12a^8b)(a^3b)}$
295. $\frac{(4u^5v^4)(15u^8v)}{(12u^3v)(u^6v)}$

Mixed Practice

296. (a) $24a^5 + 2a^5$ (b) $24a^5 - 2a^5$ (c) $24a^5 \cdot 2a^5$ (d) $24a^5 \div 2a^5$
297. (a) $15n^{10} + 3n^{10}$ (b) $15n^{10} - 3n^{10}$ (c) $15n^{10} \cdot 3n^{10}$ (d) $15n^{10} \div 3n^{10}$
298. (a) $p^4 \cdot p^6$ (b) $(p^4)^6$

12.8: Integer Exponents and Scientific Notation (Part 1)

Learning Objectives

- Use the definition of a negative exponent
- Simplify expressions with integer exponents
- Convert from decimal notation to scientific notation
- Convert scientific notation to decimal form
- Multiply and divide using scientific notation

be prepared!

Before you get started, take this readiness quiz.

1. What is the place value of the 6 in the number 64,891? If you missed this problem, review Example 1.1.3.
2. Name the decimal 0.0012. If you missed this problem, review Exercise 5.1.1.
3. Subtract: 5 − (−3). If you missed this problem, review Example 3.5.8.

Use the Definition of a Negative Exponent

The Quotient Property of Exponents, introduced in Divide Monomials, had two forms depending on whether the exponent in the numerator or denominator was larger.

Definition: Quotient Property of Exponents

If a is a real number, a ≠ 0, and m, n are whole numbers, then

$$\frac{a^m}{a^n} = a^{m-n},\ m > n \quad and \quad \frac{a^m}{a^n} = \frac{1}{a^{n-m}},\ n > m \tag{12.8.1}$$

What if we just subtract exponents, regardless of which is larger? Let's consider $\frac{x^2}{x^5}$. We subtract the exponent in the denominator from the exponent in the numerator.

$$\frac{x^2}{x^5}$$
$$x^{2-5}$$
$$x^{-3}$$

We can also simplify $\frac{x^2}{x^5}$ by dividing out common factors: $\frac{x^2}{x^5}$.

$$\frac{\cancel{x} \cdot \cancel{x}}{\cancel{x} \cdot \cancel{x} \cdot x \cdot x \cdot x}$$
$$\frac{1}{x^3}$$

This implies that $x^{-3} = \frac{1}{x^3}$ and it leads us to the definition of a **negative exponent**.

Definition: negative exponent

If n is a positive integer and a ≠ 0, then $a^{-n} = \frac{1}{a^n}$.

The negative exponent tells us to re-write the expression by taking the reciprocal of the base and then changing the sign of the exponent. Any expression that has negative exponents is not considered to be in simplest form. We will use the definition of a negative exponent and other properties of exponents to write an expression with only positive exponents.

Example 12.8.1:

Simplify: (a) 4^{-2} (b) 10^{-3}

Solution

(a) 4^{-2}

Use the definition of a negative exponent, $a^{-n} = \frac{1}{a^n}$.	$\frac{1}{4^2}$	(12.8.2)
Simplify.	$\frac{1}{16}$	(12.8.3)

(b) 10^{-3}

Use the definition of a negative exponent, $a^{-n} = \frac{1}{a^n}$.	$\frac{1}{10^3}$	(12.8.4)
Simplify.	$\frac{1}{1000}$	(12.8.5)

Exercise 12.8.1:

Simplify: (a) 2^{-3} (b) 10^{-2}

Answer a

$\frac{1}{8}$

Answer b

$\frac{1}{100}$

Exercise 12.8.2:

Simplify: (a) 3^{-2} (b) 10^{-4}

Answer a

$\frac{1}{9}$

Answer b

$\frac{1}{10,000}$

When simplifying any expression with exponents, we must be careful to correctly identify the base that is raised to each exponent.

Example 12.8.2:

Simplify: (a) $(-3)^{-2}$ (b) -3^{-2}

Solution

The negative in the exponent does not affect the sign of the base.

a) $(-3)^{-2}$

The exponent applies to the base, −3.	$(-3)^{-2}$	(12.8.6)
Take the reciprocal of the base and change the sign of the exponent.	$\frac{1}{(-3)^2}$	(12.8.7)
Simplify.	$\frac{1}{9}$	(12.8.8)

(b) -3^{-2}

The expression -3^{-2} means "find the opposite of 3^{-2}. The exponent applies only to the base, 3.	-3^{-2}	(12.8.9)
Rewrite as a product with −1.	$-1 \cdot 3^{-2}$	(12.8.10)
Take the reciprocal of the base and change the sign of the exponent.	$-1 \cdot \frac{1}{3^2}$	(12.8.11)
Simplify.	$-\frac{1}{9}$	(12.8.12)

? Exercise 12.8.3:

Simplify: (a) $(-5)^{-2}$ (b) -5^{-2}

Answer a

$\frac{1}{25}$

Answer b

$-\frac{1}{25}$

? Exercise 12.8.4:

Simplify: (a) $(-2)^{-2}$ (b) -2^{-2}

Answer a

$\frac{1}{4}$

Answer b

$-\frac{1}{4}$

We must be careful to follow the order of operations. In the next example, parts (a) and (b) look similar, but we get different results.

✓ Example 12.8.3:

Simplify: (a) $4 \cdot 2^{-1}$ (b) $(4 \cdot 2)^{-1}$

Solution

Remember to always follow the order of operations.

(a) $4 \cdot 2^{-1}$

Do exponents before multiplication.	$4 \cdot 2^{-1}$	(12.8.13)
Use $a^{-n} = \frac{1}{a^n}$.	$4 \cdot \frac{1}{2^1}$	(12.8.14)
Simplify.	2	(12.8.15)

(b) $(4 \cdot 2)^{-1}$

Simplify inside the parentheses first.	$(8)^{-1}$	(12.8.16)
Use $a^{-n} = \frac{1}{a^n}$.	$\frac{1}{8^1}$	(12.8.17)
Simplify.	$\frac{1}{8}$	(12.8.18)

? Exercise 12.8.5:

Simplify: (a) $6 \cdot 3^{-1}$ (b) $(6 \cdot 3)^{-1}$

Answer a

2

Answer b

$\frac{1}{18}$

? Exercise 12.8.6:

Simplify: (a) $8 \cdot 2^{-2}$ (b) $(8 \cdot 2)^{-2}$

Answer a

2

Answer b

$\frac{1}{256}$

When a variable is raised to a negative exponent, we apply the definition the same way we did with numbers.

✓ Example 12.8.4:

Simplify: x^{-6}.

Solution

Use the definition of a negative exponent, $a^{-n} = \frac{1}{a^n}$.	$\frac{1}{x^6}$	(12.8.19)

Exercise 12.8.7:

Simplify: y^{-7}.

Answer

$\frac{1}{y^7}$

Exercise 12.8.8:

Simplify: z^{-8}.

Answer

$\frac{1}{z^8}$

When there is a product and an exponent we have to be careful to apply the exponent to the correct quantity. According to the order of operations, expressions in parentheses are simplified before exponents are applied. We'll see how this works in the next example.

Example 12.8.5:

Simplify: (a) $5y^{-1}$ (b) $(5y)^{-1}$ (c) $(-5y)^{-1}$

Solution

(a) $5y^{-1}$

Notice the exponent applies to just the base y .	$5y^{-1}$	(12.8.20)
Take the reciprocal of y and change the sign of the exponent.	$5 \cdot \frac{1}{y^1}$	(12.8.21)
Simplify.	$\frac{5}{y}$	(12.8.22)

(b) $(5y)^{-1}$

Here the parentheses make the exponent apply to the base 5y.	$(5y)^{-1}$	(12.8.23)
Take the reciprocal of 5y and change the sign of the exponent.	$\frac{1}{(5y)^1}$	(12.8.24)
Simplify.	$\frac{1}{5y}$	(12.8.25)

(c) $(-5y)^{-1}$

The base is $-5y$. Take the reciprocal of $-5y$ and change the sign of the exponent.	$\frac{1}{(-5y)^1}$	(12.8.26)

Simplify.	$\frac{1}{-5y}$	(12.8.27)
Use $\frac{a}{-b}=-\frac{a}{b}$.	$-\frac{1}{5y}$	(12.8.28)

Exercise 12.8.9:

Simplify: (a) $8p^{-1}$ (b) $(8p)^{-1}$ (c) $(-8p)^{-1}$

Answer a

$\frac{8}{p}$

Answer b

$\frac{1}{8p}$

Answer c

$-\frac{1}{8p}$

Exercise 12.8.10:

Simplify: (a) $11q^{-1}$ (b) $(11q)^{-1}$ (c) $(-11q)^{-1}$

Answer a

$\frac{11}{q}$

Answer b

$\frac{1}{11q}$

Answer c

$-\frac{1}{11q}$

Now that we have defined negative exponents, the Quotient Property of Exponents needs only one form, $\frac{a^m}{a^n}=a^{m-n}$, where a ≠ 0 and m and n are integers.

When the exponent in the denominator is larger than the exponent in the numerator, the exponent of the quotient will be negative. If the result gives us a negative exponent, we will rewrite it by using the definition of negative exponents, $a^{-n}=\frac{1}{a^n}$.

Simplify Expressions with Integer Exponents

All the exponent properties we developed earlier in this chapter with whole number exponents apply to integer exponents, too. We restate them here for reference.

Summary of Exponent Properties

If a, b are real numbers and m, n are integers, then

Product Property	$a^m \cdot a^n = a^{m+n}$
Power Property	$(a^m)^n = a^{m \cdot n}$

Product to a Power Property	$(ab)^m = a^m b^m$
Quotient Property	$\frac{a^m}{a^n} = a^{m-n}$, $a \neq 0$, $m > n$
	$\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$, $a \neq 0$, $n > m$
Zero Exponent Property	$a^0 = 1$, $a \neq 0$
Quotient to a Power Property	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$, $b \neq 0$
Definition of a Negative Exponent	$a^{-n} = \frac{1}{a^n}$

Example 12.8.6:

Simplify: (a) $x^{-4} \cdot x^6$ (b) $y^{-6} \cdot y^4$ (c) $z^{-5} \cdot z^{-3}$

Solution

(a) $x^{-4} \cdot x^6$

Use the Product Property, $a^m \cdot a^n = a^{m+n}$.	x^{-4+6}	(12.8.29)
Simplify.	x^2	(12.8.30)

(b) $y^{-6} \cdot y^4$

The bases are the same, so add the exponents.	y^{-6+4}	(12.8.31)
Simplify.	y^{-2}	(12.8.32)
Use the definition of a negative exponent, $a^{-n} = \frac{1}{a^n}$.	$\frac{1}{y^2}$	(12.8.33)

(c) $z^{-5} \cdot z^{-3}$

The bases are the same, so add the exponents.	z^{-5-3}	(12.8.34)
Simplify.	z^{-8}	(12.8.35)
Use the definition of a negative exponent, $a^{-n} = \frac{1}{a^n}$.	$\frac{1}{z^8}$	(12.8.36)

Exercise 12.8.11:

Simplify: (a) $x^{-3} \cdot x^7$ (b) $y^{-7} \cdot y^2$ (c) $z^{-4} \cdot z^{-5}$

Answer a

x^4

Answer b

$\frac{1}{y^5}$

Answer c

$\frac{1}{z^9}$

Exercise 12.8.12:

Simplify: (a) $a^{-1} \cdot a^6$ (b) $b^{-6} \cdot b^4$ (c) $c^{-8} \cdot c^{-7}$

Answer a

a^5

Answer b

$\frac{1}{b^4}$

Answer c

$\frac{1}{c^{15}}$

In the next two examples, we'll start by using the Commutative Property to group the same variables together. This makes it easier to identify the like bases before using the Product Property of Exponents.

Example 12.8.7:

Simplify: $(m^4n^{-3})(m^{-5}n^{-2})$.

Solution

Use the Commutative Property to get like bases together.	$m^4m^{-5} \cdot n^{-2}n^{-3}$	(12.8.37)
Add the exponents for each base.	$m^{-1} \cdot n^{-5}$	(12.8.38)
Take reciprocals and change the signs of the exponents.	$\frac{1}{m^1} \cdot \frac{1}{n^5}$	(12.8.39)
Simplify.	$\frac{1}{mn^5}$	(12.8.40)

Exercise 12.8.13:

Simplify: $(p^6q^{-2})(p^{-9}q^{-1})$.

Answer

$\frac{1}{p^3q^3}$

Exercise 12.8.14:

Simplify: $(r^5s^{-3})(r^{-7}s^{-5})$.

Answer

$\frac{1}{r^2 s^8}$

If the monomials have numerical coefficients, we multiply the coefficients, just as we did in Use Multiplication Properties of Exponents.

Example 12.8.8:

Simplify: $(2x^{-6}y^8)(-5x^5\,y^{-3})$.

Solution

Rewrite with the like bases together.	$2(-5)\cdot(x^{-6}x^5)\cdot(y^8y^{-3})$	(12.8.41)
Simplify.	$-10\cdot x^{-1}\cdot y^5$	(12.8.42)
Use the definition of a negative exponent, $a^{-n}=\frac{1}{a^n}$.	$-10\cdot\frac{1}{x^1}\cdot y^5$	(12.8.43)
Simplify.	$\frac{-10y^5}{x}$	(12.8.44)

Exercise 12.8.15:

Simplify: $(3u^{-5}v^7)(-4u^4v^{-2})$.

Answer

$-\frac{12v^5}{u}$

Exercise 12.8.16:

Simplify: $(-6c^{-6}d^4)(-5c^{-2}d^{-1})$.

Answer

$\frac{30d^3}{c^8}$

In the next two examples, we'll use the Power Property and the Product to a Power Property.

Example 12.8.9:

Simplify: $(k^3)^{-2}$.

Solution

Use the Product to a Power Property, $(ab)^m = a^m b^m$.	$k^{3(-2)}$	(12.8.45)
Simplify.	k^{-6}	(12.8.46)
Rewrite with a positive exponent.	$\frac{1}{k^6}$	(12.8.47)

Exercise 12.8.17:

Simplify: $(x^4)^{-1}$.

Answer

$\frac{1}{x^4}$

Exercise 12.8.18:

Simplify: $(y^2)^{-2}$.

Answer

$\frac{1}{y^4}$

Example 12.8.10:

Simplify: $(5x^{-3})^2$.

Solution

Use the Product to a Power Property, $(ab)^m = a^m b^m$.	$5^2(x^{-3})^2$	(12.8.48)
Simplify 5^2 and multiply the exponents of x using the Power Property, $(a^m)^n = a^{m \cdot n}$.	$25k^{-6}$	(12.8.49)
Rewrite x^{-6} by using the definition of a negative exponent, $a^{-n} = \frac{1}{a^n}$.	$25 \cdot \frac{1}{x^6}$	(12.8.50)
Simplify.	$\frac{25}{x^6}$	(12.8.51)

Exercise 12.8.19:

Simplify: $(8a^{-4})^2$.

Answer

$\frac{64}{a^8}$

Exercise 12.8.20:

Simplify: $(2c^{-4})^3$.

Answer

$\frac{8}{c^12}$

To simplify a fraction, we use the Quotient Property.

Example 12.8.11:

Simplify: $\frac{r^5}{r^{-4}}$.

Solution

Use the Quotient Property, $\frac{a^m}{a^n} = a^{m-n}$.	$r^{5-(-4)}$	(12.8.52)
Be careful to subtract 5 - (\textcolor{red}{-4}).		
Simplify.	r^9	(12.8.53)

Exercise 12.8.21:

Simplify: $\frac{x^8}{x^{-3}}$.

Answer

x^{11}

Exercise 12.8.22:

Simplify: $\frac{y^7}{y^{-6}}$.

Answer

y^{13}

12.9: Integer Exponents and Scientific Notation (Part 2)

Convert from Decimal Notation to Scientific Notation

Remember working with place value for whole numbers and decimals? Our number system is based on powers of 10. We use tens, hundreds, thousands, and so on. Our decimal numbers are also based on powers of tens—tenths, hundredths, thousandths, and so on.

Consider the numbers 4000 and 0.004. We know that 4000 means 4×1000 and 0.004 means $4 \times \frac{1}{1000}$. If we write the 1000 as a power of ten in exponential form, we can rewrite these numbers in this way:

4000	0.004
4×1000	$4 \times \frac{1}{1000}$
4×10^3	$4 \times \frac{1}{10^3}$
	4×10^{-3}

When a number is written as a product of two numbers, where the first factor is a number greater than or equal to one but less than 10, and the second factor is a power of 10 written in exponential form, it is said to be in *scientific notation*.

Definition: Scientific Notation

A number is expressed in scientific notation when it is of the form $a \times 10^n$ where $a \geq 1$ and $a < 10$ and n is an integer.

It is customary in scientific notation to use × as the multiplication sign, even though we avoid using this sign elsewhere in algebra.

Scientific notation is a useful way of writing very large or very small numbers. It is used often in the sciences to make calculations easier.

If we look at what happened to the decimal point, we can see a method to easily convert from decimal notation to scientific notation.

$4000. = 4 \times 10^3$	$0.004 = 4 \times 10^{-3}$
$4000. = 4 \times 10^3$	$0.004 = 4 \times 10^{-3}$
Moved the decimal point 3 places to the left.	Moved the decimal point 3 places to the right.

In both cases, the decimal was moved 3 places to get the first factor, 4, by itself.

- The power of 10 is positive when the number is larger than 1: $4000 = 4 \times 10^3$.
- The power of 10 is negative when the number is between 0 and 1: $0.004 = 4 \times 10^{-3}$.

Example 12.9.12:

Write 37,000 in scientific notation.

Solution

Step 1: Move the decimal point so that the first factor is greater than or equal to 1 but less than 10.	37000.
Step 2: Count the number of decimal places, n, that the decimal point was moved.	3.70000 4 places
Step 3: Write the number as a product with a power of 10.	3.7×10^4

If the original number is: • greater than 1, the power of 10 will be 10^n • between 0 and 1, the power of 10 will be 10^{-n}	
Step 4: Check.10^4 is 10,000 and 10,000 times 3.7 will be 37,000.	$37{,}000 = 3.7\times10^4$

? Exercise 12.9.23:

Write in scientific notation: 96,000.

Answer

9.6×10^4

? Exercise 12.9.24:

Write in scientific notation: 48,300.

Answer

4.83×10^4

HOW TO: CONVERT FROM DECIMAL NOTATION TO SCIENTIFIC NOTATION

Step 1. Move the decimal point so that the first factor is greater than or equal to 1 but less than 10.

Step 2. Count the number of decimal places, n, that the decimal point was moved.

Step 3. Write the number as a product with a power of 10.

If the original number is:

- greater than 1, the power of 10 will be 10^n.
- between 0 and 1, the power of 10 will be 10^{-n}.

Step 4. Check.

✓ Example 12.9.13:

Write in scientific notation: 0.0052.

Solution

Move the decimal point to get 5.2, a number between 1 and 10.	0.0052
Count the number of decimal places the point was moved.	3 places
Write as a product with a power of 10.	5.2×10^{-3}
Check your answer:	5.2×10^{-3} $5.2 \times \frac{1}{10^3}$ $5.2 \times \frac{1}{1000}$ 5.2×0.001 0.0052
	$0.0052 = 5.2 \times 10^{-3}$

Exercise 12.9.25:

Write in scientific notation: 0.0078.

Answer

7.8×10^{-3}

Exercise 12.9.26:

Write in scientific notation: 0.0129.

Answer

1.29×10^{-2}

Convert Scientific Notation to Decimal Form

How can we convert from scientific notation to decimal form? Let's look at two numbers written in scientific notation and see.

9.12×10^{4}	9.12×10^{-4}
$9.12 \times 10,000$	9.12×0.0001
$91,200$	0.000912

If we look at the location of the decimal point, we can see an easy method to convert a number from scientific notation to decimal form.

$9.12 \times 10^{4} = 91,200$	$9.12 \times 10^{-4} = 0.000912$
$9.12___ \times 10^{4} = 91,200$	$___9.12 \times 10^{-4} = 0.000912$

In both cases the decimal point moved 4 places. When the exponent was positive, the decimal moved to the right. When the exponent was negative, the decimal point moved to the left.

Example 12.9.14:

Convert to decimal form: 6.2×10^{3}.

Solution

Step 1: Determine the exponent, n, on the factor 10.	6.2×10^{3}
Step 2: Move the decimal point n places, adding zeros if needed.	6,200.
• If the exponent is positive, move the decimal point n places to the right. • If the exponent is negative, move the decimal point |n| places to the left.	6,200
Step 3: Check to see if your answer makes sense.	
10^{3} is 1000 and 1000 times 6.2 will be 6,200.	$6.2 \times 10^{3} = 6,200$

Exercise 12.9.27:

Convert to decimal form: 1.3×10^{3}.

Answer

1,300

Exercise 12.9.28:

Convert to decimal form: 9.25×10^4.

Answer

92,500

HOW TO: CONVERT SCIENTIFIC NOTATION TO DECIMAL FORM

Step 1. Determine the exponent, n, on the factor 10.

Step 2. Move the decimal n places, adding zeros if needed.

- If the exponent is positive, move the decimal point n places to the right.
- If the exponent is negative, move the decimal point |n| places to the left.

Step 3. Check.

Example 12.9.15:

Convert to decimal form: 8.9×10^{-2}.

Solution

Determine the exponent n, on the factor 10.	The exponent is -2.
Move the decimal point 2 places to the left.	$\underbrace{.8.9}$
Add zeros as needed for placeholders.	0.089
	$8.9 \times 10^{-2} = 0.089$
The Check is left to you.	

Exercise 12.9.29:

Convert to decimal form: 1.2×10^{-4}.

Answer

0.00012

Exercise 12.9.30:

Convert to decimal form: 7.5×10^{-2}.

Answer

0.075

Multiply and Divide Using Scientific Notation

We use the Properties of Exponents to multiply and divide numbers in scientific notation.

Example 12.9.16:

Multiply. Write answers in decimal form: $(4 \times 10^5)(2 \times 10^{-7})$.

Solution

Use the Commutative Property to rearrange the factors.	$4 \cdot 2 \cdot 10^5 \cdot 10^{-7}$
Multiply 4 by 2 and use the Product Property to multiply 10^5 by 10^{-7}.	8×10^{-2}
Change to decimal form by moving the decimal two places left.	0.08

Exercise 12.9.31:

Multiply. Write answers in decimal form: $(3 \times 10^6)(2 \times 10^{-8})$.

Answer

0.06

Exercise 12.9.32:

Multiply. Write answers in decimal form: $(3 \times 10^{-2})(3 \times 10^{-1})$.

Answer

0.009

Example 12.9.17:

Divide. Write answers in decimal form: $\dfrac{9 \times 10^3}{3 \times 10^{-2}}$.

Solution

Separate the factors.	$\dfrac{9}{3} \times \dfrac{10^3}{10^{-2}}$	(12.9.1)
Divide 9 by 3 and use the Quotient Property to divide 10^3 by 10^{-2}.	3×10^5	
Change to decimal form by moving the decimal five places right.	300,000	

Exercise 12.9.33:

Divide. Write answers in decimal form:\dfrac{8 \times 10^{4}}{2 \times 10^{-1}}.

Answer

400,000

Exercise 12.9.34:

Divide. Write answers in decimal form:\dfrac{8 \times 10^{2}}{4 \times 10^{-2}}.

Answer

20,000

383. $p^{-3}p^{-6}$

Convert from Decimal Notation to Scientific Notation

In the following exercises, write each number in scientific notation.

384. 45,000
385. 280,000
386. 8,750,000
387. 1,290,000
388. 0.036
389. 0.041
390. 0.00000924
391. 0.0000103
392. The population of the United States on July 4, 2010 was almost 310,000,000.
393. The population of the world on July 4, 2010 was more than 6,850,000,000.
394. The average width of a human hair is 0.0018 centimeters.
395. The probability of winning the 2010 Megamillions lottery is about 0.0000000057.

Convert Scientific Notation to Decimal Form

In the following exercises, convert each number to decimal form.

396. 4.1×10^{2}
397. 8.3×10^{2}
398. 5.5×10^{8}
399. 1.6×10^{10}
400. 3.5×10^{-2}
401. 2.8×10^{-2}
402. $1.93 \times 10{-}5$
403. $6.15 \times 10{-}8$
404. In 2010, the number of Facebook users each day who changed their status to 'engaged' was 2×10^{4}.
405. At the start of 2012, the US federal budget had a deficit of more than $\$1.5 \times 10^{13}$.
406. The concentration of carbon dioxide in the atmosphere is 3.9×10^{-4}.
407. The width of a proton is 1×10^{-5} of the width of an atom.

Multiply and Divide Using Scientific Notation

In the following exercises, multiply or divide and write your answer in decimal form.

408. $(2 \times 10^{5})(2 \times 10^{-9})$
409. $(3 \times 10^{2})(1 \times 10^{-5})$
410. $(1.6 \times 10^{-2})(5.2 \times 10^{-6})$
411. $(2.1 \times 10^{-4})(3.5 \times 10^{-2})$
412. $\dfrac{6 \times 10^{4}}{3 \times 10^{-2}}$
413. $\dfrac{8 \times 10^{6}}{4 \times 10^{-1}}$
414. $\dfrac{7 \times 10^{-2}}{1 \times 10^{-8}}$
415. $\dfrac{5 \times 10^{-3}}{1 \times 10^{-10}}$

Everyday Math

416. **Calories** In May 2010 the Food and Beverage Manufacturers pledged to reduce their products by 1.5 trillion calories by the end of 2015.
    1. Write 1.5 trillion in decimal notation.
    2. Write 1.5 trillion in scientific notation.
417. **Length of a year** The difference between the calendar year and the astronomical year is 0.000125 day.
    1. Write this number in scientific notation.
    2. How many years does it take for the difference to become 1 day?
418. **Calculator display** Many calculators automatically show answers in scientific notation if there are more digits than can fit in the calculator's display. To find the probability of getting a particular 5-card hand from a deck of cards, Mario divided 1 by 2,598,960 and saw the answer 3.848×10^{-7}. Write the number in decimal notation.
419. **Calculator display** Many calculators automatically show answers in scientific notation if there are more digits than can fit in the calculator's display. To find the number of ways Barbara could make a collage with 6 of her 50 favorite photographs, she multiplied $50 \cdot 49 \cdot 48 \cdot 47 \cdot 46 \cdot 45$. Her calculator gave the answer 1.1441304×10^{10}. Write the number in decimal notation.

Writing Exercises

420. (a) Explain the meaning of the exponent in the expression 2^{3}. (b) Explain the meaning of the exponent in the expression 2^{-3}.
421. When you convert a number from decimal notation to scientific notation, how do you know if the exponent will be positive or negative?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the definition of a negative exponent.			
simplify expressions with integer exponents.			
convert from decimal notation to scientific notation.			
convert scientific notation to decimal form.			
multiply and divide using scientific notation.			

(b) After looking at the checklist, do you think you are well prepared for the next section? Why or why not?

12.10: Introduction to Factoring Polynomials

Learning Objectives

- Find the greatest common factor of two or more expressions
- Factor the greatest common factor from a polynomial

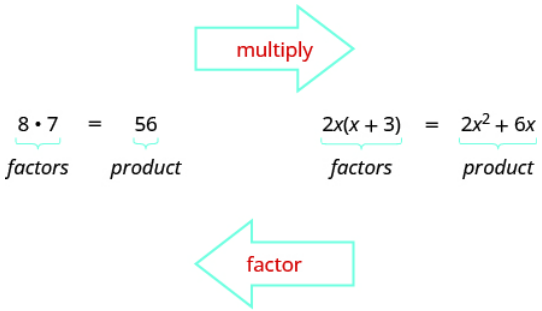
be prepared!

Before you get started, take this readiness quiz.

1. Factor 56 into primes. If you missed this problem, review Example 2.9.1.
2. Multiply: $-3(6a + 11)$. If you missed this problem, review Example 7.4.9.
3. Multiply: $4x^2(x^2 + 3x - 1)$. If you missed this problem, review Example 10.4.5.

Find the Greatest Common Factor of Two or More Expressions

Earlier we multiplied factors together to get a product. Now, we will be reversing this process; we will start with a product and then break it down into its factors. Splitting a product into factors is called factoring.



In The Language of Algebra we factored numbers to find the least common multiple (LCM) of two or more numbers. Now we will factor expressions and find the *greatest common factor* of two or more expressions. The method we use is similar to what we used to find the LCM.

Definition: Greatest Common Factor

The greatest common factor (GCF) of two or more expressions is the largest expression that is a factor of all the expressions.

First we will find the greatest common factor of two numbers

Example 12.10.1:

Find the greatest common factor of 24 and 36.

Solution

Step 1: Factor each coefficient into primes. Write all variables with exponents in expanded form.	Factor 24 and 36.	Step 2: List all factors—matching common factors in a column.		$24 = 2 \cdot 2 \cdot 2 \cdot 3$ $36 = 2 \cdot 2 \cdot \quad 3 \cdot 3$

In each column, circle the common factors.	Circle the 2, 2, and 3 that are shared by both numbers.	$24 = 2 \cdot 2 \cdot 2 \cdot 3$ $36 = 2 \cdot 2 \cdot 3 \cdot 3$ $GCF = 2 \cdot 2 \cdot 3$ $GCF = 12$
Step 3: Bring down the common factors that all expressions share.	Bring down the 2, 2, 3 and then multiply.	
Step 4: Multiply the factors.		The GCF of 24 and 36 is 12.

Notice that since the GCF is a factor of both numbers, 24 and 36 can be written as multiples of 12.

$$24 = 12 \cdot 2$$
$$36 = 12 \cdot 3$$

Exercise 12.10.1:

Find the greatest common factor: 54, 36.

Answer

18

Exercise 12.10.2:

Find the greatest common factor: 48, 80.

Answer

16

In the previous example, we found the greatest common factor of constants. The greatest common factor of an algebraic expression can contain variables raised to powers along with coefficients. We summarize the steps we use to find the greatest common factor.

HOW TO: FIND THE GREATEST COMMON FACTOR

Step 1. Factor each coefficient into primes. Write all variables with exponents in expanded form.

Step 2. List all factors—matching common factors in a column. In each column, circle the common factors.

Step 3. Bring down the common factors that all expressions share.

Step 4. Multiply the factors.

Example 12.10.2:

Find the greatest common factor of 5x and 15.

Solution

Factor each number into primes. Circle the common factors in each column. Bring down the common factors.	$5x = 5 \cdot x$ $15 = 3 \cdot 5$ $GCF = 5$

The GCF of 5x and 15 is 5.

Exercise 12.10.3:

Find the greatest common factor: 7y, 14.

Answer

7

Exercise 12.10.4:

Find the greatest common factor: 22, 11m.

Answer

11

In the examples so far, the greatest common factor was a constant. In the next two examples we will get variables in the greatest common factor.

Example 12.10.3:

Find the greatest common factor of $12x^2$ and $18x^3$.

Solution

Factor each coefficient into primes and write the variables with exponents in expanded form. Circle the common factors in each column. Bring down the common factors. Multiply the factors.	$12x^2 = 2 \cdot 2 \cdot 3 \cdot x \cdot x$ $18x^3 = 2 \cdot 3 \cdot 3 \cdot x \cdot x \cdot x$ $\text{GCF} = 2 \cdot 3 \cdot x \cdot x$ $\text{GCF} = 6x^2$

The GCF of $12x^2$ and $18x^3$ is $6x^2$.

Exercise 12.10.5:

Find the greatest common factor: $16x^2$, $24x^3$.

Answer

$8x^2$

Exercise 12.10.6:

Find the greatest common factor: $27y^3$, $18y^4$.

Answer

$9y^3$

Example 12.10.4:

Find the greatest common factor of $14x^3$, $8x^2$, $10x$.

Solution

Factor each coefficient into primes and write the variables with exponents in expanded form. Circle the common factors in each column. Bring down the common factors. Multiply the factors.	$14x^3 = 2 \cdot 7 \cdot x \cdot x \cdot x$ $8x^2 = 2 \cdot 2 \cdot 2 \cdot x \cdot x$ $10x = 2 \cdot 5 \cdot x$ $GCF = 2 \cdot x$ $GCF = 2x$

The GCF of $14x^3$ and $8x^2$, and $10x$ is $2x$.

Exercise 12.10.7:

Find the greatest common factor: $21x^3$, $9x^2$, $15x$.

Answer

3x

Exercise 12.10.8:

Find the greatest common factor: $25m^4$, $35m^3$, $20m^2$.

Answer

$5m^2$

Factor the Greatest Common Factor from a Polynomial

Just like in arithmetic, where it is sometimes useful to represent a number in factored form (for example, 12 as 2 • 6 or 3 • 4), in algebra it can be useful to represent a polynomial in factored form. One way to do this is by finding the greatest common factor of all the terms. Remember that you can multiply a polynomial by a monomial as follows:

$$\begin{aligned} &2(x+7) && factors \\ &2 \cdot x + 2 \cdot 7 && \\ &2x + 14 && product \end{aligned}$$

Here, we will start with a product, like 2x + 14, and end with its factors, 2(x + 7). To do this we apply the Distributive Property "in reverse".

Definition: Distributive Property

If a, b, c are real numbers, then a(b + c) = ab + ac and ab + ac = a(b + c).

The form on the left is used to multiply. The form on the right is used to factor.

So how do we use the Distributive Property to factor a polynomial? We find the GCF of all the terms and write the polynomial as a product!

Example 12.10.5:

Factor: 2x + 14.

Solution

Step 1: Find the GCF of all the terms of the polynomial.	Find the GCF of 2x and 14.	$2x = 2 \cdot x$ $14 = 2 \cdot 7$ $GCF = 2$

Step 2: Rewrite each term as a product using the GCF.	Rewrite 2x and 14 as products of their GCF, 2. $2x = 2 \cdot x$ $14 = 2 \cdot 7$	$2x + 14$ $2 \cdot x + 2 \cdot 7$
Step 3: Use the Distributive Property 'in reverse' to factor the expression.		2(x + 7)
Step 4: Check by multiplying the factors.	Check.	$2(x + 7)$ $2 \cdot x + 2 \cdot 7$ $2x + 14$ ✓

? Exercise 12.10.9:

Factor: 4x + 12.

Answer

4(x + 3)

? Exercise 12.10.10:

Factor: 6a + 24.

Answer

6(a + 4)

Notice that in Example 10.84, we used the word *factor* as both a noun and a verb:

Noun	7 is a factor of 14
Verb	Factor 2 from 2x + 14

HOW TO: FACTOR THE GREATEST COMMON FACTOR FROM A POLYNOMIAL

Step 1. Find the GCF of all the terms of the polynomial.

Step 2. Rewrite each term as a product using the GCF.

Step 3. Use the Distributive Property 'in reverse' to factor the expression.

Step 4. Check by multiplying the factors.

✓ Example 12.10.6:

Factor: 3a + 3.

Solution

Find the GCF of $3a$, 3.	$3a = 3 \cdot a$ $3 = 3$ GCF = 3	
Rewrite each term as a product using the GCF.	$3 \cdot a + 3 \cdot 1$	(12.10.1)

Use the Distributive Property 'in reverse' to factor the GCF.	$3(a+1)$	(12.10.2)
Check by multiplying the factors to get the original polynomial.	$3(a+1)$ $3\cdot a = 3\cdot 1$ $3a+3$ ✓	

Exercise 12.10.11:

Factor: 9a + 9.

Answer

9(a + 1)

Exercise 12.10.12:

Factor: 11x + 11.

Answer

11(x + 1)

The expressions in the next example have several factors in common. Remember to write the GCF as the product of all the common factors.

Example 12.10.7:

Factor: 12x − 60.

Find the GCF of $12x$ and 60.	$12x = 2\cdot 2\cdot 3\cdot x$ $60 = 2\cdot 2\cdot 3\cdot 5$ $\text{GCF} = 2\cdot 2\cdot 3$ $\text{GCF} = 12$	
Rewrite each term as a product using the GCF.	$12\cdot x - 12\cdot 5$	(12.10.3)
Factor the GCF.	$12(x-5)$	(12.10.4)
Check by multiplying the factors.	$12(x-5)$ $12\cdot x - 12\cdot 5$ $12x - 60$ ✓	

Exercise 12.10.13:

Factor: 11x − 44.

Answer

11(x - 4)

Exercise 12.10.14:

Factor: 13y − 52.

Answer

13(y - 4)

Now we'll factor the greatest common factor from a trinomial. We start by finding the GCF of all three terms.

Example 12.10.8:

Factor: $3y^2 + 6y + 9$.

Solution

Find the GCF of $3y^2$, $6y$, and 9.

$$\begin{aligned} 3y^2 &= 3 \cdot y \cdot y \\ 6y &= 2 \cdot 3 \cdot y \\ 9 &= 3 \cdot 3 \\ \text{GCF} &= 3 \end{aligned}$$

Rewrite each term as a product using the GCF.	$3 \cdot y^2 + 3 \cdot 2y + 3 \cdot 3$	(12.10.5)
Factor the GCF.	$3(y^2 + 2y + 3)$	(12.10.6)
Check by multiplying.	$3(y^2 + 2y + 3)$ $3 \cdot y^2 + 3 \cdot 2y + 3 \cdot 3$ $3y^2 + 6y + 9$ ✓	

Exercise 12.10.15:

Factor: $4y^2 + 8y + 12$.

Answer

$4\left(y^2 + 2y + 3\right)$

Exercise 12.10.16:

Factor: $6x^2 + 42x - 12$.

Answer

$6\left(x^2 + 7x - 2\right)$

In the next example, we factor a variable from a binomial.

Example 12.10.9:

Factor: $6x^2 + 5x$.

Solution

Find the GCF of $6x^2$ and $5x$ and the math that goes with it.	$6x^2 = 2 \cdot 3 \cdot x \cdot x$ $5x = 5 \cdot x$ $\text{GCF} = x$	
Rewrite each term as a product.	$x \cdot 6x + x \cdot 5$	(12.10.7)
Factor the GCF.	$x(6x + 5)$	(12.10.8)
Check by multiplying.	$x(6x + 5)$ $x \cdot 6x + x \cdot 5$ $6x^2 + 5x$ ✓	

? Exercise 12.10.17:

Factor: $9x^2 + 7x$.

Answer

$x(9x + 7)$

? Exercise 12.10.18:

Factor: $5a^2 - 12a$.

Answer

a(5a - 12)

When there are several common factors, as we'll see in the next two examples, good organization and neat work helps!

✓ Example 12.10.10:

Factor: $4x^3 - 20x^2$.

Solution

Find the GCF of $4x^3$ and $20x^2$.	$4x^3 = 2 \cdot 2 \cdot x \cdot x \cdot x$ $20x^2 = 2 \cdot 2 \cdot 5 \cdot x \cdot x$ $\text{GCF} = 2 \cdot 2 \cdot x \cdot x$ $\text{GCF} = 4x^2$	
Rewrite each term.	$4x^2 \cdot x - 4x^2 \cdot 5$	(12.10.9)
Factor the GCF.	$4x^2(x - 5)$	(12.10.10)
Check.	$4x^2(x - 5)$ $4x^2 \cdot x - 4x^2 \cdot 5$ $4x^3 - 20x^2$ ✓	

Exercise 12.10.19:

Factor: $2x^3 + 12x^2$.

Answer

$2x^2(x+6)$

Exercise 12.10.20:

Factor: $6y^3 - 15y^2$.

Answer

$3y^2(2y-5)$

Example 12.10.11:

Factor: $21y^2 + 35y$.

Solution

Find the GCF of $21y^2$ and $35y$.	$21y^2 = 3 \cdot 7 \cdot y \cdot y$ $35y = 5 \cdot 7 \cdot y$ $GCF = 7 \cdot y$ $GCF = 7y$	
Rewrite each term.	$7y \cdot 3y + 7y \cdot 5$	(12.10.11)
Factor the GCF.	$7y(3y+5)$	(12.10.12)

Exercise 12.10.21:

Factor: $18y^2 + 63y$.

Answer

$9y(2y + 7)$

Exercise 12.10.22:

Factor: $32k^2 + 56k$.

Answer

$8k(4k + 7)$

Example 12.10.12:

Factor: $14x^3 + 8x^2 - 10x$.

Solution

Previously, we found the GCF of $14x^3$, $8x^2$, and $10x$ to be $2x$.

Rewrite each term using the GCF, 2x.	$2x \cdot 7x^2 + 2x \cdot 4x - 2x \cdot 5$	(12.10.13)
Factor the GCF.	$2x(7x^2 + 4x - 5)$	(12.10.14)
Check.	$2x(7x^2 + 4x - 5)$ $2x \cdot 7x^2 + 2x \cdot 4x - 2x \cdot 5$ $14x^3 + 8x^2 - 10x$ ✓	

? Exercise 12.10.23:

Factor: $18y^3 - 6y^2 - 24y$.

Answer

$6y\left(3y^2 - y - 4\right)$

? Exercise 12.10.24:

Factor: $16x^3 + 8x^2 - 12x$.

Answer

$4x\left(4x^2 + 2x - 3\right)$

When the leading coefficient, the coefficient of the first term, is negative, we factor the negative out as part of the GCF.

✓ Example 12.10.13:

Factor: $-9y - 27$.

Solution

When the leading coefficient is negative, the GCF will be negative. Ignoring the signs of the terms, we first find the GCF of 9y and 27 is 9.	$9y = 3 \cdot 3 \cdot y$ $27 = 3 \cdot 3 \cdot 3$ $\text{GCF} = 3 \cdot 3$ $\text{GCF} = 9$	
Since the expression $-9y - 27$ has a negative leading coefficient, we use -9 as the GCF.		
Rewrite each term using the GCF.	$-9 \cdot y + (-9) \cdot 3$	(12.10.15)
Factor the GCF.	$-9(y + 3)$	(12.10.16)
Check.	$-9(y + 3)$ $-9 \cdot y + (-9) \cdot 3$ $-9y - 27$ ✓	

Exercise 12.10.25:

Factor: −5y − 35.

Answer

-5(y + 7)

Exercise 12.10.26:

Factor: −16z − 56.

Answer

-8(2z + 7)

Pay close attention to the signs of the terms in the next example.

Example 12.10.14:

Factor: $-4a^2 + 16a$.

Solution

The leading coefficient is negative, so the GCF will be negative.	$4a^2 = 2 \cdot 2 \cdot a \cdot a$ $16a = 2 \cdot 2 \cdot 2 \cdot 2 \cdot a$ $\text{GCF} = 2 \cdot 2 \cdot a$ $\text{GCF} = 4a$	
Since the leading coefficient is negative, the GCF is negative, −4a.		
Rewrite each term.	$-4a \cdot a - (-4a) \cdot 4$	(12.10.17)
Factor the GCF.	$-4a(a - 4)$	(12.10.18)
Check on your own by multiplying.		

Exercise 12.10.27:

Factor: $-7a^2 + 21a$.

Answer

-7a(a - 3)

Exercise 12.10.28:

Factor: $-6x^2 + x$.

Answer

-x(6x - 1)

Factor a Binomial

Identify GCF

Practice Makes Perfect

Find the Greatest Common Factor of Two or More Expressions

In the following exercises, find the greatest common factor.

422. 40, 56
423. 45, 75
424. 72, 162
425. 150, 275
426. 3x, 12
427. 4y, 28
428. 10a, 50
429. 5b, 30
430. 16y, $24y^2$
431. 9x, $15x^2$
432. $18m^3$, $36m^2$
433. $12p^4$, $48p^3$
434. 10x, $25x^2$, $15x^3$
435. 18a, $6a^2$, $22a^3$
436. 24u, $6u^2$, $30u^3$
437. 40y, $10y^2$, $90y^3$
438. $15a^4$, $9a^5$, $21a^6$
439. $35x^3$, $10x^4$, $5x^5$
440. $27y^2$, $45y^3$, $9y^4$
441. $14b^2$, $35b^3$, $63b^4$

Factor the Greatest Common Factor from a Polynomial

In the following exercises, factor the greatest common factor from each polynomial.

442. $2x + 8$
443. $5y + 15$
444. $3a - 24$
445. $4b - 20$
446. $9y - 9$
447. $7x - 7$
448. $5m^2 + 20m + 35$
449. $3n^2 + 21n + 12$
450. $8p^2 + 32p + 48$
451. $6q^2 + 30q + 42$
452. $8q^2 + 15q$
453. $9c^2 + 22c$
454. $13k^2 + 5k$
455. $17x^2 + 7x$
456. $5c^2 + 9c$
457. $4q^2 + 7q$
458. $5p^2 + 25p$
459. $3r^2 + 27r$

460. $24q^2 - 12q$
461. $30u^2 - 10u$
462. $yz + 4z$
463. $ab + 8b$
464. $60x - 6x^3$
465. $55y - 11y^4$
466. $48r^4 - 12r^3$
467. $45c^3 - 15c^2$
468. $4a^3 - 4ab^2$
469. $6c^3 - 6cd^2$
470. $30u^3 + 80u^2$
471. $48x^3 + 72x^2$
472. $120y^6 + 48y^4$
473. $144a^6 + 90a^3$
474. $4q^2 + 24q + 28$
475. $10y^2 + 50y + 40$
476. $15z^2 - 30z - 90$
477. $12u^2 - 36u - 108$
478. $3a^4 - 24a^3 + 18a^2$
479. $5p^4 - 20p^3 - 15p^2$
480. $11x^6 + 44x^5 - 121x^4$
481. $8c^5 + 40c^4 - 56c^3$
482. $-3n - 24$
483. $-7p - 84$
484. $-15a^2 - 40a$
485. $-18b^2 - 66b$
486. $-10y^3 + 60y^2$
487. $-8a^3 + 32a^2$
488. $-4u^5 + 56u^3$
489. $-9b^5 + 63b^3$

Everyday Math

490. **Revenue** A manufacturer of microwave ovens has found that the revenue received from selling microwaves a cost of p dollars each is given by the polynomial $-5p^2 + 150p$. Factor the greatest common factor from this polynomial.
491. **Height of a baseball** The height of a baseball hit with velocity 80 feet/second at 4 feet above ground level is $-16t^2 + 80t + 4$, with t = the number of seconds since it was hit. Factor the greatest common factor from this polynomial.

Writing Exercises

492. The greatest common factor of 36 and 60 is 12. Explain what this means.
493. What is the GCF of y^4, y^5, and y^{10}? Write a general rule that tells how to find the GCF of y^a, y^b, and y^c.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find the greatest common factor of two or more expressions.			
factor the greatest common factor from a polynomial.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

12.E: Polynomials (Exercises)

10.1 - Add and Subtract Polynomials

Identify Polynomials, Monomials, Binomials and Trinomials

In the following exercises, determine if each of the following polynomials is a monomial, binomial, trinomial, or other polynomial.

494. $y^2 + 8y - 20$
495. $-6a^4$
496. $9x^3 - 1$
497. $n^3 - 3n^2 + 3n - 1$

Determine the Degree of Polynomials

In the following exercises, determine the degree of each polynomial.

498. $16x^2 - 40x - 25$
499. $5m + 9$
500. -15
501. $y^2 + 6y^3 + 9y^4$

Add and Subtract Monomials

In the following exercises, add or subtract the monomials.

502. $4p + 11p$
503. $-8y^3 - 5y^3$
504. Add $4n^5$, $-n^5$, $-6n^5$
505. Subtract $10x^2$ from $3x^2$

Add and Subtract Polynomials

In the following exercises, add or subtract the polynomials.

506. $(4a^2 + 9a - 11) + (6a^2 - 5a + 10)$
507. $(8m^2 + 12m - 5) - (2m^2 - 7m - 1)$
508. $(y^2 - 3y + 12) + (5y^2 - 9)$
509. $(5u^2 + 8u) - (4u - 7)$
510. Find the sum of $8q^3 - 27$ and $q^2 + 6q - 2$
511. Find the difference of $x^2 + 6x + 8$ and $x^2 - 8x + 15$

Evaluate a Polynomial for a Given Value of the Variable

In the following exercises, evaluate each polynomial for the given value.

512. $200x - \frac{1}{5}x^2$ when $x = 5$
513. $200x - \frac{1}{5}x^2$ when $x = 0$
514. $200x - \frac{1}{5}x^2$ when $x = 15$
515. $5 + 40x - \frac{1}{2}x^2$ when $x = 10$
516. $5 + 40x - \frac{1}{2}x^2$ when $x = -4$
517. $5 + 40x - \frac{1}{2}x^2$ when $x = 0$
518. A pair of glasses is dropped off a bridge 640 feet above a river. The polynomial $-16t^2 + 640$ gives the height of the glasses t seconds after they were dropped. Find the height of the glasses when $t = 6$.
519. The fuel efficiency (in miles per gallon) of a bus going at a speed of x miles per hour is given by the polynomial $-\frac{1}{160}x^2 + \frac{1}{2}x$. Find the fuel efficiency when $x = 20$ mph.

10.2 - Use Multiplication Properties of Exponents

Simplify Expressions with Exponents

In the following exercises, simplify.

520. 6^3

521. $\left(\frac{1}{2}\right)^4$

522. $(-0.5)^2$

523. -3^2

Simplify Expressions Using the Product Property of Exponents

In the following exercises, simplify each expression.

524. $p^3 \cdot p^{10}$

525. $2 \cdot 2^6$

526. $a \cdot a^2 \cdot a^3$

527. $x \cdot x^8$

Simplify Expressions Using the Power Property of Exponents

In the following exercises, simplify each expression.

528. $(y^4)^3$

529. $(r^3)^2$

530. $(3^2)^5$

531. $(a^{10})^y$

Simplify Expressions Using the Product to a Power Property

In the following exercises, simplify each expression.

532. $(8n)^2$

533. $(-5x)^3$

534. $(2ab)^8$

535. $(-10mnp)^4$

Simplify Expressions by Applying Several Properties

In the following exercises, simplify each expression.

536. $(3a^5)^3$

537. $(4y)^2(8y)$

538. $(x^3)^5(x^2)^3$

539. $(5st^2)^3(2s^3t^4)^2$

Multiply Monomials

In the following exercises, multiply the monomials.

540. $(-6p^4)(9p)$

541. $\left(\frac{1}{3}c^2\right)(30c^8)$

542. $(8x^2y^5)(7xy^6)$

543. $\left(\frac{2}{3}m^3n^6\right)\left(\frac{1}{6}m^4n^4\right)$

10.3 - Multiply Polynomials

Multiply a Polynomial by a Monomial

In the following exercises, multiply.

544. $7(10 - x)$
545. $a^2(a^2 - 9a - 36)$
546. $-5y(125y^3 - 1)$
547. $(4n - 5)(2n^3)$

Multiply a Binomial by a Binomial

In the following exercises, multiply the binomials using various methods.

548. $(a + 5)(a + 2)$
549. $(y - 4)(y + 12)$
550. $(3x + 1)(2x - 7)$
551. $(6p - 11)(3p - 10)$
552. $(n + 8)(n + 1)$
553. $(k + 6)(k - 9)$
554. $(5u - 3)(u + 8)$
555. $(2y - 9)(5y - 7)$
556. $(p + 4)(p + 7)$
557. $(x - 8)(x + 9)$
558. $(3c + 1)(9c - 4)$
559. $(10a - 1)(3a - 3)$

Multiply a Trinomial by a Binomial

In the following exercises, multiply using any method.

560. $(x + 1)(x^2 - 3x - 21)$
561. $(5b - 2)(3b^2 + b - 9)$
562. $(m + 6)(m^2 - 7m - 30)$
563. $(4y - 1)(6y^2 - 12y + 5)$

10.4 - Divide Monomials

Simplify Expressions Using the Quotient Property of Exponents

In the following exercises, simplify.

564. $\frac{2^8}{2^2}$
565. $\frac{a^6}{a}$
566. $\frac{n^3}{n^{12}}$
567. $\frac{x}{x^5}$

Simplify Expressions with Zero Exponents

In the following exercises, simplify.

568. 3^0
569. y^0
570. $(14t)^0$
571. $12a^0 - 15b^0$

Simplify Expressions Using the Quotient to a Power Property

In the following exercises, simplify.

572. $\left(\frac{3}{5}\right)^2$
573. $\left(\frac{x}{2}\right)^5$
574. $\left(\frac{5m}{n}\right)^3$
575. $\left(\frac{s}{10t}\right)^2$

Simplify Expressions by Applying Several Properties

In the following exercises, simplify.

576. $\frac{(a^3)^2}{a^4}$
577. $\frac{u^3}{u^2 \cdot u^4}$
578. $\left(\frac{x}{x^9}\right)^5$
579. $\left(\frac{p^4 \cdot p^5}{p^3}\right)^2$
580. $\frac{(n^5)^3}{(n^2)^8}$
581. $\left(\frac{5s^2}{4t}\right)^3$

Divide Monomials

In the following exercises, divide the monomials.

582. $72p^{12} \div 8p^3$
583. $-26a^8 \div (2a^2)$
584. $\frac{45y^6}{-15y^{10}}$
585. $\frac{-30x^8}{-36x^9}$
586. $\frac{28a^9b}{7a^4b^3}$
587. $\frac{11u^6v^3}{55u^2v^8}$
588. $\frac{(5m^9n^3)(8m^3n^2)}{(10mn^4)(m^2n^5)}$
589. $\frac{42r^2s^4}{6rs^3} - \frac{54rs^2}{9s}$

10.5 - Integer Exponents and Scientific Notation

Use the Definition of a Negative Exponent

In the following exercises, simplify.

590. 6^{-2}
591. $(-10)^{-3}$
592. $5 \cdot 2^{-4}$
593. $(8n)^{-1}$

Simplify Expressions with Integer Exponents

In the following exercises, simplify.

594. $x^{-3} \cdot x^{9}$
595. $r^{-5} \cdot r^{-4}$
596. $(uv^{-3})(u^{-4}v^{-2})$
597. $(m^{5})^{-1}$
598. $(k^{-2})^{-3}$
599. $\frac{q^{4}}{q^{20}}$
600. $\frac{b^{8}}{b^{-2}}$
601. $\frac{n^{-3}}{n^{-5}}$

Convert from Decimal Notation to Scientific Notation

In the following exercises, write each number in scientific notation.

602. 5,300,000
603. 0.00814
604. The thickness of a piece of paper is about 0.097 millimeter.
605. According to www.cleanair.com, U.S. businesses use about 21,000,000 tons of paper per year.

Convert Scientific Notation to Decimal Form

In the following exercises, convert each number to decimal form.

606. 2.9×10^{4}
607. 1.5×10^{8}
608. 3.75×10^{-1}
609. 9.413×10^{-5}

Multiply and Divide Using Scientific Notation

In the following exercises, multiply and write your answer in decimal form.

610. $(3 \times 10^{7})(2 \times 10^{-4})$
611. $(1.5 \times 10^{-3})(4.8 \times 10^{-1})$
612. $\frac{6 \times 10^{9}}{2 \times 10^{-1}}$
613. $\frac{9 \times 10^{-3}}{1 \times 10^{-6}}$

10.6 - Introduction to Factoring Polynomials

Find the Greatest Common Factor of Two or More Expressions

In the following exercises, find the greatest common factor.

614. 5n, 45
615. 8a, 72
616. $12x^{2}$, $20x^{3}$, $36x^{4}$
617. $9y^{4}$, $21y^{5}$, $15y^{6}$

Factor the Greatest Common Factor from a Polynomial

In the following exercises, factor the greatest common factor from each polynomial.

618. $16u - 24$
619. $15r + 35$
620. $6p^{2} + 6p$
621. $10c^{2} - 10c$
622. $-9a^{5} - 9a^{3}$
623. $-7x^{8} - 28x^{3}$

624. $5y^2 - 55y + 45$
625. $2q^5 - 16q^3 + 30q^2$

PRACTICE TEST

626. For the polynomial $8y^4 - 3y^2 + 1$
    a. Is it a monomial, binomial, or trinomial?
    b. What is its degree?

In the following exercises, simplify each expression.

627. $(5a^2 + 2a - 12) + (9a^2 + 8a - 4)$
628. $(10x^2 - 3x + 5) - (4x^2 - 6)$
629. $\left(-\frac{3}{4}\right)^3$
630. $n \cdot n^4$
631. $(10p^3q^5)^2$
632. $(8xy^3)(-6x^4y^6)$
633. $4u(u^2 - 9u + 1)$
634. $(s + 8)(s + 9)$
635. $(m + 3)(7m - 2)$
636. $(11a - 6)(5a - 1)$
637. $(n - 8)(n\ 2 - 4n + 11)$
638. $(4a + 9b)(6a - 5b)$
639. $\frac{5^6}{5^8}$
640. $\left(\frac{x^3 \cdot x^9}{x^5}\right)^2$
641. $(47a^{18}b^{23}c^5)^0$
642. $\frac{24r^3s}{6r^2s^7}$
643. $\frac{8y^2 - 16y + 20}{4y}$
644. $(15xy^3 - 35x^2y) \div 5xy$
645. 4^{-1}
646. $(2y)^{-3}$
647. $p^{-3} \cdot p^{-8}$
648. $\frac{x^4}{x^{-5}}$
649. $(2.4 \times 10^8)(2 \times 10^{-5})$

In the following exercises, factor the greatest common factor from each polynomial.

650. $80a^3 + 120a^2 + 40a$
651. $-6x^2 - 30x$
652. Convert 5.25×10^{-4} to decimal form.

In the following exercises, simplify, and write your answer in decimal form.

653. $\frac{9 \times 10^4}{3 \times 10^{-1}}$
654. A hiker drops a pebble from a bridge 240 feet above a canyon. The polynomial $-16t^2 + 240$ gives the height of the pebble t seconds a after it was dropped. Find the height when t = 3.
655. According to www.cleanair.org, the amount of trash generated in the US in one year averages out to 112,000 pounds of trash per person. Write this number in scientific notation.

12.S: Polynomials (Summary)

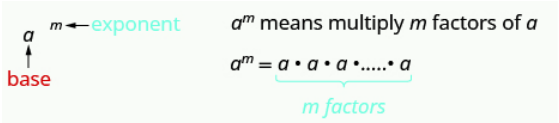
Key Terms

binomial	A polynomial with exactly two terms
degree of a constant	The degree of a constant is 0.
degree of a polynomial	The degree of a polynomial is the highest degree of all its terms.
degree of a term	The degree of a term of a polynomial is the exponent of its variable.
greatest common factor	The greatest common factor (GCF) of two or more expressions is the largest expression that is a factor of all the expressions.
monomial	A term of the form ax^m, where a is a constant and m is a whole number, is called a monomial.
negative exponent	If n is a positive integer and $a \neq 0$, then $a^{-n} = \frac{1}{a^n}$.
polynomial	A polynomial is a monomial, or two or more monomials, combined by addition or subtraction.
scientific notation	A number expressed in scientific notation when it is of the form $a \times 10^n$, where $a \geq 1$ and $a < 10$, and n is an integer.
trinomial	A trinomial is a polynomial with exactly three terms.
zero exponent	If a is a non-zero number, then $a^0 = 1$. Any nonzero number raised to the zero power is 1.

Key Concepts

10.2 - Use Multiplication Properties of Exponents

- **Exponential Notation**



This is read a to the m^{th} power.

- **Product Property of Exponents**
  - If a is a real number and m, n are counting numbers, then $a^m \cdot a^n = a^{m+n}$
  - To multiply with like bases, add the exponents.
- **Power Property for Exponents**
  - If a is a real number and m, n are counting numbers, then $(a^m)^n = a^{m \cdot n}$
- **Product to a Power Property for Exponents**
  - If a and b are real numbers and m is a whole number, then $(ab)^m = a^m b^m$

10.3 - Multiply Polynomials

• Use the FOIL method for multiplying two binomials.

Step 1. Multiply the **First** terms.	Step 2. Multiply the **Outer** terms.	
Step 3. Multiply the **Inner** terms.	

Step 4. Multiply the **Last** terms.
Step 5. Combine like terms, when possible.

- **Multiplying Two Binomials**: To multiply binomials, use the:
  - Distributive Property
  - FOIL Method
  - Vertical Method
- **Multiplying a Trinomial by a Binomial**: To multiply a trinomial by a binomial, use the:
  - Distributive Property
  - Vertical Method

10.4 - Divide Monomials

- **Equivalent Fractions Property**
  - If a, b, c are whole numbers where b ≠ 0, c ≠ 0, then

$$\frac{a}{b}=\frac{a\cdot c}{b\cdot c} \quad and \quad \frac{a\cdot c}{b\cdot c}=\frac{a}{b} \tag{12.S.1}$$

- **Zero Exponent**
  - If a is a non-zero number, then $a^0 = 1$.
  - Any nonzero number raised to the zero power is 1.
- **Quotient Property for Exponents**
  - If a is a real number, a ≠ 0, and m, n are whole numbers, then

$$\frac{a^m}{a^n}=a^{m-n},\ m>n \quad and \quad \frac{a^m}{a^n}=\frac{1}{a^{n-m}},\ n>m \tag{12.S.2}$$

- **Quotient to a Power Property for Exponents**
  - If a and b are real numbers, b ≠ 0, and m is a counting number, then

$$\left(\frac{a}{b}\right)^m=\frac{a^m}{b^m} \tag{12.S.3}$$

  - To raise a fraction to a power, raise the numerator and denominator to that power.

10.5 - Integer Exponents and Scientific Notation

- **Summary of Exponent Properties**
  - If a, b are real numbers and m, n are integers, then

Product Property	$a^m \cdot a^n = a^{m+n}$
Power Property	$(a^m)^n = a^{m\cdot n}$
Product to a Power Property	$(ab)^m = a^m b^m$
Quotient Property	$\frac{a^m}{a^n} = a^{m-n}$, a ≠ 0, m > n
	$\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$, a ≠ 0, n > m
Zero Exponent Property	$a^0 = 1$, a ≠ 0
Quotient to a Power Property	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$, b ≠ 0
Definition of a Negative Exponent	$a^{-n} = \frac{1}{a^n}$

- **Convert from Decimal Notation to Scientific Notation**: To convert a decimal to scientific notation:

1. Move the decimal point so that the first factor is greater than or equal to 1 but less than 10.
2. Count the number of decimal places, n, that the decimal point was moved. Write the number as a product with a power of 10.
   - If the original number is greater than 1, the power of 10 will be 10^n.
   - If the original number is between 0 and 1, the power of 10 will be 10^n.
3. Check.

- **Convert Scientific Notation to Decimal Form**: To convert scientific notation to decimal form:
  1. Determine the exponent, n, on the factor 10.
  2. Move the decimal n places, adding zeros if needed.
     - If the exponent is positive, move the decimal point n places to the right.
     - If the exponent is negative, move the decimal point |n| places to the left.
  3. Check.

10.6 - Introduction to Factoring Polynomials

- **Find the greatest common factor.**
  1. Factor each coefficient into primes. Write all variables with exponents in expanded form.
  2. List all factors—matching common factors in a column. In each column, circle the common factors.
  3. Bring down the common factors that all expressions share.
  4. Multiply the factors.
- **Distributive Property**
  - If a , b , c are real numbers, then a(b + c) = ab + ac and ab + ac = a(b + c).
- **Factor the greatest common factor from a polynomial.**
  1. Find the GCF of all the terms of the polynomial.
  2. Rewrite each term as a product using the GCF.
  3. Use the Distributive Property ‘in reverse’ to factor the expression.
  4. Check by multiplying the factors.

13.1: Cumulative Review

> **Note**
>
> Answers to the Cumulative Review can be found in the Supplemental Resources. Please visit http://openstax college.org to view an updated list of the Learning Resources for this title and how to access them.

Chapter 1 - Whole Numbers

No exercises.

Chapter 2 - The Language of Algebra

Simplify:

1. $5(3 + 2 \cdot 6) - 8^2$

Solve:

2. $17 = y - 13$
3. $p + 14 = 23$

Translate into an algebraic expression.

4. 11 less than the product of 7 and x.

Translate into an algebraic equation and solve.

5. Twice the difference of y and 7 gives 84.
6. Find all the factors of 72.
7. Find the prime factorization of 132.
8. Find the least common multiple of 12 and 20.

Chapter 3 - Integers

Simplify:

9. $|8 - 9| - |3 - 8|$
10. $-2 + 4(-3 + 7)$
11. $27 - (-4 - 7)$
12. $28 \div (-4) - 7$

Translate into an algebraic expression or equation.

13. The sum of −5 and 13, increased by 11.
14. The product of −11 and 8.
15. The quotient of 7 and the sum of −4 and m.
16. The product of −3 and is −51.

Solve:

17. $-6r = 24$

Chapter 4 - Fractions

18. Locate the numbers on a number line. \(\dfrac{7}{8}, \dfrac{5}{3}, 3\dfrac{1}{4}, 5.

Simplify:

19. $\dfrac{21p}{57q}$
20. $\dfrac{3}{7} \cdot \left(-\dfrac{28}{45}\right)$

21. $-6\frac{3}{4} \div \frac{9}{2}$
22. $-3\frac{3}{5} \div 6$
23. $-4\frac{2}{3}\left(-\frac{6}{7}\right)$
24. $\dfrac{-2\frac{1}{4}}{-\frac{3}{8}}$
25. $\dfrac{7 \cdot 8 + 4(7-12)}{9 \cdot 6 - 2 \cdot 9}$
26. $-\frac{23}{36} + \frac{17}{20}$
27. $\dfrac{\frac{1}{2} + \frac{1}{3}}{\frac{3}{4} - \frac{1}{3}}$
28. $3\frac{5}{8} - 2\frac{1}{2}$
29. $-\frac{2}{3}$r = 24

Chapter 5 - Decimals

Simplify:

30. 24.76 − 7.28
31. 12.9 + 15.633
32. (−5.6)(0.25)
33. \$6.29 ÷ 12
34. 3 4 (13.44 − 9.6)
35. $\sqrt{64} + \sqrt{225}$
36. $\sqrt{121x^2y^2}$
37. Write in order from smallest to largest: $\frac{5}{8}$, 0.75, $\frac{8}{15}$

Solve:

38. −8.6x = 34.4
39. Using 3.14 as the estimate for pi, approximate the (a) circumference and (b) area of a circle whose radius is 8 inches.
40. Find the mean of the numbers, 18, 16, 20, 12
41. Find the median of the numbers, 24, 29, 27, 28, 30
42. Identify the mode of the numbers, 6, 4, 4, 5, 6, 6, 4, 4, 4, 3, 5
43. Find the unit price of one t-shirt if they are sold at 3 for \$28.97.

Chapter 6 - Percents

44. Convert 14.7% to (a) a fraction and (b) a decimal.

Translate and solve.

45. 63 is 35% of what number?
46. The nutrition label on a package of granola bars says that each granola bar has 180 calories, and 81 calories are from fat. What percent of the total calories is from fat?
47. Elliot received \$510 commission when he sold a \$3,400 painting at the art gallery where he works. What was the rate of commission?
48. Nandita bought a set of towels on sale for \$67.50. The original price of the towels was \$90. What was the discount rate?
49. Alan invested \$23,000 in a friend's business. In 5 years the friend paid him the \$23,000 plus \$9,200 interest. What was the rate of interest?

Solve:

50. $\frac{9}{p} = \frac{-6}{14}$

Chapter 7 - The Properties of Real Numbers

51. List the (a) whole numbers, (b) integers, (c) r ational numbers, (d) irrational numbers, (e) real numbers -5, $-2\frac{1}{4}, -\sqrt{4}, 0.2\bar{5}, \frac{13}{5}, 4$

Simplify:

52. $\left(\frac{8}{15} + \frac{4}{7}\right) + \frac{3}{7}$
53. $3(y + 3) - 8(y - 4)$
54. $\frac{8}{17} \cdot 49 \cdot \frac{17}{8}$
55. A playground is 55 feet wide. Convert the width to yards.
56. Every day last week Amit recorded the number of minutes he spent reading. The recorded number of minutes he read each day was 48, 26, 81, 54, 43, 62, 106. How many hours did Amit spend reading last week?
57. June walked 2.8 kilometers. Convert this length to miles knowing 1 mile is 1.61 kilometer.

Chapter 8 - Solve Linear Equations

Solve:

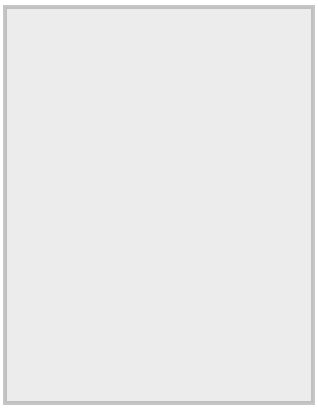
58. $y + 13 = -8$
59. $p + \frac{2}{5} = \frac{8}{5}$
60. $48 = \frac{2}{3}x$
61. $4(a - 3) - 6a = -18$
62. $7q + 14 = -35$
63. $4v - 27 = 7v$
64. $\frac{7}{8}y - 6 = \frac{3}{8}y - 8$
65. $26 - 4(z - 2) = 6$
66. $\frac{3}{4}x - \frac{2}{3} = \frac{1}{2}x - \frac{5}{6}$
67. $0.7y + 4.8 = 0.84y - 5.3$

Translate and solve.

68. Four less than n is 13.

Chapter 9 - Math Models and Geometry

69. One number is 8 less than another. Their sum is negative twenty-two. Find the numbers.
70. The sum of two consecutive integers is -95. Find the numbers.
71. Wilma has $3.65 in dimes and quarters. The number of dimes is 2 less than the number of quarters. How many of each coin does she have?
72. Two angles are supplementary. The larger angle is 24° more than the smaller angle. Find the measurements of both angles.
73. One angle of a triangle is 20° more than the smallest angle. The largest angle is the sum of the other angles. Find the measurements of all three angles.
74. Erik needs to attach a wire to hold the antenna to the roof of his house, as shown in the figure. The antenna is 12 feet tall and Erik has 15 feet of wire. How far from the base of the antenna can he attach the wire?



75. The width of a rectangle is 4 less than the length. The perimeter is 96 inches. Find the length and the width.
76. Find the (a) volume and (b) surface area of a rectangular carton with length 24 inches, width 18 inches, and height 6 inches.

Chapter 10 - Polynomials

Simplify:

77. $(8m^2 + 12m - 5) - (2m^2 - 7m - 1)$
78. $p^3 \cdot p^{10}$
79. $(y^4)^3$
80. $(3a^5)^3$
81. $(x^3)^5(x^2)3$
82. $\left(\frac{2}{3}m^3n^6\right)\left(\frac{1}{6}m^4n^4\right)$
83. $(y - 4)(y + 12)$
84. $(3c + 1)(9c - 4)$
85. $(x - 1)(x^2 - 3x - 2)$
86. $(8x)^0$
87. $\frac{(x^3)^5}{(x^2)^4}$
88. $\frac{32a^7b^2}{12a^3b^6}$
89. $(ab^{-3})(a^{-3}b^6)$
90. Write in scientific notation: (a) 4,800,000 (b) 0.00637

Factor the greatest common factor from the polynomial.

91. $3x^4 - 6x^3 - 18x^2$

Chapter 11 - Graphs

Graph:

92. $y = 4x - 3$
93. $y = -3x$
94. $y = \frac{1}{2}x + 3$
95. $x - y = 6$
96. $y = -2$
97. Find the intercepts. $2x + 3y = 12$

Graph using the intercepts.

98. $2x - 4y = 8$
99. Find the slope of the line shown.

100. Use the slope formula to find the slope of the line between the points (−5, −2), (3, 2).

101. Graph the line passing through the point (−3, 4) and with slope $m = -\frac{1}{3}$.

SECTION OVERVIEW

13.4: Math Models and Geometry

We are surrounded by all sorts of geometry. Architects use geometry to design buildings. Artists create vivid images out of colorful geometric shapes. Street signs, automobiles, and product packaging all take advantage of geometric properties. In this chapter, we will begin by considering a formal approach to solving problems and use it to solve a variety of common problems, including making decisions about money. Then we will explore geometry and relate it to everyday situations, using the problem-solving strategy we develop.

13.4.1: Solve Money Applications

13.4.2: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 1)

13.4.3: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 2)

13.4.4: Use Properties of Rectangles, Triangles, and Trapezoids (Part 1)

13.4.5: Use Properties of Rectangles, Triangles, and Trapezoids (Part 2)

This page titled 13.4: Math Models and Geometry is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

13.4.1: Solve Money Applications

Learning Objectives

- Solve coin word problems
- Solve ticket and stamp word problems

be prepared!

Before you get started, take this readiness quiz.

1. Multiply: 14(0.25). If you missed this problem, review Example 5.3.5.
2. Simplify: 100(0.2 + 0.05n). If you missed this problem, review Example 7.4.6.
3. Solve: 0.25x + 0.10(x + 4) = 2.5 If you missed this problem, review Example 8.6.8.

Solve Coin Word Problems

Imagine taking a handful of coins from your pocket or purse and placing them on your desk. How would you determine the value of that pile of coins?

If you can form a step-by-step plan for finding the total value of the coins, it will help you as you begin solving coin word problems.

One way to bring some order to the mess of coins would be to separate the coins into stacks according to their value. Quarters would go with quarters, dimes with dimes, nickels with nickels, and so on. To get the total value of all the coins, you would add the total value of each pile.

Figure 13.4.1.1- To determine the total value of a stack of nickels, multiply the number of nickels times the value of one nickel. (Credit: Darren Hester via ppdigital)

How would you determine the value of each pile? Think about the dime pile—how much is it worth? If you count the number of dimes, you'll know how many you have—the *number* of dimes.

But this does not tell you the *value* of all the dimes. Say you counted 17 dimes, how much are they worth? Each dime is worth \$0.10 —that is the *value* of one dime. To find the total value of the pile of 17 dimes, multiply 17 by \$0.10 to get \$1.70. This is the total value of all 17 dimes.

$$17 \cdot \$0.10 = \$1.70$$
$$number \cdot value = total\ value$$

Definition: Finding the Total Value for Coins of the Same Type

For coins of the same type, the total value can be found as follows:

$$number \cdot value = total\ value \tag{13.4.1.1}$$

where *number* is the number of coins, *value* is the value of each coin, and *total value* is the total value of all the coins.

You could continue this process for each type of coin, and then you would know the total value of each type of coin. To get the total value of *all* the coins, add the total value of each type of coin.

Let's look at a specific case. Suppose there are 14 quarters, 17 dimes, 21 nickels, and 39 pennies. We'll make a table to organize the information – the type of coin, the number of each, and the value.

Table 13.4.1.1

Type	Number	Value ($)	Total Value ($)
Quarters	14	0.25	3.50
Dimes	17	0.10	1.70
Nickels	21	0.05	1.05
Pennies	39	0.01	0.39
			6.64

The total value of all the coins is $6.64. Notice how Table 13.4.1.1 helped us organize all the information. Let's see how this method is used to solve a coin word problem.

Example 13.4.1.1:

Adalberto has $2.25 in dimes and nickels in his pocket. He has nine more nickels than dimes. How many of each type of coin does he have?

Solution

Step 1. **Read** the problem. Make sure you understand all the words and ideas.

- Determine the types of coins involved.

Think about the strategy we used to find the value of the handful of coins. The first thing you need is to notice what types of coins are involved. Adalberto has dimes and nickels.

- Create a table to organize the information.
  - Label the columns ‘type’, ‘number’, ‘value’, ‘total value’.
  - List the types of coins.
  - Write in the value of each type of coin.
  - Write in the total value of all the coins.

We can work this problem all in cents or in dollars. Here we will do it in dollars and put in the dollar sign ($) in the table as a reminder.

The value of a dime is $0.10 and the value of a nickel is $0.05. The total value of all the coins is $2.25.

Type	Number	Value ($)	Total Value ($)
Dimes		0.10	
Nickels		0.05	
			2.25

Step 2. **Identify** what you are looking for.

- We are asked to find the number of dimes and nickels Adalberto has.

Step 3. **Name** what you are looking for.

- Use variable expressions to represent the number of each type of coin.
- Multiply the number times the value to get the total value of each type of coin. In this problem you cannot count each type of coin—that is what you are looking for—but you have a clue. There are nine more nickels than dimes. The number of nickels is nine more than the number of dimes.
  - Let d = number of dimes.
  - d + 9 = number of nickels
- Fill in the "number" column to help get everything organized.

Type	Number	Value ($)	Total Value ($)
Dimes	d	0.10	
Nickels	d + 9	0.05	
			2.25

Now we have all the information we need from the problem!

You multiply the number times the value to get the total value of each type of coin. While you do not know the actual number, you do have an expression to represent it.

And so now multiply *number* • *value* and write the results in the Total Value column.

Type	Number	Value ($)	Total Value ($)
Dimes	d	0.10	0.10d
Nickels	d + 9	0.05	0.05(d + 9)
			2.25

Step 4. **Translate** into an equation. Restate the problem in one sentence. Then translate into an equation.

value of the dimes	+	value of the nickels	=	total value of the coins
$0.10d$	+	$0.05(d+9)$	=	2.25

Step 5. **Solve** the equation using good algebra techniques.

Write the equation.	$0.10d+0.05(d+9)=2.25$	$(13.4.1.2)$
Distribute.	$0.10d+0.05d+0.45=2.25$	$(13.4.1.3)$
Combine like terms.	$0.15d+0.45=2.25$	$(13.4.1.4)$
Subtract 0.45 from each side.	$0.15d=1.80$	$(13.4.1.5)$
Divide to find the number of dimes.	$d=12$	$(13.4.1.6)$

The number of nickels is d + 9.	$d+9$ $12+9$ 21

Step 6. **Check**.

$$\begin{aligned} 12\ dimes:\ 12(0.10) &= 1.20 \\ 21\ nickels:\ 21(0.05) &= 1.05 \\ \hline \$2.25\ \checkmark \end{aligned}$$

Step 7. Answer the question.

Adalberto has twelve dimes and twenty-one nickels.

If this were a homework exercise, our work might look like this:

Adalberto has $2.25 in dimes and nickels in his pocket. He has nine more nickels than dimes. How many of each type does he have?

Type	Number • Value($)		= Total Value ($)
Dimes	d	0.10	0.10d
Nickels	d + 9	0.05	0.05(d + 9)
			2.25

$0.10d + 0.05d + 0.45 = 2.25$
$0.15d + 0.45 = 2.25$
$0.15d = 1.80$
$d = 12$ dimes

$d + 9$
$12 + 9$
21 nickles

Check:

$$\begin{aligned} 12\ dimes \quad & 12(0.10) = 1.20 \\ 21\ nickels \quad & 21(0.05) = 1.05 \\ \hline & \$2.25 \end{aligned}$$

? Exercise 13.4.1.1:

Michaela has $2.05 in dimes and nickels in her change purse. She has seven more dimes than nickels. How many coins of each type does she have?

Answer

9 nickels, 16 dimes

? Exercise 13.4.1.2:

Liliana has $2.10 in nickels and quarters in her backpack. She has 12 more nickels than quarters. How many coins of each type does she have?

Answer

17 nickels, 5 quarters

HOW TO: SOLVE A COIN WORD PROBLEM

Step 1. **Read** the problem. Make sure you understand all the words and ideas, and create a table to organize the information.

Step 2. **Identify** what you are looking for.

Step 3. **Name** what you are looking for. Choose a variable to represent that quantity.

- Use variable expressions to represent the number of each type of coin and write them in the table.
- Multiply the number times the value to get the total value of each type of coin.

Step 4. **Translate** into an equation. Write the equation by adding the total values of all the types of coins.

Step 5. **Solve** the equation using good algebra techniques.

Step 6. **Check** the answer in the problem and make sure it makes sense.

Step 7. **Answer** the question with a complete sentence.

You may find it helpful to put all the numbers into the table to make sure they check.

Table 13.4.1.2

	Type			Number			Value ($)			Total Value ($)	

Example 13.4.1.2:

Maria has $2.43 in quarters and pennies in her wallet. She has twice as many pennies as quarters. How many coins of each type does she have?

Solution

Step 1. Read the problem.

- Determine the types of coins involved. We know that Maria has quarters and pennies.
- Create a table to organize the information.
  - Label the columns type, number, value, total value.
  - List the types of coins.
  - Write in the value of each type of coin.
  - Write in the total value of all the coins.

Type	Number	Value ($)	Total Value ($)
Quarters		0.25	
Pennies		0.01	
			2.43

Step 2. Identify what you are looking for.

- We are looking for the number of quarters and pennies.

Step 3. Name: Represent the number of quarters and pennies using variables.

- We know Maria has twice as many pennies as quarters. The number of pennies is defined in terms of quarters.
  - Let q represent the number of quarters. Then the number of pennies is 2q.

Type	Number	Value ($)	Total Value ($)
Quarters	q	0.25	
Pennies	2q	0.01	
			2.43

Multiply the ‘number’ and the ‘value’ to get the ‘total value’ of each type of coin.

Type	Number	Value ($)	Total Value ($)
Quarters	q	0.25	0.25q
Pennies	2q	0.01	0.01(2q)
			2.43

Step 4. **Translate**. Write the equation by adding the 'total value’ of all the types of coins.

Step 5. **Solve** the equation.

Write the equation.	$0.25q+0.01(2q)=2.43$	$(13.4.1.7)$
Multiply.	$0.25q+0.02q=2.43$	$(13.4.1.8)$
Combine like terms.	$0.27q=2.43$	$(13.4.1.9)$
Divide by 0.27.	$q=9\ quarters$	$(13.4.1.10)$
The number of pennies is 2q.	$2q$ $2\cdot 9$ $18\ pennies$	

Step 6. **Check** the answer in the problem. Maria has 9 quarters and 18 pennies. Does this make $2.43?

$$\begin{array}{ll} 9\ quarters & 9(0.25)=2.25 \\ 18\ pennies & 18(0.01)=0.18 \\ \hline Total & \$2.43\ \checkmark \end{array}$$

Step 7. **Answer** the question. Maria has nine quarters and eighteen pennies.

? Exercise 13.4.1.3:

Sumanta has $4.20 in nickels and dimes in her desk drawer. She has twice as many nickels as dimes. How many coins of each type does she have?

Answer

42 nickels, 21 dimes

? Exercise 13.4.1.4:

Alison has three times as many dimes as quarters in her purse. She has $9.35 altogether. How many coins of each type does she have?

Answer

51 dimes, 17 quarters

In the next example, we'll show only the completed table—make sure you understand how to fill it in step by step.

Example 13.4.1.3:

Danny has $2.14 worth of pennies and nickels in his piggy bank. The number of nickels is two more than ten times the number of pennies. How many nickels and how many pennies does Danny have?

Solution

Step 1: **Read** the problem.	
Determine the types of coins involved. Create a table.	Pennies and nickels
Write in the value of each type of coin.	Pennies are worth $0.01. Nickels are worth $0.05.
Step 2: **Identify** what you are looking for.	the number of pennies and nickels
Step 3: **Name**. Represent the number of each type of coin using variables. The number of nickels is defined in terms of the number of pennies, so start with pennies.	Let p = number of pennies
The number of nickels is two more than then times the number of pennies.	10p + 2 = number of nickels

Multiply the number and the value to get the total value of each type of coin.

Type	Number	Value ($)	Total Value ($)
pennies	p	0.01	0.01p
nickels	10p + 2	0.05	0.05(10p + 2)
			$2.14

Step 4. **Translate**: Write the equation by adding the total value of all the types of coins.

Step 5. **Solve** the equation.

	$0.01p+0.50p+0.10=2.14$	(13.4.1.11)
	$0.51p+0.10=2.14$	(13.4.1.12)
	$0.51p=2.04$	(13.4.1.13)
	$p=4\ pennies$	(13.4.1.14)
How many nickels?	$10p+2$	(13.4.1.15)
	$10(4)+2$	(13.4.1.16)
	$42\ nickels$	(13.4.1.17)

Step 6. **Check**. Is the total value of 4 pennies and 42 nickels equal to $2.14?

$$4(0.01)+42(0.05) \stackrel{?}{=} 2.14$$
$$2.14 = 2.14 \checkmark$$

Step 7. **Answer** the question. Danny has 4 pennies and 42 nickels.

? Exercise 13.4.1.5:

Jesse has $6.55 worth of quarters and nickels in his pocket. The number of nickels is five more than two times the number of quarters. How many nickels and how many quarters does Jesse have?

Answer

41 nickels, 18 quarters

? Exercise 13.4.1.6:

Elaine has $7.00 in dimes and nickels in her coin jar. The number of dimes that Elaine has is seven less than three times the number of nickels. How many of each coin does Elaine have?

Answer

22 nickels, 59 dimes

Solve Ticket and Stamp Word Problems

The strategies we used for coin problems can be easily applied to some other kinds of problems too. Problems involving tickets or stamps are very similar to coin problems, for example. Like coins, tickets and stamps have different values; so we can organize the information in tables much like we did for coin problems.

✔ Example 13.4.1.4:

At a school concert, the total value of tickets sold was $1,506. Student tickets sold for $6 each and adult tickets sold for $9 each. The number of adult tickets sold was 5 less than three times the number of student tickets sold. How many student tickets and how many adult tickets were sold?

Solution

Step 1: **Read** the problem.

- Determine the types of tickets involved. There are student tickets and adult tickets.
- Create a table to organize the information.

Type	Number	Value ($)	Total Value ($)
Student		6	
Adult		9	
			1,506

Step 2. **Identify** what you are looking for. We are looking for the number of student and adult tickets.

Step 3. **Name**. Represent the number of each type of ticket using variables.

- We know the number of adult tickets sold was 5 less than three times the number of student tickets sold. Let s be the number of student tickets.
- Then 3s − 5 is the number of adult tickets.
- Multiply the number times the value to get the total value of each type of ticket.

Type	Number	Value ($)	Total Value ($)
Student	s	6	6s
Adult	3s - 5	9	9(9s - 5)
			1,506

Step 4. **Translate**: Write the equation by adding the total values of each type of ticket.

$$6s+9(3s-5)=1506 \qquad (13.4.1.18)$$

Step 5. **Solve** the equation.

$$\begin{aligned} 6s+27s-45 &= 1506 \\ 33s-45 &= 1506 \\ 33s &= 1551 \\ s &= 47\ students \end{aligned}$$

Substitute to find the number of adults.

$$\begin{aligned} 3s-5 &= number\ of\ adults \\ 3(47)-5 &= 136\ adults \end{aligned}$$

Step 6. **Check**. There were 47 student tickets at $6 each and 136 adult tickets at $9 each. Is the total value $1506? We find the total value of each type of ticket by multiplying the number of tickets times its value; we then add to get the total value of all the tickets sold.

$$\begin{aligned} 47\cdot 6 &= 282 \\ 136\cdot 9 &= 1224 \\ \hline & 1506 \end{aligned}$$

Step 7. **Answer** the question. They sold 47 student tickets and 136 adult tickets.

? Exercise 13.4.1.7:

The first day of a water polo tournament, the total value of tickets sold was $17,610. One-day passes sold for $20 and tournament passes sold for $30. The number of tournament passes sold was 37 more than the number of day passes sold. How many day passes and how many tournament passes were sold?

Answer

330 day passes, 367 tournament passes

? Exercise 13.4.1.8:

At the movie theater, the total value of tickets sold was $2,612.50. Adult tickets sold for $10 each and senior/ child tickets sold for $7.50 each. The number of senior/child tickets sold was 25 less than twice the number of adult tickets sold. How many senior/child tickets and how many adult tickets were sold?

Answer

112 adult tickets, 199 senior/child tickets

Now we'll do one where we fill in the table all at once.

Example 13.4.1.5:

Monica paid $10.44 for stamps she needed to mail the invitations to her sister's baby shower. The number of 49-cent stamps was four more than twice the number of 8-cent stamps. How many 49-cent stamps and how many 8-cent stamps did Monica buy?

Solution

The type of stamps are 49-cent stamps and 8-cent stamps. Their names also give the value. “The number of 49 cent stamps was four more than twice the number of 8 cent stamps.”

Let x = number of 8-cent stamps

2x + 4 = number of 49-cent stamps

Type	Number	Value ($)	Total Value ($)
49-cent stamps	2x + 4	0.49	0.49(2x + 4)
8-cent stamps	x	0.08	0.08x
			10.44

Write the equation from the total values.	$0.49(2x+4)+0.08x=10.44 \quad (13.4.1.19)$
Solve the equation.	$\begin{aligned} 0.98x+1.96+0.08x &= 10.44 \\ 1.06x+1.96 &= 10.44 \\ 1.06x &= 8.48 \\ x &= 8 \end{aligned}$
Monica bought 8 eight-cent stamps.	
Find the number of 49-cent stamps she bought by evaluating.	2x + 4 for x = 8. $\begin{aligned} &2x+4 \\ &2\cdot 8+4 \\ &16+4 \\ &20 \end{aligned}$
Check.	$\begin{aligned} 8(0.08)+20(0.49) &\stackrel{?}{=} 10.44 \\ 0.64+9.80 &\stackrel{?}{=} 10.44 \\ 10.44 &= 10.44 \checkmark \end{aligned}$

Monica bought eight 8-cent stamps and twenty 49-cent stamps.

Exercise 13.4.1.9:

Eric paid $16.64 for stamps so he could mail thank you notes for his wedding gifts. The number of 49-cent stamps was eight more than twice the number of 8-cent stamps. How many 49-cent stamps and how many 8-cent stamps did Eric buy?

Answer

32 at 49 cents, 12 at 8 cents

Exercise 13.4.1.10:

Kailee paid $14.84 for stamps. The number of 49-cent stamps was four less than three times the number of 21-cent stamps. How many 49-cent stamps and how many 21-cent stamps did Kailee buy?

Answer

26 at 49 cents, 10 at 21 cents

Practice Makes Perfect

Solve Coin Word Problems

In the following exercises, solve the coin word problems.

51. Jaime has $2.60 in dimes and nickels. The number of dimes is 14 more than the number of nickels. How many of each coin does he have?
52. Lee has $1.75 in dimes and nickels. The number of nickels is 11 more than the number of dimes. How many of each coin does he have?
53. Ngo has a collection of dimes and quarters with a total value of $3.50. The number of dimes is 7 more than the number of quarters. How many of each coin does he have?
54. Connor has a collection of dimes and quarters with a total value of $6.30. The number of dimes is 14 more than the number of quarters. How many of each coin does he have?
55. Carolyn has $2.55 in her purse in nickels and dimes. The number of nickels is 9 less than three times the number of dimes. Find the number of each type of coin.
56. Julio has $2.75 in his pocket in nickels and dimes. The number of dimes is 10 less than twice the number of nickels. Find the number of each type of coin.
57. Chi has $11.30 in dimes and quarters. The number of dimes is 3 more than three times the number of quarters. How many dimes and nickels does Chi have?
58. Tyler has $9.70 in dimes and quarters. The number of quarters is 8 more than four times the number of dimes. How many of each coin does he have?
59. A cash box of $1 and $5 bills is worth $45. The number of $1 bills is 3 more than the number of $5 bills. How many of each bill does it contain?
60. Joe's wallet contains $1 and $5 bills worth $47. The number of $1 bills is 5 more than the number of $5 bills. How many of each bill does he have?
61. In a cash drawer there is $125 in $5 and $10 bills. The number of $10 bills is twice the number of $5 bills. How many of each are in the drawer?
62. John has $175 in $5 and $10 bills in his drawer. The number of $5 bills is three times the number of $10 bills. How many of each are in the drawer?
63. Mukul has $3.75 in quarters, dimes and nickels in his pocket. He has five more dimes than quarters and nine more nickels than quarters. How many of each coin are in his pocket?
64. Vina has $4.70 in quarters, dimes and nickels in her purse. She has eight more dimes than quarters and six more nickels than quarters. How many of each coin are in her purse?

Solve Ticket and Stamp Word Problems

In the following exercises, solve the ticket and stamp word problems.

65. The play took in $550 one night. The number of $8 adult tickets was 10 less than twice the number of $5 child tickets. How many of each ticket were sold?
66. If the number of $8 child tickets is seventeen less than three times the number of $12 adult tickets and the theater took in $584, how many of each ticket were sold?
67. The movie theater took in $1,220 one Monday night. The number of $7 child tickets was ten more than twice the number of $9 adult tickets. How many of each were sold?
68. The ball game took in $1,340 one Saturday. The number of $12 adult tickets was 15 more than twice the number of $5 child tickets. How many of each were sold?

69. Julie went to the post office and bought both $0.49 stamps and $0.34 postcards for her office's bills She spent $62.60. The number of stamps was 20 more than twice the number of postcards. How many of each did she buy?
70. Before he left for college out of state, Jason went to the post office and bought both $0.49 stamps and $0.34 postcards and spent $12.52. The number of stamps was 4 more than twice the number of postcards. How many of each did he buy?
71. Maria spent $16.80 at the post office. She bought three times as many $0.49 stamps as $0.21 stamps. How many of each did she buy?
72. Hector spent $43.40 at the post office. He bought four times as many $0.49 stamps as $0.21 stamps. How many of each did he buy?
73. Hilda has $210 worth of $10 and $12 stock shares. The numbers of $10 shares is 5 more than twice the number of $12 shares. How many of each does she have?
74. Mario invested $475 in $45 and $25 stock shares. The number of $25 shares was 5 less than three times the number of $45 shares. How many of each type of share did he buy?

Everyday Math

75. **Parent Volunteer** As the treasurer of her daughter's Girl Scout troop, Laney collected money for some girls and adults to go to a 3-day camp. Each girl paid $75 and each adult paid $30. The total amount of money collected for camp was $765. If the number of girls is three times the number of adults, how many girls and how many adults paid for camp?
76. **Parent Volunteer** Laurie was completing the treasurer's report for her son's Boy Scout troop at the end of the school year. She didn't remember how many boys had paid the $24 full-year registration fee and how many had paid a $16 partial-year fee. She knew that the number of boys who paid for a full-year was ten more than the number who paid for a partial-year. If $400 was collected for all the registrations, how many boys had paid the full-year fee and how many had paid the partial-year fee?

Writing Exercises

77. Suppose you have 6 quarters, 9 dimes, and 4 pennies. Explain how you find the total value of all the coins.
78. Do you find it helpful to use a table when solving coin problems? Why or why not?
79. In the table used to solve coin problems, one column is labeled “number” and another column is labeled ‘“value.” What is the difference between the number and the value?
80. What similarities and differences did you see between solving the coin problems and the ticket and stamp problems?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve coin word problems.			
solve ticket and stamp word problems.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

13.4.2: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 1)

Learning Objectives

- Use the properties of angles
- Use the properties of triangles
- Use the Pythagorean Theorem

be prepared!

Before you get started, take this readiness quiz.

1. Solve: x + 3 + 6 = 11. If you missed this problem, review Example 8.1.6.
2. Solve: $\frac{a}{45} = \frac{4}{3}$. If you missed this problem, review Example 6.5.3.
3. Simplify: $\sqrt{36+64}$. If you missed this problem, review Example 5.12.4.

So far in this chapter, we have focused on solving word problems, which are similar to many real-world applications of algebra. In the next few sections, we will apply our problem-solving strategies to some common geometry problems.

Use the Properties of Angles

Are you familiar with the phrase 'do a 180'? It means to turn so that you face the opposite direction. It comes from the fact that the measure of an angle that makes a straight line is 180 degrees. See Figure 13.4.2.1.

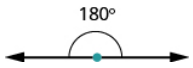

Figure 13.4.2.1

An **angle** is formed by two rays that share a common endpoint. Each ray is called a side of the angle and the common endpoint is called the **vertex**. An angle is named by its vertex. In Figure 13.4.2.2, ∠A is the angle with vertex at point A. The measure of ∠A is written m ∠ A.

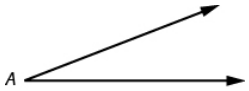

Figure 13.4.2.2- ∠ A is the angle with vertex at point A.

We measure angles in degrees, and use the symbol ° to represent degrees. We use the abbreviation m for the *measure* of an angle. So if ∠A is 27°, we would write m ∠ A = 27.

If the sum of the measures of two angles is 180°, then they are called **supplementary angles**. In Figure 13.4.2.3, each pair of angles is supplementary because their measures add to 180°. Each angle is the *supplement* of the other.

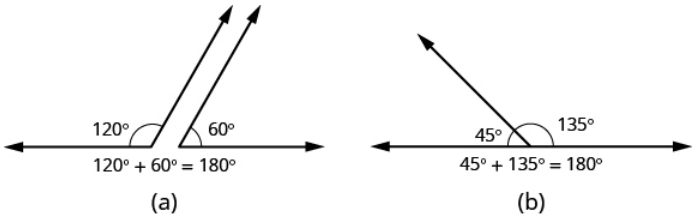

Figure 13.4.2.3- The sum of the measures of supplementary angles is 180°.

If the sum of the measures of two angles is 90°, then the angles are **complementary angles**. In Figure 13.4.2.4, each pair of angles is complementary, because their measures add to 90°. Each angle is the *complement* of the other.

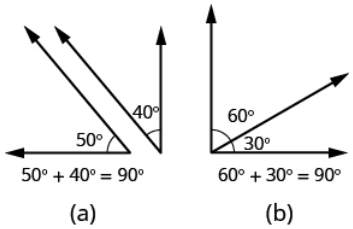

Figure 13.4.2.4- The sum of the measures of complementary angles is 90°.

Definition: Supplementary and Complementary Angles

If the sum of the measures of two angles is 180°, then the angles are supplementary.

If ∠A and ∠B are supplementary, then m∠A + m∠B = 180°.

If the sum of the measures of two angles is 90°, then the angles are complementary.

If ∠A and ∠B are complementary, then m∠A + m∠B = 90°.

In this section and the next, you will be introduced to some common geometry formulas. We will adapt our Problem Solving Strategy for Geometry Applications. The geometry formula will name the variables and give us the equation to solve.

In addition, since these applications will all involve geometric shapes, it will be helpful to draw a figure and then label it with the information from the problem. We will include this step in the Problem Solving Strategy for Geometry Applications.

HOW TO: USE A PROBLEM SOLVING STRATEGY FOR GEOMETRY APPLICATIONS

Step 1. **Read** the problem and make sure you understand all the words and ideas. Draw a figure and label it with the given information.

Step 2. **Identify** what you are looking for

Step 3. **Name** what you are looking for and choose a variable to represent it.

Step 4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.

Step 5. **Solve** the equation using good algebra techniques.

Step 6. **Check** the answer in the problem and make sure it makes sense.

Step 7. **Answer** the question with a complete sentence.

The next example will show how you can use the Problem Solving Strategy for Geometry Applications to answer questions about supplementary and complementary angles.

Example 13.4.2.1:

An angle measures 40°. Find (a) its supplement, and (b) its complement.

Solution

(a)

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the supplement of a 40°
Step 3. **Name**. Choose a variable to represent it.	let s = the measure of the supplement

Step 4. **Translate**. Write the appropriate formula for the situation and substitute in the given information.	$m\angle A + m\angle B = 180$ (13.4.2.1)
Step 5. **Solve** the equation.	$s + 40 = 180$ $s = 140$
Step 6. **Check.**	$140 + 40 \stackrel{?}{=} 180$ $180 = 180$ ✓
Step 7. **Answer** the question.	The supplement of the 40° angle is 140°.

(b)

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the complement of a 40°
Step 3. **Name**. Choose a variable to represent it.	let c = the measure of the complement
Step 4. **Translate**. Write the appropriate formula for the situation and substitute in the given information.	$m\angle A + m\angle B = 90$ (13.4.2.2)
Step 5. **Solve** the equation.	$c + 40 = 90$ $c = 50$
Step 6. **Check.**	$50 + 40 \stackrel{?}{=} 90$ $90 = 90$ ✓
Step 7. **Answer** the question.	The supplement of the 40° angle is 50°.

? Exercise 13.4.2.1:

An angle measures 25°. Find (a) its supplement, and (b) its complement.

Answer a

155°

Answer b

65°

? Exercise 13.4.2.2:

An angle measures 77°. Find (a) its supplement, and (b) its complement.

Answer a

103°

Answer b

13°

Did you notice that the words complementary and supplementary are in alphabetical order just like 90 and 180 are in numerical order?

Example 13.4.2.2:

Two angles are supplementary. The larger angle is 30° more than the smaller angle. Find the measure of both angles.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the measures of both angles
Step 3. **Name**. Choose a variable to represent it.	let a = measure of the smaller angle a + 30 = measure of larger angle
Step 4. **Translate**. Write the appropriate formula for the situation and substitute in the given information.	$m\angle A + m\angle B = 180$ (13.4.2.3)
Step 5. **Solve** the equation.	$(a+30)+a = 180$ $2a+30 = 180$ $2a = 150$ $a = 75$ *measure of smaller angle* $a+30$ *measure of larger angle* $75+30$ 105
Step 6. **Check.**	$m\angle A + m\angle B = 180$ $75+105 \stackrel{?}{=} 180$ $180 = 180$ ✓
Step 7. **Answer** the question.	The measures of the angles are 75° and 105°.

Exercise 13.4.2.3:

Two angles are supplementary. The larger angle is 100° more than the smaller angle. Find the measures of both angles.

Answer

40°, 140°

Exercise 13.4.2.4:

Two angles are complementary. The larger angle is 40° more than the smaller angle. Find the measures of both angles.

Answer

25°, 65°

Use the Properties of Triangles

What do you already know about triangles? Triangle have three sides and three angles. Triangles are named by their vertices. The **triangle** in Figure 13.4.2.5is called ΔABC, read ‘triangle ABC’. We label each side with a lower case letter to match the upper

case letter of the opposite vertex.

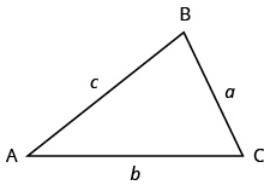

Figure 13.4.2.5- ΔABC has vertices A, B, and C and sides a, b, and c.

The three angles of a triangle are related in a special way. The sum of their measures is 180°.

$$m\angle A + m\angle B + m\angle C = 180^\circ \qquad (13.4.2.4)$$

Definition: Sum of the Measures of the Angles of a Triangle

For any ΔABC, the sum of the measures of the angles is 180°.

$$m\angle A + m\angle B + m\angle C = 180^\circ \qquad (13.4.2.5)$$

Example 13.4.2.3:

The measures of two angles of a triangle are 55° and 82°. Find the measure of the third angle.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the measure of the third angle in a triangle
Step 3. **Name**. Choose a variable to represent it.	let x = the measure of the angle
Step 4. **Translate**. Write the appropriate formula for the situation and substitute in the given information.	$m\angle A + m\angle B + m\angle C = 180 \qquad (13.4.2.6)$
Step 5. **Solve** the equation.	$55 + 82 + x = 180$ $137 + x = 180$ $x = 43$
Step 6. **Check.**	$55 + 82 + 43 \stackrel{?}{=} 180$ $180 = 180$ ✓
Step 7. **Answer** the question.	The measure of the third angle is 43 degrees.

Exercise 13.4.2.5:

The measures of two angles of a triangle are 31° and 128°. Find the measure of the third angle.

Answer

21°

Exercise 13.4.2.6:

A triangle has angles of 49° and 75°. Find the measure of the third angle.

Answer

56°

Right Triangles

Some triangles have special names. We will look first at the **right triangle**. A right triangle has one 90° angle, which is often marked with the symbol shown in Figure 13.4.2.6

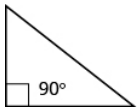

Figure 13.4.2.6

If we know that a triangle is a right triangle, we know that one angle measures 90° so we only need the measure of one of the other angles in order to determine the measure of the third angle.

Example 13.4.2.4:

One angle of a right triangle measures 28°. What is the measure of the third angle?

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the measure of an angle
Step 3. **Name**. Choose a variable to represent it.	let x = the measure of the angle
Step 4. **Translate**. Write the appropriate formula for the situation and substitute in the given information.	$m\angle A + m\angle B + m\angle C = 180$ (13.4.2.7)
Step 5. **Solve** the equation.	$x + 90 + 28 = 180$ $x + 118 = 180$ $x = 62$
Step 6. **Check.**	$180 \stackrel{?}{=} 90 + 28 + 62$ $180 = 180$ ✓
Step 7. **Answer** the question.	The measure of the third angle is 62°.

Exercise 13.4.2.7:

One angle of a right triangle measures 56°. What is the measure of the other angle?

Answer

34°

Exercise 13.4.2.8:

One angle of a right triangle measures 45°. What is the measure of the other angle?

Answer

45°

In the examples so far, we could draw a figure and label it directly after reading the problem. In the next example, we will have to define one angle in terms of another. So we will wait to draw the figure until we write expressions for all the angles we are looking for.

Example 13.4.2.5:

The measure of one angle of a right triangle is 20° more than the measure of the smallest angle. Find the measures of all three angles.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	the measures of all three angles
Step 3. **Name**. Choose a variable to represent it. Now draw the figure and label it with the given information.	Let a = 1st angle a + 20 = 2nd angle 90 = 3rd angle (the right angle) Step 4. **Translate**. Write the appropriate formula for the situation and substitute in the given information.	$m\angle A + m\angle B + m\angle C = 180$ $a + (a + 20) + 90 = 180$
Step 5. **Solve** the equation.	$2a + 110 = 180$ $2a = 70$ $a = 35$ *first angle* $a+20$ *second angle* $35+20$ 55 90 *third angle*
Step 6. **Check.**	$35 + 55 + 90 \stackrel{?}{=} 180$ $180 = 180$ ✓
Step 7. **Answer** the question.	The three angles measure 35°, 55°, and 90°.

Exercise 13.4.2.9:

The measure of one angle of a right triangle is 50° more than the measure of the smallest angle. Find the measures of all three angles.

Answer

20°, 70°, 90°

Exercise 13.4.2.10:

The measure of one angle of a right triangle is 30° more than the measure of the smallest angle. Find the measures of all three angles.

Answer

30°, 60°, 90°

Similar Triangles

When we use a map to plan a trip, a sketch to build a bookcase, or a pattern to sew a dress, we are working with similar figures. In geometry, if two figures have exactly the same shape but different sizes, we say they are **similar figures**. One is a scale model of the other. The corresponding sides of the two figures have the same ratio, and all their corresponding angles are have the same measures.

The two triangles in Figure 13.4.2.7 are similar. Each side of ΔABC is four times the length of the corresponding side of ΔXYZ and their corresponding angles have equal measures.

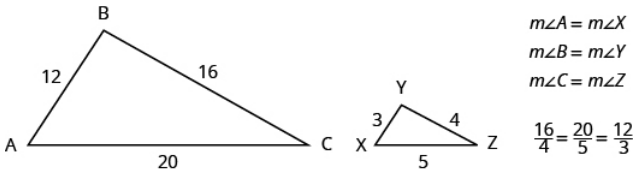

Figure 13.4.2.7- ΔABC and ΔXYZ are similar triangles. Their corresponding sides have the same ratio and the corresponding angles have the same measure.

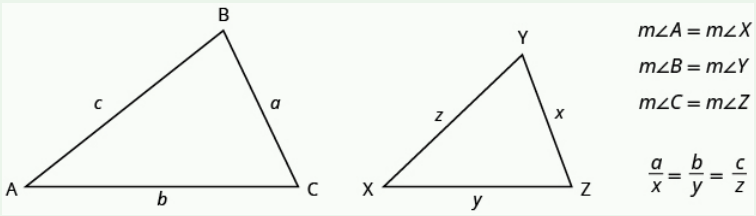
Definition: Properties of Similar Triangles

If two triangles are similar, then their corresponding angle measures are equal and their corresponding side lengths are in the same ratio.



The length of a side of a triangle may be referred to by its endpoints, two vertices of the triangle. For example, in ΔABC:

the length a can also be written BC

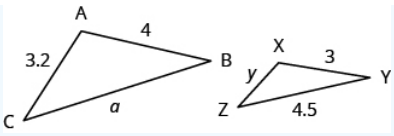
the length b can also be written AC

the length c can also be written AB

We will often use this notation when we solve similar triangles because it will help us match up the corresponding side lengths.

Example 13.4.2.6:

ΔABC and ΔXYZ are similar triangles. The lengths of two sides of each triangle are shown. Find the lengths of the third side of each triangle.



Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	The figure is provided.
Step 2. **Identify** what you are looking for.	The length of the sides of similar triangles
Step 3. **Name**. Choose a variable to represent it.	Let a = length of the third side of ΔABC, y = length of the third side ΔXYZ
Step 4. **Translate**.	The triangles are similar, so the corresponding sides are in the same ratio. So $$\frac{AB}{XY}=\frac{BC}{YZ}=\frac{AC}{XZ} \quad (13.4.2.8)$$ Since the side AB = 4 corresponds to the side XY = 3 , we will use the ratio $\frac{AB}{XY}=\frac{4}{3}$ to find the other sides. Be careful to match up corresponding sides correctly. Step 5. **Solve** the equation.	$3a=4(4.5)$ $3a=18$ $a=6$ $4y=3(3.2)$ $4y=9.6$ $y=2.4$
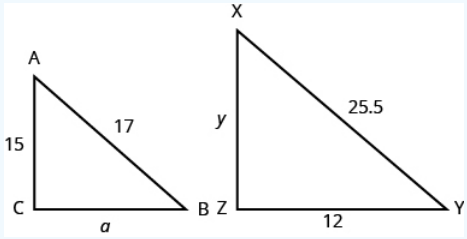
Step 6. **Check.**	$\frac{4}{3}\stackrel{?}{=}\frac{6}{4.5}$ $4(4.5)\stackrel{?}{=}6(3)$ $18=18$ ✓ $\frac{4}{3}\stackrel{?}{=}\frac{3.2}{2.4}$ $4(2.4)\stackrel{?}{=}3.2(3)$ $9.6=9.6$ ✓
Step 7. **Answer** the question.	The third side of ΔABC is 6 and the third side of ΔXYZ is 2.4.

? Exercise 13.4.2.11:

ΔABC is similar to ΔXYZ. Find a.

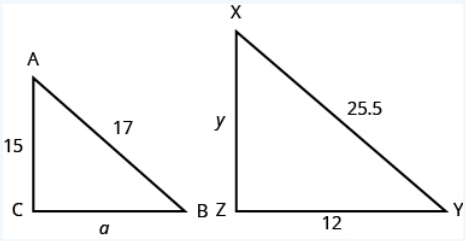


Answer

a = 8

Exercise 13.4.2.12:

ΔABC is similar to ΔXYZ. Find y.



Answer

y = 22.5

13.4.3: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 2)

Use the Pythagorean Theorem

The **Pythagorean Theorem** is a special property of right triangles that has been used since ancient times. It is named after the Greek philosopher and mathematician Pythagoras who lived around 500 BCE.

Remember that a right triangle has a 90° angle, which we usually mark with a small square in the corner. The side of the triangle opposite the 90° angle is called the **hypotenuse**, and the other two sides are called the **legs**. See Figure 13.4.3.8

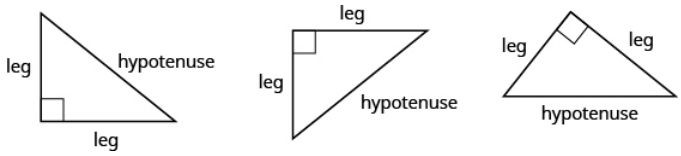

Figure 13.4.3.8- In a right triangle, the side opposite the 90° angle is called the hypotenuse and each of the other sides is called a leg.

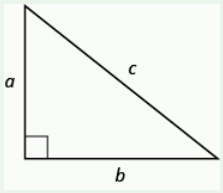
The Pythagorean Theorem tells how the lengths of the three sides of a right triangle relate to each other. It states that in any right triangle, the sum of the squares of the two legs equals the square of the hypotenuse.

Definition: The Pythagorean Theorem

In any right triangle ΔABC,

$$a^2 + b^2 = c^2 \tag{13.4.3.1}$$

where c is the length of the hypotenuse a and b are the lengths of the legs.



To solve problems that use the Pythagorean Theorem, we will need to find square roots. In Simplify and Use Square Roots we introduced the notation m and defined it in this way:

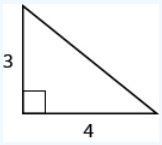
$$If\ m = n^2, then\ \sqrt{m} = n\ for\ n \geq 0 \tag{13.4.3.2}$$

For example, we found that $\sqrt{25}$ is 5 because 5^2 = 25.

We will use this definition of square roots to solve for the length of a side in a right triangle.

Example 13.4.3.7:

Use the Pythagorean Theorem to find the length of the hypotenuse.



Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	the length of the hypotenuse of the triangle

Step 3. **Name**. Choose a variable to represent it.	Let c = the length of the hypotenuse Step 4. **Translate**. Write the appropriate formula. Substitute.	$a^2+b^2=c^2$ $3^2+4^2=c^2$
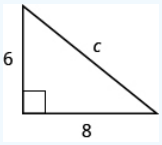
Step 5. **Solve** the equation.	$9+16=c^2$ $25=c^2$ $\sqrt{25}=c^2$ $5=c$
Step 6. **Check**.	$3^2+4^2=5^2$ $9+16\stackrel{?}{=}25$ $25=25$ ✓
Step 7. **Answer** the question.	The length of the hypotenuse is 5.

? Exercise 13.4.3.13:

Use the Pythagorean Theorem to find the length of the hypotenuse.

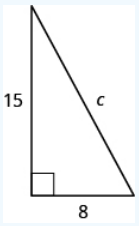


Answer

c = 10

? Exercise 13.4.3.14:

Use the Pythagorean Theorem to find the length of the hypotenuse.

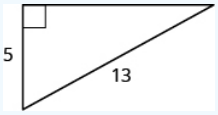


Answer

c = 17

Example 13.4.3.8:

Use the Pythagorean Theorem to find the length of the longer leg.



Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	The length of the leg of the triangle
Step 3. **Name**. Choose a variable to represent it.	Let b = the leg of the triangle Label side b Step 4. **Translate**. Write the appropriate formula. Substitute.	$a^2+b^2=c^2$ $5^2+b^2=13^2$
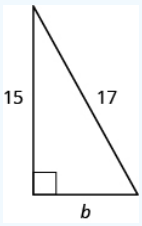
Step 5. **Solve** the equation.	$25+b^2=169$ $b^2=144$ $b^2=\sqrt{144}$ $b=12$
Step 6. **Check**.	$5^2+12^2 \stackrel{?}{=} 13^2$ $25+144 \stackrel{?}{=} 169$ $169=169$ ✓
Step 7. **Answer** the question.	The length of the leg is 12.

Exercise 13.4.3.15:

Use the Pythagorean Theorem to find the length of the leg.

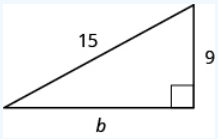


Answer

b = 8

Exercise 13.4.3.16:

Use the Pythagorean Theorem to find the length of the leg.

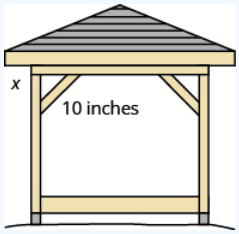


Answer

b = 12

Example 13.4.3.9:

Kelvin is building a gazebo and wants to brace each corner by placing a 10-inch wooden bracket diagonally as shown. How far below the corner should he fasten the bracket if he wants the distances from the corner to each end of the bracket to be equal? Approximate to the nearest tenth of an inch.



Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	the distance from the corner that the bracket should be attached
Step 3. **Name**. Choose a variable to represent it.	Let x = the distance from the corner Step 4. **Translate**. Write the appropriate formula. Substitute.	$a^2+b^2=c^2$ $x^2+x^2=10^2$
Step 5. **Solve** the equation. Isolate the variable. Use the definition of the square root. Simplify. Approximate to the nearest tenth.	$2x^2=100$ $x^2=50$ $x=\sqrt{50}$ $b\approx 7.1$
Step 6. **Check**.	$a^2+b^2=c^2$ $(7.1)^2+(7.1)^2 \stackrel{?}{\approx} 10^2$ $Yes.$
Step 7. **Answer** the question.	Kelvin should fasten each piece of wood approximately 7.1" from the corner.

Exercise 13.4.3.17:

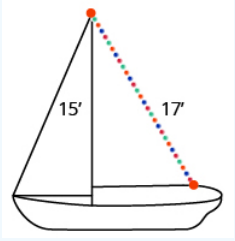
John puts the base of a 13-ft ladder 5 feet from the wall of his house. How far up the wall does the ladder reach?

Answer

12 feet

Exercise 13.4.3.18:

Randy wants to attach a 17-ft string of lights to the top of the 15-ft mast of his sailboat. How far from the base of the mast should he attach the end of the light string?



Answer

8 feet

Practice Makes Perfect

Use the Properties of Angles

In the following exercises, find (a) the supplement and (b) the complement of the given angle.

81. 53°
82. 16°
83. 29°
84. 72°

In the following exercises, use the properties of angles to solve.

85. Find the supplement of a 135° angle.
86. Find the complement of a 38° angle.
87. Find the complement of a 27.5° angle.
88. Find the supplement of a 109.5° angle.
89. Two angles are supplementary. The larger angle is 56° more than the smaller angle. Find the measures of both angles.

90. Two angles are supplementary. The smaller angle is 36° less than the larger angle. Find the measures of both angles.
91. Two angles are complementary. The smaller angle is 34° less than the larger angle. Find the measures of both angles.
92. Two angles are complementary. The larger angle is 52° more than the smaller angle. Find the measures of both angles.

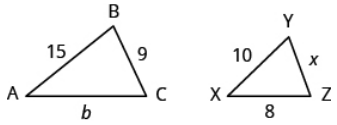
Use the Properties of Triangles

In the following exercises, solve using properties of triangles.

93. The measures of two angles of a triangle are 26° and 98°. Find the measure of the third angle.
94. The measures of two angles of a triangle are 61° and 84°. Find the measure of the third angle.
95. The measures of two angles of a triangle are 105° and 31°. Find the measure of the third angle.
96. The measures of two angles of a triangle are 47° and 72°. Find the measure of the third angle.
97. One angle of a right triangle measures 33°. What is the measure of the other angle?
98. One angle of a right triangle measures 51°. What is the measure of the other angle?
99. One angle of a right triangle measures 22.5°. What is the measure of the other angle?
100. One angle of a right triangle measures 36.5°. What is the measure of the other angle?
101. The two smaller angles of a right triangle have equal measures. Find the measures of all three angles.
102. The measure of the smallest angle of a right triangle is 20° less than the measure of the other small angle. Find the measures of all three angles.
103. The angles in a triangle are such that the measure of one angle is twice the measure of the smallest angle, while the measure of the third angle is three times the measure of the smallest angle. Find the measures of all three angles.
104. The angles in a triangle are such that the measure of one angle is 20° more than the measure of the smallest angle, while the measure of the third angle is three times the measure of the smallest angle. Find the measures of all three angles.

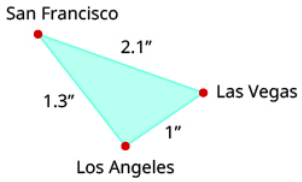
Find the Length of the Missing Side

In the following exercises, Δ ABC is similar to Δ XYZ. Find the length of the indicated side.



105. side b
106. side x

On a map, San Francisco, Las Vegas, and Los Angeles form a triangle whose sides are shown in the figure below. The actual distance from Los Angeles to Las Vegas is 270 miles.

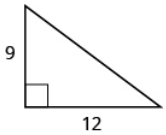


107. Find the distance from Los Angeles to San Francisco.
108. Find the distance from San Francisco to Las Vegas.

Use the Pythagorean Theorem

In the following exercises, use the Pythagorean Theorem to find the length of the hypotenuse.

109.

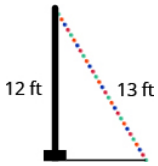


110. 
111. 
112. 
Find the Length of the Missing Side

In the following exercises, use the Pythagorean Theorem to find the length of the missing side. Round to the nearest tenth, if necessary.

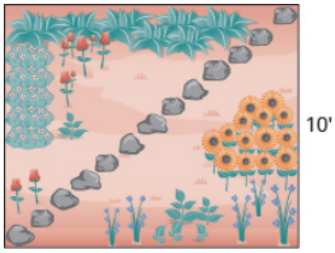
113. 
114. 
115. 
116. 
117. 
118. 
119. 
120. 
In the following exercises, solve. Approximate to the nearest tenth, if necessary.

121. A 13-foot string of lights will be attached to the top of a 12-foot pole for a holiday display. How far from the base of the pole should the end of the string of lights be anchored?



122. Pam wants to put a banner across her garage door to congratulate her son on his college graduation. The garage door is 12 feet high and 16 feet wide. How long should the banner be to fit the garage door?

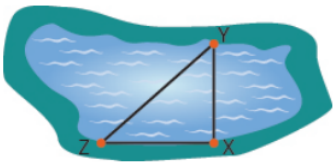
123. Chi is planning to put a path of paving stones through her flower garden. The flower garden is a square with sides of 10 feet. What will the length of the path be?



124. Brian borrowed a 20-foot extension ladder to paint his house. If he sets the base of the ladder 6 feet from the house, how far up will the top of the ladder reach?

Everyday Math

125. **Building a scale model** Joe wants to build a doll house for his daughter. He wants the doll house to look just like his house. His house is 30 feet wide and 35 feet tall at the highest point of the roof. If the dollhouse will be 2.5 feet wide, how tall will its highest point be?
126. **Measurement** A city engineer plans to build a footbridge across a lake from point X to point Y, as shown in the picture below. To find the length of the footbridge, she draws a right triangle XYZ, with right angle at X. She measures the distance from X to Z, 800 feet, and from Y to Z, 1,000 feet. How long will the bridge be?



Writing Exercises

127. Write three of the properties of triangles from this section and then explain each in your own words.
128. Explain how the figure below illustrates the Pythagorean Theorem for a triangle with legs of length 3 and 4.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the properties of angles.			
use the properties of triangles.			
use the Pythagorean Theorem.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

13.4.4: Use Properties of Rectangles, Triangles, and Trapezoids (Part 1)

Learning Objectives

- Understand linear, square, and cubic measure
- Use properties of rectangles
- Use properties of triangles
- Use properties of trapezoids

be prepared!

Before you get started, take this readiness quiz.

1. The length of a rectangle is 3 less than the width. Let w represent the width. Write an expression for the length of the rectangle. If you missed this problem, review Example 2.4.14.
2. Simplify: $\frac{1}{2}(6h)$. If you missed this problem, review Example 7.2.3.
3. Simplify: $\frac{5}{2}(10.3 - 7.9)$. If you missed this problem, review Example 5.5.9.

In this section, we'll continue working with geometry applications. We will add some more properties of triangles, and we'll learn about the properties of rectangles and trapezoids.

Understand Linear, Square, and Cubic Measure

When you measure your height or the length of a garden hose, you use a ruler or tape measure (Figure 13.4.4.1). A tape measure might remind you of a line—you use it for **linear measure**, which measures length. Inch, foot, yard, mile, centimeter and meter are units of linear measure.

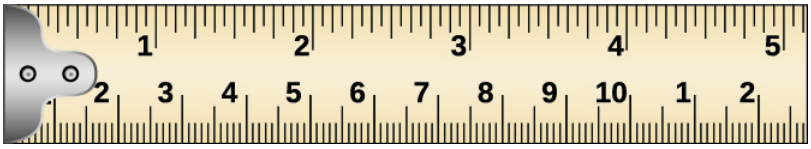

Figure 13.4.4.1- This tape measure measures inches along the top and centimeters along the bottom.

When you want to know how much tile is needed to cover a floor, or the size of a wall to be painted, you need to know the **area**, a measure of the region needed to cover a surface. Area is measured is **square units**. We often use square inches, square feet, square centimeters, or square miles to measure area. A square centimeter is a square that is one centimeter (cm) on each side. A square inch is a square that is one inch on each side (Figure 13.4.4.2).

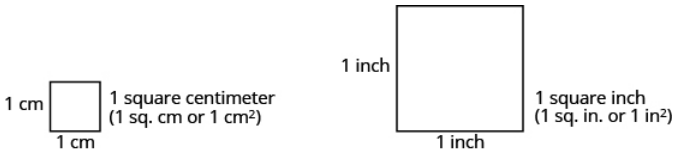

Figure 13.4.4.2- Square measures have sides that are each 1 unit in length.

Figure 13.4.4.3 shows a rectangular rug that is 2 feet long by 3 feet wide. Each square is 1 foot wide by 1 foot long, or 1 square foot. The rug is made of 6 squares. The area of the rug is 6 square feet.

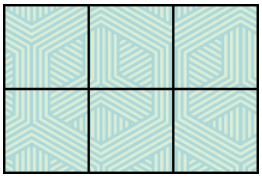

Figure 13.4.4.3- The rug contains six squares of 1 square foot each, so the total area of the rug is 6 square feet.

When you measure how much it takes to fill a container, such as the amount of gasoline that can fit in a tank, or the amount of medicine in a syringe, you are measuring **volume**. Volume is measured in **cubic units** such as cubic inches or cubic centimeters. When measuring the volume of a rectangular solid, you measure how many cubes fill the container. We often use cubic centimeters, cubic inches, and cubic feet. A cubic centimeter is a cube that measures one centimeter on each side, while a cubic inch is a cube that measures one inch on each side (Figure 13.4.4.4).

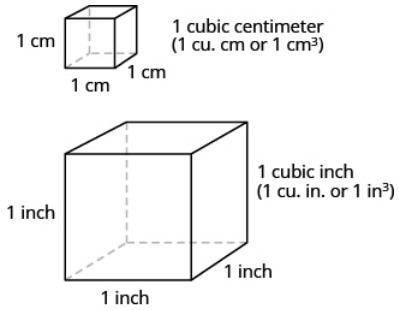

Figure 13.4.4.4- Cubic measures have sides that are 1 unit in length.

Suppose the cube in Figure 13.4.4.5 measures 3 inches on each side and is cut on the lines shown. How many little cubes does it contain? If we were to take the big cube apart, we would find 27 little cubes, with each one measuring one inch on all sides. So each little cube has a volume of 1 cubic inch, and the volume of the big cube is 27 cubic inches.

Figure 13.4.4.5- A cube that measures 3 inches on each side is made up of 27 one-inch cubes, or 27 cubic inches.

Example 13.4.4.1:

For each item, state whether you would use linear, square, or cubic measure: (a) amount of carpeting needed in a room (b) extension cord length (c) amount of sand in a sandbox (d) length of a curtain rod (e) amount of flour in a canister (f) size of the roof of a doghouse.

Solution

(a) You are measuring how much surface the carpet covers, which is the area.	square measure
(b) You are measuring how long the extension cord is, which is the length.	linear measure
(c) You are measuring the volume of the sand.	cubic measure
(d) You are measuring the length of the curtain rod.	linear measure
(e) You are measuring the volume of the flour.	cubic measure
(f) You are measuring the area of the roof.	square measure

Exercise 13.4.4.1:

Determine whether you would use linear, square, or cubic measure for each item. (a) amount of paint in a can (b) height of a tree (c) floor of your bedroom (d) diameter of bike wheel (e) size of a piece of sod (f) amount of water in a swimming pool

Answer a

cubic

Answer b

linear

Answer c

square

Answer d

linear

Answer e

square

Answer f

cubic

Exercise 13.4.4.2:

Determine whether you would use linear, square, or cubic measure for each item. (a) volume of a packing box (b) size of patio (c) amount of medicine in a syringe (d) length of a piece of yarn (e) size of housing lot (f) height of a flagpole

Answer a

cubic

Answer b

square

Answer c

cubic

Answer d

linear

Answer e

square

Answer f

linear

Many geometry applications will involve finding the perimeter or the area of a figure. There are also many applications of perimeter and area in everyday life, so it is important to make sure you understand what they each mean.

Picture a room that needs new floor tiles. The tiles come in squares that are a foot on each side—one square foot. How many of those squares are needed to cover the floor? This is the area of the floor.

Next, think about putting new baseboard around the room, once the tiles have been laid. To figure out how many strips are needed, you must know the distance around the room. You would use a tape measure to measure the number of feet around the room. This distance is the perimeter.

Definition: Perimeter and Area

The perimeter is a measure of the distance around a figure.

The area is a measure of the surface covered by a figure.

Figure 13.4.4.6shows a square tile that is 1 inch on each side. If an ant walked around the edge of the tile, it would walk 4 inches. This distance is the perimeter of the tile.

Since the tile is a square that is 1 inch on each side, its area is one square inch. The area of a shape is measured by determining how many square units cover the shape.

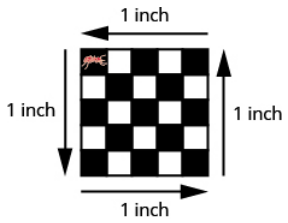

Figure 13.4.4.6- Perimeter = 4 inches, Area = 1 square inch. When the ant walks completely around the tile on its edge, it is tracing the perimeter of the tile. The area of the tile is 1 square inch.

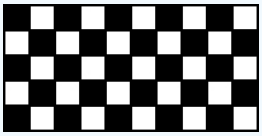
Example 13.4.4.2:

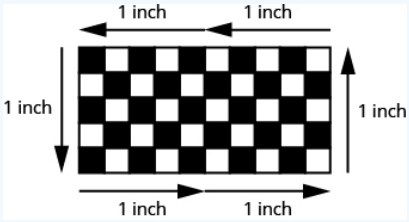
Each of two square tiles is 1 square inch. Two tiles are shown together. (a) What is the perimeter of the figure? (b) What is the area?



Solution

(a) The perimeter is the distance around the figure. The perimeter is 6 inches.

(b) The area is the surface covered by the figure. There are 2 square inch tiles so the area is 2 square inches.



Exercise 13.4.4.3:

Find the (a) perimeter and (b) area of the figure:

Answer a

8 inches

Answer b

3 sq. inches

Exercise 13.4.4.4:

Find the (a) perimeter and (b) area of the figure:

Answer a

8 centimeters

Answer b

4 sq. centimeters

Use the Properties of Rectangles

A **rectangle** has four sides and four right angles. The opposite sides of a rectangle are the same length. We refer to one side of the rectangle as the length, L, and the adjacent side as the width, W. See Figure 13.4.4.7.

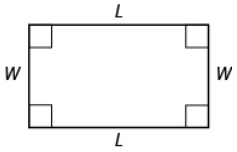


Figure 13.4.4.7- A rectangle has four sides, and four right angles. The sides are labeled L for length and W for width.

The perimeter, P, of the rectangle is the distance around the rectangle. If you started at one corner and walked around the rectangle, you would walk L + W + L + W units, or two lengths and two widths. The perimeter then is

$$P = L + W + L + W$$
$$or$$
$$P = 2L + 2W$$

What about the area of a rectangle? Remember the rectangular rug from the beginning of this section. It was 2 feet long by 3 feet wide, and its area was 6 square feet. See Figure 13.4.4.8 Since A = 2 • 3, we see that the area, A, is the length, L, times the width, W, so the area of a rectangle is A = L • W.

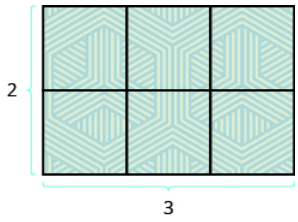

Figure 13.4.4.8- The area of this rectangular rug is 6 square feet, its length times its width.

Definition: Properties of Rectangles

- Rectangles have four sides and four right (90°) angles.
- The lengths of opposite sides are equal.
- The perimeter, P, of a rectangle is the sum of twice the length and twice the width. See Figure 9.19.

$$P = 2L + 2W \tag{13.4.4.1}$$

- The area, A, of a rectangle is the length times the width.

$$A = L \cdot W \tag{13.4.4.2}$$

For easy reference as we work the examples in this section, we will restate the Problem Solving Strategy for Geometry Applications here.

HOW TO: USE A PROBLEM SOLVING STRATEGY FOR GEOMETRY APPLICATIONS

Step 1. **Read** the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.

Step 2. **Identify** what you are looking for.

Step 3. **Name** what you are looking for. Choose a variable to represent that quantity.

Step 4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.

Step 5. **Solve** the equation using good algebra techniques.

Step 6. **Check** the answer in the problem and make sure it makes sense.

Step 7. **Answer** the question with a complete sentence.

Example 13.4.4.3:

The length of a rectangle is 32 meters and the width is 20 meters. Find (a) the perimeter, and (b) the area.

Solution

(a)

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the perimeter of a rectangle
Step 3. **Name**. Choose a variable to represent it.	Let P = the perimeter
Step 4. **Translate**. Write the appropriate formula. Substitute.	$\underbrace{P}_{P} \quad \underbrace{=}_{=} \quad \underbrace{2\,L}_{2(32)} \quad \underbrace{+}_{+} \quad \underbrace{2\,W}_{2(20)}$
Step 5. **Solve** the equation.	$P = 64 + 40$ $P = 104$
Step 6. **Check**.	$P \stackrel{?}{=} 104$ $20 + 32 + 20 + 32 \stackrel{?}{=} 104$ $104 = 104$ ✓
Step 7. **Answer** the question.	The perimeter of the rectangle is 104 meters.

(b)

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the area of a rectangle
Step 3. **Name**. Choose a variable to represent it.	Let A = the area
Step 4. **Translate**. Write the appropriate formula. Substitute.	$\underbrace{A}_{A} \quad \underbrace{=}_{=} \quad \underbrace{L}_{32\text{ m}} \quad \underbrace{\cdot}_{\cdot} \quad \underbrace{W}_{20\text{ m}}$
Step 5. **Solve** the equation.	$A = 640 \qquad (13.4.4.3)$
Step 6. **Check**.	$A \stackrel{?}{=} 640$ $32 \cdot 20 \stackrel{?}{=} 640$ $640 = 640$ ✓
Step 7. **Answer** the question.	The area of the rectangle is 60 square meters.

? Exercise 13.4.4.5:

The length of a rectangle is 120 yards and the width is 50 yards. Find (a) the perimeter and (b) the area.

Answer a

340 yd

Answer b

6000 sq. yd

? Exercise 13.4.4.6:

The length of a rectangle is 62 feet and the width is 48 feet. Find (a) the perimeter and (b) the area.

Answer a

220 ft

Answer b

2976 sq. ft

✓ Example 13.4.4.4:

Find the length of a rectangle with perimeter 50 inches and width 10 inches.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the length of the rectangle
Step 3. **Name**. Choose a variable to represent it.	Let L = the length
Step 4. **Translate**. Write the appropriate formula. Substitute.	$\underbrace{P}_{50} \underbrace{=}_{=} \underbrace{2\,L}_{2L} \underbrace{+}_{+} \underbrace{2\,W}_{2(10)}$
Step 5. **Solve** the equation.	$\begin{aligned} 50-20 &= 2L+20-20 \\ 30 &= 2L \\ \frac{30}{2} &= \frac{2L}{2} \\ 15 &= L \end{aligned}$
Step 6. **Check**.	$\begin{aligned} P &\stackrel{?}{=} 50 \\ 15+10+15+10 &\stackrel{?}{=} 50 \\ 50 &= 50 \checkmark \end{aligned}$
Step 7. **Answer** the question.	The length is 15 inches.

? Exercise 13.4.4.7:

Find the length of a rectangle with a perimeter of 80 inches and width of 25 inches.

Answer

15 inches

? Exercise 13.4.4.8:

Find the length of a rectangle with a perimeter of 30 yards and width of 6 yards.

Answer

9 yd

In the next example, the width is defined in terms of the length. We'll wait to draw the figure until we write an expression for the width so that we can label one side with that expression.

✓ Example 13.4.4.5:

The width of a rectangle is two inches less than the length. The perimeter is 52 inches. Find the length and width.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	the length and width of the rectangle

Step 3. **Name**. Choose a variable to represent it. Now we can draw a figure using these expressions for the length and width.	Since the width is defined in terms of the length, we let L = length. The width is two feet less that the length, so we let L − 2 = width. Step 4. **Translate**. Write the appropriate formula. The formula for the perimeter of a rectangle relates all the information. Substitute in the given information.	$\underbrace{P}_{52} \underbrace{=}_{=} \underbrace{2L}_{2L} \underbrace{+}_{+} \underbrace{2W}_{2(L-2)}$
Step 5. **Solve** the equation.	$52 = 2L + 2L - 4$ (13.4.4.4)
Combine like terms.	$52 = 4L - 4$ (13.4.4.5)
Add 4 to each side.	$56 = 4L$ (13.4.4.6)
Divide by 4.	$\frac{56}{4} = \frac{4L}{4}$ $14 = L$ $14 = L$ The length is 14 inches.
Now we need to find the width. The width is L − 2.	$L - 2$ $14 - 2$ 12 The width is 12 inches.
Step 6. **Check**.	Since 14 + 12 + 14 + 12 = 52 , this works!
Step 7. **Answer** the question.	The length is 14 feet and the width is 12 feet.

? Exercise 13.4.4.9:

The width of a rectangle is seven meters less than the length. The perimeter is 58 meters. Find the length and width.

Answer

18 m, 11 m

? Exercise 13.4.4.10:

The length of a rectangle is eight feet more than the width. The perimeter is 60 feet. Find the length and width.

Answer

11 ft, 19 ft

Example 13.4.4.6:

The length of a rectangle is four centimeters more than twice the width. The perimeter is 32 centimeters. Find the length and width.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	the length and width
Step 3. **Name**. Choose a variable to represent it.	let W = width The length is four more than twice the width. 2w + 4 = length Step 4. **Translate**. Write the appropriate formula and substitute in the given information.	$\underbrace{P}_{32} \quad \underbrace{=}_{=} \quad \underbrace{2L}_{2(2w+4)} \quad \underbrace{+}_{+} \quad \underbrace{2W}_{2w}$
Step 5. **Solve** the equation.	$32 = 4w + 8 + 2w$ $32 = 6w + 8$ $24 = 6w$ $4 = w \quad width$ $2w + 4 \quad length$ $2(4) + 4$ $12 \quad The\ length\ is\ 12\ cm.$
Step 6. **Check**.	$p = 2L + 2W$ $32 \stackrel{?}{=} 2 \cdot 12 + 2 \cdot 4$ $32 = 32\ \checkmark$
Step 7. **Answer** the question.	The length is 12 cm and the width is 4 cm.

Exercise 13.4.4.11:

The length of a rectangle is eight more than twice the width. The perimeter is 64 feet. Find the length and width.

Answer

8 ft, 24 ft

Exercise 13.4.4.12:

The width of a rectangle is six less than twice the length. The perimeter is 18 centimeters. Find the length and width.

Answer

5 cm, 4 cm

Example 13.4.4.7:

The area of a rectangular room is 168 square feet. The length is 14 feet. What is the width?

Solution

Step 1. **Read** the problem.	Step 2. **Identify** what you are looking for.	the width of a rectangular room
Step 3. **Name**. Choose a variable to represent it.	Let W = width
Step 4. **Translate**. Write the appropriate formula and substitute in the given information.	$A = LW$ $168 = 14W$
Step 5. **Solve** the equation.	$\frac{168}{14} = \frac{14W}{14}$ $12 = W$
Step 6. **Check**.	$A = LW$ $168 \stackrel{?}{=} 14 \cdot 12$ $168 = 168$ ✓
Step 7. **Answer** the question.	The width of the room is 12 feet.

Exercise 13.4.4.13:

The area of a rectangle is 598 square feet. The length is 23 feet. What is the width?

Answer

26 ft

Exercise 13.4.4.14:

The width of a rectangle is 21 meters. The area is 609 square meters. What is the length?

Answer

29 m

Example 13.4.4.8:

The perimeter of a rectangular swimming pool is 150 feet. The length is 15 feet more than the width. Find the length and width.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
Step 2. **Identify** what you are looking for.	the length and width of the pool
Step 3. **Name**. Choose a variable to represent it. The length is 15 feet more than the width.	Let W = width W + 15 = length
Step 4. **Translate**. Write the appropriate formula and substitute.	$\underbrace{150}_{P} \quad \underbrace{=} \quad \underbrace{2(w+15)}_{2L} \quad \underbrace{+} \quad \underbrace{2w}_{2W}$
Step 5. **Solve** the equation.	$150 = 2w + 30 + 2w$ $150 = 4w + 30$ $120 = 4w$ $30 = w \quad the\ width\ of\ the\ pool$ $w + 15 \quad the\ length\ of\ the\ pool$ $30 + 15$ 45
Step 6. **Check**.	$p = 2L + 2W$ $150 \stackrel{?}{=} 2(45) + 2(30)$ $150 = 150$ ✓
Step 7. **Answer** the question.	The length of the pool is 45 feet and the width is 30 feet.

? Exercise 13.4.4.15:

The perimeter of a rectangular swimming pool is 200 feet. The length is 40 feet more than the width. Find the length and width.

Answer

30 ft, 70 ft

? Exercise 13.4.4.16:

The length of a rectangular garden is 30 yards more than the width. The perimeter is 300 yards. Find the length and width.

Answer

60 yd, 90 yd

13.4.5: Use Properties of Rectangles, Triangles, and Trapezoids (Part 2)

Use the Properties of Triangles

We now know how to find the area of a rectangle. We can use this fact to help us visualize the formula for the area of a triangle. In the rectangle in Figure 13.4.5.9 we've labeled the length b and the width h, so it's area is bh.

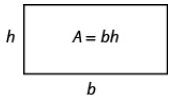

Figure 13.4.5.9- The area of a rectangle is the base, b, times the height, h.

We can divide this rectangle into two **congruent** triangles (Figure 13.4.5.10). Triangles that are congruent have identical side lengths and angles, and so their areas are equal. The area of each triangle is one-half the area of the rectangle, or $\frac{1}{2}$bh. This example helps us see why the formula for the area of a triangle is A = $\frac{1}{2}$bh.

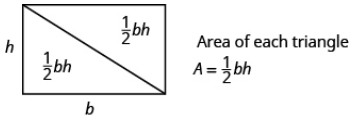

Figure 13.4.5.10- A rectangle can be divided into two triangles of equal area. The area of each triangle is one-half the area of the rectangle.

The formula for the area of a triangle is A = $\frac{1}{2}$bh, where b is the base and h is the height. To find the area of the triangle, you need to know its base and height. The base is the length of one side of the triangle, usually the side at the bottom. The height is the length of the line that connects the base to the opposite vertex, and makes a 90° angle with the base. Figure 13.4.5.11shows three triangles with the base and height of each marked.

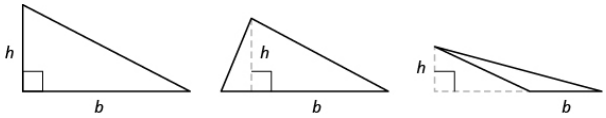

Figure 13.4.5.11- The height h of a triangle is the length of a line segment that connects the the base to the opposite vertex and makes a 90° angle with the base.

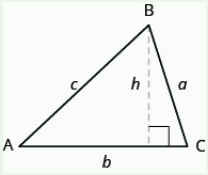
Definition: Triangle Properties

For any triangle ΔABC, the sum of the measures of the angles is 180°.

$$m\angle A + m\angle B + m\angle C = 180^\circ \$\$The perimeter of a triangle is the sum of the lengths of the sides. \$\$P = a + b + c\$ \quad (13.4.5.1)$$

$$\$The area of a triangle is one-half the base, b, times the height, h. \$\$A = \frac{1}{2}bh$$



Example 13.4.5.9:

Find the area of a triangle whose base is 11 inches and whose height is 8 inches.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
Step 2. **Identify** what you are looking for.	the area of the triangle
Step 3. **Name**. Choose a variable to represent it.	let A = area of the triangle
Step 4.**Translate**. Write the appropriate formula. Substitute.	$\underbrace{A}_{} = \underbrace{\frac{1}{2}}_{} \cdot \underbrace{b}_{} \cdot \underbrace{h}_{}$ $A = \frac{1}{2} \cdot 11 \cdot 8$
Step 5. **Solve** the equation.	A = 44 square inches
Step 6. **Check**.	$A = \frac{1}{2}bh$ $44 \stackrel{?}{=} \frac{1}{2}(11)8$ $44 = 44$ ✓
Step 7. **Answer** the question.	The area is 44 square inches.

Exercise 13.4.5.17:

Find the area of a triangle with base 13 inches and height 2 inches.

Answer

13 sq. in.

Exercise 13.4.5.18:

Find the area of a triangle with base 14 inches and height 7 inches.

Answer

49 sq. in.

Example 13.4.5.10:

The perimeter of a triangular garden is 24 feet. The lengths of two sides are 4 feet and 9 feet. How long is the third side?

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	 $P = 24$ ft
Step 2. **Identify** what you are looking for.	length of the third side of a triangle
Step 3. **Name**. Choose a variable to represent it.	Let c = the third side
Step 4.**Translate**. Write the appropriate formula. Substitute in the given information.	$\underbrace{P}_{} = \underbrace{a}_{} + \underbrace{b}_{} + \underbrace{c}_{}$ $24 = 4 + 9 + c$
Step 5. **Solve** the equation.	$24 = 13 + c$ $11 = c$
Step 6. **Check**.	$P = a + b + c$ $24 \stackrel{?}{=} 4 + 9 + 11$ $24 = 24$ ✓
Step 7. **Answer** the question.	The third side is 11 feet long.

Exercise 13.4.5.19:

The perimeter of a triangular garden is 48 feet. The lengths of two sides are 18 feet and 22 feet. How long is the third side?

Answer

8 ft

Exercise 13.4.5.20:

The lengths of two sides of a triangular window are 7 feet and 5 feet. The perimeter is 18 feet. How long is the third side?

Answer

6 ft

Example 13.4.5.11:

The area of a triangular church window is 90 square meters. The base of the window is 15 meters. What is the window's height?

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	height of a triangle
Step 3. **Name**. Choose a variable to represent it.	Let h = the height
Step 4.**Translate**. Write the appropriate formula. Substitute in the given information.	$\underbrace{A}\ \underbrace{=}\ \underbrace{\frac{1}{2}}\ \underbrace{\cdot}\ \underbrace{b}\ \underbrace{\cdot}\ \underbrace{h}$ $90 = \frac{1}{2} \cdot 15 \cdot h$
Step 5. **Solve** the equation.	$90 = \frac{15}{2}h$ $12 = h$
Step 6. **Check**.	$A = \frac{1}{2}bh$ $90 \stackrel{?}{=} \frac{1}{2} \cdot 15 \cdot 12$ $90 = 90$ ✓
Step 7. **Answer** the question.	The height of the triangle is 12 meters.

Exercise 13.4.5.21:

The area of a triangular painting is 126 square inches. The base is 18 inches. What is the height?

Answer

14 in.

Exercise 13.4.5.22:

A triangular tent door has an area of 15 square feet. The height is 5 feet. What is the base?

Answer

6 ft

Isosceles and Equilateral Triangles

Besides the right triangle, some other triangles have special names. A triangle with two sides of equal length is called an **isosceles triangle**. A triangle that has three sides of equal length is called an **equilateral triangle**. Figure 13.4.5.12shows both types of triangles.

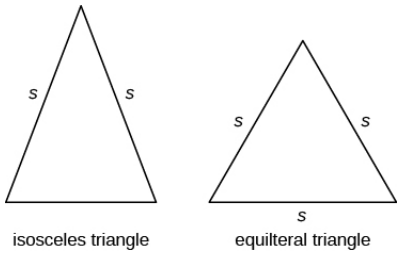

Figure 13.4.5.12- In an isosceles triangle, two sides have the same length, and the third side is the base. In an equilateral triangle, all three sides have the same length.

Definition: Isosceles and Equilateral Triangles

An isosceles triangle has two sides the same length.

An equilateral triangle has three sides of equal length.

Example 13.4.5.12:

The perimeter of an equilateral triangle is 93 inches. Find the length of each side.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	 Perimeter = 93 in.
Step 2. **Identify** what you are looking for.	length of the sides of an equilateral triangle
Step 3. **Name**. Choose a variable to represent it.	Let s = length of each side
Step 4.**Translate**. Write the appropriate formula. Substitute.	$\underbrace{P}_{93} \underbrace{=}_{=} \underbrace{a}_{s} \underbrace{+}_{+} \underbrace{b}_{s} \underbrace{+}_{+} \underbrace{c}_{s}$
Step 5. **Solve** the equation.	$93 = 3s$ $31 = s$
Step 6. **Check**.	 $93 = 31 + 31 + 31$ $93 = 93$ ✓

Step 7. **Answer** the question.	Each side is 31 inches.

Exercise 13.4.5.23:

Find the length of each side of an equilateral triangle with perimeter 39 inches.

Answer

13 in.

Exercise 13.4.5.24:

Find the length of each side of an equilateral triangle with perimeter 51 centimeters.

Answer

17 cm

Example 13.4.5.13:

Arianna has 156 inches of beading to use as trim around a scarf. The scarf will be an isosceles triangle with a base of 60 inches. How long can she make the two equal sides?

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	 P = 156 in.
Step 2. **Identify** what you are looking for.	the lengths of the two equal sides
Step 3. **Name**. Choose a variable to represent it.	Let s = the length of each side
Step 4.**Translate**. Write the appropriate formula. Substitute in the given information.	$\underbrace{P}_{156} \underbrace{=}_{=} \underbrace{a}_{s} \underbrace{+}_{+} \underbrace{b}_{60} \underbrace{+}_{+} \underbrace{c}_{s}$
Step 5. **Solve** the equation.	$156 = 2s + 60$ $96 = 2s$ $48 = s$
Step 6. **Check**.	$p = a + b + c$ $156 \stackrel{?}{=} 48 + 60 + 48$ $156 = 156$ ✓
Step 7. **Answer** the question.	Arianna can make each of the two equal sides 48 inches long.

Exercise 13.4.5.25:

A backyard deck is in the shape of an isosceles triangle with a base of 20 feet. The perimeter of the deck is 48 feet. How long is each of the equal sides of the deck?

Answer

14 ft

Exercise 13.4.5.26:

A boat's sail is an isosceles triangle with base of 8 meters. The perimeter is 22 meters. How long is each of the equal sides of the sail?

Answer

7 m

Use the Properties of Trapezoids

A **trapezoid** is four-sided figure, a *quadrilateral*, with two sides that are parallel and two sides that are not. The parallel sides are called the bases. We call the length of the smaller base b, and the length of the bigger base B. The height, h, of a trapezoid is the distance between the two bases as shown in Figure 13.4.5.13

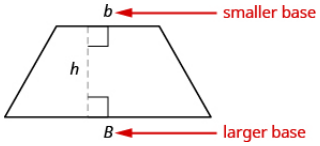

Figure 13.4.5.13- A trapezoid has a larger base, B, and a smaller base, b. The height h is the distance between the bases.

The formula for the area of a trapezoid is:

$$Area_{trapezoid} = \frac{1}{2}h(b+B) \tag{13.4.5.2}$$

Splitting the trapezoid into two triangles may help us understand the formula. The area of the trapezoid is the sum of the areas of the two triangles. See Figure 13.4.5.14

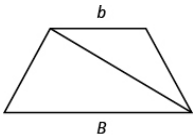

Figure 13.4.5.14- Splitting a trapezoid into two triangles may help you understand the formula for its area.

The height of the trapezoid is also the height of each of the two triangles. See Figure 13.4.5.15

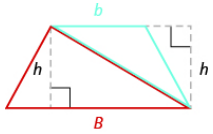

Figure 13.4.5.15

The formula for the area of a trapezoid is

$$Area_{trapezoid} = \frac{1}{2}h(b+B) \tag{13.4.5.3}$$

If we distribute, we get,

$$\text{Area}_{trapezoid} = \frac{1}{2}bh + \frac{1}{2}Bh$$

$$\text{Area}_{trapezoid} = A_{blue\triangle} + A_{red\triangle}$$

Definition: Properties of Trapezoids

- A trapezoid has four sides. See Figure 9.25.
- Two of its sides are parallel and two sides are not.
- The area, A, of a trapezoid is A = $\frac{1}{2}$h(b + B).

Example 13.4.5.14:

Find the area of a trapezoid whose height is 6 inches and whose bases are 14 and 11 inches.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the area of the trapezoid
Step 3. **Name**. Choose a variable to represent it.	Let A = the area
Step 4.**Translate**. Write the appropriate formula. Substitute.	$A = \frac{1}{2} \cdot h \cdot (b+B)$ $A = \frac{1}{2} \cdot 6 \cdot (11+14)$
Step 5. **Solve** the equation.	$A = \frac{1}{2} \cdot 6(25)$ $A = 3(25)$ $A = 75\ square\ inches$
Step 6. **Check**: Is this answer reasonable?	

If we draw a rectangle around the trapezoid that has the same big base B and a height h, its area should be greater than that of the trapezoid.

If we draw a rectangle inside the trapezoid that has the same little base b and a height h, its area should be smaller than that of the trapezoid.

$A_{rectangle} = bh$	$A_{trapezoid} = \frac{1}{2}h(b+B)$	$A_{rectangle} = bh$
$A_{rectangle} = 14 \cdot 6$	$A_{trapezoid} = \frac{1}{2} \cdot 6(11+14)$	$A_{rectangle} = 11 \cdot 6$
$A_{rectangle} = 84$ sq. in.	$A_{trapezoid} = 75$ sq. in.	$A_{rectangle} = 66$ sq. in.

The area of the larger rectangle is 84 square inches and the area of the smaller rectangle is 66 square inches. So it makes sense that the area of the trapezoid is between 84 and 66 square inches

Step 7. **Answer** the question.	The area of the trapezoid is 75 square inches.

? Exercise 13.4.5.27:

The height of a trapezoid is 14 yards and the bases are 7 and 16 yards. What is the area?

Answer

161 sq. yd

? Exercise 13.4.5.28:

The height of a trapezoid is 18 centimeters and the bases are 17 and 8 centimeters. What is the area?

Answer

255 sq. cm

✓ Example 13.4.5.15:

Find the area of a trapezoid whose height is 5 feet and whose bases are 10.3 and 13.7 feet.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the area of the trapezoid
Step 3. **Name**. Choose a variable to represent it.	Let A = the area
Step 4.**Translate**. Write the appropriate formula. Substitute.	$\underbrace{A}_{A} \quad \underbrace{=}_{=} \quad \underbrace{\frac{1}{2}}_{\frac{1}{2}} \quad \underbrace{\cdot}_{\cdot} \quad \underbrace{h}_{5} \quad \underbrace{\cdot}_{\cdot} \quad \underbrace{(b+B)}_{(10.3+13.7)}$
Step 5. **Solve** the equation.	$A = \frac{1}{2} \cdot 5(24)$ $A = 12 \cdot 5$ $A = 60 \; square \; feet$
Step 6. **Check**: Is this answer reasonable? The area of the trapezoid should be less than the area of a rectangle with base 13.7 and height 5, but more than the area of a rectangle with base 10.3 and height 5.	Step 7. **Answer** the question.	The area of the trapezoid is 60 square feet.

? Exercise 13.4.5.29:

The height of a trapezoid is 7 centimeters and the bases are 4.6 and 7.4 centimeters. What is the area?

Answer

42 sq. cm

? Exercise 13.4.5.30:

The height of a trapezoid is 9 meters and the bases are 6.2 and 7.8 meters. What is the area?

Answer

63 sq. m

✓ Example 13.4.5.16:

Vinny has a garden that is shaped like a trapezoid. The trapezoid has a height of 3.4 yards and the bases are 8.2 and 5.6 yards. How many square yards will be available to plant?

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the area of the trapezoid
Step 3. **Name**. Choose a variable to represent it.	Let A = the area

Step 4.**Translate**. Write the appropriate formula. Substitute.	$\underbrace{A}_{A} \underbrace{=}_{=} \underbrace{\frac{1}{2}}_{\frac{1}{2}} \underbrace{\cdot}_{\cdot} \underbrace{h}_{3.4} \underbrace{\cdot}_{\cdot} \underbrace{(b+B)}_{(5.6+8.2)}$ $A = \frac{1}{2} \cdot 3.4 \cdot (5.6+8.2)$
Step 5. **Solve** the equation.	$A = \frac{1}{2} \cdot (3.4)(13.8)$ $A = 23.46 \; square \; yards$

Step 6. **Check**: Is this answer reasonable? Yes. The area of the trapezoid is less than the area of a rectangle with a base of 8.2 yd and height 3.4 yd, but more than the area of a rectangle with base 5.6 yd and height 3.4 yd.

$A_{rectangle} = Bh$ $= (8.2)(3.4)$ $= 27.88 \text{ yd}^2$	$A_{trapezoid} = \frac{1}{2}(3.4 \text{ yd})(5.6 = 8.2)$ $= 23.46 \text{ yd}^2$	$A_{rectangle} = bh$ $= (5.6)(3.4)$ $= 19.04 \text{ yd}^2$
$A_{rectangle} > A_{trapezoid} > A_{rectangle}$ 27.88 23.46 19.04		

Step 7. **Answer** the question.	Vinny has 23.46 square yards in which he can plant.

? Exercise 13.4.5.31:

Lin wants to sod his lawn, which is shaped like a trapezoid. The bases are 10.8 yards and 6.7 yards, and the height is 4.6 yards. How many square yards of sod does he need?

Answer

40.25 sq. yd

? Exercise 13.4.5.32:

Kira wants cover his patio with concrete pavers. If the patio is shaped like a trapezoid whose bases are 18 feet and 14 feet and whose height is 15 feet, how many square feet of pavers will he need?

Answer

240 sq. ft

Practice Makes Perfect

Understand Linear, Square, and Cubic Measure

In the following exercises, determine whether you would measure each item using linear, square, or cubic units.

129. amount of water in a fish tank
130. length of dental floss
131. living area of an apartment
132. floor space of a bathroom tile
133. height of a doorway
134. capacity of a truck trailer

In the following exercises, find the (a) perimeter and (b) area of each figure. Assume each side of the square is 1 cm.

135.

136.

137.

138.

139.

140.

Use the Properties of Rectangles

In the following exercises, find the (a) perimeter and (b) area of each rectangle.

141. The length of a rectangle is 85 feet and the width is 45 feet.
142. The length of a rectangle is 26 inches and the width is 58 inches.
143. A rectangular room is 15 feet wide by 14 feet long.
144. A driveway is in the shape of a rectangle 20 feet wide by 35 feet long.

In the following exercises, solve.

145. Find the length of a rectangle with perimeter 124 inches and width 38 inches.
146. Find the length of a rectangle with perimeter 20.2 yards and width of 7.8 yards.
147. Find the width of a rectangle with perimeter 92 meters and length 19 meters.
148. Find the width of a rectangle with perimeter 16.2 meters and length 3.2 meters.
149. The area of a rectangle is 414 square meters. The length is 18 meters. What is the width?
150. The area of a rectangle is 782 square centimeters. The width is 17 centimeters. What is the length?
151. The length of a rectangle is 9 inches more than the width. The perimeter is 46 inches. Find the length and the width.
152. The width of a rectangle is 8 inches more than the length. The perimeter is 52 inches. Find the length and the width.
153. The perimeter of a rectangle is 58 meters. The width of the rectangle is 5 meters less than the length. Find the length and the width of the rectangle.
154. The perimeter of a rectangle is 62 feet. The width is 7 feet less than the length. Find the length and the width.
155. The width of the rectangle is 0.7 meters less than the length. The perimeter of a rectangle is 52.6 meters. Find the dimensions of the rectangle.
156. The length of the rectangle is 1.1 meters less than the width. The perimeter of a rectangle is 49.4 meters. Find the dimensions of the rectangle.
157. The perimeter of a rectangle of 150 feet. The length of the rectangle is twice the width. Find the length and width of the rectangle.
158. The length of a rectangle is three times the width. The perimeter is 72 feet. Find the length and width of the rectangle.
159. The length of a rectangle is 3 meters less than twice the width. The perimeter is 36 meters. Find the length and width.
160. The length of a rectangle is 5 inches more than twice the width. The perimeter is 34 inches. Find the length and width.
161. The width of a rectangular window is 24 inches. The area is 624 square inches. What is the length?
162. The length of a rectangular poster is 28 inches. The area is 1316 square inches. What is the width?
163. The area of a rectangular roof is 2310 square meters. The length is 42 meters. What is the width?
164. The area of a rectangular tarp is 132 square feet. The width is 12 feet. What is the length?
165. The perimeter of a rectangular courtyard is 160 feet. The length is 10 feet more than the width. Find the length and the width.

166. The perimeter of a rectangular painting is 306 centimeters. The length is 17 centimeters more than the width. Find the length and the width.
167. The width of a rectangular window is 40 inches less than the height. The perimeter of the doorway is 224 inches. Find the length and the width.
168. The width of a rectangular playground is 7 meters less than the length. The perimeter of the playground is 46 meters. Find the length and the width.

Use the Properties of Triangles

In the following exercises, solve using the properties of triangles.

169. Find the area of a triangle with base 12 inches and height 5 inches.
170. Find the area of a triangle with base 45 centimeters and height 30 centimeters.
171. Find the area of a triangle with base 8.3 meters and height 6.1 meters.
172. Find the area of a triangle with base 24.2 feet and height 20.5 feet.
173. A triangular flag has base of 1 foot and height of 1.5 feet. What is its area?
174. A triangular window has base of 8 feet and height of 6 feet. What is its area?
175. If a triangle has sides of 6 feet and 9 feet and the perimeter is 23 feet, how long is the third side?
176. If a triangle has sides of 14 centimeters and 18 centimeters and the perimeter is 49 centimeters, how long is the third side?
177. What is the base of a triangle with an area of 207 square inches and height of 18 inches?
178. What is the height of a triangle with an area of 893 square inches and base of 38 inches?
179. The perimeter of a triangular reflecting pool is 36 yards. The lengths of two sides are 10 yards and 15 yards. How long is the third side?
180. A triangular courtyard has perimeter of 120 meters. The lengths of two sides are 30 meters and 50 meters. How long is the third side?
181. An isosceles triangle has a base of 20 centimeters. If the perimeter is 76 centimeters, find the length of each of the other sides.
182. An isosceles triangle has a base of 25 inches. If the perimeter is 95 inches, find the length of each of the other sides.
183. Find the length of each side of an equilateral triangle with a perimeter of 51 yards.
184. Find the length of each side of an equilateral triangle with a perimeter of 54 meters.
185. The perimeter of an equilateral triangle is 18 meters. Find the length of each side.
186. The perimeter of an equilateral triangle is 42 miles. Find the length of each side.
187. The perimeter of an isosceles triangle is 42 feet. The length of the shortest side is 12 feet. Find the length of the other two sides.
188. The perimeter of an isosceles triangle is 83 inches. The length of the shortest side is 24 inches. Find the length of the other two sides.
189. A dish is in the shape of an equilateral triangle. Each side is 8 inches long. Find the perimeter.
190. A floor tile is in the shape of an equilateral triangle. Each side is 1.5 feet long. Find the perimeter.
191. A road sign in the shape of an isosceles triangle has a base of 36 inches. If the perimeter is 91 inches, find the length of each of the other sides.
192. A scarf in the shape of an isosceles triangle has a base of 0.75 meters. If the perimeter is 2 meters, find the length of each of the other sides.
193. The perimeter of a triangle is 39 feet. One side of the triangle is 1 foot longer than the second side. The third side is 2 feet longer than the second side. Find the length of each side.
194. The perimeter of a triangle is 35 feet. One side of the triangle is 5 feet longer than the second side. The third side is 3 feet longer than the second side. Find the length of each side.
195. One side of a triangle is twice the smallest side. The third side is 5 feet more than the shortest side. The perimeter is 17 feet. Find the lengths of all three sides.
196. One side of a triangle is three times the smallest side. The third side is 3 feet more than the shortest side. The perimeter is 13 feet. Find the lengths of all three sides.

Use the Properties of Trapezoids

In the following exercises, solve using the properties of trapezoids.

197. The height of a trapezoid is 12 feet and the bases are 9 and 15 feet. What is the area?
198. The height of a trapezoid is 24 yards and the bases are 18 and 30 yards. What is the area?
199. Find the area of a trapezoid with a height of 51 meters and bases of 43 and 67 meters.
200. Find the area of a trapezoid with a height of 62 inches and bases of 58 and 75 inches.
201. The height of a trapezoid is 15 centimeters and the bases are 12.5 and 18.3 centimeters. What is the area?
202. The height of a trapezoid is 48 feet and the bases are 38.6 and 60.2 feet. What is the area?
203. Find the area of a trapezoid with a height of 4.2 meters and bases of 8.1 and 5.5 meters.
204. Find the area of a trapezoid with a height of 32.5 centimeters and bases of 54.6 and 41.4 centimeters.
205. Laurel is making a banner shaped like a trapezoid. The height of the banner is 3 feet and the bases are 4 and 5 feet. What is the area of the banner?
206. Niko wants to tile the floor of his bathroom. The floor is shaped like a trapezoid with width 5 feet and lengths 5 feet and 8 feet. What is the area of the floor?
207. Theresa needs a new top for her kitchen counter. The counter is shaped like a trapezoid with width 18.5 inches and lengths 62 and 50 inches. What is the area of the counter?
208. Elena is knitting a scarf. The scarf will be shaped like a trapezoid with width 8 inches and lengths 48.2 inches and 56.2 inches. What is the area of the scarf?

Everyday Math

209. **Fence** Jose just removed the children's playset from his back yard to make room for a rectangular garden. He wants to put a fence around the garden to keep out the dog. He has a 50 foot roll of fence in his garage that he plans to use. To fit in the backyard, the width of the garden must be 10 feet. How long can he make the other side if he wants to use the entire roll of fence?
210. **Gardening** Lupita wants to fence in her tomato garden. The garden is rectangular and the length is twice the width. It will take 48 feet of fencing to enclose the garden. Find the length and width of her garden.
211. **Fence** Christa wants to put a fence around her triangular flowerbed. The sides of the flowerbed are 6 feet, 8 feet, and 10 feet. The fence costs $10 per foot. How much will it cost for Christa to fence in her flowerbed?
212. **Painting** Caleb wants to paint one wall of his attic. The wall is shaped like a trapezoid with height 8 feet and bases 20 feet and 12 feet. The cost of the painting one square foot of wall is about $0.05. About how much will it cost for Caleb to paint the attic wall?

Writing Exercises

213. If you need to put tile on your kitchen floor, do you need to know the perimeter or the area of the kitchen? Explain your reasoning.
214. If you need to put a fence around your backyard, do you need to know the perimeter or the area of the backyard? Explain your reasoning.
215. Look at the two figures. (a) Which figure looks like it has the larger area? Which looks like it has the larger perimeter? (b) Now calculate the area and perimeter of each figure. Which has the larger area? Which has the larger perimeter?

216. The length of a rectangle is 5 feet more than the width. The area is 50 square feet. Find the length and the width. (a) Write the equation you would use to solve the problem. (b) Why can't you solve this equation with the methods you learned in the previous chapter?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
understand linear, square, and cubic measure.			
use the properties of rectangles.			
use the properties of triangles.			
use the properties of trapezoids.			

(b) On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.5.1: Prelude to Foundations of Algebra

Just like a building needs a firm foundation to support it, your study of algebra needs to have a firm foundation. To ensure this, we begin this book with a review of arithmetic operations with whole numbers, integers, fractions, and decimals, so that you have a solid base that will support your study of algebra.

Figure 13.5.1.1: In order to be structurally sound, the foundation of a building must be carefully constructed.

13.5.2: Introduction to Whole Numbers

Learning Objectives

- By the end of this section, you will be able to:
- Use place value with whole numbers
- Identify multiples and and apply divisibility tests
- Find prime factorizations and least common multiples

As we begin our study of elementary algebra, we need to refresh some of our skills and vocabulary. This chapter will focus on whole numbers, integers, fractions, decimals, and real numbers. We will also begin our use of algebraic notation and vocabulary.

Use Place Value with Whole Numbers

The most basic numbers used in algebra are the numbers we use to count objects in our world: $1, 2, 3, 4$, and so on. These are called the **counting numbers**. Counting numbers are also called *natural numbers*. If we add zero to the counting numbers, we get the set of **whole numbers**.

- Counting Numbers: $1, 2, 3, \ldots$
- Whole Numbers: $0, 1, 2, 3, \ldots$

The notation "$\ldots$" is called ellipsis and means "and so on," or that the pattern continues endlessly.

We can visualize counting numbers and whole numbers on a **number line** (see Figure $13.5.2.1$).

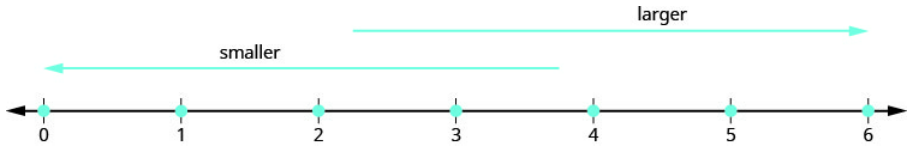

Figure 13.5.2.1: The numbers on the number line get larger as they go from left to right, and smaller as they go from right to left. While this number line shows only the whole numbers 0 through 6, the numbers keep going without end.

Doing the Manipulative Mathematics activity "Number Line-Part 1" will help you develop a better understanding of the counting numbers and the whole numbers.

Our **number system** is called a place value system, because the value of a digit depends on its position in a number. Figure $13.5.2.2$ shows the **place values**. The place values are separated into groups of three, which are called periods. The periods are *ones*, *thousands*, *millions*, *billions*, *trillions*, and so on. In a written number, commas separate the periods.

Place Value														
Trillions			Billions			Millions			Thousands			Ones		
Hundred trillions	Ten trillions	Trillions	Hundred billions	Ten billions	Billions	Hundred millions	Ten millions	Millions	Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones
								5	2	7	8	1	9	4

Figure 13.5.2.2: The number 5278194 is shown in the chart. The digit 5 is in the millions place. The digit 2 is in the hundred-thousands place. The digit 7 is in the ten-thousands place. The digit 8 is in the thousands place. The digit 1 is in the hundreds place. The digit 9 is in the tens place. The digit 4 is in the ones place.

Exercise 13.5.2.1

In the number 63407218, find the place value of each digit:

1. 7

2. 0
3. 1
4. 6
5. 3

Answer

Place the number in the place value chart:

Trillions			Billions			Millions			Thousands			Ones		
Hundred trillions	Ten trillions	Trillions	Hundred billions	Ten billions	Billions	Hundred millions	Ten millions	Millions	Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones
							6	3	4	0	7	2	1	8

1. The 7 is in the thousands place.
2. The 0 is in the ten thousands place.
3. The 1 is in the tens place.
4. The 6 is in the ten-millions place.
5. The 3 is in the millions place.

Exercise 13.5.2.2

For the number 27493615 find the place value of each digit:

1. 2
2. 1
3. 4
4. 7
5. 5

Answer

1. ten millions
2. tens
3. hundred thousands
4. millions
5. ones

Exercise 13.5.2.3

For the number 519711641328 find the place value of each digit:

1. 9
2. 4
3. 2
4. 6
5. 7

Answer

1. billions
2. ten thousands

3. tens
4. hundred thousands
5. hundred millions

When you write a check, you write out the number in words as well as in digits. To write a number in words, write the number in each period, followed by the name of the period, without the *s* at the end. Start at the left, where the periods have the largest value. The ones period is not named. The commas separate the periods, so wherever there is a comma in the number, put a comma between the words (see Figure 13.5.2.3). The number 74218369is written as seventy-four million, two hundred eighteen thousand, three hundred sixty-nine.

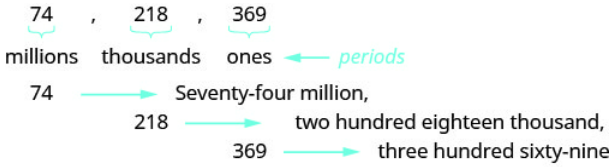

Figure 13.5.2.3

NAME A WHOLE NUMBER IN WORDS.

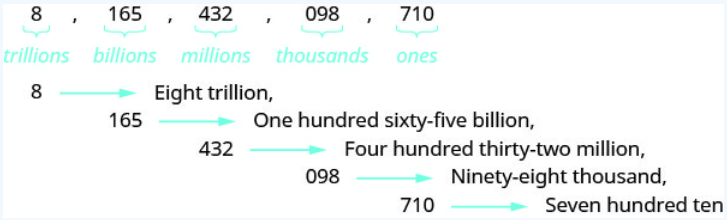
1. Start at the left and name the number in each period, followed by the period name.
2. Put commas in the number to separate the periods.
3. Do not name the ones period.

Exercise 13.5.2.4

Name the number 8165432098710using words.

Answer

Name the number in each period, followed by the period name.



Put the commas in to separate the periods.

So, 8165432098710is named as eight trillion, one hundred sixty-five billion, four hundred thirty-two million, ninety-eight thousand, seven hundred ten.

Exercise 13.5.2.5

Name the number 9,258,137,904,0619,258,137,904,061 using words.

Answer

nine trillion, two hundred fifty-eight billion, one hundred thirty-seven million, nine hundred four thousand, sixty-one

Exercise 13.5.2.6

Name the number 17,864,325,619,00417,864,325,619,004 using words.

Answer

seventeen trillion, eight hundred sixty-four billion, three hundred twenty-five million, six hundred nineteen thousand four

We are now going to reverse the process by writing the digits from the name of the number. To write the number in digits, we first look for the clue words that indicate the periods. It is helpful to draw three blanks for the needed periods and then fill in the blanks with the numbers, separating the periods with commas.

WRITE A WHOLE NUMBER USING DIGITS.

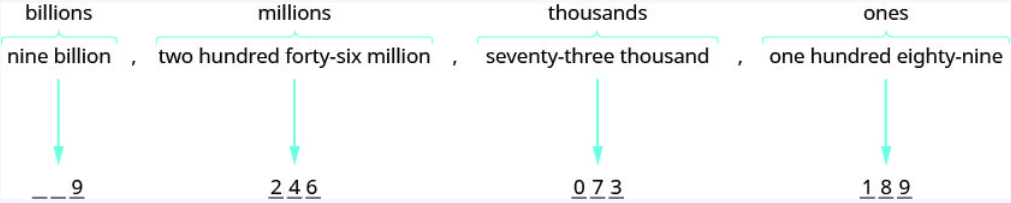
1. Identify the words that indicate periods. (Remember, the ones period is never named.)
2. Draw three blanks to indicate the number of places needed in each period. Separate the periods by commas.
3. Name the number in each period and place the digits in the correct place value position.

Exercise 13.5.2.7

Write *nine billion, two hundred forty-six million, seventy-three thousand, one hundred eighty-nine* as a whole number using digits.

Answer

Identify the words that indicate periods.
Except for the first period, all other periods must have three places. Draw three blanks to indicate the number of places needed in each period. Separate the periods by commas.
Then write the digits in each period.



The number is 9,246,073,189.

Exercise 13.5.2.8

Write the number two billion, four hundred sixty-six million, seven hundred fourteen thousand, fifty-one as a whole number using digits.

Answer

2,466,714,051

Exercise 13.5.2.9

Write the number eleven billion, nine hundred twenty-one million, eight hundred thirty thousand, one hundred six as a whole number using digits.

Answer

11,921,830,106

In 2013, the U.S. Census Bureau estimated the population of the state of New York as 19,651,127. We could say the population of New York was approximately 20 million. In many cases, you don't need the exact value; an approximate number is good enough.

The process of approximating a number is called **rounding**. Numbers are rounded to a specific place value, depending on how much accuracy is needed. Saying that the population of New York is approximately 20 million means that we rounded to the

millions place.

Exercise 13.5.2.10 How to Round Whole Numbers

Round 23,658 to the nearest hundred.

Answer

Step 1. Locate the given place value with an arrow. All digits to the left do not change.	Locate the hundreds place in 23,658.	hundredths place ↓ 23,658
Step 2. Underline the digit to the right of the given place value.	Underline the 5, which is to the right of the hundreds place.	hundredths place ↓ 23,658
Step 3. Is this digit greater than or equal to 5? Yes–add 1 to the digit in the given place value. No–do not change the digit in the given place value.	Add 1 to the 6 in the hundreds place, since 5 is greater than or equal to 5.	23,658 add 1 ↗
Step 4. Replace all digits to the right of the given place value with zeros.	Replace all digits to the right of the hundreds place with zeros.	23,700 add 1 ↗ replace with 0s ↖ So, 23,700 is rounded to the nearest hundred.

Exercise 13.5.2.11

Round to the nearest hundred: 17,852.

Answer

17,900

Exercise 13.5.2.12

Round to the nearest hundred: 468,751.

Answer

468,800

ROUND WHOLE NUMBERS.

1. Locate the given place value and mark it with an arrow. All digits to the left of the arrow do not change.
2. Underline the digit to the right of the given place value.
3. Is this digit greater than or equal to 5?
   - Yes–add 11 to the digit in the given place value.
   - No–do not change the digit in the given place value.
4. Replace all digits to the right of the given place value with zeros.

Exercise 13.5.2.13

Round 103,978103,978 to the nearest:

1. hundred
2. thousand
3. ten thousand

Answer

1.

Locate the hundreds place in 103,978.	hundreds place ↓ 103,978
Underline the digit to the right of the hundreds place.	hundreds place ↓ 103,978
Since 7 is greater than or equal to 5, add 1 to the 9. Replace all digits to the right of the hundreds place with zeros.	hundreds place ↓ 103,978 add 1 9 + 1 = 10 replace 9 with 0 and carry the 1 replace with 0s 104,000
	So, 104,000 is 103,978 rounded to the nearest hundred.

2.

Locate the thousands place and underline the digit to the right of the thousands place.	thousands place ↓ 103,978
Since 9 is greater than or equal to 5, add 1 to the 3. Replace all digits to the right of the hundreds place with zeros.	thousands place ↓ 103,978 add 1 3 + 1 = 4 replace 3 with 4 replace with 0s 104,000
	So, 104,000 is 103,978 rounded to the nearest thousand.

3.

Locate the ten thousands place and underline the digit to the right of the ten thousands place.	ten thousands place ↓ 103,978
Since 3 is less than 5, we leave the 0 as is, and then replace the digits to the right with zeros.	100,000
	So, 100,000 is 103,978 rounded to the nearest ten thousand.

Exercise 13.5.2.14

Round 206,981 to the nearest: 1. hundred 2. thousand 3. ten thousand.

Answer

1. 207,000
2. 207,000

3. 210,000

Exercise 13.5.2.15

Round 784,951 to the nearest: 1. hundred 2. thousand 3. ten thousand.

Answer

1. 785,000
2. 785,000
3. 780,000

Identify Multiples and Apply Divisibility Tests

The numbers 2, 4, 6, 8, 10, and 12 are called **multiples** of 2. A multiple of 2 can be written as the **product** of a counting number and 2.

Figure 13.5.2.4

Similarly, a multiple of 3 would be the product of a counting number and 3.

Figure 13.5.2.5

We could find the multiples of any number by continuing this process.

Note

Doing the Manipulative Mathematics activity “Multiples” will help you develop a better understanding of multiples.

Table 13.5.2.1shows the multiples of 2 through 9 for the first 12 counting numbers.

Table 13.5.2.1

Counting Number	1	2	3	4	5	6	7	8	9	10	11	12
Multiples of 2	2	4	6	8	10	12	14	16	18	20	22	24
Multiples of 3	3	6	9	12	15	18	21	24	27	30	33	36
Multiples of 4	4	8	12	16	20	24	28	32	36	40	44	48
Multiples of 5	5	10	15	20	25	30	35	40	45	50	55	60
Multiples of 6	6	12	18	24	30	36	42	48	54	60	66	72
Multiples of 7	7	14	21	28	35	42	49	56	63	70	77	84
Multiples of 8	8	16	24	32	40	48	56	64	72	80	88	96

Counting Number	1	2	3	4	5	6	7	8	9	10	11	12
Multiples of 9	9	18	27	36	45	54	63	72	81	90	99	108
Multiples of 10	10	20	30	40	50	60	70	80	90	100	110	120

MULTIPLE OF A NUMBER

A number is a **multiple** of n if it is the product of a counting number and n.

Another way to say that 15 is a multiple of 3 is to say that 15 is **divisible** by 3. That means that when we divide 3 into 15, we get a counting number. In fact, $15 \div 3$ is 5, so 15 is $5 \cdot 3$.

DIVISIBLE BY A NUMBER

If a number m is a multiple of n, then m is **divisible** by n

Look at the multiples of 5 in Table 13.5.2.1. They all end in 5 or 0. Numbers with last digit of 5 or 0 are divisible by 5. Looking for other patterns in Table 13.5.2.1that shows multiples of the numbers 2 through 9, we can discover the following divisibility tests:

DIVISIBILITY TESTS

A number is divisible by:

- 2 if the last digit is 0, 2, 4, 6, or 8.
- 3 if the sum of the digits is divisible by 3.
- 5 if the last digit is 5 or 0.
- 6 if it is divisible by both 2 and 3.
- 10 if it ends with 0.

Exercise 13.5.2.16

Is 5625 divisible by 2? By 3? By 5? By 6? By 10?

Answer

Is 5625 divisible by 2?
Does it end in 0, 2, 4, 6, or 8? No. 5625 is not divisible by 2. (13.5.2.1)

Is 5625 divisible by 3?
What is the sum of the digits? $5+6+2+5=18$
Is the sum divisible by 3? Yes, 5625 is divisible by 3. (13.5.2.2)

Is 5625 divisible by 5 or 10?
What is the last digit? It is 5. 5625 is divisible by 5 but not by 10. (13.5.2.3)

Is 5625 divisible by 6?
Is it divisible by both 2 and 3? No, 5625 is not divisible by 2, so 5625 is not divisible by 6. (13.5.2.4)

Exercise 13.5.2.17

Determine whether 4,962 is divisible by 2, by 3, by 5, by 6, and by 10.

Answer

by 2, 3, and 6

Exercise 13.5.2.18

Determine whether 3,765 is divisible by 2, by 3, by 5, by 6, and by 10.

Answer

by 3 and 5

Find Prime Factorizations and Least Common Multiples

In mathematics, there are often several ways to talk about the same ideas. So far, we've seen that if m is a multiple of n, we can say that m is divisible by n. For example, since 72 is a multiple of 8, we say 72 is divisible by 8. Since 72 is a multiple of 9, we say 72 is divisible by 9. We can express this still another way.

Since $8 \cdot 9 = 72$, we say that 8 and 9 are **factors** of 72. When we write $72 = 8 \cdot 9$, we say we have factored 72.

$$\underbrace{8 \cdot 9}_{\text{factors}} = \underbrace{72}_{\text{product}}$$

Figure 13.5.2.6

Other ways to factor 72 are $1 \cdot 72$, $2 \cdot 36$, $3 \cdot 24$, $4 \cdot 18$ and $6 \cdot 12$. Seventy-two has many factors: 1, 2, 3, 4, 6, 8, 9, 12, 18, 36, and 72.

FACTORS

If $a \cdot b = m$, then a and b are **factors** of m.

Some numbers, like 72, have many factors. Other numbers have only two factors.

Note

Doing the Manipulative Mathematics activity "Model Multiplication and Factoring" will help you develop a better understanding of multiplication and factoring.

PRIME NUMBER AND COMPOSITE NUMBER

A **prime number** is a counting number greater than 1, whose only factors are 1 and itself.

A **composite number** is a counting number that is not prime. A composite number has factors other than 1 and itself.

Note

Doing the Manipulative Mathematics activity "Prime Numbers" will help you develop a better understanding of prime numbers.

The counting numbers from 2 to 19 are listed in Figure 13.5.2.7, with their factors. Make sure to agree with the "prime" or "composite" label for each!

Number	Factors	Prime or Composite?
2	1,2	Prime
3	1,3	Prime
4	1,2,4	Composite
5	1,5	Prime
6	1,2,3,6	Composite
7	1,7	Prime
8	1,2,4,8	Composite
9	1,3,9	Composite
10	1,2,5,10	Composite

Number	Factors	Prime or Composite?
11	1,11	Prime
12	1,2,3,4,6,12	Composite
13	1,13	Prime
14	1,2,7,14	Composite
15	1,3,5,15	Composite
16	1,2,4,8,16	Composite
17	1,17	Prime
18	1,2,3,6,9,18	Composite
19	1,19	Prime

Figure 13.5.2.7

The **prime numbers** less than 20 are 2, 3, 5, 7, 11, 13, 17, and 19. Notice that the only even prime number is 2.

A composite number can be written as a unique **product** of primes. This is called the **prime factorization** of the number. Finding the prime factorization of a composite number will be useful later in this course.

PRIME FACTORIZATION

The **prime factorization** of a number is the product of prime numbers that equals the number.

To find the prime factorization of a composite number, find any two factors of the number and use them to create two branches. If a factor is prime, that branch is complete. Circle that prime!

If the factor is not prime, find two factors of the number and continue the process. Once all the branches have circled primes at the end, the factorization is complete. The composite number can now be written as a product of prime numbers.

Exercise 13.5.2.19

Factor 48.

Answer

Step 1. Find two factors whose product is the given number. Use these numbers to create two branches.	$48 = 2 \cdot 24$	
Step 2. If a factor is prime, that branch is complete. Circle the prime.	2 is prime. Circle the prime.	
Step 3. If a factor is not prime, write it as the product of two factors and continue the process.	24 is not prime. Break it into 2 more factors. 4 and 6 are not prime. Break them each into two factors. 2 and 3 are prime, so circle them.	Step 4. Write the composite number as the product of all the circled primes.		$48 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$

We say $2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$ is the prime factorization of 48. We generally write the primes in ascending order. Be sure to multiply the factors to verify your answer!

If we first factored 48 in a different way, for example as $6 \cdot 8$, the result would still be the same. Finish the prime factorization and verify this for yourself.

? Exercise 13.5.2.20

Find the prime factorization of 80.

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 5$

? Exercise 13.5.2.21

Find the prime factorization of 60.

Answer

$2 \cdot 2 \cdot 3 \cdot 5$

FIND THE PRIME FACTORIZATION OF A COMPOSITE NUMBER.

1. Find two factors whose product is the given number, and use these numbers to create two branches.
2. If a factor is prime, that branch is complete. Circle the prime, like a bud on the tree.
3. If a factor is not prime, write it as the product of two factors and continue the process.
4. Write the composite number as the product of all the circled primes.

? Exercise 13.5.2.22

Find the prime factorization of 252.

Answer

Step 1. Find two factors whose product is 252. 12 and 21 are not prime. Break 12 and 21 into two more factors. Continue until all primes are factored.	Step 2. Write 252 as the product of all the circled primes.	$252 = 2 \cdot 2 \cdot 3 \cdot 3 \cdot 7$

? Exercise 13.5.2.23

Find the prime factorization of 126.

Answer

$2 \cdot 3 \cdot 3 \cdot 7$

? Exercise 13.5.2.24

Find the prime factorization of 294.

Answer

$2 \cdot 3 \cdot 7 \cdot 7$

One of the reasons we look at multiples and primes is to use these techniques to find the **least common multiple** of two numbers. This will be useful when we add and subtract fractions with different **denominator**s. Two methods are used most often to find the least common multiple and we will look at both of them.

The first method is the Listing Multiples Method. To find the least common multiple of 12 and 18, we list the first few multiples of 12 and 18:

12: 12, 24, **36**, 48, 60, **72**, 84, 96, **108**...

18: 18, **36**, 54, **72**, 90, **108**...

Common Multiples: 36, 72, 108...

Least Common Multiple: 36

Figure 13.5.2.8

Notice that some numbers appear in both lists. They are the **common multiples** of 12 and 18.

We see that the first few common multiples of 12 and 18 are 36, 72, and 108. Since 36 is the smallest of the common multiples, we call it the *least common multiple*. We often use the abbreviation LCM.

LEAST COMMON MULTIPLE

The **least common multiple** (LCM) of two numbers is the smallest number that is a multiple of both numbers.

The procedure box lists the steps to take to find the LCM using the prime factors method we used above for 12 and 18.

FIND THE LEAST COMMON MULTIPLE BY LISTING MULTIPLES.

1. List several multiples of each number.
2. Look for the smallest number that appears on both lists.
3. This number is the LCM.

Exercise 13.5.2.25

Find the least common multiple of 15 and 20 by listing multiples.

Answer

Make lists of the first few multiples of 15 and of 20, and use them to find the least common multiple.	**15:** 15, 30, 45, **60**, 75, 90, 105, 120 **20:** 20, 40, **60**, 80, 100, 120, 140, 160
Look for the smallest number that appears in both lists.	The first number to appear on both lists is 60, so 60 is the least common multiple of 15 and 20.

Notice that 120 is in both lists, too. It is a common multiple, but it is not the *least* common multiple.

Exercise 13.5.2.26

Find the least common multiple by listing multiples: 9 and 12.

Answer

36

Exercise 13.5.2.27

Find the least common multiple by listing multiples: 18 and 24.

Answer

72

Our second method to find the least common multiple of two numbers is to use The Prime Factors Method. Let's find the LCM of 12 and 18 again, this time using their prime factors.

Exercise 13.5.2.28

Find the Least Common Multiple (LCM) of 12 and 18 using the prime factors method.

Answer

Step 1. Write each number as a product of primes.		Step 2. List the primes of each number. Match primes vertically when possible.	List the primes of 12. List the primes of 18. Line up with the primes of 12 when possible. If not create a new column.	$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$
Step 3. Bring down the number from each column.		$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$ $\text{LCM} = 2 \cdot 2 \cdot 3 \cdot 3$
Step 4. Multiply the factors.		$\text{LCM} = 36$

Notice that the prime factors of $12(2 \cdot 2 \cdot 3)$ and the prime factors of $18(2 \cdot 3 \cdot 3)$ are included in the LCM $(2 \cdot 2 \cdot 3 \cdot 3)$. So 36 is the least common multiple of 12 and 18.

By matching up the common primes, each common prime factor is used only once. This way you are sure that 36 is the *least* common multiple.

Exercise 13.5.2.29

Find the LCM using the prime factors method: 9 and 12.

Answer

36

Exercise 13.5.2.30

Find the LCM using the prime factors method: 18 and 24.

Answer

72

FIND THE LEAST COMMON MULTIPLE USING THE PRIME FACTORS METHOD.

1. Write each number as a product of primes.
2. List the primes of each number. Match primes vertically when possible.
3. Bring down the columns.
4. Multiply the factors.

Exercise 13.5.2.31

Find the Least Common Multiple (LCM) of 24 and 36 using the prime factors method.

Answer

Find the primes of 24 and 36. Match primes vertically when possible. Bring down all columns.	$24 = 2 \cdot 2 \cdot 2 \cdot 3$ $36 = 2 \cdot 2 \cdot \quad 3 \cdot 3$ $\text{LCM} = 2 \cdot 2 \cdot 2 \cdot 3 \cdot 3$
Multiply the factors.	$\text{LCM} = 72$
	The LCM of 24 and 36 is 72.

Exercise 13.5.2.32

Find the LCM using the prime factors method: 21 and 28.

Answer

84

Exercise 13.5.2.33

Find the LCM using the prime factors method: 24 and 32.

Answer

96

Note

Access this online resource for additional instruction and practice with using whole numbers. You will need to enable Java in your web browser to use the application.

- Sieve of Eratosthenes

Key Concepts

- **Place Value** as in Figure.
- **Name a Whole Number in Words**
  1. Start at the left and name the number in each period, followed by the period name.
  2. Put commas in the number to separate the periods.
  3. Do not name the ones period.
- **Write a Whole Number Using Digits**
  1. Identify the words that indicate periods. (Remember the ones period is never named.)
  2. Draw 3 blanks to indicate the number of places needed in each period. Separate the periods by commas.
  3. Name the number in each period and place the digits in the correct place value position.
- **Round Whole Numbers**
  1. Locate the given place value and mark it with an arrow. All digits to the left of the arrow do not change.
  2. Underline the digit to the right of the given place value.
  3. Is this digit greater than or equal to 5?
     - Yes—add 1 to the digit in the given place value.
     - No—do not change the digit in the given place value.
  4. Replace all digits to the right of the given place value with zeros.
- **Divisibility Tests:** A number is divisible by:
  - 2 if the last digit is 0, 2, 4, 6, or 8.
  - 3 if the sum of the digits is divisible by 3.
  - 5 if the last digit is 5 or 0.
  - 6 if it is divisible by both 2 and 3.
  - 10 if it ends with 0.
- **Find the Prime Factorization of a Composite Number**
  1. Find two factors whose product is the given number, and use these numbers to create two branches.
  2. If a factor is prime, that branch is complete. Circle the prime, like a bud on the tree.
  3. If a factor is not prime, write it as the product of two factors and continue the process.
  4. Write the composite number as the product of all the circled primes.
- **Find the Least Common Multiple by Listing Multiples**
  1. List several multiples of each number.
  2. Look for the smallest number that appears on both lists.
  3. This number is the LCM.
- **Find the Least Common Multiple Using the Prime Factors Method**
  1. Write each number as a product of primes.
  2. List the primes of each number. Match primes vertically when possible.
  3. Bring down the columns.

4. Multiply the factors.

Glossary

composite number

A composite number is a counting number that is not prime. A composite number has factors other than 1 and itself.

counting numbers

The counting numbers are the numbers 1, 2, 3, …

divisible by a number

If a number m is a multiple of n, then m is divisible by n. (If 6 is a multiple of 3, then 6 is divisible by 3.)

factors

If $a \cdot b = m$, then a and b are factors of m. Since $3 \cdot 4 = 12$, then 3 and 4 are factors of 12.

least common multiple

The least common multiple of two numbers is the smallest number that is a multiple of both numbers.

multiple of a number

A number is a multiple of n if it is the product of a counting number and n.

number line

A number line is used to visualize numbers. The numbers on the number line get larger as they go from left to right, and smaller as they go from right to left.

origin

The origin is the point labeled 0 on a number line.

prime factorization

The prime factorization of a number is the product of prime numbers that equals the number.

prime number

A prime number is a counting number greater than 1, whose only factors are 1 and itself.

whole numbers

The whole numbers are the numbers 0, 1, 2, 3, ...

13.5.2E: Exercises

Practice Makes Perfect

Use Place Value with Whole Numbers

In the following exercises, find the place value of each digit in the given numbers.

Exercise 13.5.2E.34

51,493

1. 1
2. 4
3. 9
4. 5
5. 3

Answer

1. thousands
2. hundreds
3. tens
4. ten thousands
5. ones

Exercise 13.5.2E.35

87,210

1. 2
2. 8
3. 0
4. 7
5. 1

Exercise 13.5.2E.36

164,285

1. 5
2. 6
3. 1
4. 8
5. 2

Answer

1. ones
2. ten thousands
3. hundred thousands
4. tens
5. hundreds

Exercise 13.5.2E. 37

395,076

1. 5
2. 3
3. 7
4. 0
5. 9

Exercise 13.5.2E. 38

93,285,170

1. 9
2. 8
3. 7
4. 5
5. 3

Answer

1. ten millions
2. ten thousands
3. tens
4. thousands
5. millions

Exercise 13.5.2E. 39

36,084,215

1. 8
2. 6
3. 5
4. 4
5. 3

Exercise 13.5.2E. 40

7,284,915,860,132

1. 7
2. 4
3. 5
4. 3
5. 0

Answer

1. trillions
2. billions
3. millions
4. tens
5. thousands

Exercise 13.5.2E.41

2,850,361,159,433

1. 9
2. 8
3. 6
4. 4
5. 2

In the following exercises, name each number using words.

Exercise 13.5.2E.42

1,078

Answer

one thousand, seventy-eight

Exercise 13.5.2E.43

5,902

Exercise 13.5.2E.44

364,510

Answer

three hundred sixty-four thousand, five hundred ten

Exercise 13.5.2E.45

146,023

Exercise 13.5.2E.46

5,846,103

Answer

five million, eight hundred forty-six thousand, one hundred three

Exercise 13.5.2E.47

1,458,398

Exercise 13.5.2E.48

37,889,005

Answer

thirty-seven million, eight hundred eighty-nine thousand, five

Exercise 13.5.2E.49

62,008,465

In the following exercises, write each number as a whole number using digits.

Exercise 13.5.2E.50

four hundred twelve

Answer

412

Exercise 13.5.2E.51

two hundred fifty-three

Exercise 13.5.2E.52

thirty-five thousand, nine hundred seventy-five

Answer

35,975

Exercise 13.5.2E.53

sixty-one thousand, four hundred fifteen

Exercise 13.5.2E.54

eleven million, forty-four thousand, one hundred sixty-seven

Answer

11,044,167

Exercise 13.5.2E.55

eighteen million, one hundred two thousand, seven hundred eighty-three

Exercise 13.5.2E.56

three billion, two hundred twenty-six million, five hundred twelve thousand, seventeen

Answer

3,226,512,017

Exercise 13.5.2E.57

eleven billion, four hundred seventy-one million, thirty-six thousand, one hundred six

In the following, round to the indicated place value.

Exercise 13.5.2E.58

Round to the nearest ten.

1. 386
2. 2,931

Answer

1. 390
2. 2,930

Exercise 13.5.2E.59

Round to the nearest ten.

1. 792
2. 5,647

Exercise 13.5.2E.60

Round to the nearest hundred.

1. 13,748
2. 391,794

Answer

1. 13,700
2. 391,800

Exercise 13.5.2E.61

Round to the nearest hundred.

1. 28,166
2. 481,628

Exercise 13.5.2E.62

Round to the nearest ten.

1. 1,492
2. 1,497

Answer

1. 1,490
2. 1,500

Exercise 13.5.2E.63

Round to the nearest ten.

1. 2,791
2. 2,795

Exercise 13.5.2E.64

Round to the nearest hundred.

1. 63,994
2. 63,940

Answer

1. 64,000
2. 63,900

Exercise 13.5.2E.65

Round to the nearest hundred.

1. 49,584
2. 49,548

In the following exercises, round each number to the nearest ⓐ hundred, ⓑ thousand, ⓒ ten thousand.

Exercise 13.5.2E.66

392,546

Answer

1. 392,500
2. 393,000
3. 390,000

Exercise 13.5.2E.67

619,348

Exercise 13.5.2E.68

2,586,991

Answer

1. 2,587,000
2. 2,587,000
3. 2,590,000

Exercise 13.5.2E.69

4,287,965

Identify Multiples and Factors

In the following exercises, use the divisibility tests to determine whether each number is divisible by 2, 3, 5, 6, and 10.

Exercise 13.5.2E.70

84

Answer

divisible by 2, 3, and 6

Exercise 13.5.2E.71

9,696

Exercise 13.5.2E.72

75

Answer

divisible by 3 and 5

Exercise 13.5.2E.73

78

Exercise 13.5.2E.74

900

Answer

divisible by 2, 3, 5, 6, and 10

Exercise 13.5.2E.75

800

Exercise 13.5.2E.76

986

Answer

divisible by 2

Exercise 13.5.2E.77

942

Exercise 13.5.2E.78

350

Answer

divisible by 2, 5, and 10

Exercise 13.5.2E.79

550

Exercise 13.5.2E.80

22,335

Answer

divisible by 3 and 5

Exercise 13.5.2E.81

39,075

Find Prime Factorizations and Least Common Multiples

In the following exercises, find the prime factorization.

Exercise 13.5.2E.82

86

Answer

$2 \cdot 43$

Exercise 13.5.2E.83

78

Exercise 13.5.2E.84

132

Answer

$2 \cdot 2 \cdot 3 \cdot 11$

Exercise 13.5.2E.85

455

Exercise 13.5.2E.86

693

Answer

$3 \cdot 3 \cdot 7 \cdot 11$

Exercise 13.5.2E.87

400

Exercise 13.5.2E.88

432

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 3 \cdot 3 \cdot 3$

Exercise 13.5.2E.89

627

Exercise 13.5.2E.90

2,160

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 3 \cdot 3 \cdot 3 \cdot 5$

Exercise 13.5.2E.91

2,520

In the following exercises, find the least common multiple of the each pair of numbers using the multiples method.

Exercise 13.5.2E.92

8, 12

Answer

24

Exercise 13.5.2E.93

4, 3

Exercise 13.5.2E.94

12, 16

Exercise 13.5.2E.95

30, 40

Exercise 13.5.2E.96

20, 30

Answer

60

Exercise 13.5.2E.97

44, 55

In the following exercises, find the least common multiple of each pair of numbers using the prime factors method.

Exercise 13.5.2E.98

8, 12

Answer

24

Exercise 13.5.2E.99

12, 16

Exercise 13.5.2E.100

28, 40

Answer

280

Exercise 13.5.2E.101

84, 90

Exercise 13.5.2E.102

55, 88

Answer

440

Exercise 13.5.2E.103

60, 72

Everyday Math

Exercise 13.5.2E.104

Writing a Check Jorge bought a car for $24,493. He paid for the car with a check. Write the purchase price in words.

Answer

twenty-four thousand, four hundred ninety-three dollars

Exercise 13.5.2E.105

Writing a Check Marissa's kitchen remodeling cost $18,549. She wrote a check to the contractor. Write the amount paid in words.

Exercise 13.5.2E.106

Buying a Car Jorge bought a car for $24,493. Round the price to the nearest

1. ten
2. hundred
3. thousand; and
4. ten-thousand.

Answer

1. $24,490
2. $24,500
3. $24,000
4. $20,000

Exercise 13.5.2E.107

Remodeling a Kitchen Marissa's kitchen remodeling cost $18,549, Round the cost to the nearest

1. ten
2. hundred
3. thousand and
4. ten-thousand.

Exercise 13.5.2E.108

Population The population of China was 1,339,724,852 on November 1, 2010. Round the population to the nearest

1. billion
2. hundred-million; and
3. million.

Answer

1. 1,000,000,000
2. 1,300,000,000
3. 1,340,000,000

Exercise 13.5.2E.109

Astronomy The average distance between Earth and the sun is 149,597,888 kilometers. Round the distance to the nearest

1. hundred-million
2. ten-million; and
3. million.

Exercise 13.5.2E.110

Grocery Shopping Hot dogs are sold in packages of 10, but hot dog buns come in packs of eight. What is the smallest number that makes the hot dogs and buns come out even?

Answer

40

Exercise 13.5.2E.111

Grocery Shopping Paper plates are sold in packages of 12 and party cups come in packs of eight. What is the smallest number that makes the plates and cups come out even?

Writing Exercises

Exercise 13.5.2E.112

Give an everyday example where it helps to round numbers.

Exercise 13.5.2E.113

If a number is divisible by 2 and by 3 why is it also divisible by 6?

Exercise 13.5.2E.114

What is the difference between prime numbers and composite numbers?

Answer

Answers may vary.

Exercise 13.5.2E.115

Explain in your own words how to find the prime factorization of a composite number, using any method you prefer.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use place value with whole numbers.			
identify multiples and apply divisibility tests.			
find prime factorizations and least common multiples.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

13.5.3: Use the Language of Algebra

Learning Objectives

By the end of this section, you will be able to:

- Use variables and algebraic symbols
- Simplify expressions using the order of operations
- Evaluate an expression
- Identify and combine like terms
- Translate an English phrase to an algebraic expression

Use Variables and Algebraic Symbols

Suppose this year Greg is 20 years old and Alex is 23. You know that Alex is 3 years older than Greg. When Greg was 12, Alex was 15. When Greg is 35, Alex will be 38. No matter what Greg's age is, Alex's age will always be 3 years more, right? In the language of algebra, we say that Greg's age and Alex's age are variables and the 3 is a constant. The ages change ("vary") but the 3 years between them always stays the same ("constant"). Since Greg's age and Alex's age will always differ by 3 years, 3 is the constant. In algebra, we use letters of the alphabet to represent variables. So if we call Greg's age g, then we could use $g+3g+3$ to represent Alex's age. See Table 13.5.3.1.

Table 13.5.3.1

Greg's age	Alex's age
12	15
20	23
35	38
g	$g+3$

The letters used to represent these changing ages are called variables. The letters most commonly used for variables are $x, y, a, b,$ and c.

Definition: VARIABLE

A **variable** is a letter that represents a number whose value may change.

Definition: CONSTANT

A **constant** is a number whose value always stays the same.

To write algebraically, we need some operation symbols as well as numbers and variables. There are several types of symbols we will be using.

There are four basic arithmetic **operations: addition, subtraction, multiplication,** and **division**. We'll list the symbols used to indicate these operations below (Table 13.5.3.2). You'll probably recognize some of them.

Table 13.5.3.2

Operation	Notation	Say:	The result is...
Addition	$a+b$	a plus b	the sum of a and b
Subtraction	$a-b$	a minus b	the difference of a and b
Multiplication	$a \cdot b, ab, (a)(b), (a)b, a(b)$	a times b	the product of a and b
Division	$a \div b, a/b, \frac{a}{b}, b\overline{)a}$	a divided by b	the quotient of a and b, a is called the dividend, and b is called the divisor

We perform these operations on two numbers. When translating from symbolic form to English, or from English to symbolic form, pay attention to the words “of” and “and.”

- The *difference* of 9 and 2 means subtract 9 and 2, in other words, 9 minus 2, which we write symbolically as $9-2$.
- The *product* of 4 and 8 means multiply 4 and 8, in other words 4 times 8, which we write symbolically as $4 \cdot 8$.

In algebra, the cross symbol, $\times$, is not used to show multiplication because that symbol may cause confusion. Does $3xy$ mean $3 \times y$ (‘three times y’) or $3 \cdot x \cdot y$ (three times x times y)? To make it clear, use $\cdot$ or parentheses for multiplication.

When two quantities have the same value, we say they are equal and connect them with an **equal sign**.

EQUALITY SYMBOL

$a = b$ is read “a is equal to b”

The symbol “$=$” is called the **equal sign**.

On the number line, the numbers get larger as they go from left to right. The number line can be used to explain the symbols “$<$” and “$>$”.

INEQUALITY

$a < b$ is read “a is less than b”

a is to the left of b on the number line

Figure 13.5.3.1

$a > b$ is read "a is greater than b”

a is to the right of b on the number line

Figure 13.5.3.2

The expressions $a < b$ or $a > b$ can be read from left to right or right to left, though in English we usually read from left to right Table 13.5.3.3 In general, $a < b$ is equivalent to $b > a$. For example $7 < 11$ is equivalent to $11 > 7$. And $a > b$ is equivalent to $b < a$. For example $17 > 4$ is equivalent to $4 < 17$.

Table 13.5.3.3

Inequality Symbols	Words
$a \neq b$	a is not equal to b
$a < b$	a is less than b
$a \leq b$	a is less than or equal to b
$a > b$	a is greater than b
$a \geq b$	a is greater than or not equal to b

Example 13.5.3.1

Translate from algebra into English:

1. $17 \leq 26$
2. $8 \neq 17 - 3$
3. $12 > 27 \div 3$
4. $y + 7 < 19$

Solution

1. $17 \leq 26$, 17 is less than or equal to 26
2. $8 \neq 17 - 3$, 8 is not equal to 17 minus 3

3. $12 > 27 \div 3$, 12 is greater than 27 divided by 3
4. $y + 7 < 19$, y plus 7 is less than 19

Try It 13.5.3.2

Translate from algebra into English:

1. $14 \leq 27$
2. $19 - 2 \neq 8$
3. $12 > 4 \div 2$
4. $x - 7 < 1$

Answer

1. 14 is less than or equal to 27
2. 19 minus 2 is not equal to 8
3. 12 is greater than 4 divided by 2
4. x minus 7 is less than 1

Try It 13.5.3.3

Translate from algebra into English:

1. $19 \leq 15$
2. $7 = 12 - 5$
3. $15 \div 3 < 8$
4. $y + 3 < 6$

Answer

1. 19 is greater then or equal to 15
2. 7 is equal to 12 minus 5
3. 15 divided by 3 is less than 8
4. y plus 3 is greater than 6

Grouping symbols in algebra are much like the commas, colons, and other punctuation marks in English. They help to make clear which expressions are to be kept together and separate from other expressions. We will introduce three types now.

GROUPING SYMBOLS

Parentheses	$()$
Brackets	$[]$
Braces	$\{\}$

Here are some examples of expressions that include **grouping symbols**. We will simplify expressions like these later in this section.

$$8(14-8) \qquad 21-3[2+4(9-8)] \qquad 24 \div \{13-2[1(6-5)+4]\}$$

What is the difference in English between a phrase and a sentence? A phrase expresses a single thought that is incomplete by itself, but a sentence makes a complete statement. “Running very fast” is a phrase, but “The football player was running very fast” is a sentence. A sentence has a subject and a verb. In algebra, we have expressions and *equations*.

EXPRESSION

An **expression** is a number, a variable, or a combination of numbers and variables using operation symbols.

An **expression** is like an English phrase. Here are some examples of expressions:

Table 13.5.3.4

Expression	Words	English Phrase
$3+5$	3 plus 5	the sum of three and five
$n-1$	n minus one	the difference of n and one
$6 \cdot 7$	6 times 7	the product of six and seven
$\frac{x}{y}$	x divided by y	the quotient of x and y

Notice that the English phrases do not form a complete sentence because the phrase does not have a verb. An **equation** is two expressions linked with an **equal sign**. When you read the words the symbols represent in an equation, you have a complete sentence in English. The equal sign gives the verb.

Definition: EQUATION

An **equation** is two expressions connected by an equal sign.

Here are some examples of equations.

Table 13.5.3.5

Equation	English Sentence
$3+5=8$	the sum of three and five is equal to eight
$n-1=14$	n minus one equals fourteen
$6 \cdot 7=42$	The product of six ans seven is equal to forty-two
$x=53$	x is equal to fifty-three
$y+9=2y-3$	y plus nine is equal to two y minus three

Example 13.5.3.4

Determine if each is an expression or an equation:

1. $2(x+3)=10$
2. $4(y-1)+1$
3. $x \div 25$
4. $y+8=40$

Solution

1. $2(x+3)=10$. This is an equation — two expressions are connected with an equal sign.
2. $4(y-1)+1$. This is an expression — no equal sign.
3. $x \div 25$. This is an expression — no equal sign.
4. $y+8=40$. This is an equation — two expressions are connected with an equal sign.

Try It 13.5.3.5

Determine if each is an expression or an equation:

1. $3(x-7)=27$
2. $5(4y-2)-7$

Answer

1. equation
2. expression

Try It 13.5.3.6

Determine if each is an expression or an equation:

1. $y^3 \div 14$
2. $4x - 6 = 22$

Answer

1. expression
2. equation

Suppose we need to multiply nine factors of 2. We could write this as $2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$. This is tedious and it can be hard to keep track of all those 2s, so we use exponents. We write $2 \cdot 2 \cdot 2$ as 2^3 and $2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$ as 2^9. In expressions such as 2^3, the 2 is called the base and the 3 is called the *exponent*. The exponent tells us how many times we need to multiply the base.

Figure 13.5.3.3

We read 2^3 as "two to the third power" or "two cubed."

We say 2^3 is in exponential notation and $2 \cdot 2 \cdot 2$ is in expanded notation.

EXPONENTIAL NOTATION

a^n means the product of n factors of a.

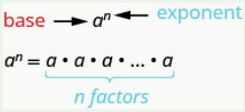

Figure 13.5.3.4

The expression a^n is read a to the n^{th} power.

While we read a^n as "a to the n^{th} power," we usually read:

- a^2 "a squared"
- a^3 "a cubed"

We'll see later why a^2 and a^3 have special names.

Table 13.5.3.6shows how we read some expressions with exponents.

Table 13.5.3.6

Expression	In Words
7^2	7 to the second power or 7 squared
5^3	5 to the third power or 5 cubed
9^4	9 to the fourth power
12^5	12 to the fifth power

Example 13.5.3.7

Simplify: 3^4

Solution

3^4

Expand the expression	$3 \cdot 3 \cdot 3 \cdot 3$
Multiply left to right	$9 \cdot 3 \cdot 3$
Multiply	$27 \cdot 3$
Multiply	81

? Try It 13.5.3.8

Simplify:

1. 5^3
2. 1^7

Answer

1. 125
2. 1

? Try It 13.5.3.9

1. 7^2
2. 0^5

Answer

1. 49
2. 0

Simplify Expressions Using the Order of Operations

To **simplify an expression** means to do all the math possible. For example, to simplify $4 \cdot 2 + 1$ we'd first multiply $4 \cdot 2$ to get 8 and then add the 1 to get 9. A good habit to develop is to work down the page, writing each step of the process below the previous step. The example just described would look like this:

$$4 \cdot 2 + 1$$

$$8 + 1$$

$$9$$

By not using an **equal sign** when you simplify an expression, you may avoid confusing expressions with equations.

SIMPLIFY AN EXPRESSION

To **simplify an expression**, do all operations in the expression.

We've introduced most of the symbols and notation used in algebra, but now we need to clarify the order of operations. Otherwise, expressions may have different meanings, and they may result in different values. For example, consider the expression:

$$4 + 3 \cdot 7$$

If you simplify this expression, what do you get?

Some students say 49,

$$4 + 3 \cdot 7$$

Since $4 + 3$ gives 7.

$$7 \cdot 7$$

And $7 \cdot 7$ is 49

$$49$$

Others say 25,

$$4+3\cdot 7$$

Since $3\cdot 7$ is 21.

$$4+21$$

And $21+4$ makes 25.

$$25$$

Imagine the confusion in our banking system if every problem had several different correct answers!

The same expression should give the same result. So mathematicians early on established some guidelines that are called the **Order of Operations**.

PERFORM THE ORDER OF OPERATIONS.

1. Parentheses and Other Grouping Symbols
   - Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. Exponents
   - Simplify all expressions with exponents.
3. Multiplication and Division
   - Perform all multiplication and division in order from left to right. These operations have equal priority.
4. Addition and Subtraction
   - Perform all addition and subtraction in order from left to right. These operations have equal priority.

Note

Doing the Manipulative Mathematics activity "Game of 24" will give you practice using the order of operations.

Students often ask, "How will I remember the order?" Here is a way to help you remember: Take the first letter of each key word and substitute the silly phrase: "Please Excuse My Dear Aunt Sally."

Parentheses	**P**lease
Exponents	**E**xcuse
Multiplication **D**ivision	**M**y **D**ear
Addition **S**ubtraction	**A**unt **S**ally

It's good that "**M**y **D**ear" goes together, as this reminds us that **m**ultiplication and **d**ivision have equal priority. We do not always do multiplication before division or always do division before multiplication. We do them in order from left to right.

Similarly, "**A**unt **S**ally" goes together and so reminds us that **a**ddition and **s**ubtraction also have equal priority and we do them in order from left to right.

Let's try an example.

Example 13.5.3.10

Simplify:

1. $4+3\cdot 7$
2. $(4+3)\cdot 7$

Solution

1.

	$4+3\cdot 7$
Are there any **p**arentheses? No.	

Are there any **e**xponents? No.	
Is there any **m**ultiplication or **d**ivision? Yes.	
Multiply first.	$4+3\cdot 7$
Add.	$4+21$
	25

2.

	$(4+3)\cdot 7$
Are there any **p**arentheses? Yes.	$(4+3)\cdot 7$
Simplify inside the parentheses.	$(7)7$
Are there any **e**xponents? No.	
Is there any **m**ultiplication or **d**ivision? Yes.	
Multiply.	49

Try It 13.5.3.11

Simplify:

1. $12-5\cdot 2$
2. $(12-5)\cdot 2$

Answer

1. 2
2. 14

Try It 13.5.3.12

Simplify:

1. $8+3\cdot 9$
2. $(8+3)\cdot 9$

Answer

1. 35
2. 99

Example 13.5.3.13

Simplify: $18\div 6+4(5-2)$

Solution

Parentheses? Yes, subtract first.	$18\div 6+4(5-2)$ $18\div 6+4(3)$
Exponents? No.	
Multiplication or division? Yes.	$18\div 6+4(3)$
Divide first because we multiply and divide left to right.	$3+4(3)$
Any other multiplication or division? Yes.	

Multiply.	$3+12$
Any other multiplication or division? No.	
Any addition or subtraction? Yes.	15

Try It 13.5.3.14

Simplify: $30 \div 5+10(3-2)$

Answer

16

Try It 13.5.3.15

Simplify: $70 \div 10+4(6-2)$

Answer

23

When there are multiple grouping symbols, we simplify the innermost parentheses first and work outward.

Example 13.5.3.16

Simplify: $5+2^3+3[6-3(4-2)]$.

Solution

	$5+2^3+3[6-3(4-2)]$
Are there any parentheses (or other grouping symbol)? Yes.	
Focus on the parentheses that are inside the brackets.	$5+2^3+3[6-3(4-2)]$
Subtract.	$5+2^3+3[6-3(2)]$
Continue inside the brackets and multiply.	$5+2^3+3[6-6]$
Continue inside the brackets and subtract.	$5+2^3+3[0]$
The expression inside the brackets requires no further simplification.	
Are there any exponents? Yes.	$5+2^3+3[0]$
Simplify exponents.	$5+8+3[0]$
Is there any multiplication or division? Yes.	
Multiply.	$5+8+0$
Is there any addition or subtraction? Yes.	
Add.	$13+0$
Add.	13

Try It 13.5.3.17

Simplify: $9+5^3-[4(9+3)]$.

Answer

86

Try It 13.5.3.18

Simplify: $7^2 - 2[4(5+1)]$.

Answer

1

Evaluate an Expression

In the last few examples, we simplified expressions using the order of operations. Now we'll evaluate some expressions—again following the order of operations. To **evaluate an expression** means to find the value of the expression when the variable is replaced by a given number.

EVALUATE AN EXPRESSION

To **evaluate an expression** means to find the value of the expression when the variable is replaced by a given number.

To evaluate an expression, substitute that number for the variable in the expression and then simplify the expression.

Example 13.5.3.19

Evaluate $7x - 4$, when

1. $x = 5$
2. $x = 1$

Solution

1.

when $x = 5$	$7x - 4$
	$7(5) - 4$
Multiply.	$35 - 4$
Subtract.	31

2.

when $x = 1$	$7x - 4$
	$7(1) - 4$
Multiply.	$7 - 4$
Subtract.	3

Try It 13.5.3.20

Evaluate $8x - 3$, when

1. $x = 2$
2. $x = 1$

Answer

1. 13
2. 5

Try It 13.5.3.21

Evaluate $4y - 4$, when

1. $y = 3$
2. $y = 5$

Answer

1. 8
2. 16

Example 13.5.3.22

Evaluate $x = 4$, when

1. x^2
2. 3^x

Solution

1.

	x^2
Replace x with 4.	$(4)^2$
Use definition of exponent.	$4 \cdot 4$
Simplify.	16

2.

	3^x
Replace x with 4.	3^4
Use definition of exponent.	$3 \cdot 3 \cdot 3 \cdot 3$
Simplify.	81

Try It 13.5.3.23

Evaluate $x = 3$, when

1. x^2
2. 4^x

Answer

1. 9
2. 64

Try It 13.5.3.24

Evaluate $x = 6$, when

1. x^3
2. 2^x

Answer

1. 216
2. 64

Example 13.5.3.25

Evaluate $2x^2+3x+8$ when $x=4$.

Solution

	$2x^2+3x+8$
Substitute $x=4$.	$2x^2+3x+8$ $2(4)^2+3(4)+8$
Follow the order of operations.	$2(16)+3(4)+8$
	$32+12+8$
	52

Try It 13.5.3.26

Evaluate $3x^2+4x+1$ when $x=3$.

Answer

40

Try It 13.5.3.27

Evaluate $6x^2-4x-7$ when $x=2$.

Answer

9

Identify and Combine Like Terms

Algebraic expressions are made up of terms. A **term** is a constant, or the product of a constant and one or more variables.

TERM

A **term** is a constant, or the product of a constant and one or more variables.

Examples of terms are $7, y, 5x^2, 9a$, and b^5.

The constant that multiplies the variable is called the **coefficient**.

COEFFICIENT

The **coefficient** of a term is the constant that multiplies the variable in a term.

Think of the coefficient as the number in front of the variable. The coefficient of the term $3x$ is 3. When we write x, the coefficient is 1, since $x=1\cdot x$.

Example 13.5.3.28

Identify the coefficient of each term:

1. $14y$
2. $15x^2$
3. a

Solution

1. The coefficient of $14y$ is 14
2. The coefficient of $15x^2$ is 15
3. The coefficient of a is 1 since $a = 1a$.

Try It 13.5.3.29

Identify the coefficient of each term:

1. $17x$
2. $41b^2$
3. z

Answer

1. 14
2. 41
3. 1

Try It 13.5.3.30

Identify the coefficient of each term:

1. $9p$
2. $13a^2$
3. y^3

Answer

1. 9
2. 13
3. 1

Some terms share common traits. Look at the following 6 terms. Which ones seem to have traits in common?

$$5x \quad 7 \quad n^2 \quad 4 \quad 3x \quad 9n^2$$

The 7 and the 4 are both constant terms.

The $5x$ and the $3x$ are both terms with x.

The n^2 and the $9n^2$ are both terms with n^2.

When two terms are constants or have the same variable and exponent, we say they are **like terms**.

- 7 and 4 are like terms.
- $5x$ and $3x$ are like terms.
- x^2 and $9x^2$ are like terms.

LIKE TERMS

Terms that are either constants or have the same variables raised to the same powers are called **like terms**.

Example 13.5.3.31

Identify the like terms: $y^3, 7x^2, 14, 23, 4y^3, 9x, 5x^2$.

Solution

y^3 and $4y^3$ are like terms because both have y^3; the variable and the exponent match.

$7x^2$ and $5x^2$ are like terms because both have x^2; the variable and the exponent match.

14 and 23 are like terms because both are constants.

There is no other term like $9x$.

Try It 13.5.3.32

Identify the like terms: $9, 2x^3, y^2, 8x^3, 15, 9y, 11y^2$.

Answer

9 and 15, y^2 and $11y^2$, $2x^3$ and $8x^3$

Try It 13.5.3.33

Identify the like terms: $4x^3, 8x^2, 19, 3x^3, 24, 6x^3$.

Answer

19 and 24, $8x^2$ and $3x^2$, $4x^3$ and $6x^3$

Adding or subtracting terms forms an expression. In the expression $2x^2 + 3x + 8$, from Example, the three terms are $2x^2$, $3x$, and 8.

Example 13.5.3.34

Identify the terms in each expression.

1. $9x^2 + 7x + 12$
2. $8x + 3y$

Solution

1. The terms of $9x^2 + 7x + 12$ are $9x^2$, $7x$, and 12.
2. The terms of $8x + 3y$ are $8x$ and $3y$.

Try It 13.5.3.35

Identify the terms in the expression $4x^2 + 5x + 17$.

Answer

$4x^2, 5x, 17$

Try It 13.5.3.36

Identify the terms in the expression $5x + 2y$.

Answer

$5x, 2y$

If there are like terms in an expression, you can simplify the expression by combining the like terms. What do you think $4x + 7x + x$ would simplify to? If you thought $12x$, you would be right!

$$\begin{array}{c} 4x + 7x + x \\ x + x + x + x \quad + x + x + x + x + x + x + x \quad + x \\ 12x \end{array} \tag{13.5.3.1}$$

Add the coefficients and keep the same variable. It doesn't matter what x is—if you have 4 of something and add 7 more of the same thing and then add 1 more, the result is 12 of them. For example, 4 oranges plus 7 oranges plus 1 orange is 12 oranges. We will discuss the mathematical properties behind this later.

Simplify: $4x + 7x + x$

Add the coefficients. $12x$

Example 13.5.3.37: How To Combine Like Terms

Simplify: $2x^2+3x+7+x^2+4x+5$

Solution

Step 1. Identify the like terms.	$2x^2+3x+7+x^2+4x+5$ $2x^2+3x+7+x^2+4x+5$
Step 2. Rearrange the expression so the like terms are together.	$2x^2+x^2+3x+4x+7+5$
Step 3. Combine like terms.	$3x^2+7x+12$

Try It 13.5.3.38

Simplify: $3x^2+7x+9+7x^2+9x+8$.

Answer

$10x^2+16x+17$

Try It 13.5.3.39

Simplify: $4y^2+5y+2+8y^2+4y+5$.

Answer

$12y^2+9y+7$

COMBINE LIKE TERMS.

1. Identify like terms.
2. Rearrange the expression so like terms are together.
3. Add or subtract the coefficients and keep the same variable for each group of like terms.

Translate an English Phrase to an Algebraic Expression

In the last section, we listed many operation symbols that are used in algebra, then we translated expressions and equations into English phrases and sentences. Now we'll reverse the process. We'll translate English phrases into algebraic expressions. The symbols and variables we've talked about will help us do that. Table 13.5.3.7summarizes them.

Table 13.5.3.7

Operation	Phrase	Expression	
Addition	a plus b the sum of a and b a increased by b b more than a the total of a and b b added to a	$a+b$	(13.5.3.2)
Subtraction	a minus b the difference of a and b a decreased by b b less than a b subtracted from a	$a-b$	(13.5.3.3)

Operation	Phrase	Expression
Multiplication	a times b the product of a and b twice a	$a \cdot b, ab, a(b), (a)(b)$ (13.5.3.4) $2a$ (13.5.3.5)
Division	a divided by b the quotient of a and b the ratio of a and b b divided into a	$a \div b, a/b, \frac{a}{b}, b\overline{)a}$ (13.5.3.6)

Look closely at these phrases using the four operations:

the **sum** *of a and b*

the **difference** *of a and b*

the **product** *of a and b*

the **quotient** *of a and b*

Figure 13.5.3.5

Each phrase tells us to operate on two numbers. Look for the words *of* and *and* to find the numbers.

Example 13.5.3.40

Translate each English phrase into an algebraic expression:

1. the difference of $17x$ and 5
2. the quotient of $10x^2$ and 7.

Solution

1. The key word is *difference*, which tells us the operation is subtraction. Look for the words *of* and *and* to find the numbers to subtract.

   the *difference of* 17*x and* 5

   17*x* minus 5

   17*x* – 5

2. The key word is "quotient," which tells us the operation is division.

   the *quotient of* 10*x*² *and* 7

   divide 10*x*² by 7

   10*x*² ÷ 7

This can also be written $10x^2/7$ or $\frac{10x^2}{7}$.

Try It 13.5.3.41

Translate each English phrase into an algebraic expression:

1. the difference of $14x^2$ and 13
2. the quotient of $12x$ and 2.

Answer

1. $14x^2 - 13$
2. $12x \div 2$

Try It 13.5.3.42

Translate each English phrase into an algebraic expression:

1. the sum of $17y^2$ and 19
2. the product of 7 and y.

Answer

1. $17y^2+19$
2. $7y$

How old will you be in eight years? What age is eight more years than your age now? Did you add 8 to your present age? Eight "more than" means 8 added to your present age. How old were you seven years ago? This is 7 years less than your age now. You subtract 7 from your present age. Seven "less than" means 7 subtracted from your present age.

Example 13.5.3.43

Translate the English phrase into an algebraic expression:

1. Seventeen more than y
2. Nine less than $9x^2$.

Solution

1. The key words are *more than*. They tell us the operation is addition. *More than* means "added to."

$$\begin{aligned}&\text{Seventeen more than } y\\&\text{Seventeen added to } y\\&y+17\end{aligned}$$

2. The key words are *less than*. They tell us to subtract. *Less than* means "subtracted from."

$$\begin{aligned}&\text{Nine less than } 9x^2\\&\text{Nine subtracted from } 9x^2\\&9x^2-9\end{aligned}$$

Try It 13.5.3.44

Translate the English phrase into an algebraic expression:

1. Eleven more than x
2. Fourteen less than $11a$.

Answer

1. $x+11$
2. $11a-14$

Try It 13.5.3.45

Translate the English phrase into an algebraic expression:

1. 13 more than z
2. 18 less than $8x$.

Answer

1. $z+13$
2. $8x-18$

Example 13.5.3.46

Translate the English phrase into an algebraic expression:

1. five times the sum of m and n
2. the sum of five times m and n.

Solution

There are two operation words—*times* tells us to multiply and *sum* tells us to add.
1. Because we are multiplying 5 times the sum we need parentheses around the sum of m and n, $(m+n)$. This forces us to determine the sum first. (Remember the order of operations.)

$$\begin{array}{c}\text{five times the sum of } m \text{ and } n \\ 5(m+n)\end{array} \tag{13.5.3.7}$$

2. To take a sum, we look for the words "of" and "and" to see what is being added. Here we are taking the sum *of* five times m and \ (n\.)

$$\begin{array}{c}\text{the sum of five times } m \text{ and } n \\ 5m+n\end{array} \tag{13.5.3.8}$$

Try It 13.5.3.47

Translate the English phrase into an algebraic expression:

1. four times the sum of p and q
2. the sum of four times p and q.

Answer

1. $4(p+q)$
2. $4p+q$

Try It 13.5.3.48

Translate the English phrase into an algebraic expression:

1. the difference of two times x and 8,
2. two times the difference of x and 8.

Answer

1. $2x-8$
2. $2(x-8)$

Later in this course, we'll apply our skills in algebra to solving applications. The first step will be to translate an English phrase to an algebraic expression. We'll see how to do this in the next two examples.

Example 13.5.3.49

The length of a rectangle is 6 less than the width. Let w represent the width of the rectangle. Write an expression for the length of the rectangle.

Solution

$$\begin{array}{ll} \text{Write a phrase about the length of the rectangle.} & \text{6 less than the width} \\ \text{Substitute } w \text{ for "the width."} & \text{6 less then w} \\ \text{Rewrite "less than" as "subtracted from."} & \text{6 subtracted from w} \\ \text{Translate the phrase into algebra.} & w-6 \end{array} \tag{13.5.3.9}$$

Try It 13.5.3.50

The length of a rectangle is 7 less than the width. Let w represent the width of the rectangle. Write an expression for the length of the rectangle.

Answer

$w-7$

Try It 13.5.3.51

The width of a rectangle is 6 less than the length. Let l represent the length of the rectangle. Write an expression for the width of the rectangle.

Answer

$l-6$

Example 13.5.3.52

June has dimes and quarters in her purse. The number of dimes is three less than four times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Solution

Write the phrase about the number of dimes.	three less than four times the number of quarters
Substitute q for the number of quarters.	3 less than 4 times q
Translate "4 times q ."	3 less than 4q
Translate the phrase into algebra.	4q - 3

(13.5.3.10)

Try It 13.5.3.53

Geoffrey has dimes and quarters in his pocket. The number of dimes is eight less than four times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Answer

$4q-8$

Try It 13.5.3.54

Lauren has dimes and nickels in her purse. The number of dimes is three more than seven times the number of nickels. Let n represent the number of nickels. Write an expression for the number of dimes.

Answer

$7n+3$

Key Concepts

- **Notation** — **The result is…**
  - $a+b$ — the sum of a and b
  - $a-b$ — the difference of a and b
  - $a\cdot b, ab, (a)(b)(a)b, a(b)$ — the product of a and b
  - $a\div b, a/b, \frac{a}{b}, b\overline{)a}$ — the quotient of a and b
- **Inequality**
  - $a<b$ is read "a is less than b" — a is to the left of b on the number line
  - $a>b$ is read "a is greater than b" — a is to the right of b on the number line

- **Inequality Symbols** **Words**
  - $a \neq b$ a is not equal to b
  - $a < b$ a is less than b
  - $a \leq b$ a is less than or equal to b
  - $a > b$ a is greater than b
  - $a \geq b$ a is greater than or equal to b
- **Grouping Symbols**
  - Parentheses ()
  - Brackets []
  - Braces {}
- **Exponential Notation**
  - a^n means the product of n factors of a. The expression a^n is read a to the n^{th} power.
- **Order of Operations:** When simplifying mathematical expressions perform the operations in the following order:
  1. Parentheses and other Grouping Symbols: Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
  2. Exponents: Simplify all expressions with exponents.
  3. Multiplication and Division: Perform all multiplication and division in order from left to right. These operations have equal priority.
  4. Addition and Subtraction: Perform all addition and subtraction in order from left to right. These operations have equal priority.
- **Combine Like Terms**
  1. Identify like terms.
  2. Rearrange the expression so like terms are together.
  3. Add or subtract the coefficients and keep the same variable for each group of like terms.

Glossary

coefficient

The coefficient of a term is the constant that multiplies the variable in a term.

constant

A constant is a number whose value always stays the same.

equality symbol

The symbol "$=$" is called the equal sign. We read $a = b$ as "a is equal to b."

equation

An equation is two expressions connected by an equal sign.

evaluate an expression

To evaluate an expression means to find the value of the expression when the variable is replaced by a given number.

expression

An expression is a number, a variable, or a combination of numbers and variables using operation symbols.

like terms

Terms that are either constants or have the same variables raised to the same powers are called like terms.

simplify an expression

To simplify an expression, do all operations in the expression.

term

A term is a constant or the product of a constant and one or more variables.

variable

A variable is a letter that represents a number whose value may change.

13.5.3E: Exercises

Practice Makes Perfect

Use Variables and Algebraic Symbols

In the following exercises, translate from algebra to English.

Exercise 13.5.3E.55

$16 - 9$

Answer

16 minus 9, the difference of sixteen and nine

Exercise 13.5.3E.56

$3 \cdot 9$

Exercise 13.5.3E.57

$28 \div 4$

Answer

28 divided by 4, the quotient of twenty-eight and four

Exercise 13.5.3E.58

$x + 11$

Exercise 13.5.3E.59

$(2)(7)$

Answer

2 times 7, the product of two and seven

Exercise 13.5.3E.60

$(4)(8)$

Exercise 13.5.3E.61

$14 < 21$

Answer

fourteen is less than twenty-one

Exercise 13.5.3E.62

$17 < 35$

Exercise 13.5.3E.63

$36 \geq 19$

Answer

thirty-six is greater than or equal to nineteen

Exercise 13.5.3E.64

$6n = 36$

Exercise 13.5.3E.65

$y - 1 > 6$

Answer

y minus 1 is greater than 6, the difference of y and one is greater than six

Exercise 13.5.3E.66

$y - 4 > 8$

Exercise 13.5.3E.67

$2 \leq 18 \div 6$

Answer

2 is less than or equal to 18 divided by 6; 2 is less than or equal to the quotient of eighteen and six

Exercise 13.5.3E.68

$a \neq 1 \cdot 12$

In the following exercises, determine if each is an expression or an equation.

Exercise 13.5.3E.69

$9 \cdot 6 = 54$

Answer

equation

Exercise 13.5.3E.70

$7 \cdot 9 = 63$

Exercise 13.5.3E.71

$5 \cdot 4 + 3$

Answer

expression

Exercise 13.5.3E.72

$x+7$

Exercise 13.5.3E.73

$x+9$

Answer

expression

Exercise 13.5.3E.74

$y-5=25$

Simplify Expressions Using the Order of Operations

In the following exercises, simplify each expression.

Exercise 13.5.3E.75

5^3

Answer

125

Exercise 13.5.3E.76

8^3

Exercise 13.5.3E.77

2^8

Answer

256

Exercise 13.5.3E.78

10^5

In the following exercises, simplify using the order of operations.

Exercise 13.5.3E.79

1. $3+8\cdot 5$
2. $(3+8)\cdot 5$

Answer

1. 43
2. 55

Exercise 13.5.3E.80

1. $2+6\cdot 3$
2. $(2+6)\cdot 3$

Exercise 13.5.3E.81

$2^3-12\div(9-5)$

Answer

5

Exercise 13.5.3E.82

$3^2-18\div(11-5)$

Exercise 13.5.3E.83

$3\cdot 8+5\cdot 2$

Answer

34

Exercise 13.5.3E.84

$4\cdot 7+3\cdot 5$

Exercise 13.5.3E.85

$2+8(6+1)$

Answer

58

Exercise 13.5.3E.86

$4+6(3+6)$

Exercise 13.5.3E.87

$4\cdot 12/8$

Answer

6

Exercise 13.5.3E.88

$2\cdot 36/6$

Exercise 13.5.3E.89

$(6+10)\div(2+2)$

Answer

4

Exercise 13.5.3E.90

$(9+12)\div(3+4)$

Exercise 13.5.3E.91

$20\div4+6\cdot5$

Answer

35

Exercise 13.5.3E.92

$33\div3+8\cdot2$

Exercise 13.5.3E.93

3^2+7^2

Answer

58

Exercise 13.5.3E.94

$(3+7)^2$

Exercise 13.5.3E.95

$3(1+9\cdot6)-4^2$

Answer

149

Exercise 13.5.3E.96

$5(2+8\cdot4)-7^2$

Exercise 13.5.3E.97

$2[1+3(10-2)]$

Answer

50

Exercise 13.5.3E.98

$5[2+4(3-2)]$

Evaluate an Expression

In the following exercises, evaluate the following expressions.

Exercise 13.5.3E.99

$7x+8$ when $x=2$

Answer

22

Exercise 13.5.3E.100

$8x-6$ when $x=7$

Exercise 13.5.3E.101

x^2 when $x=12$

Answer

144

Exercise 13.5.3E.102

x^3 when $x=5$

Exercise 13.5.3E.103

x^5 when $x=2$

Answer

32

Exercise 13.5.3E.104

4^x when $x=2$

Exercise 13.5.3E.105

x^2+3x-7 when $x=4$

Answer

21

Exercise 13.5.3E.106

$6x+3y-9$ when $x=10, y=7$

Answer

9

Exercise 13.5.3E.107

$(x+y)^2$ when $x=6, y=9$

Exercise 13.5.3E.108

a^2+b^2 when $a=3, b=8$

Answer

73

Exercise 13.5.3E.109

r^2-s^2 when $r=12, s=5$

Exercise 13.5.3E.110

$2l+2w$ when $l=15, w=12$

Answer

54

Exercise 13.5.3E.111

$2l+2w$ when $l=18, w=14$

Simplify Expressions by Combining Like Terms

In the following exercises, identify the coefficient of each term.

Exercise 13.5.3E.112

$8a$

Answer

8

Exercise 13.5.3E.113

$13m$

Exercise 13.5.3E.114

$5r^2$

Answer

5

Exercise 13.5.3E.115

$6x^3$

In the following exercises, identify the like terms.

Exercise 13.5.3E.116

$x^3, 8x, 14, 8y, 5, 8x^3$

Answer

x^3 and $8x^3$, 14 and 5

Exercise 13.5.3E.117

$6z, 3w^2, 1, 6z^2, 4z, w^2$

Exercise 13.5.3E.118

$9a, a^2, 16, 16b^2, 4, 9b^2$

Answer

16 and 4, $16b^2$ and $9b^2$

Exercise 13.5.3E.119

$3, 25r^2, 10s, 10r, 4r^2, 3s$

In the following exercises, identify the terms in each expression.

Exercise 13.5.3E.120

$15x^2 + 6x + 2$

Answer

$15x^2, 6x, 2$

Exercise 13.5.3E.121

$11x^2 + 8x + 5$

Exercise 13.5.3E.122

$10y^3 + y + 2$

Answer

$10y^3, y, 2$

Exercise 13.5.3E.123

$9y^3 + y + 5$

In the following exercises, simplify the following expressions by combining like terms.

Exercise 13.5.3E.124

$10x + 3x$

Answer

$13x$

Exercise 13.5.3E.125

$15x + 4x$

Exercise 13.5.3E.126

$4c + 2c + c$

Answer

$7c$

Exercise 13.5.3E.127

$6y + 4y + y$

Exercise 13.5.3E.128

$7u + 2 + 3u + 1$

Answer

$10u + 3$

Exercise 13.5.3E.129

$8d + 6 + 2d + 5$

Exercise 13.5.3E.130

$10a + 7 + 5a - 2 + 7a - 4$

Answer

$22a + 1$

Exercise 13.5.3E.131

$7c + 4 + 6c - 3 + 9c - 1$

Exercise 13.5.3E.132

$3x^2 + 12x + 11 + 14x^2 + 8x + 5$

Answer

$17x^2 + 20x + 16$

Exercise 13.5.3E.133

$5b^2+9b+10+2b^2+3b-4$

Translate an English Phrase to an Algebraic Expression

In the following exercises, translate the phrases into algebraic expressions.

Exercise 13.5.3E.134

the difference of 14 and 9

Answer

$14-9$

Exercise 13.5.3E.135

the difference of 19 and 8

Exercise 13.5.3E.136

the product of 9 and 7

Answer

$9 \cdot 7$

Exercise 13.5.3E.137

the product of 8 and 7

Exercise 13.5.3E.138

the quotient of 36 and 9

Answer

$36 \div 9$

Exercise 13.5.3E.139

the quotient of 42 and 7

Exercise 13.5.3E.140

the sum of $8x$ and $3x$

Answer

$8x+3x$

Exercise 13.5.3E.141

the sum of $13x$ and $3x$

Exercise 13.5.3E.142

the quotient of y and 3

Answer

$\frac{y}{3}$

Exercise 13.5.3E.143

the quotient of y and 8

Exercise 13.5.3E.144

eight times the difference of y and nine

Answer

$8(y-9)$

Exercise 13.5.3E.145

seven times the difference of y and one

Exercise 13.5.3E.146

Eric has rock and classical CDs in his car. The number of rock CDs is 3 more than the number of classical CDs. Let c represent the number of classical CDs. Write an expression for the number of rock CDs.

Answer

$c+3$

Exercise 13.5.3E.147

The number of girls in a second-grade class is 4 less than the number of boys. Let b represent the number of boys. Write an expression for the number of girls.

Exercise 13.5.3E.148

Greg has nickels and pennies in his pocket. The number of pennies is seven less than twice the number of nickels. Let n represent the number of nickels. Write an expression for the number of pennies.

Answer

$2n-7$

Exercise 13.5.3E.149

Jeannette has $5 and $10 bills in her wallet. The number of fives is three more than six times the number of tens. Let t represent the number of tens. Write an expression for the number of fives.

Everyday Math

Exercise 13.5.3E.150

Car insurance Justin's car insurance has a $750 deductible per incident. This means that he pays $750 and his insurance company will pay all costs beyond $750. If Justin files a claim for $2,100.

1. how much will he pay?
2. how much will his insurance company pay?

Answer

1. $750
2. $1,350

Exercise 13.5.3E.151

Home insurance Armando's home insurance has a $2,500 deductible per incident. This means that he pays $2,500 and the insurance company will pay all costs beyond $2,500. If Armando files a claim for $19,400.

1. how much will he pay?
2. how much will the insurance company pay?

Writing Exercises

Exercise 13.5.3E.152

Explain the difference between an expression and an equation.

Answer

Answers may vary

Exercise 13.5.3E.153

Why is it important to use the order of operations to simplify an expression?

Exercise 13.5.3E.154

Explain how you identify the like terms in the expression $8a^2+4a+9-a^2-1$

Answer

Answers may vary

Exercise 13.5.3E.155

Explain the difference between the phrases "4 times the sum of x and y" and "the sum of 4 times x and y."

Self Check

ⓐ Use this checklist to evaluate your mastery of the objectives of this section.

the *quotient of* $10x^2$ *and* 7
divide $10x^2$ by 7
$10x^2 \div 7$

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 13.5.3E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **1.3E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

13.5.4: Add and Subtract Integers

Learning Objectives

- Use negatives and opposites
- Simplify: expressions with absolute value
- Add integers
- Subtract integers

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra* chapter, **Integers**.

Use Negatives and Opposites

Our work so far has only included the counting numbers and the whole numbers. But if you have ever experienced a temperature below zero or accidentally overdrawn your checking account, you are already familiar with negative numbers. **Negative numbers** are numbers less than 0. The **negative numbers** are to the left of zero on the number line. See Figure 13.5.4.1.

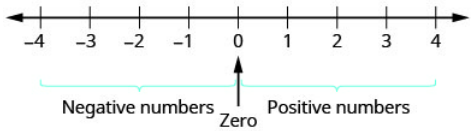

Figure 13.5.4.1. The number line shows the location of positive and negative numbers.

The arrows on the ends of the number line indicate that the numbers keep going forever. There is no biggest positive number, and there is no smallest negative number.

Is zero a positive or a negative number? Numbers larger than zero are positive, and numbers smaller than zero are negative. Zero is neither positive nor negative.

Consider how numbers are ordered on the number line. Going from left to right, the numbers increase in value. Going from right to left, the numbers decrease in value. See Figure 13.5.4.2

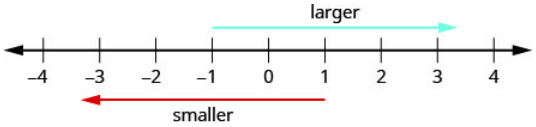

Figure 13.5.4.2. The numbers on a number line increase in value going from left to right and decrease in value going from right to left.

Doing the Manipulative Mathematics activity "Number Line-part 2" will help you develop a better understanding of integers.

Remember that we use the notation:

$a < b$ (read "a is less than b") when a is to the left of b on the number line.

$a > b$ (read "a is greater than b") when a is to the right of b on the number line.

Now we need to extend the number line which showed the whole numbers to include negative numbers, too. The numbers marked by points in Figure 13.5.4.3 are called the integers. The integers are the numbers $\ldots -3, -2, -1, 0, 1, 2, 3 \ldots$

Figure 13.5.4.3. All the marked numbers are called *integers*.

Example 13.5.4.1

Order each of the following pairs of numbers, using $<$ or $>$:

1. 14 ___ 6
2. -1 ___ 9
3. -1 ___ -4
4. 2 ___ -20

Solution:

It may be helpful to refer to the number line shown.

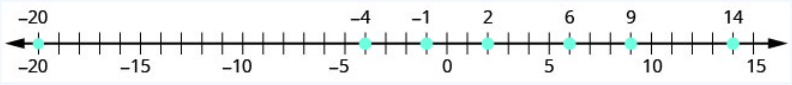

Figure 13.5.4.4

1. $14 ___ 6$

   $14 > 6$ 14 is to the right of 6 on the number line.

2. $-1 ___ 9$

   $-1 < 9$ -1 is to the left of 9 on the number line.

3. $-1 ___ -4$

   $-1 > -4$ -1 is to the right of -4 on the number line.

4. $2 ___ -20$

   $2 > -20$ 2 is to the right of -20 on the number line.

Try It 13.5.4.1

Order each of the following pairs of numbers, using $<$ or $>$:

1. $15 ___ 7$
2. $-2 ___ 5$
3. $-3 ___ -7$
4. $5 ___ -17$

Answer

1. $<$
2. $>$
3. $<$
4. $>$

Try It 13.5.4.2

Order each of the following pairs of numbers, using $<$ or $>$:

1. $8 ___ 13$
2. $3 ___ -4$
3. $-5 ___ -2$
4. $9 ___ -21$

Answer

1. $<$
2. $>$
3. $<$
4. $>$

You may have noticed that, on the **number line**, the negative numbers are a mirror image of the positive numbers, with zero in the middle. Because the numbers 2 and -2 are the same distance from zero, they are called **opposites**. The opposite of 2 is -2, and

the opposite of -2 is 2.

OPPOSITE

The **opposite** of a number is the number that is the same distance from zero on the number line but on the opposite side of zero.

Figure 13.5.4.5illustrates the definition.

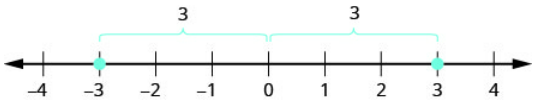

Figure 13.5.4.5: The opposite of 3 is -3.

Sometimes in algebra the same symbol has different meanings. Just like some words in English, the specific meaning becomes clear by looking at how it is used. You have seen the symbol "$-$" used in three different ways.

$10-4$ Between two numbers, it indicates the operation of *subtraction*.
We read $10-4$ as "10 minus 4."

-8 In front of a number, it indicates a *negative* number.
We read -8 as "negative eight."

$-x$ In front of a variable, it indicates the *opposite*.
We read $-x$ as "the opposite of x"

$-(-2)$ Here there are two "$-$" signs.
The one in the parentheses tells us the number is negative 2.
The one outside the parentheses tells us to take the *opposite* of -2.
We read $-(-2)$ as "the opposite of negative two."

OPPOSITE NOTATION

$-a$ means the opposite of the number a.

The notation $-a$ is read as "the opposite of a."

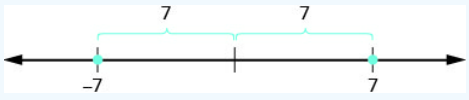
Example 13.5.4.2

Find:

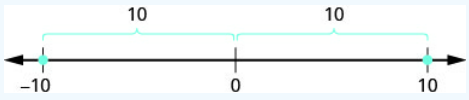
1. the opposite of 7
2. the opposite of -10
3. the opposite of $-(-6)$

Solution:

1. -7 is the same distance from 0 as 7, but on the opposite side of 0. The opposite of 7 is -7.



2. 10 is the same distance from 0 as -10, but on the opposite side of 0. The opposite of -10 is 10.



3. The opposite of $-(-6)$ is -6.

Try It 13.5.4.3

Find:

1. the opposite of 4
2. the opposite of -3
3. $-(-1)$

Answer

1. -4
2. 3
3. 1

Try It 13.5.4.4

Find:

1. the opposite of 8
2. the opposite of -5
3. $-(-5)$

Answer

1. -8
2. 5
3. 5

Our work with opposites gives us a way to define the integers. The whole numbers and their opposites are called the **integers**. The integers are the numbers $\ldots -3, -2, -1, 0, 1, 2, 3 \ldots$

INTEGERS

The whole numbers and their opposites are called the **integers**.

The integers are the numbers

$$\ldots -3, -2, -1, 0, 1, 2, 3 \ldots$$

When evaluating the opposite of a **variable**, we must be very careful. Without knowing whether the variable represents a positive or negative number, we don't know whether −x−x is positive or negative. We can see this in Example $13.5.4.1$.

Example 13.5.4.3:

Evaluate

1. $-x$, when $x = 8$
2. $-x$, when $x = -8$

Solution:

1.

To evaluate when $x = 8$ means to substitute 8 for x.	
	-x

Substitute 8 for x.	$-(8)$
Write the opposite of 8.	-8

2.

To evaluate when $x = -8$ means to substitute -8 for $-x$.	
	-x
Substitute -8 for x.	$-(-8)$
Write the opposite of -8.	8

Try It 13.5.4.5

Evaluate $-n$, when

1. $n = 4$
2. $n = -4$

Answer

1. -4
2. 4

Try It 13.5.4.6

Evaluate $-m$, when

1. $m = 11$
2. $m = -11$

Answer

1. -11
2. 11

Simplify: Expressions with Absolute Value

We saw that numbers such as 2 and -2 are opposites because they are the same distance from 0 on the number line. They are both two units from 0. The distance between 0 and any number on the number line is called the **absolute value** of that number.

ABSOLUTE VALUE

The **absolute value** of a number is its distance from 0 on the number line.

The absolute value of a number \(n\) is written as $|n|$.

For example,

- -5 is 5 units away from 0, so $|-5| = 5$.
- 5 is 5 units away from 0, so $|5| = 5$.

Figure $13.5.4.6$illustrates this idea.

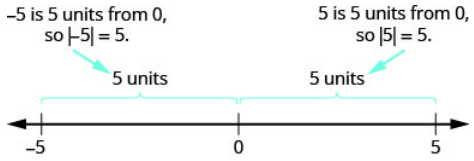


Figure 13.5.4.6: The integers 5 and are 5 units away from 0.

The absolute value of a number is never negative (because distance cannot be negative). The only number with absolute value equal to zero is the number zero itself, because the distance from 0 to 0 on the number line is zero units.

PROPERTY OF ABSOLUTE VALUE

$|n| \geq 0$ for all numbers

Absolute values are always greater than or equal to zero!

Mathematicians say it more precisely, "absolute values are always non-negative." Non-negative means greater than or equal to zero.

Example 13.5.4.4:

Simplify:

1. $|3|$
2. $|-44|$
3. $|0|$

Solution:

The absolute value of a number is the distance between the number and zero. Distance is never negative, so the absolute value is never negative.

1. $|3| = 3$
2. $|-44| = 44$
3. $|0| = 0$

Try It 13.5.4.7

Simplify:

1. $|4|$
2. $|-28|$
3. $|0|$

Answer

1. 4
2. 28
3. 0

Try It 13.5.4.8

Simplify:

1. $|-13|$
2. $|47|$

Answer

1. 13

2. 47

In the next example, we'll order expressions with absolute values. Remember, positive numbers are always greater than negative numbers!

Example 13.5.4.5:

Fill in $<, >,$ or $=$ for each of the following pairs of numbers:

1. $|-5|$ ____ $-|-5|$
2. 8 ____ $-|-8|$
3. -9 ____ $-|-9|$
4. $-(-16)$ ____ $-|-16|$

Solution:

1. Simplification $|-5| \quad ____ \quad -|-5|$
   Order. $5 \quad ____ \quad -5$
   $5 \quad > \quad -5$
   $|-5| \quad > \quad -|-5|$
2. Simplification $8 \quad ____ \quad -|-8|$
   Order. $8 \quad ____ \quad -8$
   $8 \quad > \quad -8$
   so
   $|8| \quad > \quad -|-8|$
3. Simplification $-9 \quad ____ \quad -|-9|$
   Order. $-9 \quad ____ \quad -9$
   $-9 \quad = \quad -9$
   so
   $-9 \quad = \quad -|-9|$
4. Simplification $-(-16) \quad ____ \quad -|16|$
   Order. $16 \quad ____ \quad -16$
   $16 \quad > \quad -16$
   so
   $-(-16) \quad > \quad -|-16|$

Try It 13.5.4.9

Fill in $<, >,$ or $=$ for each of the following pairs of numbers:

1. $|-9|$ ____ $-|-9|$
2. 2 ____ $-|-2|$
3. -8 ____ $-|-8|$
4. $-(-9)$ ____ $-|-9|$

Answer

1. $>$
2. $>$
3. $<$
4. $>$

Try It 13.5.4.10

Fill in $<$, $>$, or $=$ for each of the following pairs of numbers:

1. 7 ____ $-|-7|$
2. $-(-10)$ ____ $-|-10|$
3. $|-4|$ ____ $-|-4|$
4. -1 ____ $|-1|$

Answer

1. $>$
2. $>$
3. $>$
4. $<$

We now add absolute value bars to our list of grouping symbols. When we use the order of operations, first we simplify inside the absolute value bars as much as possible, then we take the **absolute value** of the resulting number.

GROUPING SYMBOLS

Parentheses	$()$	Braces	$\{\}$
Brackets	$[\,]$	Absolute	$\|\,\|$

In the next example, we simplify the expressions inside absolute value bars first, just like we do with parentheses.

Example 13.5.4.6:

Simplify: $24-|19-3(6-2)|$

Solution:

	$24-\|19-3(6-2)\|$
Work inside parentheses first: subtract 2 from 6	$24-\|19-3(4)\|$
Multiply $3(4)$	$24-\|19-12\|$
Subtract inside the absolute value bars.	$24-\|7\|$
Take the absolute value.	$24-7$
Subtract.	17

Try It 13.5.4.11

Simplify: $19-|11-4(3-1)|$

Answer

16

Try It 13.5.4.12

Simplify: $9-|8-4(7-5)|$

Answer

9

Example 13.5.4.7

Evaluate:

1. $|x|$ when $x = -35$
2. $|y|$ when $y = -20$
3. $-|u|$ when $u = 12$
4. $-|p|$ when $p = -14$

Solution:

1. $|x|$ when $x = -35$

	$\|x\|$
Substitute -35 for x	$\|-35\|$
Take the absolute value.	35

2. $|y|$ when $y = -20$

	$\|-y\|$
Substitute -20 for y	$\|-(-20)\|$
Simplify	$\|20\|$
Take the absolute value.	20

3. $-|u|$ when $u = 12$

	$-\|u\|$
Substitute 12 for u	$\|-12\|$
Take the absolute value.	-12

4. $-|p|$ when $p = -14$

	$-\|p\|$
Substitute -14 for p	$-\|-14\|$
Take the absolute value.	-14

Try It 13.5.4.13

Evaluate:

1. $|x|$ when $x = -17$
2. $|y|$ when $y = -39$
3. $-|m|$ when $m = 22$
4. $-|p|$ when $p = -11$

Answer

1. 17
2. 39
3. -22
4. -11

Try It 13.5.4.14

Evaluate:

1. $|y|$ when $y = -23$
2. $|-y|$ when $y = -21$
3. $-|n|$ when $n = 37$
4. $-|q|$ when $q = -49$

Answer

1. 23
2. 21
3. -37
4. -49

Add Integers

Most students are comfortable with the addition and subtraction facts for positive numbers. But doing addition or subtraction with both positive and negative numbers may be more challenging.

Doing the Manipulative Mathematics activity "Addition of Signed Numbers" will help you develop a better understanding of adding integers."

We will use two color counters to model addition and subtraction of negatives so that you can visualize the procedures instead of memorizing the rules.

We let one color (blue) represent positive. The other color (red) will represent the negatives. If we have one positive counter and one negative counter, the value of the pair is zero. They form a neutral pair. The value of this neutral pair is zero.

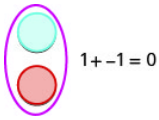

Figure 13.5.4.7

We will use the counters to show how to add the four addition facts using the numbers $5, -5$ and $3, -3$.

$$5+3 \quad -5+(-3) \quad -5+3 \quad 5+(-3)$$

To add $5+3$, we realize that $5+3$ means the sum of 5 and 3.

We start with 5 positives.	And then we add 3 positives.	
We now have 8 positives. The sum of 5 and 3 is 8.	

Now we will add $-5+(-3)$. Watch for similarities to the last example $5+3=8$.

To add $-5+(-3)$, we realize this means the sum of -5 and -3.

We start with 5 negatives.	And then we add 3 negatives.	
We now have 8 negative. The sum of -5 and -3 is -8.	

In what ways were these first two examples similar?

- The first example adds 5 positives and 3 positives—both positives.
- The second example adds 5 negatives and 3 negatives—both negatives.

In each case we got 8 — either 8 positives or 8 negatives.

When the signs were the same, the counters were all the same color, and so we added them.

Figure 13.5.4.7

? Example 13.5.4.8

Add:

1. $1+4$
2. $-1+(-4)$

Solution:

1.

1 positive plus 4 positives is 5 positives.

2. 
1 negative plus 4 negatives is 5 negatives.

? Try It 13.5.4.15

Add:

1. $2+4$
2. $-2+(-4)$

Answer

1. 6
2. -6

? Try It 13.5.4.16

Add:

1. $2+5$
2. $-2+(-5)$

Answer

1. 7
2. -7

So what happens when the signs are different? Let's add $-5+3$. We realize this means the sum of -5 and 3. When the counters were the same color, we put them in a row. When the counters are a different color, we line them up under each other.

Table 13.5.4.1

	$-5+3$ means the sum of -5 and 3.
We start with 5 negatives.	

And then we add 3 positives.	We remove any neutral pairs.	We have 2 negatives left.	
The sum of -5 and 3 is -2.	$-5+3=2$

Notice that there were more negatives than positives, so the result was negative.

Let's now add the last combination, $5+(-3)$.

Table 13.5.4.2

	$5+(-3)$ means the sum of -5 and -3.
We start with 5 positives.	
And then we add 3 negatives.	We remove any neutral pairs.	We have 2 positives left.	
The sum of 5 and -3 is 2.	$5+(-3)=2$

When we use counters to model addition of positive and negative integers, it is easy to see whether there are more positive or more negative counters. So we know whether the sum will be positive or negative.

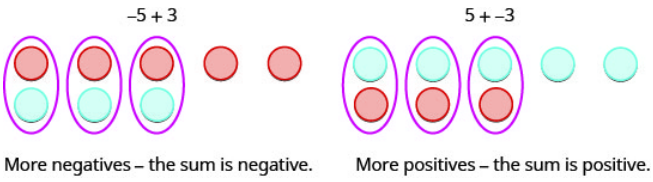

Figure 13.5.4.8

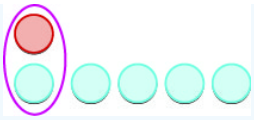
? Example 13.5.4.9

Add:

1. $-1+5$
2. $1+(-5)$

Solution:

1. $-1+5$



There are more positives, so the sum is positive.

So, $-1+5=4$.

2. $1+(-5)$

There are more negatives, so the sum is negative.

So, $1+(-5)=-4$

Try It 13.5.4.17

Add:

1. $-2+4$
2. $2+(-4)$

Answer

1. 2
2. -2

Try It 13.5.4.18

Add:

1. $-2+5$
2. $2+(-5)$

Answer

1. 3
2. -3

Now that we have added small positive and negative integers with a model, we can visualize the model in our minds to simplify problems with any numbers.

When you need to add numbers such as $37+(-53)$, you really don't want to have to count out 37 blue counters and 53 red counters. With the model in your mind, can you visualize what you would do to solve the problem?

Picture 37 blue counters with 53 red counters lined up underneath. Since there would be more red (negative) counters than blue (positive) counters, the sum would be *negative*. How many more red counters would there be? Because $53-37=16$, there are 16 more red counters.

Therefore, the sum of $37+(-53)$ is -16.

$$37+(-53)=-16$$

Let's try another one. We'll add $-74+(-27)$. Again, imagine 74 red counters and 27 more red counters, so we'd have 101 red counters. This means the sum is -101.

$$-74+(-27)=-101$$

Let's look again at the results of adding the different combinations of $5, -5$ and $3, -3$.

ADDITION OF POSITIVE AND NEGATIVE INTEGERS

$5+3=8$ — both positive, sum positive

$-5+(-3)=-8$ — both negative, sum negative

When the signs are the same, the counters would be all the same color, so add them.

$-5+3=-2$ — different signs, more negatives, sum negative

$5+(-3)=2$ — different signs, more positives, sum positive

When the signs are different, some of the counters would make neutral pairs, so subtract to see how many are left.

Visualize the model as you simplify the expressions in the following examples.

Example 13.5.4.10

Simplify:

1. $19+(-47)$
2. $-14+(-36)$

Solution:

1. Since the signs are different, we subtract 19 from 47. The answer will be negative because there are more negatives than positives.

Add. $19+(-47)=-28$

2. Since the signs are same, we add. The answer will be negative because there are more negatives than positives.

Add. $-14+(-36)=-50$

Try It 13.5.4.19

Simplify:

1. $-31+(-19)$
2. $15+(-32)$

Answer

1. -50
2. -17

Try It 13.5.4.20

Simplify:

1. $-42+(-28)$
2. $25+(-61)$

Answer

1. -70
2. -36

The techniques used up to now extend to more complicated problems, like the ones we've seen before. Remember to follow the order of operations!

Example 13.5.4.11

Simplify:

$-5+3(-2+7)$

Solution:

	$-5+3(-2+7)$
Simplify inside the parenthesis	$-5+3(5)$
Multiply	$-5+15$
add left to right	10

Try It 13.5.4.21

Simplify:

$-2+5(-4+7)$

Answer

13

Try It 13.5.4.22

Simplify:

$-4+2(-3+5)$

Answer

0

Subtract Integers

Note

Doing the Manipulative Mathematics activity "Subtraction of Signed Numbers" will help you develop a better understanding of subtracting integers.

We will continue to use counters to model the subtraction. Remember, the blue counters represent positive numbers and the red counters represent negative numbers.

Perhaps when you were younger, you read "$5-3$" as "5 take away 3." When you use counters, you can think of subtraction the same way!

We will model the four subtraction facts using the numbers 5 and 3.

$$5-3 \quad -5-(-3)) \quad -5-3 \quad 5-(-3)$$

To subtract $5-3$, we restate the problem as "5 take away 3."

Table 13.5.4.3

We start with 5 positives.	
We 'take away' 3 positives.	

We have 2 positives left.	
The difference of 5 and 3 is 2.	2

Now we will subtract $-5-(-3)$. Watch for similarities to the last example $5-3=2$.

To subtract $-5-(-3)$, we restate this as "-5 take away -3"

Table 13.5.4.4

We start with 5 negatives.	
We 'take away' 3 negatives.	
We have 2 negatives left.	
The difference of -5 and -3 is -2.	-2

Notice that these two examples are much alike: The first example, we subtract 3 positives from 5 positives and end up with 2 positives.

In the second example, we subtract 3 negatives from 5 negatives and end up with 2 negatives.

Each example used counters of only one color, and the "take away" model of subtraction was easy to apply.

Figure 13.5.4.9

Example 13.5.4.12

Subtract:

1. $7-5$
2. $-7-(-5)$

Solution:

1. $7-5$
   2 Take 5 positives from 7 positives and get 2 positives
2. $-7-(-5)$
   -2 Take 5 negatives from 7 negatives and get 2 negatives

Try It 13.5.4.23

Subtract:

1. $6-4$
2. $-6-(-4)$

Answer

1. 2
2. -2

Try It 13.5.4.24

Subtract:

1. $7 - 4$
2. $-7 - (-4)$

Answer

1. 3
2. -3

What happens when we have to subtract one positive and one negative number? We'll need to use both white and red counters as well as some **neutral pairs**. Adding a neutral pair does not change the value. It is like changing quarters to nickels—the value is the same, but it looks different.

- To subtract $-5 - 3$, we restate it as -5 take away 3.

We start with 5 negatives. We need to take away 3 positives, but we do not have any positives to take away.

Remember, a neutral pair has value zero. If we add 0 to 5 its value is still 5. We add neutral pairs to the 5 negatives until we get 3 positives to take away.

Table 13.5.4.5

	$-5 - 3$ means -5 take away 3
We start with 5 negatives.	
We now add the neutrals needed to get 3 positives.	
We remove the 3 positives.	We are left with 8 negatives.	
The difference of -5 and 3 is -8.	$-5 - 3 = -8$

And now, the fourth case, $5 - (-3)$. We start with 5 positives. We need to take away 3 negatives, but there are no negatives to take away. So we add neutral pairs until we have 3 negatives to take away.

Table 13.5.4.6

	$5 - (-3)$ means 5 take away -3
We start with 5 positives.	
We now add the needed neutrals pairs.	
We remove the 3 negatives.	
We are left with 8 positives.	8 positives
The difference of 5 and -3 is 8.	$5-(-3)=8$

Example 13.5.4.13

Subtract:

1. $-3-1$
2. $3-(-1)$

Solution:

1.

Take 1 positive from the one added neutral pair.		$-3-1$ -4

2.

Take 1 negative from the one added neutral pair.		$3-(-1)$ 4

Try It 13.5.4.25

Subtract:

1. $-6-4$
2. $6-(-4)$

Answer

1. -10
2. 10

Try It 13.5.4.26

Subtract:

1. $-7-4$
2. $7-(-4)$

Answer

1. -11
2. 11

Have you noticed that *subtraction of signed numbers can be done by adding the opposite*? In Exercise 13.5.4.33 $-3-1$ is the same as $-3+(-1)$ and $3-(-1)$ is the same as $3+1$. You will often see this idea, the **subtraction property**, written as follows:

SUBTRACTION PROPERTY

$$a-b=a+(-b)$$

Subtracting a number is the same as adding its opposite.

Look at these two examples.

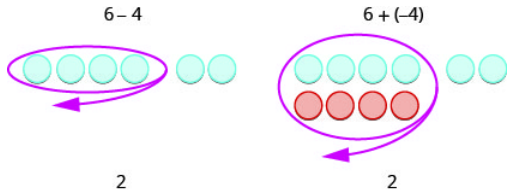

Figure 13.5.4.10: $6-4$ gives the same answer as $6+(-4)$.

Of course, when you have a subtraction problem that has only positive numbers, like $6-4$, you just do the subtraction. You already knew how to subtract $6-4$ long ago. But *knowing* that $6-4$ gives the same answer as $6+(-4)$ helps when you are subtracting negative numbers. Make sure that you understand how $6-4$ and $6+(-4)$ give the same results!

Example 13.5.4.14

Simplify:

1. $13-8$ and $13+(-8)$
2. $-17-9$ and $-17+(-9)$

Solution:

1. Subtract. $13-8$ and $13+(-8)$
   5 5
2. Subtract. $-17-9$ and $-17+(-9)$
   -26 -26

Try It 13.5.4.27

Simplify:

1. $21-13$ and $21+(-13)$
2. $-11-7$ and $-11+(-7)$

Answer

1. 8
2. -18

Try It 13.5.4.28

Simplify:

1. $15-7$ and $15+(-7)$
2. $-14-8$ and $-14+(-8)$

Answer

1. 8
2. -22

Look at what happens when we subtract a negative.

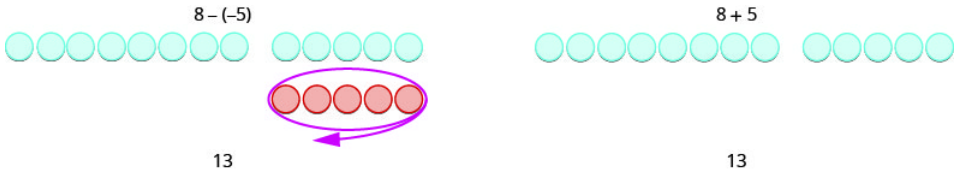

Figure 13.5.4.11: $8-(-5)$ gives the same answer as $8+5$

Subtracting a negative number is like adding a positive!

You will often see this written as $a-(-b)=a+b$.

Does that work for other numbers, too? Let's do the following example and see.

Example 13.5.4.15

Simplify:

1. $9-(-15)$ and $9+15$
2. $-7-(-4)$ and $-7+4$

Solution:

1.		$9-(-15)$	$9+15$
	Subtract	24	24
2.		$-7-(-4)$	$-7+4$
	Subtract	-3	-3

Try It 13.5.4.29

Simplify:

1. $6-(-13)$ and $6+13$
2. $-5-(-1)$ and $-5+1$

Answer

1. 19
2. -4

Try It 13.5.4.30

Simplify:

1. $4-(-19)$ and $4+19$
2. $-4-(-7)$ and $-4+7$

Answer

1. 23
2. 3

Let's look again at the results of subtracting the different combinations of $5, -5$ and $3, -3$.

SUBTRACTION OF INTEGERS

$5-3$	$-5-(-3)$
2	-2
5 positives take away 3 positives	5 negatives take away 3 negatives
2 positives	2 negatives

When there would be enough counters of the color to take away, subtract.

$-5-3$	$5-(-3)$
-8	8
5 negatives, want to take away 3 positives need neutral pairs	5 positives, want to take away 3 negatives need neutral pairs

When there would be not enough counters of the color to take away, add.

What happens when there are more than three integers? We just use the order of operations as usual.

? Example 13.5.4.16

Simplify:

$7-(-4-3)-9$

Solution:

	$7-(-4-3)-9$
Simplify inside the parenthesis first.	$7-(-7)-9$
Subtract left to right.	$14-9$
Subtract	5

? Try It 13.5.4.31

Simplify:

$8-(-3-1)-9$

Answer

3

? Try It 13.5.4.32

Simplify:

$12-(-9-6)-14$

Answer

12

Access these online resources for additional instruction and practice with adding and subtracting integers. You will need to enable Java in your web browser to use the applications.

- Add Colored Chip
- Subtract Colored Chip

Key Concepts

- **Addition of Positive and Negative Integers**

$5+3$	$-5+(-3)$
8	-8
both positive, sum positive	both negative, sum negative

$-5+3$	$5+(-3)$
-2	2
different signs, more negatives sum negative	different signs, more positives sum positive

- **Property of Absolute Value**:

$|n| \geq 0$ for all numbers. Absolute values are always greater than or equal to zero!

- **Subtraction of Integers**

$5-3$	$-5-(-3)$
2	-2
5 positives take away 3 positives 2 positives	5 negatives take away 3 negatives 2 negatives
$-5-3$	$5-(-3)$
-8	8
5 negatives, want to subtract 3 positives need neutral pairs	5 positives, want to subtract 3 negatives need neutral pairs

- **Subtraction Property:** Subtracting a number is the same as adding its opposite.

Glossary

absolute value

The absolute value of a number is its distance from 0 on the number line. The absolute value of a number nn is written as |n|.

integers

The whole numbers and their opposites are called the integers: $\ldots -3, -2, -1, 0, 1, 2, 3 \ldots$

opposite

The opposite of a number is the number that is the same distance from zero on the number line but on the opposite side of zero: $-a$ means the opposite of the number. The notation $-a$ is read “the opposite of a.”

13.5.4E: Exercises

Practice Makes Perfect

Use Negatives and Opposites of Integers

In the following exercises, order each of the following pairs of numbers, using < or >.

Exercise 13.5.4E.1

1. 9___4
2. −3___6
3. −8___−2
4. 1___−10

Answer

1. >
2. <
3. <
4. >

Exercise 13.5.4E.2

1. −7___3
2. −10___−5
3. 2___−6
4. 8___9

In the following exercises, find the opposite of each number.

Exercise 13.5.4E.3

1. 2
2. −6

Answer

1. −2
2. 6

Exercise 13.5.4E.4

1. 9
2. −4

In the following exercises, simplify.

Exercise 13.5.4E.5

−(−4)

Answer

4

Exercise 13.5.4E.6

$-(-8)$

Exercise 13.5.4E.7

$-(-15)$

Answer

15

Exercise 13.5.4E.8

$-(-11)$

In the following exercises, evaluate.

Exercise 13.5.4E.9

$-c$ when

1. $c=12$
2. $c=-12$

Answer

1. -12
2. 12

1. Exercise 13.5.4E.10

$-d$ when

1. $d=21$
2. $d=-21$

Simplify Expressions with Absolute Value

In the following exercises, simplify.

Exercise 13.5.4E.11

1. $|-32|$
2. $|0|$
3. $|16|$

Answer

1. 32
2. 0
3. 16

Exercise 13.5.4E.12

1. $|0|$
2. $|-40|$
3. $|22|$

In the following exercises, fill in <, >, or = for each of the following pairs of numbers.

Exercise 13.5.4E.13

1. $-6 ___ |-6|$
2. $-|-3| ___ -3$

Answer

1. <
2. =

Exercise 13.5.4E.14

1. $|-5| ___ -|-5|$
2. $9 ___ -|-9|$

In the following exercises, simplify.

Exercise 13.5.4E.15

$-(-5)$ and $-|-5|$

Answer

5,−5

Exercise 13.5.4E.16

$-|-9|$ and $-(-9)$

Exercise 13.5.4E.17

$8|-7|$

Answer

56

Exercise 13.5.4E.18

$5|-5|$

Exercise 13.5.4E.19

$|15-7|-|14-6|$

Answer

0

Exercise 13.5.4E.20

$|17-8|-|13-4|$

Exercise 13.5.4E.21

$18-|2(8-3)|$

Answer

8

Exercise 13.5.4E.22

$18-|3(8-5)|$

In the following exercises, evaluate.

Exercise 13.5.4E.23

1. $-|p|$ when $p=19$
2. $-|q|$ when $q=-33$

Answer

1. -19
2. -33

Exercise 13.5.4E.24

1. $-|a|$ when $a=60$
2. $-|b|$ when $b=-12$

Add Integers

In the following exercises, simplify each expression.

Exercise 13.5.4E.25

$-21+(-59)$

Answer

-80

Exercise 13.5.4E.26

$-35+(-47)$

Exercise 13.5.4E.27

$48+(-16)$

Answer

32

Exercise 13.5.4E.28

$34+(-19)$

Exercise 13.5.4E.29

$-14+(-12)+4$

Answer

-22

Exercise 13.5.4E.30

$-17+(-18)+6$

Exercise 13.5.4E.31

$135+(-110)+83$

Answer

108

Exercise 13.5.4E.32

$-38+27+(-8)+12$

Exercise 13.5.4E.33

$19+2(-3+8)$

Answer

29

Exercise 13.5.4E.34

$24+3(-5+9)$

Subtract Integers

In the following exercises, simplify.

Exercise 13.5.4E.35

$8-2$

Answer

6

Exercise 13.5.4E.36

$-6-(-4)$

Exercise 13.5.4E.37

$-5-4$

Answer

-9

Exercise 13.5.4E.38

$-7-2$

Exercise 13.5.4E.39

$8-(-4)$

Answer

12

Exercise 13.5.4E.40

$7-(-3)$

Exercise 13.5.4E.41

1. $44-28$
2. $44+(-28)$

Answer

1. 16
2. 16

Exercise 13.5.4E.42

1. $35-16$
2. $35+(-16)$

Exercise 13.5.4E.43

1. $27-(-18)$
2. $27+18$

Answer

1. 45
2. 45

Exercise 13.5.4E.44

1. $46-(-37)$
2. $46+37$

In the following exercises, simplify each expression.

Exercise 13.5.4E.45

$15-(-12)$

Answer

27

Exercise 13.5.4E.46

14−(−11)

Exercise 13.5.4E.47

48−87

Answer

-39

Exercise 13.5.4E.48

45−69

Exercise 13.5.4E.49

−17−42

Answer

-59

Exercise 13.5.4E.50

−19−46

Exercise 13.5.4E.51

−103−(−52)

Answer

-51

Exercise 13.5.4E.52

−105−(−68)

Exercise 13.5.4E.53

−45−(−54)

Answer

9

Exercise 13.5.4E.54

−58−(−67)

Exercise 13.5.4E.55

8−3−7

Answer

-2

Exercise 13.5.4E.56

9−6−5

Exercise 13.5.4E.57

−5−4+7

Answer

-2

Exercise 13.5.4E.58

−3−8+4

Exercise 13.5.4E.59

−14−(−27)+9

Answer

22

Exercise 13.5.4E.60

64+(−17)−9

Exercise 13.5.4E.61

(2−7)−(3−8)

Answer

0

Exercise 13.5.4E.62

(1−8)−(2−9)

Exercise 13.5.4E.63

−(6−8)−(2−4)

Answer

4

Exercise 13.5.4E.64

−(4−5)−(7−8)

Exercise 13.5.4E.65

25−[10−(3−12)]

Answer

6

Exercise 13.5.4E.66

32−[5−(15−20)]

Exercise 13.5.4E.67

6.3−4.3−7.2

Answer

-5.2

Exercise 13.5.4E.68

5.7−8.2−4.9

Exercise 13.5.4E.69

$5^2 - 6^2$

Answer

-11

Exercise 13.5.4E.70

$6^2 - 7^2$

Everyday Math

Exercise 13.5.4E.71

Elevation The highest elevation in the United States is Mount McKinley, Alaska, at 20,320 feet above sea level. The lowest elevation is Death Valley, California, at 282 feet below sea level.

Use integers to write the elevation of:

1. Mount McKinley.
2. Death Valley.

Answer

1. 20,329
2. −282

Exercise 13.5.4E.72

Extreme temperatures The highest recorded temperature on Earth was 58° Celsius, recorded in the Sahara Desert in 1922. The lowest recorded temperature was 90° below 0° Celsius, recorded in Antarctica in 1983.

Use integers to write the:

1. highest recorded temperature.
2. lowest recorded temperature.

Exercise 13.5.4E.73

State budgets In June, 2011, the state of Pennsylvania estimated it would have a budget surplus of $540 million. That same month, Texas estimated it would have a budget deficit of $27 billion.

Use integers to write the budget of:

1. Pennsylvania.
2. Texas.

Answer

1. $540 million
2. −$27 billion

Exercise 13.5.4E.74

College enrollments Across the United States, community college enrollment grew by 1,400,000 students from Fall 2007 to Fall 2010. In California, community college enrollment declined by 110,171 students from Fall 2009 to Fall 2010.

Use integers to write the change in enrollment:

1. in the U.S. from Fall 2007 to Fall 2010.
2. in California from Fall 2009 to Fall 2010.

Exercise 13.5.4E.75

Stock Market The week of September 15, 2008 was one of the most volatile weeks ever for the US stock market. The closing numbers of the Dow Jones Industrial Average each day were:

Monday	−504
Tuesday	+142
Wednesday	−449
Thursday	+410
Friday	+369

What was the overall change for the week? Was it positive or negative?

Answer

-32

Exercise 13.5.4E.76

Stock Market During the week of June 22, 2009, the closing numbers of the Dow Jones Industrial Average each day were:

Monday	−201
Tuesday	−16
Wednesday	−23
Thursday	+172
Friday	−34

What was the overall change for the week? Was it positive or negative?

Writing Exercises

Exercise 13.5.4E.77

Give an example of a negative number from your life experience.

Answer

Answers may vary

Exercise 13.5.4E.78

What are the three uses of the "−" sign in algebra? Explain how they differ.

Exercise 13.5.4E.79

Explain why the sum of −8 and 2 is negative, but the sum of 8 and −2 is positive.

Answer

Answers may vary

Exercise 13.5.4E.80

Give an example from your life experience of adding two negative numbers.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use negatives and opposites of integers.			
simplify expressions with absolute value.			
add integers.			
subtract integers.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 13.5.4E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **1.4E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

13.5.5: Multiply and Divide Integers

Learning Objectives

By the end of this section, you will be able to:

- Multiply integers
- Divide integers
- Simplify expressions with integers
- Evaluate variable expressions with integers
- Translate English phrases to algebraic expressions
- Use integers in applications

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra* chapter, **Integers**.

Multiply Integers

Since multiplication is mathematical shorthand for repeated addition, our model can easily be applied to show **multiplication** of **integers**. Let's look at this concrete model to see what patterns we notice. We will use the same examples that we used for addition and subtraction. Here, we will use the model just to help us discover the pattern.

We remember that $a \cdot b$ means add a, b times. Here, we are using the model just to help us discover the pattern.

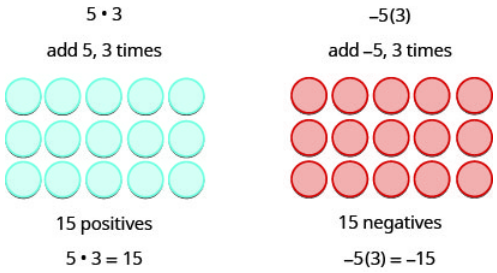

Figure 13.5.5.1

The next two examples are more interesting.

What does it mean to multiply 5 by -3? It means subtract $5, 3$ times. Looking at subtraction as "taking away," it means to take away $5, 3$ times. But there is nothing to take away, so we start by adding neutral pairs on the workspace. Then we take away 5 three times.

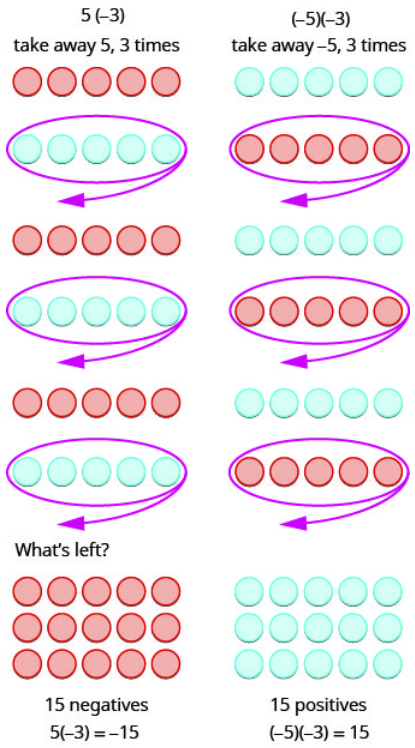

Figure 13.5.5.2

In summary:

$$5 \cdot 3 = 15 \qquad -5(3) = -15$$
$$5(-3) = -15 \qquad (-5)(-3) = 15$$

Notice that for multiplication of two signed numbers, when the:

- signs are the *same*, the product is *positive*.
- signs are *different*, the product is *negative*.

We'll put this all together in the chart below.

MULTIPLICATION OF SIGNED NUMBERS

For multiplication of two signed numbers:

Table 13.5.5.1

Same signs	Product	Example
Two positives	Positive	$7 \cdot 4 = 28$
Two negatives	Positive	$-8(-6) = 48$

Table 13.5.5.2

Different signs	Product	Example
Positive · negative	Negative	$7(-9) = -63$
Negative · positive	Negative	$-5 \cdot 10 = -50$

Example 13.5.5.1

Multiply:

1. $-9 \cdot 3$
2. $-2(-5)$
3. $4(-8)$
4. $7 \cdot 6$

Solution

1. $-9 \cdot 3 = -27$ Multiply, noting that the signs are different, so the product is negative.
2. $-2(-5) = 10$ Multiply, noting that the signs are same, so the product is positive.
3. $4(-8) = -32$ Multiply, with different signs.
4. $7 \cdot 6 = 42$ Multiply, with the same signs.

Try It 13.5.5.2

Multiply:

1. $-6 \cdot 8$
2. $-4(-7)$
3. $9(-7)$
4. $5 \cdot 12$

Answer

1. -48
2. 28
3. -63
4. 60

Try It 13.5.5.3

Multiply:

1. $-8 \cdot 7$
2. $-6(-9)$
3. $7(-4)$
4. $3 \cdot 13$

Answer

1. -56
2. 54
3. -28
4. 39

When we multiply a number by 1, the result is the same number. What happens when we multiply a number by -1? Let's multiply a positive number and then a negative number by -1 to see what we get.

Multiply.	Multiply.
$-1 \cdot 4 = -4$	$-1(-3) = 3$
Note that -4 is the opposite of 4.	Note that 3 is the opposite of -3

Each time we multiply a number by -1, we get its opposite!

MULTIPLICATION BY −1

$$-1a = -a$$

Multiplying a number by -1 gives its opposite.

Example 13.5.5.4

Multiply:

1. $-1 \cdot 7$
2. $-1(-11)$

Solution

1.		$-1 \cdot 7$
	Multiply, noting that the signs are different so the product is negative.	-7
		-7 is the opposite of 7.
2.		$-1(-11)$
	Multiply, noting that the signs are the same so the product is positive.	11
		11 is the opposite of -11.

Try It 13.5.5.5

Multiply:

1. $-1 \cdot 9$
2. $-1 \cdot (-17)$

Answer

1. -9
2. 17

Try It 13.5.5.6

Multiply:

1. $-1 \cdot 8$
2. $-1 \cdot (-16)$

Answer

1. -8
2. 16

Divide Integers

What about **division**? Division is the inverse operation of multiplication. So, $15 \div 3 = 5$ because $5 \cdot 3 = 15$. In words, this expression says that 15 can be divided into three groups of five each because adding five three times gives 15. Look at some examples of multiplying integers, to figure out the rules for dividing integers.

$$\begin{aligned} 5 \cdot 3 &= 15 \quad \text{so} \quad 15 \div 3 = 5 \\ -5 \cdot 3 &= -15 \quad \text{so} \quad -15 \div 3 = -5 \\ (5)(-3) &= -15 \quad \text{so} \quad -15 \div (-3) = 5 \\ (-5)(-3) &= 15 \quad \text{so} \quad 15 \div (-3) = -5 \end{aligned}$$

Division follows the same rules as multiplication!

For division of two signed numbers, when the:

- signs are the *same*, the quotient is *positive*.
- signs are *different*, the quotient is *negative*.

And remember that we can always check the answer of a division problem by multiplying.

MULTIPLICATION AND DIVISION OF SIGNED NUMBERS

For multiplication and division of two signed numbers:

- If the signs are the same, the result is positive.
- If the signs are different, the result is negative.

Table 13.5.5.3

Same signs	Result
Two positives	Positive
Two negatives	Positive
If the signs are the same, the result is positive.	

Table 13.5.5.4

Different signs	Result
Positive and negative	Negative
Negative and positive	Negative
If the signs are different, the result is negative.	

Example 13.5.5.7

1. $-27 \div 3$
2. $-100 \div (-4)$

Solution

1. $-27 \div 3$
   Divide, with different signs, the quotient is negative. -9
2. $-100 \div (-4)$
   Divide, with signs that are the same the quotient is negative. 25

Try It 13.5.5.8

Divide:

1. $-42 \div 6$
2. $-117 \div (-3)$

Answer

1. -7
2. 39

Try It 13.5.5.9

Divide:

1. $-63 \div 7$
2. $-115 \div (-5)$

Answer

1. -9
2. 23

Simplify Expressions with Integers

What happens when there are more than two numbers in an expression? The order of operations still applies when negatives are included. Remember My Dear Aunt Sally?

Let's try some examples. We'll simplify expressions that use all four operations with integers—addition, subtraction, multiplication, and division. Remember to follow the order of operations.

Example 13.5.5.10

Simplify:

$7(-2)+4(-7)-6$

Solution

	$7(-2)+4(-7)-6$
Multiply first.	$-14+(-28)-6$
Add.	$-42-6$
Subtract	-48

Try It 13.5.5.11

Simplify:

$8(-3)+5(-7)-4$

Answer

-63

Try It 13.5.5.12

Simplify:

$9(-3)+7(-8)-1$

Answer

-84

Example 13.5.5.13

Simplify:

1. $(-2)^4$
2. -2^4

Solution

1. $(-2)^4$

Write in expanded form.	$(-2)(-2)(-2)(-2)$
Multiply	$4(-2)(-2)$
Multiply	$-8(-2)$
Multiply	16

2. -2^4

Write in expanded form. We are asked to find the opposite of 2^4.	$-(2\cdot 2\cdot 2\cdot 2)$
Multiply	$-(4\cdot 2\cdot 2)$
Multiply	$-(8\cdot 2)$
Multiply	-16

Notice the difference in parts (1) and (2). In part (1), the exponent means to raise what is in the parentheses, the (-2) to the 4^{th} power. In part (2), the exponent means to raise just the 2 to the 4^{th} power and then take the opposite.

? Try It 13.5.5.14

Simplify:

1. $(-3)^4$
2. -3^4

Answer

1. 81
2. -81

? Try It 13.5.5.15

Simplify:

1. $(-7)^2$
2. -7^2

Answer

1. 49
2. -49

The next example reminds us to simplify inside parentheses first.

✓ Example 13.5.5.16

Simplify:

$12-3(9-12)$

Solution

$12-3(9-12)$	
$=12-3(-3)$	Subtract in parentheses first.
$=12-(-9)$	Multiply.
$=12+9$	Add the opposite.
$=21$	

Try It 13.5.5.17

Simplify:

$17-4(8-11)$

Answer

29

Try It 13.5.5.18

Simplify:

$16-6(7-13)$

Answer

52

Example 13.5.5.19

Simplify:

$8(-9)\div(-2)^3$

Solution

	$8(-9)\div(-2)^3$
Exponents first	$8(-9)\div(-8)$
Multiply.	$-72\div(-8)$
Divide	9

Try It 13.5.5.20

Simplify:

$12(-9)\div(-3)^3$

Answer

4

Try It 13.5.5.21

Simplify:

$18(-4)\div(-2)^3$

Answer

9

Example 13.5.5.22

Simplify:

$-30\div 2+(-3)(-7)$

Solution

	$-30 \div 2 + (-3)(-7)$
Multiply and divide left to right, so divide first.	$-15 + (-3)(-7)$
Multiply.	$-15 + 21$
Add	6

Try It 13.5.5.23

Simplify:

$-27 \div 3 + (-5)(-6)$

Answer

21

Try It 13.5.5.24

Simplify:

$-32 \div 4 + (-2)(-7)$

Answer

6

Evaluate Variable Expressions with Integers

Remember that to evaluate an expression means to substitute a number for the variable in the expression. Now we can use negative numbers as well as positive numbers.

Example 13.5.5.25

When $n = -5$, evaluate:

1. $n + 1$
2. $-n + 1$.

Solution

1.

	$n + 1$
Substitute -5 for n	$-5 + 1$
Simplify.	-4

2.

	$n + 1$
Substitute -5 for n	$-(-5) + 1$
Simplify.	$5 + 1$
Add.	6

Try It 13.5.5.26

When $n = -8$, evaluate:

1. $n + 2$
2. $-n + 2$.

Answer

1. -6
2. 10

Try It 13.5.5.27

When $y = -9$, evaluate:

1. $y + 8$
2. $-y + 8$.

Answer

1. -1
2. 17

Example 13.5.5.28

Evaluate $(x + y)^2$ when $x = -18$ and $y = 24$.

Solution

	$(x + y)^2$
Substitute -18 for x and 24 for y	$(-18 + 24)^2$
Add inside parentheses	$(6)^2$
Simplify.	36

Try It 13.5.5.29

Evaluate $(x + y)^2$ when $x = -15$ and $y = 29$.

Answer

196

Try It 13.5.5.30

Evaluate $(x + y)^3$ when $x = -8$ and $y = 10$.

Answer

8

Example 13.5.5.31

Evaluate $20 - z$ when

1. $z = 12$
2. $z = -12$

Solution

1.

	$20 - z$
Substitute 12 for z.	$20 - 12$
Subtract	8

2.

	$20 - z$
Substitute -12 for z.	$20 - (-12)$
Subtract	32

Try It 13.5.5.32

Evaluate $17 - k$ when

1. $k = 19$
2. $k = -19$

Answer

1. -2
2. 36

Try It 13.5.5.33

Evaluate $-5 - b$ when

1. $b = 14$
2. $b = -14$

Answer

1. -19
2. 9

Example 13.5.5.34

Evaluate:

$2x^2 + 3x + 8$ when $x = 4$.

Solution

Substitute 4 for x. Use parentheses to show multiplication.

	$2x^2 + 3x + 8$
Substitute	$2(4)^2 + 3(4) + 8$
Evaluate exponents.	$2(16) + 3(4) + 8$
Multiply.	$32 + 12 + 8$
Add.	52

Try It 13.5.5.35

Evaluate:

$3x^2 - 2x + 6$ when $x = -3$.

Answer

39

Try It 13.5.5.36

Evaluate:

$4x^2 - x - 5$ when $x = -2$.

Answer

13

Translate Phrases to Expressions with Integers

Our earlier work translating English to algebra also applies to phrases that include both positive and negative numbers.

Example 13.5.5.37

Translate and simplify: the sum of 8 and -12, increased by 3.

Solution

	the **sum** of 8 and -12, increased by 3
Translate.	$[8+(-12)]+3$
Simplify. Be careful not to confuse the brackets with an absolute value sign.	$(-4)+3$
Add.	-1

Try It 13.5.5.38

Translate and simplify: the sum of 9 and -16, increased by 4.

Answer

$(9+(-16))+4-3$

Try It 13.5.5.39

Translate and simplify: the sum of -8 and -12, increased by 7.

Answer

$(-8+(-12))+7-13$

When we first introduced the operation symbols, we saw that the expression may be read in several ways. They are listed in the chart below.

Table 13.5.5.5

$a-b$
a minus b
the difference of a and b
b subtracted from a
b less than a

Be careful to get a and b in the right order!

Example 13.5.5.40

Translate and then simplify

1. the difference of 13 and -21
2. subtract 24 from -19.

Solution

1.

	the **difference** of 13 and -21
Translate.	$13-(-21)$
Simplify.	34

2.

	subtract 24 **from** -19
Translate.	$-19-24$
Remember, subtract b from a means $a-b$	
Simplify.	-43

Try It 13.5.5.41

Translate and simplify

1. the difference of 14 and -23
2. subtract 21 from -17.

Answer

1. $14-(-23); 37$
2. $-17-21; -38$

Try It 13.5.5.42

Translate and simplify

1. the difference of 11 and -19
2. subtract 18 from -11.

Answer

1. $11-(-19); 30$
2. $-11-18; -29$

Once again, our prior work translating English to algebra transfers to phrases that include both multiplying and dividing integers. Remember that the key word for **multiplication** is "**product**" and for **division** is "**quotient**."

Example 13.5.5.43

Translate to an algebraic expression and simplify if possible: the product of -2 and 14.

Solution

	the product of -2 and 14
Translate.	$(-2)(14)$
Simplify.	-28

Try It 13.5.5.44

Translate to an algebraic expression and simplify if possible: the product of -5 and 12.

Answer

$-5(12); -60$

Try It 13.5.5.45

Translate to an algebraic expression and simplify if possible: the product of 8 and -13.

Answer

$-8(13); -104$

Example 13.5.5.46

Translate to an algebraic expression and simplify if possible: the quotient of -56 and -7.

Solution

$$\begin{array}{ll} & \text{the quotient of } -56 \text{ and } -7 \\ \text{Translate.} & -56 \div (-7) \\ \text{Simplify.} & 8 \end{array} \qquad (13.5.5.1)$$

Try It 13.5.5.47

Translate to an algebraic expression and simplify if possible: the quotient of -63 and -9.

Answer

$-63 \div (-9); 7$

Try It 13.5.5.48

Translate to an algebraic expression and simplify if possible: the quotient of -72 and -9.

Answer

$-72 \div (-9); 8$

Use Integers in Applications

We'll outline a plan to solve applications. It's hard to find something if we don't know what we're looking for or what to call it! So when we solve an application, we first need to determine what the problem is asking us to find. Then we'll write a phrase that gives the information to find it. We'll translate the phrase into an expression and then simplify the expression to get the answer. Finally, we summarize the answer in a sentence to make sure it makes sense.

How to Apply a Strategy to Solve Applications with Integers

Example 13.5.5.49

The temperature in Urbana, Illinois one morning was 11 degrees. By mid-afternoon, the temperature had dropped to -9 degrees. What was the difference of the morning and afternoon temperatures?

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.	
Step 2. Identify what we are asked to find.	the difference of the morning and afternoon temperatures
Step 3. Write a phrase that gives the information to find it.	the difference of 11 and -9
Step 4. Translate the phrase to an expression.	$11 - (-9)$
Step 5. Simplify the expression.	20
Step 6. Write a complete sentence that answers the question.	The difference in temperatures was 20 degrees.

Try It 13.5.5.50

The temperature in Anchorage, Alaska one morning was 15 degrees. By mid-afternoon the temperature had dropped to 30 degrees below zero. What was the difference in the morning and afternoon temperatures?

Answer

The difference in temperatures was 45 degrees.

Try It 13.5.5.51

The temperature in Denver was -6 degrees at lunchtime. By sunset the temperature had dropped to -15 degrees. What was the difference in the lunchtime and sunset temperatures?

Answer

The difference in temperatures was 9 degrees.

APPLY A STRATEGY TO SOLVE APPLICATIONS WITH INTEGERS.

1. Read the problem. Make sure all the words and ideas are understood
2. Identify what we are asked to find.
3. Write a phrase that gives the information to find it.
4. Translate the phrase to an expression.
5. Simplify the expression.
6. Answer the question with a complete sentence.

Example 13.5.5.52

The Mustangs football team received three penalties in the third quarter. Each penalty gave them a loss of fifteen yards. What is the number of yards lost?

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.	
Step 2. Identify what we are asked to find.	the number of yards lost
Step 3. Write a phrase that gives the information to find it.	three times a 15-yard penalty
Step 4. Translate the phrase to an expression.	$3(-15)$
Step 5. Simplify the expression.	-45
Step 6. Write a complete sentence that answers the question.	The team lost 45 yards.

Try It 13.5.5.53

The Bears played poorly and had seven penalties in the game. Each penalty resulted in a loss of 15 yards. What is the number of yards lost due to penalties?

Answer

The Bears lost 105 yards.

? Try It 13.5.5.54

Bill uses the ATM on campus because it is convenient. However, each time he uses it he is charged a $2 fee. Last month he used the ATM eight times. How much was his total fee for using the ATM?

Answer

A $16 fee was deducted from his checking account.

Key Concepts

- **Multiplication and Division of Two Signed Numbers**
  - Same signs—Product is positive
  - Different signs—Product is negative
- **Strategy for Applications**
  1. Identify what you are asked to find.
  2. Write a phrase that gives the information to find it.
  3. Translate the phrase to an expression.
  4. Simplify the expression.
  5. Answer the question with a complete sentence.

13.5.5E: Exercises

Practice Makes Perfect

Multiply Integers

In the following exercises, multiply.

Exercise 13.5.5E.55

$-4 \cdot 8$

Answer

-32

Exercise 13.5.5E.56

$-3 \cdot 9$

Exercise 13.5.5E.57

$9(-7)$

Answer

-63

Exercise 13.5.5E.58

$13(-5)$

Exercise 13.5.5E.59

$-1 \cdot 6$

Answer

-6

Exercise 13.5.5E.60

$-1 \cdot 3$

Exercise 13.5.5E.61

$-1(-14)$

Answer

14

Exercise 13.5.5E.62

$-1(-19)$

Divide Integers

In the following exercises, divide.

Exercise 13.5.5E.63

$-24 \div 6$

Answer

-4

Exercise 13.5.5E.64

$35 \div (-7)$

Exercise 13.5.5E.65

$-52 \div (-4)$

Answer

13

Exercise 13.5.5E.66

$-84 \div (-6)$

Exercise 13.5.5E.67

$-180 \div 15$

Answer

-12

Exercise 13.5.5E.68

$-192 \div 12$

Simplify Expressions with Integers

In the following exercises, simplify each expression.

Exercise 13.5.5E.69

$5(-6)+7(-2)-3$

Answer

-47

Exercise 13.5.5E.70

$8(-4)+5(-4)-6$

Exercise 13.5.5E.71

$(-2)^6$

Answer

64

Exercise 13.5.5E.72

$(-3)^5$

Exercise 13.5.5E.73

$(-4)^2$

Answer

-16

Exercise 13.5.5E.74

$(-6)^2$

Exercise 13.5.5E.75

$-3(-5)(6)$

Answer

90

Exercise 13.5.5E.76

$-4(-6)(3)$

Exercise 13.5.5E.77

$(8-11)(9-12)$

Answer

9

Exercise 13.5.5E.78

$(6-11)(8-13)$

Exercise 13.5.5E.79

$26-3(2-7)$

Answer

41

Exercise 13.5.5E.80

23−2(4−6)

Exercise 13.5.5E.81

$65 \div (-5) + (-28) \div (-7)$

Answer

-9

Exercise 13.5.5E.82

$52 \div (-4) + (-32) \div (-8)$

Exercise 13.5.5E.83

9−2[3−8(−2)]

Answer

-29

Exercise 13.5.5E.84

11−3[7−4(−20)]

Exercise 13.5.5E.85

$(-3)^2 - 24 \div (8 - 2)$

Answer

5

Exercise 13.5.5E.86

$(-4)^2 - 32 \div (12 - 4)$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

Exercise 13.5.5E.87

y+(−14) when

1. y=−33
2. y=30

Answer

1. −47
2. 16

Exercise 13.5.5E.88

x+(−21) when

1. x=−27
2. x=44

Exercise 13.5.5E.89

1. a+3 when a=−7
2. −a+3 when a=−7

Answer

1. −4
2. 10

Exercise 13.5.5E.90

1. d+(−9) when d=−8
2. −d+(−9) when d=−8

Exercise 13.5.5E.91

m+n when
m=−15,n=7

Answer

-8

Exercise 13.5.5E.92

p+q when
p=−9,q=17

Exercise 13.5.5E.93

r+s when r=−9,s=−7

Answer

-16

Exercise 13.5.5E.94

t+u when t=−6,u=−5

Exercise 13.5.5E.95

$(x+y)^2$ when
x=−3,y=14

Answer

121

Exercise 13.5.5E.96

$(y+z)^2$ when
y=−3, z=15

Exercise 13.5.5E.97

−2x+17 when

1. x=8
2. x=−8

Answer

1. 1
2. 33

Exercise 13.5.5E.98

−5y+14 when

1. y=9
2. y=−9

Exercise 13.5.5E.99

10−3m when

1. m=5
2. m=−5

Answer

1. −5
2. 25

Exercise 13.5.5E.100

18−4n when

1. n=3
2. n=−3

Exercise 13.5.5E.101

$2w^2-3w+7$ when
w=−2

Answer

21

Exercise 13.5.5E.102

$3u^2-4u+5$

Exercise 13.5.5E.103

9a−2b−8 when
a=−6 and b=−3

Answer

-56

Exercise 13.5.5E.104

7m−4n−2 when
m=−4 and n=−9

Translate English Phrases to Algebraic Expressions

In the following exercises, translate to an algebraic expression and simplify if possible.

Exercise 13.5.5E.105

the sum of 3 and −15, increased by 7

Answer

(3+(−15))+7;−5

Exercise 13.5.5E.106

the sum of −8 and −9, increased by 23

Exercise 13.5.5E.107

the difference of 10 and −18

Answer

10−(−18);28

Exercise 13.5.5E.108

subtract 11 from −25

Exercise 13.5.5E.109

the difference of −5 and −30

Answer

−5−(−30);25

Exercise 13.5.5E.110

subtract −6 from −13

Exercise 13.5.5E.111

the product of −3 and 15

Answer

$-3 \cdot 15; -45$

Exercise 13.5.5E.112

the product of −4 and 16

Exercise 13.5.5E.113

the quotient of −60 and −20

Answer

$-60 \div (-20); 3$

Exercise 13.5.5E.114

the quotient of −40 and −20

Exercise 13.5.5E.115

the quotient of −6 and the sum of *a* and *b*

Answer

$\frac{-6}{a+b}$

Exercise 13.5.5E.116

the quotient of −6 and the sum of *a* and *b*

Exercise 13.5.5E.117

the product of −10 and the difference of p and q

Answer

−10(p−q)

Exercise 13.5.5E.118

the product of −13 and the difference of c and d

Use Integers in Applications

In the following exercises, solve.

Exercise 13.5.5E.119

Temperature On January 15, the high temperature in Anaheim, California, was 84°. That same day, the high temperature in Embarrass, Minnesota was −12°. What was the difference between the temperature in Anaheim and the temperature in Embarrass?

Answer

96°

Exercise 13.5.5E.120

Temperature On January 21, the high temperature in Palm Springs, California, was 89°, and the high temperature in Whitefield, New Hampshire was −31°. What was the difference between the temperature in Palm Springs and the temperature in Whitefield?

Exercise 13.5.5E.121

Football At the first down, the Chargers had the ball on their 25 yard line. On the next three downs, they lost 6 yards, gained 10 yards, and lost 8 yards. What was the yard line at the end of the fourth down?

Answer

21

Exercise 13.5.5E.122

Football At the first down, the Steelers had the ball on their 30 yard line. On the next three downs, they gained 9 yards, lost 14 yards, and lost 2 yards. What was the yard line at the end of the fourth down?

Exercise 13.5.5E.123

Checking Account Mayra has $124 in her checking account. She writes a check for $152. What is the new balance in her checking account?

Answer

−$28

Exercise 13.5.5E.124

Checking Account Selina has $165 in her checking account. She writes a check for $207. What is the new balance in her checking account?

Exercise 13.5.5E.125

Checking Account Diontre has a balance of −$38 in his checking account. He deposits $225 to the account. What is the new balance?

Answer

$187

Exercise 13.5.5E.126

Checking Account Reymonte has a balance of −$49 in his checking account. He deposits $281 to the account. What is the new balance?

Everyday Math

Exercise 13.5.5E.127

Stock market Javier owns 300 shares of stock in one company. On Tuesday, the stock price dropped $12 per share. What was the total effect on Javier's portfolio?

Answer

Weight loss In the first week of a diet program, eight women lost an average of 3 pounds each. What was the total weight change for the eight women?

Exercise 13.5.5E.128

Weight loss In the first week of a diet program, eight women lost an average of 3 pounds each. What was the total weight change for the eight women?

Writing Exercises

Exercise 13.5.5E.129

In your own words, state the rules for multiplying integers.

Answer

Answers may vary

Exercise 13.5.5E.130

In your own words, state the rules for dividing integers.

Exercise 13.5.5E.131

Why is $-2^4 \neq (-2)^4$?

Answer

Answers may vary

Exercise 13.5.5E.132

Why is $-4^3 \neq (-4)^3$?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
multiply integers.			
divide integers.			
simplify expressions with integers.			
evaluate variable expressions with integers.			
translate English phrases to algebraic expressions.			
use integers in applications.			

ⓑ On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.5.6: Visualize Fractions

Learning Objectives

By the end of this section, you will be able to:

- Find equivalent fractions
- Simplify fractions
- Multiply fractions
- Divide fractions
- Simplify expressions written with a fraction bar
- Translate phrases to expressions with fractions

Note

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra* chapter, **Fractions**.

Find Equivalent Fractions

Fractions are a way to represent parts of a whole. The fraction $\frac{1}{3}$ means that one whole has been divided into 3 equal parts and each part is one of the three equal parts. See Figure 13.5.6.1. The fraction $\frac{2}{3}$ represents two of three equal parts. In the fraction $\frac{2}{3}$, the 2 is called the **numerator** and the 3 is called the **denominator**.

Figure 13.5.6.1: The circle on the left has been divided into 3 equal parts. Each part is $\frac{1}{3}$ of the 3 equal parts. In the circle on the right, $\frac{2}{3}$ of the circle is shaded (2 of the 3 equal parts).

Doing the Manipulative Mathematics activity "Model Fractions" will help you develop a better understanding of fractions, their numerators and denominators.

FRACTION

A **fraction** is written $\frac{a}{b}$, where $b \neq 0$ and

- a is the **numerator** and b is the **denominator**.

A fraction represents parts of a whole. The denominator b is the number of equal parts the whole has been divided into, and the numerator a indicates how many parts are included.

If a whole pie has been cut into 6 pieces and we eat all 6 pieces, we ate $\frac{6}{6}$ pieces, or, in other words, one whole pie.

Figure 13.5.6.2

So $\frac{6}{6} = 1$. This leads us to the property of one that tells us that any number, except zero, divided by itself is 1.

PROPERTY OF ONE

$$\frac{a}{a} = 1 \quad (a \neq 0) \tag{13.5.6.1}$$

Any number, except zero, divided by itself is one.

Note

Doing the Manipulative Mathematics activity “Fractions Equivalent to One” will help you develop a better understanding of fractions that are equivalent to one.

If a pie was cut in 6 pieces and we ate all 6, we ate $\frac{6}{6}$ pieces, or, in other words, one whole pie. If the pie was cut into 8 pieces and we ate all 8, we ate $\frac{8}{8}$ pieces, or one whole pie. We ate the same amount—one whole pie.

The fractions $\frac{6}{6}$ and $\frac{8}{8}$ have the same value, 1, and so they are called equivalent fractions. **Equivalent fractions** are fractions that have the same value.

Let’s think of pizzas this time. Figure $13.5.6.3$shows two images: a single pizza on the left, cut into two equal pieces, and a second pizza of the same size, cut into eight pieces on the right. This is a way to show that $\frac{1}{2}$ is equivalent to $\frac{4}{8}$. In other words, they are **equivalent fractions**.

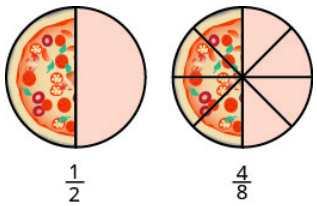

Figure $13.5.6.3$: Since the same amount is of each pizza is shaded, we see that $\frac{1}{2}$ is equivalent to $\frac{4}{8}$. They are equivalent fractions.

EQUIVALENT FRACTIONS

Equivalent fractions are fractions that have the same value.

How can we use mathematics to change $\frac{1}{2}$ into $\frac{4}{8}$? How could we take a pizza that is cut into 2 pieces and cut it into 8 pieces? We could cut each of the 2 larger pieces into 4 smaller pieces! The whole pizza would then be cut into 88 pieces instead of just 2. Mathematically, what we’ve described could be written like this as $\frac{1 \cdot 4}{2 \cdot 4} = \frac{4}{8}$. See Figure $13.5.6.4$

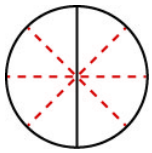

Figure $13.5.6.4$: Cutting each half of the pizza into 4 pieces, gives us pizza cut into 8 pieces: $\frac{1 \cdot 4}{2 \cdot 4} = \frac{4}{8}$

This model leads to the following property:

EQUIVALENT FRACTIONS PROPERTY

If a, b, c are numbers where $b \neq 0, c \neq 0$, then

$$\frac{a}{b} = \frac{a \cdot c}{b \cdot c} \tag{13.5.6.2}$$

If we had cut the pizza differently, we could get

$$\frac{1 \cdot 2}{2 \cdot 2} = \frac{2}{4} \text{ so } \frac{1}{2} = \frac{2}{4}$$

$$\frac{1 \cdot 3}{2 \cdot 3} = \frac{3}{6} \text{ so } \frac{1}{2} = \frac{3}{6}$$

$$\frac{1 \cdot 10}{2 \cdot 10} = \frac{10}{20} \text{ so } \frac{1}{2} = \frac{10}{20}$$

Figure 13.5.6.5

So, we say $\frac{1}{2}$, $\frac{2}{4}$, $\frac{3}{6}$, and $\frac{10}{20}$ are equivalent fractions.

Note

Doing the Manipulative Mathematics activity "Equivalent Fractions" will help you develop a better understanding of what it means when two fractions are equivalent.

Example 13.5.6.1

Find three fractions equivalent to $\frac{2}{5}$.

Solution

To find a fraction equivalent to $\frac{2}{5}$, we multiply the numerator and denominator by the same number. We can choose any number, except for zero. Let's multiply them by 2, 3, and then 5.

$$\frac{2 \cdot 2}{5 \cdot 2} = \frac{4}{10} \quad \frac{2 \cdot 3}{5 \cdot 3} = \frac{6}{15} \quad \frac{2 \cdot 5}{5 \cdot 5} = \frac{10}{25}$$

So, $\frac{4}{10}$, $\frac{6}{15}$, and $\frac{10}{25}$ are equivalent to $\frac{2}{5}$.

Try It 13.5.6.2

Find three fractions equivalent to $\frac{3}{5}$.

Answer

$\frac{6}{10}$, $\frac{9}{15}$, $\frac{12}{20}$; answers may vary

Try It 13.5.6.3

Find three fractions equivalent to $\frac{4}{5}$.

Answer

$\frac{8}{10}$, $\frac{12}{15}$, $\frac{16}{20}$; answers may vary

Simplify Fractions

A fraction is considered **simplified** if there are no common factors, other than 1, in its numerator and denominator.

For example,

- $\frac{2}{3}$ is simplified because there are no common factors of 2 and 3.
- $\frac{10}{15}$ is not simplified because 5 is a common factor of 10 and 15.

SIMPLIFIED FRACTION

A fraction is considered **simplified** if there are no common factors in its numerator and denominator.

The phrase *reduce a fraction* means to simplify the fraction. We simplify, or reduce, a fraction by removing the common factors of the numerator and denominator. A fraction is not simplified until all common factors have been removed. If an expression has fractions, it is not completely simplified until the fractions are simplified.

In Exercise 13.5.6.4 we used the equivalent fractions property to find equivalent fractions. Now we'll use the equivalent fractions property in reverse to simplify fractions. We can rewrite the property to show both forms together.

EQUIVALENT FRACTIONS PROPERTY

If a, b, c are numbers where $b \neq 0, c \neq 0$,

$$\text{then } \frac{a}{b} = \frac{a \cdot c}{b \cdot c} \text{ and } \frac{a \cdot c}{b \cdot c} = \frac{a}{b} \tag{13.5.6.3}$$

Example 13.5.6.4

Simplify: $-\frac{32}{56}$

Solution

	$-\frac{32}{56}$
Rewrite the numerator and denominator showing the common factors.	$-\frac{4 \cdot 8}{7 \cdot 8}$
Simplify using the equivalent fractions property.	$-\frac{4}{7}$

Notice that the fraction $-\frac{4}{7}$ is simplified because there are no more common factors.

p

Try It 13.5.6.5

Simplify: $-\frac{42}{54}$

Answer

$-\frac{7}{9}$

Try It 13.5.6.6

Simplify: $-\frac{30}{54}$

Answer

$-\frac{5}{9}$

Sometimes it may not be easy to find common factors of the numerator and denominator. When this happens, a good idea is to factor the numerator and the denominator into **prime numbers**. Then divide out the common factors using the equivalent fractions property.

Example 13.5.6.7

Simplify: $-\frac{210}{385}$

Solution

Step 1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers first.	Rewrite 210 and 385 as the product of the primes.	$-\frac{210}{385}$ $-\frac{2\cdot 3\cdot 5\cdot 7}{5\cdot 7\cdot 11}$
Step 2. Simplify using the equivalent fractions property by dividing out common factors.	Mark the common factors 5 and 7. Divide out the common factors.	$-\frac{2\cdot 3\cdot \cancel{5}\cdot \cancel{7}}{\cancel{5}\cdot \cancel{7}\cdot 11}$ $-\frac{2\cdot 3}{11}$
Step 3. Multiplify the remaining factors, if necessary.		$-\frac{6}{11}$

Try It 13.5.6.8

Simplify: $-\frac{69}{120}$

Answer

$-\frac{23}{40}$

Try It 13.5.6.9

Simplify: $-\frac{120}{192}$

Answer

$-\frac{5}{8}$

We now summarize the steps you should follow to simplify fractions.

SIMPLIFY A FRACTION.

1. Rewrite the numerator and denominator to show the common factors.
   If needed, factor the numerator and denominator into prime numbers first.
2. Simplify using the equivalent fractions property by dividing out common factors.
3. Multiply any remaining factors, if needed.

Example 13.5.6.10

Simplify: $\frac{5x}{5y}$

Solution

$\frac{5x}{5y}$

Rewrite showing the common factors, then divide out the common factors.	Rewrite showing the common factors, then divide out the common factors. $\frac{5x}{5y}$ $\frac{5 \cdot x}{5 \cdot y}$ Simplify. $\frac{x}{y}$
Simplify.	$\frac{x}{y}$

Try It 13.5.6.11

Simplify: $\frac{7x}{7y}$

Answer

$\frac{x}{y}$

Try It 13.5.6.12

Simplify: $\frac{3a}{3b}$

Answer

$\frac{a}{b}$

Multiply Fractions

Many people find multiplying and dividing fractions easier than adding and subtracting fractions. So we will start with fraction multiplication.

Doing the Manipulative Mathematics activity "Model Fraction Multiplication" will help you develop a better understanding of multiplying fractions.

We'll use a model to show you how to multiply two fractions and to help you remember the procedure. Let's start with $\frac{3}{4}$.

Figure 13.5.6.6

Now we'll take $\frac{1}{2}$ of $\frac{3}{4}$.

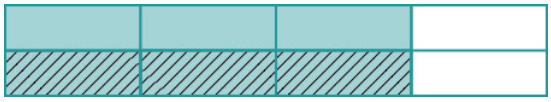

Figure 13.5.6.6

Notice that now, the whole is divided into 8 equal parts. So $\frac{1}{2} \cdot \frac{3}{4} = \frac{3}{8}$.

To multiply fractions, we multiply the numerators and multiply the denominators.

FRACTION MULTIPLICATION

If a, b, c and d are numbers where $b \neq 0$ and $d \neq 0$, then

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd} \tag{13.5.6.4}$$

To multiply fractions, multiply the numerators and multiply the denominators.

When **multiplying fractions**, the properties of positive and negative numbers still apply, of course. It is a good idea to determine the sign of the **product** as the first step. In Exercise 13.5.6.13 we will multiply negative and a positive, so the product will be negative.

Example 13.5.6.13

Multiply: $-\frac{11}{12} \cdot \frac{5}{7}$

Solution

The first step is to find the sign of the product. Since the signs are the different, the product is negative.

	$-\frac{11}{12} \cdot \frac{5}{7}$
Determine the sign of the product; multiply.	$-\frac{11 \cdot 5}{12 \cdot 7}$
Are there any common factors in the numerator and the denominator? No	$-\frac{55}{84}$

(13.5.6.5)

Try It 13.5.6.14

Multiply: $-\frac{10}{28} \cdot \frac{8}{15}$

Answer

$-\frac{4}{21}$

Try It 13.5.6.15

Multiply: $-\frac{9}{20} \cdot \frac{5}{12}$

Answer

$-\frac{3}{16}$

When multiplying a fraction by an integer, it may be helpful to write the integer as a fraction. Any integer, a, can be written as $\frac{a}{1}$. So, for example, $3 = \frac{3}{1}$.

Example 13.5.6.16

Multiply: $-\frac{12}{5}(-20x)$

Solution

Determine the sign of the product. The signs are the same, so the product is positive.

	$-\frac{12}{5}(-20x)$
Write $20x$ as a fraction.	$\frac{12}{5}(\frac{20x}{1})$
Multiply.	
Rewrite 20 to show the common factor 5 and divide it out.	$\frac{12 \cdot 4 \cdot \cancel{5}x}{\cancel{5} \cdot 1}$
Simplify.	$48x$

Try It 13.5.6.17

Multiply: $\frac{11}{3}(-9a)$

Answer

$-33a$

Try It 13.5.6.18

Multiply: $\frac{13}{7}(-14b)$

Answer

$-26b$

Divide Fractions

Now that we know how to multiply fractions, we are almost ready to divide. Before we can do that, that we need some vocabulary.

The **reciprocal** of a fraction is found by inverting the fraction, placing the numerator in the denominator and the denominator in the numerator. The reciprocal of $\frac{2}{3}$ is $\frac{3}{2}$.

Notice that $\frac{2}{3} \cdot \frac{3}{2} = 1$. A number and its reciprocal multiply to 1.

To get a **product** of positive 1 when multiplying two numbers, the numbers must have the same sign. So reciprocals must have the same sign.

The reciprocal of $-\frac{10}{7}$ is $-\frac{7}{10}$, since $-\frac{10}{7}(-\frac{7}{10}) = 1$.

RECIPROCAL

The **reciprocal** of $\frac{a}{b}$ is $\frac{b}{a}$.

A number and its reciprocal multiply to one $\frac{a}{b} \cdot \frac{b}{a} = 1$

Note

Doing the Manipulative Mathematics activity “Model Fraction Division” will help you develop a better understanding of dividing fractions.

To divide fractions, we multiply the first fraction by the reciprocal of the second.

FRACTION DIVISION

If a, b, c and d are numbers where $b \neq 0, c \neq 0$ and $d \neq 0$, then

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} \tag{13.5.6.6}$$

To divide fractions, we multiply the first fraction by the reciprocal of the second.

We need to say $b \neq 0, c \neq 0$ and $d \neq 0$ to be sure we don't divide by zero!

Example 13.5.6.19

Divide: $-\frac{2}{3} \div \frac{n}{5}$

Solution

	$-\frac{2}{3} \div \frac{n}{5}$
To divide, multiply the first fraction by the reciprocal of the second.	$-\frac{2}{3} \cdot \frac{5}{n}$
Multiply.	$-\frac{10}{3n}$

(13.5.6.7)

Try It 13.5.6.20

Divide: $-\frac{3}{5} \div \frac{p}{7}$.

Answer

$-\frac{21}{5p}$

Try It 13.5.6.21

Divide: $-\frac{5}{8} \div \frac{q}{3}$.

Answer

$-\frac{15}{8q}$

Example 13.5.6.22

Find the quotient:

$-\frac{7}{18} \div (-\frac{14}{27})$

Solution

	$-\frac{7}{18} \div (-\frac{14}{27})$

To divide, multiply the first fraction by the reciprocal of the second.	$-\frac{7}{18} \cdot -\frac{27}{14}$
Determine the sign of the product, and then multiply..	$\frac{7 \cdot 27}{18 \cdot 14}$
Rewrite showing common factors.	$\frac{7 \cdot 9 \cdot 3}{9 \cdot 2 \cdot 7 \cdot 2}$
Remove common factors.	$\frac{3}{2 \cdot 2}$
Simplify.	$\frac{3}{4}$

Try It 13.5.6.23

Find the quotient:

$-\frac{7}{8} \div (-\frac{14}{27})$

Answer

$\frac{4}{15}$

Try It 13.5.6.24

Find the quotient:

$-\frac{7}{8} \div (-\frac{14}{27})$

Answer

$\frac{2}{3}$

There are several ways to remember which steps to take to multiply or divide fractions. One way is to repeat the call outs to yourself. If you do this each time you do an exercise, you will have the steps memorized.

- “To multiply fractions, multiply the numerators and multiply the denominators.”
- “To divide fractions, multiply the first fraction by the reciprocal of the second.”

Another way is to keep two examples in mind:

One fourth of two pizzas is one half of a pizza.

$$2 \cdot \frac{1}{4}$$

$$\frac{2}{1} \cdot \frac{1}{4}$$

$$\frac{2}{4}$$

$$\frac{1}{2}$$

There are eight quarters in $2.00.

$$2 \div \frac{1}{4}$$

$$\frac{2}{1} \div \frac{1}{4}$$

$$\frac{2}{1} \cdot \frac{4}{1}$$

$$8$$

Figure 13.5.6.7

The numerators or denominators of some fractions contain fractions themselves. A fraction in which the numerator or the denominator is a fraction is called a **complex fraction**.

COMPLEX FRACTION

A **complex fraction** is a fraction in which the numerator or the denominator contains a fraction.

Some examples of complex fractions are:

$$\frac{\frac{6}{7}}{3} \quad \frac{\frac{3}{4}}{\frac{5}{8}} \quad \frac{\frac{x}{2}}{\frac{5}{6}} \tag{13.5.6.8}$$

To simplify a complex fraction, we remember that the fraction bar means **division**. For example, the complex fraction $\frac{\frac{3}{4}}{\frac{5}{8}}$ means $\frac{3}{4} \div \frac{5}{8}$.

Example 13.5.6.25

Simplify: $\frac{\frac{3}{4}}{\frac{5}{8}}$

Solution

	$\frac{\frac{3}{4}}{\frac{5}{8}}$
Rewrite as division.	$\frac{3}{4} \div \frac{5}{8}$
Multiply the first fraction by the reciprocal of the second.	$\frac{3}{4} \cdot \frac{8}{5}$
Multiply.	$\frac{3 \cdot 8}{4 \cdot 5}$
Look for common factors.	$\frac{3 \cdot 4 \cdot 2}{4 \cdot 5}$
Divide out common factors and simplify.	$\frac{6}{5}$

Try It 13.5.6.26

Simplify: $\frac{\frac{2}{3}}{\frac{5}{6}}$

Answer

$\frac{4}{5}$

Try It 13.5.6.27

Simplify: $\frac{\frac{3}{7}}{\frac{6}{11}}$

Answer

$\frac{11}{14}$

Example 13.5.6.28

Simplify: $\frac{\frac{x}{2}}{\frac{xy}{6}}$

Solution

	$\frac{\frac{x}{2}}{\frac{xy}{6}}$
Rewrite as division.	$\frac{x}{2} \div \frac{xy}{6}$
Multiply the first fraction by the reciprocal of the second.	$\frac{x}{2} \cdot \frac{6}{xy}$
Multiply.	$\frac{x \cdot 6}{2 \cdot xy}$
Look for common factors.	$\frac{x \cdot 3 \cdot 2}{2 \cdot x \cdot y}$
Divide out common factors and simplify.	$\frac{3}{y}$

Try It 13.5.6.29

Simplify: $\frac{\frac{a}{8}}{\frac{ab}{6}}$

Answer

$\frac{3}{4b}$

Try It 13.5.6.30

Simplify: $\dfrac{\frac{p}{2}}{\frac{pq}{8}}$

Answer

$\dfrac{4}{q}$

Simplify Expressions with a Fraction Bar

The line that separates the numerator from the denominator in a fraction is called a fraction bar. A **fraction bar** acts as grouping symbol. The order of operations then tells us to simplify the numerator and then the denominator. Then we divide.

To simplify the expression $\dfrac{5-3}{7+1}$, we first simplify the numerator and the denominator separately. Then we divide.

$$\begin{array}{l} \dfrac{5-3}{7+1} \\ \dfrac{2}{8} \\ \dfrac{1}{4} \end{array} \tag{13.5.6.9}$$

SIMPLIFY AN EXPRESSION WITH A FRACTION BAR.

1. Simplify the expression in the numerator. Simplify the expression in the denominator.
2. Simplify the fraction.

Example 13.5.6.31

Simplify: $\dfrac{4-2(3)}{2^2+2}$

Solution

	$\dfrac{4-2(3)}{2^2+2}$
Use the order of operations to simplify the numerator and the denominator.	$\dfrac{4-6}{4+2}$
Simplify the numerator and the denominator	$\dfrac{-2}{6}$
Simplify. A negative divided by a positive is negative.	$-\dfrac{1}{3}$

(13.5.6.10)

Try It 13.5.6.32

Simplify: $\dfrac{6-3(5)}{3^2+3}$

Answer

$-\dfrac{3}{4}$

Try It 13.5.6.33

Simplify: $\dfrac{4-4(6)}{3^2+3}$

Answer

$-\dfrac{5}{3}$

Where does the negative sign go in a fraction? Usually the negative sign is in front of the fraction, but you will sometimes see a fraction with a negative numerator, or sometimes with a negative denominator. Remember that fractions represent division. When the numerator and denominator have different signs, the quotient is negative.

$$\begin{aligned} \tfrac{-1}{3} &= -\tfrac{1}{3} \quad \tfrac{\text{negative}}{\text{positive}} = \text{negative} \\ \tfrac{1}{-3} &= -\tfrac{1}{3} \quad \tfrac{\text{positive}}{\text{negative}} = \text{negative} \end{aligned} \tag{13.5.6.11}$$

PLACEMENT OF NEGATIVE SIGN IN A FRACTION

For any positive numbers a and b,

$$\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b} \tag{13.5.6.12}$$

Example 13.5.6.34

Simplify: $\frac{4(-3)+6(-2)}{-3(2)-2}$

Solution

The fraction bar acts like a grouping symbol. So completely simplify the numerator and the denominator separately.

$$\begin{aligned} & \tfrac{4(-3)+6(-2)}{-3(2)-2} \\ \text{Multiply.} \quad & \tfrac{-12+(-12)}{-6-2} \\ \text{Simplify.} \quad & \tfrac{-24}{-8} \\ \text{Divide.} \quad & 3 \end{aligned} \tag{13.5.6.13}$$

Try It 13.5.6.35

Simplify: $\frac{8(-2)+4(-3)}{-5(2)+3}$

Answer

4

Try It 13.5.6.36

Simplify: $\frac{7(-1)+9(-3)}{-5(3)-2}$

Answer

2

Translate Phrases to Expressions with Fractions

Now that we have done some work with fractions, we are ready to translate phrases that would result in expressions with fractions.

The English words **quotient** and **ratio** are often used to describe fractions. Remember that "quotient" means **division**. The quotient of aa and bb is the result we get from dividing a by b, or $\frac{a}{b}$.

Example 13.5.6.37

Translate the English phrase into an algebraic expression: the quotient of the difference of m and n, and p.

Solution

We are looking for the *quotient of* the difference of m and n, and p. This means we want to divide the difference of m and n, and p.

$$\frac{m-n}{p} \tag{13.5.6.14}$$

Try It 13.5.6.38

Translate the English phrase into an algebraic expression: the quotient of the difference of a and b, and cd.

Answer

$\frac{a-b}{cd}$

Try It 13.5.6.39

Translate the English phrase into an algebraic expression: the quotient of the sum of p and q, and r.

Answer

$\frac{p+q}{r}$

Key Concepts

- **Equivalent Fractions Property:** If a, b, c are numbers where $b \neq 0, c \neq 0$, then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$ and $\frac{a \cdot c}{b \cdot c} = \frac{a}{b}$
- **Fraction Division:** If a, b, c and d are numbers where $b \neq 0, c \neq 0$ and $d \neq 0$, then $\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c}$. To divide fractions, multiply the first fraction by the reciprocal of the second.
- **Fraction Multiplication:** If a, b, c and d are numbers where $b \neq 0, d \neq 0$, then $\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$. To multiply fractions, multiply the numerators and multiply the denominators.
- **Placement of Negative Sign in a Fraction:** For any positive numbers a and b, $\frac{-a}{a} = \frac{a}{-a} = -\frac{a}{b}$
- **Property of One:** $\frac{a}{a} = 1$; Any number, except zero, divided by itself is one.
- **Simplify a Fraction**
  1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers first.
  2. Simplify using the equivalent fractions property by dividing out common factors.
  3. Multiply any remaining factors.
- **Simplify an Expression with a Fraction Bar**
  1. Simplify the expression in the numerator. Simplify the expression in the denominator.
  2. Simplify the fraction.

Glossary

complex fraction

A complex fraction is a fraction in which the numerator or the denominator contains a fraction.

denominator

The denominator is the value on the bottom part of the fraction that indicates the number of equal parts into which the whole has been divided.

equivalent fractions

Equivalent fractions are fractions that have the same value.

fraction

A fraction is written $\frac{a}{b}$, where $b \neq 0$, a is the numerator and b is the denominator. A fraction represents parts of a whole. The denominator b is the number of equal parts the whole has been divided into, and the numerator aa indicates how many parts are included.

numerator

The numerator is the value on the top part of the fraction that indicates how many parts of the whole are included.

reciprocal

The reciprocal of $\frac{a}{b}$ is $\frac{b}{a}$. A number and its reciprocal multiply to one: $\frac{a}{b} \cdot \frac{b}{a} = 1$.

simplified fraction

A fraction is considered simplified if there are no common factors in its numerator and denominator.

13.5.6E: Exercises

Practice Makes Perfect

Find Equivalent Fractions

In the following exercises, find three fractions equivalent to the given fraction. Show your work, using figures or algebra.

Exercise 13.5.6E.1

$\frac{3}{8}$

Answer

$\frac{6}{16}, \frac{9}{24}, \frac{12}{32}$, answers may vary

Exercise 13.5.6E.2

$\frac{5}{8}$

Exercise 13.5.6E.3

$\frac{5}{9}$

Answer

$\frac{10}{18}, \frac{15}{27}, \frac{20}{36}$, answers may vary

Exercise 13.5.6E.4

$\frac{1}{8}$

Simplify Fractions

In the following exercises, simplify.

Exercise 13.5.6E.5

$-\frac{40}{88}$

Answer

$-\frac{5}{11}$

Exercise 13.5.6E.6

$-\frac{63}{99}$

Exercise 13.5.6E.7

$$-\frac{108}{63}$$

Answer

$$-\frac{12}{7}$$

Exercise 13.5.6E.8

$$-\frac{104}{48}$$

Exercise 13.5.6E.9

$$\frac{120}{252}$$

Answer

$$\frac{10}{21}$$

Exercise 13.5.6E.10

$$\frac{182}{294}$$

Exercise 13.5.6E.11

$$-\frac{3x}{12y}$$

Answer

$$-\frac{x}{4y}$$

Exercise 13.5.6E.12

$$-\frac{4x}{32y}$$

Exercise 13.5.6E.13

$$\frac{14x^2}{21y}$$

Answer

$$\frac{2x^2}{3y}$$

Exercise 13.5.6E.14

$$\frac{24a}{32b^2}$$

Multiply Fractions

In the following exercises, multiply.

Exercise 13.5.6E.15

$$\frac{3}{4} \cdot \frac{9}{10}$$

Answer

$$\frac{27}{40}$$

Exercise 13.5.6E.16

$$\frac{4}{5} \cdot \frac{2}{7}$$

Exercise 13.5.6E.17

$$-\frac{2}{3} \cdot -\frac{3}{8}$$

Answer

$$\frac{1}{4}$$

Exercise 13.5.6E.18

$$-\frac{3}{4}\left(-\frac{4}{9}\right)$$

Exercise 13.5.6E.19

$$-\frac{5}{9} \cdot \frac{3}{10}$$

Answer

$$-\frac{1}{6}$$

Exercise 13.5.6E.20

$$-\frac{3}{8} \cdot \frac{4}{15}$$

Exercise 13.5.6E.21

$$\left(-\frac{14}{15}\right)\left(\frac{9}{20}\right)$$

Answer

$$-\frac{21}{50}$$

Exercise 13.5.6E.22

$$\left(-\frac{9}{10}\right)\left(\frac{25}{33}\right)$$

Exercise 13.5.6E.23

$$\left(-\frac{63}{84}\right)\left(-\frac{44}{90}\right)$$

Answer

$$\frac{11}{30}$$

Exercise 13.5.6E.24

$$\left(-\frac{63}{60}\right)\left(-\frac{40}{88}\right)$$

Exercise 13.5.6E.25

$$4 \cdot \frac{5}{11}$$

Answer

$$\frac{20}{11}$$

Exercise 13.5.6E.26

$$5 \cdot \frac{8}{3}$$

Exercise 13.5.6E.27

$$\frac{3}{7} \cdot 21n$$

Answer

9n

Exercise 13.5.6E.28

$$\frac{5}{6} \cdot 30m$$

Exercise 13.5.6E.29

$-8 \cdot \frac{17}{4}$

Answer

-34

Exercise 13.5.6E.30

$(-1)\left(-\frac{6}{7}\right)$

Divide Fractions

In the following exercises, divide.

Exercise 13.5.6E.31

$\frac{3}{4} \div \frac{2}{3}$

Answer

$\frac{9}{8}$

Exercise 13.5.6E.32

$\frac{4}{5} \div \frac{3}{4}$

Exercise 13.5.6E.33

$-\frac{7}{9} \div \left(-\frac{7}{4}\right)$

Answer

$\frac{4}{9}$

Exercise 13.5.6E.34

$-\frac{5}{6} \div \left(-\frac{5}{6}\right)$

Exercise 13.5.6E.35

$\frac{3}{4} \div \frac{x}{11}$

Answer

$\frac{33}{4x}$

Exercise 13.5.6E.36

$\frac{2}{5} \div \frac{y}{9}$

Exercise 13.5.6E.37

$\frac{5}{18} \div -\frac{15}{24}$

Answer

$-\frac{4}{9}$

Exercise 13.5.6E.38

$\frac{7}{18} \div \left(-\frac{14}{27}\right)$

Exercise 13.5.6E.39

$\frac{8u}{15} \div \frac{12v}{25}$

Answer

$\frac{10u}{9v}$

Exercise 13.5.6E.40

$\frac{12r}{25} \div \frac{18s}{35}$

Exercise 13.5.6E.41

$-5 \div \frac{1}{2}$

Answer

-10

Exercise 13.5.6E.42

$-3 \div \frac{1}{4}$

Exercise 13.5.6E.43

$\frac{3}{4} \div (-12)$

Answer

$\frac{1}{16}$

Exercise 13.5.6E.44

$-15 \div -\frac{5}{3}$

In the following exercises, simplify.

Exercise 13.5.6E.45

$$\frac{-\frac{8}{21}}{\frac{12}{35}}$$

Answer

$-\frac{10}{9}$

Exercise 13.5.6E.46

$$\frac{-\frac{9}{16}}{\frac{33}{40}}$$

Exercise 13.5.6E.47

$$\frac{-\frac{4}{5}}{2}$$

Answer

$-\frac{2}{5}$

Exercise 13.5.6E.48

$$\frac{5}{\frac{3}{10}}$$

Exercise 13.5.6E.49

$$\frac{\frac{m}{3}}{\frac{n}{2}}$$

Answer

$\frac{2m}{3n}$

Exercise 13.5.6E.50

$$\frac{-\frac{3}{8}}{-\frac{y}{12}}$$

Simplify Expressions Written with a Fraction Bar

In the following exercises, simplify.

Exercise 13.5.6E.51

$$\frac{22+3}{10}$$

Answer

$$\frac{5}{2}$$

Exercise 13.5.6E.52

$$\frac{19-4}{6}$$

Exercise 13.5.6E.53

$$\frac{48}{24-15}$$

Answer

$$\frac{16}{3}$$

Exercise 13.5.6E.54

$$\frac{46}{4+4}$$

Exercise 13.5.6E.55

$$\frac{-6+6}{8+4}$$

$$\frac{3}{5}$$

Exercise 13.5.6E.60

$$\frac{7^2 + 1}{60}$$

Exercise 13.5.6E.61

$$\frac{8 \cdot 3 + 2 \cdot 9}{14 + 3}$$

Answer

$$\frac{42}{17}$$

Exercise 13.5.6E.62

$$\frac{9 \cdot 6 - 4 \cdot 7}{22 + 3}$$

Exercise 13.5.6E.63

$$\frac{5 \cdot 6 - 3 \cdot 4}{4 \cdot 5 - 2 \cdot 3}$$

Answer

$$\frac{9}{7}$$

Exercise 13.5.6E.64

$$\frac{8 \cdot 9 - 7 \cdot 6}{5 \cdot 6 - 9 \cdot 2}$$

Exercise 13.5.6E.65

$$\frac{5^2 - 3^2}{3 - 5}$$

Answer

-8

Exercise 13.5.6E.66

$$\frac{6^2 - 4^2}{4 - 6}$$

Exercise 13.5.6E.67

$$\frac{7 \cdot 4 - 2(8 - 5)}{9 \cdot 3 - 3 \cdot 5}$$

Answer

$\frac{11}{6}$

Exercise 13.5.6E.68

$$\frac{9 \cdot 7 - 3(12 - 8)}{8 \cdot 7 - 6 \cdot 6}$$

Exercise 13.5.6E.69

$$\frac{9(8 - 2) - 3(15 - 7)}{6(7 - 1) - 3(17 - 9)}$$

Answer

$\frac{5}{2}$

Exercise 13.5.6E.70

$$\frac{8(9 - 2) - 4(14 - 9)}{7(8 - 3) - 3(16 - 9)}$$

Translate Phrases to Expressions with Fractions

In the following exercises, translate each English phrase into an algebraic expression.

Exercise 13.5.6E.71

the quotient of r and the sum of s and 10

Answer

$$\frac{r}{s+10}$$

Exercise 13.5.6E. 72

the quotient of A and the difference of 3 and B

Exercise 13.5.6E. 73

the quotient of the difference of x and y, and -3

Answer

$$\frac{x-y}{-3}$$

Exercise 13.5.6E. 74

the quotient of the sum of m and n, and $4q$

Everyday Math

Exercise 13.5.6E. 75

Baking. A recipe for chocolate chip cookies calls for $\frac{3}{4}$ cup brown sugar. Imelda wants to double the recipe.

1. How much brown sugar will Imelda need? Show your calculation.
2. Measuring cups usually come in sets of $\frac{1}{4}$, $\frac{1}{3}$, $\frac{1}{2}$, and 1 cup. Draw a diagram to show two different ways that Imelda could measure the brown sugar needed to double the cookie recipe.

Answer

1. $1\frac{1}{2}$ cups
2. answers will vary

Exercise 13.5.6E. 76

Baking. Nina is making 4 pans of fudge to serve after a music recital. For each pan, she needs $\frac{2}{3}$ cup of condensed milk.

1. How much condensed milk will Nina need? Show your calculation.
2. Measuring cups usually come in sets of $\frac{1}{4}$, $\frac{1}{3}$, $\frac{1}{2}$, and 1 cup. Draw a diagram to show two different ways that Nina could measure the condensed milk needed for 4 pans of fudge.

Exercise 13.5.6E. 77

Portions Don purchased a bulk package of candy that weighs 5 pounds. He wants to sell the candy in little bags that hold $\frac{1}{4}$ pound. How many little bags of candy can he fill from the bulk package?

Answer

20 bags

Exercise 13.5.6E.78

Portions Kristen has $\frac{3}{4}$ yards of ribbon that she wants to cut into 6 equal parts to make hair ribbons for her daughter's 6 dolls. How long will each doll's hair ribbon be?

Writing Exercises

Exercise 13.5.6E.79

Rafael wanted to order half a medium pizza at a restaurant. The waiter told him that a medium pizza could be cut into 6 or 8 slices. Would he prefer 3 out of 6 slices or 4 out of 8 slices? Rafael replied that since he wasn't very hungry, he would prefer 3 out of 6 slices. Explain what is wrong with Rafael's reasoning.

Answer

Answers may vary

Exercise 13.5.6E.80

Give an example from everyday life that demonstrates how $\frac{1}{2} \cdot \frac{2}{3}$ is $\frac{1}{3}$.

Exercise 13.5.6E.81

Explain how you find the reciprocal of a fraction.

Answer

Answers may vary

Exercise 13.5.6E.82

Explain how you find the reciprocal of a negative number.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find equivalent fractions.			
simplify fractions.			
multiply fractions.			
divide fractions.			
simplify expressions written with a fraction bar.			
translate phrases to expressions with fractions.			

ⓑ After looking at the checklist, do you think you are well prepared for the next section? Why or why not?

This page titled 13.5.6E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **1.6E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

13.5.7: Add and Subtract Fractions

Learning Objectives

By the end of this section, you will be able to:

- Add or subtract fractions with a common denominator
- Add or subtract fractions with different denominators
- Use the order of operations to simplify complex fractions
- Evaluate variable expressions with fractions

Note

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra*chapter, **Fractions**.

Add or Subtract Fractions with a Common Denominator

When we multiplied fractions, we just multiplied the numerators and multiplied the denominators right straight across. To add or subtract fractions, they must have a common denominator.

FRACTION ADDITION AND SUBTRACTION

If a, b, and c are numbers where $c \neq 0$, then

$$\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c} \quad \text{and} \quad \frac{a}{c}-\frac{b}{c}=\frac{a-b}{c} \tag{13.5.7.1}$$

To add or subtract fractions, add or subtract the numerators and place the result over the common denominator.

Manipulative Mathematics

Doing the Manipulative Mathematics activities "Model Fraction Addition" and "Model Fraction Subtraction" will help you develop a better understanding of adding and subtracting fractions.

Example 13.5.7.1

Find the sum: $\frac{x}{3}+\frac{2}{3}$.

Solution

$$\begin{array}{ll} & \frac{x}{3}+\frac{2}{3} \\ \text{Add the numerators and place the sum over the common denominator} & \frac{x+2}{3} \end{array} \tag{13.5.7.2}$$

Try It 13.5.7.2

Find the sum: $\frac{x}{4}+\frac{3}{4}$.

Answer

$\frac{x+3}{4}$

Try It 13.5.7.3

Find the sum: $\frac{y}{8}+\frac{5}{8}$.

Answer

$\frac{y+5}{8}$

Example 13.5.7.4

Find the difference: $-\frac{23}{24}-\frac{13}{24}$

Solution

	$-\frac{23}{24}-\frac{13}{24}$
Subtract the numerators and place the difference over the common denominator	$\frac{-23-13}{24}$ (13.5.7.3)
Simplify.	$\frac{-36}{24}$
Simplify. Remember, $-\frac{a}{b}=\frac{-a}{b}$	$-\frac{3}{2}$

Try It 13.5.7.5

Find the difference: $-\frac{19}{28}-\frac{7}{28}$

Answer

$-\frac{26}{28}$

Try It 13.5.7.6

Find the difference: $-\frac{27}{32}-\frac{1}{32}$

Answer

$-\frac{7}{8}$

Example 13.5.7.7

Find the difference: $-\frac{10}{x}-\frac{4}{x}$

Solution

	$-\frac{10}{x}-\frac{4}{x}$	
Subtract the numerators and place the difference over the common denominator	$\frac{-14}{x}$	(13.5.7.4)
Rewrite with the sign in front of the fraction.	$-\frac{14}{x}$	

Try It 13.5.7.8

Find the difference: $-\frac{9}{x}-\frac{7}{x}$

Answer

$-\frac{16}{x}$

Try It 13.5.7.9

Find the difference: $-\frac{17}{a}-\frac{5}{a}$

Answer

$-\frac{22}{a}$

Now we will do an example that has both addition and subtraction.

Example 13.5.7.10

Simplify: $\frac{3}{8}+(-\frac{5}{8})-\frac{1}{8}$

Solution

Add and Subtract fractions — do they have a common denominator? Yes.	$\frac{3}{8}+(-\frac{5}{8})-\frac{1}{8}$	
Add and subtract the numerators and place the result over the common denominator.	$\frac{3+(-5)-1}{8}$	(13.5.7.5)
Simplify left to right.	$\frac{-2-1}{8}$	
Simplify.	$-\frac{3}{8}$	

Try It 13.5.7.11

Simplify: $\frac{2}{9}+(-\frac{4}{9})-\frac{7}{9}$

Answer

-1

Try It 13.5.7.12

Simplify: $\frac{2}{5}+(-\frac{4}{9})-\frac{7}{9}$

Answer

$-\frac{2}{3}$

Add or Subtract Fractions with Different Denominators

As we have seen, to add or subtract fractions, their denominators must be the same. The **least common denominator** (LCD) of two fractions is the smallest number that can be used as a common **denominator** of the fractions. The LCD of the two fractions is the least common multiple (LCM) of their denominators.

LEAST COMMON DENOMINATOR

The least common denominator (LCD) of two fractions is the least common multiple (LCM) of their denominators.

Note

Doing the Manipulative Mathematics activity "Finding the Least Common Denominator" will help you develop a better understanding of the LCD.

After we find the least common denominator of two fractions, we convert the fractions to equivalent fractions with the LCD. Putting these steps together allows us to add and subtract fractions because their denominators will be the same!

Example 13.5.7.13

Add: $\frac{7}{12}+\frac{5}{18}$

Solution

Step 1. Do they have a common denominator? No—rewrite each fraction with the LCD (least common denominator).	No. Find the LCD of 12, 18. Change into equivalent fractions with the LCD, 36. Do not simplify the equivalent fractions! If you do, you'll get back to the original fractions and lose the common denominator!	$12=2\cdot2\cdot3$ $18=2\cdot\quad3\cdot3$ $\text{LCD}=2\cdot2\cdot3\cdot3$ $\text{LCD}=36$ $\frac{7}{12}+\frac{5}{18}$ $\frac{7\cdot3}{12\cdot3}+\frac{5\cdot2}{18\cdot2}$ $\frac{21}{36}+\frac{10}{36}$
Step 2. Add or subtract the fractions.	Add.	$\frac{31}{36}$
Step 3. Simplify, if possible.	Because 31 is a prime number, it has no factors in common with 36. The answer is simplified.	

Try It 13.5.7.14

Add: $\frac{7}{12}+\frac{11}{15}$

Answer

$\frac{79}{60}$

Try It 13.5.7.15

Add: $\frac{13}{15}+\frac{17}{20}$

Answer

$\frac{103}{60}$

ADD OR SUBTRACT FRACTIONS.

1. Do they have a common denominator?
   - Yes—go to step 2.
   - No—rewrite each fraction with the LCD (least common denominator). Find the LCD. Change each fraction into an equivalent fraction with the LCD as its denominator.
2. Add or subtract the fractions.
3. Simplify, if possible.

When finding the equivalent fractions needed to create the common denominators, there is a quick way to find the number we need to multiply both the numerator and denominator. This method works if we found the LCD by factoring into primes.

Look at the factors of the LCD and then at each column above those factors. The "missing" factors of each denominator are the numbers we need.

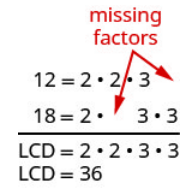

Figure: 13.5.7.1

In Exercise 13.5.7.13, the LCD, 36, has two factors of 2 and two factors of 3.

The numerator 12 has two factors of 2 but only one of 3—so it is "missing" one 3—we multiply the numerator and denominator by 3.

The numerator 18 is missing one factor of 2—so we multiply the numerator and denominator by 2.

We will apply this method as we subtract the fractions in Exercise 13.5.7.16

Example 13.5.7.16

Subtract: $\frac{7}{15}-\frac{19}{24}$

Solution

Do the fractions have a common denominator? No, so we need to find the LCD.

Find the LCD. $\frac{7}{15}-\frac{19}{24}$ $15=3\cdot 5$ $24=2\cdot 2\cdot 2\cdot 3$ $LCD=2\cdot 2\cdot 2\cdot 3\cdot 5$ $LCD=120$	
Notice, 15 is “missing” three factors of 2 and 24 is “missing” the 5 from the factors of the LCD. So we multiply 8 in the first fraction and 5 in the second fraction to get the LCD.	
Rewrite as equivalent fractions with the LCD.	$\frac{7\cdot 8}{15\cdot 8}-\frac{19\cdot 5}{24\cdot 5}$
Simplify.	$\frac{56}{120}-\frac{95}{120}$
Subtract.	$-\frac{39}{120}$
Check to see if the answer can be simplified.	$-\frac{13\cdot 3}{40\cdot 3}$
Both 39 and 120 have a factor of 3.	
Simplify.	$-\frac{13}{40}$

Do not simplify the equivalent fractions! If you do, you’ll get back to the original fractions and lose the common denominator!

? Try It 13.5.7.17

Subtract: $\frac{13}{24}-\frac{17}{32}$

Answer

$\frac{1}{96}$

? Try It 13.5.7.18

Subtract: $\frac{7}{15}-\frac{19}{24}$

Answer

$\frac{75}{224}$

In the next example, one of the fractions has a variable in its numerator. Notice that we do the same steps as when both numerators are numbers.

✓ Example 13.5.7.19

Add: $\frac{3}{5}+\frac{x}{8}$

Solution

The fractions have different denominators.

	$\frac{3}{5}+\frac{x}{8}$

Find the LCD. $\begin{array}{l} 5= \quad 5 \\ 8=2\cdot 2\cdot 2 \\ \text{LCD}=2\cdot 2\cdot 2\cdot 5 \\ \text{LCD}=40 \end{array}$	
Rewrite as equivalent fractions with the LCD.	$\frac{3\cdot 8}{5\cdot 8}+\frac{x\cdot 5}{8\cdot 5}$
Simplify.	$\frac{24}{40}+\frac{5x}{40}$
Add.	$\frac{24+5x}{40}$

Remember, we can only add like terms: 24 and $5x$ are not like terms.

Try It 13.5.7.20

Add: $\frac{y}{6}+\frac{7}{9}$

Answer

$\frac{3y+14}{18}$

Try It 13.5.7.21

Add: $\frac{x}{6}+\frac{7}{15}$

Answer

$\frac{15x+42}{153}$

We now have all four operations for fractions. Table $13.5.7.1$summarizes **fraction operations**.

Table 13.5.7.1

Fraction Multiplication	**Fraction Division**
$\frac{a}{b}\cdot\frac{c}{d}=\frac{ac}{bd}$ Multiply the numerators and multiply the denominators	$\frac{a}{b}\div\frac{c}{d}=\frac{a}{b}\cdot\frac{d}{c}$ Multiply the first fraction by the reciprocal of the second.
Fraction Addition	**Fraction Subtraction**
$\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c}$ Add the numerators and place the sum over the common denominator.	$\frac{a}{c}-\frac{b}{c}=\frac{a-b}{c}$ Subtract the numerators and place the difference over the common denominator.
To multiply or divide fractions, and LCD is NOT needed. To add or subtract fractions, an LCD is needed.	

Example 13.5.7.22

Simplify:

1. $\frac{5x}{6}-\frac{3}{10}$
2. $\frac{5x}{6}\cdot\frac{3}{10}$.

Solution

First ask, “What is the operation?” Once we identify the operation that will determine whether we need a common denominator. Remember, we need a common denominator to add or subtract, but not to multiply or divide.

1. What is the operation? The operation is subtraction.

Do the fractions have a common denominator? No.	$\frac{5x}{6}-\frac{3}{10}$	(13.5.7.6)
Rewrite each fractions as an equivalent fraction with the LCD.	$\frac{5x\cdot 5}{6\cdot 5}-\frac{3\cdot 3}{10\cdot 3}$	
	$\frac{25x}{30}-\frac{9}{30}$	
Subtract the numerators and place the difference over the common denominators.	$\frac{25x-9}{30}$	
Simplify, if possible. There are no common factors.		
The fraction is simplified.		

2. What is the operation? Multiplication.

	$\frac{5x}{6}\cdot\frac{3}{10}$	(13.5.7.7)
To multiply fractions, multiply the numerators and multiply the denominators	$\frac{5x\cdot 3}{6\cdot 10}$	
Rewrite, showing common factors.	$\frac{5x\cdot 3}{2\cdot 3\cdot 2\cdot 5}$	
common denominators.		
Simplify.	$\frac{x}{4}$	

? Try It 13.5.7.23

Simplify:

1. $\frac{3a}{4}-\frac{8}{9}$
2. $\frac{3a}{4}\cdot\frac{8}{9}$

Answer

1. $\frac{27a-32}{36}$
2. $\frac{2a}{3}$

? Try It 13.5.7.24

Simplify:

1. $\frac{4k}{5}-\frac{1}{6}$
2. $\frac{4k}{5}\cdot\frac{1}{6}$

Answer

1. $\frac{24k-5}{30}$
2. $\frac{2k}{15}$

Use the Order of Operations to Simplify Complex Fractions

We have seen that a complex fraction is a fraction in which the numerat or or denominator contains a fraction. The fraction bar indicates **division**. We simplified the complex fraction $\frac{\frac{3}{4}}{\frac{5}{8}}$ by dividing $\frac{3}{4}$ by $\frac{5}{8}$.

Now we'll look at complex fractions where the numerator or denominator contains an expression that can be simplified. So we first must completely simplify the numerator and denominator separately using the order of operations. Then we divide the numerator by the denominator.

Example 13.5.7.25: How to simplify complex fractions

Simplify: $\frac{(\frac{1}{2})^2}{4+3^2}$

Solution

Step 1. Simplify the numerator. * Remember, $\left(\frac{1}{2}\right)^2$ means $\frac{1}{2}\cdot\frac{1}{2}$.	$\frac{\left(\frac{1}{2}\right)^2}{4+3^2}$ $\frac{\frac{1}{4}}{4+3^2}$
Step 2. Simplify the denominator.	$\frac{\frac{1}{4}}{4+9}$ $\frac{\frac{1}{4}}{13}$
Step 3. Divide the numerator by the denominator. Simplify if possible. * Remember, $13=\frac{13}{1}$	$\frac{1}{4}\div 13$ $\frac{1}{4}\cdot\frac{1}{13}$ $\frac{1}{52}$

Try It 13.5.7.26

Simplify: $\frac{(\frac{1}{3})^2}{2^3+2}$

Answer

$\frac{1}{90}$

Try It 13.5.7.27

Simplify: $\frac{1+4^2}{(\frac{1}{4})^2}$

Answer

272

SIMPLIFY COMPLEX FRACTIONS.

1. Simplify the numerator.
2. Simplify the denominator.
3. Divide the numerator by the denominator. Simplify if possible.

Example 13.5.7.28

Simplify: $\dfrac{\frac{1}{2}+\frac{2}{3}}{\frac{3}{4}-\frac{1}{6}}$

Solution

	$\frac{(\frac{1}{2}+\frac{2}{3})}{(\frac{3}{4}-\frac{1}{6})}$	
Simplify the numerator (LCD $= 6$) and simplify the denominator (LCD $= 12$).	$\frac{(\frac{3}{6}+\frac{4}{6})}{(\frac{9}{12}-\frac{2}{12})}$	
Simplify.	$\frac{(\frac{7}{6})}{(\frac{7}{12})}$	(13.5.7.8)
Divide the numerator by the denominator.	$\frac{7}{6} \div \frac{7}{12}$	
Simplify.	$\frac{7}{6} \cdot \frac{12}{7}$	
Divide out common factors.	$\frac{7 \cdot 6 \cdot 2}{6 \cdot 7}$	
Simplify.	2	

Try It 13.5.7.29

Simplify: $\dfrac{\frac{1}{3}+\frac{1}{2}}{\frac{3}{4}-\frac{1}{3}}$

Answer

2

Try It 13.5.7.30

Simplify: $\dfrac{\frac{2}{3}-\frac{1}{2}}{\frac{1}{4}+\frac{1}{3}}$

Answer

$\frac{2}{7}$

Evaluate Variable Expressions with Fractions

We have evaluated expressions before, but now we can evaluate expressions with fractions. Remember, to evaluate an expression, we substitute the value of the variable into the expression and then simplify.

Example 13.5.7.31

Evaluate $x+\dfrac{1}{3}$ when

1. $x=-\dfrac{1}{3}$

2. $x = -\frac{3}{4}$

Solution

1. To evaluate $x + \frac{1}{3}$ when $x = -\frac{1}{3}$, substitute $-\frac{1}{3}$ for x in the expression.

	$x+\frac{1}{3}$
Substitute $-\frac{1}{3}$ for x.	$-\frac{1}{3}+\frac{1}{3}$
Simplify.	0

2. To evaluate $x + \frac{1}{3}$ when $x = -\frac{3}{4}$, substitute $-\frac{3}{4}$ for x in the expression.

	$x+\frac{1}{3}$
Substitute $-\frac{3}{4}$ for x.	$-\frac{3}{4}+\frac{1}{3}$
Rewrite as equivalent fractions with the LCD, 12.	$-\frac{3\cdot 3}{4\cdot 3}+\frac{1\cdot 4}{3\cdot 4}$
Simplify.	$-\frac{9}{12}+\frac{4}{12}$
Add.	$-\frac{5}{12}$

? Try It 13.5.7.32

Evaluate $x + \frac{3}{4}$ when

1. $x = -\frac{7}{4}$
2. $x = -\frac{5}{4}$

Answer

1. -1
2. $-\frac{1}{2}$

? Try It 13.5.7.33

Evaluate $y + \frac{1}{2}$ when

1. $y = \frac{2}{3}$
2. $y = -\frac{3}{4}$

Answer

1. $\frac{7}{6}$
2. $-\frac{1}{12}$

Example 13.5.7.34

Evaluate $-\frac{5}{6}-y$ when $y=-\frac{2}{3}$

Solution

	$-\frac{5}{6}-y$
Substitute $-\frac{2}{3}$ for y.	$-\frac{5}{6}-\left(-\frac{2}{3}\right)$
Rewrite as equivalent fractions with the LCD, 6.	$-\frac{5}{6}-\left(-\frac{4}{6}\right)$
Subtract.	$\frac{-5-(-4)}{6}$
Simplify.	$-\frac{1}{6}$

Try It 13.5.7.35

Evaluate $y+\frac{1}{2}$ when $y=\frac{2}{3}$

Answer

$-\frac{1}{4}$

Try It 13.5.7.36

Evaluate $y+\frac{1}{2}$ when $y=\frac{2}{3}$

Answer

$-\frac{17}{8}$

Example 13.5.7.37

Evaluate $2x^2y$ when $x=\frac{1}{4}$ and $y=-\frac{2}{3}$.

Solution

Substitute the values into the expression.

	$2x^2y$
Substitute $\frac{1}{4}$ for x and $-\frac{2}{3}$ for y.	$2\left(\frac{1}{4}\right)^2\left(-\frac{2}{3}\right)$
Simplify exponents first.	$2\left(\frac{1}{16}\right)\left(-\frac{2}{3}\right)$
Multiply. Divide out the common factors. Notice we write 16 as $2\cdot 2\cdot 4$ to make it easy to remove	$-\frac{\cancel{2}\cdot 1\cdot\cancel{2}}{\cancel{2}\cdot\cancel{2}\cdot 4\cdot 3}$
Simplify.	$-\frac{1}{12}$

Try It 13.5.7.38

Evaluate $3ab^2$ when $a=-\frac{2}{3}$ and $b=-\frac{1}{2}$.

Answer

$-\frac{1}{2}$

Try It 13.5.7.39

Evaluate $4c^3d$ when $c=-\frac{1}{2}$ and $d=-\frac{4}{3}$.

Answer

$\frac{2}{3}$

The next example will have only variables, no constants.

Example 13.5.7.40

Evaluate $\frac{p+q}{r}$ when $p=-4, q=-2$, and $r=8$.

Solution

To evaluate $\frac{p+q}{r}$ when $p=-4, q=-2$, and $r=8$, we substitute the values into the expression.

	$\frac{p+q}{r}$
Substitute –4 for p, –2 for q and 8 for r.	$\frac{-4+(-2)}{8}$
Add in the numerator first.	$\frac{-6}{8}$
Simplify.	$-\frac{3}{4}$

Try It 13.5.7.41

Evaluate $\frac{a+b}{c}$ when $a=-8, b=-7$, and $c=6$.

Answer

$-\frac{5}{2}$

Try It 13.5.7.42

Evaluate $\frac{x+y}{z}$ when $x=9, y=-18$, and $z=-6$.

Answer

$\frac{3}{2}$

Key Concepts

- **Fraction Addition and Subtraction:** If a, b, and c are numbers where $c \neq 0$, then
  $\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c}$ and $\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$
  To add or subtract fractions, add or subtract the numerators and place the result over the common denominator.
- **Strategy for Adding or Subtracting Fractions**
  1. Do they have a common denominator?
     Yes—go to step 2.
     No—Rewrite each fraction with the LCD (Least Common Denominator). Find the LCD. Change each fraction into an equivalent fraction with the LCD as its denominator.
  2. Add or subtract the fractions.
  3. Simplify, if possible. To multiply or divide fractions, an LCD IS NOT needed. To add or subtract fractions, an LCD IS needed.
- **Simplify Complex Fractions**
  1. Simplify the numerator.
  2. Simplify the denominator.
  3. Divide the numerator by the denominator. Simplify if possible.

13.5.7E: Exercises

Practice Makes Perfect

Add and Subtract Fractions with a Common Denominator

In the following exercises, add.

Exercise 13.5.7E.1

$$\frac{6}{13}+\frac{5}{13}$$

Answer

$\frac{11}{13}$

Exercise 13.5.7E.2

$$\frac{4}{15}+\frac{7}{15}$$

Exercise 13.5.7E.3

$$\frac{x}{4}+\frac{3}{4}$$

Answer

$\frac{x+3}{4}$

Exercise 13.5.7E.4

$$\frac{8}{q}+\frac{6}{q}$$

Exercise 13.5.7E.5

$$-\frac{3}{16}+\left(-\frac{7}{16}\right)$$

Answer

$-\frac{5}{8}$

Exercise 13.5.7E.6

$$-\frac{5}{16}+\left(-\frac{9}{16}\right)$$

Exercise 13.5.7E.7

$$-\frac{8}{17}+\frac{15}{17}$$

Answer

$\frac{7}{17}$

Exercise 13.5.7E.8

$$-\frac{9}{19}+\frac{17}{19}$$

Exercise 13.5.7E.9

$$\frac{6}{13}+\left(-\frac{10}{13}\right)+\left(-\frac{12}{13}\right)$$

Answer

$-\frac{16}{13}$

Exercise 13.5.7E.10

$$\frac{5}{12}+\left(-\frac{7}{12}\right)+\left(-\frac{11}{12}\right)$$

In the following exercises, subtract.

Exercise 13.5.7E.11

$$\frac{11}{15}-\frac{7}{15}$$

Answer

$\frac{4}{15}$

Exercise 13.5.7E.12

$$\frac{9}{13}-\frac{4}{13}$$

Exercise 13.5.7E.13

$$\frac{11}{12}-\frac{5}{12}$$

Answer

$\frac{1}{2}$

Exercise 13.5.7E.14

$$\frac{7}{12}-\frac{5}{12}$$

Exercise 13.5.7E.15

$$\frac{19}{21}-\frac{4}{21}$$

Answer

$\frac{5}{7}$

Exercise 13.5.7E.16

$$\frac{17}{21} - \frac{8}{21}$$

Exercise 13.5.7E.17

$$\frac{5y}{8} - \frac{7}{8}$$

Answer

$\frac{5y-7}{8}$

Exercise 13.5.7E.18

$$\frac{11z}{13} - \frac{8}{13}$$

Exercise 13.5.7E.19

$$-\frac{23}{u} - \frac{15}{u}$$

Answer

$-\frac{38}{u}$

Exercise 13.5.7E.20

$$-\frac{29}{v} - \frac{26}{v}$$

Exercise 13.5.7E.21

$$-\frac{3}{5} - \left(-\frac{4}{5}\right)$$

Answer

$\frac{1}{5}$

Exercise 13.5.7E.22

$$-\frac{3}{7} - \left(-\frac{5}{7}\right)$$

Exercise 13.5.7E.23

$$-\frac{7}{9} - \left(-\frac{5}{9}\right)$$

Answer

$-\frac{2}{9}$

Exercise 13.5.7E.24

$$-\frac{8}{11}-\left(-\frac{5}{11}\right)$$

Mixed Practice

In the following exercises, simplify.

Exercise 13.5.7E.25

$$-\frac{5}{18}\cdot\frac{9}{10}$$

Answer

$-\frac{1}{4}$

Exercise 13.5.7E.26

$$-\frac{3}{14}\cdot\frac{7}{12}$$

Exercise 13.5.7E.27

$$\frac{n}{5}-\frac{4}{5}$$

Answer

$\frac{n-4}{5}$

Exercise 13.5.7E.28

$$\frac{6}{11}-\frac{s}{11}$$

Exercise 13.5.7E.29

$$-\frac{7}{24}+\frac{2}{24}$$

Answer

$-frac524$

Exercise 13.5.7E.30

$$-\frac{5}{18}+\frac{1}{18}$$

Exercise 13.5.7E.31

$$\frac{8}{15}\div\frac{12}{5}$$

Answer

$\frac{2}{9}$

Exercise 13.5.7E.32

$\frac{7}{12} \div \frac{9}{28}$

Add or Subtract Fractions with Different Denominators

In the following exercises, add or subtract.

Exercise 13.5.7E.33

$\frac{1}{2} + \frac{1}{7}$

Answer

$\frac{9}{14}$

Exercise 13.5.7E.34

$\frac{1}{3} + \frac{1}{8}$

Exercise 13.5.7E.35

$\frac{1}{3} - \left(-\frac{1}{9}\right)$

Answer

$\frac{5}{6} - \frac{3}{4}$

Exercise 13.5.7E.43

$-\frac{11}{30} + \frac{27}{40}$

Answer

$\frac{37}{120}$

Exercise 13.5.7E.44

$-\frac{9}{20} + \frac{17}{30}$

Exercise 13.5.7E.45

$-\frac{13}{30} + \frac{25}{42}$

Answer

$\frac{17}{105}$

Exercise 13.5.7E.46

$-\frac{23}{30} + \frac{5}{48}$

Exercise 13.5.7E.47

$-\frac{39}{56} - \frac{22}{35}$

Answer

$-\frac{53}{40}$

Exercise 13.5.7E.48

$-\frac{33}{49} - \frac{18}{35}$

Exercise 13.5.7E.49

$-\frac{2}{3}-\left(-\frac{3}{4}\right)$

Answer

$\frac{1}{12}$

Exercise 13.5.7E.50

$-\frac{3}{4}-\left(-\frac{4}{5}\right)$

Exercise 13.5.7E.51

$1+\frac{7}{8}$

Answer

$\frac{15}{8}$

Exercise 13.5.7E.52

$1-\frac{3}{10}$

Exercise 13.5.7E.53

$\frac{x}{3}+\frac{1}{4}$

Answer

$\frac{4x+3}{12}$

Exercise 13.5.7E.54

$\frac{y}{2}+\frac{2}{3}$

Exercise 13.5.7E.55

$\frac{y}{4}-\frac{3}{5}$

Answer

$\frac{5y-12}{20}$

Exercise 13.5.7E.56

$\frac{x}{5}-\frac{1}{4}$

Mixed Practice

In the following exercises, simplify.

Exercise 13.5.7E.57

1. $\frac{2}{3}+\frac{1}{6}$
2. $\frac{2}{3} \div \frac{1}{6}$

Answer

1. $\frac{5}{6}$
2. 4

Exercise 13.5.7E.58

1. $-\frac{2}{5}-\frac{1}{8}$
2. $-\frac{2}{5} \cdot \frac{1}{8}$

Exercise 13.5.7E.59

1. $\frac{5n}{6} \div \frac{8}{15}$
2. $\frac{5n}{6}-\frac{8}{15}$

Answer

1. $\frac{25n}{16}$
2. $\frac{25n-16}{30}$

Exercise 13.5.7E.60

1. $\frac{3a}{8} \div \frac{7}{12}$
2. $\frac{3a}{8}-\frac{7}{12}$

Exercise 13.5.7E.61

$-\frac{3}{8} \div \left(-\frac{3}{10}\right)$

Answer

$\frac{5}{4}$

Exercise 13.5.7E.62

$-\frac{5}{12} \div \left(-\frac{5}{9}\right)$

Exercise 13.5.7E.63

$-\frac{3}{8}+\frac{5}{12}$

Answer

$\frac{1}{24}$

Exercise 13.5.7E.64

$-\frac{1}{8}+\frac{7}{12}$

Exercise 13.5.7E.65

$\frac{5}{6} - \frac{1}{9}$

Answer

$\frac{13}{18}$

Exercise 13.5.7E.66

$\frac{5}{9} - \frac{1}{6}$

Exercise 13.5.7E.67

$-\frac{7}{15} - \frac{y}{4}$

Answer

$\frac{-28-15y}{60}$

Exercise 13.5.7E.68

$-\frac{3}{8} - \frac{x}{11}$

Exercise 13.5.7E.69

$\frac{11}{12a} \cdot \frac{9a}{16}$

Answer

$\frac{33}{64}$

Exercise 13.5.7E.70

$\frac{10y}{13} \cdot \frac{8}{15y}$

Use the Order of Operations to Simplify Complex Fractions

In the following exercises, simplify.

Exercise 13.5.7E.71

$\frac{2^3+4^2}{\left(\frac{2}{3}\right)^2}$

Answer

54

Exercise 13.5.7E.72

$\frac{3^3-3^2}{\left(\frac{3}{4}\right)^2}$

Exercise 13.5.7E.73

$$\frac{\left(\frac{3}{5}\right)^2}{\left(\frac{3}{7}\right)^2}$$

Answer

$\frac{49}{25}$

Exercise 13.5.7E.74

$$\frac{\left(\frac{3}{4}\right)^2}{\left(\frac{5}{8}\right)^2}$$

Exercise 13.5.7E.75

$$\frac{2}{\frac{1}{3}+\frac{1}{5}}$$

Answer

$\frac{15}{4}$

Exercise 13.5.7E.76

$$\frac{5}{\frac{1}{4}+\frac{1}{3}}$$

Exercise 13.5.7E.77

$$\frac{\frac{7}{8}-\frac{2}{3}}{\frac{1}{2}+\frac{3}{8}}$$

Answer

$\frac{5}{21}$

Exercise 13.5.7E.78

$$\frac{\frac{3}{4}-\frac{3}{5}}{\frac{1}{4}+\frac{2}{5}}$$

Exercise 13.5.7E.79

$\frac{1}{2}+\frac{2}{3}\cdot\frac{5}{12}$

Answer

$\frac{7}{9}$

Exercise 13.5.7E.80

$\frac{1}{3}+\frac{2}{5}\cdot\frac{3}{4}$

Exercise 13.5.7E.81

$1-\frac{3}{5} \div \frac{1}{10}$

Answer

-5

Exercise 13.5.7E.82

$1-\frac{5}{6} \div \frac{1}{12}$

Exercise 13.5.7E.83

$\frac{2}{3}+\frac{1}{6}+\frac{3}{4}$

Answer

$\frac{19}{12}$

Exercise 13.5.7E.84

$\frac{2}{3}+\frac{1}{4}+\frac{3}{5}$

Exercise 13.5.7E.85

$\frac{3}{8}-\frac{1}{6}+\frac{3}{4}$

Answer

$\frac{23}{24}$

Exercise 13.5.7E.86

$\frac{2}{5}+\frac{5}{8}-\frac{3}{4}$

Exercise 13.5.7E.87

$12\left(\frac{9}{20}-\frac{4}{15}\right)$

Answer

$\frac{11}{5}$

Exercise 13.5.7E.88

$8\left(\frac{15}{16}-\frac{5}{6}\right)$

Exercise 13.5.7E.89

$\frac{\frac{5}{8}+\frac{1}{6}}{\frac{19}{24}}$

Answer

1

Exercise 13.5.7E.90

$\frac{\frac{1}{6}+\frac{3}{10}}{\frac{14}{30}}$

Exercise 13.5.7E.91

$\left(\frac{5}{9}+\frac{1}{6}\right) \div \left(\frac{2}{3}-\frac{1}{2}\right)$

Answer

$\frac{13}{3}$

Exercise 13.5.7E.92

$\left(\frac{3}{4}+\frac{1}{6}\right) \div \left(\frac{5}{8}-\frac{1}{3}\right)$

Evaluate Variable Expressions with Fractions

In the following exercises, evaluate.

Exercise 13.5.7E.93

$x+\left(-\frac{5}{6}\right)$ when

1. $x=\frac{1}{3}$
2. $x=-\frac{1}{6}$

Answer

1. $-\frac{1}{2}$
2. -1

Exercise 13.5.7E.94

$x+\left(-\frac{11}{12}\right)$ when

1. $x=\frac{11}{12}$
2. $x=-\frac{3}{4}$

Exercise 13.5.7E.95

$x-\frac{2}{5}$ when

1. $x=\frac{3}{5}$
2. $x=-\frac{3}{5}$

Answer

1. $\frac{1}{5}$
2. -1

Exercise 13.5.7E.96

$x - \frac{1}{3}$ when

1. $x = \frac{2}{3}$
2. $x = -\frac{2}{3}$

Exercise 13.5.7E.97

$\frac{7}{10} - w$ when

1. $w = \frac{1}{2}$
2. $w = -\frac{1}{2}$

Answer

1. $\frac{1}{5}$
2. $\frac{6}{5}$

Exercise 13.5.7E.98

$\frac{5}{12} - w$ when

1. $w = \frac{1}{4}$
2. $w = -\frac{1}{4}$

Exercise 13.5.7E.99

$2x^2y^3$ when $x = -\frac{2}{3}$ and $y = -\frac{1}{2}$

Answer

$-\frac{1}{9}$

Exercise 13.5.7E.100

$8u^2v^3$ when $u = -\frac{3}{4}$ and $v = -\frac{1}{2}$

Exercise 13.5.7E.101

$\frac{a+b}{a-b}$ when $a = -3, b = 8$

Answer

$-\frac{5}{11}$

Exercise 13.5.7E.102

$\frac{r-s}{r+s}$ when $r = 10, s = -5$

Everyday Math

Exercise 13.5.7E.103

Decorating Laronda is making covers for the throw pillows on her sofa. For each pillow cover, she needs $\frac{1}{2}$ yard of print fabric and \frac{3}{8}\) yard of solid fabric. What is the total amount of fabric Laronda needs for each pillow cover?

Answer

$\frac{7}{8}$ yard

Exercise 13.5.7E.104

Baking Vanessa is baking chocolate chip cookies and oatmeal cookies. She needs $\frac{1}{2}$ cup of sugar for the chocolate chip cookies and $\frac{1}{4}$ of sugar for the oatmeal cookies. How much sugar does she need altogether?

Writing Exercises

Exercise 13.5.7E.105

Why do you need a common denominator to add or subtract fractions? Explain.

Answer

Answers may vary

Exercise 13.5.7E.106

How do you find the LCD of 2 fractions?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add and subtract fractions with different denominators.			
identify and use fraction operations.			
use the order of operations to simplify complex fractions.			
evaluate variable expressions with fractions.			

ⓑ After looking at the checklist, do you think you are well-prepared for the next chapter? Why or why not?

13.5.8: Decimals

Learning Objectives

By the end of this section, you will be able to:

- Name and write decimals
- Round decimals
- Add and subtract decimals
- Multiply and divide decimals
- Convert decimals, fractions, and percents

Note

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra*chapter, **Decimals**.

Name and Write Decimals

Decimals are another way of writing **fraction**s whose denominators are powers of 10.

$$\begin{aligned} 0.1 &= \tfrac{1}{10} && 0.1 \text{ is "one tenth"} \\ 0.01 &= \tfrac{1}{100} && 0.01 \text{ is "one hundredth} \\ 0.001 &= \tfrac{1}{1{,}000} && 0.001 \text{ is "one thousandth} \\ 0.0001 &= \tfrac{1}{10{,}000} && 0.0001 \text{ is "one ten-thousandth"} \end{aligned} \tag{13.5.8.1}$$

Notice that "ten thousand" is a number larger than one, but "one ten-thousand**th**" is a number smaller than one. The "th" at the end of the name tells you that the number is smaller than one.

When we name a whole number, the name corresponds to the place value based on the powers of ten. We read 10,000 as "ten thousand" and 10,000,000 as "ten million." Likewise, the names of the **decimal** places correspond to their fraction values. Figure 13.5.8.1shows the names of the **place values** to the left and right of the decimal point.

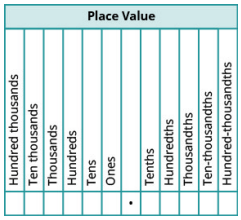

Figure 13.5.8.1: Place value of decimal numbers are shown to the left and right of the decimal point.

Exercise 13.5.8.1

Name the decimal 4.3.

Answer

Step 1. Name the number to the left of the decimal point.	4 is to the left of the decimal point.	4.3 four _____	**Step 2.** Write 'and' for the decimal point.		four and _____
Step 3. Name the 'number' part to the right of the decimal point as if it were a whole number.	3 is to the right of the decimal point.	four and three _____	**Step 4.** Name the decimal place.		four and three tenths

Exercise 13.5.8.2

Name the decimal 6.7.

Answer

six and seven tenths

Exercise 13.5.8.3

Name the decimal 5.8.

Answer

five and eight tenths

We summarize the steps needed to name a **decimal** below.

NAME A DECIMAL.

1. Name the number to the left of the decimal point.
2. Write "and" for the decimal point.
3. Name the "number" part to the right of the decimal point as if it were a whole number.
4. Name the decimal place of the last digit.

Exercise 13.5.8.4

Name the decimal: -15.571.

Answer

	-15.571
Name the number to the left of the decimal point.	negative fifteen _____
Write “and” for the decimal point.	negative fifteen and _____
Name the number to the right of the decimal point.	negative fifteen and five hundred seventy-one _____
The 1 is in the thousandths place.	negative fifteen and five hundred seventy-one thousandths

Exercise 13.5.8.5

Name the decimal: -13.461.

Answer

negative thirteen and four hundred sixty-one thousandths

Exercise 13.5.8.6

Name the decimal: -2.053.

Answer

negative two and fifty-three thousandths

When we write a check we write both the numerals and the name of the number. Let’s see how to write the decimal from the name.

Exercise 13.5.8.7: How to Write decimals

Write “fourteen and twenty-four thousandths” as a decimal.

Answer

Step 1. Look for the word ‘and’; it locates the decimal point. Place a decimal point under the word ‘and’. Translate the words before ‘and’ into the whole number and place to the left of the decimal point.		fourteen and twenty-four thousandths fourteen and twenty-four thousandths ____ . _____ 14 . _____
Step 2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.	The last word is ‘thousandths’.	14 . ____ ____ ____ tenths hundredths thousandths
Step 3. Translate the words after ‘and’ into the number to the right of the decimal point. Write the number in the spaces – putting the final digit in the last place.		14 . ____ 2 4
Step 4. Fill in zeros for empty place holders as needed.	Zeros are needed in the tenths place.	14 . 0 2 4 Fourteen and twenty-four thousandths is written 14.024.

Exercise 13.5.8.8

Write as a decimal: thirteen and sixty-eight thousandths.

Answer

13.068

Exercise 13.5.8.9

Write as a decimal: five and ninety-four thousandths.

Answer

5.094

We summarize the steps to writing a **decimal**.

WRITE A DECIMAL.

1. Look for the word “and”—it locates the decimal point.
   - Place a decimal point under the word “and.” Translate the words before “and” into the whole number and place it to the left of the decimal point.
   - If there is no “and,” write a “0” with a decimal point to its right.
2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.
3. Translate the words after “and” into the number to the right of the decimal point. Write the number in the spaces—putting the final digit in the last place.
4. Fill in zeros for place holders as needed.

Round Decimals

Rounding decimals is very much like rounding whole numbers. We will round decimals with a method based on the one we used to round whole numbers.

Exercise 13.5.8.10

Round 18.379 to the nearest hundredth.

Answer

Step 1. Locate the given place value and mark it with an arrow.		hundredths place ↓ 18.379	**Step 2.** Underline the digit to the right of the given place value.		hundredths place ↓ 18.379
Step 3. Is this digit greater than or equal to 5? **Yes:** Add 1 to the digit in the given place value. **No:** Do not change the digit in the given place value.	Because 9 is greater than or equal to 5, add 1 to the 7.	18.37 9 add 1 ↗ delete	**Step 4.** Rewrite the number, removing all digits to the right of the rounding digit.		18.38 18.38 is 18.379 rounded to the nearest hundredth.

Exercise 13.5.8.11

Round to the nearest hundredth: 1.047.

Answer

1.05

Exercise 13.5.8.12

Round to the nearest hundredth: 9.173.

Answer

9.17

We summarize the steps for rounding a **decimal** here.

ROUND DECIMALS.

1. Locate the given place value and mark it with an arrow.
2. Underline the digit to the right of the place value.
3. Is this digit greater than or equal to 5?
   - Yes—add 1 to the digit in the given place value.
   - No—do not change the digit in the given place value.
4. Rewrite the number, deleting all digits to the right of the rounding digit.

Exercise 13.5.8.13

Round 18.379 to the nearest

1. tenth
2. whole number.

Answer

Round 18.379

1. to the nearest tenth

Locate the tenths place with an arrow.	tenths place ↓ 18.379
Underline the digit to the right of the given place value.	tenths place ↓ 18.379
Because 7 is greater than or equal to 5, add 1 to the 3.	18.379 add 1 ↗ delete
Rewrite the number, deleting all digits to the right of the rounding digit.	18.4
Notice that the deleted digits were NOT replaced with zeros.	So, 18.379 rounded to the nearest tenth is 18.4.

2. to the nearest whole number

Locate the ones place with an arrow.	ones place ↓ 18.379
Underline the digit to the right of the given place value.	ones place ↓ 18.379

Since 3 is not greater than or equal to 5, do not add 1 to the 8.	18.379 (do not add 1, delete)
Rewrite the number, deleting all digits to the right of the rounding digit.	18
	So, 18.379 rounded to the nearest whole number is 18.

Exercise 13.5.8.14

Round 6.582 to the nearest

1. hundredth
2. tenth
3. whole number.

Answer

1. 6.58
2. 6.6
3. 7

Exercise 13.5.8.15

Round 15.2175 to the nearest

1. thousandth
2. hundredth
3. tenth.

Answer

1. 15.218
2. 15.22
3. 15.2

Add and Subtract Decimals

To add or subtract decimals, we line up the decimal points. By lining up the decimal points this way, we can add or subtract the corresponding **place values**. We then add or subtract the numbers as if they were whole numbers and then place the decimal point in the sum.

ADD OR SUBTRACT DECIMALS.

1. Write the numbers so the decimal points line up vertically.
2. Use zeros as place holders, as needed.
3. Add or subtract the numbers as if they were whole numbers. Then place the decimal point in the answer under the decimal points in the given numbers.

Exercise 13.5.8.16

Add: $23.5+41.38$.

Answer

Write the numbers so that the decimal points line up vertically.

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline \end{array} \tag{13.5.8.2}$$

Put 0 as a placeholder after the 5 in 23.5. Remember, $\frac{5}{10}=\frac{50}{100}$, so $0.5=0.50$

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline \end{array} \tag{13.5.8.3}$$

Add the numbers as if they were whole numbers . Then place the decimal point in the sum.

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline 64.88 \end{array} \tag{13.5.8.4}$$

Exercise 13.5.8.17

Add: $4.8+11.69$.

Answer

16.49

Exercise 13.5.8.18

Add: $5.123+18.47$.

Answer

23.593

Exercise 13.5.8.19

Subtract: $20 - 14.65$.

Answer

Write the numbers so that the decimal points line up vertically.

$$\begin{array}{r} 20 - 14.65 \\ 20. \\ -14.65 \\ \hline \end{array}$$

Remember, 20 is a whole number, so place the decimal point after the 0.

Put zeros to the right as placeholders.

$$\begin{array}{rr} 20.00 & (13.5.8.8) \\ -14.65 & (13.5.8.9) \\ \hline \end{array}$$

Write the numbers so that the decimal points line up vertically.

$$\begin{array}{r} {}^{9}\quad{}^{9} \\ 1\,\not{1}\not{0}\;\not{1}\not{0}\;\not{1}\not{0} \\ \not{2}\;\not{0}.\;\not{0}\;\not{0} \\ -14.65 \\ \hline 5.35 \end{array}$$

Exercise 13.5.8.20

Subtract: $10 - 9.58$.

Answer

0.42

Exercise 13.5.8.21

Subtract: $50 - 37.42$.

Answer

12.58

Multiply and Divide Decimals

Multiplying decimals is very much like multiplying whole numbers—we just have to determine where to place the decimal point. The procedure for multiplying decimals will make sense if we first convert them to fractions and then multiply.

So let's see what we would get as the **product** of decimals by converting them to fractions first. We will do two examples side-by-side. Look for a pattern!

Table 13.5.8.1

	$\underbrace{(0.3)}_{1\text{ place}}\ \underbrace{(0.7)}_{1\text{ place}}$	$\underbrace{(0.2)}_{1\text{ place}}\ \underbrace{(0.46)}_{2\text{ places}}$
Convert to fractions.	$\frac{3}{10} \cdot \frac{7}{10}$	$\frac{2}{10} \cdot \frac{46}{100}$
Multiply.	$\frac{21}{100}$	$\frac{92}{1000}$
Convert to decimals.	$\underbrace{0.21}_{2\text{ places}}$	$\underbrace{0.092}_{3\text{ places}}$

Notice, in the first example, we multiplied two numbers that each had one digit after the decimal point and the product had two decimal places. In the second example, we multiplied a number with one decimal place by a number with two decimal places and the product had three decimal places.

We multiply the numbers just as we do whole numbers, temporarily ignoring the decimal point. We then count the number of decimal points in the factors and that sum tells us the number of decimal places in the product.

The rules for multiplying positive and negative numbers apply to decimals, too, of course!

When *multiplying* two numbers,

- if their signs are the *same* the product is *positive*.
- if their signs are *different* the product is *negative*.

When we multiply signed decimals, first we determine the sign of the product and then multiply as if the numbers were both positive. Finally, we write the product with the appropriate sign.

MULTIPLY DECIMALS.

1. Determine the sign of the product.
2. Write in vertical format, lining up the numbers on the right. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
3. Place the decimal point. The number of decimal places in the product is the sum of the number of decimal places in the factors.
4. Write the product with the appropriate sign.

Exercise 13.5.8.22

Multiply: $(-3.9)(4.075)$.

Answer

	$(-3.9)(4.075)$
The signs are different. The product will be negative.	
Write in vertical format, lining up the numbers on the right.	4.075 × 3.9
Multiply.	4.075 × 3.9 36675 12225 158925
Add the number of decimal places in the factors $(1+3)$. (–3.9) (4.075) 1 place 3 places Place the decimal point 4 places from the right.	4.075 × 3.9 36675 12225 15.8925 4 places
The signs are different, so the product is negative.	$(-3.9)(4.075) = -15.8925$

Exercise 13.5.8.23

Multiply: $-4.5(6.107)$

Answer

-27.4815

Exercise 13.5.8.24

Multiply: $-10.79(8.12)$.

Answer

-87.6148

In many of your other classes, especially in the sciences, you will multiply decimals by powers of 10 (10, 100, 1000, etc.). If you multiply a few products on paper, you may notice a pattern relating the number of zeros in the power of 10 to number of decimal places we move the decimal point to the right to get the product.

MULTIPLY A DECIMAL BY A POWER OF TEN.

1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
2. Add zeros at the end of the number as needed.

Exercise 13.5.8.25

Multiply 5.63

1. by 10
2. by 100
3. by 1,000.

Answer

By looking at the number of zeros in the multiple of ten, we see the number of places we need to move the decimal to the right.

ⓐ

	$5.63(10)$
There is 1 zero in 10, so move the decimal point 1 place to the right.	5.63 56.3

ⓑ

	$5.63(100)$
There are 2 zeros in 100, so move the decimal point 2 places to the right.	There are 2 zeros in 100, so move the decimal point 2 places to the right. 5.63 (100) 5.63 563

ⓒ

There are 3 zeros in 1,000, so move the decimal point 3 places to the right.	5.63
A zero must be added at the end.	5,630

Exercise 13.5.8.26

Multiply 2.58

1. by 10
2. by 100
3. by 1,000.

Answer

1. 25.8
2. 258
3. 2,580

Exercise 13.5.8.27

Multiply 14.2

1. by 10
2. by 100
3. by 1,000.

Answer

1. 142
2. 1,420
3. 14,200

Just as with multiplication, **division** of decimals is very much like dividing whole numbers. We just have to figure out where the decimal point must be placed.

To divide decimals, determine what power of 10 to multiply the denominator by to make it a whole number. Then multiply the numerator by that same power of 10. Because of the equivalent fractions property, we haven't changed the value of the fraction! The effect is to move the decimal points in the numerator and denominator the same number of places to the right. For example:

$$\begin{array}{c} \frac{0.8}{0.4} \\ \frac{0.8(10)}{0.4(10)} \\ \frac{8}{4} \end{array} \tag{13.5.8.16}$$

We use the rules for dividing positive and negative numbers with decimals, too. When dividing signed decimals, first determine the sign of the quotient and then divide as if the numbers were both positive. Finally, write the quotient with the appropriate sign.

We review the notation and vocabulary for division:

$$\underset{\text{dividend}}{a} \div \underset{\text{divisor}}{b} = \underset{\text{quotient}}{c} \qquad \begin{array}{r} \overset{\text{quotient}}{c} \\ \underset{\text{divisor}}{b}\,\overline{)\,\underset{\text{dividend}}{a}} \end{array} \tag{13.5.8.17}$$

We'll write the steps to take when dividing decimals, for easy reference.

DIVIDE DECIMALS.

1. Determine the sign of the quotient.
2. Make the divisor a whole number by "moving" the decimal point all the way to the right. "Move" the decimal point in the dividend the same number of places—adding zeros as needed.
3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
4. Write the quotient with the appropriate sign.

Exercise 13.5.8.28

Divide: $-25.65 \div (-0.06)$.

Answer

Remember, you can "move" the decimals in the divisor and dividend because of the Equivalent Fractions Property.

	$-25.65 \div (-0.06)$
The signs are the same.	The quotient is positive.
Make the divisor a whole number by "moving" the decimal point all the way to the right.	
"Move" the decimal point in the dividend the same number of places.	$0.06\overline{)25.65}$
Divide. Place the decimal point in the quotient above the decimal point in the dividend.	$\begin{array}{r} 427.5 \\ 006\overline{)2565.0} \\ \underline{-24} \\ 16 \\ \underline{-12} \\ 45 \\ \underline{-42} \\ 30 \\ \underline{30} \end{array}$
Write the quotient with the appropriate sign.	$-25.65 \div (-0.06) = 427.5$

Exercise 13.5.8.29

Divide: $-23.492 \div (-0.04)$.

Answer

687.3

Exercise 13.5.8.30

Divide: $-4.11 \div (-0.12)$.

Answer

34.25

A common application of dividing whole numbers into decimals is when we want to find the price of one item that is sold as part of a multi-pack. For example, suppose a case of 24 water bottles costs $3.99. To find the price of one water bottle, we would divide $3.99 by 24. We show this division in Exercise 13.5.8.31 In calculations with money, we will round the answer to the nearest cent (hundredth).

Exercise 13.5.8.31

Divide: $3.99 \div 24$.

Answer

.99 divided by 24 is given. A long division problem is set up with 24 dividing 3.99. A table is given with directions on the left and the mathematical steps on the right. The first step reads “Place the decimal point in the quotient above the decimal point in the dividend. Divide as usual. When do we stop? Since this division involves money, we round it to the nearest cent (hundredth). To do this, we must carry the division to the thousandths place.” To the right of this, we have a long division problem set up with 24 dividing 3.990. The quotient is given as 0.166. To show the work, below 3.990 it reads 24, solid horizontal line, 159, 144, solid horizontal line, 150, 144, solid horizontal line, and finally 6. The fifth step reads “Round to the nearest cent.” To the right of this, we have $0.166 is approximately equal to $0.17 and hence >.99 divided by 24 is $0.17.">

	$3.99 \div 24$
Place the decimal point in the quotient above the decimal point in the dividend.	
Divide as usual. When do we stop? Since this division involves money, we round it to the nearest cent (hundredth.) To do this, we must carry the division to the thousandths place.	$$\begin{array}{r} 0.166 \\ 24\overline{)3.990} \\ \underline{24} \\ 159 \\ \underline{144} \\ 150 \\ \underline{144} \\ 6 \end{array}$$
Round to the nearest cent.	$0.166 \approx $0.17 $3.99 \div 2 \approx $0.17

Exercise 13.5.8.32

Divide: $6.99 \div 36$.

Answer

$0.19

Exercise 13.5.8.33

Divide: $4.99 \div 12$.

Answer

$0.42

Convert Decimals, Fractions, and Percents

We convert decimals into fractions by identifying the place value of the last (farthest right) digit. In the decimal 0.03 the 3 is in the hundredths place, so 100 is the denominator of the fraction equivalent to 0.03.

$$00.03 = \frac{3}{100} \tag{13.5.8.18}$$

Notice, when the number to the left of the decimal is zero, we get a fraction whose numerator is less than its denominator. Fractions like this are called **proper fractions**.

The steps to take to convert a decimal to a fraction are summarized in the procedure box.

CONVERT A DECIMAL TO A PROPER FRACTION.

1. Determine the place value of the final digit.
2. Write the fraction.
   - numerator—the “numbers” to the right of the decimal point
   - denominator—the place value corresponding to the final digit

Exercise 13.5.8.34

Write 0.374 as a fraction.

Answer

	0.374
Determine the place value of the final digit.	$$\begin{array}{lll} 0.3 & 7 & 4 \\ \text{tenths} & \text{hundredths} & \text{thousandths} \end{array}$$
Write the fraction for 0.374: • The numerator is 374. • The denominator is 1,000.	$\frac{374}{1000}$
Simplify the fraction.	$\frac{2 \cdot 187}{2 \cdot 500}$
Divide out the common factors.	$\frac{187}{500}$ so, $0.374 = \frac{187}{500}$

Did you notice that the number of zeros in the denominator of $\frac{374}{1000}$ is the same as the number of decimal places in 0.374?

Exercise 13.5.8.35

Write 0.234 as a fraction.

Answer

$\frac{117}{500}$

Exercise 13.5.8.36

Write 0.024 as a fraction.

Answer

$\frac{3}{125}$

We've learned to convert decimals to fractions. Now we will do the reverse—convert fractions to decimals. Remember that the fraction bar means division. So $\frac{4}{5}$ can be written $4 \div 5$ or $5\overline{)4}$. This leads to the following method for converting a fraction to a decimal.

CONVERT A FRACTION TO A DECIMAL.

To convert a fraction to a decimal, divide the numerator of the fraction by the denominator of the fraction.

Exercise 13.5.8.37

Write $-\frac{5}{8}$ as a decimal.

Answer

Since a fraction bar means division, we begin by writing $\frac{5}{8}$ as $8\overline{)5}$. Now divide.

$$\begin{array}{r} 0.625 \\ 8\overline{)5.000} \\ \underline{48} \\ 20 \\ \underline{16} \\ 40 \\ \underline{40} \\ \end{array}$$

so, $-\frac{5}{8} = -0.625$

Exercise 13.5.8.38

Write $-\frac{7}{8}$ as a decimal.

Answer

−0.875

Exercise 13.5.8.39

Write $-\frac{3}{8}$ as a decimal.

Answer

−0.375

When we divide, we will not always get a zero remainder. Sometimes the quotient ends up with a decimal that repeats. A **repeating decimal** is a decimal in which the last digit or group of digits repeats endlessly. A bar is placed over the repeating block of digits to indicate it repeats.

REPEATING DECIMAL

A **repeating decimal** is a decimal in which the last digit or group of digits repeats endlessly.

A bar is placed over the repeating block of digits to indicate it repeats.

Exercise 13.5.8.40

Write $\frac{43}{22}$ as a decimal.

Answer

Divide 43 by 22.

$$\begin{array}{r} 1.95454 \\ 22\overline{)43.00000} \\ 22 \\ \hline 210 \\ 198 \\ \hline 120 \\ 110 \\ \hline 100 \\ 88 \\ \hline 120 \\ 110 \\ \hline 100 \\ 88 \\ \hline \cdots \end{array}$$

120 repeats

The pattern repeats, so the numbers in the quotient will repeat as well.

100 repeats

so, $\frac{43}{22} = 1.95\overline{4}$

Exercise 13.5.8.41

Write $\frac{27}{11}$ as a decimal.

Answer

$2.\overline{45}$

Exercise 13.5.8.42

Write $\frac{51}{22}$ as a decimal.

Answer

$2.3\overline{18}$

Sometimes we may have to simplify expressions with fractions and decimals together.

Exercise 13.5.8.43

Simplify: $\frac{7}{8} + 6.4$.

Answer

First we must change one number so both numbers are in the same form. We can change the fraction to a decimal, or change the decimal to a fraction. Usually it is easier to change the fraction to a decimal.

		$\frac{7}{8} + 6.4$
Change $\frac{7}{8}$ to a decimal.	$\begin{array}{r} 0.875 \\ 8\overline{)7.000} \\ 64 \\ \hline 60 \\ 56 \\ \hline 40 \\ 40 \\ \hline 0 \end{array}$	
Add.		$0.875 + 6.4$
		7.275
		So, $\frac{7}{8} + 6.4 = 7.275$

Exercise 13.5.8.44

Simplify: $\frac{3}{8} + 4.9$.

Answer

5.275

Exercise 13.5.8.45

Simplify: $5.7 + \frac{13}{20}$.

Answer

6.35

A **percent** is a ratio whose denominator is 100. Percent means per hundred. We use the percent symbol, %, to show percent.

PERCENT

A **percent** is a ratio whose denominator is 100.

Since a percent is a ratio, it can easily be expressed as a fraction. Percent means per 100, so the denominator of the fraction is 100. We then change the fraction to a decimal by dividing the numerator by the denominator.

	6%	78%	135%
Write as a ratio with denominator 100.	$\frac{6}{100}$	$\frac{78}{100}$	$\frac{135}{100}$
Change the fraction to a decimal by dividing the numerator by the denominator.	0.06	0.78	1.35

(13.5.8.19)

Do you see the pattern? *To convert a percent number to a decimal number, we move the decimal point two places to the left.*

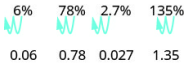

Figure 13.5.8.2

Exercise 13.5.8.46

Convert each percent to a decimal:

1. 62%
2. 135%
3. 35.7%.

Answer

1.	
	62%
Move the decimal point two places to the left.	0.62
2.	
	135%
Move the decimal point two places to the left.	1.35
3.	
	5.7%
Move the decimal point two places to the left.	0.057

Exercise 13.5.8.47

Convert each percent to a decimal:

1. 9%
2. 87%
3. 3.9%.

Answer

1. 0.09
2. 0.87
3. 0.039

Exercise 13.5.8.48

Convert each percent to a decimal:

1. 3%
2. 91%
3. 8.3%.

Answer

1. 0.03
2. 0.91
3. 0.083

Converting a decimal to a percent makes sense if we remember the definition of percent and keep place value in mind.

To convert a decimal to a percent, remember that percent means per hundred. If we change the decimal to a fraction whose denominator is 100, it is easy to change that fraction to a percent.

	0.83	1.05	0.075
Write as a fraction	$\frac{83}{100}$	$1\frac{5}{100}$	$\frac{75}{1000}$
The denominator is 100.		$\frac{105}{100}$	$\frac{7.5}{100}$
Write the ratio as a percent.	83%	105%	7.5%

(13.5.8.20)

Recognize the pattern? *To convert a decimal to a percent, we move the decimal point two places to the right and then add the percent sign.*

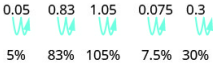

Figure 13.5.8.3

Exercise 13.5.8.49

Convert each decimal to a percent:

1. 0.51
2. 1.25
3. 0.093.

Answer

1.	
	0.51
Move the decimal point two places to the right.	51

2.	
	1.25
Move the decimal point two places to the right.	125

3.	
	0.093
Move the decimal point two places to the right.	9.3

Exercise 13.5.8.50

Convert each decimal to a percent:

1. 0.17
2. 1.75
3. 0.0825

Answer

1. 17%
2. 175%
3. 8.25%

Exercise 13.5.8.51

Convert each decimal to a percent:

1. 0.41
2. 2.25
3. 0.0925.

Answer

1. 41%
2. 225%
3. 9.25%

Key Concepts

- **Name a Decimal**
  1. Name the number to the left of the decimal point.
  2. Write ”and” for the decimal point.
  3. Name the “number” part to the right of the decimal point as if it were a whole number.
  4. Name the decimal place of the last digit.
- **Write a Decimal**
  1. Look for the word ‘and’—it locates the decimal point. Place a decimal point under the word ‘and.’ Translate the words before ‘and’ into the whole number and place it to the left of the decimal point. If there is no “and,” write a “0” with a decimal point to its right.
  2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.
  3. Translate the words after ‘and’ into the number to the right of the decimal point. Write the number in the spaces—putting the final digit in the last place.
  4. Fill in zeros for place holders as needed.
- **Round a Decimal**
  1. Locate the given place value and mark it with an arrow.
  2. Underline the digit to the right of the place value.
  3. Is this digit greater than or equal to 5? Yes—add 1 to the digit in the given place value. No—do not change the digit in the given place value.
  4. Rewrite the number, deleting all digits to the right of the rounding digit.
- **Add or Subtract Decimals**
  1. Write the numbers so the decimal points line up vertically.
  2. Use zeros as place holders, as needed.
  3. Add or subtract the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.
- **Multiply Decimals**
  1. Determine the sign of the product.

2. Write in vertical format, lining up the numbers on the right. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
3. Place the decimal point. The number of decimal places in the product is the sum of the decimal places in the factors.
4. Write the product with the appropriate sign.

- **Multiply a Decimal by a Power of Ten**
  1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
  2. Add zeros at the end of the number as needed.
- **Divide Decimals**
  1. Determine the sign of the quotient.
  2. Make the divisor a whole number by “moving” the decimal point all the way to the right. “Move” the decimal point in the dividend the same number of places - adding zeros as needed.
  3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
  4. Write the quotient with the appropriate sign.
- **Convert a Decimal to a Proper Fraction**
  1. Determine the place value of the final digit.
  2. Write the fraction: numerator—the ‘numbers’ to the right of the decimal point; denominator—the place value corresponding to the final digit.
- **Convert a Fraction to a Decimal** Divide the numerator of the fraction by the denominator.

Paycheck Annie has two jobs. She gets paid $14.04 per hour for tutoring at City College and $8.75 per hour at a coffee shop. Last week she tutored for 8 hours and worked at the coffee shop for 15 hours.
ⓐ How much did she earn?
ⓑ If she had worked all 23 hours as a tutor instead of working both jobs, how much more would she have earned?

654.

Paycheck Jake has two jobs. He gets paid $7.95 per hour at the college cafeteria and $20.25 at the art gallery. Last week he worked 12 hours at the cafeteria and 5 hours at the art gallery.

ⓐ How much did he earn?

ⓑ If he had worked all 17 hours at the art gallery instead of working both jobs, how much more would he have earned?

Writing Exercises

655.

How does knowing about US money help you learn about decimals?

656.

Explain how you write “three and nine hundredths” as a decimal.

657.

Without solving the problem “44 is 80% of what number” think about what the solution might be. Should it be a number that is greater than 44 or less than 44? Explain your reasoning.

658.

When the Szetos sold their home, the selling price was 500% of what they had paid for the house 30 years ago. Explain what 500% means in this context.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
name and write decimals.			
round decimals.			
add and subtract decimals.			
multiply and divide decimals.			
convert decimals, fractions, and percents.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

13.5.9: The Real Numbers

Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with square roots
- Identify integers, rational numbers, irrational numbers, and real numbers
- Locate fractions on the number line
- Locate decimals on the number line

Note

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra* chapters, **Decimals** and **Properties of Real Numbers**.

Simplify Expressions with Square Roots

Remember that when a number n is multiplied by itself, we write n^2 and read it "n squared." The result is called the **square** of n. For example,

$$\begin{array}{ll} 8^2 & \text{read '8 squared'} \\ 64 & 64 \text{ is called the square of } 8\text{ .} \end{array}$$

Similarly, 121 is the square of 11, because 11^2 is 121.

SQUARE OF A NUMBER

If $n^2 = m$, then m is the **square** of n.

Note

Doing the Manipulative Mathematics activity "Square Numbers" will help you develop a better understanding of perfect square numbers.

Complete the following table to show the squares of the counting numbers 1 through 15.

Number	n	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Square	n^2								64			121				

Figure 13.5.9.1

The numbers in the second row are called perfect square numbers. It will be helpful to learn to recognize the perfect square numbers.

The squares of the counting numbers are positive numbers. What about the squares of negative numbers? We know that when the signs of two numbers are the same, their product is positive. So the square of any negative number is also positive.

$$(-3)^2 = 9 \quad (-8)^2 = 64 \quad (-11)^2 = 121 \quad (-15)^2 = 225$$

Did you notice that these squares are the same as the squares of the positive numbers?

Sometimes we will need to look at the relationship between numbers and their squares in reverse. Because $10^2 = 100$, we say 100 is the square of 10. We also say that 10 is a *square root* of 100. A number whose square is mm is called a **square root** of m.

SQUARE ROOT OF A NUMBER

If $n^2 = m$, then n is a **square root** of m.

Notice $(-10)^2 = 100$ also, so -10 is also a square root of 100. Therefore, both 10 and -10 are square roots of 100.

So, every positive number has two square roots—one positive and one negative. What if we only wanted the positive square root of a positive number? The **radical sign**, $\sqrt{m}$, denotes the positive square root. The positive square root is called the **principal square root**. When we use the radical sign that always means we want the principal square root.

We also use the radical sign for the square root of zero. Because $0^2 = 0$, $\sqrt{0} = 0$. Notice that zero has only one square root.

SQUARE ROOT NOTATION

$\sqrt{m}$ is read "the square root of m"

radical sign $\rightarrow \sqrt{m} \leftarrow$ radicand

If $m = n^2$, then $\sqrt{m} = n$, for $n \geq 0$.

The square root of m, $\sqrt{m}$, is the positive number whose square is m.

Since 10 is the principal square root of 100, we write $\sqrt{100} = 10$. You may want to complete the following table to help you recognize square roots.

$\sqrt{1}$	$\sqrt{4}$	$\sqrt{9}$	$\sqrt{16}$	$\sqrt{25}$	$\sqrt{36}$	$\sqrt{49}$	$\sqrt{64}$	$\sqrt{81}$	$\sqrt{100}$	$\sqrt{121}$	$\sqrt{144}$	$\sqrt{169}$	$\sqrt{196}$	$\sqrt{225}$
									10					

Figure 13.5.9.2

Exercise 13.5.9.1

Simplify:

1. $\sqrt{25}$
2. $\sqrt{121}$

Answer

1. $\sqrt{25} = 5$, since $5^2 = 25$.
2. $\sqrt{121} = 11$, since $11^2 = 121$.

Exercise 13.5.9.2

Simplify:

1. $\sqrt{36}$
2. $\sqrt{169}$

Answer

1. $\sqrt{36} = 6$
2. $\sqrt{169} = 13$

Exercise 13.5.9.3

Simplify:

1. $\sqrt{16}$
2. $\sqrt{196}$

Answer

1. $\sqrt{16} = 4$
2. $\sqrt{196} = 14$

We know that every positive number has two square roots and the radical sign indicates the positive one. We write $\sqrt{100}=10$. If we want to find the negative square root of a number, we place a negative in front of the radical sign. For example, $-\sqrt{100}=-10$. We read $-\sqrt{100}$ as "the opposite of the square root of 10."

Exercise 13.5.9.4

Simplify:

1. $-\sqrt{9}$
2. $-\sqrt{144}$

Answer

1. $-\sqrt{9}=-3$, since the negative is in front of the radical sign.
2. $-\sqrt{144}=-12$, since the negative is in front of the radical sign.

Exercise 13.5.9.5

Simplify:

1. $-\sqrt{4}$
2. $-\sqrt{225}$

Answer

1. $-\sqrt{4}=-2$
2. $-\sqrt{225}=-15$

Exercise 13.5.9.6

Simplify:

1. $-\sqrt{81}$
2. $-\sqrt{100}$

Answer

1. $-\sqrt{81}=-9$
2. $-\sqrt{100}=-10$

Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

We have already described numbers as ***counting numbers***, ***whole numbers***, and ***integers***. What is the difference between these types of numbers?

Counting numbers	$1, 2, 3, 4, \ldots$
Whole numbers	$0, 1, 2, 3, 4, \ldots$
Integers	$\cdots -3, -2, -1, 0, 1, 2, 3, \ldots$

What type of numbers would we get if we started with all the integers and then included all the fractions? The numbers we would have form the set of rational numbers. A **rational number** is a number that can be written as a ratio of two integers.

RATIONAL NUMBER

A **rational number** is a number of the form $\frac{p}{q}$, where p and q are integers and $q \neq 0$

A rational number can be written as the ratio of two integers.

All signed fractions, such as $\frac{4}{5}, -\frac{7}{8}, \frac{13}{4}, -\frac{20}{3}$ are rational numbers. Each numerator and each denominator is an integer.

Are integers rational numbers? To decide if an integer is a rational number, we try to write it as a ratio of two integers. Each integer can be written as a ratio of integers in many ways. For example, 3 is equivalent to $\frac{3}{1}, -\frac{6}{2}, \frac{9}{3}, \frac{12}{4}, -\frac{15}{5} \ldots$

An easy way to write an integer as a ratio of integers is to write it as a fraction with denominator one.

$$3 = \frac{3}{1} \quad -8 = -\frac{8}{1} \quad 0 = \frac{0}{1}$$

Since any integer can be written as the ratio of two integers, *all integers are rational numbers*! Remember that the counting numbers and the whole numbers are also integers, and so they, too, are rational.

What about decimals? Are they rational? Let's look at a few to see if we can write each of them as the ratio of two integers.

We've already seen that integers are rational numbers. The integer -8 could be written as the decimal -8.0. So, clearly, some decimals are rational.

Think about the decimal 7.3. Can we write it as a ratio of two integers? Because 7.3 means $7\frac{3}{10}$, we can write it as an improper fraction, $\frac{73}{10}$. So 7.3 is the ratio of the integers 73 and 10. It is a rational number.

In general, any decimal that ends after a number of digits (such as 7.3 or -1.2684) is a rational number. We can use the place value of the last digit as the denominator when writing the decimal as a fraction.

? Exercise 13.5.9.7

Write as the ratio of two integers:

1. -27
2. 7.31

Answer

1. Writing -27 as a fraction with denominator 1, we get $\frac{-27}{1}$.
2. For 7.31, we have two ways to think of it. We could see that it is equal to 731 hundredths or $\frac{731}{100}$,

   or we could start by rewriting 7.31 as a mixed number. That is, $7.31 = 7\frac{31}{100}$. Then we can convert this mixed number to an improper fraction to get $\frac{731}{100}$.

Since both numbers can be written as the ratio of two integers, we see that -27 and 7.31 are both rational numbers.

? Exercise 13.5.9.8

Write as the ratio of two integers:

1. -24
2. 3.57

Answer

1. $-24 = \frac{-24}{1}$
2. $3.57 = \frac{357}{100}$

Exercise 13.5.9.9

Write as the ratio of two integers:

1. -19
2. 8.41

Answer

1. $-19 = \dfrac{-19}{1}$
2. $8.41 = \dfrac{841}{100}$

Let's look at the decimal form of the numbers we know are rational.

We have seen that *every integer is a rational number*, since $a = \dfrac{a}{1}$ for any integer, a. We can also change any integer to a decimal by adding a decimal point and a zero.

Integer	-2	-1	0	1	2	3
Decimal form	-2.0	-1.0	0.0	1.0	2.0	3.0

These decimal numbers stop.

We have also seen that *every fraction is a rational number*. Look at the decimal form of the fractions we considered above.

Ratio of integers	$\frac{4}{5}$	$-\frac{7}{8}$	$\frac{13}{4}$	$-\frac{20}{3}$
The decimal form	0.8	-0.875	3.25	$-6.666\ldots$
			$-6.\overline{6}$	

These decimal numbers either stop or repeat.

What do these examples tell us?

Every rational number can be written both as a ratio of integers, ($\dfrac{p}{q}$, where p and q are integers and $q \neq 0$), and as a decimal that either stops or repeats.

Here are the numbers we looked at above expressed as a ratio of integers and as a decimal:

Table 13.5.9.1

Fractions					Integers					
Number	$\frac{4}{5}$	$\frac{7}{8}$	$\frac{13}{4}$	$-\frac{20}{3}$	-2	-1	0	1	2	3
Ratio of Integers	$\frac{4}{5}$	$\frac{7}{8}$	$\frac{13}{4}$	$-\frac{20}{3}$	$-\frac{2}{1}$	$-\frac{1}{1}$	$\frac{0}{1}$	$\frac{1}{1}$	$\frac{2}{1}$	$\frac{3}{1}$
Decimal Form	0.8	-0.875	3.25	$-6.\overline{6}$	-2.0	-1.0	0.0	1.0	2.0	3.0

RATIONAL NUMBER

A **rational number** is a number of the form $\frac{p}{q}$, where p and q are integers and $q \neq 0$

Its decimal form stops or repeats.

Are there any decimals that do not stop or repeat? Yes!

The number π (the Greek letter *pi*, pronounced "pie"), which is very important in describing circles, has a decimal form that does not stop or repeat.

$$\pi = 3.141592654\ldots \tag{13.5.9.1}$$

We can even create a decimal pattern that does not stop or repeat, such as

$$2.01001000100001\ldots \tag{13.5.9.2}$$

Numbers whose decimal form does not stop or repeat cannot be written as a fraction of integers. We call these numbers irrational.

IRRATIONAL NUMBER

An **irrational number** is a number that cannot be written as the ratio of two integers.

Its decimal form does not stop and does not repeat.

Let's summarize a method we can use to determine whether a number is rational or irrational.

RATIONAL OR IRRATIONAL?

If the decimal form of a number

- *repeats or stops*, the number is **rational**.
- *does not repeat and does not stop*, the number is **irrational**.

Exercise 13.5.9.10

Given the numbers $0.58\overline{3}, 0.47, 3.605551275\ldots$ list the

1. rational numbers
2. irrational numbers.

Answer

1.	Look for decimals that repeat or stop	The 3 repeats in $0.58\overline{3}$. The decimal 0.47 stops after the 7. So $0.58\overline{3}$ and $0.47$are rational
2.	Look for decimals that repeat or stop	$3.605551275\ldots$ has no repeating block of digits and it does not stop. So $3.605551275\ldots$ is irrational.

Exercise 13.5.9.11

For the given numbers list the

1. rational numbers
2. irrational numbers: $0.29, 0.81\overline{6}, 2.515115111\ldots.$

Answer

1. $0.29, 0.81\overline{6}$
2. $2.515115111\ldots.$

Exercise 13.5.9.12

For the given numbers list the

1. rational numbers
2. irrational numbers: $2.6\overline{3}, 0.125, 0.418302\ldots$

Answer

1. $2.6\overline{3}, 0.125$

2. $0.418302\ldots$

Exercise 13.5.9.13

For each number given, identify whether it is rational or irrational:

1. $\sqrt{36}$
2. $\sqrt{44}$

Answer

1. Recognize that 36 is a perfect square, since $6^2 = 36$. So $\sqrt{36} = 6$, therefore $\sqrt{36}$ is rational.
2. Remember that $6^2 = 36$ and $7^2 = 49$, so 44 is not a perfect square. Therefore, the decimal form of $\sqrt{44}$ will never repeat and never stop, so $\sqrt{44}$ is irrational.

Exercise 13.5.9.14

For each number given, identify whether it is rational or irrational:

1. $\sqrt{81}$
2. $\sqrt{17}$

Answer

1. rational
2. irrational

Exercise 13.5.9.15

For each number given, identify whether it is rational or irrational:

1. $\sqrt{116}$
2. $\sqrt{121}$

Answer

1. irrational
2. rational

We have seen that all counting numbers are whole numbers, all whole numbers are integers, and all integers are rational numbers. The irrational numbers are numbers whose decimal form does not stop and does not repeat. When we put together the rational numbers and the irrational numbers, we get the set of **real numbers**.

REAL NUMBER

A **real number** is a number that is either rational or irrational.

All the numbers we use in elementary algebra are real numbers. Figure 13.5.9.3illustrates how the number sets we've discussed in this section fit together.

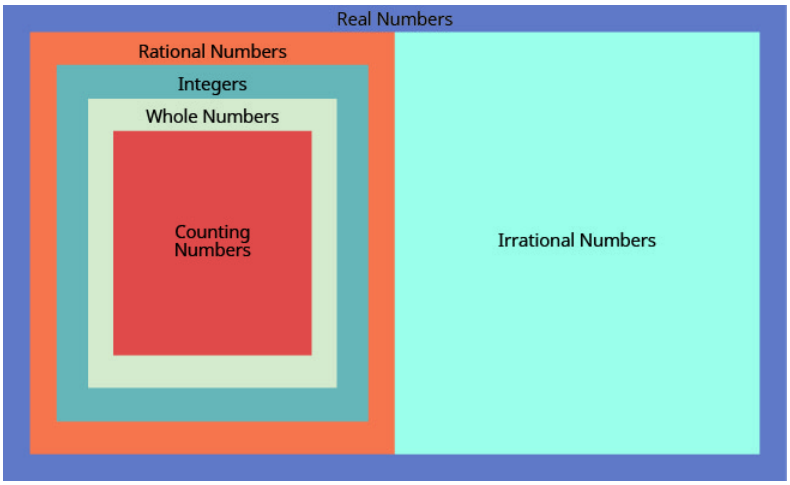

Figure 13.5.9.3: This chart shows the number sets that make up the set of real numbers. Does the term "real numbers" seem strange to you? Are there any numbers that are not "real," and, if so, what could they be?

Can we simplify $\sqrt{-25}$? Is there a number whose square is -25?

$$(\quad)^2 = -25?$$

None of the numbers that we have dealt with so far has a square that is -25. Why? Any positive number squared is positive. Any negative number squared is positive. So we say there is no real number equal to $\sqrt{-25}$.

The square root of a negative number is not a real number.

? Exercise 13.5.9.16

For each number given, identify whether it is a real number or not a real number:

1. $\sqrt{-169}$
2. $-\sqrt{64}$

Answer

1. There is no real number whose square is -169. Therefore, $\sqrt{-169}$ is not a real number.
2. Since the negative is in front of the radical, $-\sqrt{64}$ is -8, Since -8 is a real number, $-\sqrt{64}$ is a real number.

? Exercise 13.5.9.17

For each number given, identify whether it is a real number or not a real number:

1. $\sqrt{-196}$
2. $-\sqrt{81}$

Answer

1. not a real number
2. real number

? Exercise 13.5.9.18

For each number given, identify whether it is a real number or not a real number:

1. $-\sqrt{49}$
2. $\sqrt{-121}$

Answer

1. real number

2. not a real number

Exercise 13.5.9.19

Given the numbers $-7, \frac{14}{5}, 8, \sqrt{5}, 5.9, \sqrt{64}$ list the

1. whole numbers
2. integers
3. rational numbers
4. irrational numbers
5. real numbers

Answer

1. Remember, the whole numbers are 0, 1, 2, 3, … and 8 is the only whole number given.
2. The integers are the whole numbers, their opposites, and 0. So the whole number 8 is an integer, and -7 is the opposite of a whole number so it is an integer, too. Also, notice that 64 is the square of 8 so $-\sqrt{64} = -8$. So the integers are $-7, 8, \sqrt{64}$.
3. Since all integers are rational, then $-7, 8, -\sqrt{64}$ are rational. Rational numbers also include fractions and decimals that repeat or stop, so $\frac{14}{5}$ and 5.9 are rational. So the list of rational numbers is $-7, \frac{14}{5}, 8, 5.9, \sqrt{64}$
4. Remember that 5 is not a perfect square, so $\sqrt{5}$ is irrational.
5. All the numbers listed are real numbers.

Exercise 13.5.9.20

For the given numbers, list the

1. whole numbers
2. integers
3. rational numbers
4. irrational numbers
5. real numbers: $-3, -\sqrt{2}, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$

Answer

1. $4, \sqrt{49}$.
2. $-3, 4, \sqrt{49}$
3. $-3, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$
4. $-\sqrt{2}$
5. $-3, \sqrt{2}, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$

Exercise 13.5.9.21

For the given numbers, list the

1. whole numbers
2. integers
3. rational numbers
4. irrational numbers
5. real numbers: $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}, 2.041975\ldots$

Answer

1. $6, \sqrt{121}$.
2. $-\sqrt{25}, -1, 6, \sqrt{121}$
3. $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}$

4. $2.041975\ldots$
5. $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}, 2.041975\ldots$

Locate Fractions on the Number Line

The last time we looked at the **number line**, it only had positive and negative integers on it. We now want to include **fraction**s and decimals on it.

Note

Doing the Manipulative Mathematics activity "Number Line Part 3" will help you develop a better understanding of the location of fractions on the number line.

Let's start with fractions and locate $\frac{1}{5}, -\frac{4}{5}, 3, \frac{7}{4}, -\frac{9}{2}, -5$ and $\frac{8}{3}$ on the number line.

We'll start with the whole numbers 3 and −5. because they are the easiest to plot. See Figure 13.5.9.4

The **proper fractions** listed are $\frac{1}{5}$ and $-\frac{4}{5}$. We know the proper fraction $\frac{1}{5}$ has value less than one and so would be located between 0 and 1. The denominator is 5, so we divide the unit from 0 to 1 into 5 equal parts $\frac{1}{5}, \frac{2}{5}, \frac{3}{5}, \frac{4}{5}$. We plot $\frac{1}{5}$. See Figure 13.5.9.4

Similarly, $-\frac{4}{5}$ is between 0 and −1. After dividing the unit into 5 equal parts we plot $-\frac{4}{5}$. See Figure 13.5.9.4

Finally, look at the **improper fractions** $\frac{7}{4}, -\frac{9}{2}, \frac{8}{3}$. These are fractions in which the numerator is greater than the denominator. Locating these points may be easier if you change each of them to a mixed number. See Figure 13.5.9.4

$$\frac{7}{4} = 1\frac{3}{4} \quad -\frac{9}{2} = -4\frac{1}{2} \quad \frac{8}{3} = 2\frac{2}{3} \tag{13.5.9.3}$$

Figure 13.5.9.4shows the number line with all the points plotted.

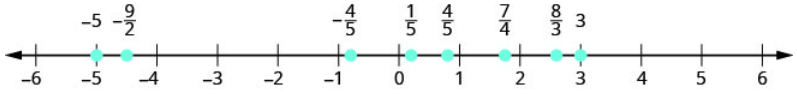

Figure 13.5.9.4

Exercise 13.5.9.22

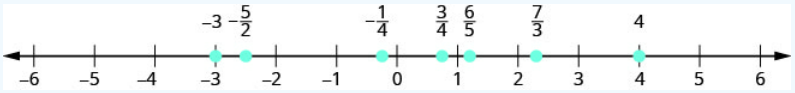
Locate and label the following on a number line: $4, \frac{3}{4}, -\frac{1}{4}, -3, \frac{6}{5}, -\frac{5}{2}$ and $\frac{7}{3}$.

Answer

Locate and plot the integers, 4,−3.

Locate the proper fraction $\frac{3}{4}$ first. The fraction $\frac{3}{4}$ is between 0 and 1. Divide the distance between 0 and 1 into four equal parts then, we plot $\frac{3}{4}$. Similarly plot $-\frac{1}{4}$.

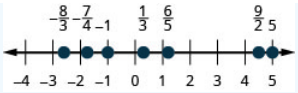
Now locate the improper fractions $\frac{6}{5}, -\frac{5}{2}, \frac{7}{3}$. It is easier to plot them if we convert them to mixed numbers and then plot them as described above: $\frac{6}{5} = 1\frac{1}{5}, -\frac{5}{2} = -2\frac{1}{2}, \frac{7}{3} = 2\frac{1}{3}$.



Exercise 13.5.9.23

Locate and label the following on a number line: $-1, \frac{1}{3}, \frac{6}{5}, -\frac{7}{4}, \frac{9}{2}, 5$ and $-\frac{8}{3}$.

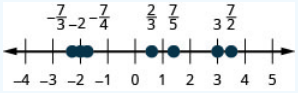
Answer



Exercise 13.5.9.24

Locate and label the following on a number line: $\frac{1}{5}, -\frac{4}{5}, 3, \frac{7}{4}, -\frac{9}{2}, -5$ and $\frac{8}{3}$.

Answer



In Exercise 13.5.9.25 we'll use the inequality symbols to order fractions. In previous chapters we used the number line to order numbers.

- $a < b$ "a is less than b" when a is to the left of b on the number line.
- $a < b$ " a is greater than b" when a is to the right of b on the number line.

As we move from left to right on a number line, the values increase.

Exercise 13.5.9.25

Order each of the following pairs of numbers, using $<$ or $>$. It may be helpful to refer Figure 13.5.9.5

1. $-\frac{2}{3}___ -1$
2. $-3\frac{1}{2}___ -3$
3. $-\frac{3}{4}___ -\frac{1}{4}$
4. $-2___ -\frac{8}{3}$

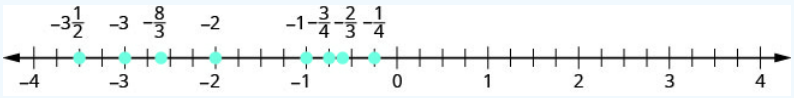


Figure 13.5.9.5

Answer

Be careful when ordering negative numbers.

1. Since $-\frac{2}{3}$ is to the right of -1 on the number line, we know that $-\frac{2}{3} > -1$.
2. Since $-3\frac{1}{2}$ is to the left of -3 on the number line, we know that $-3\frac{1}{2} < -3$.
3. Since $-\frac{3}{4}$ is to the left of $-\frac{1}{4}$ on the number line, we know that $-\frac{3}{4} < -\frac{1}{4}$.
4. Since -2 is to the right of $-\frac{8}{3}$ on the number line, we know that $-2 > -\frac{8}{3}$.

Exercise 13.5.9.26

Order each of the following pairs of numbers, using $<$ or $>$.

1. $-\frac{1}{3}___ -1$
2. $-1\frac{1}{2}___ -2$
3. $-\frac{2}{3}___ -\frac{1}{3}$
4. $-3___ -\frac{7}{3}$

Answer

1. $-\frac{1}{3} > -1$
2. $-1\frac{1}{2} > -2$

3. $-\frac{2}{3} < -\frac{1}{3}$
4. $-3 < -\frac{7}{3}$

Exercise 13.5.9.27

Order each of the following pairs of numbers, using $<$ or $>$.

1. $-1 ___ -\frac{2}{3}$
2. $-2\frac{1}{4} ___ -2$
3. $-\frac{3}{5} ___ -\frac{4}{5}$
4. $-4 ___ -\frac{10}{3}$

Answer

1. $-1 < -\frac{2}{3}$
2. $-2\frac{1}{4} < -2$
3. $-\frac{3}{5} > -\frac{4}{5}$
4. $-4 < -\frac{10}{3}$

Locate Decimals on the Number Line

Since decimals are forms of fractions, locating decimals on the number line is similar to locating fractions on the number line.

Exercise 13.5.9.28

Locate 0.4 on the number line.

Answer

A proper fraction has value less than one. The decimal number 0.4 is equivalent to $\frac{4}{10}$, a proper fraction, so 0.4 is located between 0 and 1. On a number line, divide the interval between 0 and 1 into 10 equal parts. Now label the parts $0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0$. We write 0 as 0.0 and 1 and 1.0, so that the numbers are consistently in tenths. Finally, mark 0.4 on the number line. See Figure 13.5.9.6

Figure 13.5.9.6

Exercise 13.5.9.29

Locate on the number line: 0.6.

Answer

Exercise 13.5.9.30

Locate on the number line: 0.9.

Answer

Exercise 13.5.9.31

Locate -0.74 on the number line.

Answer

The decimal (−0.74\) is equivalent to $-\frac{74}{100}$, so it is located between 0 and −1. On a number line, mark off and label the hundredths in the interval between 0 and −1. See Figure 13.5.9.7

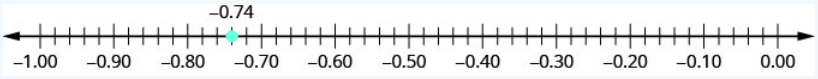

Figure 13.5.9.7

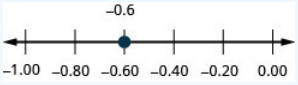
Exercise 13.5.9.32

Locate on the number line: −0.6.

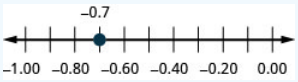
Answer



Exercise 13.5.9.33

Locate on the number line: −0.7.

Answer



Which is larger, 0.04 or 0.40? If you think of this as money, you know that \$0.40 (forty cents) is greater than \$0.04 (four cents). So, $0.40 > 0.04$

Again, we can use the number line to order numbers.

- $a < b$ "a is less than b" when a is to the left of b on the number line.
- $a < b$ " a is greater than b" when a is to the right of b on the number line.

Where are 0.04 and 0.40 located on the number line? See Figure 13.5.9.8

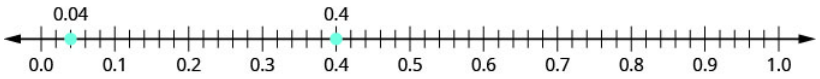


Figure 13.5.9.8

We see that 0.40 is to the right of 0.04 on the number line. This is another way to demonstrate that $0.40 > 0.04$.

How does 0.31 compare to 0.308? This doesn't translate into money to make it easy to compare. But if we convert 0.31 and 0.308 into fractions, we can tell which is larger.

Table 13.5.9.2

	0.31	0.308
Convert to fractions.	$\frac{31}{100}$	$\frac{308}{1000}$
We need a common denominator to compare them.	$\frac{31 \cdot 10}{100 \cdot 10}$	$\frac{308}{1000}$
	$\frac{310}{1000}$	$\frac{308}{1000}$

Because $310 > 308$, we know that $\frac{310}{1000} > \frac{308}{1000}$. Therefore, $0.31 > 0.308$.

Notice what we did in converting 0.31 to a fraction—we started with the fraction $\frac{31}{100}$ and ended with the equivalent fraction $\frac{310}{1000}$.Converting $\frac{310}{1000}$ back to a decimal gives 0.310. So 0.31 is equivalent to 0.310. Writing zeros at the end of a decimal does not change its value!

$$\frac{31}{100} = \frac{310}{1000} \quad \text{and} \quad 0.31 = 0.310$$

We say 0.31 and 0.310 are **equivalent decimals**.

EQUIVALENT DECIMALS

Two decimals are equivalent if they convert to equivalent fractions.

We use equivalent decimals when we order decimals.

The steps we take to order decimals are summarized here.

ORDER DECIMALS.

1. Write the numbers one under the other, lining up the decimal points.
2. Check to see if both numbers have the same number of digits. If not, write zeros at the end of the one with fewer digits to make them match.
3. Compare the numbers as if they were whole numbers.
4. Order the numbers using the appropriate inequality sign.

Exercise 13.5.9.34

Order 0.64 ___ 0.6using $<$ or $>$.

Answer

Write the numbers one under the other, lining up the decimal points.	0.64 0.6
Add a zero to 0.6 to make it a decimal with 2 decimal places. Now they are both hundredths.	0.64 0.60
64 is greater than 60.	$64 > 60$
64 hundredths is greater than 60 hundredths.	$0.64 > 0.60$
	$0.64 > 0.6$

Exercise 13.5.9.35

Order each of the following pairs of numbers, using $<$ or $>$: 0.42 ___ 0.4

Answer

$0.42 > 0.4$

Exercise 13.5.9.36

Order each of the following pairs of numbers, using $<$ or $>$: 0.18 ___ 0.1

Answer

$0.18 > 0.1$

Exercise 13.5.9.37

Order 0.83 ___ 0.803using $<$ or $>$.

Answer

0.83 ___ 0.803

Write the numbers one under the other, lining up the decimal points.	0.83 0.803
They do not have the same number of digits. Write one zero at the end of 0.83.	0.830 0.803
Since $830 > 803$, 830 hundredths is greater than 803 thousandths.	$0.830 > 0.803$
	$0.83 > 0.803$

Exercise 13.5.9.38

Order each of the following pairs of numbers, using $<$ or $>$: 0.76 ___ 0.706

Answer

$0.76 > 0.706$

Exercise 13.5.9.39

Order each of the following pairs of numbers, using $<$ or $>$: 0.305 ___ 0.35

Answer

$0.305 < 0.35$

When we order negative decimals, it is important to remember how to order negative integers. Recall that larger numbers are to the right on the number line. For example, because -2 lies to the right of -3 on the number line, we know that $-2 > -3$. Similarly, smaller numbers lie to the left on the number line. For example, because -9 lies to the left of -6 on the number line, we know that $-9 < -6$. See Figure 13.5.9.9

Figure 13.5.9.9

If we zoomed in on the interval between 0 and -1, as shown in Exercise 13.5.9.40, we would see in the same way that $-0.2 > -0.3$ and $-0.9 < -0.6$.

Exercise 13.5.9.40

Use $<$ or $>$ to order -0.1 ___ -0.8.

Answer

	-0.1 ___ -0.8
Write the numbers one under the other, lining up the decimal points. They have the same number of digits.	-0.1 -0.8
Since $-1 > -8$, we know that -1 tenth is greater than -8 tenths. So, we know that	$-0.1 > -0.8$

Exercise 13.5.9.41

Order the following pair of numbers, using $<$ or $>$: -0.3 ___ -0.5.

Answer

$-0.3 > -0.5$

Exercise 13.5.9.42

Order the following pair of numbers, using $<$ or $>$: -0.6 ___ -0.7.

Answer

$-0.6 > -0.7$

Key Concepts

- **Square Root Notation**
  $\sqrt{m}$ is read 'the square root of m.' If $m = n^2$, then $\sqrt{m} = n$, for $n \geq 0$.
- **Order Decimals**
  1. Write the numbers one under the other, lining up the decimal points.
  2. Check to see if both numbers have the same number of digits. If not, write zeros at the end of the one with fewer digits to make them match.
  3. Compare the numbers as if they were whole numbers.
  4. Order the numbers using the appropriate inequality sign.

Practice Makes Perfect

Simplify Expressions with Square Roots

In the following exercises, simplify.

13.5.9E: Exercises

Practice Makes Perfect

Simplify Expressions with Square Roots

In the following exercises, simplify.

1. $\sqrt{36}$

Answer

$\sqrt{36} = 6$

2. $\sqrt{4}$

3. $\sqrt{64}$

Answer

$\sqrt{64} = 8$

4. $\sqrt{169}$

5. $\sqrt{9}$

Answer

$\sqrt{9} = 3$

6. $\sqrt{16}$

7. $\sqrt{100}$

Answer

$\sqrt{100} = 10$

8. $\sqrt{144}$

9. $\sqrt{-4}$

Answer

$\sqrt{-4}$ is not a real number.

10. $\sqrt{-100}$

11. $\sqrt{-1}$

Answer

$\sqrt{-1}$ is not a real number.

12. $\sqrt{-121}$

Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

In the following exercises, write each rational number as the ratio of two integers.

13. ⓐ 5 ⓑ 3.19

Answer

a. $5 = \frac{5}{1}$ b. $3.19 = \frac{319}{100}$

14. ⓐ 8 ⓑ 1.61

15. ⓐ -12 ⓑ 9.279

Answer

a. $-12 = \frac{-12}{1}$ b. $9.279 = \frac{9279}{1000}$

16. ⓐ -16 ⓑ 4.399

In the following exercises, list the ⓐ rational numbers, ⓑ irrational numbers

17. $\{0.75, 0.22\overline{3}, 1.39174\}$

Answer

All of these numbers are rational.

18. $\{0.36, 0.94729\ldots, 2.52\overline{8}\}$

19. $\{0.4\overline{5}, 1.919293\ldots, 3.59\}$

Answer

a. $0.4\overline{5}$and 3.59 are rational numbers. b. 1.919293… is irrational, since it does not terminate or repeat.

20. $\{0.1\overline{3}, 0.42982\ldots, 1.875\}$

In the following exercises, identify whether each number is rational or irrational.

21. ⓐ $\sqrt{25}$ ⓑ $\sqrt{30}$

Answer

a. $\sqrt{25} = 5$ is rational. b. $\sqrt{30}$ is irrational.

22. ⓐ $\sqrt{44}$ ⓑ $\sqrt{49}$

23. ⓐ $\sqrt{164}$ ⓑ $\sqrt{169}$

Answer

a. $\sqrt{164}$ is irrational. b. $\sqrt{169} = 13$ is rational.

24. ⓐ $\sqrt{225}$ ⓑ $\sqrt{216}$

In the following exercises, identify whether each number is a real number or not a real number.

25. ⓐ $-\sqrt{81}$ ⓑ $\sqrt{-121}$

Answer

a. $-\sqrt{81} = -9$ is a real number. b. $\sqrt{-121}$ is not a real number.

26. ⓐ $-\sqrt{64}$ ⓑ $\sqrt{-9}$

27. ⓐ $\sqrt{-36}$ ⓑ $-\sqrt{144}$

Answer

a. $\sqrt{-36}$ is not a real number. b. $-\sqrt{144} = -12$ is a real number.

28. ⓐ $\sqrt{-49}$ ⓑ $-\sqrt{144}$

In the following exercises, for each set of numbers, list the ⓐ whole numbers, ⓑ integers, ⓒ rational numbers, ⓓ irrational numbers, ⓔ real numbers.

29. $\{-8, 0, 1.95286\ldots, \frac{12}{5}, \sqrt{36}, 9\}$

Answer

a. whole numbers: 0, $\sqrt{36}=6$, 9
b. integers: -8, 0, $\sqrt{36}=6$, 9
c. rational numbers: -8, 0, $\sqrt{36}=6$, 9, $\frac{12}{5}$
d. irrational numbers: 1.95286…
e. real numbers: All of these numbers are real numbers.

30. $\{-9, -3\frac{4}{9}, -\sqrt{9}, 0.40\overline{9}, 116, 7\}$

31. $\{-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}\}$

Answer

a. whole numbers: None of these numbers are whole numbers.
b. integers: $-\sqrt{100}=-10$, −7, -1
c. rational numbers: All of these numbers are rational.
d. irrational numbers: None of these numbers is irrational.
e. real numbers: All of these numbers are real numbers.

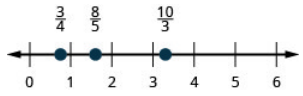
32. $\{-6, -\frac{5}{2}, 0, 0.\overline{714285}, 2\frac{1}{5}, \sqrt{14}\}$

Locate Fractions on the Number Line

In the following exercises, locate the numbers on a number line.

33. $\frac{3}{4}, \frac{8}{5}, \frac{10}{3}$

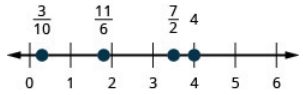
Answer



34. $\frac{1}{4}, \frac{9}{5}, \frac{11}{3}$

35. $\frac{3}{10}, \frac{7}{2}, \frac{11}{6}, 4$

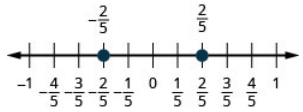
Answer



36. $\frac{7}{10}, \frac{5}{2}, \frac{13}{8}, 3$

37. $\frac{2}{5}, -\frac{2}{5}$

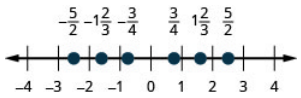
Answer



38. $\frac{3}{4}, -\frac{3}{4}$

39. $\frac{3}{4}, -\frac{3}{4}, 1\frac{2}{3}, -1\frac{2}{3}, \frac{5}{2}, -\frac{5}{2}$

Answer



40. $\frac{1}{5}, -\frac{2}{5}, 1\frac{3}{4}, -1\frac{3}{4}, \frac{8}{3}, -\frac{8}{3}$

In the following exercises, order each of the pairs of numbers, using < or >.

41. -1 ___ $-\frac{1}{4}$

Answer

$-1 < -\frac{1}{4}$

42. -1 ___ $-\frac{1}{3}$

43. $-2\frac{1}{2}$ ___ -3

Answer

$-2\frac{1}{2} > -3$

44. $-1\frac{3}{4}$ ___ -2

45. $-\frac{5}{12}$ ___ $-\frac{7}{12}$

Answer

$-\frac{5}{12} > -\frac{7}{12}$

46. $-\frac{9}{10}$ ___ $-\frac{3}{10}$

47. -3 ___ $-\frac{13}{5}$

Answer

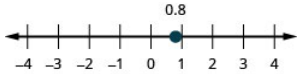
$-3 < -\frac{13}{5}$

48. -4 ___ $-\frac{23}{6}$

Locating Decimals on the Number Line In the following exercises, locate the number on the number line.

49. 0.8

Answer



50. −0.9

51. −1.6

Answer

52. 3.1

In the following exercises, order each pair of numbers, using < or >.

53. 0.37 ___ 0.63

Answer

$0.37 < 0.63$

54. 0.86 ___ 0.69

55. 0.91 ___ 0.901

Answer

$0.91 > 0.901$

56. 0.415 ___ 0.41

57. -0.5 ___ -0.3

Answer

$-0.5 < -0.3$

58. -0.1 ___ -0.4

59. -0.62 ___ -0.619

Answer

$-0.62 < -0.619$

60. -7.31 ___ -7.3

Everyday Math

61. **Field trip** All the 5th graders at Lincoln Elementary School will go on a field trip to the science museum. Counting all the children, teachers, and chaperones, there will be 147 people. Each bus holds 44 people.

ⓐ How many busses will be needed?
ⓑ Why must the answer be a whole number?
ⓒ Why shouldn't you round the answer the usual way, by choosing the whole number closest to the exact answer?

62. **Child care** Serena wants to open a licensed child care center. Her state requires there be no more than 12 children for each teacher. She would like her child care center to serve 40 children.

ⓐ How many teachers will be needed?
ⓑ Why must the answer be a whole number?
ⓒ Why shouldn't you round the answer the usual way, by choosing the whole number closest to the exact answer?

Writing Exercises

63. In your own words, explain the difference between a rational number and an irrational number.

64. Explain how the sets of numbers (counting, whole, integer, rational, irrationals, reals) are related to each other.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objective of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with square roots.			
identify integers, rational numbers, irrational numbers, and real numbers.			
locate fractions on the number line.			
locate decimals on the number line.			

ⓑ On a scale of 1−10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

This page titled 13.5.9E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

13.5.10: Properties of Real Numbers

Learning Objectives

By the end of this section, you will be able to:

- Use the commutative and associative properties
- Use the identity and inverse properties of addition and multiplication
- Use the properties of zero
- Simplify expressions using the distributive property

Note

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra* chapter, **The Properties of Real Numbers**.

Use the Commutative and Associative Properties

Think about adding two numbers, say 5 and 3. The order we add them doesn't affect the result, does it?

$$\begin{array}{ll} 5+3 & 3+5 \\ 8 & 8 \\ 5+3= & 3+5 \end{array}$$

The results are the same.

As we can see, the order in which we add does not matter!

What about multiplying 5 and 3?

$$\begin{array}{ll} 5\cdot 3 & 3\cdot 5 \\ 15 & 15 \\ 5\cdot 3= & 3\cdot 5 \end{array}$$

Again, the results are the same!

The order in which we multiply does not matter!

These examples illustrate the **commutative property**. When adding or multiplying, changing the *order* gives the same result.

COMMUTATIVE PROPERTY

of Addition	If a, b are real numbers, then	$a+b=b+a$
of Multiplication	If a, b are real numbers, then	$a\cdot b=b\cdot a$

When adding or multiplying, changing the *order* gives the same result.

The commutative property has to do with order. If you change the order of the numbers when adding or multiplying, the result is the same.

What about subtraction? Does order matter when we subtract numbers? Does $7-3$ give the same result as $3-7$?

$$\begin{array}{ll} 7-3 & 3-7 \\ 4 & -4 \end{array}$$

$$4 \neq -4$$

$$7-3 \neq 3-7$$

The results are not the same.

Since changing the order of the subtraction did not give the same result, we know that *subtraction is not commutative*.

Let's see what happens when we divide two numbers. Is **division** commutative?

$$\begin{array}{ll} 12 \div 4 & 4 \div 12 \\ \frac{12}{4} & \frac{4}{12} \\ 3 & \frac{1}{3} \end{array}$$

$$3 \neq \frac{1}{3}$$
$$12 \div 4 \neq 4 \div 12$$

The results are not the same.

Since changing the order of the division did not give the same result, *division is not commutative*. The commutative properties only apply to addition and multiplication!

- Addition and multiplication *are* commutative.
- Subtraction and Division *are not* commutative.

If you were asked to simplify this expression, how would you do it and what would your answer be?

$$7+8+2$$

Some people would think $7+8$ is 15 and then $15+2$ is 17. Others might start with $8+2$ makes 10 and then $7+10$ makes 17.

Either way gives the same result. Remember, we use parentheses as grouping symbols to indicate which operation should be done first.

Add $7+8$.	$(7+8)+2$
Add.	$15+2$
Add.	17

	$7+(8+2)$
Add $8+2$.	$7+10$
Add.	77

$$(7+8)+2=7+(8+2)$$

When adding three numbers, changing the grouping of the numbers gives the same result.

This is true for multiplication, too.

	$(5 \cdot \frac{1}{3}) \cdot 3$
Multiply. $5 \cdot \frac{1}{3}$	$\frac{5}{3} \cdot 3$
Multiply.	5

	$5 \cdot (\frac{1}{3} \cdot 3)$
Multiply. $\frac{1}{3} \cdot 3$	$5 \cdot 1$
Multiply.	5

$$(5 \cdot \tfrac{1}{3}) \cdot 3 = 5 \cdot (\tfrac{1}{3} \cdot 3)$$

When multiplying three numbers, changing the grouping of the numbers gives the same result.

You probably know this, but the terminology may be new to you. These examples illustrate the **associative property**.

ASSOCIATIVE PROPERTY

of Addition	If a, b, c are real numbers, then $(a+b)+c=a+(b+c)$
of Multiplication	If a, b, c are real numbers, then $(a \cdot b) \cdot c=a \cdot(b \cdot c)$

When adding or multiplying, changing the *grouping* gives the same result.

Let's think again about multiplying $5 \cdot \frac{1}{3} \cdot 3$. We got the same result both ways, but which way was easier? Multiplying $\frac{1}{3}$ and 3 first, as shown above on the right side, eliminates the fraction in the first step. Using the associative property can make the math easier!

The **associative property** has to do with grouping. If we change how the numbers are grouped, the result will be the same. Notice it is the same three numbers in the same order—the only difference is the grouping.

We saw that subtraction and division were not commutative. They are not associative either.

When simplifying an expression, it is always a good idea to plan what the steps will be. In order to combine like terms in the next example, we will use the commutative property of addition to write the like terms together.

Example 13.5.10.1

Simplify: $18p+6q+15p+5q$.

Solution

	$18p+6q+15p+5q$
Use the commutative property of addition to re-order so that like terms are together.	$18p+15p+6q+5q$
Add like terms.	$33p+11q$

Try It 13.5.10.2

Simplify: $23r+14s+9r+15s$.

Answer

$32r+29s$

Try It 13.5.10.3

Simplify: $37m+21n+4m-15n$.

Answer

$41m+6n$

When we have to simplify algebraic **expressions**, we can often make the work easier by applying the commutative or associative property first, instead of automatically following the order of operations. When adding or subtracting fractions, combine those with a common denominator first.

Example 13.5.10.4

Simplify: $\left(\frac{5}{13}+\frac{3}{4}\right)+\frac{1}{4}$

Solution

	$(\frac{5}{13}+\frac{3}{4})+\frac{1}{4}$
Notice that the last 2 terms have a common denominator, so change the grouping.	$\frac{5}{13}+(\frac{3}{4}+\frac{1}{4})$
Add in parentheses first.	$\frac{5}{13}+(\frac{4}{4})$
Simplify the fraction.	$\frac{5}{13}+1$
Add.	$1\frac{5}{13}$
Convert to an improper fraction.	$\frac{18}{13}$

Try It 13.5.10.5

Simplify: $(\frac{7}{15}+\frac{5}{8})+\frac{3}{8}$

Answer

$1\frac{7}{15}$

Try It 13.5.10.6

Simplify: $(\frac{2}{9}+\frac{7}{12})+\frac{5}{12}$

Answer

$1\frac{2}{9}$

Example 13.5.10.7

Use the associative property to simplify $6(3x)$.

Solution

Use the associative property of multiplication, $(a\cdot b)\cdot c=a\cdot(b\cdot c)$, to change the grouping.

	$6(3x)$
Change the grouping.	$(6\cdot 3)x$
Multiply in the parentheses.	18

Notice that we can multiply $6\cdot 3$ but we could not multiply $3x$ without having a value for x.

Try It 13.5.10.8

Use the associative property to simplify $8(4x)$.

Answer

$32x$

Try It 13.5.10.9

Use the associative property to simplify $-9(7y)$.

Answer

$-63y$

Use the Identity and Inverse Properties of Addition and Multiplication

What happens when we add 0 to any number? Adding 0 doesn't change the value. For this reason, we call 0 the **additive identity**.

For example,

$$\begin{array}{ccc} 13+0 & -14+0 & 0+(-8) \\ 13 & -14 & -8 \end{array}$$

These examples illustrate the **Identity Property of Addition** that states that for any real number a, $a+0=a$ and $0+a=a$.

What happens when we multiply any number by one? Multiplying by 1 doesn't change the value. So we call 1 the **multiplicative identity**.

For example,

$$\begin{array}{ccc} 43\cdot 1 & -27\cdot 1 & 1\cdot\frac{3}{5} \\ 43 & -27 & \frac{3}{5} \end{array}$$

These examples illustrate the **Identity Property of Multiplication** that states that for any real number a, $a\cdot 1=a$ and $1\cdot a=a$.

We summarize the Identity Properties below.

IDENTITY PROPERTY

of addition For any real number a: $a+0=a \quad 0+a=a$
0 is the **additive identity**
of multiplication For any real number a: $a\cdot 1=a \quad 1\cdot a=a$
1 is the **multiplicative identity**

What number added to 5 gives the additive identity, 0?
$5+_____=0$ We know $5+(-5)=0$
What number added to −6 gives the additive identity, 0?
$-6+_____=0$ We know $-6+6=0$

Figure 13.5.10.1

Notice that in each case, the missing number was the opposite of the number!

We call $-a$. the **additive inverse** of a. *The opposite of a number is its additive inverse.* A number and its opposite add to zero, which is the additive identity. This leads to the **Inverse Property of Addition** that states for any real number $a, a+(-a)=0$. Remember, a number and its opposite add to zero.

What number multiplied by $\frac{2}{3}$ gives the multiplicative identity, 1? In other words, $\frac{2}{3}$ times what results in 1?

$\frac{2}{3}\cdot___=1$ We know $\frac{2}{3}\cdot\frac{3}{2}=1$

Figure 13.5.10.2

What number multiplied by 2 gives the multiplicative identity, 1? In other words 2 times what results in 1?

$2\cdot___=1$ We know $2\cdot\frac{1}{2}=1$

Figure 13.5.10.3

Notice that in each case, the missing number was the **reciprocal** of the number!

We call $\frac{1}{a}$ the **multiplicative inverse** of a. *The reciprocal of aa number is its multiplicative inverse.* A number and its reciprocal multiply to one, which is the multiplicative identity. This leads to the **Inverse Property of Multiplication** that states that for any real number $a, a \neq 0, a \cdot \frac{1}{a} = 1$.

We'll formally state the inverse properties here:

INVERSE PROPERTY

of addition	For any real number a, $-a$. is the **additive inverse** of a A number and its opposite add to zero.	$a + (-a) = 0$
of multiplication	For any real number $a, a \neq 0$ $\frac{1}{a}$. is the **multiplicative inverse** of a A number and its reciprocal multiply to one.	$a \cdot \frac{1}{a} = 1$

Example 13.5.10.10

Find the additive inverse of

1. $\frac{5}{8}$
2. 0.6
3. -8
4. $-\frac{4}{3}$

Solution

To find the additive inverse, we find the opposite.

1. The additive inverse of $\frac{5}{8}$ is the opposite of $\frac{5}{8}$. The additive inverse of $\frac{5}{8}$ is $-\frac{5}{8}$
2. The additive inverse of 0.6 is the opposite of 0.6. The additive inverse of 0.6 is -0.6.
3. The additive inverse of -8 is the opposite of -8. We write the opposite of -8 as $-(-8)$, and then simplify it to 8. Therefore, the additive inverse of -8 is 8.
4. The additive inverse of $-\frac{4}{3}$ is the opposite of $-\frac{4}{3}$. We write this as $-(-\frac{4}{3})$, and then simplify to $\frac{4}{3}$. Thus, the additive inverse of $-\frac{4}{3}$ is $\frac{4}{3}$.

Try It 13.5.10.11

Find the additive inverse of

1. $\frac{7}{9}$
2. 1.2
3. -14
4. $-\frac{9}{4}$

Answer

1. $-\frac{7}{9}$
2. -1.2
3. 14
4. $\frac{9}{4}$

Try It 13.5.10.12

Find the additive inverse of

1. $\frac{7}{13}$
2. 8.4
3. -46
4. $-\frac{5}{2}$

Answer

1. $-\frac{7}{13}$
2. -8.4
3. 46
4. $\frac{5}{2}$

Example 13.5.10.13

Find the multiplicative inverse of

1. 9
2. $-\frac{1}{9}$
3. 0.9

Solution

To find the multiplicative inverse, we find the reciprocal.

1. The multiplicative inverse of 9 is the reciprocal of 9, which is $\frac{1}{9}$. Therefore, the multiplicative inverse of 9 is $\frac{1}{9}$.
2. The multiplicative inverse of $-\frac{1}{9}$ is the reciprocal of $-\frac{1}{9}$, which is -9. Thus, the multiplicative inverse of $-\frac{1}{9}$ is -9.
3. To find the multiplicative inverse of 0.9, we first convert 0.9 to a fraction, $\frac{9}{10}$. Then we find the reciprocal of the fraction. The reciprocal of $\frac{9}{10}$ is $\frac{10}{9}$. So the multiplicative inverse of 0.9 is $\frac{10}{9}$.

Try It 13.5.10.14

Find the multiplicative inverse of

1. 4
2. $-\frac{1}{7}$
3. 0.3

Answer

1. $\frac{1}{4}$
2. -7
3. $\frac{10}{3}$

Try It 13.5.10.15

Find the multiplicative inverse of

1. 18
2. $-\frac{4}{5}$
3. 0.6

Answer

1. $\frac{1}{18}$

2. $-\frac{5}{4}$
3. $\frac{5}{3}$

Use the Properties of Zero

The identity property of addition says that when we add 0 to any number, the result is that same number. What happens when we multiply a number by 0? Multiplying by 0 makes the **product** equal zero.

MULTIPLICATION BY ZERO

For any real number a.

$$a \cdot 0 = 0 \quad 0 \cdot a = 0$$

The product of any real number and 0 is 0.

What about **division** involving zero? What is $0 \div 3$? Think about a real example: If there are no cookies in the cookie jar and 3 people are to share them, how many cookies does each person get? There are no cookies to share, so each person gets 0 cookies. So,

$$0 \div 3 = 0$$

We can check division with the related multiplication fact.

$$12 \div 6 = 2 \text{ because } 2 \cdot 6 = 12$$

So we know $0 \div 3 = 0$ because $0 \cdot 3 = 0$.

DIVISION OF ZERO

For any real number a, except 0, $\frac{0}{a} = 0$ and $0 \div a = 0$.

Zero divided by any real number except zero is zero.

Now think about dividing *by* zero. What is the result of dividing 4 by 0? Think about the related multiplication fact: $4 \div 0 = ?$ means $? \cdot 0 = 4$. Is there a number that multiplied by 0 gives 4? Since any real number multiplied by 0 gives 0, there is no real number that can be multiplied by 0 to obtain 4.

We conclude that there is no answer to $4 \div 0$ and so we say that division by 0 is undefined.

DIVISION BY ZERO

For any real number a, $\frac{a}{0}$ and $a \div 0$ are undefined.

Division by zero is undefined.

We summarize the properties of zero below.

PROPERTIES OF ZERO

Multiplication by Zero: For any real number a,

$$a \cdot 0 = 0 \quad 0 \cdot a = 0 \quad \text{The product of any number and 0 is 0}$$

Division of Zero, Division by Zero: For any real number $a, a \neq 0$

$\frac{0}{a} = 0$	Zero divided by any real number, except itself is zero.
$\frac{a}{0}$ is undefined	Division by zero is undefined.

Example 13.5.10.16

Simplify:

1. $-8 \cdot 0$
2. $\frac{0}{-2}$
3. $\frac{-32}{0}$

Solution

1. $-8 \cdot 0$

   The product of any real number and 0 is 0 — 0

2. $\frac{0}{-2}$

   Zero divided by any real number, except itself, is 0 — 0

3. $\frac{-32}{0}$

   Division by 0 is undefined. — undefined

Try It 13.5.10.17

Simplify:

1. $-14 \cdot 0$
2. $\frac{0}{-6}$
3. $\frac{-2}{0}$

Answer

1. 0
2. 0
3. undefined

Try It 13.5.10.18

Simplify:

1. $0(-17)$
2. $\frac{0}{-10}$
3. $\frac{-5}{0}$

Answer

1. 0
2. 0
3. undefined

We will now practice using the properties of identities, inverses, and zero to simplify expressions.

Example 13.5.10.19

Simplify:

1. $\frac{0}{n+5}$, where $n \neq -5$
2. $\frac{10-3p}{0}$ where $10-3p \neq 0$

Solution

1. $\frac{0}{n+5}$

   Zero divided by any real number except itself is 0. 0

2. $\frac{10-3p}{0}$

   Division by 0 is undefined undefined

Try It 13.5.10.26

Simplify:

1. $\frac{0}{m+7}$, where $m \neq -7$
2. $\frac{18-6c}{0}$, where $18-6c \neq 0$

Answer

1. 0
2. undefined

Try It 13.5.10.27

Simplify:

1. $\frac{0}{d-4}$, where $d \neq 4$
2. $\frac{15-4q}{0}$, where $15-4q \neq 0$

Answer

1. 0
2. undefined

Example 13.5.10.20

Simplify: $-84n+(-73n)+84n$.

Solution

	$-84n+(-73n)+84n$
Notice that the first and third terms are opposites; use the commutative property of addition to re-order the terms.	$-84n+84n+(-73n)$
Add left to right.	$0+(-73)$
Add.	$-73n$

Try It 13.5.10.21

Simplify: $-27a+(-48a)+27a$.

Answer

$-48a$

? Try It 13.5.10.22

Simplify: $39x+(-92x)+(-39x)$.

Answer

$-92x$

Now we will see how recognizing reciprocals is helpful. Before multiplying left to right, look for reciprocals—their product is 1.

✓ Example 13.5.10.23

Simplify: $\frac{7}{15}\cdot\frac{8}{23}\cdot\frac{15}{7}$

Solution

	$\frac{7}{15}\cdot\frac{8}{23}\cdot\frac{15}{7}$
Notice that the first and third terms are reciprocals, so use the commutative property of multiplication to re-order the factors.	$\frac{7}{15}\cdot\frac{15}{7}\cdot\frac{8}{23}$
Multiply left to right.	$1\cdot\frac{8}{23}$
Multiply.	$\frac{8}{23}$

? Exercise 13.5.10.24

Simplify: $\frac{9}{16}\cdot\frac{5}{49}\cdot\frac{16}{9}$

Answer

$\frac{5}{49}$

? Try It 13.5.10.25

Simplify: $\frac{6}{17}\cdot\frac{11}{25}\cdot\frac{17}{6}$

Answer

$\frac{11}{25}$

✓ Example 13.5.10.28

Simplify: $\frac{3}{4}\cdot\frac{4}{3}(6x+12)$

Solution

	$\frac{3}{4} \cdot \frac{4}{3}(6x+12)$
There is nothing to do in the parentheses, so multiply the two fractions first—notice, they are reciprocals.	$1(6x+12)$
Simplify by recognizing the multiplicative identity.	$6x+12$

? Try It 13.5.10.29

Simplify: $\frac{2}{5} \cdot \frac{5}{2}(20y+50)$

Answer

$20y+50$

? Try It 13.5.10.30

Simplify: $\frac{3}{8} \cdot \frac{8}{3}(12z+16)$

Answer

$12z+16$

Simplify Expressions Using the Distributive Property

Suppose that three friends are going to the movies. They each need $9.25—that's 9 dollars and 1 quarter—to pay for their tickets. How much money do they need all together?

You can think about the dollars separately from the quarters. They need 3 times $9 so $27, and 3 times 1 quarter, so 75 cents. In total, they need $27.75. If you think about doing the math in this way, you are using the **distributive property**.

DISTRIBUTIVE PROPERTY

If a, b, c are real numbers, then	$a(b+c) = ab+ac$
Also,	$(b+c)a = ba+ca$
	$a(b-c) = ab-ac$
	$(b-c)a = ba-ca$

Back to our friends at the movies, we could find the total amount of money they need like this:

$$3(9.25)$$
$$3(9+0.25)$$
$$3(9)+3(0.25)$$
$$27+0.75$$
$$27.75$$

In algebra, we use the **distributive property** to remove parentheses as we simplify expressions.

For example, if we are asked to simplify the expression $3(x+4)$, the order of operations says to work in the parentheses first. But we cannot add *x* and 4, since they are not like terms. So we use the distributive property, as shown in Exercise 13.5.10.31

Example 13.5.10.31

Simplify: $3(x+4)$.

Solution

	$3(x+4)$
Distribute.	$3\cdot x+3\cdot 4$
Multiply.	$3x+12$

Try It 13.5.10.32

Simplify: $4(x+2)$.

Answer

$4x+8$

Try It 13.5.10.33

Simplify: $6(x+7)$.

Answer

$6x+42$

Some students find it helpful to draw in arrows to remind them how to use the distributive property. Then the first step in Exercise 13.5.10.31would look like this:

Example 13.5.10.34

Simplify: $8(\frac{3}{8}x+\frac{1}{4})$.

Solution

	$8\left(\frac{3}{8}x+\frac{1}{4}\right)$
Distribute.	$8\cdot\frac{3}{8}x+8\cdot\frac{1}{4}$
Multiply.	$3x+2$

Try It 13.5.10.35

Simplify: $6(\frac{5}{6}y+\frac{1}{2})$.

Answer

$5y+3$

Try It 13.5.10.36

Simplify: $12(\frac{1}{3}n+\frac{3}{4})$.

Answer

$4n+9$

Using the distributive property as shown in Exercise $13.5.10.37$will be very useful when we solve money applications in later chapters.

Example 13.5.10.37

Simplify: $100(0.3+0.25q)$.

Solution

	$100(0.3+0.25q)$
Distribute.	$100(0.3)+100(0.25q)$
Multiply.	$30+25q$

Try It 13.5.10.38

Simplify: $100(0.7+0.15p)$.

Answer

$70+15p$

Try It 13.5.10.39

Simplify: $100(0.04+0.35d)$.

Answer

$4+35d$

When we distribute a negative number, we need to be extra careful to get the signs correct!

Example 13.5.10.40

Simplify: $-2(4y+1)$.

Solution

	$-2(4y+1)$
Distribute.	$-2 \cdot 4y+(-2) \cdot 1$
Multiply.	$-8y-2$

Try It 13.5.10.41

Simplify: $-3(6m+5)$.

Answer

$-18m-15)$

Try It 13.5.10.42

Simplify: $-6(8n+11)$.

Answer

$-48n-66)$

Example 13.5.10.43

Simplify: $-11(4-3a)$.

Solution

Distribute.	$-11(4-3a)$
Multiply.	$-11 \cdot 4-(-11) \cdot 3a$ $-44-(-33a)$
Simplify.	$-44+33a$

Notice that you could also write the result as $33a-44$. Do you know why?

Try It 13.5.10.44

Simplify: $-5(2-3a)$.

Answer

$10+15a$

Try It 13.5.10.45

Simplify: $-7(8-15y)$.

Answer

$-56+105y$

Exercise 13.5.10.46will show how to use the distributive property to find the opposite of an expression.

Example 13.5.10.46

Simplify: $-(y+5)$.

Solution

	$-(y+5)$
Multiplying by -1 results in the opposite.	$-1(y+5)$
Distribute.	$-1 \cdot y+(-1) \cdot 5$
Simplify.	$-y+(-5)$
	$-y-5$

Try It 13.5.10.47

Simplify: $-(z-11)$.

Answer

$-z+11$

Try It 13.5.10.48

Simplify: $-(x-4)$.

Answer

$-x+4$

There will be times when we'll need to use the **distributive property** as part of the order of operations. Start by looking at the parentheses. If the expression inside the parentheses cannot be simplified, the next step would be multiply using the distributive property, which removes the parentheses. The next two examples will illustrate this.

Example 13.5.10.49

Simplify: $8-2(x+3)$.

Be sure to follow the order of operations. Multiplication comes before subtraction, so we will distribute the 2 first and then subtract.

Solution

	$8-2(x+3)$
Distribute.	$8-2\cdot x-2\cdot 3$
Multiply.	$8-2x-6$
Combine like terms.	$-2x+2$

Try It 13.5.10.50

Simplify: $9-3(x+2)$.

Answer

$3-3x$

Try It 13.5.10.51

Simplify: $7x-5(x+4)$.

Answer

$2x-20$

Example 13.5.10.52

Simplify: $4(x-8)-(x+3)$.

Solution

	$4(x-8)-(x+3)$
Distribute.	$4x-32-x-3$
Combine like terms.	$3x-35$

Try It 13.5.10.53

Simplify: $6(x-9)-(x+12)$.

Answer

$5x-66$

Try It 13.5.10.54

Simplify: $8(x-1)-(x+5)$.

Answer

$7x-13$

All the properties of real numbers we have used in this chapter are summarized in Table 13.5.10.1

Table 13.5.10.1

Commutative Property	
of addition If a,b are real numbers, then	$a+b=b+a$
of multiplication If a,b are real numbers, then	$a\cdot b=b\cdot a$
Associative Property	
of addition If a,b,c are real numbers, then	$(a+b)+c=a+(b+c)$
of multiplication If a,b,c are real numbers, then	$(a\cdot b)\cdot c=a\cdot(b\cdot c)$
Distributive Property	
If a,b,c are real numbers, then	$a(b+c)=ab+ac$
Identity Property	
of addition For any real number a: 0 is the **additive identity** **of multiplication** For any real number a: **1** is the **multiplicative identity**	$a+0=a$ $0+a=a$ $a\cdot 1=a$ $1\cdot a=a$
Inverse Property	

of addition For any real number a, $-a$ is the **additive inverse** of a	$a+(-a)=0$
of multiplication For any real number $a, a \neq 0$ $\frac{1}{a}$ is the **multiplicative inverse** of a	$a \cdot \frac{1}{a}=1$
Properties of Zero	
For any real number a,	$a \cdot 0=0$
For any real number $a, a \neq 0$	$0 \cdot a=0$
	$\frac{0}{a}=0$
For any real number $a, a \neq 0$	$\frac{a}{0}$ is undefined

Key Concepts

- **Commutative Property of**
  - **Addition:** If a,b are real numbers, then $a+b=b+a$.
  - **Multiplication:** If a,b are real numbers, then $a \cdot b=b \cdot a$. When adding or multiplying, changing the *order* gives the same result.
- **Associative Property of**
  - **Addition:** If a,b,c are real numbers, then $(a+b)+c=a+(b+c)$.
  - **Multiplication:** If a,b,c are real numbers, then $(a \cdot b) \cdot c=a \cdot(b \cdot c)$. When adding or multiplying, changing the *grouping* gives the same result.
- **Distributive Property:** If a,b,c are real numbers, then
  - $a(b+c)=ab+ac$
  - $(b+c)a=ba+ca$
  - $a(b-c)=ab-ac$
  - $(b+c)a=ba+ca$
- **Identity Property**
  - **of Addition:** For any real number a: $a+0=a$ **0** is the **additive identity**
  - **of Multiplication:** For any real number a: $a \cdot 1=a \quad 1 \cdot a=a$ **1**1 is the **multiplicative identity**
- **Inverse Property**
  - **of Addition:** For any real number $a, a+(-a)=0$. A number and its *opposite* add to zero. $-a$ is the **additive inverse** of a.
  - **of Multiplication:** For any real number $a,(a \neq 0) a \cdot \frac{1}{a}=1$. A number and its *reciprocal* multiply to one. $\frac{1}{a}$ is the **multiplicative inverse** of a.
- **Properties of Zero**
  - For any real number a, $a \cdot 0=0 \quad 0 \cdot a=0$ – The product of any real number and 0 is 0.
  - $\frac{0}{a}=0$ for $a \neq 0$ – Zero divided by any real number except zero is zero.
  - $\frac{a}{0}$ is undefined – Division by zero is undefined.

13.5.10E: Exercises

Practice Makes Perfect

Use the Commutative and Associative Properties

In the following exercises, use the associative property to simplify.

Exercise 1

$3(4x)$

Answer

$12x$

Exercise 2

$4(7m)$

Exercise 3

$(y+12)+28$

Answer

$y+40$

Exercise 4

$(n+17)+33$

In the following exercises, simplify.

Exercise 5

$\frac{1}{2}+\frac{7}{8}+\left(-\frac{1}{2}\right)$

Answer

$\frac{7}{8}$

Exercise 6

$\frac{2}{5}+\frac{5}{12}+\left(-\frac{2}{5}\right)$

Exercise 7

$\frac{3}{20}\cdot\frac{49}{11}\cdot\frac{20}{3}$

Answer

$\frac{49}{11}$

Exercise 8

$\frac{13}{18} \cdot \frac{25}{7} \cdot \frac{18}{13}$

Exercise 9

$-24 \cdot 7 \cdot \frac{3}{8}$

Answer

-63

Exercise 10

$-36 \cdot 11 \cdot \frac{4}{9}$

Exercise 11

$\left(\frac{5}{6} + \frac{8}{15}\right) + \frac{7}{15}$

Answer

$1\frac{5}{6}$

Exercise 12

$\left(\frac{11}{12} + \frac{4}{9}\right) + \frac{5}{9}$

Exercise 13

$17(0.25)(4)$

Answer

17

Exercise 14

$36(0.2)(5)$

Exercise 15

$[2.48(12)](0.5)$

Answer

14.88

Exercise 16

$[9.731(4)](0.75)$

Exercise 17

$7(4a)$

Answer

$28a$

Exercise 18

$9(8w)$

Exercise 19

$-15(5m)$

Answer

$-75m$

Exercise 20

$-23(2n)$

Exercise 21

$12(\frac{5}{6}p)$

Answer

$10p$

Exercise 22

$20(\frac{3}{5}q)$

Exercise 23

$43m+(-12n)+(-16m)+(-9n)$

Answer

$27m+(-21n)$

Exercise 24

$-22p+17q+(-35p)+(-27q)$

Exercise 25

$\frac{3}{8}g+\frac{1}{12}h+\frac{7}{8}g+\frac{5}{12}h$

Answer

$\frac{5}{4}g+\frac{1}{2}h$

Exercise 26

$\frac{5}{6}a+\frac{3}{10}b+\frac{1}{6}a+\frac{9}{10}b$

Exercise 27

$6.8p+9.14q+(-4.37p)+(-0.88q)$

Answer

$2.43p+8.26q$

Exercise 28

$9.6m+7.22n+(-2.19m)+(-0.65n)$

Use the Identity and Inverse Properties of Addition and Multiplication

In the following exercises, find the additive inverse of each number

Exercise 29

1. $\frac{2}{5}$
2. 4.3
3. -8
4. $-\frac{10}{3}$

Answer

1. $-\frac{2}{5}$
2. -4.3
3. 8
4. $\frac{10}{3}$

Exercise 30

1. $\frac{5}{9}$
2. 2.1
3. -3
4. $-\frac{9}{5}$

Exercise 31

1. $-\frac{7}{6}$
2. -0.075
3. 23
4. $\frac{1}{4}$

Answer

1. $\frac{7}{6}$
2. 0.075
3. -23
4. $-\frac{1}{4}$

Exercise 32

1. $-\frac{8}{3}$
2. -0.019
3. 52
4. $\frac{5}{6}$

In the following exercises, find the multiplicative inverse of each number.

Exercise 33

1. 6
2. $-\frac{3}{4}$
3. 0.7

Answer

1. $\frac{1}{6}$
2. $-\frac{4}{3}$
3. $\frac{10}{7}$

Exercise 34

1. 12
2. $-\frac{9}{2}$
3. 0.13

Exercise 35

1. $\frac{11}{12}$
2. -1.1
3. -4

Answer

1. $\frac{12}{11}$
2. $-\frac{10}{11}$
3. $-\frac{1}{4}$

Exercise 36

1. $\frac{17}{20}$
2. -1.5
3. -3

Use the Properties of Zero

In the following exercises, simplify.

Exercise 37

$\frac{0}{6}$

Answer

0

Exercise 38

$\frac{3}{0}$

Exercise 39

$0 \div \frac{11}{12}$

Answer

0

Exercise 40

$\frac{0}{3}$

Exercise 41

$\frac{6}{0}$

Answer

undefined

Exercise 42

$0 \cdot \frac{8}{15}$

Exercise 43

$(-3.14)(0)$

Answer

0

Exercise 44

$\frac{\frac{1}{10}}{0}$

Mixed Practice

In the following exercises, simplify.

Exercise 45

$19a + 44 - 19a$

Answer

44

Exercise 46

$27c + 16 - 27c$

Exercise 47

$10(0.1d)$

Answer

$1d$

Exercise 48

$100(0.01p)$

Exercise 49

$\frac{0}{u-4.99}$, where $u \neq 4.99$

Answer

0

Exercise 50

$\frac{0}{v-65.1}$, where $v \neq 65.1$

Exercise 51

$0 \div \left(x - \frac{1}{2}\right)$, where $x \neq \frac{1}{2}$

Answer

0

Exercise 52

$0 \div \left(y - \frac{1}{6}\right)$, where $y \neq \frac{1}{6}$

Exercise 53

$\frac{32-5a}{0}$, where $32 - 5a \neq 0$

Answer

undefined

Exercise 54

$\frac{28-9b}{0}$, where $28 - 9b \neq 0$

Exercise 55

$\left(\frac{3}{4}+\frac{9}{10}m\right)\div 0$ where $\frac{3}{4}+\frac{9}{10}m\neq 0$

Answer

undefined

Exercise 56

$\left(\frac{5}{16}n-\frac{3}{7}\right)\div 0$ where $\frac{5}{16}n-\frac{3}{7}\neq 0$

Exercise 57

$15\cdot\frac{3}{5}(4d+10)$

Answer

$36d+90$

Exercise 58

$18\cdot\frac{5}{6}(15h+24)$

Simplify Expressions Using the Distributive Property

In the following exercises, simplify using the distributive property.

Exercise 59

$8(4y+9)$

Answer

$32y+72$

Exercise 60

$9(3w+7)$

Exercise 61

$6(c-13)$

Answer

$6c-78$

Exercise 62

$7(y-13)$

Exercise 63

$\frac{1}{4}(3q+12)$

Answer

$\frac{3}{4}q+3$

Exercise 64

$\frac{1}{5}(4m+20)$

Exercise 65

$9\left(\frac{5}{9}y-\frac{1}{3}\right)$

Answer

$5y-3$

Exercise 66

$10\left(\frac{3}{10}x-\frac{2}{5}\right)$

Exercise 67

$12\left(\frac{1}{4}+\frac{2}{3}r\right)$

Answer

$3+8r$

Exercise 68

$12\left(\frac{1}{6}+\frac{3}{4}s\right)$

Exercise 69

$r(s-18)$

Answer

$rs-18r$

Exercise 70

$u(v-10)$

Exercise 71

$(y+4)p$

Answer

$yp+4p$

Exercise 72

$(a+7)x$

Exercise 73

$-7(4p+1)$

Answer

$-28p-7$

Exercise 74

$-9(9a+4)$

Exercise 75

$-3(x-6)$

Answer

$-3x+18$

Exercise 76

$-4(q-7)$

Exercise 77

$-(3x-7)$

Answer

$-3x+7$

Exercise 78

$-(5p-4)$

Exercise 79

$16-3(y+8)$

Answer

$-3y-8$

Exercise 80

$18-4(x+2)$

Exercise 81

$4-11(3c-2)$

Answer

$-33c+26$

Exercise 82

$9-6(7n-5)$

Exercise 83

$22-(a+3)$

Answer

$-a+19$

Exercise 84

$8-(r-7)$

Exercise 85

$(5m-3)-(m+7)$

Answer

$4m-10$

Exercise 86

$(4y-1)-(y-2)$

Exercise 87

$5(2n+9)+12(n-3)$

Answer

$22n+9$

Exercise 88

$9(5u+8)+2(u-6)$

Exercise 89

$9(8x-3)-(-2)$

Answer

$72x-25$

Exercise 90

$4(6x-1)-(-8)$

Exercise 91

$14(c-1)-8(c-6)$

Answer

$6c+34$

Exercise 92

$11(n-7)-5(n-1)$

Exercise 93

$6(7y+8)-(30y-15)$

Answer

$12y+63$

Exercise 94

$7(3n+9)-(4n-13)$

Everyday Math

Exercise 95

Insurance copayment Carrie had to have 5 fillings done. Each filling cost $80. Her dental insurance required her to pay 20% of the cost as a copay. Calculate Carrie's copay:

1. First, by multiplying 0.20 by 80 to find her copay for each filling and then multiplying your answer by 5 to find her total copay for 5 fillings.
2. Next, by multiplying [5(0.20)](80)
3. Which of the properties of real numbers says that your answers to parts (a), where you multiplied 5[(0.20)(80)] and (b), where you multiplied [5(0.20)](80), should be equal?

Answer

1. $80
2. $80
3. answers will vary

Exercise 96

Cooking time Helen bought a 24-pound turkey for her family's Thanksgiving dinner and wants to know what time to put the turkey in to the oven. She wants to allow 20 minutes per pound cooking time. Calculate the length of time needed to roast the turkey:

1. First, by multiplying 24·20 to find the total number of minutes and then multiplying the answer by $\frac{1}{60}$ to convert minutes into hours.
2. Next, by multiplying $24(20\cdot\frac{1}{60})$.
3. Which of the properties of real numbers says that your answers to parts (a), where you multiplied $(24\cdot 20)\frac{1}{60}$, and (b), where you multiplied $24(20\cdot\frac{1}{60})$, should be equal?

Exercise 97

Buying by the case Trader Joe's grocery stores sold a bottle of wine they called "Two Buck Chuck" for $1.99. They sold a case of 12 bottles for $23.88. To find the cost of 12 bottles at $1.99, notice that 1.99 is 2−0.01.

1. Multiply 12(1.99) by using the distributive property to multiply 12(2−0.01).
2. Was it a bargain to buy "Two Buck Chuck" by the case?

Answer

1. $23.88
2. no, the price is the same

Exercise 98

Multi-pack purchase Adele's shampoo sells for $3.99 per bottle at the grocery store. At the warehouse store, the same shampoo is sold as a 3 pack for $10.49. To find the cost of 3 bottles at $3.99, notice that 3.99 is 4−0.01.

1. Multiply 3(3.99) by using the distributive property to multiply 3(4−0.01).
2. How much would Adele save by buying 3 bottles at the warehouse store instead of at the grocery store?

Writing Exercises

Exercise 99

In your own words, state the commutative property of addition.

Answer

$Answers may vary$

Exercise 100

What is the difference between the additive inverse and the multiplicative inverse of a number?

Exercise 101

Simplify $8\left(x-\frac{1}{4}\right)$ using the distributive property and explain each step.

Answer

$Answers may vary$

Exercise 102

Explain how you can multiply 4($5.97) without paper or calculator by thinking of $5.97 as 6−0.03 and then using the distributive property.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the commutative and associative properties.			
use the identity and inverse properties of addition and multiplication.			
use the properties of zero.			
simplify expressions using the distributive property.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

13.5.11: Systems of Measurement

Learning Objectives

By the end of this section, you will be able to:

- Make unit conversions in the US system
- Use mixed units of measurement in the US system
- Make unit conversions in the metric system
- Use mixed units of measurement in the metric system
- Convert between the US and the metric systems of measurement
- Convert between Fahrenheit and Celsius temperatures

Note

A more thorough introduction to the topics covered in this section can be found in the *Prealgebra* chapter, **The Properties of Real Numbers**.

Make Unit Conversions in the U.S. System

There are two systems of measurement commonly used around the world. Most countries use the metric system. The U.S. uses a different system of measurement, usually called the **U.S. system**. We will look at the U.S. system first.

The U.S. system of measurement uses units of inch, foot, yard, and mile to measure length and pound and ton to measure weight. For capacity, the units used are cup, pint, quart, and gallons. Both the U.S. system and the metric system measure time in seconds, minutes, and hours.

The equivalencies of measurements are shown in Table 13.5.11.1 The table also shows, in parentheses, the common abbreviations for each measurement.

Table 13.5.11.1

U.S. System of Measurement			
Length	1 foot (ft.)	=	12 inches (in.)
	1 yard (yd.)	=	3 feet (ft.)
	1 mile (mi.)	=	5280 feet (ft.)
Volume	3 teaspoons (t)	=	1 tablespoon (T)
	16 tablespoons (T)	=	1 cup (C)
	1 cup (C)	=	8 fluid ounces (fl.oz.)
	1 pint (pt.)	=	2 cups (C)
	1 quart (qt.)	=	2 pints (ft.)
	1 gallon (gal)	=	4 quarts (qt.)
Weight	1 pound (lb.)	=	16 ounces (oz.)
	1 ton	=	2000 pounds (lb.)
Time	1 minute (min)	=	60 seconds (sec)
	1 hour (hr)	=	60 minutes (min)
	1 day	=	24 hours (hr)
	1 week (wk)	=	7 days
	1 year (yr)	=	365 days

In many real-life applications, we need to convert between units of measurement, such as feet and yards, minutes and seconds, quarts and gallons, etc. We will use the identity property of multiplication to do these conversions. We'll restate the identity property of multiplication here for easy reference.

IDENTITY PROPERTY OF MULTIPLICATION

For any real number a : $a \cdot 1 = a \quad 1 \cdot a = a$

1 is the **multiplicative identity**

To use the identity property of multiplication, we write 1 in a form that will help us convert the units. For example, suppose we want to change inches to feet. We know that 1 foot is equal to 12 inches, so we will write 1 as the fraction $\frac{1 \text{ foot}}{12 \text{ inches}}$. When we multiply by this fraction we do not change the value, but just change the units.

But $\frac{12 \text{ inches}}{1 \text{ foot}}$ also equals 1. How do we decide whether to multiply by $\frac{1 \text{ foot}}{12 \text{ inches}}$ or $\frac{12 \text{ inches}}{1 \text{ foot}}$? We choose the fraction that will make the units we want to convert *from* divide out. Treat the unit words like **factors** and "divide out" common units like we do common factors. If we want to convert 6666 inches to feet, which multiplication will eliminate the inches?

$$66 \text{ inches} \cdot \frac{1 \text{ foot}}{12 \text{ inches}} \quad \text{or} \quad 66 \text{ inches} \cdot \frac{12 \text{ inches}}{1 \text{ foot}}$$

The first form works since $66 \text{ inches} \cdot \frac{1 \text{ foot}}{12 \text{ inches}}$.

Figure 13.5.11.1

The inches divide out and leave only feet. The second form does not have any units that will divide out and so will not help us.

Example 13.5.11.1

Mary Anne is 66 inches tall. Convert her height into feet.

Solution

Step 1. Multiply the measurement to be converted by 1; write 1 as a fraction relating the units given and the units needed.	Multiply 66 inches by 1, writing 1 as a fraction relating inches and feet. We need inches in the denominator so that the inches will divide out!	$66 \text{ inches} \cdot 1$ $66 \text{ inches} \cdot \frac{1 \text{ foot}}{12 \text{ inches}}$
Step 2. Multiply.	Think of 66 inches as $\frac{66 \text{ inches}}{1}$.	$\frac{66 \text{ inches} \cdot 1 \text{ foot}}{12 \text{ inches}}$
Step 3. Simplify the fraction.	Notice: inches divide out.	$\frac{66 \text{ inches} \cdot 1 \text{ foot}}{12 \text{ inches}}$ $\frac{66 \text{ feet}}{12}$
Step 4. Simplify.	Divide 66 by 12.	5.5 feet

Try It 13.5.11.2

Lexie is 30 inches tall. Convert her height to feet.

Answer

2.5 feet

Try It 13.5.11.3

Rene bought a hose that is 18 yards long. Convert the length to feet.

Answer

54 feet

MAKE UNIT CONVERSIONS.

1. Multiply the measurement to be converted by 1; write 1 as a fraction relating the units given and the units needed.
2. Multiply.
3. Simplify the fraction.
4. Simplify.

When we use the identity property of multiplication to convert units, we need to make sure the units we want to change from will divide out. Usually this means we want the conversion fraction to have those units in the denominator.

Example 13.5.11.4

Ndula, an elephant at the San Diego Safari Park, weighs almost 3.2 tons. Convert her weight to pounds.

Solution

We will convert 3.2 tons into pounds. We will use the identity property of multiplication, writing 1 as the fraction $\frac{2000 \text{ pounds}}{1 \text{ ton}}$.

	3.2 tons
Multiply the measurement to be converted, by 1.	$3.2 \text{ tons} \cdot 1$
Write 1 as a fraction relating tons and pounds.	$3.2 \text{ tons} \cdot \frac{2000 \text{ pounds}}{1 \text{ ton}}$
Simplify.	$\frac{3.2 \cancel{\text{tons}} \cdot 2{,}000 \text{ pounds}}{1 \cancel{\text{ton}}}$
Multiply.	6400 pounds
	Ndula weighs almost 6400 pounds.

Try It 13.5.11.5

Arnold's SUV weighs about 4.3 tons. Convert the weight to pounds.

Answer

8600 pounds

Try It 13.5.11.6

The Carnival *Destiny* cruise ship weighs 51000 tons. Convert the weight to pounds.

Answer

102000000 pounds

Sometimes, to convert from one unit to another, we may need to use several other units in between, so we will need to multiply several fractions.

Example 13.5.11.7

Juliet is going with her family to their summer home. She will be away from her boyfriend for 9 weeks. Convert the time to minutes.

Solution

To convert weeks into minutes we will convert weeks into days, days into hours, and then hours into minutes. To do this we will multiply by conversion factors of 1.

	9 weeks
Write 1 as $\frac{7\text{ days}}{1\text{ week}}$, and $\frac{60\text{ minutes}}{1\text{ hour}}$.	$\frac{9\text{ wk}}{1}\cdot\frac{7\text{ days}}{1\text{ wk}}\cdot\frac{24\text{ hr}}{1\text{ day}}\cdot\frac{60\text{ min}}{1\text{ hr}}$
Divide out the common units.	9 weeks Write 1 as $\frac{7\text{ days}}{1\text{ week}}$, $\frac{24\text{ hours}}{1\text{ day}}$, and $\frac{60\text{ minutes}}{1\text{ hour}}$. $\frac{9\text{ wk}}{1}\cdot\frac{7\text{ days}}{1\text{ wk}}\cdot\frac{24\text{ hr}}{1\text{ day}}\cdot\frac{60\text{ min}}{1\text{ hr}}$ Divide out the common units. $\frac{9\,\cancel{\text{wk}}}{1}\cdot\frac{7\,\cancel{\text{days}}}{1\,\cancel{\text{wk}}}\cdot\frac{24\,\cancel{\text{hr}}}{1\,\cancel{\text{day}}}\cdot\frac{60\text{ min}}{1\,\cancel{\text{hr}}}$ Multiply. $\frac{9\cdot7\cdot24\cdot60\text{ min}}{1\cdot1\cdot1\cdot1}$ Multiply. 90,720 min
Multiply.	$\frac{9\cdot7\cdot24\cdot60\text{ min}}{1\cdot1\cdot1\cdot1}$
Multiply.	90,720 min

Juliet and her boyfriend will be apart for 90,720 minutes (although it may seem like an eternity!).

Try It 13.5.11.8

The distance between the earth and the moon is about 250,000 miles. Convert this length to yards.

Answer

440,000,000 yards

Try It 13.5.11.9

The astronauts of Expedition 28 on the International Space Station spend 15 weeks in space. Convert the time to minutes.

Answer

151,200 minutes

Example 13.5.11.10

How many ounces are in 1 gallon?

Solution

We will convert gallons to ounces by multiplying by several conversion factors. Refer to Table 13.5.11.1

	1 gallon
Multiply the measurement to be converted by 1.	$\frac{1\text{ gallon}}{1}\cdot\frac{4\text{ quarts}}{1\text{ gallon}}\cdot\frac{2\text{ pints}}{1\text{ quart}}\cdot\frac{2\text{ cups}}{1\text{ pint}}\cdot\frac{8\text{ ounces}}{1\text{ cup}}$
Use conversion factors to get to the right unit. Simplify.	1 gallon Multiply the measurement to be converted by 1. $\frac{1\text{ gallon}}{1}\cdot\frac{4\text{ quarts}}{1\text{ gallon}}\cdot\frac{2\text{ pints}}{1\text{ quart}}\cdot\frac{2\text{ cups}}{1\text{ pint}}\cdot\frac{8\text{ ounces}}{1\text{ cup}}$ Use conversion factors to get to the right unit. Simplify. $\frac{1\,\cancel{\text{gallon}}}{1}\cdot\frac{4\text{ quarts}}{1\,\cancel{\text{gallon}}}\cdot\frac{2\,\cancel{\text{pints}}}{1\text{ quart}}\cdot\frac{2\,\cancel{\text{cups}}}{1\,\cancel{\text{pint}}}\cdot\frac{8\text{ ounces}}{1\,\cancel{\text{cup}}}$ Multiply. $\frac{1\cdot4\cdot2\cdot2\cdot8\text{ ounces}}{1\cdot1\cdot1\cdot1\cdot1}$ Simplify. 128 ounces There are 128 ounces in a gallon.
Multiply.	$\frac{1\cdot4\cdot2\cdot2\cdot8\text{ ounces}}{1\cdot1\cdot1\cdot1\cdot1}$
Simplify.	128 ounces

Try It 13.5.11.11

How many cups are in 1 gallon?

Answer

16 cups

Try It 13.5.11.12

How many teaspoons are in 1 cup?

Answer

48 teaspoons

Use Mixed Units of Measurement in the U.S. System

We often use mixed units of measurement in everyday situations. Suppose Joe is 5 feet 10 inches tall, stays at work for 7 hours and 45 minutes, and then eats a 1 pound 2 ounce steak for dinner—all these measurements have mixed units.

Performing arithmetic operations on measurements with mixed units of measures requires care. Be sure to add or subtract like units!

Example 13.5.11.13

Seymour bought three steaks for a barbecue. Their weights were 14 ounces, 1 pound 2 ounces and 1 pound 6 ounces. How many total pounds of steak did he buy?

Solution

We will add the weights of the steaks to find the total weight of the steaks.

Add the ounces. Then add the pounds.	14 ounces 1 pound 2 ounces + 1 pound 6 ounces 2 pounds 22 ounces
Convert 22 ounces to pounds and ounces.	2 pounds + 1 pound, 6 ounces 3 pounds, 6 ounces
Add the pounds.	Seymour bought 3 pounds 6 ounces of steak.

Add the ounces. Then add the pounds.	
Convert 22 ounces to pounds and ounces.	2 pounds + 1 pound, 6 ounces
Add the pounds.	3 pounds, 6 ounces
	Seymour bought 3 pounds 6 ounces of steak.

Try It 13.5.11.14

Laura gave birth to triplets weighing 3 pounds 3 ounces, 3 pounds 3 ounces, and 2 pounds 9 ounces. What was the total birth weight of the three babies?

Answer

8 lbs. 15 oz

Try It 13.5.11.15

Stan cut two pieces of crown molding for his family room that were 8 feet 7 inches and 12 feet 11 inches. What was the total length of the molding?

Answer

21 ft. 6 in.

Example 13.5.11.16

Anthony bought four planks of wood that were each 6 feet 4 inches long. What is the total length of the wood he purchased?

Solution

We will multiply the length of one plank to find the total length.

Multiply the inches and then the feet.	6 feet 4 inches × 4 24 feet 16 inches
Convert the 16 inches to feet. Add the feet.	24 feet + 1 foot 4 inches 25 feet 4 inches
	Anthony bought 25 feet and 4 inches of wood.

Try It 13.5.11.17

Henri wants to triple his spaghetti sauce recipe that uses 1 pound 8 ounces of ground turkey. How many pounds of ground turkey will he need?

Answer

4 lbs. 8 oz.

Try It 13.5.11.18

Joellen wants to double a solution of 5 gallons 3 quarts. How many gallons of solution will she have in all?

Answer

11 gallons 2 qt.

Make Unit Conversions in the Metric System

In the **metric system**, units are related by powers of 10. The roots words of their names reflect this relation. For example, the basic unit for measuring length is a meter. One kilometer is 1,000 meters; the prefix *kilo* means *thousand*. One centimeter is $\frac{1}{100}$ of a meter, just like one cent is $\frac{1}{100}$ of one dollar.

The equivalencies of measurements in the metric system are shown in Table 13.5.11.2 The common abbreviations for each measurement are given in parentheses.

Table 13.5.11.2

Metric System of Measurement		
Length	Mass	Capacity

Metric System of Measurement		
Length	Mass	Capacity
1 kilometer (km) = 1,000 m	1 kilogram (kg) = 1,000 g	1 kiloliter (kL) = 1,000 L
1 hectometer (hm) = 100 m	1 hectogram (hg) = 100 g	1 hectoliter (hL) = 100 L
1 dekameter (dam) = 10 m	1 dekagram (dag) = 10 g	1 dekaliter (daL) = 10 L
1 meter (m) = 1 m	1 gram (g) = 1 g	1 liter (L) = 1 L
1 decimeter (dm) = 0.1 m	1 decigram (dg) = 0.1 g	1 deciliter (dL) = 0.1 L
1 centimeter (cm) = 0.01 m	1 centigram (cg) = 0.01 g	1 centiliter (cL) = 0.01 L
1 millimeter (mm) = 0.001 m	1 milligram (mg) = 0.001 g	1 milliliter (mL) = 0.001 L
1 meter = 100 centimeters	1 gram = 100 centigrams	1 liter = 100 centiliters
1 meter = 1,000 millimeters	1 gram = 1,000 milligrams	1 liter = 1,000 milliliters

To make conversions in the metric system, we will use the same technique we did in the US system. Using the identity property of multiplication, we will multiply by a conversion factor of one to get to the correct units.

Have you ever run a 5K or 10K race? The length of those races are measured in kilometers. The metric system is commonly used in the United States when talking about the length of a race.

Example 13.5.11.19

Nick ran a 10K race. How many meters did he run?

Solution

We will convert kilometers to meters using the identity property of multiplication.

	10 kilometers
Multiply the measurement to be converted by 1.	$10 \text{ kilometers} \cdot 1$
Write 1 as a fraction relating kilometers and meters.	$10 \text{ kilometers} \cdot \frac{1{,}000 \text{ meters}}{1 \text{ kilometers}}$
Simplify.	$\frac{10 \text{ kilometers} \cdot 1{,}000 \text{ m}}{1 \text{ kilometers}}$
Multiply.	10,000 meters
	Nick ran 10,000 meters.

Try It 13.5.11.20

Sandy completed her first 5K race! How many meters did she run?

Answer

5,000 meters

Try It 13.5.11.21

Herman bought a rug 2.5 meters in length. How many centimeters is the length?

Answer

250 centimeters

Example 13.5.11.22

Eleanor's newborn baby weighed 3,200 grams. How many kilograms did the baby weigh?

Solution

We will convert grams into kilograms.

	$3{,}200\ \text{grams}$
Multiply the measurement to be converted by 1.	$3{,}200\ \text{grams} \cdot 1$
Write 1 as a function relating kilograms and grams.	$3{,}200\ \text{grams} \cdot \frac{1\ \text{kg}}{1{,}000\ \text{grams}}$
Simplify.	$3{,}200\ \cancel{\text{grams}} \cdot \frac{1\ \text{kg}}{1{,}000\ \cancel{\text{grams}}}$
Multiply.	$\frac{3{,}200\ \text{kilograms}}{1{,}000}$
Divide.	3.2 kilograms The baby weighed 3.2 kilograms.

Try It 13.5.11.23

Kari's newborn baby weighed 2,800 grams. How many kilograms did the baby weigh?

Answer

2.8 kilograms

Try It 13.5.11.24

Anderson received a package that was marked 4,500 grams. How many kilograms did this package weigh?

Answer

4.5 kilograms

As you become familiar with the metric system you may see a pattern. Since the system is based on multiples of ten, the calculations involve multiplying by multiples of ten. We have learned how to simplify these calculations by just moving the decimal.

To multiply by 10, 100, or 1,000, we move the decimal to the right one, two, or three places, respectively. To multiply by 0.1, 0.01, or 0.001, we move the decimal to the left one, two, or three places, respectively.

We can apply this pattern when we make measurement conversions in the metric system. In Exercise 13.5.11.25 we changed 3,200 grams to kilograms by multiplying by $\frac{1}{1000}$ (or 0.001). This is the same as moving the decimal three places to the left.

$$3{,}200 \cdot \frac{1}{1{,}000} \qquad 3{,}200.$$
$$3.2 \qquad\qquad 3.2$$

Figure 13.5.11.2

Example 13.5.11.25

Convert

1. 350 L to kiloliters
2. 4.1 L to milliliters.

Solution

1. We will convert liters to kiloliters. In Table 13.5.11.2 we see that 1 kiloliter=1,000 liters.1kiloliter=1,000 liters.

	350 L
Multiply by 1, writing 1 as a fraction relating liters to kiloliters.	$350\ \text{L}\ \frac{1\ \text{kL}}{1000\text{L}}$
Simplify.	$350\ \cancel{\text{L}}\ \frac{1\ \text{kL}}{1000\ \cancel{\text{L}}}$
Multiply by 1, writing 1 as a fraction relating liters to kiloliters. Simplify. Move the decimal 3 units to the left. (350.)	350 L $350\ \cancel{\text{L}} \cdot \frac{1\ \text{kL}}{1{,}000\ \cancel{\text{L}}}$ 0.35 kL
	0.35 kL

2. We will convert liters to milliliters. From Table 13.5.11.2we see that 1 liter=1,000 milliliters.1 liter=1,000 milliliters.

	4.1 L
Multiply by 1, writing 1 as a fraction relating liters to milliliters.	$4.1\ \text{L} \cdot \frac{1{,}000\ \text{mL}}{1\ \text{L}}$
Simplify.	$4.1\ \cancel{\text{L}} \cdot \frac{1{,}000\ \text{mL}}{1\ \cancel{\text{L}}}$
Move the decimal 3 units to the right.	4.100 mL
	4,100 mL

Try It 13.5.11.26

Convert:

1. 725 L to kiloliters
2. 6.3 L to milliliters

Answer

1. 7,250 kiloliters
2. 6,300 milliliters

Try It 13.5.11.27

Convert:

1. 350 hL to liters
2. 4.1 L to centiliters

Answer

1. 35,000 liters
2. 410 centiliters

Use Mixed Units of Measurement in the Metric System

Performing arithmetic operations on measurements with mixed units of measures in the metric system requires the same care we used in the US system. But it may be easier because of the relation of the units to the powers of 10. Make sure to add or subtract like units.

Example 13.5.11.28

Ryland is 1.6 meters tall. His younger brother is 85 centimeters tall. How much taller is Ryland than his younger brother?

Solution

We can convert both measurements to either centimeters or meters. Since meters is the larger unit, we will subtract the lengths in meters. We convert 85 centimeters to meters by moving the decimal 2 places to the left.

$$\begin{array}{ll} \text{Write the 85 centimeters as meters.} & 1.60\text{m} \\ & \underline{-0.85\text{m}} \\ & 0.75\text{m} \end{array} \qquad (13.5.11.1)$$

Ryland is 0.75 m0.75 m taller than his brother.

Try It 13.5.11.29

Mariella is 1.58 meters tall. Her daughter is 75 centimeters tall. How much taller is Mariella than her daughter? Write the answer in centimeters.

Answer

83 centimeters

Try It 13.5.11.30

The fence around Hank's yard is 2 meters high. Hank is 96 centimeters tall. How much shorter than the fence is Hank? Write the answer in meters.

Answer

1.04 meters

Example 13.5.11.31

Dena's recipe for lentil soup calls for 150 milliliters of olive oil. Dena wants to triple the recipe. How many liters of olive oil will she need?

Solution

We will find the amount of olive oil in milliliters then convert to liters.

	Triple 150 mL
Translate to algebra.	$3 \cdot 150$ mL
Multiply.	450 mL
Convert to liters.	$450 \cdot \frac{0.001\text{ L}}{1\text{ ml}}$
Simplify.	0.45 L
	Dena needs 0.45 liters of olive oil.

Try It 13.5.11.32

A recipe for Alfredo sauce calls for 250 milliliters of milk. Renata is making pasta with Alfredo sauce for a big party and needs to multiply the recipe amounts by 8. How many liters of milk will she need?

Answer

2 liters

Try It 13.5.11.33

To make one pan of baklava, Dorothea needs 400 grams of filo pastry. If Dorothea plans to make 6 pans of baklava, how many kilograms of filo pastry will she need?

Answer

2.4 kilograms

Convert Between the U.S. and the Metric Systems of Measurement

Many measurements in the United States are made in metric units. Our soda may come in 2-liter bottles, our calcium may come in 500-mg capsules, and we may run a 5K race. To work easily in both systems, we need to be able to convert between the two systems.

Table 13.5.11.3shows some of the most common conversions.

Table 13.5.11.3

Conversion Factors Between U.S. and Metric Systems		
Length	Mass	Capacity
1 in. = 2.54 cm		
1 ft. = 0.305 m	1 lb. = 0.45 kg	1 qt. = 0.95 L
1 yd. = 0.914 m	1 oz. = 28 g	1 fl. oz. = 30 ml
1 mi. = 1.61 km	1 kg = 2.2 lb	1 L = 1.06 lb
1 m = 3.28 ft		

Figure 13.5.11.3shows how inches and centimeters are related on a ruler.

Figure 13.5.11.3: This ruler shows inches and centimeters.

Figure 13.5.11.4shows the ounce and milliliter markings on a measuring cup.

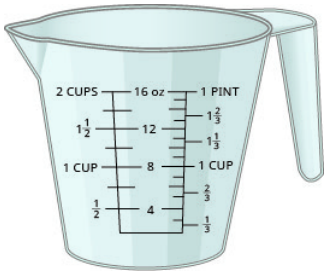

Figure 13.5.11.4: This measuring cup shows ounces and cups.

Figure 13.5.11.5shows how pounds and kilograms marked on a bathroom scale.

Figure 13.5.11.5: This scale shows pounds and kilograms.

We make conversions between the systems just as we do within the systems—by multiplying by unit conversion factors.

Example 13.5.11.34

Lee's water bottle holds 500 mL of water. How many ounces are in the bottle? Round to the nearest tenth of an ounce.

Solution

	500 mL
Multiplying by a unit conversion factor relating mL and ounces	$500 \text{ milliliters} \cdot \frac{1 \text{ ounce}}{30 \text{ milliliters}}$
Simplify.	$\frac{50 \text{ ounce}}{30}$
Divide.	16.7 ounces
	The water bottle has 16.7 ounces

Try It 13.5.11.35

How many quarts of soda are in a 2-L bottle?

Answer

2.12 quarts

Try It 13.5.11.36

How many liters are in 4 quarts of milk?

Answer

3.8 liters

Example 13.5.11.37

Soleil was on a road trip and saw a sign that said the next rest stop was in 100 kilometers. How many miles until the next rest stop?

Solution

	100 kilometers
Multiplying by a unit conversion factor relating km and mi.	$100 \text{ kilometers} \cdot \frac{1 \text{ mile}}{1.61 \text{ kilometers}}$
Simplify.	$\frac{100 \text{ miles}}{1.61}$
Divide.	62 miles
	Soleil will travel 62 miles.

Try It 13.5.11.38

The height of Mount Kilimanjaro is 5,895 meters. Convert the height to feet.

Answer

19,335.6 feet

Try It 13.5.11.39

The flight distance from New York City to London is 5,586 kilometers. Convert the distance to miles.

Answer

3,469.57 miles

Convert between Fahrenheit and Celsius Temperatures

Have you ever been in a foreign country and heard the weather forecast? If the forecast is for 22°C, what does that mean?

The U.S. and metric systems use different scales to measure temperature. The U.S. system uses degrees Fahrenheit, written °F. The metric system uses degrees Celsius, written °C. Figure 13.5.11.6shows the relationship between the two systems.

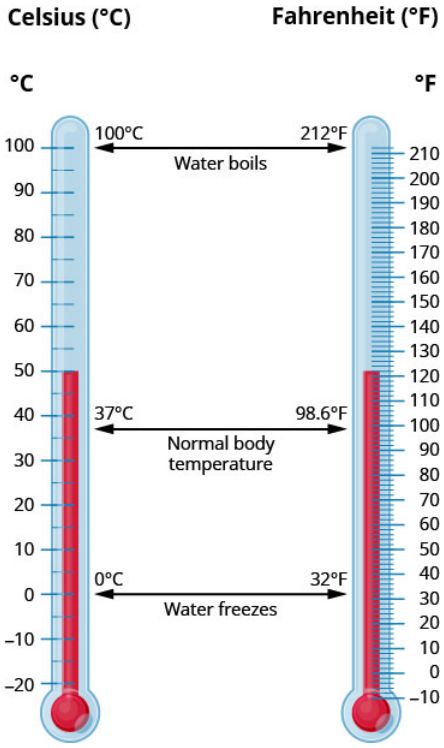

Figure 13.5.11.6: The diagram shows normal body temperature, along with the freezing and boiling temperatures of water in degrees Fahrenheit and degrees Celsius.

TEMPERATURE CONVERSION

To convert from Fahrenheit temperature, F, to Celsius temperature, C, use the formula

$$C = \frac{5}{9}(F - 32) \tag{13.5.11.2}$$

To convert from Celsius temperature, C, to Fahrenheit temperature, F, use the formula

$$F = \frac{9}{5}C + 32 \tag{13.5.11.3}$$

Example 13.5.11.40

Convert 50° Fahrenheit into degrees Celsius.

Solution

We will substitute 50°F into the formula to find C.

	$C = \frac{5}{9}(F - 32)$
Substitute 50 for F.	$C = \frac{5}{9}(50 - 32)$
Simplify in parentheses.	$C = \frac{5}{9}(18)$
Multiply.	$C = 10$
	So we found that 50°F is equivalent to 10°C.

Try It 13.5.11.41

Convert the Fahrenheit temperature to degrees Celsius: 59° Fahrenheit.

Answer

15°C

Try It 13.5.11.42

Convert the Fahrenheit temperature to degrees Celsius: 41° Fahrenheit.

Answer

5°C

Example 13.5.11.43

While visiting Paris, Woody saw the temperature was 20° Celsius. Convert the temperature into degrees Fahrenheit.

Solution

We will substitute 20°C into the formula to find F.

	$F = \frac{9}{5}C + 32$
Substitute 20 for C.	$F = \frac{9}{5}(20) + 32$
Multiply.	$F = 36 + 32$
Add.	$F = 68$
	So we found that 20°C is equivalent to 68°F.

Try It 13.5.11.44

Convert the Celsius temperature to degrees Fahrenheit: the temperature in Helsinki, Finland, was 15° Celsius.

Answer

59°F

Try It 13.5.11.45

Convert the Celsius temperature to degrees Fahrenheit: the temperature in Sydney, Australia, was 10° Celsius.

Answer

50°F

Key Concepts

- **Metric System of Measurement**
  - **Length**

    1 kilometer (km) = 1,000 m

    1 hectometer (hm) = 100 m

    1 dekameter (dam) = 10 m

    1 meter (m) = 1 m

    1 decimeter (dm) = 0.1 m

    1 centimeter (cm) = 0.01 m

    1 millimeter (mm) = 0.001 m

    1 meter = 100 centimeters

    1 meter = 1,000 millimeters
- **Mass**

  1 kilogram (kg) = 1,000 g

  1 hectogram (hg) = 100 g

  1 dekagram (dag) = 10 g

  1 gram (g) = 1 g

  1 decigram (dg) = 0.1 g

  1 centigram (cg) = 0.01 g

  1 milligram (mg) = 0.001 g

  1 gram = 100 centigrams

  1 gram = 1,000 milligrams
- **Capacity**

  1 kiloliter (kL) = 1,000 L

1 hectoliter (hL) = 100 L

1 dekaliter (daL) = 10 L

1 liter (L) = 1 L

1 deciliter (dL) = 0.1 L

1 centiliter (cL) = 0.01 L

1 milliliter (mL) = 0.001 L

1 liter = 100 centiliters

1 liter = 1,000 milliliters

- **Temperature Conversion**
  - To convert from Fahrenheit temperature, F, to Celsius temperature, C, use the formula $C = \frac{5}{9}(F - 32)$
  - To convert from Celsius temperature, C, to Fahrenheit temperature, F, use the formula $F = \frac{9}{5}C + 32$

13.5.11E: Exercises

Practice Makes Perfect

Make Unit Conversions in the U.S. System

In the following exercises, convert the units.

Exercise 13.5.11E.1

A park bench is 6 feet long. Convert the length to inches.

Answer

72 inches

Exercise 13.5.11E.2

A floor tile is 2 feet wide. Convert the width to inches.

Exercise 13.5.11E.3

A ribbon is 18 inches long. Convert the length to feet.

Answer

1.5 feet

Exercise 13.5.11E.4

Carson is 45 inches tall. Convert his height to feet.

Exercise 13.5.11E.5

A football field is 160 feet wide. Convert the width to yards.

Answer

$53\frac{1}{3}$ yards

Exercise 13.5.11E.6

On a baseball diamond, the distance from home plate to first base is 30 yards. Convert the distance to feet.

Exercise 13.5.11E.7

On a baseball diamond, the distance from home plate to first base is 30 yards. Convert the distance to feet.

Answer

7,920 feet

Exercise 13.5.11E.8

Denver, Colorado, is 5,183 feet above sea level. Convert the height to miles.

Exercise 13.5.11E.9

A killer whale weighs 4.6 tons. Convert the weight to pounds.

Answer

9,200 pounds

Exercise 13.5.11E.10

Blue whales can weigh as much as 150 tons. Convert the weight to pounds.

Exercise 13.5.11E.11

An empty bus weighs 35,000 pounds. Convert the weight to tons.

Answer

$17\frac{1}{2}$ tons

Exercise 13.5.11E.12

At take-off, an airplane weighs 220,000 pounds. Convert the weight to tons.

Exercise 13.5.11E.13

Rocco waited $1\frac{1}{2}$ hours for his appointment. Convert the time to seconds.

Answer

5,400 s

Exercise 13.5.11E.14

Misty's surgery lasted $2\frac{1}{4}$ hours. Convert the time to seconds.

Exercise 13.5.11E.15

How many teaspoons are in a pint?

Answer

96 teaspoons

Exercise 13.5.11E.16

How many tablespoons are in a gallon?

Exercise 13.5.11E.17

JJ's cat, Posy, weighs 14 pounds. Convert her weight to ounces.

Answer

224 ounces

Exercise 13.5.11E.18

April's dog, Beans, weighs 8 pounds. Convert his weight to ounces.

Exercise 13.5.11E.19

Crista will serve 20 cups of juice at her son's party. Convert the volume to gallons.

Answer

$1\frac{1}{4}$ gallons

Exercise 13.5.11E.20

Lance needs 50 cups of water for the runners in a race. Convert the volume to gallons.

Exercise 13.5.11E.21

Jon is 6 feet 4 inches tall. Convert his height to inches.

Answer

26 in.

Exercise 13.5.11E.22

Faye is 4 feet 10 inches tall. Convert her height to inches.

Exercise 13.5.11E.23

The voyage of the *Mayflower* took 2 months and 5 days. Convert the time to days.

Answer

65 days

Exercise 13.5.11E.24

Lynn's cruise lasted 6 days and 18 hours. Convert the time to hours.

Exercise 13.5.11E.25

Baby Preston weighed 7 pounds 3 ounces at birth. Convert his weight to ounces.

Answer

115 ounces

Exercise 13.5.11E.26

Baby Audrey weighted 6 pounds 15 ounces at birth. Convert her weight to ounces.

Use Mixed Units of Measurement in the U.S. System

In the following exercises, solve.

Exercise 13.5.11E.27

Eli caught three fish. The weights of the fish were 2 pounds 4 ounces, 1 pound 11 ounces, and 4 pounds 14 ounces. What was the total weight of the three fish?

Answer

8 lbs. 13 oz.

Exercise 13.5.11E.28

Judy bought 1 pound 6 ounces of almonds, 2 pounds 3 ounces of walnuts, and 8 ounces of cashews. How many pounds of nuts did Judy buy?

Exercise 13.5.11E.29

One day Anya kept track of the number of minutes she spent driving. She recorded 45, 10, 8, 65, 20, and 35. How many hours did Anya spend driving?

Answer

3.05 hours

Exercise 13.5.11E.30

Last year Eric went on 6 business trips. The number of days of each was 5, 2, 8, 12, 6, and 3. How many weeks did Eric spend on business trips last year?

Exercise 13.5.11E.31

Renee attached a 6 feet 6 inch extension cord to her computer's 3 feet 8 inch power cord. What was the total length of the cords?

Answer

10 ft. 2 in.

Exercise 13.5.11E.32

Fawzi's SUV is 6 feet 4 inches tall. If he puts a 2 feet 10 inch box on top of his SUV, what is the total height of the SUV and the box?

Exercise 13.5.11E.33

Leilani wants to make 8 placemats. For each placemat she needs 18 inches of fabric. How many yards of fabric will she need for the 8 placemats?

Answer

4 yards

Exercise 13.5.11E.34

Mireille needs to cut 24 inches of ribbon for each of the 12 girls in her dance class. How many yards of ribbon will she need altogether?

Make Unit Conversions in the Metric System

In the following exercises, convert the units.

Exercise 13.5.11E.35

Ghalib ran 5 kilometers. Convert the length to meters.

Answer

5,000 meters

Exercise 13.5.11E.36

Kitaka hiked 8 kilometers. Convert the length to meters.

Exercise 13.5.11E.37

Estrella is 1.55 meters tall. Convert her height to centimeters.

Answer

155 centimeters

Exercise 13.5.11E.38

The width of the wading pool is 2.45 meters. Convert the width to centimeters.

Exercise 13.5.11E.39

Mount Whitney is 3,072 meters tall. Convert the height to kilometers.

Answer

3.072 kilometers

Exercise 13.5.11E.40

The depth of the Mariana Trench is 10,911 meters. Convert the depth to kilometers.

Exercise 13.5.11E.41

June’s multivitamin contains 1,500 milligrams of calcium. Convert this to grams.

Answer

1.5 grams

Exercise 13.5.11E.42

A typical ruby-throated hummingbird weights 3 grams. Convert this to milligrams.

Exercise 13.5.11E.43

One stick of butter contains 91.6 grams of fat. Convert this to milligrams.

Answer

91,600 milligrams

Exercise 13.5.11E.44

One serving of gourmet ice cream has 25 grams of fat. Convert this to milligrams.

Exercise 13.5.11E.45

The maximum mass of an airmail letter is 2 kilograms. Convert this to grams.

Answer

2,000 grams

Exercise 13.5.11E.46

Dimitri's daughter weighed 3.8 kilograms at birth. Convert this to grams.

Exercise 13.5.11E.47

A bottle of wine contained 750 milliliters. Convert this to liters.

Answer

0.75 liters

Exercise 13.5.11E.48

A bottle of medicine contained 300 milliliters. Convert this to liters.

Use Mixed Units of Measurement in the Metric System

In the following exercises, solve.

Exercise 13.5.11E.49

Matthias is 1.8 meters tall. His son is 89 centimeters tall. How much taller is Matthias than his son?

Answer

91 centimeters

Exercise 13.5.11E.50

Stavros is 1.6 meters tall. His sister is 95 centimeters tall. How much taller is Stavros than his sister?

Exercise 13.5.11E.51

A typical dove weighs 345 grams. A typical duck weighs 1.2 kilograms. What is the difference, in grams, of the weights of a duck and a dove?

Answer

855 grams

Exercise 13.5.11E.52

Concetta had a 2-kilogram bag of flour. She used 180 grams of flour to make biscotti. How many kilograms of flour are left in the bag?

Exercise 13.5.11E.53

Harry mailed 5 packages that weighed 420 grams each. What was the total weight of the packages in kilograms?

Answer

2.1 kilograms

Exercise 13.5.11E.54

One glass of orange juice provides 560 milligrams of potassium. Linda drinks one glass of orange juice every morning. How many grams of potassium does Linda get from her orange juice in 30 days?

Exercise 13.5.11E.55

Jonas drinks 200 milliliters of water 8 times a day. How many liters of water does Jonas drink in a day?

Answer

1.6 liters

Exercise 13.5.11E.56

One serving of whole grain sandwich bread provides 6 grams of protein. How many milligrams of protein are provided by 7 servings of whole grain sandwich bread?

Convert Between the U.S. and the Metric Systems of Measurement

In the following exercises, make the unit conversions. Round to the nearest tenth.

Exercise 13.5.11E.57

Bill is 75 inches tall. Convert his height to centimeters.

Answer

190.5 centimeters

Exercise 13.5.11E.58

Frankie is 42 inches tall. Convert his height to centimeters.

Exercise 13.5.11E.59

Marcus passed a football 24 yards. Convert the pass length to meters

Answer

21.9 meters

Exercise 13.5.11E.60

Connie bought 9 yards of fabric to make drapes. Convert the fabric length to meters.

Exercise 13.5.11E.61

Each American throws out an average of 1,650 pounds of garbage per year. Convert this weight to kilograms.

Answer

742.5 kilograms

Exercise 13.5.11E.62

An average American will throw away 90,000 pounds of trash over his or her lifetime. Convert this weight to kilograms.

Exercise 13.5.11E.63

A 5K run is 5 kilometers long. Convert this length to miles.

Answer

3.1 miles

Exercise 13.5.11E.64

Kathryn is 1.6 meters tall. Convert her height to feet.

Exercise 13.5.11E.65

Dawn's suitcase weighed 20 kilograms. Convert the weight to pounds.

Answer

44 pounds

Exercise 13.5.11E.66

Jackson's backpack weighed 15 kilograms. Convert the weight to pounds.

Exercise 13.5.11E.67

Ozzie put 14 gallons of gas in his truck. Convert the volume to liters.

Answer

53.2 liters

Exercise 13.5.11E.68

Bernard bought 8 gallons of paint. Convert the volume to liters.

Convert between Fahrenheit and Celsius Temperatures

In the following exercises, convert the Fahrenheit temperatures to degrees Celsius. Round to the nearest tenth.

Exercise 13.5.11E.69

86° Fahrenheit

Answer

30°C

Exercise 13.5.11E.70

77° Fahrenheit

Exercise 13.5.11E.71

104° Fahrenheit

Answer

40°C

Exercise 13.5.11E.72

14° Fahrenheit

Exercise 13.5.11E.73

72° Fahrenheit

Answer

22.2°C

Exercise 13.5.11E.74

4° Fahrenheit

Exercise 13.5.11E.75

0° Fahrenheit

Answer

−17.8°C

Exercise 13.5.11E.76

120° Fahrenheit

In the following exercises, convert the Celsius temperatures to degrees Fahrenheit. Round to the nearest tenth.

Exercise 13.5.11E.77

5° Celsius

Answer

41°F

Exercise 13.5.11E.78

25° Celsius

Exercise 13.5.11E.79

−10° Celsius

Answer

14°F

Exercise 13.5.11E.80

−15° Celsius

Exercise 13.5.11E.81

22° Celsius

Answer

71.6°F

Exercise 13.5.11E.82

8° Celsius

Exercise 13.5.11E.83

43° Celsius

Answer

109.4°F

Exercise 13.5.11E.84

16° Celsius

Everyday Math

Exercise 13.5.11E.85

Nutrition Julian drinks one can of soda every day. Each can of soda contains 40 grams of sugar. How many kilograms of sugar does Julian get from soda in 1 year?

Answer

14.6 kilograms

Exercise 13.5.11E.86

Reflectors The reflectors in each lane-marking stripe on a highway are spaced 16 yards apart. How many reflectors are needed for a one mile long lane-marking stripe?

Writing Exercises

Exercise 13.5.11E. 87

Some people think that 65° to 75° Fahrenheit is the ideal temperature range.

1. What is your ideal temperature range? Why do you think so?
2. Convert your ideal temperatures from Fahrenheit to Celsius.

Answer

Answers may vary.

Exercise 13.5.11E. 88

1. Did you grow up using the U.S. or the metric system of measurement?
2. Describe two examples in your life when you had to convert between the two systems of measurement.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
define U.S. units of measurement and convert from one unit to another.			
use U.S units of measurement.			
define metric units of measurement and convert from one unit to another.			
use metric units of measurement.			
convert between the U.S. and the metric system of measurement.			
convert between Fahrenheit and Celsius temperatures.			

ⓑ Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

13.5.12: Chapter 1 Review Exercises

Chapter Review Exercises

Introduction to Whole Numbers

Use Place Value with Whole Number

In the following exercises find the place value of each digit.

Exercise 13.5.12.1

26,915

1. 1
2. 2
3. 9
4. 5
5. 6

Answer

1. tens
2. ten thousands
3. hundreds
4. ones
5. thousands

Exercise 13.5.12.2

359,417

1. 9
2. 3
3. 4
4. 7
5. 1

Exercise 13.5.12.3

58,129,304

1. 5
2. 0
3. 1
4. 8
5. 2

Answer

1. ten millions
2. tens
3. hundred thousands
4. millions
5. ten thousands

Exercise 13.5.12.4

9,430,286,157

1. 6
2. 4
3. 9
4. 0
5. 5

In the following exercises, name each number.

Exercise 13.5.12.5

6,104

Answer

six thousand, one hundred four

Exercise 13.5.12.6

493,068

Exercise 13.5.12.7

3,975,284

Answer

three million, nine hundred seventy-five thousand, two hundred eighty-four

Exercise 13.5.12.8

85,620,435

In the following exercises, write each number as a whole number using digits.

Exercise 13.5.12.9

three hundred fifteen

Answer

315

Exercise 13.5.12.10

sixty-five thousand, nine hundred twelve

Exercise 13.5.12.11

ninety million, four hundred twenty-five thousand, sixteen

Answer

90,425,016

Exercise 13.5.12.12

one billion, forty-three million, nine hundred twenty-two thousand, three hundred eleven

In the following exercises, round to the indicated place value.

Exercise 13.5.12.13

Round to the nearest ten.

1. 407
2. 8,564

Answer

1. 410
2. 8,560

Exercise 13.5.12.14

Round to the nearest hundred.

1. 25,846
2. 25,864

In the following exercises, round each number to the nearest 1. hundred 2. thousand 3. ten thousand.

Exercise 13.5.12.15

864,951

Answer

1. 865,000865,000
2. 865,000865,000
3. 860,000

Exercise 13.5.12.16

3,972,849

Identify Multiples and Factors

In the following exercises, use the divisibility tests to determine whether each number is divisible by 2, by 3, by 5, by 6, and by 10.

Exercise 13.5.12.17

168

Answer

by 2,3,6

Exercise 13.5.12.18

264

Exercise 13.5.12.19

375

Answer

by 3,5

Exercise 13.5.12.20

750

Exercise 13.5.12.21

1430

Answer

by 2,5,10

Exercise 13.5.12.22

1080

Find Prime Factorizations and Least Common Multiples

In the following exercises, find the prime factorization.

Exercise 13.5.12.23

420

Answer

$2 \cdot 2 \cdot 3 \cdot 5 \cdot 7$

Exercise 13.5.12.24

115

Exercise 13.5.12.25

225

Answer

$3 \cdot 3 \cdot 5 \cdot 5$

Exercise 13.5.12.26

2475

Exercise 13.5.12.27

1560

Answer

$2 \cdot 2 \cdot 2 \cdot 3 \cdot 5 \cdot 13$

Exercise 13.5.12.28

56

Exercise 13.5.12.29

72

Answer

$2 \cdot 2 \cdot 2 \cdot 3 \cdot 3$

Exercise 13.5.12.30

168

Exercise 13.5.12.31

252

Answer

$2 \cdot 2 \cdot 3 \cdot 3 \cdot 7$

Exercise 13.5.12.32

391

In the following exercises, find the least common multiple of the following numbers using the multiples method.

Exercise 13.5.12.33

6,15

Answer

30

Exercise 13.5.12.34

60, 75

In the following exercises, find the least common multiple of the following numbers using the prime factors method.

Exercise 13.5.12.35

24, 30

Answer

120

Exercise 13.5.12.36

70, 84

Use the Language of Algebra

Use Variables and Algebraic Symbols

In the following exercises, translate the following from algebra to English.

Exercise 13.5.12.37

$25-7$

Answer

25 minus 7, the difference of twenty-five and seven

Exercise 13.5.12.38

$5 \cdot 6$

Exercise 13.5.12.39

$45 \div 5$

Answer

45 divided by 5, the quotient of forty-five and five

Exercise 13.5.12.40

x+8

Exercise 13.5.12.41

$42 \geq 27$

Answer

forty-two is greater than or equal to twenty-seven

Exercise 13.5.12.42

3n=24

Exercise 13.5.12.43

$3 \leq 20 \div 4$

Answer

3 is less than or equal to 20 divided by 4, three is less than or equal to the quotient of twenty and four

Exercise 13.5.12.44

$a \neq 7 \cdot 4$

In the following exercises, determine if each is an expression or an equation.

Exercise 13.5.12.45

$6 \cdot 3 + 5$

Answer

expression

Exercise 13.5.12.46

y−8=32

Simplify Expressions Using the Order of Operations

In the following exercises, simplify each expression.

Exercise 13.5.12.47

3^5

Answer

243

Exercise 13.5.12.48

10^8

In the following exercises, simplify

Exercise 13.5.12.49

6+10/2+2

Answer

13

Exercise 13.5.12.50

9+12/3+4

Exercise 13.5.12.51

$20 \div (4 + 6) \cdot 5$

Answer

10

Exercise 13.5.12.52

$33 \div (3+8) \cdot 2$

Exercise 13.5.12.53

$4^2 + 5^2$

Answer

41

Exercise 13.5.12.54

$(4+5)^2$

Evaluate an Expression

In the following exercises, evaluate the following expressions.

Exercise 13.5.12.55

9x+7 when x=3

Answer

34

Exercise 13.5.12.56

5x−4 when x=6

Exercise 13.5.12.57

x^4 when $x = 3$

Answer

81

Exercise 13.5.12.58

3^x when $x = 3$

Exercise 13.5.12.59

$x^2 + 5x - 8$ when $x = 6$

Answer

58

Exercise 13.5.12.60

$2x + 4y - 5$ when
$x = 7, y = 8$

Simplify Expressions by Combining Like Terms

In the following exercises, identify the coefficient of each term.

Exercise 13.5.12.61

12n

Answer

12

Exercise 13.5.12.62

$9x^2$

In the following exercises, identify the like terms.

Exercise 13.5.12.63

$3n, n^2, 12, 12p^2, 3, 3n^2$

Answer

12 and 3, n^2 and $3n^2$

Exercise 13.5.12.64

$5, 18r^2, 9s, 9r, 5r^2, 5s$

In the following exercises, identify the terms in each expression.

Exercise 13.5.12.65

$11x^2 + 3x + 6$

Answer

$11x^2, 3x, 6$

Exercise 13.5.12.66

$22y^3 + y + 15$

In the following exercises, simplify the following expressions by combining like terms.

Exercise 13.5.12.67

17a+9a

Answer

26a

Exercise 13.5.12.68

18z+9z

Exercise 13.5.12.69

9x+3x+8

Answer

12x+8

Exercise 13.5.12.70

8a+5a+9

Exercise 13.5.12.71

7p+6+5p−4

Answer

12p+2

Exercise 13.5.12.72

8x+7+4x−5

Translate an English Phrase to an Algebraic Expression

In the following exercises, translate the following phrases into algebraic expressions.

Exercise 13.5.12.73

the sum of 8 and 12

Answer

8+12

Exercise 13.5.12.74

the sum of 9 and 1

Exercise 13.5.12.75

the difference of x and 4

Answer

x−4

Exercise 13.5.12.76

the difference of x and 3

Exercise 13.5.12.77

the product of 6 and y

Answer

6y

Exercise 13.5.12.78

the product of 9 and y

Exercise 13.5.12.79

Adele bought a skirt and a blouse. The skirt cost $15 more than the blouse. Let bb represent the cost of the blouse. Write an expression for the cost of the skirt.

Answer

b+15

Exercise 13.5.12.80

Marcella has 6 fewer boy cousins than girl cousins. Let g represent the number of girl cousins. Write an expression for the number of boy cousins.

Add and Subtract Integers

Use Negatives and Opposites of Integers

In the following exercises, order each of the following pairs of numbers, using < or >.

Exercise 13.5.12.81

1. 6___2
2. −7___4
3. −9___−1
4. 9___−3

Answer

1. >
2. <
3. <
4. >

Exercise 13.5.12.82

1. −5___1
2. −4___−9
3. 6___10
4. 3___−8

In the following exercises,, find the opposite of each number.

Exercise 13.5.12.83

1. −8
2. 1

Answer

1. 8
2. −1

Exercise 13.5.12.84

1. −2
2. 6

In the following exercises, simplify.

Exercise 13.5.12.85

−(−19)

Answer

19

Exercise 13.5.12.86

−(−53)

In the following exercises, simplify.

Exercise 13.5.12.87

−m when

1. m=3
2. m=−3

Answer

1. −3
2. 3

Exercise 13.5.12.88

−p when

1. p=6
2. p=−6

Simplify Expressions with Absolute Value

In the following exercises,, simplify.

Exercise 13.5.12.89

1. |7|
2. |−25|
3. |0|

Answer

1. 7
2. 25
3. 0

Exercise 13.5.12.90

1. |5|
2. |0|
3. |−19|

In the following exercises, fill in <, >, or = for each of the following pairs of numbers.

Exercise 13.5.12.91

1. −8___|−8|
2. −|−2|___−2

Answer

1. <
2. =

Exercise 13.5.12.92

1. |−3|___−|−3|
2. 4___−|−4|

In the following exercises, simplify.

Exercise 13.5.12.93

|8−4|

Answer

4

Exercise 13.5.12.94

|9−6|

Exercise 13.5.12.95

8(14−2|−2|)

Answer

80

Exercise 13.5.12.96

6(13−4|−2|)

In the following exercises, evaluate.

Exercise 13.5.12.97

1. $|x|$ when $x=-28$

Answer

1. 28
2. 15

Exercise 13.5.12.98

1. $|y|$ when $y=-37$
2. $|-z|$ when $z=-24$

Add Integers

In the following exercises, simplify each expression.

Exercise 13.5.12.99

$-200+65$

Answer

-135

Exercise 13.5.12.100

$-150+45$

Exercise 13.5.12.101

$2+(-8)+6$

Answer

0

Exercise 13.5.12.102

$4+(-9)+7$

Exercise 13.5.12.103

$140+(-75)+67$

Answer

132

Exercise 13.5.12.104

$-32+24+(-6)+10$

Subtract Integers

In the following exercises, simplify.

Exercise 13.5.12.105

$9-3$

Answer

6

Exercise 13.5.12.106

$-5-(-1)$

Exercise 13.5.12.107

1. $15-6$
2. $15+(-6)$

Answer

1. 9
2. 9

Exercise 13.5.12.108

1. $12-9$
2. $12+(-9)$

Exercise 13.5.12.109

1. $8-(-9)$
2. $8+9$

Answer

1. 17
2. 17

Exercise 13.5.12.110

1. $4-(-4)$
2. $4+4$

In the following exercises, simplify each expression.

Exercise 13.5.12.111

$10-(-19)$

Answer

29

Exercise 13.5.12.112

$11-(-18)$

Exercise 13.5.12.113

$31-79$

Answer

-48

Exercise 13.5.12.114

$39-81$

Exercise 13.5.12.115

$-31-11$

Answer

-42

Exercise 13.5.12.116

$-32-18$

Exercise 13.5.12.117

$-15-(-28)+5$

Answer

18

Exercise 13.5.12.118

$71+(-10)-8$

Exercise 13.5.12.119

$-16-(-4+1)-7$

Answer

-20

Exercise 13.5.12.120

$-15-(-6+4)-3$

Multiply Integers

In the following exercises, multiply.

Exercise 13.5.12.121

$-5(7)$

Answer

−35

Exercise 13.5.12.122

−8(6)

Exercise 13.5.12.123

−18(−2)

Answer

36

Exercise 13.5.12.124

−10(−6)

Divide Integers

In the following exercises, divide.

Exercise 13.5.12.125

$-28 \div 7$

Answer

-4

Exercise 13.5.12.126

$56 \div (-7)$

Exercise 13.5.12.127

$-120 \div (-20)$

Answer

6

Exercise 13.5.12.128

$-200 \div 25$

Simplify Expressions with Integers

In the following exercises, simplify each expression.

Exercise 13.5.12.129

−8(−2)−3(−9)

Answer

43

Exercise 13.5.12.130

$-7(-4)-5(-3)$

Exercise 13.5.12.131

$(-5)^3$

Answer

-125

Exercise 13.5.12.132

$(-4)^3$

Exercise 13.5.12.133

$-4 \cdot 2 \cdot 11$

Answer

-88

Exercise 13.5.12.134

$-5 \cdot 3 \cdot 10$

Exercise 13.5.12.135

$-10(-4) \div (-8)$

Answer

-5

Exercise 13.5.12.136

$-8(-6) \div (-4)$

Exercise 13.5.12.137

$31-4(3-9)$

Answer

55

Exercise 13.5.12.138

$24-3(2-10)$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

Exercise 13.5.12.139

x+8 when

1. x=−26
2. x=−95

Answer

1. −18
2. −87

Exercise 13.5.12.140

y+9 when

1. y=−29
2. y=−84

Exercise 13.5.12.141

When b=−11, evaluate:

1. b+6
2. −b+6

Answer

1. −5
2. 17

Exercise 13.5.12.142

When c=−9, evaluate:

1. c+(−4)c+(−4)
2. −c+(−4)

Exercise 13.5.12.143

$p^2 - 5p + 2$ when
$p = -1$

Answer

8

Exercise 13.5.12.144

$q^2 - 2q + 9$ when $q = -2$

Exercise 13.5.12.145

$6x - 5y + 15$ when $x = 3$ and $y = -1$

Answer

38

Exercise 13.5.12.146

$3p-2q+9$ when $p=8$ and $q=-2$

Translate English Phrases to Algebraic Expressions

In the following exercises, translate to an algebraic expression and simplify if possible.

Exercise 13.5.12.147

the sum of −4 and −17, increased by 32

Answer

(−4+(−17))+32;11

Exercise 13.5.12.148

1. the difference of 15 and −7
2. subtract 15 from −7

Exercise 13.5.12.149

the quotient of −45 and −9

Answer

$\frac{-45}{-9}; 5$

Exercise 13.5.12.150

the product of −12 and the difference of c and d

Use Integers in Applications

In the following exercises, solve.

Exercise 13.5.12.151

Temperature The high temperature one day in Miami Beach, Florida, was 76°. That same day, the high temperature in Buffalo, New York was −8°. What was the difference between the temperature in Miami Beach and the temperature in Buffalo?

Answer

84 degrees

Exercise 13.5.12.152

Checking Account Adrianne has a balance of −$22 in her checking account. She deposits $301 to the account. What is the new balance?

Visualize Fractions

Find Equivalent Fractions

In the following exercises, find three fractions equivalent to the given fraction. Show your work, using figures or algebra.

Exercise 13.5.12.153

$\frac{1}{4}$

Answer

$\frac{2}{8}, \frac{3}{12}, \frac{4}{16}$ answers may vary

Exercise 13.5.12.154

$\frac{1}{3}$

Exercise 13.5.12.155

$\frac{5}{6}$

Answer

$\frac{10}{12}, \frac{15}{18}, \frac{20}{24}$ answers may vary

Exercise 13.5.12.156

$\frac{2}{7}$

Simplify Fractions

In the following exercises, simplify.

Exercise 13.5.12.157

$\frac{7}{21}$

Answer

$\frac{1}{3}$

Exercise 13.5.12.158

$\frac{8}{24}$

Exercise 13.5.12.159

$\frac{15}{20}$

Answer

$\frac{3}{4}$

Exercise 13.5.12.160

$\frac{12}{18}$

Exercise 13.5.12.161

$-\frac{168}{192}$

Answer

$-\frac{7}{8}$

Exercise 13.5.12.162

$-\frac{140}{224}$

Exercise 13.5.12.163

$\frac{11x}{11y}$

Answer

$\frac{x}{y}$

Exercise 13.5.12.164

$\frac{15a}{15b}$

Multiply Fractions

In the following exercises, multiply.

Exercise 13.5.12.165

$\frac{2}{5} \cdot \frac{1}{3}$

Answer

$\frac{2}{15}$

Exercise 13.5.12.166

$\frac{1}{2} \cdot \frac{3}{8}$

Exercise 13.5.12.167

$\frac{7}{12}\left(-\frac{8}{21}\right)$

Answer

$-\frac{2}{9}$

Exercise 13.5.12.168

$\frac{5}{12}\left(-\frac{8}{15}\right)$

Exercise 13.5.12.169

$-28p\left(-\frac{1}{4}\right)$

Answer

7p

Exercise 13.5.12.170

$-51q\left(-\frac{1}{3}\right)$

Exercise 13.5.12.172

$\frac{14}{5}(-15)$

Answer

-42

Exercise 13.5.12.173

$-1\left(-\frac{3}{8}\right)$

Divide Fractions

In the following exercises, divide

Exercise 13.5.12.174

$\frac{1}{2} \div \frac{1}{4}$

Answer

2

Exercise 13.5.12.175

$\frac{1}{2} \div \frac{1}{8}$

Exercise 13.5.12.176

$-\frac{4}{5} \div \frac{4}{7}$

Answer

$-\frac{7}{5}$

Exercise 13.5.12.177

$-\frac{3}{4} \div \frac{3}{5}$

Exercise 13.5.12.178

$\frac{5}{8} \div \frac{a}{10}$

Answer

$\frac{25}{4a}$

Exercise 13.5.12.179

$\frac{5}{6} \div \frac{c}{15}$

Exercise 13.5.12.180

$\frac{7p}{12} \div \frac{21p}{8}$

Answer

$\frac{2}{9}$

Exercise 13.5.12.181

$\frac{5q}{12} \div \frac{15q}{8}$

Exercise 13.5.12.182

$\frac{2}{5} \div (-10)$

Answer

$-\frac{1}{25}$

Exercise 13.5.12.183

$-18 \div -\left(\frac{9}{2}\right)$

In the following exercises, simplify.

Exercise 13.5.12.184

$\frac{\frac{2}{3}}{\frac{8}{9}}$

Answer

$\frac{3}{4}$

Exercise 13.5.12.185

$\frac{\frac{4}{5}}{\frac{8}{15}}$

Exercise 13.5.12.186

$\frac{-\frac{9}{10}}{3}$

Answer

$-\frac{3}{10}$

Exercise 13.5.12.187

$\frac{2}{\frac{5}{8}}$

Exercise 13.5.12.188

$\frac{\frac{r}{5}}{\frac{s}{3}}$

Answer

$\frac{3r}{5s}$

Exercise 13.5.12.189

$\frac{-\frac{x}{6}}{-\frac{8}{9}}$

Simplify Expressions Written with a Fraction Bar

In the following exercises, simplify.

Exercise 13.5.12.190

$\frac{4+11}{8}$

Answer

$\frac{15}{8}$

Exercise 13.5.12.191

$\frac{9+3}{7}$

Exercise 13.5.12.192

$\frac{30}{7-12}$

Answer

-6

Exercise 13.5.12.193

$\frac{15}{4-9}$

Exercise 13.5.12.194

$\frac{22-14}{19-13}$

Answer

$\frac{4}{3}$

Exercise 13.5.12.195

$\frac{15+9}{18+12}$

Exercise 13.5.12.196

$\frac{5 \cdot 8}{-10}$

Answer

-4

Exercise 13.5.12.197

$\frac{3 \cdot 4}{-24}$

Exercise 13.5.12.198

$\frac{15 \cdot 5-5^2}{2 \cdot 10}$

Answer

$\frac{5}{2}$

Exercise 13.5.12.199

$\frac{12 \cdot 9-3^2}{3 \cdot 18}$

Exercise 13.5.12.200

$\frac{2+4(3)}{-3-2^2}$

Answer

-2

Exercise 13.5.12.201

$\frac{7+3(5)}{-2-3^2}$

Translate Phrases to Expressions with Fractions

In the following exercises, translate each English phrase into an algebraic expression.

Exercise 13.5.12.202

the quotient of c and the sum of d and 9.

Answer

$\frac{c}{d+9}$

Exercise 13.5.12.203

the quotient of the difference of h and k, and -5.

Add and Subtract Fractions

Add and Subtract Fractions with a Common Denominator

In the following exercises, add.

Exercise 13.5.12.204

$\frac{4}{9}+\frac{1}{9}$

Answer

$\frac{5}{9}$

Exercise 13.5.12.205

$\frac{2}{9}+\frac{5}{9}$

Exercise 13.5.12.206

$\frac{y}{3}+\frac{2}{3}$

Answer

$\frac{y+2}{3}$

Exercise 13.5.12.207

$\frac{7}{p}+\frac{9}{p}$

Exercise 13.5.12.208

$-\frac{1}{8}+\left(-\frac{3}{8}\right)$

Answer

$-\frac{1}{2}$

Exercise 13.5.12.209

$-\frac{1}{8}+\left(-\frac{5}{8}\right)$

In the following exercises, subtract.

Exercise 13.5.12.210

$\frac{4}{5} - \frac{1}{5}$

Answer

$\frac{3}{5}$

Exercise 13.5.12.211

$\frac{4}{5} - \frac{3}{5}$

Exercise 13.5.12.212

$\frac{y}{17} - \frac{9}{17}$

Answer

$\frac{y-9}{17}$

Exercise 13.5.12.213

$\frac{x}{19} - \frac{8}{19}$

Exercise 13.5.12.214

$-\frac{8}{d} - \frac{3}{d}$

Answer

$-\frac{11}{d}$

Exercise 13.5.12.215

$-\frac{7}{c} - \frac{7}{c}$

Add or Subtract Fractions with Different Denominators

In the following exercises, add or subtract.

Exercise 13.5.12.216

$\frac{1}{3} + \frac{1}{5}$

Answer

$\frac{8}{15}$

Exercise 13.5.12.217

$\frac{1}{4} + \frac{1}{5}$

Exercise 13.5.12.218

$\frac{1}{5}-\left(-\frac{1}{10}\right)$

Answer

$\frac{3}{10}$

Exercise 13.5.12.219

$\frac{1}{2}-\left(-\frac{1}{6}\right)$

Exercise 13.5.12.220

$\frac{2}{3}+\frac{3}{4}$

Answer

$\frac{17}{12}$

Exercise 13.5.12.221

$\frac{3}{4}+\frac{2}{5}$

Exercise 13.5.12.222

$\frac{11}{12}-\frac{3}{8}$

Answer

$\frac{13}{24}$

Exercise 13.5.12.223

$\frac{5}{8}-\frac{7}{12}$

Exercise 13.5.12.224

$-\frac{9}{16}-\left(-\frac{4}{5}\right)$

Answer

$\frac{19}{80}$

Exercise 13.5.12.225

$-\frac{7}{20}-\left(-\frac{5}{8}\right)$

Exercise 13.5.12.226

$1+\frac{5}{6}$

Answer

$\frac{11}{6}$

Exercise 13.5.12.227

$1-\frac{5}{9}$

Use the Order of Operations to Simplify Complex Fractions

In the following exercises, simplify.

Exercise 13.5.12.228

$\frac{\left(\frac{1}{5}\right)^2}{2+3^2}$

Answer

$\frac{1}{275}$

Exercise 13.5.12.229

$\frac{\left(\frac{1}{3}\right)^2}{5+2^2}$

Exercise 13.5.12.230

$\frac{\frac{2}{3}+\frac{1}{2}}{\frac{3}{4}-\frac{2}{3}}$

Answer

14

Exercise 13.5.12.231

$\frac{\frac{3}{4}+\frac{1}{2}}{\frac{5}{6}-\frac{2}{3}}$

Evaluate Variable Expressions with Fractions

In the following exercises, evaluate.

Exercise 13.5.12.232

$x+\frac{1}{2}$ when

1. $x=-\frac{1}{8}$
2. $x=-\frac{1}{2}$

Answer

1. $\frac{3}{8}$
2. 0

Exercise 13.5.12.233

$x+\frac{2}{3}$ when

1. $x=-\frac{1}{6}$

2. $x = -\frac{5}{3}$

Exercise 13.5.12.234

$4p^2q$ when $p = -\frac{1}{2}$ and $q = \frac{5}{9}$

Answer

$\frac{5}{9}$

Exercise 13.5.12.235

$5m^2n$ when $m = -\frac{2}{5}$ and $n = \frac{1}{3}$

Exercise 13.5.12.236

$\frac{u+v}{w}$ when
$u = -4, v = -8, w = 2$

Answer

-6

Exercise 13.5.12.237

$\frac{m+n}{p}$ when
$m = -6, n = -2, p = 4$

Decimals

Name and Write Decimals

In the following exercises, write as a decimal.

Exercise 13.5.12.238

Eight and three hundredths

Answer

8.03

Exercise 13.5.12.239

Nine and seven hundredths

Exercise 13.5.12.240

One thousandth

Answer

0.001

Exercise 13.5.12.241

Nine thousandths

In the following exercises, name each decimal.

Exercise 13.5.12.242

7.8

Answer

seven and eight tenths

Exercise 13.5.12.243

5.01

Exercise 13.5.12.244

0.005

Answer

five thousandths

Exercise 13.5.12.245

0.381

Round Decimals

In the following exercises, round each number to the nearest

1. hundredth
2. tenth
3. whole number.

Exercise 13.5.12.246

5.7932

Answer

1. 5.79
2. 5.8
3. 6

Exercise 13.5.12.247

3.6284

Exercise 13.5.12.248

12.4768

Answer

1. 12.48
2. 12.5
3. 12

Exercise 13.5.12.249

25.8449

Add and Subtract Decimals

In the following exercises, add or subtract.

Exercise 13.5.12.250

18.37+9.36

Answer

27.73

Exercise 13.5.12.251

256.37−85.49

Exercise 13.5.12.252

15.35−20.88

Answer

−5.53

Exercise 13.5.12.253

37.5+12.23

Exercise 13.5.12.254

−4.2+(−9.3)

Answer

−13.5

Exercise 13.5.12.255

−8.6+(−8.6)

Exercise 13.5.12.256

100−64.2

Answer

35.8

Exercise 13.5.12.257

100−65.83

Exercise 13.5.12.258

2.51+40

Answer

42.51

Exercise 13.5.12.259

9.38+60

Multiply and Divide Decimals

In the following exercises, multiply.

Exercise 13.5.12.260

(0.3)(0.4)

Answer

0.12

Exercise 13.5.12.261

(0.6)(0.7)

Exercise 13.5.12.262

(8.52)(3.14)

Answer

26.7528

Exercise 13.5.12.263

(5.32)(4.86)

Exercise 13.5.12.264

(0.09)(24.78)

Answer

2.2302

Exercise 13.5.12.265

(0.04)(36.89)

In the following exercises, divide.

Exercise 13.5.12.266

$0.15 \div 5$

Answer

0.03

Exercise 13.5.12.267

$0.27 \div 3$

Exercise 13.5.12.268

$\$8.49 \div 12$

Answer

$0.71

Exercise 13.5.12.269

$\$16.99 \div 9$

Exercise 13.5.12.270

$12 \div 0.08$

Answer

150

Exercise 13.5.12.271

$5 \div 0.04$

Convert Decimals, Fractions, and Percents

In the following exercises, write each decimal as a fraction.

Exercise 13.5.12.272

0.08

Answer

$\frac{2}{25}$

Exercise 13.5.12.273

0.17

Exercise 13.5.12.274

0.425

Answer

$\frac{17}{40}$

Exercise 13.5.12.275

0.184

Exercise 13.5.12.276

1.75

Answer

$\frac{7}{4}$

Exercise 13.5.12.277

0.035

In the following exercises, convert each fraction to a decimal.

Exercise 13.5.12.278

$\frac{2}{5}$

Answer

0.4

Exercise 13.5.12.279

$\frac{4}{5}$

Exercise 13.5.12.280

$-\frac{3}{8}$

Answer

−0.375

Exercise 13.5.12.281

$-\frac{5}{8}$

Exercise 13.5.12.282

$\frac{5}{9}$

Answer

$0.\overline{5}$

Exercise 13.5.12.283

$\frac{2}{9}$

Exercise 13.5.12.284

$\frac{1}{2}+6.5$

Answer

7

Exercise 13.5.12.285

$\frac{1}{4}+10.75$

In the following exercises, convert each percent to a decimal.

Exercise 13.5.12.286

5%

Answer

0.05

Exercise 13.5.12.287

9%

Exercise 13.5.12.288

40%

Answer

0.4

Exercise 13.5.12.289

50%

Exercise 13.5.12.290

115%

Answer

1.15

Exercise 13.5.12.291

125%

In the following exercises, convert each decimal to a percent.

Exercise 13.5.12.292

0.18

Answer

18%

Exercise 13.5.12.293

0.15

Exercise 13.5.12.294

0.009

Answer

0.9%

Exercise 13.5.12.295

0.008

Exercise 13.5.12.296

1.5

Answer

150%

Exercise 13.5.12.297

2.2

The Real Numbers

Simplify Expressions with Square Roots

In the following exercises, simplify.

Exercise 13.5.12.298

$\sqrt{64}$

Answer

8

Exercise 13.5.12.299

$\sqrt{144}$

Exercise 13.5.12.300

$-\sqrt{25}$

Answer

-5

Exercise 13.5.12.301

$-\sqrt{81}$

Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

In the following exercises, write as the ratio of two integers.

Exercise 13.5.12.302

1. 9
2. 8.47

Answer

1. $\frac{9}{1}$
2. $\frac{847}{100}$

Exercise 13.5.12.303

1. -15
2. 3.591

In the following exercises, list the

1. rational numbers,
2. irrational numbers.

Exercise 13.5.12.304

$0.84, 0.79132\ldots, 1.\overline{3}$

Answer

1. $0.84, 1.3$
2. $0.79132\ldots$

Exercise 13.5.12.305

$2.3\overline{8}, 0.572, 4.93814\ldots$

In the following exercises, identify whether each number is rational or irrational.

Exercise 13.5.12.306

1. $\sqrt{121}$
2. $\sqrt{48}$

Answer

1. rational

2. irrational

Exercise 13.5.12.307

1. $\sqrt{56}$
2. $\sqrt{16}$

In the following exercises, identify whether each number is a real number or not a real number.

Exercise 13.5.12.308

1. $\sqrt{-9}$
2. $-\sqrt{169}$

Answer

1. not a real number
2. real number

Exercise 13.5.12.309

1. $\sqrt{-64}$
2. $-\sqrt{81}$

In the following exercises, list the

1. whole numbers,
2. integers,
3. rational numbers,
4. irrational numbers,
5. real numbers for each set of numbers.

Exercise 13.5.12.310

$-4, 0, \frac{5}{6}, \sqrt{16}, \sqrt{18}, 5.2537\ldots$

Answer

1. $0, \sqrt{16}$
2. $-4, 0, \sqrt{16}$
3. $-4, 0, \frac{5}{6}, \sqrt{16}$
4. $\sqrt{18}, 5.2537\ldots$
5. $-4, 0, \frac{5}{6}, \sqrt{16}, \sqrt{18}, 5.2537\ldots$

Exercise 13.5.12.311

$-\sqrt{4}, 0.\overline{36}, \frac{13}{3}, 6.9152\ldots, \sqrt{48}, 10\frac{1}{2}$

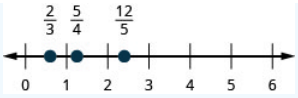
Locate Fractions on the Number Line

In the following exercises, locate the numbers on a number line.

Exercise 13.5.12.312

$\frac{2}{3}, \frac{5}{4}, \frac{12}{5}$

Answer



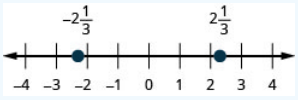
Exercise 13.5.12.313

$\frac{1}{3}, \frac{7}{4}, \frac{13}{5}$

Exercise 13.5.12.314

$2\frac{1}{3}, -2\frac{1}{3}$

Answer



Exercise 13.5.12.315

$1\frac{3}{5}, -1\frac{3}{5}$

In the following exercises, order each of the following pairs of numbers, using < or >.

Exercise 13.5.12.316

$-1 ___ -\frac{1}{8}$

Answer

$<$

Exercise 13.5.12.317

$-3\frac{1}{4} ___ -4$

Exercise 13.5.12.318

$-\frac{7}{9} ___ \frac{4}{9}$

Answer

$>$

Exercise 13.5.12.319

$-2 ___ \frac{19}{8}$

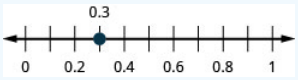
Locate Decimals on the Number Line

In the following exercises, locate on the number line.

Exercise 13.5.12.320

0.3

Answer



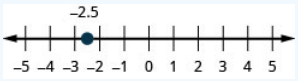
Exercise 13.5.12.321

−0.2

Exercise 13.5.12.322

−2.5

Answer



Exercise 13.5.12.323

2.7

In the following exercises, order each of the following pairs of numbers, using < or >.

Exercise 13.5.12.324

0.9___0.6

Answer

>

Exercise 13.5.12.325

0.7___0.8

Exercise 13.5.12.326

−0.6___−0.59

Answer

>

Exercise 13.5.12.327

−0.27___−0.3

Properties of Real Numbers

Use the Commutative and Associative Properties

In the following exercises, use the Associative Property to simplify.

Exercise 13.5.12.328

$-12(4m)$

Answer

$-48m$

Exercise 13.5.12.329

$30\left(\frac{5}{6}q\right)$

Exercise 13.5.12.330

(a+16)+31

Answer

a+47

Exercise 13.5.12.331

(c+0.2)+0.7

In the following exercises, simplify.

Exercise 13.5.12.332

6y+37+(−6y)

Answer

37

Exercise 13.5.12.333

$\frac{1}{4}+\frac{11}{15}+\left(-\frac{1}{4}\right)$

Exercise 13.5.12.334

$\frac{14}{11}\cdot\frac{35}{9}\cdot\frac{14}{11}$

Answer

$\frac{35}{9}$

Exercise 13.5.12.335

$-18\cdot 15\cdot\frac{2}{9}$

Exercise 13.5.12.336

$\left(\frac{7}{12}+\frac{4}{5}\right)+\frac{1}{5}$

Answer

$1\frac{7}{12}$

Exercise 13.5.12.337

(3.98d+0.75d)+1.25d

Exercise 13.5.12.338

11x+8y+16x+15y

Answer

27x+23y

Exercise 13.5.12.339

52m+(−20n)+(−18m)+(−5n)

Use the Identity and Inverse Properties of Addition and Multiplication

In the following exercises, find the additive inverse of each number.

Exercise 13.5.12.340

1. $\frac{1}{3}$
2. 5.1
3. -14
4. $-\frac{8}{5}$

Answer

1. $-\frac{1}{3}$
2. -5.1
3. -14
4. $-\frac{8}{5}$

Exercise 13.5.12.341

1. $-\frac{7}{8}$
2. -0.03
3. 17
4. $\frac{12}{5}$

In the following exercises, find the multiplicative inverse of each number.

Exercise 13.5.12.342

1. 10
2. $-\frac{4}{9}$
3. 0.6

Answer

1. $\frac{1}{10}$
2. $-\frac{9}{4}$
3. $\frac{5}{3}$

Exercise 13.5.12.343

1. $-\frac{9}{2}$
2. -7
3. 2.1

Use the Properties of Zero

In the following exercises, simplify.

Exercise 13.5.12.344

$83 \cdot 0$

Answer

0

Exercise 13.5.12.345

$\frac{0}{9}$

Exercise 13.5.12.346

$\frac{5}{0}$

Answer

undefined

Exercise 13.5.12.347

$0 \div \frac{2}{3}$

In the following exercises, simplify.

Exercise 13.5.12.348

$43+39+(-43)$

Answer

39

Exercise 13.5.12.349

$(n+6.75)+0.25$

Exercise 13.5.12.350

$\frac{5}{13} \cdot 57 \cdot \frac{13}{5}$

Answer

57

Exercise 13.5.12.351

$\frac{1}{6} \cdot 17 \cdot 12$

Exercise 13.5.12.352

$\frac{2}{3} \cdot 28 \cdot \frac{3}{7}$

Answer

8

Exercise 13.5.12.353

$9(6x - 11) + 15$

Simplify Expressions Using the Distributive Property

In the following exercises, simplify using the Distributive Property.

Exercise 13.5.12.354

7(x+9)

Answer

7x+63

Exercise 13.5.12.355

9(u−4)

Exercise 13.5.12.356

−3(6m−1)

Answer

−18m+3

Exercise 13.5.12.357

−8(−7a−12)

Exercise 13.5.12.358

$\frac{1}{3}(15n - 6)$

Answer

5n−2

Exercise 13.5.12.359

$(y + 10) \cdot p$

Exercise 13.5.12.360

$(a-4)-(6a+9)$

Answer

$-5a-13$

Exercise 13.5.12.361

$4(x+3)-8(x-7)$

Systems of Measurement

1.1 Define U.S. Units of Measurement and Convert from One Unit to Another

In the following exercises, convert the units. Round to the nearest tenth.

Exercise 13.5.12.362

A floral arbor is 7 feet tall. Convert the height to inches.

Answer

84 inches

Exercise 13.5.12.363

A picture frame is 42 inches wide. Convert the width to feet.

Exercise 13.5.12.364

Kelly is 5 feet 4 inches tall. Convert her height to inches.

Answer

64 inches

Exercise 13.5.12.365

A playground is 45 feet wide. Convert the width to yards.

Exercise 13.5.12.366

The height of Mount Shasta is 14,179 feet. Convert the height to miles.

Answer

2.7 miles

Exercise 13.5.12.367

Shamu weights 4.5 tons. Convert the weight to pounds.

Exercise 13.5.12.368

The play lasted $1\frac{3}{4}$ hours. Convert the time to minutes.

Answer

105 minutes

Exercise 13.5.12.369

How many tablespoons are in a quart?

Exercise 13.5.12.370

Naomi's baby weighed 5 pounds 14 ounces at birth. Convert the weight to ounces.

Answer

94 ounces

Exercise 13.5.12.371

Trinh needs 30 cups of paint for her class art project. Convert the volume to gallons.

Use Mixed Units of Measurement in the U.S. System.

In the following exercises, solve.

Exercise 13.5.12.372

John caught 4 lobsters. The weights of the lobsters were 1 pound 9 ounces, 1 pound 12 ounces, 4 pounds 2 ounces, and 2 pounds 15 ounces. What was the total weight of the lobsters?

Answer

10 lbs. 6 oz.

Exercise 13.5.12.373

Every day last week Pedro recorded the number of minutes he spent reading. The number of minutes were 50, 25, 83, 45, 32, 60, 135. How many hours did Pedro spend reading?

Exercise 13.5.12.374

Fouad is 6 feet 2 inches tall. If he stands on a rung of a ladder 8 feet 10 inches high, how high off the ground is the top of Fouad's head?

Answer

15 feet

Exercise 13.5.12.375

Dalila wants to make throw pillow covers. Each cover takes 30 inches of fabric. How many yards of fabric does she need for 4 covers?

Make Unit Conversions in the Metric System

In the following exercises, convert the units.

Exercise 13.5.12.376

Donna is 1.7 meters tall. Convert her height to centimeters.

Answer

170 centimeters

Exercise 13.5.12.377

Mount Everest is 8,850 meters tall. Convert the height to kilometers.

Exercise 13.5.12.378

One cup of yogurt contains 488 milligrams of calcium. Convert this to grams.

Answer

0.488 grams

Exercise 13.5.12.379

One cup of yogurt contains 13 grams of protein. Convert this to milligrams.

Exercise 13.5.12.380

Sergio weighed 2.9 kilograms at birth. Convert this to grams.

Answer

2,900 grams

Exercise 13.5.12.381

A bottle of water contained 650 milliliters. Convert this to liters.

Use Mixed Units of Measurement in the Metric System

In the following exerices, solve.

Exercise 13.5.12.382

Minh is 2 meters tall. His daughter is 88 centimeters tall. How much taller is Minh than his daughter?

Answer

1.12 meter

Exercise 13.5.12.383

Selma had a 1 liter bottle of water. If she drank 145 milliliters, how much water was left in the bottle?

Exercise 13.5.12.384

One serving of cranberry juice contains 30 grams of sugar. How many kilograms of sugar are in 30 servings of cranberry juice?

Answer

0.9 kilograms

Exercise 13.5.12.385

One ounce of tofu provided 2 grams of protein. How many milligrams of protein are provided by 5 ounces of tofu?

Convert between the U.S. and the Metric Systems of Measurement

In the following exercises, make the unit conversions. Round to the nearest tenth.

Exercise 13.5.12.386

Majid is 69 inches tall. Convert his height to centimeters.

Answer

175.3 centimeters

Exercise 13.5.12.387

A college basketball court is 84 feet long. Convert this length to meters.

Exercise 13.5.12.388

Caroline walked 2.5 kilometers. Convert this length to miles.

Answer

1.6 miles

Exercise 13.5.12.389

Lucas weighs 78 kilograms. Convert his weight to pounds.

Exercise 13.5.12.390

Steve’s car holds 55 liters of gas. Convert this to gallons.

Answer

14.6 gallons

Exercise 13.5.12.391

A box of books weighs 25 pounds. Convert the weight to kilograms.

Convert between Fahrenheit and Celsius Temperatures

In the following exercises, convert the Fahrenheit temperatures to degrees Celsius. Round to the nearest tenth.

Exercise 13.5.12.392

95° Fahrenheit

Answer

35° C

Exercise 13.5.12.393

23° Fahrenheit

Exercise 13.5.12.394

20° Fahrenheit

Answer

–6.7° C

Exercise 13.5.12.395

64° Fahrenheit

In the following exercises, convert the Celsius temperatures to degrees Fahrenheit. Round to the nearest tenth.

Exercise 13.5.12.396

30° Celsius

Answer

86° F

Exercise 13.5.12.397

–5° Celsius

Exercise 13.5.12.398

–12° Celsius

Answer

10.4° F

Exercise 13.5.12.399

24° Celsius

Chapter Practice Test

Exercise 13.5.12.1

Write as a whole number using digits: two hundred five thousand, six hundred seventeen.

Answer

205,617

Exercise 13.5.12.2

Find the prime factorization of 504.

Exercise 13.5.12.3

Find the Least Common Multiple of 18 and 24.

Answer

72

Exercise 13.5.12.4

Combine like terms: 5n+8+2n−1.

In the following exercises, evaluate.

Exercise 13.5.12.5

$-|x|$ when $x = -2$

Answer

−2

Exercise 13.5.12.6

11−a when a=−3

Exercise 13.5.12.7

Translate to an algebraic expression and simplify: twenty less than negative 7.

Answer

−7−20;−27

Exercise 13.5.12.8

Monique has a balance of −$18 in her checking account. She deposits $152 to the account. What is the new balance?

Exercise 13.5.12.9

Round 677.1348 to the nearest hundredth.

Answer

677.13

Exercise 13.5.12.10

Convert $\frac{4}{5}$ to a decimal.

Exercise 13.5.12.11

Convert 1.85 to a percent.

Answer

185%

Exercise 13.5.12.12

Locate $\frac{2}{3}, -1.5,$ and $\frac{9}{4}$ on a number line.

In the following exercises, simplify each expression.

Exercise 13.5.12.13

$4+10(3+9)-5^2$

Answer

99

Exercise 13.5.12.14

$-85+42$

Exercise 13.5.12.15

$-19-25$

Answer

-44

Exercise 13.5.12.16

$(-2)^4$

Exercise 13.5.12.17

$-5(-9)\div 15$

Answer

3

Exercise 13.5.12.18

$\frac{3}{8}\cdot\frac{11}{12}$

Exercise 13.5.12.19

$\frac{4}{5} \div \frac{9}{20}$

Answer

$\frac{16}{9}$

Exercise 13.5.12.20

$\frac{12+3 \cdot 5}{15-6}$

Exercise 13.5.12.21

$\frac{m}{7} + \frac{10}{7}$

Answer

$\frac{m+10}{7}$

Exercise 13.5.12.22

$\frac{7}{12} - \frac{3}{8}$

Exercise 13.5.12.23

$-5.8 + (-4.7)$

Answer

−10.5

Exercise 13.5.12.24

100−64.25

Exercise 13.5.12.25

(0.07)(31.95)

Answer

2.2365

Exercise 13.5.12.26

$9 \div 0.05$

Exercise 13.5.12.27

$-14\left(\frac{5}{7}p\right)$

Answer

−10p

Exercise 13.5.12.28

$(u+8)-9$

Exercise 13.5.12.29

$6x+(-4y)+9x+8y$

Answer

$15x+4y$

Exercise 13.5.12.30

$\frac{0}{23}$

Exercise 13.5.12.31

$\frac{75}{0}$

Answer

undefined

Exercise 13.5.12.32

$-2(13q-5)$

Exercise 13.5.12.33

A movie lasted $1\frac{2}{3}$ hours. How many minutes did it last? (1 hour $=$ 60 minutes)

Answer

100 minutes

Exercise 13.5.12.34

Mike's SUV is 5 feet 11 inches tall. He wants to put a rooftop cargo bag on the the SUV. The cargo bag is 1 foot 6 inches tall. What will the total height be of the SUV with the cargo bag on the roof? *(1 foot = 12 inches)*

Exercise 13.5.12.35

Jennifer ran 2.8 miles. Convert this length to kilometers. *(1 mile = 1.61 kilometers)*

Answer

4.508 km

13.6.1: Use a Problem-Solving Strategy

Learning Objectives

By the end of this section, you will be able to:

- Approach word problems with a positive attitude
- Use a problem-solving strategy for word problems
- Solve number problems

Note

Before you get started, take this readiness quiz.

1. Translate "6 less than twice x" into an algebraic expression.
   If you missed this problem, review Exercise 1.3.43.
2. Solve: $\frac{2}{3}x = 24$.
   If you missed this problem, review Exercise 2.2.10.
3. Solve: $3x + 8 = 14$.
   If you missed this problem, review Exercise 2.3.1.

Approach Word Problems with a Positive Attitude

"If you think you can… or think you can't… you're right."—Henry Ford

The world is full of word problems! Will my income qualify me to rent that apartment? How much punch do I need to make for the party? What size diamond can I afford to buy my girlfriend? Should I fly or drive to my family reunion? How much money do I need to fill the car with gas? How much tip should I leave at a restaurant? How many socks should I pack for vacation? What size turkey do I need to buy for Thanksgiving dinner, and then what time do I need to put it in the oven? If my sister and I buy our mother a present, how much does each of us pay?

Now that we can solve equations, we are ready to apply our new skills to word problems. Do you know anyone who has had negative experiences in the past with word problems? Have you ever had thoughts like the student below (Figure 13.6.1.1)?

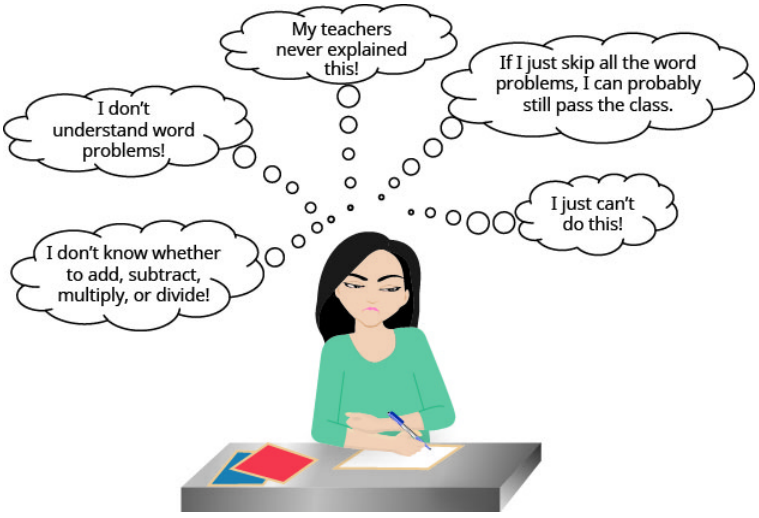

Figure 13.6.1.1: Negative thoughts can be barriers to success.

When we feel we have no control, and continue repeating negative thoughts, we set up barriers to success. We need to calm our fears and change our negative feelings.

Start with a fresh slate and begin to think positive thoughts. If we take control and believe we can be successful, we will be able to master word problems! Read the positive thoughts in Figure 13.6.1.2and say them out loud.

Figure 13.6.1.2: Thinking positive thoughts is a first step towards success.

Think of something, outside of school, that you can do now but couldn't do 3 years ago. Is it driving a car? Snowboarding? Cooking a gourmet meal? Speaking a new language? Your past experiences with word problems happened when you were younger—now you're older and ready to succeed!

Use a Problem-Solving Strategy for Word Problems

We have reviewed translating English phrases into algebraic expressions, using some basic mathematical vocabulary and symbols. We have also translated English sentences into algebraic equations and solved some word problems. The word problems applied math to everyday situations. We restated the situation in one sentence, assigned a variable, and then wrote an equation to solve the problem. This method works as long as the situation is familiar and the math is not too complicated.

Now, we'll expand our strategy so we can use it to successfully solve any word problem. We'll list the strategy here, and then we'll use it to solve some problems. We summarize below an effective strategy for problem solving.

USE A PROBLEM-SOLVING STRATEGY TO SOLVE WORD PROBLEMS.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Example 13.6.1.1

Pilar bought a purse on sale for $18, which is one-half of the original price. What was the original price of the purse?

Solution

Step 1. Read the problem. Read the problem two or more times if necessary. Look up any unfamiliar words in a dictionary or on the internet.

In this problem, is it clear what is being discussed? Is every word familiar?

Let p = the original price of the purse.

Step 2. Identify what you are looking for. Did you ever go into your bedroom to get something and then forget what you were looking for? It's hard to find something if you are not sure what it is! Read the problem again and look for words that tell you what you are looking for!

In this problem, the words "what was the original price of the purse" tell us what we need to find.

Step 3. Name what we are looking for. Choose a variable to represent that quantity. We can use any letter for the variable, but choose one that makes it easy to remember what it represents.

Step 4. Translate into an equation. It may be helpful to restate the problem in one sentence with all the important information. Translate the English sentence into an algebraic equation.

Reread the problem carefully to see how the given information is related. Often, there is one sentence that gives this information, or it may help to write one sentence with all the important information. Look for clue words to help translate the sentence into algebra. Translate the sentence into an equation.

Restate the problem in one sentence with all the important information.	**18** **is** **one-half the original price.**
Translate into an equation.	$18 = \frac{1}{2} \cdot p$

Step 5. Solve the equation using good algebraic techniques. Even if you know the solution right away, using good algebraic techniques here will better prepare you to solve problems that do not have obvious answers.

Solve the equation.	$18 = \frac{1}{2}p$
Multiply both sides by 2.	$2 \cdot 18 = 2 \cdot \frac{1}{2}p$
Simplify.	$36 = p$

Step 6. Check the answer in the problem to make sure it makes sense. We solved the equation and found that $p = 36$,which means "the original price" was $\$36$.

Does $36 make sense in the problem? Yes, because 18 is one-half of 36, and the purse was on sale at half the original price.

If this were a homework exercise, our work might look like this:

Pilar bought a purse on sale for $\$18$, which is one-half the original price. What was the original price of the purse?

Step 7. Answer the question with a complete sentence. The problem asked "What was the original price of the purse?"

The answer to the question is: "The original price of the purse was $36."

	Let $p =$ the original price.
	18 is one-half the original price.
	$18 = \frac{1}{2}p$
Multiply both sides by 2.	$2 \cdot 18 = 2 \cdot \frac{1}{2}p$
Simplify.	$36 = p$
Check. Is $36 a reasonable price for a purse?	
Yes.	
Is 18 one half of 36?	
$18 \stackrel{?}{=} \frac{1}{2} \cdot 36$	
$18 = 18$✓	
	The original price of the purse was $36.

Try It 13.6.1.2

Joaquin bought a bookcase on sale for $120, which was two-thirds of the original price. What was the original price of the bookcase?

Answer

$180

Try It 13.6.1.3

Two-fifths of the songs in Mariel's playlist are country. If there are 16 country songs, what is the total number of songs in the playlist?

Answer

40

Let's try this approach with another example.

Example 13.6.1.4

Ginny and her classmates formed a study group. The number of girls in the study group was three more than twice the number of boys. There were 11 girls in the study group. How many boys were in the study group?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	How many boys were in the study group?
Step 3. Name. Choose a variable to represent the number of boys.	Let $n =$ the number of boys.
Step 4. Translate. Restate the problem in one sentence with all the important information.	**The number of girls** (11) **was** **three more than twice the number of boys**
Translate into an equation.	$11 = 2b+3$
Step 5. Solve the equation.	$11 = 2b+3$
Subtract 3 from each side.	$11-3 = 2b+3-3$
Simplify.	$8 = 2b$
Divide each side by 2.	$\frac{8}{2} = \frac{2b}{2}$
Simplify.	$4 = b$
Step 6. Check. First, is our answer reasonable? Yes, having 4 boys in a study group seems OK. The problem says the number of girls was 3 more than twice the number of boys. If there are four boys, does that make eleven girls? Twice 4 boys is 8. Three more than 8 is 11.	
Step 7. Answer the question.	There were 4 boys in the study group.

Try It 13.6.1.5

Guillermo bought textbooks and notebooks at the bookstore. The number of textbooks was 3 more than twice the number of notebooks. He bought 7 textbooks. How many notebooks did he buy?

Answer

2

Try It 13.6.1.6

Gerry worked Sudoku puzzles and crossword puzzles this week. The number of Sudoku puzzles he completed is eight more than twice the number of crossword puzzles. He completed 22 Sudoku puzzles. How many crossword puzzles did he do?

Answer

7

Solve Number Problems

Now that we have a problem solving strategy, we will use it on several different types of word problems. The first type we will work on is “number problems.” Number problems give some clues about one or more numbers. We use these clues to write an equation. Number problems don’t usually arise on an everyday basis, but they provide a good introduction to practicing the problem solving strategy outlined above.

Example 13.6.1.7

The difference of a number and six is 13. Find the number.

Solution

Step 1. Read the problem. Are all the words familiar?	
Step 2. Identify what we are looking for.	the number
Step 3. Name. Choose a variable to represent the number.	Let $n =$ the number.
Step 4. Translate. Remember to look for clue words like "difference... of... and..."	
Restate the problem as one sentence.	$\underbrace{\textbf{The difference of the number and 6}}$ $\underbrace{\textbf{is}}$ $\underbrace{\textbf{13}}$
Translate into an equation.	$n - 6 \quad = \quad 13$
Step 5. Solve the equation.	$n - 6 = 13$
Simplify.	$n = 19$
Step 6. Check.	
The difference of 19 and 6 is 13. It checks!	
Step 7. Answer the question.	The number is 19.

Try It 13.6.1.8

The difference of a number and eight is 17. Find the number.

Answer

25

Try It 13.6.1.9

The difference of a number and eleven is -7. Find the number.

Answer

4

Example 13.6.1.10

The sum of twice a number and seven is 15. Find the number.

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the number
Step 3. Name. Choose a variable to represent the number.	Let $n =$ the number.
Step 4. Translate.	
Restate the problem as one sentence.	The sum of twice a number and 7 is 15
Translate into an equation.	$2n + 7 = 15$
Step 5. Solve the equation.	$2n + 7 = 15$
Subtract 7 from each side and simplify.	$2n = 8$
Divide each side by 2 and simplify.	$n = 4$
Step 6. Check.	
Is the sum of twice 4 and 7 equal to 15?	
$2 \cdot 4 + 7 \stackrel{?}{=} 15$ $15 = 15\checkmark$	
Step 7. Answer the question.	The number is 4.

Did you notice that we left out some of the steps as we solved this equation? If you're not yet ready to leave out these steps, write down as many as you need.

Try It 13.6.1.11

The sum of four times a number and two is 14. Find the number.

Answer

3

Try It 13.6.1.12

The sum of three times a number and seven is 25. Find the number.

Answer

6

Some number word problems ask us to find two or more numbers. It may be tempting to name them all with different variables, but so far we have only solved equations with one variable. In order to avoid using more than one variable, we will define the numbers in terms of the same variable. Be sure to read the problem carefully to discover how all the numbers relate to each other.

Example 13.6.1.13

One number is five more than another. The sum of the numbers is 21. Find the numbers.

Solution

Step 1. Read the problem.		
Step 2. Identify what we are looking for.		We are looking for two numbers.
Step 3. Name. We have two numbers to name and need a name for each.		
Choose a variable to represent the first number.		Let $n = 1^{st}$ number.
What do we know about the second number?		One number is five more than another.
		$n + 5 = 2^{nd}$ number
Step 4. Translate. Restate the problem as one sentence with all the important information.		The sum of the 1st number and the 2nd number is 21.
Translate into an equation.		1st number + 2nd number = 21
Substitute the variable expressions.		$n + n + 5 = 21$
Step 5. Solve the equation.		$n + n + 5 = 21$
Combine like terms.		$2n + 5 = 21$
Subtract 5 from both sides and simplify.		$2n = 16$
Divide by 2 and simplify.		$n = 8$ 1st number
Find the second number, too.		$n + 5$ 2nd number
		$8 + 5$
		13
Step 6. Check.		
Do these numbers check in the problem?		
Is one number 5 more than the other?	$13 \stackrel{?}{=} 8 + 5$	
Is thirteen 5 more than 8? Yes.	$13 = 13$✓	
Is the sum of the two numbers 21?	$8 + 13 \stackrel{?}{=} 21$	
	$21 = 21$✓	
Step 7. Answer the question.		The numbers are 8 and 13.

Try It 13.6.1.14

One number is six more than another. The sum of the numbers is twenty-four. Find the numbers.

Answer

9, 15

Try It 13.6.1.15

The sum of two numbers is fifty-eight. One number is four more than the other. Find the numbers.

Answer

27, 31

Example 13.6.1.16

The sum of two numbers is negative fourteen. One number is four less than the other. Find the numbers.

Solution

Step 1. Read the problem.		
Step 2. Identify what we are looking for.		We are looking for two numbers.
Step 3. Name.		
Choose a variable.		Let $n = 1^{st}$ number.
One number is 4 less than the other.		$n - 4 = 2^{nd}$ number
Step 4. Translate.		
Write as one sentence.		The sum of the 2 numbers is negative 14.
Translate into an equation.		1st number + 2nd number is negative fourteen
Step 5. Solve the equation.		$n + n - 4 = -14$
Combine like terms.		$n + n - 4 = -14$
Add 4 to each side and simplify.		$2n - 4 = -14$
Simplify.		$2n = -10$
		$n = -5$ 1st number
		$n - 4$ 2nd number
		$-5 - 4$
		-9
Step 6. Check.		
Is −9 four less than −5?	$-5 - 4 \stackrel{?}{=} -9$	
	$-9 = -9$✓	
Is their sum −14?	$-5 + (-9) \stackrel{?}{=} -14$	
	$-14 = -14$✓	
Step 7. Answer the question.		The numbers are −5 and −9.

Try It 13.6.1.17

The sum of two numbers is negative twenty-three. One number is seven less than the other. Find the numbers.

Answer

-15, -8

Try It 13.6.1.18

The sum of two numbers is -18. One number is 40 more than the other. Find the numbers.

Answer

-29, 11

Example 13.6.1.19

One number is ten more than twice another. Their sum is one. Find the numbers.

Solution

Step 1. Read the problem.		
Step 2. Identify what you are looking for.		We are looking for two numbers.
Step 3. Name.		
Choose a variable.		Let $x = 1^{st}$ number.
One number is 10 more than twice another.		$2x + 10 = 2^{nd}$ number
Step 4. Translate.		
Restate as one sentence.		Their sum is one.
		The sum of the two numbers is 1.
Translate into an equation.		$x + 2x + 10 = 1$
Step 5. Solve the equation.		
Combine like terms.		$x + 2x + 10 = 1$
Subtract 10 from each side.		$3x + 10 = 1$
Divide each side by 3.		$3x = -9$
		$x = -3$ 1st number
		$2x + 10$ 2nd number
		$2(-3) + 10$
		4
Step 6. Check.		
Is ten more than twice −3 equal to 4?	$2(-3) + 10 \stackrel{?}{=} 4$	
	$-6 + 10 \stackrel{?}{=} 4$	
	$4 = 4$✓	

Is their sum 1?	$-3+4\stackrel{?}{=}1$	
	$1=1\checkmark$	
Step 7. Answer the question.		The numbers are -3 and 4.

Try It 13.6.1.20

One number is eight more than twice another. Their sum is negative four. Find the numbers.

Answer

$-4,\ 0$

Try It 13.6.1.21

One number is three more than three times another. Their sum is -5. Find the numbers.

Answer

$-3,\ -2$

Some number problems involve consecutive integers. *Consecutive integers* are integers that immediately follow each other. Examples of consecutive integers are:

$$\begin{aligned} &1, 2, 3, 4 \\ &-10, -9, -8, -7 \\ &150, 151, 152, 153 \end{aligned} \tag{13.6.1.1}$$

Notice that each number is one more than the number preceding it. So if we define the first integer as n, the next consecutive integer is $n+1$. The one after that is one more than $n+1$, so it is $n+1+1$, which is $n+2$.

$$\begin{aligned} &n && 1^{\text{st}} \text{ integer} \\ &n+1 && 2^{\text{nd}} \text{ consecutive integer} \\ &n+2 && 3^{\text{rd}} \text{ consecutive integer } \ldots \text{ etc.} \end{aligned} \tag{13.6.1.2}$$

Example 13.6.1.22

The sum of two consecutive integers is 47. Find the numbers.

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	two consecutive integers
Step 3. Name each number.	Let $n = 1^{st}$ integer.
	$n+1 =$ next consecutive integer
Step 4. Translate.	
Restate as one sentence.	The sum of the integers is 47.
Translate into an equation.	$n + n + 1 = 47$
Step 5. Solve the equation.	$n + n + 1 = 47$
Combine like terms.	$2n + 1 = 47$
Subtract 1 from each side.	$2n = 46$

Divide each side by 2.	$n = 23$ 1st integer
	$n + 1$ next consecutive integer
	$23 + 1$
	24
Step 6. Check.	
$23 + 24 \stackrel{?}{=} 47$ $47 = 47$✓	
Step 7. Answer the question.	The two consecutive integers are 23 and 24.

Try It 13.6.1.23

The sum of two consecutive integers is 95. Find the numbers.

Answer

47, 48

Try It 13.6.1.24

The sum of two consecutive integers is −31. Find the numbers.

Answer

-16, -15

Example 13.6.1.25

Find three consecutive integers whose sum is −42.

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	three consecutive integers
Step 3. Name each of the three numbers.	Let $n = 1^{st}$ integer.
	$n + 1 = 2^{nd}$ consecutive integer
	$n + 2 = 3^{rd}$ consecutive integer
Step 4. Translate.	
Restate as one sentence.	The sum of the three integers is -42.
Translate into an equation.	$n + n + 1 + n + 2 = -42$
Step 5. Solve the equation.	$n + n + 1 + n + 2 = -42$
Combine like terms.	$3n + 3 = -42$
Subtract 3 from each side.	$3n = -45$
Divide each side by 3.	$n = -15$ 1st integer
	$n + 1$ 2nd integer

	$-15+1$
	-14
	$n+2$ 3rd integer
	$-15+2$
	-13
Step 6. Check.	
$-13+(-14)+(-15) \stackrel{?}{=} -42$ $-42 = -42\checkmark$	
Step 7. Answer the question.	The three consecutive integers are −13, −14, and −15.

Try It 13.6.1.26

Find three consecutive integers whose sum is −96.

Answer

-33, -32, -31

Try It 13.6.1.27

Find three consecutive integers whose sum is −36.

Answer

-13, -12, -11

Now that we have worked with consecutive integers, we will expand our work to include consecutive even integers and consecutive odd integers. *Consecutive even integers* are even integers that immediately follow one another. Examples of consecutive even integers are:

$$\begin{aligned} &18, 20, 22 \\ &64, 66, 68 \\ &-12, -10, -8 \end{aligned} \tag{13.6.1.3}$$

Notice each integer is 2 more than the number preceding it. If we call the first one n, then the next one is $n+2$. The next one would be $n+2+2$ or $n+4$.

$$\begin{aligned} n &\quad 1^{\text{st}} \text{ even integer} \\ n+2 &\quad 2^{\text{nd}} \text{ consecutive even integer} \\ n+4 &\quad 3^{\text{rd}} \text{ consecutive even integer } \ldots \text{ etc.} \end{aligned} \tag{13.6.1.4}$$

Consecutive odd integers are odd integers that immediately follow one another. Consider the consecutive odd integers 77, 79, and 81.

$$\begin{aligned} &77, 79, 81 \\ &n, n+2, n+4 \end{aligned} \tag{13.6.1.5}$$

$$\begin{aligned} n &\quad 1^{\text{st}} \text{ odd integer} \\ n+2 &\quad 2^{\text{nd}} \text{ consecutive odd integer} \\ n+4 &\quad 3^{\text{rd}} \text{ consecutive odd integer } \ldots \text{ etc.} \end{aligned} \tag{13.6.1.6}$$

Does it seem strange to add 2 (an even number) to get from one odd integer to the next? Do you get an odd number or an even number when we add 2 to 3? to 11? to 47?

Whether the problem asks for consecutive even numbers or odd numbers, you don't have to do anything different. The pattern is still the same—to get from one odd or one even integer to the next, add 2.

Example 13.6.1.28

Find three consecutive even integers whose sum is 84.

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	three consecutive even integers
Step 3. Name the integers.	Let $n = 1^{st}$ even integers.
	$n+2 = 2^{nd}$ consecutive even integer
	$n+4 = 3^{rd}$ consecutive even integer
Step 4. Translate.	
Restate as one sentence.	The sum of the three even integers is 84.
Translate into an equation.	$n+n+2+n+4=84$
Step 5. Solve the equation.	
Combine like terms.	$n+n+2+n+4=84$
Subtract 6 from each side.	$3n+6=84$
Divide each side by 3.	$3n=78$
	$n=26$ 1^{st} integer
	$n+2$ 2^{nd} integer
	$26+2$
	28
	$n+4$ 3^{rd} integer
	$26+4$
	30
Step 6. Check.	
	$26+28+30 \stackrel{?}{=} 84$
	$84=84$✓
Step 7. Answer the question.	The three consecutive integers are 26, 28, and 30.

(13.6.1.7)

Try It 13.6.1.29

Find three consecutive even integers whose sum is 102.

Answer

32, 34, 36

Try It 13.6.1.30

Find three consecutive even integers whose sum is −24.

Answer

$-10, -8, -6$

Example 13.6.1.31

A married couple together earns $110,000 a year. The wife earns $16,000 less than twice what her husband earns. What does the husband earn?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	How much does the husband earn?
Step 3. Name.	
Choose a variable to represent the amount the husband earns.	Let $h =$ the amount the husband earns.
The wife earns $\$16,000$ less than twice that.	$2h - 16,000$ the amount the wife earns.
Step 4. Translate.	Together the husband and wife earn $\$110,000$.
Restate the problem in one sentence with all the important information.	The amount the husband earns plus the amount the wife earns is $110,000
Translate into an equation.	$h + 2h - 16,000 = 110,000$
Step 5. Solve the equation.	$h + 2h - 16,000 = 110,000$
Combine like terms.	$3h - 16,000 = 110,000$
Add $16,000$ to both sides and simplify.	$3h = 126,000$
Divide each side by 3.	$h = 42,000$
	$\$42,000$ amount husband earns
	$2h - 16,000$ amount wife earns
	$2(42,000) - 16,000$
	$84,000 - 16,000$
	$68,000$
Step 6. Check.	
If the wife earns $\$68,000$ and the husband earns $\$42,000$ is the total $\$110,000$? Yes!	
Step 7. Answer the question.	The husband earns $\$42,000$ a year.

Try It 13.6.1.32

According to the National Automobile Dealers Association, the average cost of a car in 2014 was $28,500. This was $1,500 less than 6 times the cost in 1975. What was the average cost of a car in 1975?

Answer

$5000

? Try It 13.6.1.33

U.S. Census data shows that the median price of new home in the United States in November 2014 was $280,900. This was $10,700 more than 14 times the price in November 1964. What was the median price of a new home in November 1964?

Answer

$19300

Key Concepts

- **Problem-Solving Strategy**
  1. **Read** the problem. Make sure all the words and ideas are understood.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose a variable to represent that quantity.
  4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebra equation.
  5. **Solve** the equation using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.
- **Consecutive Integers**
  Consecutive integers are integers that immediately follow each other.

$$\begin{array}{ll} n & 1^{\text{st}} \text{ integer} \\ n+1 & 2^{\text{nd}} \text{ consecutive integer} \\ n+2 & 3^{\text{rd}} \text{ consecutive integer } \ldots \text{ etc.} \end{array} \tag{13.6.1.8}$$

  Consecutive even integers are even integers that immediately follow one another.

$$\begin{array}{ll} n & 1^{\text{st}} \text{ integer} \\ n+2 & 2^{\text{nd}} \text{ consecutive even integer} \\ n+4 & 3^{\text{rd}} \text{ consecutive even integer } \ldots \text{ etc.} \end{array} \tag{13.6.1.9}$$

  Consecutive odd integers are odd integers that immediately follow one another.

$$\begin{array}{ll} n & 1^{\text{st}} \text{ integer} \\ n+2 & 2^{\text{nd}} \text{ consecutive odd integer} \\ n+4 & 3^{\text{rd}} \text{ consecutive odd integer } \ldots \text{ etc.} \end{array} \tag{13.6.1.10}$$

13.6.1E: Exercises

Practice Makes Perfect

Use the Approach Word Problems with a Positive Attitude

In the following exercises, prepare the lists described.

Exercise 13.6.1E.1

List five positive thoughts you can say to yourself that will help you approach word problems with a positive attitude. You may want to copy them on a sheet of paper and put it in the front of your notebook, where you can read them often.

Answer

Answers will vary

Exercise 13.6.1E.2

List five negative thoughts that you have said to yourself in the past that will hinder your progress on word problems. You may want to write each one on a small piece of paper and rip it up to symbolically destroy the negative thoughts.

Use a Problem-Solving Strategy for Word Problems

In the following exercises, solve using the problem solving strategy for word problems. Remember to write a complete sentence to answer each question.

Exercise 13.6.1E.3

Two-thirds of the children in the fourth-grade class are girls. If there are 20 girls, what is the total number of children in the class?

Answer

30

Exercise 13.6.1E.4

Three-fifths of the members of the school choir are women. If there are 24 women, what is the total number of choir members?

Exercise 13.6.1E.5

Zachary has 25 country music CDs, which is one-fifth of his CD collection. How many CDs does Zachary have?

Answer

125

Exercise 13.6.1E.6

One-fourth of the candies in a bag of M&M's are red. If there are 23 red candies, how many candies are in the bag?

Exercise 13.6.1E.7

There are 16 girls in a school club. The number of girls is four more than twice the number of boys. Find the number of boys.

Answer

6

Exercise 13.6.1E.8

There are 18 Cub Scouts in Pack 645. The number of scouts is three more than five times the number of adult leaders. Find the number of adult leaders.

Exercise 13.6.1E.9

Huong is organizing paperback and hardback books for her club's used book sale. The number of paperbacks is 12 less than three times the number of hardbacks. Huong had 162 paperbacks. How many hardback books were there?

Answer

58

Exercise 13.6.1E.10

Jeff is lining up children's and adult bicycles at the bike shop where he works. The number of children's bicycles is nine less than three times the number of adult bicycles. There are 42 adult bicycles. How many children's bicycles are there?

Exercise 13.6.1E.11

Philip pays $1,620 in rent every month. This amount is $120 more than twice what his brother Paul pays for rent. How much does Paul pay for rent?

Answer

$750

Exercise 13.6.1E.12

Marc just bought an SUV for $54,000. This is $7,400 less than twice what his wife paid for her car last year. How much did his wife pay for her car?

Exercise 13.6.1E.13

Laurie has $46,000 invested in stocks and bonds. The amount invested in stocks is $8,000 less than four times the amount invested in bonds. How much does Laurie have invested in bonds?

Answer

$13,500

Exercise 13.6.1E.14

Erica earned a total of $50,450 last year from her two jobs. The amount she earned from her job at the store was $1,250 more than three times the amount she earned from her job at the college. How much did she earn from her job at the college?

Solve Number Problems

In the following exercises, solve each number word problem.

Exercise 13.6.1E.15

The sum of a number and eight is 12. Find the number.

Answer

4

Exercise 13.6.1E.16

The sum of a number and nine is 17. Find the number.

Exercise 13.6.1E.17

The difference of a number and 12 is three. Find the number.

Answer

15

Exercise 13.6.1E.18

The difference of a number and eight is four. Find the number.

Exercise 13.6.1E.19

The sum of three times a number and eight is 23. Find the number.

Answer

5

Exercise 13.6.1E.20

The sum of twice a number and six is 14. Find the number.

Exercise 13.6.1E.21

The difference of twice a number and seven is 17. Find the number.

Answer

12

Exercise 13.6.1E.22

The difference of four times a number and seven is 21. Find the number.

Exercise 13.6.1E.23

Three times the sum of a number and nine is 12. Find the number.

Answer

-5

Exercise 13.6.1E. 24

Six times the sum of a number and eight is 30. Find the number.

Exercise 13.6.1E. 25

One number is six more than the other. Their sum is 42. Find the numbers.

Answer

18, 24

Exercise 13.6.1E. 26

One number is five more than the other. Their sum is 33. Find the numbers.

Exercise 13.6.1E. 27

The sum of two numbers is 20. One number is four less than the other. Find the numbers.

Answer

8, 12

Exercise 13.6.1E. 28

The sum of two numbers is 27. One number is seven less than the other. Find the numbers.

Exercise 13.6.1E. 29

The sum of two numbers is −45. One number is nine more than the other. Find the numbers.

Answer

−18,−27

Exercise 13.6.1E. 30

The sum of two numbers is −61. One number is 35 more than the other. Find the numbers.

Exercise 13.6.1E. 31

The sum of two numbers is −316. One number is 94 less than the other. Find the numbers.

Answer

−111,−205

Exercise 13.6.1E. 32

The sum of two numbers is −284. One number is 62 less than the other. Find the numbers.

Exercise 13.6.1E.33

One number is 14 less than another. If their sum is increased by seven, the result is 85. Find the numbers.

Answer

32, 46

Exercise 13.6.1E.34

One number is 11 less than another. If their sum is increased by eight, the result is 71. Find the numbers.

Exercise 13.6.1E.35

One number is five more than another. If their sum is increased by nine, the result is 60. Find the numbers.

Answer

23, 28

Exercise 13.6.1E.36

One number is eight more than another. If their sum is increased by 17, the result is 95. Find the numbers.

Exercise 13.6.1E.37

One number is one more than twice another. Their sum is −5. Find the numbers.

Answer

−2,−3

Exercise 13.6.1E.38

One number is six more than five times another. Their sum is six. Find the numbers.

Exercise 13.6.1E.39

The sum of two numbers is 14. One number is two less than three times the other. Find the numbers.

Answer

4, 10

Exercise 13.6.1E.40

The sum of two numbers is zero. One number is nine less than twice the other. Find the numbers.

Exercise 13.6.1E.41

The sum of two consecutive integers is 77. Find the integers.

Answer

38, 39

Exercise 13.6.1E.42

The sum of two consecutive integers is 89. Find the integers.

Exercise 13.6.1E.43

The sum of two consecutive integers is −23. Find the integers.

Answer

−11,−12

Exercise 13.6.1E.44

The sum of two consecutive integers is −37. Find the integers.

Exercise 13.6.1E.45

The sum of three consecutive integers is 78. Find the integers.

Answer

25, 26, 27

Exercise 13.6.1E.46

The sum of three consecutive integers is 60. Find the integers.

Exercise 13.6.1E.47

Find three consecutive integers whose sum is −36.

Answer

−11,−12,−13

Exercise 13.6.1E.48

Find three consecutive integers whose sum is −3.

Exercise 13.6.1E.49

Find three consecutive even integers whose sum is 258.

Answer

84, 86, 88

Exercise 13.6.1E.50

Find three consecutive even integers whose sum is 222.

Exercise 13.6.1E.51

Find three consecutive odd integers whose sum is 171.

Answer

55, 57, 59

Exercise 13.6.1E.52

Find three consecutive odd integers whose sum is 291.

Exercise 13.6.1E.53

Find three consecutive even integers whose sum is −36.

Answer

−10,−12,−14

Exercise 13.6.1E.54

Find three consecutive even integers whose sum is −84.

Exercise 13.6.1E.55

Find three consecutive odd integers whose sum is −213.

Answer

−69,−71,−73

Exercise 13.6.1E.56

Find three consecutive odd integers whose sum is −267.

Everyday Math

Exercise 13.6.1E.57

Sale Price Patty paid $35 for a purse on sale for $10 off the original price. What was the original price of the purse?

Answer

$45

Exercise 13.6.1E.58

Sale Price Travis bought a pair of boots on sale for $25 off the original price. He paid $60 for the boots. What was the original price of the boots?

Exercise 13.6.1E.59

Buying in Bulk Minh spent $6.25 on five sticker books to give his nephews. Find the cost of each sticker book.

Answer

$1.25

Exercise 13.6.1E.60

Buying in Bulk Alicia bought a package of eight peaches for $3.20. Find the cost of each peach.

Exercise 13.6.1E.61

Price before Sales Tax Tom paid $1,166.40 for a new refrigerator, including $86.40 tax. What was the price of the refrigerator?

Answer

$1080

Exercise 13.6.1E.62

Price before Sales Tax Kenji paid $2,279 for a new living room set, including $129 tax. What was the price of the living room set?

Writing Exercises

Exercise 13.6.1E.63

What has been your past experience solving word problems?

Answer

answers will vary

Exercise 13.6.1E.64

When you start to solve a word problem, how do you decide what to let the variable represent?

Exercise 13.6.1E.65

What are consecutive odd integers? Name three consecutive odd integers between 50 and 60.

Answer

Consecutive odd integers are odd numbers that immediately follow each other. An example of three consecutive odd integers between 50 and 60 would be 51, 53, and 55.

Exercise 13.6.1E.66

What are consecutive even integers? Name three consecutive even integers between −50 and −40.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
approach word problems with a positive attitude.			
use a problem solving strategy for word problems.			
solve number problems.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved your goals in this section! Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific!

…with some help. This must be addressed quickly as topics you do not master become potholes in your road to success. Math is sequential—every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is critical and you must not ignore it. You need to get help immediately or you will quickly be overwhelmed. See your instructor as soon as possible to discuss your situation. Together you can come up with a plan to get you the help you need.

13.6.2: Solve Percent Applications

Learning Objectives

By the end of this section, you will be able to:

- Translate and solve basic percent equations
- Solve percent applications
- Find percent increase and percent decrease
- Solve simple interest applications
- Solve applications with discount or mark-up

Be prepared

Before you get started, take this readiness quiz.

1. Convert 4.5% to a decimal.
   If you missed this problem, review [link].
2. Convert 0.6 to a percent.
   If you missed this problem, review [link].
3. Round 0.875 to the nearest hundredth.
   If you missed this problem, review [link].
4. Multiply (4.5)(2.38).
   If you missed this problem, review [link].
5. Solve 3.5=0.7n.
   If you missed this problem, review [link].
6. Subtract 50−37.45.
   If you missed this problem, review [link].

Translate and Solve Basic Percent Equations

We will solve percent equations using the methods we used to solve equations with fractions or decimals. Without the tools of algebra, the best method available to solve percent problems was by setting them up as proportions. Now as an algebra student, you can just translate English sentences into algebraic equations and then solve the equations.

We can use any letter you like as a variable, but it is a good idea to choose a letter that will remind us of what you are looking for. We must be sure to change the given percent to a decimal when we put it in the equation.

Example 13.6.2.1

Translate and solve: What number is 35% of 90?

Solution

	What number is 35% of 90?
Translate into algebra. Let n= the number.	$n = 0.35 \cdot 90$
Remember "of" means multiply, "is" means equals.	
Multiply.	$n = 31.5$
	31.5 is 35% of 90

Try It 13.6.2.2

Translate and solve:

What number is 45% of 80?

Answer

36

Try It 13.6.2.3

Translate and solve:

What number is 55% of 60?

Answer

33

We must be very careful when we translate the words in the next example. The unknown quantity will not be isolated at first, like it was in Example. We will again use direct translation to write the equation.

Example 13.6.2.4

Translate and solve: 6.5% of what number is $1.17?

Solution

	6.5% of what number is $1.17?
Translate. Let n= the number.	$0.065 \cdot n = 1.17$
Multiply.	$0.065n = 1.17$
Divide both sides by 0.065 and simplify.	$n = 18$
	6.5% of $18 is $1.17

Try It 13.6.2.5

Translate and solve:

7.5% of what number is $1.95?

Answer

$26

Try It 13.6.2.6

Translate and solve:

8.5% of what number is $3.06?

Answer

$36

In the next example, we are looking for the percent.

Example 13.6.2.7

Translate and solve: 144 is what percent of 96?

Solution

	144 is what percent of 96?
Translate into algebra. Let p= the percent.	$144 = p \cdot 96$
Multiply.	$144 = 96p$
Divide by 96 and simplify.	$1.5 = p$
Convert to percent.	$150\% = p$
	144 is 150% of 96

Note that we are asked to find percent, so we must have our final result in percent form.

Try It 13.6.2.8

Translate and solve:

110 is what percent of 88?

Answer

125%

Try It 13.6.2.9

Translate and solve:

126 is what percent of 72?

Answer

175%

Solve Applications of Percent

Many applications of **percent**—such as tips, sales tax, discounts, and interest—occur in our daily lives. To solve these applications we'll translate to a basic percent equation, just like those we solved in previous examples. Once we translate the sentence into a percent equation, we know how to solve it.

We will restate the problem solving strategy we used earlier for easy reference.

USE A PROBLEM-SOLVING STRATEGY TO SOLVE AN APPLICATION.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Now that we have the strategy to refer to, and have practiced solving basic percent equations, we are ready to solve percent applications. Be sure to ask yourself if your final answer makes sense—since many of the applications will involve everyday situations, you can rely on your own experience.

Example 13.6.2.10

Dezohn and his girlfriend enjoyed a nice dinner at a restaurant and his bill was $68.50. He wants to leave an 18% tip. If the tip will be 18% of the total bill, how much tip should he leave?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the amount of tip should Dezohn leave
Step 3. Name what we are looking for.	
Choose a variable to represent it.	Let t = amount of tip.
Step 4. Translate into an equation.	The tip is 18% of the total bill.
Write a sentence that gives the information to find it.	$\underbrace{\text{The tip}}\ \underbrace{\text{is}}\ \underbrace{18\%}\ \underbrace{\text{of}}\ \underbrace{\$68.50}$
Translate the sentence into an equation.	$t = 0.18 \cdot 68.50$
Step 5. Solve the equation. Multiply.	$t = 12.33$
Step 6. Check. Does this make sense?	
Yes, 20% is close to 18%, and 20% of $70 is $14.	
Step 7. Answer the question with a complete sentence.	Dezohn should leave a tip of $12.33.

Notice that we used t to represent the unknown tip.

Try It 13.6.2.11

Cierra and her sister enjoyed a dinner in a restaurant and the bill was $81.50. If she wants to leave 18% of the total bill as her tip, how much should she leave?

Answer

$14.67

Try It 13.6.2.12

Kimngoc had lunch at her favorite restaurant. She wants to leave 15% of the total bill as her tip. If her bill was $14.40, how much will she leave for the tip?

Answer

$2.16

Example 13.6.2.13

The label on Masao's breakfast cereal said that one serving of cereal provides 85 milligrams (mg) of potassium, which is 2% of the recommended daily amount. What is the total recommended daily amount of potassium?

Solution

Step 1. Read the problem.	

Step 2. Identify what we are looking for.	the total amount of potassium that is recommended
Step 3. Name what we are looking for.	
Choose a variable to represent it.	Let a= total amount of potassium.
Step 4. Translate. Write a sentence that gives the information to find it.	85 mg is 2% of the total amount
Translate into an equation.	$85 = 0.02 \cdot a$
Step 5. Solve the equation.	$4{,}250 = a$
Step 6. Check. Does this make sense?	
Yes, 2% is a small percent and 85 is a small part of 4,250.	
Step 7. Answer the question with a complete sentence.	The amount of potassium that is recommended is 4,250 mg.

Try It 13.6.2.14

One serving of wheat square cereal has seven grams of fiber, which is 28% of the recommended daily amount. What is the total recommended daily amount of fiber?

Answer

25 grams

Try It 13.6.2.15

One serving of rice cereal has 190 mg of sodium, which is 8% of the recommended daily amount. What is the total recommended daily amount of sodium?

Answer

2,375 mg

Example 13.6.2.16

Mitzi received some gourmet brownies as a gift. The wrapper said each brownie was 480 calories, and had 240 calories of fat. What percent of the total calories in each brownie comes from fat?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the percent of the total calories from fat
Step 3. Name what we are looking for.	
Choose a variable to represent it.	Let p= percent of fat.
Step 4. Translate. Write a sentence that gives the information to find it.	What percent of 480 is 240?
Translate into an equation.	$p \cdot 480 = 240$
Step 5. Solve the equation.	$480\,p = 240$
Divide by 480.	$p = 0.5$
Put in a percent form.	$p = 50\%$

Step 6. Check. Does this make sense?	
Yes, 240 is half of 480, so 50% makes sense.	
Step 7. Answer the question with a complete sentence.	Of the total calories in each brownie, 50% is fat.

Try It 13.6.2.17

Solve. Round to the nearest whole percent.

Veronica is planning to make muffins from a mix. The package says each muffin will be 230 calories and 60 calories will be from fat. What percent of the total calories is from fat?

Answer

26%

Try It 13.6.2.18

Solve. Round to the nearest whole percent.

The mix Ricardo plans to use to make brownies says that each brownie will be 190 calories, and 76 calories are from fat. What percent of the total calories are from fat?

Answer

40%

Find Percent Increase and Percent Decrease

People in the media often talk about how much an amount has increased or decreased over a certain period of time. They usually express this increase or decrease as a percent.

To find the **percent increase**, first we find the amount of increase, the difference of the new amount and the original amount. Then we find what percent the amount of increase is of the original amount.

FIND THE PERCENT INCREASE.

1. Find the amount of increase.

   $$\text{new amount} - \text{original amount} = \text{increase}$$
2. Find the percent increase.

   The increase is what percent of the original amount?

Example 13.6.2.19

In 2011, the California governor proposed raising community college fees from $26 a unit to $36 a unit. Find the percent increase. (Round to the nearest tenth of a percent.)

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the percent increase
Step 3. Name what we are looking for.	
Choose a variable to represent it.	Let p = the percent.

Step 4. Translate. Write a sentence that gives the information to find it.	
First find the amount of increase.	new amount − original amount = increase
	$36-26=10$
Find the percent.	Increase is what percent of the original amount?
	10 is what percent of 26?
Translate into an equation.	$10 = p \cdot 26$
Step 5. Solve the equation.	$10 = 26p$
Divide by 26.	$0.3846\ldots = p$
Change to percent form; round to the nearest tenth.	$38.5\% = p$
Step 6. Check. Does this make sense?	
Yes, 38.5% is close to $\frac{1}{3}$, and 10 is close to $\frac{1}{3}$ of 26.	
Step 7. Answer the question with a complete sentence.	The new fees represent a 38.5% increase over the old fees.

Try It 13.6.2.20

Find the percent increase. (Round to the nearest tenth of a percent.)

In 2011, the IRS increased the deductible mileage cost to 55.5 cents from 51 cents.

Answer

8.8%

Try It 13.6.2.21

Find the percent increase.

In 1995, the standard bus fare in Chicago was $1.50. In 2008, the standard bus fare was $2.25.

Answer

50%

Finding the **percent decrease** is very similar to finding the percent increase, but now the amount of decrease is the difference of the original amount and the new amount. Then we find what percent the amount of decrease is of the original amount.

FIND THE PERCENT DECREASE.

1. Find the amount of decrease.

   $$\text{original amount} - \text{new amount} = \text{decrease}$$
2. Find the percent decrease.

   The decrease is what percent of the original amount?

Example 13.6.2.22

The average price of a gallon of gas in one city in June 2014 was $3.71. The average price in that city in July was $3.64. Find the percent decrease.

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the percent decrease
Step 3. Name what we are looking for.	
Choose a variable to represent that quantity.	Let p= the percent decrease.
Step 4. Translate. Write a sentence that gives the information to find it.	
First find the amount of decrease.	3.71−3.64=0.07
Find the percent.	Decrease is what percent of the original amount?
	0.07 is what percent of 3.71?
Translate into an equation.	$0.07 = p \cdot 3.71$
Step 5. Solve the equation.	$0.07 = 3.71\,p$
Divide by 3.71.	$0.0188\ldots = p$
Change to percent form; round to the nearest tenth.	$1.9\% = p$
Step 6. Check. Does this make sense?	
Yes, if the original price was $4, a 2% decrease would be 8 cents.	
Step 7. Answer the question with a complete sentence.	The price of gas decreased 1.9%.

Try It 13.6.2.23

Find the percent decrease. (Round to the nearest tenth of a percent.)

The population of North Dakota was about 672,000 in 2010. The population is projected to be about 630,000 in 2020.

Answer

6.3%

Try It 13.6.2.24

Find the percent decrease.

Last year, Sheila's salary was $42,000. Because of furlough days, this year, her salary was $37,800.

Answer

10%

Solve Simple Interest Applications

Do you know that banks pay you to keep your money? The money a customer puts in the bank is called the **principal**, P, and the money the bank pays the customer is called the **interest**. The interest is computed as a certain percent of the principal; called the

rate of interest, *r*. We usually express rate of interest as a percent per year, and we calculate it by using the decimal equivalent of the percent. The variable *t*, (for *time*) represents the number of years the money is in the account.

To find the interest we use the simple interest formula, I=Prt.

SIMPLE INTEREST

If an amount of money, *P*, called the principal, is invested for a period of *t* years at an annual interest rate *r*, the amount of interest, *I*, earned is

$$I = Prt \quad \text{where} \quad \begin{aligned} I &= \text{interest} \\ P &= \text{principle} \\ r &= \text{rate} \\ t &= \text{time} \end{aligned} \tag{13.6.2.1}$$

Interest earned according to this formula is called **simple interest**.

Interest may also be calculated another way, called compound interest. This type of interest will be covered in later math classes.

The formula we use to calculate simple interest is I=Prt. To use the formula, we substitute in the values the problem gives us for the variables, and then solve for the unknown variable. It may be helpful to organize the information in a chart.

Example 13.6.2.25

Nathaly deposited $12,500 in her bank account where it will earn 4% interest. How much interest will Nathaly earn in 5 years?

$$\begin{aligned} I &= ? \\ P &= \$12,500 \\ r &= 4\% \\ t &= 5 \text{ years} \end{aligned}$$

Solution

Step 1. Read the problem.

Step 2. Identify what we are looking for. — the amount of interest earned

Step 3. Name what we are looking for. Choose a variable to represent that quantity — Let I = the amount of interest.

Step 4. Translate into an equation.

Write the formula. — $I = Prt$

Substitute in the given information. — $I = (12500)(.04)(5)$

Step 5. Solve the equation. — $I = 2500$

Step 6. Check: Does this make sense?

Is $2,500 is a reasonable interest on $12,500? Yes.

Step 7. Answer the question with a complete sentence. — The interest is $2500

Try It 13.6.2.26

Areli invested a principal of $950 in her bank account with interest rate 3%. How much interest did she earn in 5 years?

Answer

$142.50

Try It 13.6.2.27

Susana invested a principal of $36,000 in her bank account with interest rate 6.5%. How much interest did she earn in 3 years?

Answer

$7020

There may be times when we know the amount of interest earned on a given principal over a certain length of time, but we don't know the rate. To find the rate, we use the simple interest formula, substitute in the given values for the principal and time, and then solve for the rate.

Example 13.6.2.28

Loren loaned his brother $3,000 to help him buy a car. In 4 years his brother paid him back the $3,000 plus $660 in interest. What was the rate of interest?

$$\begin{aligned} I &= \$660 \\ P &= \$3000 \\ r &= ? \\ t &= 4 \text{ years} \end{aligned} \tag{13.6.2.2}$$

Solution

Step 1. Read the problem.

Step 2. Identify what we are looking for.	the rate of interest
Step 3. Name what we are looking for. Choose a variable to represent that quantity	Let r = the rate of interest.
Step 4. Translate into an equation.	
Write the formula.	$I = Prt$
Substitute in the given information.	$660 = (3000)r(4)$
Step 5. Solve the equation.	
	$660 = (12000)r$
Divide.	$0.055 = r$
Change to percent form.	$5.5\% = r$

Step 6. Check: Does this make sense?

$I = Prt$

$660 \stackrel{?}{=} (3000)(0.055)(4)$

$660 = 660$✓

Step 7. Answer the question with a complete sentence.	The rate of interest was 5.5%

Notice that in this example, Loren's brother paid Loren interest, just like a bank would have paid interest if Loren invested his money there.

? Try It 13.6.2.29

Jim loaned his sister $5,000 to help her buy a house. In 3 years, she paid him the $5,000, plus $900 interest. What was the rate of interest?

Answer

6%

? Try It 13.6.2.30

Hang borrowed $7,500 from her parents to pay her tuition. In 5 years, she paid them $1,500 interest in addition to the $7,500 she borrowed. What was the rate of interest?

Answer

4%

✓ Example 13.6.2.31

Eduardo noticed that his new car loan papers stated that with a 7.5% interest rate, he would pay $6,596.25 in interest over 5 years. How much did he borrow to pay for his car?

Solution

Step 1. Read the problem.

Step 2. Identify what we are looking for. Choose a variable to represent that quantity.	the amount borrowed (the principal)
Step 3. Name what we are looking for. Choose a variable to represent that quantity	Let P = principal borrowed.
Step 4. Translate into an equation.	
Write the formula.	$I = Prt$
Substitute in the given information.	$6596.25 = P(0.075)(5)$
Step 5. Solve the equation.	
	$6596.25 = 0.375P$
Divide.	$17590 = P$

Step 6. Check: Does this make sense?

$I = Prt$

$6596.25 \stackrel{?}{=} (17590)(0.075)(5)$

$6596.25 = 6596.25$✓

Step 7. Answer the question with a complete sentence. The principal is $17590

? Try It 13.6.2.32

Sean's new car loan statement said he would pay $4,866.25 in interest from an interest rate of 8.5% over 5 years. How much did he borrow to buy his new car?

Answer

$11,450

? Try It 13.6.2.33

In 5 years, Gloria's bank account earned $2,400 interest at 5%. How much had she deposited in the account?

Answer

$9,600

Solve Applications with Discount or Mark-up

Applications of discount are very common in retail settings. When you buy an item on sale, the original price has been discounted by some dollar amount. The **discount rate**, usually given as a percent, is used to determine the amount of the discount. To determine the **amount of discount**, we multiply the discount rate by the original price.

We summarize the discount model in the box below.

DISCOUNT

$$\begin{aligned} \text{amount of discount} &= \text{discount rate} \times \text{original price} \\ \text{sale price} &= \text{original price - amount of discount} \end{aligned} \tag{13.6.2.3}$$

Keep in mind that the sale price should always be less than the original price.

Example 13.6.2.34

Elise bought a dress that was discounted 35% off of the original price of $140. What was (a) the amount of discount and (b) the sale price of the dress?

Solution

(a)
$$\begin{aligned} \text{Original price} &= \$140 \\ \text{Discount rate} &= 35\% \\ \text{Discount} &= ? \end{aligned}$$

Step 1. Read the problem.

Step 2. Identify what we are looking for. — the amount of discount

Step 3. Name what we are looking for. Choose a variable to represent that quantity. — Let d = the amount of discount.

Step 4. Translate into an equation. Write a sentence that gives the information to find it. Translate into an equation — $d = 0.35(140)$

Step 5. Solve the equation. — $d = 49$

Step 6. Check: Does this make sense?

Is a $49 discount reasonable for a $140 dress? Yes.

Step 7. Write a complete sentence to answer the question. — The amount of discount was $49

(b) Read the problem again.

Step 1. Identify what we are looking for.	the sale price of the dress
Step 2. Name what we are looking for.	
Choose a variable to represent that quantity.	Let s= the sale price.
Step 3. Translate into an equation.	
Write a sentence that gives the information to find it.	The sale price is the $140 minus the $49 discount
Translate into an equation.	$s = 140 - 49$
Step 4. Solve the equation.	$s = 91$
Step 5. Check. Does this make sense?	
Is the sale price less than the original price?	

Yes, $91 is less than $140.	
Step 6. Answer the question with a complete sentence.	The sale price of the dress was $91.

Try It 13.6.2.35

Find (a) the amount of discount and (b) the sale price:

Sergio bought a belt that was discounted 40% from an original price of $29.

Answer

(a) $11.60, (b) $17.40

Try It 13.6.2.36

Find (a) the amount of discount and (b) the sale price:

Oscar bought a barbecue that was discounted 65% from an original price of $395.

Answer

(a) $256.75, (b) $138.25

There may be times when we know the original price and the sale price, and we want to know the **discount rate**. To find the discount rate, first we will find the amount of discount and then use it to compute the rate as a percent of the original price. Example 13.6.2.37will show this case.

Example 13.6.2.37

Jeannette bought a swimsuit at a sale price of $13.95. The original price of the swimsuit was $31. Find the (a) amount of discount and (b) discount rate.

Solution

(a) Original price = $31
Discount rate = ?
Discount = $13.95

Step 1. Read the problem.

Step 2. Identify what we are looking for. — the amount of discount

Step 3. Name what we are looking for.
Choose a variable to represent that quantity. — Let d = the amount of discount.

Step 4. Translate into an equation. Write a sentence that gives the information to find it. — The discount is the difference between the original price and the sale price.

Translate into an equation — $d = 31 - 13.95$

Step 5. Solve the equation. — $d = 17.05$

Step 6. Check: Does this make sense?

Is 17.05 less than 31? Yes.

Step 7. Answer the question with a complete sentence. — The amount of discount was $17.05

(b) Read the problem again.

Step 1. Identify what we are looking for.	the discount rate
Step 2. Name what we are looking for.	
Choose a variable to represent it.	Let r = the discount rate.
Step 3. Translate into an equation.	
Write a sentence that gives the information to find it.	The discount of $17.05 is what percent of $31 ?
Translate into an equation.	$17.05 = r \cdot 31$
Step 4. Solve the equation.	$17.05 = 31r$
Divide both sides by 31.	$0.55 = r$
Change to percent form.	$r = 55\%$
Step 5. Check. Does this make sense?	
Is $17.05 equal to 55% of $31?	
$17.05 \stackrel{?}{=} 0.55(31)$	
$17.05 = 17.05$✓	
Step 6. Answer the question with a complete sentence.	The rate of discount was 55%.

Try It 13.6.2.38

Find

a. the amount of discount and
b. the discount rate.

Lena bought a kitchen table at the sale price of $375.20. The original price of the table was $560.

Answer

a. $184.80
b. 33%

Try It 13.6.2.39

Find

a. the amount of discount and
b. the discount rate.

Nick bought a multi-room air conditioner at a sale price of $340. The original price of the air conditioner was $400.

Answer

a. $60
b. 15%

Applications of mark-up are very common in retail settings. The price a retailer pays for an item is called the **original cost**. The retailer then adds a **mark-up** to the original cost to get the **list price**, the price he sells the item for. The mark-up is usually calculated as a percent of the original cost. To determine the amount of mark-up, multiply the mark-up rate by the original cost.

We summarize the mark-up model in the box below.

MARK-UP

$$\begin{aligned} \text{amount of mark-up} &= \text{mark-up rate} \times \text{original cost} \\ \text{list price} &= \text{original cost} + \text{amount of mark up} \end{aligned} \tag{13.6.2.4}$$

Keep in mind that the list price should always be more than the original cost.

Example 13.6.2.40

Adam's art gallery bought a photograph at original cost $250. Adam marked the price up 40%. Find the

a. amount of mark-up and
b. the list price of the photograph.

Solution

a.

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the amount of mark-up
Step 3. Name what we are looking for.	
Choose a variable to represent it.	Let m = the amount of markup.
Step 4. Translate into an equation.	
Write a sentence that gives the information to find it.	The mark-up is 40% of the $250 original cost

Translate into an equation.	$m = 0.40 \cdot 250$
Step 5. Solve the equation.	$m = 100$
Step 6. Check. Does this make sense?	
Yes, 40% is less than one-half and 100 is less than half of 250.	
Step 7. Answer the question with a complete sentence.	The mark-up on the photograph was $100.

b.

Step 1. Read the problem again.	
Step 2. Identify what we are looking for.	the list price
Step 3. Name what we are looking for.	
Choose a variable to represent it.	Let p= the list price.
Step 4. Translate into an equation.	
Write a sentence that gives the information to find it.	The list price is original cost plus the mark-up
Translate into an equation.	$p = 250 + 100$
Step 5. Solve the equation.	$p = 350$
Step 6. Check. Does this make sense?	
Is the list price more than the net price? Is $350 more than $250? Yes.	
Step 7. Answer the question with a complete sentence.	The list price of the photograph was $350.

Try It 13.6.2.41

Find

a. the amount of mark-up and
b. the list price.

Jim's music store bought a guitar at original cost $1,200. Jim marked the price up 50%.

Answer

a. $600
b. $1,800

Try It 13.6.2.42

Find

a. the amount of mark-up and
b. the list price.

The Auto Resale Store bought Pablo's Toyota for $8,500. They marked the price up 35%.

Answer

a. $2,975
b. $11,475

Key Concepts

- **Percent Increase** To find the percent increase:
  1. Find the amount of increase. increase=new amount−originalamount
  2. Find the percent increase. Increase is what percent of the original amount?
- **Percent Decrease** To find the percent decrease:
  1. Find the amount of decrease. decrease=original amount−newamount
  2. Find the percent decrease. Decrease is what percent of the original amount?
- **Simple Interest** If an amount of money, *P*, called the principal, is invested for a period of *t* years at an annual interest rate *r*, the amount of interest, *I*, earned is

$$I = Prt \quad \text{where} \quad \begin{aligned} I &= \text{interest} \\ P &= \text{principle} \\ r &= \text{rate} \\ t &= \text{time} \end{aligned} \tag{13.6.2.5}$$

- **Discount**
  - amount of discount is discount rate × original price
  - sale price is original price – discount
- **Mark-up**
  - amount of mark-up is mark-up rate × original cost
  - list price is original cost + mark up

Glossary

amount of discount

The amount of discount is the amount resulting when a discount rate is multiplied by the original price of an item.

discount rate

The discount rate is the percent used to determine the amount of a discount, common in retail settings.

interest

Interest is the money that a bank pays its customers for keeping their money in the bank.

list price

The list price is the price a retailer sells an item for.

mark-up

A mark-up is a percentage of the original cost used to increase the price of an item.

original cost

The original cost in a retail setting, is the price that a retailer pays for an item.

principal

The principal is the original amount of money invested or borrowed for a period of time at a specific interest rate.

rate of interest

The rate of interest is a percent of the principal, usually expressed as a percent per year.

simple interest

Simple interest is the interest earned according to the formula I=Prt.

13.6.2E: Exercises

Practice Makes Perfect

Translate and Solve Basic Percent Equations

In the following exercises, translate and solve.

Exercise 13.6.2E.1

What number is 45% of 120?

Answer

54

Exercise 13.6.2E.2

What number is 65% of 100?

Exercise 13.6.2E.3

What number is 24% of 112?

Answer

26.88

Exercise 13.6.2E.4

What number is 36% of 124?

Exercise 13.6.2E.5

250% of 65 is what number?

Answer

162.5

Exercise 13.6.2E.6

150% of 90 is what number?

Exercise 13.6.2E.7

800% of 2250 is what number?

Answer

18,000

Exercise 13.6.2E.8

600% of 1740 is what number?

Exercise 13.6.2E.9

28 is 25% of what number?

Answer

112

Exercise 13.6.2E.10

36 is 25% of what number?

Exercise 13.6.2E.11

81 is 75% of what number?

Answer

108

Exercise 13.6.2E.12

93 is 75% of what number?

Exercise 13.6.2E.13

8.2% of what number is $2.87?

Answer

$35

Exercise 13.6.2E.14

6.4% of what number is $2.88?

Exercise 13.6.2E.15

11.5% of what number is $108.10?

Answer

$940

Exercise 13.6.2E.16

12.3% of what number is $92.25?

Exercise 13.6.2E.17

What percent of 260 is 78?

Answer

30%

Exercise 13.6.2E.18

What percent of 215 is 86?

Exercise 13.6.2E.19

What percent of 1500 is 540?

Answer

36%

Exercise 13.6.2E.20

What percent of 1800 is 846?

Exercise 13.6.2E.21

30 is what percent of 20?

Answer

150%

Exercise 13.6.2E.22

50 is what percent of 40?

Exercise 13.6.2E.23

840 is what percent of 480?

Answer

175%

Exercise 13.6.2E.24

790 is what percent of 395?

Solve Percent Applications

In the following exercises, solve.

Exercise 13.6.2E.25

Geneva treated her parents to dinner at their favorite restaurant. The bill was $74.25. Geneva wants to leave 16% of the total bill as a tip. How much should the tip be?

Answer

$11.88

Exercise 13.6.2E.26

When Hiro and his co-workers had lunch at a restaurant near their work, the bill was $90.50. They want to leave 18% of the total bill as a tip. How much should the tip be?

Exercise 13.6.2E.27

Trong has 12% of each paycheck automatically deposited to his savings account. His last paycheck was $2165. How much money was deposited to Trong's savings account?

Answer

$259.80

Exercise 13.6.2E.28

Cherise deposits 8% of each paycheck into her retirement account. Her last paycheck was $1,485. How much did Cherise deposit into her retirement account?

Exercise 13.6.2E.29

One serving of oatmeal has eight grams of fiber, which is 33% of the recommended daily amount. What is the total recommended daily amount of fiber?

Answer

24.2 g

Exercise 13.6.2E.30

One serving of trail mix has 67 grams of carbohydrates, which is 22% of the recommended daily amount. What is the total recommended daily amount of carbohydrates?

Exercise 13.6.2E.31

A bacon cheeseburger at a popular fast food restaurant contains 2070 milligrams (mg) of sodium, which is 86% of the recommended daily amount. What is the total recommended daily amount of sodium?

Answer

2407 mg

Exercise 13.6.2E.32

A grilled chicken salad at a popular fast food restaurant contains 650 milligrams (mg) of sodium, which is 27% of the recommended daily amount. What is the total recommended daily amount of sodium?

Exercise 13.6.2E.33

After 3 months on a diet, Lisa had lost 12% of her original weight. She lost 21 pounds. What was Lisa's original weight?

Answer

175 lb.

Exercise 13.6.2E.34

Tricia got a 6% raise on her weekly salary. The raise was $30 per week. What was her original salary?

Exercise 13.6.2E.35

Yuki bought a dress on sale for $72. The sale price was 60% of the original price. What was the original price of the dress?

Answer

$120

Exercise 13.6.2E.36

Kim bought a pair of shoes on sale for $40.50. The sale price was 45% of the original price. What was the original price of the shoes?

Exercise 13.6.2E.37

Tim left a $9 tip for a $50 restaurant bill. What percent tip did he leave?

Answer

18%

Exercise 13.6.2E.38

Rashid left a $15 tip for a $75 restaurant bill. What percent tip did he leave?

Exercise 13.6.2E.39

The nutrition fact sheet at a fast food restaurant says the fish sandwich has 380 calories, and 171 calories are from fat. What percent of the total calories is from fat?

Answer

45%

Exercise 13.6.2E.40

The nutrition fact sheet at a fast food restaurant says a small portion of chicken nuggets has 190 calories, and 114 calories are from fat. What percent of the total calories is from fat?

Exercise 13.6.2E.41

Emma gets paid $3,000 per month. She pays $750 a month for rent. What percent of her monthly pay goes to rent?

Answer

25%

Exercise 13.6.2E.42

Dimple gets paid $3,200 per month. She pays $960 a month for rent. What percent of her monthly pay goes to rent?

Find Percent Increase and Percent Decrease

In the following exercises, solve.

Exercise 13.6.2E.43

Tamanika got a raise in her hourly pay, from $15.50 to $17.36. Find the percent increase.

Answer

12%

Exercise 13.6.2E.44

Ayodele got a raise in her hourly pay, from $24.50 to $25.48. Find the percent increase.

Exercise 13.6.2E.45

Annual student fees at the University of California rose from about $4,000 in 2000 to about $12,000 in 2010. Find the percent increase.

Answer

200%

Exercise 13.6.2E.46

The price of a share of one stock rose from $12.50 to $50. Find the percent increase.

Exercise 13.6.2E.47

According to *Time* magazine annual global seafood consumption rose from 22 pounds per person in the 1960s to 38 pounds per person in 2011. Find the percent increase. (Round to the nearest tenth of a percent.)

Answer

72.7%

Exercise 13.6.2E.48

In one month, the median home price in the Northeast rose from $225,400 to $241,500. Find the percent increase. (Round to the nearest tenth of a percent.)

Exercise 13.6.2E.49

A grocery store reduced the price of a loaf of bread from $2.80 to $2.73. Find the percent decrease.

Answer

2.5%

Exercise 13.6.2E.50

The price of a share of one stock fell from $8.75 to $8.54. Find the percent decrease.

Exercise 13.6.2E.51

Hernando's salary was $49,500 last year. This year his salary was cut to $44,055. Find the percent decrease.

Answer

11%

Exercise 13.6.2E.52

In 10 years, the population of Detroit fell from 950,000 to about 712,500. Find the percent decrease.

Exercise 13.6.2E.53

In 1 month, the median home price in the West fell from $203,400 to $192,300. Find the percent decrease. (Round to the nearest tenth of a percent.)

Answer

5.5%

Exercise 13.6.2E.54

Sales of video games and consoles fell from $1,150 million to $1,030 million in 1 year. Find the percent decrease. (Round to the nearest tenth of a percent.)

Solve Simple Interest Applications

In the following exercises, solve.

Exercise 13.6.2E.55

Casey deposited $1,450 in a bank account with interest rate 4%. How much interest was earned in two years?

Answer

$116

Exercise 13.6.2E.56

Terrence deposited $5,720 in a bank account with interest rate 6%. How much interest was earned in 4 years?

Exercise 13.6.2E.57

Robin deposited $31,000 in a bank account with interest rate 5.2%. How much interest was earned in 3 years?

Answer

$4,836

Exercise 13.6.2E.58

Carleen deposited $16,400 in a bank account with interest rate 3.9%. How much interest was earned in 8 years?

Exercise 13.6.2E.59

Hilaria borrowed $8,000 from her grandfather to pay for college. Five years later, she paid him back the $8,000, plus $1,200 interest. What was the rate of interest?

Answer

3%

Exercise 13.6.2E.60

Kenneth loaned his niece $1,200 to buy a computer. Two years later, she paid him back the $1,200, plus $96 interest. What was the rate of interest?

Exercise 13.6.2E.61

Lebron loaned his daughter $20,000 to help her buy a condominium. When she sold the condominium four years later, she paid him the $20,000, plus $3,000 interest. What was the rate of interest?

Answer

3.75%

Exercise 13.6.2E.62

Pablo borrowed $50,000 to start a business. Three years later, he repaid the $50,000, plus $9,375 interest. What was the rate of interest?

Exercise 13.6.2E.63

In 10 years, a bank account that paid 5.25% earned $18,375 interest. What was the principal of the account?

Answer

$35,000

Exercise 13.6.2E.64

In 25 years, a bond that paid 4.75% earned $2,375 interest. What was the principal of the bond?

Exercise 13.6.2E.65

Joshua's computer loan statement said he would pay $1,244.34 in interest for a 3-year loan at 12.4%. How much did Joshua borrow to buy the computer?

Answer

$3,345

Exercise 13.6.2E.66

Margaret's car loan statement said she would pay $7,683.20 in interest for a 5-year loan at 9.8%. How much did Margaret borrow to buy the car?

Solve Applications with Discount or Mark-up

In the following exercises, find the sale price.

Exercise 13.6.2E.67

Perla bought a cell phone that was on sale for $50 off. The original price of the cell phone was $189.

Answer

$139

Exercise 13.6.2E.68

Sophie saw a dress she liked on sale for $15 off. The original price of the dress was $96.

Exercise 13.6.2E.69

Rick wants to buy a tool set with original price $165. Next week the tool set will be on sale for $40 off.

Answer

$125

Exercise 13.6.2E.70

Angelo's store is having a sale on televisions. One television, with original price $859, is selling for $125 off.

In the following exercises, find

1. the amount of discount and
2. the sale price.

Exercise 13.6.2E.71

Janelle bought a beach chair on sale at 60% off. The original price was $44.95.

Answer

1. $26.97
2. $17.98

Exercise 13.6.2E.72

Errol bought a skateboard helmet on sale at 40% off. The original price was $49.95.

Exercise 13.6.2E.73

Kathy wants to buy a camera that lists for $389. The camera is on sale with a 33% discount.

Answer

1. $128.37
2. $260.63

Exercise 13.6.2E.74

Colleen bought a suit that was discounted 25% from an original price of $245.

Exercise 13.6.2E.75

Erys bought a treadmill on sale at 35% off. The original price was $949.95 (round to the nearest cent.)

Answer

1. $332.48
2. $617.47

Exercise 13.6.2E.76

Jay bought a guitar on sale at 45% off. The original price was $514.75 (round to the nearest cent.)

In the following exercises, find

1. the amount of discount and
2. the discount rate. (Round to the nearest tenth of a percent if needed.)

Exercise 13.6.2E.77

Larry and Donna bought a sofa at the sale price of $1,344. The original price of the sofa was $1,920.

Answer

1. $576
2. 30%

Exercise 13.6.2E.78

Hiroshi bought a lawnmower at the sale price of $240. The original price of the lawnmower is $300.

Exercise 13.6.2E.79

Patty bought a baby stroller on sale for $301.75. The original price of the stroller was $355.

Answer

1. $53.25
2. 15%

Exercise 13.6.2E.80

Bill found a book he wanted on sale for $20.80. The original price of the book was $32.

Exercise 13.6.2E.81

Nikki bought a patio set on sale for $480. The original price was $850. To the nearest tenth of a percent, what was the rate of discount?

Answer

1. $370
2. 43.5%

Exercise 13.6.2E.82

Stella bought a dinette set on sale for $725. The original price was $1,299. To the nearest tenth of a percent, what was the rate of discount?

In the following exercises, find ⓐ the amount of the mark-up and ⓑ the list price.

Exercise 13.6.2E.83

Daria bought a bracelet at original cost $16 to sell in her handicraft store. She marked the price up 45%.

Answer

1. $7.20
2. $23.20

Exercise 13.6.2E.84

Regina bought a handmade quilt at original cost $120 to sell in her quilt store. She marked the price up 55%.

Exercise 13.6.2E.85

Tom paid $0.60 a pound for tomatoes to sell at his produce store. He added a 33% mark-up.

Answer

1. $0.20
2. $0.80

Exercise 13.6.2E.86

Flora paid her supplier $0.74 a stem for roses to sell at her flower shop. She added an 85% mark-up.

Exercise 13.6.2E.87

Alan bought a used bicycle for $115. After re-conditioning it, he added 225% mark-up and then advertised it for sale.

Answer

1. $258.75
2. $373.75

Exercise 13.6.2E.88

Michael bought a classic car for $8,500. He restored it, then added 150% mark-up before advertising it for sale.

Everyday Math

Exercise 13.6.2E.89

Leaving a Tip At the campus coffee cart, a medium coffee costs $1.65. MaryAnne brings $2.00 with her when she buys a cup of coffee and leaves the change as a tip. What percent tip does she leave?

Answer

21.2%

Exercise 13.6.2E.90

Splitting a Bill Four friends went out to lunch and the bill came to $53.75. They decided to add enough tip to make a total of $64, so that they could easily split the bill evenly among themselves. What percent tip did they leave?

Writing Exercises

Exercise 13.6.2E.91

Without solving the problem “44 is 80% of what number” think about what the solution might be. Should it be a number that is greater than 44 or less than 44? Explain your reasoning.

Answer

The number should be greater than 44. Since 80% equals 0.8 in decimal form, 0.8 is less than one, and we must multiply the number by 0.8 to get 44, the number must be greater than 44.

Exercise 13.6.2E.92

Without solving the problem “What is 20% of 300?” think about what the solution might be. Should it be a number that is greater than 300 or less than 300? Explain your reasoning.

Exercise 13.6.2E.93

After returning from vacation, Alex said he should have packed 50% fewer shorts and 200% more shirts. Explain what Alex meant.

Answer

He meant that he should have packed half the shorts and twice the shirts.

Exercise 13.6.2E.94

Because of road construction in one city, commuters were advised to plan that their Monday morning commute would take 150% of their usual commuting time. Explain what this means.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
translate and solve basic percent equations.			
solve percent applications.			
find percent increase and percent decrease.			
solve simple interest applications.			
solve applications with discount or mark-up.			

ⓑ After reviewing this checklist, what will you do to become confident for all goals?

13.6.3: Solve Mixture Applications

Learning Objectives

By the end of this section, you will be able to:

- Solve coin word problems
- Solve ticket and stamp word problems
- Solve mixture word problems
- Use the mixture model to solve investment problems using simple interest

Note

Before you get started, take this readiness quiz.

1. Multiply: $14(0.25)$.
   If you missed this problem, review Exercise 1.8.19.
2. Solve: $0.25x + 0.10(x + 4) = 2.5$.
   If you missed this problem, review Exercise 2.4.22.
3. The number of dimes is three more than the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.
   If you missed this problem, review Exercise 1.3.43.

Solve Coin Word Problems

In **mixture problems**, we will have two or more items with different values to combine together. The mixture model is used by grocers and bartenders to make sure they set fair prices for the products they sell. Many other professionals, like chemists, investment bankers, and landscapers also use the mixture model.

Note

Doing the Manipulative Mathematics activity *Coin Lab* will help you develop a better understanding of mixture word problems.

We will start by looking at an application everyone is familiar with—money!

Imagine that we take a handful of coins from a pocket or purse and place them on a desk. How would we determine the value of that pile of coins? If we can form a step-by-step plan for finding the total value of the coins, it will help us as we begin solving coin word problems.

So what would we do? To get some order to the mess of coins, we could separate the coins into piles according to their value. Quarters would go with quarters, dimes with dimes, nickels with nickels, and so on. To get the total value of all the coins, we would add the total value of each pile.

Figure 13.6.3.1

How would we determine the value of each pile? Think about the dime pile—how much is it worth? If we count the number of dimes, we'll know how many we have—the *number* of dimes.

But this does not tell us the *value* of all the dimes. Say we counted 17 dimes, how much are they worth? Each dime is worth \$0.10—that is the *value* of one dime. To find the total value of the pile of 17 dimes, multiply 17 by \$0.10 to get \$1.70. This is the total

value of all 17 dimes. This method leads to the following model.

TOTAL VALUE OF COINS

For the same type of coin, the total value of a number of coins is found by using the model

$$number \cdot value = total\ value \tag{13.6.3.1}$$

where

number is the number of coins

value is the value of each coin

total value is the total value of all the coins

The number of dimes times the value of each dime equals the total value of the dimes.

$$\begin{aligned} \text{number.} \cdot \text{ value } &= \text{ total value} \\ 17 \cdot \$0.10 &= \$1.70 \end{aligned}$$

We could continue this process for each type of coin, and then we would know the total value of each type of coin. To get the total value of *all* the coins, add the total value of each type of coin.

Let's look at a specific case. Suppose there are 14 quarters, 17 dimes, 21 nickels, and 39 pennies.

Type	Number	• Value($)	= Total Value($)
Quarters	14	0.25	3.50
Dimes	17	0.10	1.70
Nickels	21	0.05	1.05
Pennies	39	0.01	0.39
			6.64

Table 13.6.3.1

The total value of all the coins is $6.64.

Notice how the chart helps organize all the information! Let's see how we use this method to solve a coin word problem.

Example 13.6.3.1

Adalberto has $2.25 in dimes and nickels in his pocket. He has nine more nickels than dimes. How many of each type of coin does he have?

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.

Determine the types of coins involved.
Think about the strategy we used to find the value of the handful of coins. The first thing we need is to notice what types of coins are involved. Adalberto has dimes and nickels. **Create a table** to organize the information. See chart below.

- Label the columns "type," "number," "value," "total value."
- List the types of coins.
- Write in the value of each type of coin.
- Write in the total value of all the coins.

We can work this problem all in cents or in dollars. Here we will do it in dollars and put in the dollar sign ($) in the table as a reminder.
The value of a dime is $0.10 and the value of a nickel is $0.05. The total value of all the coins is $2.25. The table below shows

this information.

Type	Number •	Value($) =	Total Value($)
Dimes		0.10	
Nickels		0.05	
			2.25

Step 2. Identify what we are looking for.

We are asked to find the number of dimes and nickels Adalberto has.

Step 3. Name what we are looking for. Choose a variable to represent that quantity.

Use variable expressions to represent the number of each type of coin and write them in the table.

Multiply the number times the value to get the total value of each type of coin.

Next we counted the number of each type of coin. In this problem we cannot count each type of coin—that is what you are looking for—but we have a clue. There are nine more nickels than dimes. The number of nickels is nine more than the number of dimes.

$$\begin{aligned} \text{Let } d &= \text{ number of dimes.} \\ d+9 &= \text{ number of nickels} \end{aligned}$$

Fill in the "number" column in the table to help get everything organized.

Type	Number •	Value($) =	Total Value($)
Dimes	d	0.10	
Nickels	$d+9$	0.05	
			2.25

Now we have all the information we need from the problem!

We multiply the number times the value to get the total value of each type of coin. While we do not know the actual number, we do have an expression to represent it.

And so now multiply $\text{number} \cdot \text{value} = \text{total value}$. See how this is done in the table below.

Type	Number •	Value($) =	Total Value($)
Dimes	d	0.10	$0.10d$
Nickels	$d+9$	0.05	$0.05(d+9)$
			2.25

Notice that we made the heading of the table show the model.

Step 4. Translate into an equation. It may be helpful to restate the problem in one sentence. Translate the English sentence into an algebraic equation.

Write the equation by adding the total values of all the types of coins.

	Value of dimes	+	value of nickels	=	total value of coins
Translate to an equation.	$0.10d$	+	$0.05(d+9)$	=	2.25

Step 5. Solve the equation using good algebra techniques.

Now solve this equation.	$0.10d + 0.05(d + 9) = 2.25$
Distribute.	$0.10d + 0.05d + 0.45 = 2.25$
Combine like terms.	$0.15d + 0.45 = 2.25$
Subtract 0.45 from each side.	$0.15d = 1.80$
Divide.	$d = 12$

So there are 12 dimes.	
The number of nickels is d+9d+9.	$d + 9$
	$12 + 9$
	21

Step 6. Check the answer in the problem and make sure it makes sense.

Does this check?

$$\begin{array}{lrcl} 12 \text{ dimes} & 12(0.10) & = & 1.20 \\ 21 \text{ nickels} & 21(0.05) & = & \underline{1.05} \\ & & & \$2.25 \checkmark \end{array} \qquad (13.6.3.2)$$

Step 7. Answer the question with a complete sentence.

Adalberto has twelve dimes and twenty-one nickels.

If this were a homework exercise, our work might look like the following.

Adalberto has $2.25 in dimes and nickels in his pocket. He has nine more nickels than dimes.

How many of each type does he have?

Type	Number • Value($)		= Total Value ($)
Dimes	d	0.10	0.10d
Nickels	d + 9	0.05	0.05(d + 9)
			2.25 ✓

12 dimes 12(0.10) = 1.20

21 nickels 21(0.05) = 1.05

$2.25 ✓

Adalberto has twelve dimes and twenty-one nickels.

$0.10d + 0.05d + 0.45 = 2.25$

$0.15d + 0.45 = 2.25$

$0.15d = 1.80$

$d = 12$ dimes

$d + 9$

$12 + 9$

21 nickels

? Try It 13.6.3.1

Michaela has $2.05 in dimes and nickels in her change purse. She has seven more dimes than nickels. How many coins of each type does she have?

Answer

9 nickels, 16 dimes

? Try It 13.6.3.2

Liliana has $2.10 in nickels and quarters in her backpack. She has 12 more nickels than quarters. How many coins of each type does she have?

Answer

17 nickels, 5 quarters

SOLVE COIN WORD PROBLEMS.

1. **Read** the problem. Make sure all the words and ideas are understood.
   - Determine the types of coins involved.
   - Create a table to organize the information.
   - Label the columns “type,” “number,” “value,” “total value.”
   - List the types of coins.
   - Write in the value of each type of coin.
   - Write in the total value of all the coins.

Type	Number •	Value($) =	Total Value($)

2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
   - Use variable expressions to represent the number of each type of coin and write them in the table.
   - Multiply the number times the value to get the total value of each type of coin.
4. **Translate** into an equation.
   It may be helpful to restate the problem in one sentence with all the important information. Then, translate the sentence into an equation.
   Write the equation by adding the total values of all the types of coins.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Example 13.6.3.2

Maria has $2.43 in quarters and pennies in her wallet. She has twice as many pennies as quarters. How many coins of each type does she have?

Solution

Step 1. Read the problem.

Determine the types of coins involved.

We know that Maria has quarters and pennies.

Create a table to organize the information.

- **Step 2. Identify** what you are looking for.
  - We are looking for the number of quarters and pennies.

  Step 3. Name. Represent the number of quarters and pennies using variables.
  - Multiply the ‘number’ and the ‘value’ to get the ‘total value’ of each type of coin.

Type	Number •	Value($) =	Total Value($)
Quarters	q	0.25	$0.25q$
Pennies	$2q$	0.01	$0.01(2q)$
			2.43

  Step 4. Translate. Write the equation by adding the ‘total value’ of all the types of coins.

Step5. Solve the equation.	$0.25q+0.01(2q)=2.43$
Multiply.	$0.25q+0.02q=2.43$
Combine like terms.	$0.27q=2.43$
Divide by 0.27	$q=9$ quarters
The number of pennies is 2q.	$2q$
	$2\cdot 9$
	18 pennies

Step 6. Check the answer in the problem.

Maria has 9 quarters and 18 pennies. Dies this make $2.43?

9 quarters	$9(0.25)$	$=$	2.25
18 pennies	$18(0.01)$	$=$	0.18
Total			$2.43✓

Step 7. Answer the question. Maria has nine quarters and eighteen pennies.

Try It 13.6.3.3

Sumanta has $4.20 in nickels and dimes in her piggy bank. She has twice as many nickels as dimes. How many coins of each type does she have?

Answer

42 nickels, 21 dimes

Try It 13.6.3.4

Alison has three times as many dimes as quarters in her purse. She has $9.35 altogether. How many coins of each type does she have?

Answer

51 dimes, 17 quarters

In the next example, we'll show only the completed table—remember the steps we take to fill in the table.

Example 13.6.3.3

Danny has $2.14 worth of pennies and nickels in his piggy bank. The number of nickels is two more than ten times the number of pennies. How many nickels and how many pennies does Danny have?

Solution

Step 1. Read the problem.	
Determine the types of coins involved.	pennies and nickels
Create a table.	
Write in the value of each type of coin.	Pennies are worth $0.01. Nickels are worth $0.05.
Step 2. Identify what we are looking for.	the number of pennies and nickels

Step 3. Name. Represent the number of each type of coin using variables.	
The number of nickels is defined in terms of the number of pennies, so start with pennies.	Let $p =$ number of pennies.
The number of nickels is two more than ten times the number of pennies.	And let $10p + 2 =$ number of nickels.
Multiply the number and the value to get the total value of each type of coin.	

Type	Number • Value ($) = Total Value ($)		
pennies	p	0.01	$0.01p$
nickels	$10p + 2$	0.05	$0.05(10p + 2)$
			$2.14

Step 4. Translate. Write the equation by adding the total value of all the types of coins.	$0.01p + 0.05(10p + 2) = 2.14$
Step 5. Solve the equation.	$0.01p + 0.50p + 0.10 = 2.14$ $0.51p + 0.10 = 2.14$ $0.51p = 2.04$ $p = 4$ pennies
How many nickels?	$10p + 2$ $10(4) + 2$ 42 nickels
Step 6. Check the answer in the problem and make sure it makes sense Danny has four pennies and 42 nickels. Is the total value $2.14? $4(0.01) + 42(0.05) \stackrel{?}{=} 2.14$ $2.14 = 2.14$✓	
Step 7. Answer the question.	Danny has four pennies and 42 nickels.

Try It 13.6.3.5

Jesse has $6.55 worth of quarters and nickels in his pocket. The number of nickels is five more than two times the number of quarters. How many nickels and how many quarters does Jesse have?

Answer

41 nickels, 18 quarters

Try It 13.6.3.6

Elane has $7.00 total in dimes and nickels in her coin jar. The number of dimes that Elane has is seven less than three times the number of nickels. How many of each coin does Elane have?

Answer

22 nickels, 59 dimes

Solve Ticket and Stamp Word Problems

Problems involving tickets or stamps are very much like coin problems. Each type of ticket and stamp has a value, just like each type of coin does. So to solve these problems, we will follow the same steps we used to solve coin problems.

Example 13.6.3.4

At a school concert, the total value of tickets sold was $1,506. Student tickets sold for $6 each and adult tickets sold for $9 each. The number of adult tickets sold was five less than three times the number of student tickets sold. How many student tickets and how many adult tickets were sold?

Solution

Step 1. Read the problem.

- Determine the types of tickets involved. There are student tickets and adult tickets.
- Create a table to organize the information.

Type	Number •	Value($) =	Total Value($)
Student		6	
Adult		9	
			1506

Step 2. Identify what we are looking for.

- We are looking for the number of student and adult tickets.

Step 3. Name. Represent the number of each type of ticket using variables.

We know the number of adult tickets sold was five less than three times the number of student tickets sold.

- Multiply the number times the value to get the total value of each type of ticket.

Type	Number •	Value($) =	Total Value($)
Student	s	6	$6s$
Adult	$3s-5$	9	$9(3s-5)$
			1506

Step 4. Translate. Write the equation by adding the total values of each type of ticket.

$$6s+9(3s-5)=1506$$

Step 5. Solve the equation.

$$\begin{aligned} 6s+27s-45 &= 1506 \\ 33s-45 &= 1506 \\ 33s &= 1551 \\ s &= 47 \text{ student tickets} \\ \text{Number of adult tickets} &= 3s-5 \\ &= 3(47)-5 \\ \text{So there were} \quad 136 &\quad \text{adult tickets} \end{aligned}$$

Step 6. Check the answer.

There were 47 student tickets at $6 each and 136 adult tickets at $9 each. Is the total value $1,506? We find the total value of each type of ticket by multiplying the number of tickets times its value then add to get the total value of all the tickets sold.

$$\begin{aligned} 47\cdot 6 &= 282 \\ 136\cdot 9 &= \underline{1224} \\ & \quad 1506\checkmark \end{aligned}$$

Step 7. Answer the question. They sold 47 student tickets and 136 adult tickets.

Try It 13.6.3.7

The first day of a water polo tournament the total value of tickets sold was $17,610. One-day passes sold for $20 and tournament passes sold for $30. The number of tournament passes sold was 37 more than the number of day passes sold. How many day passes and how many tournament passes were sold?

Answer

330 day passes, 367 tournament passes

Try It 13.6.3.8

At the movie theater, the total value of tickets sold was $2,612.50. Adult tickets sold for $10 each and senior/child tickets sold for $7.50 each. The number of senior/child tickets sold was 25 less than twice the number of adult tickets sold. How many senior/child tickets and how many adult tickets were sold?

Answer

112 adult tickets, 199 senior/child tickets

We have learned how to find the total number of tickets when the number of one type of ticket is based on the number of the other type. Next, we'll look at an example where we know the total number of tickets and have to figure out how the two types of tickets relate.

Suppose Bianca sold a total of 100 tickets. Each ticket was either an adult ticket or a child ticket. If she sold 20 child tickets, how many adult tickets did she sell?

- *Did you say '80'? How did you figure that out? Did you subtract 20 from 100?*

If she sold 45 child tickets, how many adult tickets did she sell?

- *Did you say '55'? How did you find it? By subtracting 45 from 100?*

What if she sold 75 child tickets? How many adult tickets did she sell?

- *The number of adult tickets must be 100−75. She sold 25 adult tickets.*

Now, suppose Bianca sold x child tickets. Then how many adult tickets did she sell? To find out, we would follow the same logic we used above. In each case, we subtracted the number of child tickets from 100 to get the number of adult tickets. We now do the same with x.

We have summarized this below.

Child tickets	Adult tickets
20	80
45	55
75	25
x	$100-x$

Table 13.6.3.2

We can apply these techniques to other examples

Example 13.6.3.5

Galen sold 810 tickets for his church's carnival for a total of $2,820. Children's tickets cost $3 each and adult tickets cost $5 each. How many children's tickets and how many adult tickets did he sell?

Solution

Step 1. Read the problem.

- Determine the types of tickets involved. There are children tickets and adult tickets.
- Create a table to organize the information.

Type	Number	• Value($)	= Total Value($)
Children		3	
Adult		5	
			2820

Step 2. Identify what we are looking for.

- We are looking for the number of children and adult tickets.

Step 3. Name. Represent the number of each type of ticket using variables.

- We know the total number of tickets sold was 810.
- This means the number of children's tickets plus the number of adult tickets must add up to 810.
- Let c be the number of children tickets.

Type	Number	• Value($)	= Total Value($)
Children	c	3	$3c$
Adult	$810-c$	5	$5(810-c)$
			2820

- Then $810-c$ is the number of adult tickets.
- Multiply the number times the value to get the total value of each type of ticket.

Step 4. Translate.

Write the equation by adding the total values of each type of ticket.

Step 5. Solve the equation.

$$\begin{aligned} 3c+5(810-c) &= 2,820 \\ 3c+4,050-5c &= 2,820 \\ -2c &= -1,230 \\ c &= 615 \text{ children tickets} \end{aligned}$$

How many adults?

$$\begin{aligned} &810-c \\ &810-615 \\ &195 \text{ adult tickets} \end{aligned}$$

Step 6. Check the answer. There were 615 children's tickets at $3 each and 195 adult tickets at $5 each. Is the total value $2,820?

$$\begin{aligned} 615\cdot 3 &= 1845 \\ 195\cdot 5 &= \underline{975} \\ & 2,820\checkmark \end{aligned}$$

Step 7. Answer the question. Galen sold 615 children's tickets and 195 adult tickets.

Try It 13.6.3.9

During her shift at the museum ticket booth, Leah sold 115 tickets for a total of $1,163. Adult tickets cost $12 and student tickets cost $5. How many adult tickets and how many student tickets did Leah sell?

Answer

84 adult tickets, 31 student tickets

Try It 13.6.3.10

A whale-watching ship had 40 paying passengers on board. The total collected from tickets was $1,196. Full-fare passengers paid $32 each and reduced-fare passengers paid $26 each. How many full-fare passengers and how many reduced-fare passengers were on the ship?

Answer

26 full-fare, 14 reduced fare

Now, we'll do one where we fill in the table all at once.

Example 13.6.3.6

Monica paid $8.36 for stamps. The number of 41-cent stamps was four more than twice the number of two-cent stamps. How many 41-cent stamps and how many two-cent stamps did Monica buy?

Solution

The types of stamps are 41-cent stamps and two-cent stamps. Their names also give the value!

"The number of 41-cent stamps was four more than twice the number of two-cent stamps."

$$\text{Let } x = \text{ number of 2 -cent stamps.}$$
$$2x+4 = \text{ number of 41 - cent stamps}$$

Type	Number •	Value($) =	Total Value($)
41 cent stamps	$2x+4$	0.41	$0.41(2x+4)$
2 cent stamps	x	0.02	$0.02x$
			8.36

Write the equation from the total values.

$$0.41(2x+4)+0.02x = 8.36$$
$$0.82x+1.64+0.02x = 8.36$$
$$0.84x+1.64 = 8.36$$

Solve the equation.

$$0.84x = 6.72$$
$$x = 8$$

Monica bought eight two-cent stamps.

Find the number of 41-cent stamps she bought by evaluating $2x+4$ for $x=8$

$$2x+4$$
$$2(8)+4$$
$$20$$

Check.

$$\begin{aligned} 8(0.02)+20(0.41) &\stackrel{?}{=} 8.36 \\ 0.16+8.20 &\stackrel{?}{=} 8.36 \\ 8.36 &= 8.36\checkmark \end{aligned} \qquad (13.6.3.3)$$

Monica bought eight two-cent stamps and 20 41-cent stamps

Try It 13.6.3.11

Eric paid $13.36 for stamps. The number of 41-cent stamps was eight more than twice the number of two-cent stamps. How many 41-cent stamps and how many two-cent stamps did Eric buy?

Answer

32 at $0.41, 12 at $0.02

Try It 13.6.3.12

Kailee paid $12.66 for stamps. The number of 41-cent stamps was four less than three times the number of 20-cent stamps. How many 41-cent stamps and how many 20-cent stamps did Kailee buy?

Answer

26 at $0.41, 10 at $0.20

Solve Mixture Word Problems

Now we'll solve some more general applications of the mixture model. Grocers and bartenders use the mixture model to set a fair price for a product made from mixing two or more ingredients. Financial planners use the mixture model when they invest money in a variety of accounts and want to find the overall interest rate. Landscape designers use the mixture model when they have an assortment of plants and a fixed budget, and event coordinators do the same when choosing appetizers and entrees for a banquet.

Our first mixture word problem will be making trail mix from raisins and nuts.

Example 13.6.3.7

Henning is mixing raisins and nuts to make 10 pounds of trail mix. Raisins cost $2 a pound and nuts cost $6 a pound. If Henning wants his cost for the trail mix to be $5.20 a pound, how many pounds of raisins and how many pounds of nuts should he use?

Solution

As before, we fill in a chart to organize our information.

The 10 pounds of trail mix will come from mixing raisins and nuts.

$$\text{Let } x = \text{ number of pounds of raisins.}$$
$$10 - x = \text{ number of pounds of nuts}$$

We enter the price per pound for each item.

We multiply the number times the value to get the total value.

Type	Number of pounds	• Price per pound ($)	= Total Value ($)
Raisins	x	2	$2x$
Nuts	$10 - x$	6	$6(10 - x)$
Trail mix	10	5.20	10(5.20)

Notice that the last line in the table gives the information for the total amount of the mixture.

We know the value of the raisins plus the value of the nuts will be the value of the trail mix.

Write the equation from the total values.	$2x + 6(10 - x) = 10(5.20)$
Solve the equation.	$2x + 60 - 6x = 52$
	$-4x = -8$

	$x = 2$ pounds of raisins
Find the number of pounds of nuts.	$10 - x$
	$10 - 2$
	8 pounds of nuts
Check. $2(\$2) + 8(\$6) \stackrel{?}{=} 10(\$5.20)$ $\$4 + \$48 \stackrel{?}{=} \$52$ $\$52 = \$52\checkmark$	
	Henning mixed two pounds of raisins with eight pounds of nuts.

Try It 13.6.3.13

Orlando is mixing nuts and cereal squares to make a party mix. Nuts sell for $7 a pound and cereal squares sell for $4 a pound. Orlando wants to make 30 pounds of party mix at a cost of $6.50 a pound, how many pounds of nuts and how many pounds of cereal squares should he use?

Answer

5 pounds cereal squares, 25 pounds nuts

Try It 13.6.3.14

Becca wants to mix fruit juice and soda to make a punch. She can buy fruit juice for $3 a gallon and soda for $4 a gallon. If she wants to make 28 gallons of punch at a cost of $3.25 a gallon, how many gallons of fruit juice and how many gallons of soda should she buy?

Answer

21 gallons of fruit punch, 7 gallons of soda

We can also use the mixture model to solve investment problems using **simple interest**. We have used the simple interest formula, $I = Prt$, where t represented the number of years. When we just need to find the interest for one year, $t = 1$, so then $I = Pr$.

Example 13.6.3.8

Stacey has $20,000 to invest in two different bank accounts. One account pays interest at 3% per year and the other account pays interest at 5% per year. How much should she invest in each account if she wants to earn 4.5% interest per year on the total amount?

Solution

We will fill in a chart to organize our information. We will use the simple interest formula to find the interest earned in the different accounts.

The interest on the mixed investment will come from adding the interest from the account earning 3% and the interest from the account earning 5% to get the total interest on the $20,000.

$$\begin{aligned} \text{Let } x &= \text{amount invested at } 3\% \\ 20,000 - x &= \text{amount invested at } 5\% \end{aligned}$$

The amount invested is the *principal* for each account.

We enter the interest rate for each account.

We multiply the amount invested times the rate to get the interest.

Type	Amount Invested	• Rate	= Interest
3%	x	0.03	$0.03x$
5%	$20{,}000 - x$	0.05	$0.05(20{,}000 - x)$
4.5%	20,000	0.045	$0.045(20{,}000)$

Notice that the total amount invested, 20,000, is the sum of the amount invested at 3% and the amount invested at 5%. And the total interest, $0.045(20,000)$ is the sum of the interest earned in the 3% account and the interest earned in the 5% account.

As with the other mixture applications, the last column in the table gives us the equation to solve.

Write the equation from the interest earned. Solve the equation.	$0.03x + 0.05(20000 - x) = 0.045(20000)$ $0.03x + 1000 - 0.05x = 900$ $-0.02x = -100$ $x = 5000$ $\text{amount invested at } 3\%$
Find the amount invested at 5%.	$20{,}000 - x$ $20{,}000 - 5{,}000$ 15,000 = amount invested at 5%
Check. $0.03x + 0.05(15000 + x) \stackrel{?}{=} 0.045(20000)$ $150 + 750 \stackrel{?}{=} 900$ $900 = 900\checkmark$	
	Stacey should invest \$5,000 in the account that earns 3% and \$15,000 in the account that earns 5%.

? Try It 13.6.3.15

Remy has \$14,000 to invest in two mutual funds. One fund pays interest at 4% per year and the other fund pays interest at 7% per year. How much should she invest in each fund if she wants to earn 6.1% interest on the total amount?

Answer

\$4,200 at 4%, \$9,800 at 7%

? Try It 13.6.3.16

Marco has \$8,000 to save for his daughter's college education. He wants to divide it between one account that pays 3.2% interest per year and another account that pays 8% interest per year. How much should he invest in each account if he wants the interest on the total investment to be 6.5%?

Answer

\$2,500 at 3.2%, \$5,500 at 8%

Key Concepts

- **Total Value of Coins** For the same type of coin, the total value of a number of coins is found by using the model. number·value=total value where *number* is the number of coins and *value* is the value of each coin; *total value* is the total value of all the coins
- **Problem-Solving Strategy—Coin Word Problems**

1. **Read** the problem. Make all the words and ideas are understood. Determine the types of coins involved.
   - Create a table to organize the information.
   - Label the columns type, number, value, total value.
   - List the types of coins.
   - Write in the value of each type of coin.
   - Write in the total value of all the coins.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
   Use variable expressions to represent the number of each type of coin and write them in the table.
   Multiply the number times the value to get the total value of each type of coin.
4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information.
   Then, translate the sentence into an equation.
   Write the equation by adding the total values of all the types of coins.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Glossary

mixture problems

Mixture problems combine two or more items with different values together.

13.6.3E: Exercises

Practice Makes Perfect

Solve Coin Word Problems

In the following exercises, solve each coin word problem.

Exercise 13.6.3E.1

Jaime has $2.60 in dimes and nickels. The number of dimes is 14 more than the number of nickels. How many of each coin does he have?

Answer

8 nickels, 22 dimes

Exercise 13.6.3E.2

Lee has $1.75 in dimes and nickels. The number of nickels is 11 more than the number of dimes. How many of each coin does he have?

Exercise 13.6.3E.3

Ngo has a collection of dimes and quarters with a total value of $3.50. The number of dimes is seven more than the number of quarters. How many of each coin does he have?

Answer

15 dimes, 8 quarters

Exercise 13.6.3E.4

Connor has a collection of dimes and quarters with a total value of $6.30. The number of dimes is 14 more than the number of quarters. How many of each coin does he have?

Exercise 13.6.3E.5

A cash box of $1 and $5 bills is worth $45. The number of $1 bills is three more than the number of $5 bills. How many of each bill does it contain?

Answer

10 at $1, 7 at $5

Exercise 13.6.3E.6

Joe’s wallet contains $1 and $5 bills worth $47. The number of $1 bills is five more than the number of $5 bills. How many of each bill does he have?

Exercise 13.6.3E.7

Rachelle has $6.30 in nickels and quarters in her coin purse. The number of nickels is twice the number of quarters. How many coins of each type does she have?

Answer

18 quarters, 36 nickels

Exercise 13.6.3E.8

Deloise has $1.20 in pennies and nickels in a jar on her desk. The number of pennies is three times the number of nickels. How many coins of each type does she have?

Exercise 13.6.3E.9

Harrison has $9.30 in his coin collection, all in pennies and dimes. The number of dimes is three times the number of pennies. How many coins of each type does he have?

Answer

30 pennies, 90 dimes

Exercise 13.6.3E.10

Ivan has $8.75 in nickels and quarters in his desk drawer. The number of nickels is twice the number of quarters. How many coins of each type does he have?

Exercise 13.6.3E.11

In a cash drawer there is $125 in $5 and $10 bills. The number of $10 bills is twice the number of $5 bills. How many of each are in the drawer?

Answer

10 at $10, 5 at $5

Exercise 13.6.3E.12

John has $175 in $5 and $10 bills in his drawer. The number of $5 bills is three times the number of $10 bills. How many of each are in the drawer?

Exercise 13.6.3E.13

Carolyn has $2.55 in her purse in nickels and dimes. The number of nickels is nine less than three times the number of dimes. Find the number of each type of coin.

Answer

12 dimes and 27 nickels

Exercise 13.6.3E.14

Julio has $2.75 in his pocket in nickels and dimes. The number of dimes is 10 less than twice the number of nickels. Find the number of each type of coin.

Exercise 13.6.3E.15

Chi has $11.30 in dimes and quarters. The number of dimes is three more than three times the number of quarters. How many of each are there?

Answer

63 dimes, 20 quarters

Exercise 13.6.3E.16

Tyler has $9.70 in dimes and quarters. The number of quarters is eight more than four times the number of dimes. How many of each coin does he have?

Exercise 13.6.3E.17

Mukul has $3.75 in quarters, dimes and nickels in his pocket. He has five more dimes than quarters and nine more nickels than quarters. How many of each coin are in his pocket?

Answer

16 nickels, 12 dimes, 7 quarters

Exercise 13.6.3E.18

Vina has $4.70 in quarters, dimes and nickels in her purse. She has eight more dimes than quarters and six more nickels than quarters. How many of each coin are in her purse?

Solve Ticket and Stamp Word Problems

In the following exercises, solve each ticket or stamp word problem.

Exercise 13.6.3E.19

The school play sold $550 in tickets one night. The number of $8 adult tickets was 10 less than twice the number of $5 child tickets. How many of each ticket were sold?

Answer

30 child tickets, 50 adult tickets

Exercise 13.6.3E.20

If the number of $8 child tickets is seventeen less than three times the number of $12 adult tickets and the theater took in $584, how many of each ticket were sold?

Exercise 13.6.3E.21

The movie theater took in $1,220 one Monday night. The number of $7 child tickets was ten more than twice the number of $9 adult tickets. How many of each were sold?

Answer

110 child tickets, 50 adult tickets

Exercise 13.6.3E.22

The ball game sold $1,340 in tickets one Saturday. The number of $12 adult tickets was 15 more than twice the number of $5 child tickets. How many of each were sold?

Exercise 13.6.3E.23

The ice rink sold 95 tickets for the afternoon skating session, for a total of $828. General admission tickets cost $10 each and youth tickets cost $8 each. How many general admission tickets and how many youth tickets were sold?

Answer

34 general, 61 youth

Exercise 13.6.3E.24

For the 7:30 show time, 140 movie tickets were sold. Receipts from the $13 adult tickets and the $10 senior tickets totaled $1,664. How many adult tickets and how many senior tickets were sold?

Exercise 13.6.3E.25

The box office sold 360 tickets to a concert at the college. The total receipts were $4170. General admission tickets cost $15 and student tickets cost $10. How many of each kind of ticket was sold?

Answer

114 general, 246 student

Exercise 13.6.3E.26

Last Saturday, the museum box office sold 281 tickets for a total of $3954. Adult tickets cost $15 and student tickets cost $12. How many of each kind of ticket was sold?

Exercise 13.6.3E.27

Julie went to the post office and bought both $0.41 stamps and $0.26 postcards. She spent $51.40. The number of stamps was 20 more than twice the number of postcards. How many of each did she buy?

Answer

40 postcards, 100 stamps

Exercise 13.6.3E.28

Jason went to the post office and bought both $0.41 stamps and $0.26 postcards and spent $10.28. The number of stamps was four more than twice the number of postcards. How many of each did he buy?

Exercise 13.6.3E.29

Maria spent $12.50 at the post office. She bought three times as many $0.41 stamps as $0.02 stamps. How many of each did she buy?

Answer

30 at $0.41, 10 at $0.02

Exercise 13.6.3E.30

Hector spent $33.20 at the post office. He bought four times as many $0.41 stamps as $0.02 stamps. How many of each did he buy?

Exercise 13.6.3E.31

Hilda has $210 worth of $10 and $12 stock shares. The numbers of $10 shares is five more than twice the number of $12 shares. How many of each does she have?

Answer

15 $10 shares, 5 $12 shares

Exercise 13.6.3E.32

Mario invested $475 in $45 and $25 stock shares. The number of $25 shares was five less than three times the number of $45 shares. How many of each type of share did he buy?

Solve Mixture Word Problems

In the following exercises, solve each mixture word problem.

Exercise 13.6.3E.33

Lauren in making 15 liters of mimosas for a brunch banquet. Orange juice costs her $1.50 per liter and champagne costs her $12 per liter. How many liters of orange juice and how many liters of champagne should she use for the mimosas to cost Lauren $5 per liter?

Answer

5 liters champagne, 10 liters orange juice

Exercise 13.6.3E.34

Macario is making 12 pounds of nut mixture with macadamia nuts and almonds. Macadamia nuts cost $9 per pound and almonds cost $5.25 per pound. How many pounds of macadamia nuts and how many pounds of almonds should Macario use for the mixture to cost $6.50 per pound to make?

Exercise 13.6.3E.35

Kaapo is mixing Kona beans and Maui beans to make 25 pounds of coffee blend. Kona beans cost Kaapo $15 per pound and Maui beans cost $24 per pound. How many pounds of each coffee bean should Kaapo use for his blend to cost him $17.70 per pound?

Answer

7.5 lbs Maui beans, 17.5 Kona beans

Exercise 13.6.3E.36

Estelle is making 30 pounds of fruit salad from strawberries and blueberries. Strawberries cost $1.80 per pound and blueberries cost $4.50 per pound. If Estelle wants the fruit salad to cost her $2.52 per pound, how many pounds of each berry should she use?

Exercise 13.6.3E.37

Carmen wants to tile the floor of his house. He will need 1000 square feet of tile. He will do most of the floor with a tile that costs $1.50 per square foot, but also wants to use an accent tile that costs $9.00 per square foot. How many square feet of each tile should he plan to use if he wants the overall cost to be $3 per square foot?

Answer

800 at $1.50, 200 at $9.00

Exercise 13.6.3E.38

Riley is planning to plant a lawn in his yard. He will need nine pounds of grass seed. He wants to mix Bermuda seed that costs $4.80 per pound with Fescue seed that costs $3.50 per pound. How much of each seed should he buy so that the overall cost will be $4.02 per pound?

Exercise 13.6.3E.39

Vartan was paid $25,000 for a cell phone app that he wrote and wants to invest it to save for his son's education. He wants to put some of the money into a bond that pays 4% annual interest and the rest into stocks that pay 9% annual interest. If he wants to earn 7.4% annual interest on the total amount, how much money should he invest in each account?

Answer

$8000 at 4%, $17,000 at 9%

Exercise 13.6.3E.40

Vern sold his 1964 Ford Mustang for $55,000 and wants to invest the money to earn him 5.8% interest per year. He will put some of the money into Fund A that earns 3% per year and the rest in Fund B that earns 10% per year. How much should he invest into each fund if he wants to earn 5.8% interest per year on the total amount?

Exercise 13.6.3E.41

Stephanie inherited $40,000. She wants to put some of the money in a certificate of deposit that pays 2.1% interest per year and the rest in a mutual fund account that pays 6.5% per year. How much should she invest in each account if she wants to earn 5.4% interest per year on the total amount?

Answer

$10,000 in CD, $30,000 in mutual fund

Exercise 13.6.3E.42

Avery and Caden have saved $27,000 towards a down payment on a house. They want to keep some of the money in a bank account that pays 2.4% annual interest and the rest in a stock fund that pays 7.2% annual interest. How much should they put into each account so that they earn 6% interest per year?

Exercise 13.6.3E.43

Dominic pays 7% interest on his $15,000 college loan and 12% interest on his $11,000 car loan. What average interest rate does he pay on the total $26,000 he owes? (Round your answer to the nearest tenth of a percent.)

Answer

9.1%

Exercise 13.6.3E.44

Liam borrowed a total of $35,000 to pay for college. He pays his parents 3% interest on the $8,000 he borrowed from them and pays the bank 6.8% on the rest. What average interest rate does he pay on the total $35,000? (Round your answer to the nearest tenth of a percent.)

Everyday Math

Exercise 13.6.3E.45

As the treasurer of her daughter's Girl Scout troop, Laney collected money for some girls and adults to go to a 3-day camp. Each girl paid $75 and each adult paid $30. The total amount of money collected for camp was $765. If the number of girls is three times the number of adults, how many girls and how many adults paid for camp?

Answer

9 girls, 3 adults

Exercise 13.6.3E.46

Laurie was completing the treasurer's report for her son's Boy Scout troop at the end of the school year. She didn't remember how many boys had paid the $15 full-year registration fee and how many had paid the $10 partial-year fee. She knew that the number of boys who paid for a full-year was ten more than the number who paid for a partial-year. If $250 was collected for all the registrations, how many boys had paid the full-year fee and how many had paid the partial-year fee?

Writing Exercises

Exercise 13.6.3E.47

Suppose you have six quarters, nine dimes, and four pennies. Explain how you find the total value of all the coins.

Answer

Answers will vary.

Exercise 13.6.3E.48

Do you find it helpful to use a table when solving coin problems? Why or why not?

Exercise 13.6.3E.49

In the table used to solve coin problems, one column is labeled "number" and another column is labeled "value." What is the difference between the "number" and the "value?"

Answer

Answers will vary.

Exercise 13.6.3E.50

What similarities and differences did you see between solving the coin problems and the ticket and stamp problems?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve coin word problems.			
solve ticket and stamp word problems.			
solve mixture word problems.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 13.6.3E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **3.3E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

13.6.4: Triangles, Rectangles, and the Pythagorean Theorem

Learning Objectives

By the end of this section, you will be able to:

- Solve applications using properties of triangles
- Use the Pythagorean Theorem
- Solve applications using rectangle properties

Be prepared

Before you get started, take this readiness quiz.

1. Simplify: $12(6h)$.
   If you missed this problem, review Exercise 1.10.1.
2. The length of a rectangle is three less than the width. Let w represent the width. Write an expression for the length of the rectangle.
   If you missed this problem, review Exercise 1.3.43.
3. Solve: $A = \frac{1}{2}bh$ for b when A=260 and h=52.
   If you missed this problem, review Exercise 2.6.10.
4. Simplify: $\sqrt{144}$.
   If you missed this problem, review Exercise 1.9.10.

Solve Applications Using Properties of Triangles

In this section we will use some common geometry formulas. We will adapt our problem-solving strategy so that we can solve geometry applications. The geometry formula will name the variables and give us the equation to solve. In addition, since these applications will all involve shapes of some sort, most people find it helpful to draw a figure and label it with the given information. We will include this in the first step of the problem solving strategy for geometry applications.

SOLVE GEOMETRY APPLICATIONS

1. **Read** the problem and make sure all the words and ideas are understood. Draw the figure and label it with the given information.
2. **Identify** what we are looking for.
3. **Label** what we are looking for by choosing a variable to represent it.
4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer by substituting it back into the equation solved in step 5 and by making sure it makes sense in the context of the problem.
7. **Answer** the question with a complete sentence.

We will start geometry applications by looking at the properties of triangles. Let's review some basic facts about triangles. Triangles have three sides and three interior angles. Usually each side is labeled with a lowercase letter to match the uppercase letter of the opposite vertex.

The plural of the word *vertex* is *vertices*. All triangles have three **vertices**. Triangles are named by their vertices: The triangle in Figure 13.6.4.1is called $\triangle ABC$.

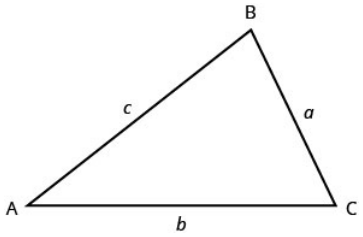

Figure 13.6.4.1: Triangle ABC has vertices A, B, and C. The lengths of the sides are a, b, and c.

The three angles of a triangle are related in a special way. The sum of their measures is 180°. Note that we read $m\angle A$ as "the measure of angle A." So in $\triangle ABC$ in Figure 13.6.4.1

$$m\angle A + m\angle B + m\angle C = 180^\circ$$

Because the **perimeter** of a figure is the length of its boundary, the perimeter of $\triangle ABC$ is the sum of the lengths of its three sides.

$$P = a + b + c$$

To find the **area** of a triangle, we need to know its base and height. The height is a line that connects the base to the opposite vertex and makes a 90° angle with the base. We will draw $\triangle ABC$ again, and now show the height, h. See Figure 13.6.4.2

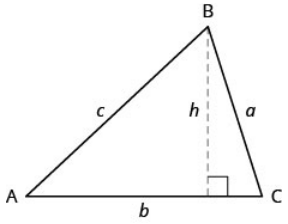

Figure 13.6.4.2: The formula for the area of $\triangle ABC$ is $A = \frac{1}{2}bh$ where b is the base and h is the height.

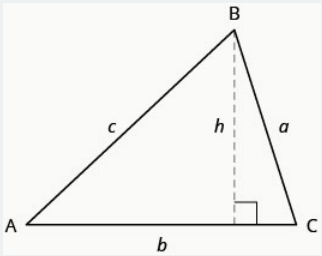
TRIANGLE PROPERTIES



For $\triangle ABC$

Angle measures:

$$m\angle A + m\angle B + m\angle C = 180^\circ \qquad (13.6.4.1)$$

- The sum of the measures of the angles of a triangle is 180°.

Perimeter:

$$P = a + b + c \qquad (13.6.4.2)$$

- The perimeter is the sum of the lengths of the sides of the triangle.

Area:

$A = \frac{1}{2}bh, b =$ base , $h =$ height

- The area of a triangle is one-half the base times the height.

Example 13.6.4.1

The measures of two angles of a triangle are 55 and 82 degrees. Find the measure of the third angle.

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	Step 2. Identify what you are looking for.	the measure of the third angle in a triangle
Step 3. Name. Choose a variable to represent it.	Let $x =$ the measure of the angle.
Step 4. Translate.	
Write the appropriate formula and substitute.	$m\angle A + m\angle B + m\angle C = 180^\circ$
Step 5. Solve the equation.	$\begin{aligned} 55 + 82 + x &= 180 \\ 137 + x &= 180 \\ x &= 43 \end{aligned}$
Step 6. Check. $\begin{aligned} 55 + 82 + 43 &\stackrel{?}{=} 180 \\ 180 &= 180\checkmark \end{aligned}$	
Step 7. Answer the question.	The measure of the third angle is 43 degrees.

Try It 13.6.4.1

The measures of two angles of a triangle are 31 and 128 degrees. Find the measure of the third angle.

Answer

21 degrees

Try It 13.6.4.2

The measures of two angles of a triangle are 49 and 75 degrees. Find the measure of the third angle.

Answer

56 degrees

Example 13.6.4.2

The perimeter of a triangular garden is 24 feet. The lengths of two sides are four feet and nine feet. How long is the third side?

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	 P = 24 ft
Step 2. Identify what you are looking for.	length of the third side of a triangle
Step 3. Name. Choose a variable to represent it.	Let $c =$ the third side.
Step 4. Translate.	
Write the appropriate formula and substitute.	$\underbrace{P}\ = \underbrace{a}\ + \underbrace{b}\ + \underbrace{c}$
Substitute in the given information.	$24 \text{ ft} = 4 \text{ ft} + 9 \text{ ft} + c$
Step 5. Solve the equation.	$24 = 13 + c$ $11 = c$
Step 6. Check. $P = a+b+c$ $24 \stackrel{?}{=} 4+9+11$ $24 = 24\checkmark$	
Step 7. Answer the question.	The third side is 11 feet long.

Try It 13.6.4.3

The perimeter of a triangular garden is 48 feet. The lengths of two sides are 18 feet and 22 feet. How long is the third side?

Answer

8 feet

Try It 13.6.4.4

The lengths of two sides of a triangular window are seven feet and five feet. The perimeter is 18 feet. How long is the third side?

Answer

6 feet

Example 13.6.4.3

The area of a triangular church window is 90 square meters. The base of the window is 15 meters. What is the window's height?

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	 Area $= 90m^2$
Step 2. Identify what you are looking for.	height of a triangle
Step 3. Name. Choose a variable to represent it.	Let $h =$ the height.
Step 4. Translate.	
Write the appropriate formula.	$A = \frac{1}{2} \cdot b \cdot h$
Substitute in the given information.	$90\ \text{m}^2 = \frac{1}{2} \cdot 15\ \text{m} \cdot h$
Step 5. Solve the equation.	$90 = \frac{15}{2}h$ $12 = h$
Step 6. Check. $A = \frac{1}{2}bh$ $90 \stackrel{?}{=} \frac{1}{2} \cdot 15 \cdot 12$ $90 = 90\checkmark$	
Step 7. Answer the question.	The height of the triangle is 12 meters.

? Try It 13.6.4.5

The area of a triangular painting is 126 square inches. The base is 18 inches. What is the height?

Answer

14 inches

? Try It 13.6.4.6

A triangular tent door has area 15 square feet. The height is five feet. What is the base?

Answer

6 feet

The triangle properties we used so far apply to all triangles. Now we will look at one specific type of triangle—a right triangle. A **right triangle** has one 90° angle, which we usually mark with a small square in the corner.

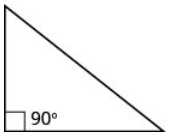

Figure 13.6.4.3

Definition: RIGHT TRIANGLE

A **right triangle** has one 90° angle, which is often marked with a square at the vertex.

Example 13.6.4.4

One angle of a right triangle measures 28°. What is the measure of the third angle?

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	Step 2. Identify what you are looking for.	the measure of an angle
Step 3. Name. Choose a variable to represent it.	Let $x =$ the measure of an angle.
Step 4. Translate.	$m\angle A + m\angle B + m\angle C = 180$
Write the appropriate formula and substitute.	$x + 90 + 28 = 180$
Step 5. Solve the equation.	$x = 62$
Step 6. Check. $180 \stackrel{?}{=} 90 + 28 + 62$ $180 = 180\checkmark$	
Step 7. Answer the question.	The measure of the third angle is 62°.

Try It 13.6.4.7

One angle of a right triangle measures 56°. What is the measure of the other small angle?

Answer

34°

Try It 13.6.4.8

One angle of a right triangle measures 45°. What is the measure of the other small angle?

Answer

45°

In the examples we have seen so far, we could draw a figure and label it directly after reading the problem. In the next example, we will have to define one angle in terms of another. We will wait to draw the figure until we write expressions for all the angles we are looking for.

Example 13.6.4.5

The measure of one angle of a right triangle is 20 degrees more than the measure of the smallest angle. Find the measures of all three angles.

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the measures of all three angles
Step 3. Name. Choose a variable to represent it.	Let $a = 1^{st}$ angle. $a + 20 = 2^{nd}$ angle $90 = 3^{rd}$ angle (the right angle)
Draw the figure and label it with the given information	Step 4. Translate	$m\angle A + m\angle B + m\angle C = 180$
Write the appropriate formula. Substitute into the formula.	$a + (a + 20) + 90 = 180$
Step 5. Solve the equation.	$2a + 110 = 180$ $2a = 70$ $a = 35$ first angle $a + 20$ second angle $35 + 20 = 55$ And the third angle is 90.
Step 6. Check. $35 + 55 + 90 \stackrel{?}{=} 180$ $180 = 180$✓	
Step 7. Answer the question.	The three angles measure 35°, 55°, and 90°.

? Try It 13.6.4.9

The measure of one angle of a right triangle is 50° more than the measure of the smallest angle. Find the measures of all three angles.

Answer

20°,70°,90°

? Try It 13.6.4.10

The measure of one angle of a right triangle is 30° more than the measure of the smallest angle. Find the measures of all three angles.

Answer

30°,60°,90°

Use the Pythagorean Theorem

We have learned how the measures of the angles of a triangle relate to each other. Now, we will learn how the lengths of the sides relate to each other. An important property that describes the relationship among the lengths of the three sides of a right triangle is

called the **Pythagorean Theorem**. This theorem has been used around the world since ancient times. It is named after the Greek philosopher and mathematician, Pythagoras, who lived around 500 BC.

Before we state the Pythagorean Theorem, we need to introduce some terms for the sides of a triangle. Remember that a right triangle has a 90° angle, marked with a small square in the corner. The side of the triangle opposite the 90°90° angle is called the *hypotenuse* and each of the other sides are called *legs*.

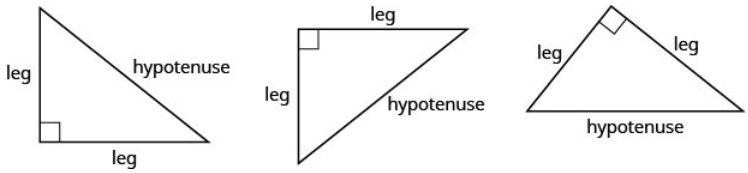

Figure 13.6.4.4

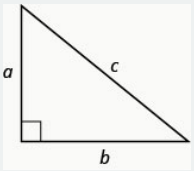
The Pythagorean Theorem tells how the lengths of the three sides of a right triangle relate to each other. It states that in any right triangle, the sum of the squares of the lengths of the two legs equals the square of the length of the hypotenuse. In symbols we say: in any right triangle, $a^2+b^2=c^2$, where a and b are the lengths of the legs and cc is the length of the hypotenuse.

Writing the formula in every exercise and saying it aloud as you write it, may help you remember the Pythagorean Theorem.

THE PYTHAGOREAN THEOREM

In any right triangle, where a and b are the lengths of the legs, c is the length of the hypotenuse.



Then

$$a^2+b^2=c^2 \tag{13.6.4.3}$$

To solve exercises that use the Pythagorean Theorem (Equation 13.6.4.3), we will need to find square roots. We have used the notation $\sqrt{m}$ and the definition:

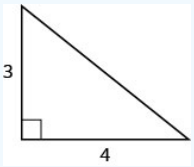
If $m=n^2$, then $\sqrt{m}=n$, for $n\geq 0$.

For example, we found that $\sqrt{25}$ is 5 because $25=5^2$.

Because the Pythagorean Theorem contains variables that are squared, to solve for the length of a side in a right triangle, we will have to use square roots.

Example 13.6.4.6

Use the Pythagorean Theorem to find the length of the hypotenuse shown below.



Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the length of the hypotenuse of the triangle

Step 3. Name. Choose a variable to represent it. Label side c on the figure.	Let c = the length of the hypotenuse. Step 4. Translate.	
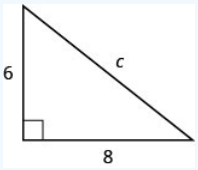
Write the appropriate formula.	$a^2+b^2=c^2$
Substitute.	$3^2+4^2=c^2$
Step 5. Solve the equation.	$9+16=c^2$
Simplify.	$25=c^2$
Use the definition of square root.	$\sqrt{25}=c$
Simplify.	$5=c$
Step 6. Check. $3^2+4^2 \stackrel{?}{=} 5^2$ $9+16 \stackrel{?}{=} 25$ $25=25$ ✓	
Step 7. Answer the question.	The length of the hypotenuse is 5.

Try It 13.6.4.11

Use the Pythagorean Theorem to find the length of the hypotenuse in the triangle shown below.

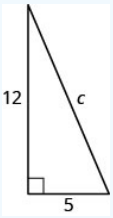


Answer

c=10

Try It 13.6.4.12

Use the Pythagorean Theorem to find the length of the hypotenuse in the triangle shown below.

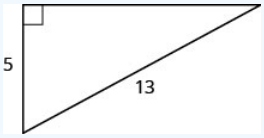


Answer

c=13

Example 13.6.4.7

Use the Pythagorean Theorem to find the length of the leg shown below.



Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the length of the leg of the triangle
Step 3. Name. Choose a variable to represent it.	Let $b =$ the leg of the triangle.
Label side b.	Step 4. Translate	
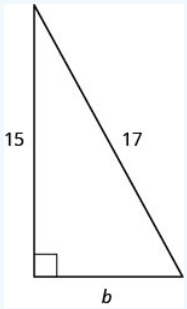
Write the appropriate formula.	$a^2 + b^2 = c^2$
Substitute.	$5^2 + b^2 = 13^2$
Step 5. Solve the equation.	$25 + b^2 = 169$
Isolate the variable term.	$b^2 = 144$
Use the definition of square root.	$b = \sqrt{144}$
Simplify.	$b = 12$
Step 6. Check. $5^2 + 12^2 \stackrel{?}{=} 13^2$ $25 + 144 \stackrel{?}{=} 169$ $169 = 169$ ✓	
Step 7. Answer the question.	The length of the leg is 12.

Try It 13.6.4.13

Use the Pythagorean Theorem to find the length of the leg in the triangle shown below.

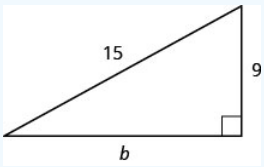


Answer

8

Try It 13.6.4.14

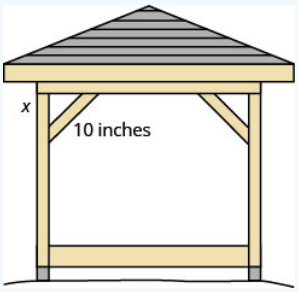
Use the Pythagorean Theorem to find the length of the leg in the triangle shown below.



Answer

12

Example 13.6.4.8



Kelvin is building a gazebo and wants to brace each corner by placing a 10″ piece of wood diagonally as shown above.

If he fastens the wood so that the ends of the brace are the same distance from the corner, what is the length of the legs of the right triangle formed? Approximate to the nearest tenth of an inch.

Solution

Step 1. Read the problem.

Step 2. Identify what we are looking for.	the distance from the corner that the bracket should be attached
Step 3. Name. Choose a variable to represent it.	Let x = distance from the corner.
Step 4. Translate Write the appropriate formula and substitute.	$a^2+b^2=c^2$ $x^2+x^2=10^2$
Step 5. Solve the equation.	
	$2x^2=100$
Isolate the variable.	$x^2=50$
Simplify. Approximate to the nearest tenth.	$x\approx 7.1$

Step 6. Check.
$a^2+b^2=c^2$
$(7.1)^2+(7.1)^2\approx 10^2$ Yes.

Step 7. Answer the question.	Kelven should fasten each piece of wood approximately 7.1'' from the corner.

? Try It 13.6.4.15

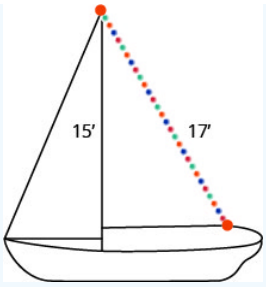
John puts the base of a 13-foot ladder five feet from the wall of his house as shown below. How far up the wall does the ladder reach?

Answer

12 feet

? Try It 13.6.4.16

Randy wants to attach a 17 foot string of lights to the top of the 15 foot mast of his sailboat, as shown below. How far from the base of the mast should he attach the end of the light string?

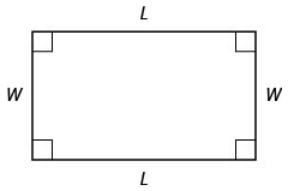


Answer

8 feet

Solve Applications Using Rectangle Properties

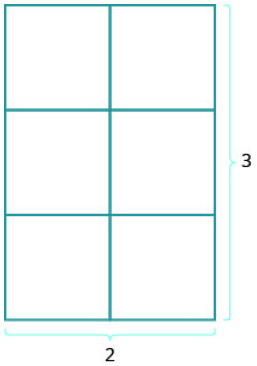
You may already be familiar with the properties of rectangles. Rectangles have four sides and four right (90°) angles. The opposite sides of a **rectangle** are the same length. We refer to one side of the rectangle as the length, L, and its adjacent side as the width, W.



The distance around this rectangle is $L+W+L+W$, or $2L+2W$. This is the **perimeter**, P, of the rectangle.

$$P=2L+2W \tag{13.6.4.4}$$

What about the **area** of a rectangle? Imagine a rectangular rug that is 2-feet long by 3-feet wide. Its area is 6 square feet. There are six squares in the figure.



$$\begin{aligned} A&=6\\ A&=2\cdot 3\\ A&=L\cdot W \end{aligned} \tag{13.6.4.5}$$

The area is the length times the width. The formula for the area of a rectangle is

$$A=LW. \tag{13.6.4.6}$$

PROPERTIES OF RECTANGLES

Rectangles have four sides and four right (90°) angles.

The lengths of opposite sides are equal.

The perimeter of a rectangle is the sum of twice the length and twice the width.

$$P = 2L + 2W \tag{13.6.4.7}$$

The area of a rectangle is the product of the length and the width.

$$A = L \cdot W \tag{13.6.4.8}$$

Example 13.6.4.9

The length of a rectangle is 32 meters and the width is 20 meters. What is the perimeter?

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	Step 2. Identify what you are looking for.	the perimeter of a rectangle
Step 3. Name. Choose a variable to represent it.	Let $P =$ the perimeter.
Step 4. Translate.	
Write the appropriate formula.	$P = 2L + 2W$
Substitute.	$P = 2(32\text{ m}) + 2(20\text{ m})$
Step 5. Solve the equation.	$P = 64 + 40$ $P = 104$
Step 6. Check. $P \stackrel{?}{=} 104$ $20 + 32 + 20 + 32 \stackrel{?}{=} 104$ $104 = 104\checkmark$	
Step 7. Answer the question.	The perimeter of the rectangle is 104 meters.

Try It 13.6.4.17

The length of a rectangle is 120 yards and the width is 50 yards. What is the perimeter?

Answer

340 yards

Try It 13.6.4.18

The length of a rectangle is 62 feet and the width is 48 feet. What is the perimeter?

Answer

220 feet

Example 13.6.4.10

The area of a rectangular room is 168 square feet. The length is 14 feet. What is the width?

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	Step 2. Identify what you are looking for.	the width of a rectangular room
Step 3. Name. Choose a variable to represent it.	Let $W =$ the width.
Step 4. Translate.	
Write the appropriate formula.	$A = LW$
Substitute.	$168 = 14W$
Step 5. Solve the equation.	$\frac{168}{14} = \frac{14W}{14}$ $12 = W$
Step 6. Check.  $A = LW$ $168 \stackrel{?}{=} 14 \cdot 12$ $168 = 168$✓	
Step 7. Answer the question.	The width of the room is 12 feet.

Try It 13.6.4.19

The area of a rectangle is 598 square feet. The length is 23 feet. What is the width?

Answer

26 feet

Try It 13.6.4.20

The width of a rectangle is 21 meters. The area is 609 square meters. What is the length?

Answer

29 meters

Example 13.6.4.11

Find the length of a rectangle with perimeter 50 inches and width 10 inches.

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	Step 2. Identify what you are looking for.	the length of the rectangle
Step 3. Name. Choose a variable to represent it.	Let $L =$ the length.
Step 4. Translate.	
Write the appropriate formula.	$P = 2L + 2W$
Substitute.	$50 = 2L + 2(10)$
Step 5. Solve the equation.	$50 - 20 = 2L + 20 - 20$ $30 = 2L$ $\frac{30}{2} = \frac{2L}{2}$ $15 = L$
Step 6. Check.  $P = 50$ $15 + 10 + 15 + 10 \stackrel{?}{=} 50$ $50 = 50\checkmark$	
Step 7. Answer the question.	The length is 15 inches.

Try It 13.6.4.21

Find the length of a rectangle with: perimeter 80 and width 25.

Answer

15

Try It 13.6.4.22

Find the length of a rectangle with: perimeter 30 and width 6.

Answer

9

We have solved problems where either the length or width was given, along with the perimeter or area; now we will learn how to solve problems in which the width is defined in terms of the length. We will wait to draw the figure until we write an expression for the width so that we can label one side with that expression.

Example 13.6.4.12

The width of a rectangle is two feet less than the length. The perimeter is 52 feet. Find the length and width.

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the length and width of a rectangle
Step 3. Name. Choose a variable to represent it. Since the width is defined in terms of the length, we let $L =$ length. The width is two feet less than the length, so we let $L-2$ width.	 $P = 52$ ft
Step 4. Translate.	
Write the appropriate formula. The formula for the perimeter of a rectangle relates all the information.	$P = 2L + 2W$
Substitute in the given information.	$52 = 2L + 2(L-2)$
Step 5. Solve the equation.	$52 = 2L + 2L - 4$
Combine like terms.	$52 = 4L - 4$
Add 4 to each side.	$56 = 4L$
Divide by 4.	$\frac{56}{4} = \frac{4L}{4}$ $14 = L$ The length is 14 feet.
Now we need to find the width.	The width is $L-2$. $L-2$ $14-2$ 12 The width is 12 feet.
Step 6. Check. Since $14+12+14+12=52$, this works! 	
Step 7. Answer the question.	The length is 14 feet and the width is 12 feet.

Try It 13.6.4.23

The width of a rectangle is seven meters less than the length. The perimeter is 58 meters. Find the length and width.

Answer

18 meters, 11 meters

Try It 13.6.4.24

The length of a rectangle is eight feet more than the width. The perimeter is 60 feet. Find the length and width.

Answer

19 feet, 11 feet

Example 13.6.4.13

The length of a rectangle is four centimeters more than twice the width. The perimeter is 32 centimeters. Find the length and width.

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	the length and the width
Step 3. Name. Choose a variable to represent the width.	Let W = width
The length is four more than twice the width.	$2W + 4$ = length  P = 32 cm
Step 4. Translate	
Write the appropriate formula.	$P = 2L + 2W$
Substitute in the given information.	$32 = 2(2W + 4) + 2W$
Step 5. Solve the equation.	$32 = 4W + 8 + 2W$ $32 = 6W + 8$ $24 = 6W$ $4 = W$ (width) $2W + 4$ (length) $2(4) + 4$ 12 The length is 12 cm.

Step 6. Check.  $P = 2L + 2W$ $32 \stackrel{?}{=} 2 \cdot 12 + 2 \cdot 4$ $32 = 32\checkmark$	
Step 7. Answer the question.	The length is 12 cm and the width is 4 cm.

Try It 13.6.4.25

The length of a rectangle is eight more than twice the width. The perimeter is 64. Find the length and width.

Answer

24, 8

Try It 13.6.4.26

The width of a rectangle is six less than twice the length. The perimeter is 18. Find the length and width.

Answer

5, 4

Example 13.6.4.14

The perimeter of a rectangular swimming pool is 150 feet. The length is 15 feet more than the width. Find the length and width.

Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	 $P = 150$ ft
Step 2. Identify what you are looking for.	the length and the width of the pool
Step 3. Name. Choose a variable to represent the width. The length is 15 feet more than the width.	Let W = width $W + 15$ = length
Step 4. Translate	
Write the appropriate formula.	$P = 2L + 2W$
Substitute.	$150 = 2(W + 15) + 2W$

Step 5. Solve the equation.	$150 = 2W + 30 + 2W$ $150 = 4W + 30$ $120 = 4W$ $30 = W$ (the width of the pool) $W + 15$ (the length of the pool) $30 + 15$ 45
Step 6. Check. $P = 2L + 2W$ $150 \stackrel{?}{=} 2(45) + 2(30)$ $150 = 150\checkmark$	
Step 7. Answer the question.	The length of the pool is 45 feet and the width is 30 feet.

The perimeter of a rectangular swimming pool is 200 feet. The length is 40 feet more than the width. Find the length and width.

Answer

70 feet, 30 feet

? Try It 13.6.4.28

The length of a rectangular garden is 30 yards more than the width. The perimeter is 300 yards. Find the length and width.

Answer

90 yards, 60 yards

Key Concepts

- **Problem-Solving Strategy for Geometry Applications**
  1. **Read** the problem and make all the words and ideas are understood. Draw the figure and label it with the given information.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for by choosing a variable to represent it.
  4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
  5. **Solve** the equation using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.
- **Triangle Properties For △ABC**
  Angle measures:
  - $m\angle A + m\angle B + m\angle C = 180$

  Perimeter:
  - $P = a + b + c$

  Area:
  - $A = \frac{1}{2}bh$, b=base,h=height

  A right triangle has one 90° angle.
- **The Pythagorean Theorem** In any right triangle, $a^2 + b^2 = c^2$ where c is the length of the hypotenuse and a and b are the lengths of the legs.

- **Properties of Rectangles**
  - Rectangles have four sides and four right (90°) angles.
  - The lengths of opposite sides are equal.
  - The perimeter of a rectangle is the sum of twice the length and twice the width: $P = 2L + 2W$.
  - The area of a rectangle is the length times the width: $A = LW$.

13.6.4E: Exercises

Practice Makes Perfect

Solving Applications Using Triangle Properties

In the following exercises, solve using triangle properties.

Exercise 13.6.4E.1

The measures of two angles of a triangle are 26 and 98 degrees. Find the measure of the third angle.

Answer

56 degrees

Exercise 13.6.4E.2

The measures of two angles of a triangle are 61 and 84 degrees. Find the measure of the third angle.

Exercise 13.6.4E.3

The measures of two angles of a triangle are 105 and 31 degrees. Find the measure of the third angle.

Answer

44 degrees

Exercise 13.6.4E.4

The measures of two angles of a triangle are 47 and 72 degrees. Find the measure of the third angle.

Exercise 13.6.4E.5

The perimeter of a triangular pool is 36 yards. The lengths of two sides are 10 yards and 15 yards. How long is the third side?

Answer

11 feet

Exercise 13.6.4E.6

A triangular courtyard has perimeter 120 meters. The lengths of two sides are 30 meters and 50 meters. How long is the third side?

Exercise 13.6.4E.7

If a triangle has sides 6 feet and 9 feet and the perimeter is 23 feet, how long is the third side?

Answer

8 feet

Exercise 13.6.4E.8

If a triangle has sides 14 centimeters and 18 centimeters and the perimeter is 49 centimeters, how long is the third side?

Exercise 13.6.4E.9

A triangular flag has base one foot and height 1.5 foot. What is its area?

Answer

0.75 sq. ft.

Exercise 13.6.4E.10

A triangular window has base eight feet and height six feet. What is its area?

Exercise 13.6.4E.11

What is the base of a triangle with area 207 square inches and height 18 inches?

Answer

23 inches

Exercise 13.6.4E.12

What is the height of a triangle with area 893 square inches and base 38 inches?

Exercise 13.6.4E.13

One angle of a right triangle measures 33 degrees. What is the measure of the other small angle?

Answer

57

Exercise 13.6.4E.14

One angle of a right triangle measures 51 degrees. What is the measure of the other small angle?

Exercise 13.6.4E.15

One angle of a right triangle measures 22.5 degrees. What is the measure of the other small angle?

Answer

67.5

Exercise 13.6.4E.16

One angle of a right triangle measures 36.5 degrees. What is the measure of the other small angle?

Exercise 13.6.4E.17

The perimeter of a triangle is 39 feet. One side of the triangle is one foot longer than the second side. The third side is two feet longer than the second side. Find the length of each side.

Answer

13 ft., 12 ft., 14 ft.

Exercise 13.6.4E.18

The perimeter of a triangle is 35 feet. One side of the triangle is five feet longer than the second side. The third side is three feet longer than the second side. Find the length of each side.

Exercise 13.6.4E.19

One side of a triangle is twice the shortest side. The third side is five feet more than the shortest side. The perimeter is 17 feet. Find the lengths of all three sides.

Answer

3 ft., 6 ft., 8 ft.

Exercise 13.6.4E.20

One side of a triangle is three times the shortest side. The third side is three feet more than the shortest side. The perimeter is 13 feet. Find the lengths of all three sides.

Exercise 13.6.4E.21

The two smaller angles of a right triangle have equal measures. Find the measures of all three angles.

Answer

$45^\circ, 45^\circ, 90^\circ$

Exercise 13.6.4E.22

The measure of the smallest angle of a right triangle is 20° less than the measure of the next larger angle. Find the measures of all three angles.

Exercise 13.6.4E.23

The angles in a triangle are such that one angle is twice the smallest angle, while the third angle is three times as large as the smallest angle. Find the measures of all three angles.

Answer

$30^\circ, 60^\circ, 90^\circ$

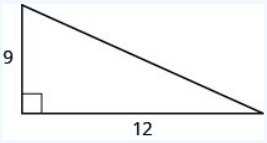
Exercise 13.6.4E.24

The angles in a triangle are such that one angle is 20° more than the smallest angle, while the third angle is three times as large as the smallest angle. Find the measures of all three angles.

Use the Pythagorean Theorem

In the following exercises, use the Pythagorean Theorem to find the length of the hypotenuse.

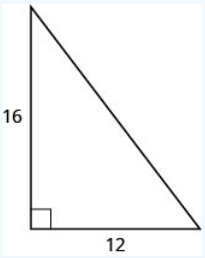
Exercise 13.6.4E.25



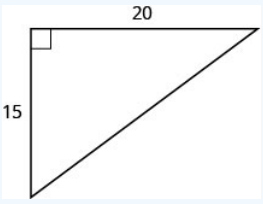
Answer

15

Exercise 13.6.4E.26



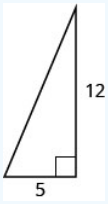
Exercise 13.6.4E.27



Answer

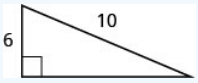
25

Exercise 13.6.4E.28



In the following exercises, use the Pythagorean Theorem to find the length of the leg. Round to the nearest tenth, if necessary.

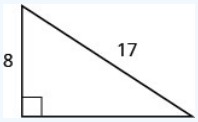
Exercise 13.6.4E.29



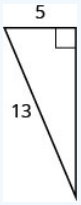
Answer

8

Exercise 13.6.4E.30



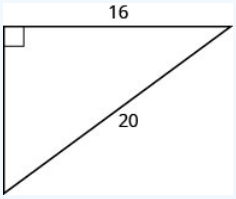
Exercise 13.6.4E.31



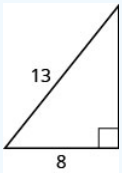
Answer

12

Exercise 13.6.4E.32



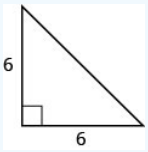
Exercise 13.6.4E.33



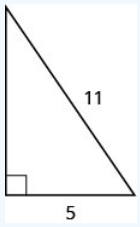
Answer

10.2

Exercise 13.6.4E.34



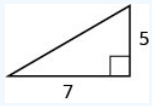
Exercise 13.6.4E.35



Answer

9.8

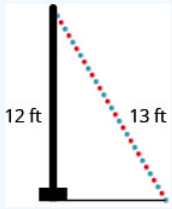
Exercise 13.6.4E.36



In the following exercises, solve using the Pythagorean Theorem. Approximate to the nearest tenth, if necessary.

Exercise 13.6.4E.37

A 13-foot string of lights will be attached to the top of a 12-foot pole for a holiday display, as shown below. How far from the base of the pole should the end of the string of lights be anchored?



Answer

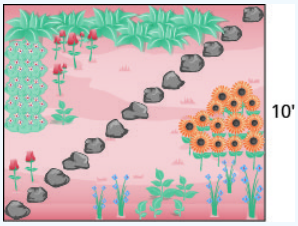
5 feet

Exercise 13.6.4E.38

Pam wants to put a banner across her garage door, as shown below, to congratulate her son for his college graduation. The garage door is 12 feet high and 16 feet wide. How long should the banner be to fit the garage door?

Exercise 13.6.4E. 39

Chi is planning to put a path of paving stones through her flower garden, as shown below. The flower garden is a square with side 10 feet. What will the length of the path be?



Answer

14.1 feet

Exercise 13.6.4E. 40

Brian borrowed a 20 foot extension ladder to use when he paints his house. If he sets the base of the ladder 6 feet from the house, as shown below, how far up will the top of the ladder reach?

Solve Applications Using Rectangle Properties

In the following exercises, solve using rectangle properties.

Exercise 13.6.4E. 41

The length of a rectangle is 85 feet and the width is 45 feet. What is the perimeter?

Answer

260 feet

Exercise 13.6.4E. 42

The length of a rectangle is 26 inches and the width is 58 inches. What is the perimeter?

Exercise 13.6.4E. 43

A rectangular room is 15 feet wide by 14 feet long. What is its perimeter?

Answer

58 feet

Exercise 13.6.4E.44

A driveway is in the shape of a rectangle 20 feet wide by 35 feet long. What is its perimeter?

Exercise 13.6.4E.45

The area of a rectangle is 414 square meters. The length is 18 meters. What is the width?

Answer

23 meters

Exercise 13.6.4E.46

The area of a rectangle is 782 square centimeters. The width is 17 centimeters. What is the length?

Exercise 13.6.4E.47

The width of a rectangular window is 24 inches. The area is 624 square inches. What is the length?

Answer

26 inches

Exercise 13.6.4E.48

The length of a rectangular poster is 28 inches. The area is 1316 square inches. What is the width?

Exercise 13.6.4E.49

Find the length of a rectangle with perimeter 124 and width 38.

Answer

24

Exercise 13.6.4E.50

Find the width of a rectangle with perimeter 92 and length 19.

Exercise 13.6.4E.51

Find the width of a rectangle with perimeter 16.2 and length 3.2.

Answer

4.9

Exercise 13.6.4E.52

Find the length of a rectangle with perimeter 20.2 and width 7.8.

Exercise 13.6.4E.53

The length of a rectangle is nine inches more than the width. The perimeter is 46 inches. Find the length and the width.

Answer

16 in., 7 in.

Exercise 13.6.4E.54

The width of a rectangle is eight inches more than the length. The perimeter is 52 inches. Find the length and the width.

Exercise 13.6.4E.55

The perimeter of a rectangle is 58 meters. The width of the rectangle is five meters less than the length. Find the length and the width of the rectangle.

Answer

17 m, 12 m

Exercise 13.6.4E.56

The perimeter of a rectangle is 62 feet. The width is seven feet less than the length. Find the length and the width.

Exercise 13.6.4E.57

The width of the rectangle is 0.7 meters less than the length. The perimeter of a rectangle is 52.6 meters. Find the dimensions of the rectangle.

Answer

13.5 m length, 12.8 m width

Exercise 13.6.4E.58

The length of the rectangle is 1.1 meters less than the width. The perimeter of a rectangle is 49.4 meters. Find the dimensions of the rectangle.

Exercise 13.6.4E.59

The perimeter of a rectangle is 150 feet. The length of the rectangle is twice the width. Find the length and width of the rectangle.

Answer

50 ft., 25 ft.

Exercise 13.6.4E.60

The length of a rectangle is three times the width. The perimeter of the rectangle is 72 feet. Find the length and width of the rectangle.

Exercise 13.6.4E.61

The length of a rectangle is three meters less than twice the width. The perimeter of the rectangle is 36 meters. Find the dimensions of the rectangle.

Answer

7 m width, 11 m length

Exercise 13.6.4E.62

The length of a rectangle is five inches more than twice the width. The perimeter is 34 inches. Find the length and width.

Exercise 13.6.4E.63

The perimeter of a rectangular field is 560 yards. The length is 40 yards more than the width. Find the length and width of the field.

Answer

160 yd., 120 yd.

Exercise 13.6.4E.64

The perimeter of a rectangular atrium is 160 feet. The length is 16 feet more than the width. Find the length and width of the atrium.

Exercise 13.6.4E.65

A rectangular parking lot has perimeter 250 feet. The length is five feet more than twice the width. Find the length and width of the parking lot.

Answer

85 ft., 40 ft.

Exercise 13.6.4E.66

A rectangular rug has perimeter 240 inches. The length is 12 inches more than twice the width. Find the length and width of the rug.

Everyday Math

Exercise 13.6.4E.67

Christa wants to put a fence around her triangular flowerbed. The sides of the flowerbed are six feet, eight feet and 10 feet. How many feet of fencing will she need to enclose her flowerbed?

Answer

24 feet

Exercise 13.6.4E.68

Jose just removed the children's playset from his back yard to make room for a rectangular garden. He wants to put a fence around the garden to keep out the dog. He has a 50 foot roll of fence in his garage that he plans to use. To fit in the backyard, the width of the garden must be 10 feet. How long can he make the other length?

Writing Exercises

Exercise 13.6.4E.69

If you need to put tile on your kitchen floor, do you need to know the perimeter or the area of the kitchen? Explain your reasoning.

Answer

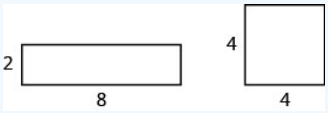
area; answers will vary

Exercise 13.6.4E.70

If you need to put a fence around your backyard, do you need to know the perimeter or the area of the backyard? Explain your reasoning.

Exercise 13.6.4E.71

Look at the two figures below.



1. Which figure looks like it has the larger area?
2. Which looks like it has the larger perimeter?
3. Now calculate the area and perimeter of each figure.
4. Which has the larger area?
5. Which has the larger perimeter?

Answer

1. Answers will vary.
2. Answers will vary.
3. Answers will vary.
4. The areas are the same.
5. The 2x8 rectangle has a larger perimeter than the 4x4 square.

Exercise 13.6.4E.72

Write a geometry word problem that relates to your life experience, then solve it and explain all your steps.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve applications using triangle properties.			
use the Pythagorean Theorem.			
solve applications using rectangle properties.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 13.6.4E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

13.6.5: Solve Uniform Motion Applications

Learning Objectives

By the end of this section, you will be able to:

- Solve uniform motion applications

Note

Before you get started, take this readiness quiz.

1. Find the distance traveled by a car going 70 miles per hour for 3 hours.
   If you missed this problem, review Exercise 2.6.1.
2. Solve $x+1.2(x-10)=98$.
   If you missed this problem, review Exercise 2.4.7.
3. Convert 90 minutes to hours.
   If you missed this problem, review Exercise 1.11.1.

Solve Uniform Motion Applications

When planning a road trip, it often helps to know how long it will take to reach the destination or how far to travel each day. We would use the distance, rate, and time formula, D=rt, which we have already seen.

In this section, we will use this formula in situations that require a little more algebra to solve than the ones we saw earlier. Generally, we will be looking at comparing two scenarios, such as two vehicles traveling at different rates or in opposite directions. When the speed of each vehicle is constant, we call applications like this *uniform motion problems*.

Our problem-solving strategies will still apply here, but we will add to the first step. The first step will include drawing a diagram that shows what is happening in the example. Drawing the diagram helps us understand what is happening so that we will write an appropriate equation. Then we will make a table to organize the information, like we did for the money applications.

The steps are listed here for easy reference:

USE A PROBLEM-SOLVING STRATEGY IN DISTANCE, RATE, AND TIME APPLICATIONS.

1. **Read** the problem. Make sure all the words and ideas are understood.
   - Draw a diagram to illustrate what it happening.
   - Create a table to organize the information.
   - Label the columns rate, time, distance.
   - List the two scenarios.
   - Write in the information you know.

	Rate	•	Time	=	Distance

2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
   - Complete the chart.
   - Use variable expressions to represent that quantity in each row.
   - Multiply the rate times the time to get the distance.
4. **Translate** into an equation.
   - Restate the problem in one sentence with all the important information.
   - Then, translate the sentence into an equation.
5. **Solve** the equation using good algebra techniques.

6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Example 13.6.5.1

An express train and a local train leave Pittsburgh to travel to Washington, D.C. The express train can make the trip in 4 hours and the local train takes 5 hours for the trip. The speed of the express train is 12 miles per hour faster than the speed of the local train. Find the speed of both trains.

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.

Draw a diagram to illustrate what it happening. Shown below is a sketch of what is happening in the example.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
Express			4		
Local			5		

Create a table to organize the information. Label the columns “Rate,” “Time,” and “Distance.” List the two scenarios. Write in the information you know.

Step 2. Identify what we are looking for.

We are asked to find the speed of both trains. Notice that the distance formula uses the word “rate,” but it is more common to use “speed” when we talk about vehicles in everyday English.

Step 3. Name what we are looking for. Choose a variable to represent that quantity.

Complete the chart Use variable expressions to represent that quantity in each row. We are looking for the speed of the trains. Let’s let r represent the speed of the local train. Since the speed of the express train is 12 mph faster, we represent that as r+12.

$$\begin{aligned} r &= \text{speed of the local train} \\ r+12 &= \text{speed of the express train} \end{aligned}$$

Fill in the speeds into the chart.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
Express	$r+12$		4		
Local	r		5		

Multiply the rate times the time to get the distance.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
Express	$r+12$		4		$4(r+12)$
Local	r		5		$5r$

Step 4. Translate into an equation.

Restate the problem in one sentence with all the important information. Then, translate the sentence into an equation.

	distance traveled by express train	=	distance traveled by local train
Translate to an equation.	$4(r+12)$	=	$5r$

- The equation to model this situation will come from the relation between the distances. Look at the diagram we drew above. How is the distance traveled by the express train related to the distance traveled by the local train?
- Since both trains leave from Pittsburgh and travel to Washington, D.C. they travel the same distance. So we write:

Step 5. Solve the equation using good algebra techniques.

Now solve this equation.	$4(r+12)=5r$ $4r+48=5r$ $48=r$ So the speed of the local train is 48 mph.
Find the speed of the express train.	$r+12$ $48+12$ 60 he speed of the express train is 60 mph.

Step 6. Check the answer in the problem and make sure it makes sense. \[\begin{array}{ll}{\text { express train }} & {60 \mathrm{mph}(4 \text { hours })=240 \mathrm{miles}} \\ {\text { local train }} & {48 \mathrm{mph}(5 \text { hours })=240 \mathrm{miles}} \checkmark \end{array}\]

Step 7. Answer the question with a complete sentence.

The speed of the local train is 48 mph and the speed of the express train is 60 mph.

Try It 13.6.5.2

Wayne and Dennis like to ride the bike path from Riverside Park to the beach. Dennis's speed is seven miles per hour faster than Wayne's speed, so it takes Wayne 2 hours to ride to the beach while it takes Dennis 1.5 hours for the ride. Find the speed of both bikers.

Answer

Wayne 21 mph, Dennis 28 mph

Try It 13.6.5.3

Jeromy can drive from his house in Cleveland to his college in Chicago in 4.5 hours. It takes his mother 6 hours to make the same drive. Jeromy drives 20 miles per hour faster than his mother. Find Jeromy's speed and his mother's speed.

Answer

Jeromy 80 mph, mother 60 mph

In Exercise 13.6.5.4 the last example, we had two trains traveling the same distance. The diagram and the chart helped us write the equation we solved. Let's see how this works in another case.

Example 13.6.5.4

Christopher and his parents live 115 miles apart. They met at a restaurant between their homes to celebrate his mother's birthday. Christopher drove 1.5 hours while his parents drove 1 hour to get to the restaurant. Christopher's average speed was 10 miles per hour faster than his parents' average speed. What were the average speeds of Christopher and of his parents as they drove to the restaurant?

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.

Draw a diagram to illustrate what it happening. Below shows a sketch of what is happening in the example.

Create a table to organize the information.

Label the columns rate, time, distance.

List the two scenarios.

Write in the information you know.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
Christopher			1.5		
Parents			1		
					115

Step 2. Identify what we are looking for.

We are asked to find the average speeds of Christopher and his parents.

Step 3. Name what we are looking for. Choose a variable to represent that quantity.

Complete the chart.

Use variable expressions to represent that quantity in each row.

We are looking for their average speeds. Let's let r represent the average speed of the parents. Since the Christopher's speed is 10 mph faster, we represent that as r+10.

Fill in the speeds into the chart.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
Christopher	$r+10$		1.5		$1.5(r+10)$
Parents	r		1		r
					115

Multiply the rate times the time to get the distance.

Step 4. Translate into an equation.

Restate the problem in one sentence with all the important information. Then, translate the sentence into an equation. Again, we need to identify a relationship between the distances in order to write an equation. Look at the diagram we created above and notice the relationship between the distance Christopher traveled and the distance his parents traveled.

The distance Christopher travelled plus the distance his parents travel must add up to 115 miles. So we write:

	distance traveled by Christopher	+	distance traveled by his parents	= 115
Translate to an equation.	$1.5(r+10)$	+	r	= 115

Step 5. Solve the equation using good algebra techniques.

	$1.5(r+10)+r=115$
	$1.5r+15+r=115$
Now solve this equation.	$2.5r+15=115$
	$2.5r=100$
	$r=40$
	so the parents' speed was 40 mph.
	$r+10$
Christopher's speed is r + 10	$40+10$
	50
	Christopher's speed was 50 mph.

Step 6. Check the answer in the problem and make sure it makes sense.

Christopher drove	50 mph (1.5 hours)	=	75 miles
His parents drove	40 mph (1 hour)	=	40 miles
			115 miles

Step 7. Answer the question with a complete sentence.

Christopher's speed was 50 mph.
His parents' speed was 40 mph.

Try It 13.6.5.5

Carina is driving from her home in Anaheim to Berkeley on the same day her brother is driving from Berkeley to Anaheim, so they decide to meet for lunch along the way in Buttonwillow. The distance from Anaheim to Berkeley is 410 miles. It takes Carina 3 hours to get to Buttonwillow, while her brother drives 4 hours to get there. The average speed Carina's brother drove was 15 miles per hour faster than Carina's average speed. Find Carina's and her brother's average speeds.

Answer

Carina 50 mph, brother 65 mph

Try It 13.6.5.6

Ashley goes to college in Minneapolis, 234 miles from her home in Sioux Falls. She wants her parents to bring her more winter clothes, so they decide to meet at a restaurant on the road between Minneapolis and Sioux Falls. Ashley and her parents both drove 2 hours to the restaurant. Ashley's average speed was seven miles per hour faster than her parents' average speed. Find Ashley's and her parents' average speed.

Answer

parents 55 mph, Ashley 62 mph

As you read the next example, think about the relationship of the distances traveled. Which of the previous two examples is more similar to this situation?

Example 13.6.5.7

Two truck drivers leave a rest area on the interstate at the same time. One truck travels east and the other one travels west. The truck traveling west travels at 70 mph and the truck traveling east has an average speed of 60 mph. How long will they travel before they are 325 miles apart?

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.

Draw a diagram to illustrate what it happening.

Create a table to organize the information.

	Rate (mph)	• Time (hrs)	= Distance (miles)
West	70		
East	60		
			325

Step 2. Identify what we are looking for.

We are asked to find the amount of time the trucks will travel until they are 325 miles apart.

Step 3. Name what we are looking for. Choose a variable to represent that quantity.

We are looking for the time traveled. Both trucks will travel the same amount of time. Let's call the time t. Since their speeds are different, they will travel different distances. Complete the chart.

	Rate (mph)	• Time (hrs)	= Distance (miles)
West	70	t	$70t$
East	60	t	$60t$
			325

Step 4. Translate into an equation.

We need to find a relation between the distances in order to write an equation. Looking at the diagram, what is the relationship between the distance each of the trucks will travel? The distance traveled by the truck going west plus the distance traveled by the truck going east must add up to 325 miles. So we write:

	distance traveled by westbound truck	+	distance traveled by eastbound truck	= 32
Translate to an equation.	70t	+	60t	= 32

Step 5. Solve the equation using good algebra techniques.

$$\begin{aligned} \text{Now solve this equation.} \quad 70t+60t &= 325 \\ 130t &= 325 \\ t &= 2.5 \end{aligned} \tag{13.6.5.1}$$

Step 6. Check the answer in the problem and make sure it makes sense.

$$\begin{aligned} \text{Truck going West} \quad 70 \text{ mph } (2.5 \text{ hours}) &= 175 \text{ miles} \\ \text{Truck going East} \quad 60 \text{ mph } (2.5 \text{ hour}) &= \underline{150 \text{ miles}} \\ & \quad 325 \text{ miles} \end{aligned}$$

Step 7. Answer the question with a complete sentence. It will take the truck 2.5 hours to be 325 miles apart.

? Try It 13.6.5.8

Pierre and Monique leave their home in Portland at the same time. Pierre drives north on the turnpike at a speed of 75 miles per hour while Monique drives south at a speed of 68 miles per hour. How long will it take them to be 429 miles apart?

Answer

3 hours

Try It 13.6.5.9

Thanh and Nhat leave their office in Sacramento at the same time. Thanh drives north on I-5 at a speed of 72 miles per hour. Nhat drives south on I-5 at a speed of 76 miles per hour. How long will it take them to be 330 miles apart?

Answer

2.2 hours

MATCHING UNITS IN PROBLEMS

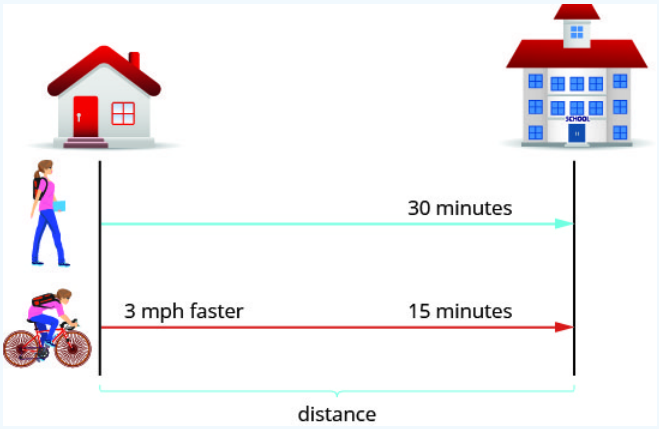
It is important to make sure the units match when we use the distance rate and time formula. For instance, if the rate is in miles per hour, then the time must be in hours.

Example 13.6.5.10

When Katie Mae walks to school, it takes her 30 minutes. If she rides her bike, it takes her 15 minutes. Her speed is three miles per hour faster when she rides her bike than when she walks. What are her walking speed and her speed riding her bike?

Solution

First, we draw a diagram that represents the situation to help us see what is happening.



We are asked to find her speed walking and riding her bike. Let's call her walking speed r. Since her biking speed is three miles per hour faster, we will call that speed r+3. We write the speeds in the chart.

The speed is in miles per hour, so we need to express the times in hours, too, in order for the units to be the same. Remember, one hour is 60 minutes. So:

$$\begin{aligned} 30 \text{ minutes is } \tfrac{30}{60} \text{ or } \tfrac{1}{2} \text{ hour} \\ 15 \text{ minutes is } \tfrac{15}{60} \text{ or } \tfrac{1}{4} \text{ hour} \end{aligned} \qquad (13.6.5.2)$$

Next, we multiply rate times time to fill in the distance column.

	Rate (mph)	• Time (hrs)	= Distance (miles)
Walk	r	$\frac{1}{2}$	$\frac{1}{2}r$
Bike	$r+3$	$\frac{1}{4}$	$\frac{1}{4}(r+3)$

The equation will come from the fact that the distance from Katie Mae's home to her school is the same whether she is walking or riding her bike.

So we say:

	distance walked = distance covered by bike
Translate into an equation.	$\frac{1}{2}r = \frac{1}{4}(r+3)$
Solve this equation.	$\frac{1}{2}r = \frac{1}{4}(r+3)$
Clear the fractions by multiplying by the LCD of all the fractions in the equation.	$8 \cdot \frac{1}{2}r = 8 \cdot \frac{1}{4}(r+3)$
Simplify.	$4r = 2(r+3)$ $4r = 2r + 6$ $2r = 6$ $r = 3$ mph (Katie Mae's walking speed) $r + 3$ biking speed $3 + 3$ 6 mph (Katie Mae's biking speed)
Let's check if this works. Walk 3 mph (0.5 hour) = 1.5 miles Bike 6 mph (0.25 hour) = 1.5 miles	
Yes, either way Katie Mae travels 1.5 miles to school.	Katie Mae's walking speed is 3 mph. Her speed riding her bike is 6 mph.

Try It 13.6.5.11

Suzy takes 50 minutes to hike uphill from the parking lot to the lookout tower. It takes her 30 minutes to hike back down to the parking lot. Her speed going downhill is 1.2 miles per hour faster than her speed going uphill. Find Suzy's uphill and downhill speeds.

Answer

uphill 1.8 mph, downhill three mph

Try It 13.6.5.12

Llewyn takes 45 minutes to drive his boat upstream from the dock to his favorite fishing spot. It takes him 30 minutes to drive the boat back downstream to the dock. The boat's speed going downstream is four miles per hour faster than its speed going upstream. Find the boat's upstream and downstream speeds.

Answer

upstream 8 mph, downstream 12 mph

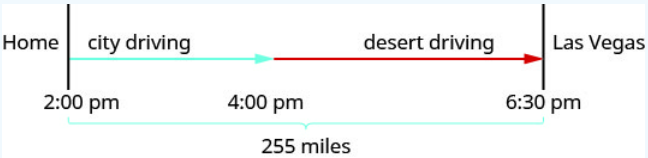
In the distance, rate, and time formula, time represents the actual amount of **elapsed time** (in hours, minutes, etc.). If a problem gives us starting and ending times as clock times, we must find the elapsed time in order to use the formula.

Example 13.6.5.13

Hamilton loves to travel to Las Vegas, 255 miles from his home in Orange County. On his last trip, he left his house at 2:00 pm. The first part of his trip was on congested city freeways. At 4:00 pm, the traffic cleared and he was able to drive through the desert at a speed 1.75 times as fast as when he drove in the congested area. He arrived in Las Vegas at 6:30 pm. How fast was he driving during each part of his trip?

Solution

A diagram will help us model this trip.



Next, we create a table to organize the information.

We know the total distance is 255 miles. We are looking for the rate of speed for each part of the trip. The rate in the desert is 1.75 times the rate in the city. If we let r= the rate in the city, then the rate in the desert is 1.75r.

The times here are given as clock times. Hamilton started from home at 2:00 pm and entered the desert at 4:30 pm. So he spent two hours driving the congested freeways in the city. Then he drove faster from 4:00 pm until 6:30 pm in the desert. So he drove 2.5 hours in the desert.

Now, we multiply the rates by the times.

	Rate (mph)	• Time (hrs)	= Distance (miles)
City	r	2	$2r$
Desert	$1.75r$	2.5	$2.5(1.75r)$
			255

By looking at the diagram below, we can see that the sum of the distance driven in the city and the distance driven in desert is 255 miles.

	distance driven in the city + distance driven in desert = 255
Translate into an equation.	$2r + 2.5(1.75r) = 255$
Solve this equation.	$2r + 2.5(1.75r) = 255$ $2r + 4.375r = 255$ $6.375r = 255$ $r = 40$ mph city $1.75r$ desert speed $1.75(40)$ 70 mph
Check. City 40 mph (2 hours) = 80 miles Desert 70 mph (2.5 hours) = 175 miles 255 miles	
	Hamilton drove 40 mph in the city and 70 mph in the desert.

? Try It 13.6.5.14

Cruz is training to compete in a triathlon. He left his house at 6:00 and ran until 7:30. Then he rode his bike until 9:45. He covered a total distance of 51 miles. His speed when biking was 1.6 times his speed when running. Find Cruz's biking and running speeds.

Answer

biking 16 mph, running 10 mph

? Try It 13.6.5.15

Phuong left home on his bicycle at 10:00. He rode on the flat street until 11:15, then rode uphill until 11:45. He rode a total of 31 miles. His speed riding uphill was 0.6 times his speed on the flat street. Find his speed biking uphill and on the flat street.

Answer

uphill 12 mph, flat street 20 mph

Key Concepts

- **Distance, Rate, and Time**
  - $D = rt$ where D = distance, r = rate, t = time
- **Problem-Solving Strategy—Distance, Rate, and Time Applications**
  1. **Read** the problem. Make sure all the words and ideas are understood.
     Draw a diagram to illustrate what it happening.
     Create a table to organize the information: Label the columns rate, time, distance. List the two scenarios. Write in the information you know.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose a variable to represent that quantity.
     Complete the chart.
     Use variable expressions to represent that quantity in each row.
     Multiply the rate times the time to get the distance.
  4. **Translate** into an equation.
     Restate the problem in one sentence with all the important information.
     Then, translate the sentence into an equation.
  5. **Solve** the equation using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.

13.6.5E: Exercises

Practice Makes Perfect

Solve Uniform Motion Applications

In the following exercises, solve.

Exercise 13.6.5E.1

Lilah is moving from Portland to Seattle. It takes her three hours to go by train. Mason leaves the train station in Portland and drives to the train station in Seattle with all Lilah's boxes in his car. It takes him 2.4 hours to get to Seattle, driving at 15 miles per hour faster than the speed of the train. Find Mason's speed and the speed of the train.

Answer

Mason 75 mph, train 60 mph

Exercise 13.6.5E.2

Kathy and Cheryl are walking in a fundraiser. Kathy completes the course in 4.8 hours and Cheryl completes the course in 8 hours. Kathy walks two miles per hour faster than Cheryl. Find Kathy's speed and Cheryl's speed.

Exercise 13.6.5E.3

Two busses go from Sacramento for San Diego. The express bus makes the trip in 6.8 hours and the local bus takes 10.2 hours for the trip. The speed of the express bus is 25 mph faster than the speed of the local bus. Find the speed of both busses.

Answer

express bus 75mph, local 50 mph

Exercise 13.6.5E.4

A commercial jet and a private airplane fly from Denver to Phoenix. It takes the commercial jet 1.1 hours for the flight, and it takes the private airplane 1.8 hours. The speed of the commercial jet is 210 miles per hour faster than the speed of the private airplane. Find the speed of both airplanes.

Exercise 13.6.5E.5

Saul drove his truck 3 hours from Dallas towards Kansas City and stopped at a truck stop to get dinner. At the truck stop he met Erwin, who had driven 4 hours from Kansas City towards Dallas. The distance between Dallas and Kansas City is 542 miles, and Erwin's speed was eight miles per hour slower than Saul's speed. Find the speed of the two truckers.

Answer

Saul 82 mph, Erwin 74 mph

Exercise 13.6.5E.6

Charlie and Violet met for lunch at a restaurant between Memphis and New Orleans. Charlie had left Memphis and drove 4.8 hours towards New Orleans. Violet had left New Orleans and drove 2 hours towards Memphis, at a speed 10 miles per hour faster than Charlie's speed. The distance between Memphis and New Orleans is 394 miles. Find the speed of the two drivers.

Exercise 13.6.5E.7

Sisters Helen and Anne live 332 miles apart. For Thanksgiving, they met at their other sister's house partway between their homes. Helen drove 3.2 hours and Anne drove 2.8 hours. Helen's average speed was four miles per hour faster than Anne's. Find Helen's average speed and Anne's average speed.

Answer

Helen 60 mph, Anne 56 mph

Exercise 13.6.5E.8

Ethan and Leo start riding their bikes at the opposite ends of a 65-mile bike path. After Ethan has ridden 1.5 hours and Leo has ridden 2 hours, they meet on the path. Ethan's speed is six miles per hour faster than Leo's speed. Find the speed of the two bikers.

Exercise 13.6.5E.9

Elvira and Aletheia live 3.1 miles apart on the same street. They are in a study group that meets at a coffee shop between their houses. It took Elvira half an hour and Aletheia two-thirds of an hour to walk to the coffee shop. Aletheia's speed is 0.6 miles per hour slower than Elvira's speed. Find both women's walking speeds.

Answer

Aletheia 2.4 mph, Elvira 3 mph

Exercise 13.6.5E.10

DaMarcus and Fabian live 23 miles apart and play soccer at a park between their homes. DaMarcus rode his bike for three-quarters of an hour and Fabian rode his bike for half an hour to get to the park. Fabian's speed was six miles per hour faster than DaMarcus' speed. Find the speed of both soccer players.

Exercise 13.6.5E.11

Cindy and Richard leave their dorm in Charleston at the same time. Cindy rides her bicycle north at a speed of 18 miles per hour. Richard rides his bicycle south at a speed of 14 miles per hour. How long will it take them to be 96 miles apart?

Answer

3 hours

Exercise 13.6.5E.12

Matt and Chris leave their uncle's house in Phoenix at the same time. Matt drives west on I-60 at a speed of 76 miles per hour. Chris drives east on I-60 at a speed of 82 miles per hour. How many hours will it take them to be 632 miles apart?

Exercise 13.6.5E.13

Two busses leave Billings at the same time. The Seattle bus heads west on I-90 at a speed of 73 miles per hour while the Chicago bus heads east at a speed of 79 miles an hour. How many hours will it take them to be 532 miles apart?

Answer

3.5 hours

Exercise 13.6.5E.14

Two boats leave the same dock in Cairo at the same time. One heads north on the Mississippi River while the other heads south. The northbound boat travels four miles per hour. The southbound boat goes eight miles per hour. How long will it take them to be 54 miles apart?

Exercise 13.6.5E.15

Lorena walks the path around the park in 30 minutes. If she jogs, it takes her 20 minutes. Her jogging speed is 1.5 miles per hour faster than her walking speed. Find Lorena's walking speed and jogging speed.

Answer

walking 3 mph, jogging 4.5 mph

Exercise 13.6.5E.16

Julian rides his bike uphill for 45 minutes, then turns around and rides back downhill. It takes him 15 minutes to get back to where he started. His uphill speed is 3.2 miles per hour slower than his downhill speed. Find Julian's uphill and downhill speed.

Exercise 13.6.5E.17

Cassius drives his boat upstream for 45 minutes. It takes him 30 minutes to return downstream. His speed going upstream is three miles per hour slower than his speed going downstream. Find his upstream and downstream speeds.

Answer

upstream 6 mph, downstream 9 mph

Exercise 13.6.5E.18

It takes Darline 20 minutes to drive to work in light traffic. To come home, when there is heavy traffic, it takes her 36 minutes. Her speed in light traffic is 24 miles per hour faster than her speed in heavy traffic. Find her speed in light traffic and in heavy traffic.

Exercise 13.6.5E.19

At 1:30 Marlon left his house to go to the beach, a distance of 7.6 miles. He rode his skateboard until 2:15, then walked the rest of the way. He arrived at the beach at 3:00. Marlon's speed on his skateboard is 2.5 times his walking speed. Find his speed when skateboarding and when walking.

Answer

skateboarding 8 mph, walking 3.2 mph

Exercise 13.6.5E.20

Aaron left at 9:15 to drive to his mountain cabin 108 miles away. He drove on the freeway until 10:45, and then he drove on the mountain road. He arrived at 11:05. His speed on the freeway was three times his speed on the mountain road. Find Aaron's speed on the freeway and on the mountain road.

Exercise 13.6.5E.21

Marisol left Los Angeles at 2:30 to drive to Santa Barbara, a distance of 95 miles. The traffic was heavy until 3:20. She drove the rest of the way in very light traffic and arrived at 4:20. Her speed in heavy traffic was 40 miles per hour slower than her speed in light traffic. Find her speed in heavy traffic and in light traffic.

Answer

heavy traffic 30 mph, light traffic 70 mph

Exercise 13.6.5E.22

Lizette is training for a marathon. At 7:00 she left her house and ran until 8:15, then she walked until 11:15. She covered a total distance of 19 miles. Her running speed was five miles per hour faster than her walking speed. Find her running and walking speeds.

Everyday Math

Exercise 13.6.5E.23

John left his house in Irvine at 8:35 am to drive to a meeting in Los Angeles, 45 miles away. He arrived at the meeting at 9:50. At 3:30 pm, he left the meeting and drove home. He arrived home at 5:18.

1. What was his average speed on the drive from Irvine to Los Angeles?
2. What was his average speed on the drive from Los Angeles to Irvine?
3. What was the total time he spent driving to and from this meeting?
4. John drove a total of 90 miles roundtrip. Find his average speed. (Round to the nearest tenth.)

Answer

1. 36 mph
2. 25 mph
3. 3.05 hours
4. 29.5 mph

Exercise 13.6.5E.24

Sarah wants to arrive at her friend's wedding at 3:00. The distance from Sarah's house to the wedding is 95 miles. Based on usual traffic patterns, Sarah predicts she can drive the first 15 miles at 60 miles per hour, the next 10 miles at 30 miles per hour, and the remainder of the drive at 70 miles per hour.

1. How long will it take Sarah to drive the first 15 miles?
2. How long will it take Sarah to drive the next 10 miles?
3. How long will it take Sarah to drive the rest of the trip?
4. What time should Sarah leave her house?

Writing Exercises

Exercise 13.6.5E.25

When solving a uniform motion problem, how does drawing a diagram of the situation help you?

Answer

Answers will vary.

Exercise 13.6.5E. 26

When solving a uniform motion problem, how does creating a table help you?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve uniform motion applications.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 13.6.5E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

13.6.6: Solve Applications with Linear Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Solve applications with linear inequalities

Note

Before you get started, take this readiness quiz.

1. Write as an inequality: x is at least 30.
   If you missed this problem, review Exercise 2.7.34.
2. Solve $8-3y<41$.
   If you missed this problem, review Exercise 2.7.22.

Solve Applications with Linear Inequalities

Many real-life situations require us to solve inequalities. In fact, inequality applications are so common that we often do not even realize we are doing algebra. For example, how many gallons of gas can be put in the car for $20? Is the rent on an apartment affordable? Is there enough time before class to go get lunch, eat it, and return? How much money should each family member's holiday gift cost without going over budget?

The method we will use to solve applications with linear inequalities is very much like the one we used when we solved applications with equations. We will read the problem and make sure all the words are understood. Next, we will identify what we are looking for and assign a variable to represent it. We will restate the problem in one sentence to make it easy to translate into an inequality. Then, we will solve the inequality.

Example 13.6.6.1

Emma got a new job and will have to move. Her monthly income will be $5,265. To qualify to rent an apartment, Emma's monthly income must be at least three times as much as the rent. What is the highest rent Emma will qualify for?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the highest rent Emma will qualify for
Step 3. Name what we are looking for.	
Choose a variable to represent that quantity.	Let r = rent
Step 4. Translate into an inequality.	
First write a sentence that gives the information to find it.	Emma's monthly income must be at least three times the rent.
Step 5. Solve the inequality.	$5265 \geq 3r$
Remember, $a>x$ has the same meaning as $x<a$	$1755 \geq r$ $r \leq 1755$
Step 6. Check the answer in the problem and make sure it makes sense.	
A maximum rent of $1,755 seems reasonable for an income of $5,265.	
Step 7. Answer the question with a complete sentence.	The maximum rent is $1,755.

Try It 13.6.6.2

Alan is loading a pallet with boxes that each weighs 45 pounds. The pallet can safely support no more than 900 pounds. How many boxes can he safely load onto the pallet?

Answer

There can be no more than 20 boxes.

Try It 13.6.6.3

The elevator in Yehire's apartment building has a sign that says the maximum weight is 2,100 pounds. If the average weight of one person is 150 pounds, how many people can safely ride the elevator?

Answer

A maximum of 14 people can safely ride in the elevator.

Sometimes an application requires the solution to be a whole number, but the algebraic solution to the inequality is not a whole number. In that case, we must round the algebraic solution to a whole number. The context of the application will determine whether we round up or down. To check applications like this, we will round our answer to a number that is easy to compute with and make sure that number makes the inequality true.

Example 13.6.6.4

Dawn won a mini-grant of $4,000 to buy tablet computers for her classroom. The tablets she would like to buy cost $254.12 each, including tax and delivery. What is the maximum number of tablets Dawn can buy?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the maximum number of tablets Dawn can buy
Step 3. Name what we are looking for. Choose a variable to represent that quantity.	Let n = the number of tablets.
Step 4. Translate. write a sentence that gives the information to find it.	$254.12 times the number of tablets is no more than $4000.
Translate into an inequality.	$254.12n \leq 4000$
Step 5. Solve the inequality.	$n \leq 15.74$
But n must be a whole number of tablets, so round to 15.	$n \leq 15$
Step 6. Check the answer in the problem and make sure it makes sense. Rounding down the price to $250, 15 tablets would cost $3750, while 16 tablets would be $4000. So a maximum of 15 tablets at $254.12 seems reasonable.	
Step 7. Answer the answer in the problem complete sentence.	the question with a Dawn can buy a maximum of 15 tablets.

Try It 13.6.6.5

Angie has $20 to spend on juice boxes for her son's preschool picnic. Each pack of juice boxes costs $2.63. What is the maximum number of packs she can buy?

Answer

seven packs

Try It 13.6.6.6

Daniel wants to surprise his girlfriend with a birthday party at her favorite restaurant. It will cost $42.75 per person for dinner, including tip and tax. His budget for the party is $500. What is the maximum number of people Daniel can have at the party?

Answer

11 people

Example 13.6.6.7

Pete works at a computer store. His weekly pay will be either a fixed amount, $925, or $500 plus 12% of his total sales. How much should his total sales be for his variable pay option to exceed the fixed amount of $925?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the total sales needed for his variable pay option to exceed the fixed amount of $925
Step 3. Name what we are looking for. Choose a variable to represent that quantity.	Let s = the total sales.
Step 4. Translate. write a sentence that gives the information to find it. Translate into an inequality. Remember to convert the percent to a decimal.	$500 plus 12% of total sales is more than $925. $500 + 0.12s > 925$
Step 5. Solve the inequality.	$0.12s > 425$ $s > 3541.\overline{66}$
Step 6. Check the answer in the problem and make sure it makes sense. Rounding down the price to $250, 15 tablets would cost $3750, while If we round the total sales up to $4000, we see that $500+0.12(4000) = 980$, which is more than $925.	
Step 7. Answer the the question with a complete sentence.	The total sales must be more than $3541.67

Try It 13.6.6.8

Tiffany just graduated from college and her new job will pay her $20000 per year plus 2% of all sales. She wants to earn at least $100000 per year. For what total sales will she be able to achieve her goal?

Answer

at least $4000000

Try It 13.6.6.9

Christian has been offered a new job that pays $24000 a year plus 3% of sales. For what total sales would this new job pay more than his current job which pays $60000?

Answer

at least $1200000

Example 13.6.6.10

Sergio and Lizeth have a very tight vacation budget. They plan to rent a car from a company that charges $75 a week plus $0.25 a mile. How many miles can they travel and still keep within their $200 budget?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the number of miles Sergio and Lizeth can travel
Step 3. Name what we are looking for. Choose a variable to represent that quantity.	Let m = the number of miles.
Step 4. Translate. write a sentence that gives the information to find it. Translate into an inequality.	$75 plus 0.25 times the number of miles is less than or equal to $200. $75 + 25m \leq 200$
Step 5. Solve the inequality.	$0.25m \leq 125$ $m \leq 500$ miles
Step 6. Check the answer in the problem and make sure it makes sense. Yes, $75 + 0.25(500) = 200$.	
Step 7. Answer the the question with a complete sentence.	Sergio and Lizeth can travel 500 miles and still stay on budget.

Try It 13.6.6.11

Taleisha's phone plan costs her $28.80 a month plus $0.20 per text message. How many text messages can she use and keep her monthly phone bill no more than $50?

Answer

no more than 106 text messages

Try It 13.6.6.12

Rameen's heating bill is $5.42 per month plus $1.08 per therm. How many therms can Rameen use if he wants his heating bill to be a maximum of $87.50?

Answer

no more than 76 therms

A common goal of most businesses is to make a profit. *Profit* is the money that remains when the expenses have been subtracted from the money earned. In the next example, we will find the number of jobs a small businessman needs to do every month in order to make a certain amount of **profit**.

Example 13.6.6.13

Elliot has a landscape maintenance business. His monthly expenses are $1,100. If he charges $60 per job, how many jobs must he do to earn a profit of at least $4,000 a month?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the number of jobs Elliot needs
Step 3. Name what we are looking for.	
Choose a variable to represent it	Let j = the number of jobs.
Step 4. Translate. write a sentence that	$60 times the number of jobs minus $1,100 is at least $4,000.
gives the information to find it.	less than or equal to $200.
Translate into an inequality.	$60j - 1100 \geq 4000$
Step 5. Solve the inequality.	$60j \geq 5100$
	$j \geq 85$ jobs
Step 6. Check the answer in the problem and make sure it makes sense.	If Elliot did 90 jobs, his profit would be $60(90) - 1{,}100$, or $4,300. This is more than $4,000.
Step 7. Answer the the question with a complete sentence.	Elliot must work at least 85 jobs.

Try It 13.6.6.14

Caleb has a pet sitting business. He charges $32 per hour. His monthly expenses are $2272. How many hours must he work in order to earn a profit of at least $800 per month?

Answer

at least 96 hours

Try It 13.6.6.15

Felicity has a calligraphy business. She charges $2.50 per wedding invitation. Her monthly expenses are $650. How many invitations must she write to earn a profit of at least $2800 per month?

Answer

at least 1380 invitations

Sometimes life gets complicated! There are many situations in which several quantities contribute to the total expense. We must make sure to account for all the individual expenses when we solve problems like this.

Example 13.6.6.16

Brenda's best friend is having a destination wedding and the event will last 3 days. Brenda has $500 in savings and can earn $15 an hour babysitting. She expects to pay $350 airfare, $375 for food and entertainment and $60 a night for her share of a hotel room. How many hours must she babysit to have enough money to pay for the trip?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	the number of hours Brenda must babysit
Step 3. Name what we are looking for. Choose a variable to represent that quantity.	Let h = the number of hours.
Step 4. Translate. write a sentence that gives the information to find it.	The expenses must be less than or equal to the income. The cost of airfare plus the cost of food and entertainment and the hotel bill must be less than or equal to the savings plus the amount earned babysitting.
Translate into an inequality.	$\$350 + \$375 + \$60(3) \leq \$500 + \$15h$
Step 5. Solve the inequality.	$905 \leq 500 + 15h$ $405 \leq 15h$ $27 \leq h$ $h \geq 27$
Step 6. Check the answer in the problem and make sure it makes sense.	
We substitute 27 into the inequality.	
$905 \leq 500 + 15h$	
$905 \leq 500 + 15(27)$	
$905 \leq 905$	
Step 7. Answer the the question with a complete sentence.	Brenda must babysit at least 27 hours.

? Try It 13.6.6.17

Malik is planning a 6-day summer vacation trip. He has $840 in savings, and he earns $45 per hour for tutoring. The trip will cost him $525 for airfare, $780 for food and sightseeing, and $95 per night for the hotel. How many hours must he tutor to have enough money to pay for the trip?

Answer

at least 23 hours

? Try It 13.6.6.18

Josue wants to go on a 10-day road trip next spring. It will cost him $180 for gas, $450 for food, and $49 per night for a motel. He has $520 in savings and can earn $30 per driveway shoveling snow. How many driveways must he shovel to have enough money to pay for the trip?

Answer

at least 20 driveways

Key Concepts

- **Solving inequalities**
  1. **Read** the problem.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose a variable to represent that quantity.
  4. **Translate.** Write a sentence that gives the information to find it. Translate into an inequality.

5. **Solve** the inequality.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

13.6.6E: Exercises

Practice Makes Perfect

Solve Applications with Linear Inequalities

In the following exercises, solve.

Exercise 13.6.6E.1

Mona is planning her son's birthday party and has a budget of $285. The Fun Zone charges $19 per child. How many children can she have at the party and stay within her budget?

Answer

15 children

Exercise 13.6.6E.2

Carlos is looking at apartments with three of his friends. They want the monthly rent to be no more than $2360. If the roommates split the rent evenly among the four of them, what is the maximum rent each will pay?

Exercise 13.6.6E.3

A water taxi has a maximum load of 1,800 pounds. If the average weight of one person is 150 pounds, how many people can safely ride in the water taxi?

Answer

12 people

Exercise 13.6.6E.4

Marcela is registering for her college classes, which cost $105 per unit. How many units can she take to have a maximum cost of $1,365?

Exercise 13.6.6E.5

Arleen got a $20 gift card for the coffee shop. Her favorite iced drink costs $3.79. What is the maximum number of drinks she can buy with the gift card?

Answer

five drinks

Exercise 13.6.6E.6

Teegan likes to play golf. He has budgeted $60 next month for the driving range. It costs him $10.55 for a bucket of balls each time he goes. What is the maximum number of times he can go to the driving range next month?

Exercise 13.6.6E.7

Joni sells kitchen aprons online for $32.50 each. How many aprons must she sell next month if she wants to earn at least $1,000?

Answer

31 aprons

Exercise 13.6.6E.8

Ryan charges his neighbors $17.50 to wash their car. How many cars must he wash next summer if his goal is to earn at least $1,500?

Exercise 13.6.6E.9

Keshad gets paid $2,400 per month plus 6% of his sales. His brother earns $3,300 per month. For what amount of total sales will Keshad's monthly pay be higher than his brother's monthly pay?

Answer

$15,000

Exercise 13.6.6E.10

Kimuyen needs to earn $4,150 per month in order to pay all her expenses. Her job pays her $3,475 per month plus 4% of her total sales. What is the minimum Kimuyen's total sales must be in order for her to pay all her expenses?

Exercise 13.6.6E.11

Andre has been offered an entry-level job. The company offered him $48,000 per year plus 3.5% of his total sales. Andre knows that the average pay for this job is $62,000. What would Andre's total sales need to be for his pay to be at least as high as the average pay for this job?

Answer

$400,000

Exercise 13.6.6E.12

Nataly is considering two job offers. The first job would pay her $83,000 per year. The second would pay her $66,500 plus 15% of her total sales. What would her total sales need to be for her salary on the second offer be higher than the first?

Exercise 13.6.6E.13

Jake's water bill is $24.80 per month plus $2.20 per ccf (hundred cubic feet) of water. What is the maximum number of ccf Jake can use if he wants his bill to be no more than $60?

Answer

16 ccf

Exercise 13.6.6E.14

Kiyoshi's phone plan costs $17.50 per month plus $0.15 per text message. What is the maximum number of text messages Kiyoshi can use so the phone bill is no more than $56.50?

Exercise 13.6.6E.15

Marlon's TV plan costs $49.99 per month plus $5.49 per first-run movie. How many first-run movies can he watch if he wants to keep his monthly bill to be a maximum of $100?

Answer

nine movies

Exercise 13.6.6E.16

Kellen wants to rent a banquet room in a restaurant for her cousin's baby shower. The restaurant charges $350 for the banquet room plus $32.50 per person for lunch. How many people can Kellen have at the shower if she wants the maximum cost to be $1,500?

Exercise 13.6.6E.17

Moshde runs a hairstyling business from her house. She charges $45 for a haircut and style. Her monthly expenses are $960. She wants to be able to put at least $1,200 per month into her savings account order to open her own salon. How many "cut & styles" must she do to save at least $1,200 per month?

Answer

48 cut & styles

Exercise 13.6.6E.18

Noe installs and configures software on home computers. He charges $125 per job. His monthly expenses are $1,600. How many jobs must he work in order to make a profit of at least $2,400?

Exercise 13.6.6E.19

Katherine is a personal chef. She charges $115 per four-person meal. Her monthly expenses are $3,150. How many four-person meals must she sell in order to make a profit of at least $1,900?

Answer

44 meals

Exercise 13.6.6E.20

Melissa makes necklaces and sells them online. She charges $88 per necklace. Her monthly expenses are $3745. How many necklaces must she sell if she wants to make a profit of at least $1,650?

Exercise 13.6.6E.21

Five student government officers want to go to the state convention. It will cost them $110 for registration, $375 for transportation and food, and $42 per person for the hotel. There is $450 budgeted for the convention in the student government savings account. They can earn the rest of the money they need by having a car wash. If they charge $5 per car, how many cars must they wash in order to have enough money to pay for the trip?

Answer

49 cars

Exercise 13.6.6E.22

Cesar is planning a 4-day trip to visit his friend at a college in another state. It will cost him $198 for airfare, $56 for local transportation, and $45 per day for food. He has $189 in savings and can earn $35 for each lawn he mows. How many lawns must he mow to have enough money to pay for the trip?

Exercise 13.6.6E.23

Alonzo works as a car detailer. He charges $175 per car. He is planning to move out of his parents' house and rent his first apartment. He will need to pay $120 for application fees, $950 for security deposit, and first and last months' rent at $1,140 per month. He has $1,810 in savings. How many cars must he detail to have enough money to rent the apartment?

Answer

9 cars

Exercise 13.6.6E.24

Eun-Kyung works as a tutor and earns $60 per hour. She has $792 in savings. She is planning an anniversary party for her parents. She would like to invite 40 guests. The party will cost her $1,520 for food and drinks and $150 for the photographer. She will also have a favor for each of the guests, and each favor will cost $7.50. How many hours must she tutor to have enough money for the party?

Everyday Math

Exercise 13.6.6E.25

Maximum Load on a Stage In 2014, a high school stage collapsed in Fullerton, California, when 250 students got on stage for the finale of a musical production. Two dozen students were injured. The stage could support a maximum of 12,750 pounds. If the average weight of a student is assumed to be 140 pounds, what is the maximum number of students who could safely be on the stage?

Answer

91 students

Exercise 13.6.6E.26

Maximum Weight on a Boat In 2004, a water taxi sank in Baltimore harbor and five people drowned. The water taxi had a maximum capacity of 3,500 pounds (25 people with average weight 140 pounds). The average weight of the 25 people on the water taxi when it sank was 168 pounds per person. What should the maximum number of people of this weight have been?

Exercise 13.6.6E.27

Wedding Budget Adele and Walter found the perfect venue for their wedding reception. The cost is $9,850 for up to 100 guests, plus $38 for each additional guest. How many guests can attend if Adele and Walter want the total cost to be no more than $12,500?

Answer

169 guests

Exercise 13.6.6E.28

Shower Budget Penny is planning a baby shower for her daughter-in-law. The restaurant charges $950 for up to 25 guests, plus $31.95 for each additional guest. How many guests can attend if Penny wants the total cost to be no more than $1,500?

Writing Exercises

Exercise 13.6.6E. 29

Find your last month's phone bill and the hourly salary you are paid at your job. (If you do not have a job, use the hourly salary you would realistically be paid if you had a job.) Calculate the number of hours of work it would take you to earn at least enough money to pay your phone bill by writing an appropriate inequality and then solving it.

Answer

Answers will vary.

Exercise 13.6.6E. 30

Find out how many units you have left, after this term, to achieve your college goal and estimate the number of units you can take each term in college. Calculate the number of terms it will take you to achieve your college goal by writing an appropriate inequality and then solving it.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve applications with linear inequalities.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 13.6.6E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

13.6.7: Chapter 3 Review Exercises

Chapter 3 Review Exercises

3.1 Using a Problem Solving Strategy

Approach Word Problems with a Positive Attitude

In the following exercises, reflect on your approach to word problems.

Exercise 13.6.7.1

How has your attitude towards solving word problems changed as a result of working through this chapter? Explain.

Answer

answers will vary

Exercise 13.6.7.2

Did the problem-solving strategy help you solve word problems in this chapter? Explain.

Use a Problem-Solving Strategy for Word Problems

In the following exercises, solve using the problem-solving strategy for word problems. Remember to write a complete sentence to answer each question.

Exercise 13.6.7.3

Three-fourths of the people at a concert are children. If there are 87 children, what is the total number of people at the concert?

Answer

116

Exercise 13.6.7.4

There are nine saxophone players in the band. The number of saxophone players is one less than twice the number of tuba players. Find the number of tuba players.

Solve Number Problems

In the following exercises, solve each number word problem.

Exercise 13.6.7.5

The sum of a number and three is forty-one. Find the number.

Answer

38

Exercise 13.6.7.6

Twice the difference of a number and ten is fifty-four. Find the number.

Exercise 13.6.7.7

One number is nine less than another. Their sum is negative twenty-seven. Find the numbers.

Answer

−18,−9

Exercise 13.6.7.8

One number is eleven more than another. If their sum is increased by seventeen, the result is 90. Find the numbers.

Exercise 13.6.7.9

One number is two more than four times another. Their sum is −13. Find the numbers.

Answer

−3,−10

Exercise 13.6.7.10

The sum of two consecutive integers is −135. Find the numbers.

Exercise 13.6.7.11

Find three consecutive integers whose sum is −141.

Answer

−48,−47,−46

Exercise 13.6.7.12

Find three consecutive even integers whose sum is 234.

Exercise 13.6.7.13

Find three consecutive odd integers whose sum is 51.

Answer

15, 17, 19

Exercise 13.6.7.14

Koji has $5,502 in his savings account. This is $30 less than six times the amount in his checking account. How much money does Koji have in his checking account?

3.2 Solve Percent Applications

Translate and Solve Basic Percent Equations

In the following exercises, translate and solve.

Exercise 13.6.7.15

What number is 67% of 250?

Answer

167.5

Exercise 13.6.7.16

300% of 82 is what number?

Exercise 13.6.7.17

12.5% of what number is 20?

Answer

160

Exercise 13.6.7.18

72 is 30% of what number?

Exercise 13.6.7.19

What percent of 125 is 150?

Answer

120%

Exercise 13.6.7.20

127.5 is what percent of 850?

Solve Percent Applications

In the following exercises, solve.

Exercise 13.6.7.21

The bill for Dino's lunch was $19.45. He wanted to leave 20% of the total bill as a tip. How much should the tip be?

Answer

$3.89

Exercise 13.6.7.22

Reza was very sick and lost 15% of his original weight. He lost 27 pounds. What was his original weight?

Exercise 13.6.7.23

Dolores bought a crib on sale for $350. The sale price was 40% of the original price. What was the original price of the crib?

Answer

$875

Exercise 13.6.7.24

Jaden earns $2,680 per month. He pays $938 a month for rent. What percent of his monthly pay goes to rent?

Find Percent Increase and Percent Decrease

In the following exercises, solve.

Exercise 13.6.7.25

Angel's got a raise in his annual salary from $55,400 to $56,785. Find the percent increase.

Answer

2.5%

Exercise 13.6.7.26

Rowena's monthly gasoline bill dropped from $83.75 last month to $56.95 this month. Find the percent decrease.

Solve Simple Interest Applications

In the following exercises, solve.

Exercise 13.6.7.27

Winston deposited $3,294 in a bank account with interest rate 2.6%. How much interest was earned in 5 years?

Answer

$428.22

Exercise 13.6.7.28

Moira borrowed $4,500 from her grandfather to pay for her first year of college. Three years later, she repaid the $4,500 plus $243 interest. What was the rate of interest?

Exercise 13.6.7.29

Jaime's refrigerator loan statement said he would pay $1,026 in interest for a 4-year loan at 13.5%. How much did Jaime borrow to buy the refrigerator?

Answer

$1,900

Exercise 13.6.7.30

In 12 years, a bond that paid 6.35% interest earned $7,620 interest. What was the principal of the bond?

Solve Applications with Discount or Mark-up

In the following exercises, find the sale price.

Exercise 13.6.7.31

The original price of a handbag was $84. Carole bought it on sale for $21 off.

Answer

$63

Exercise 13.6.7.32

Marian wants to buy a coffee table that costs $495. Next week the coffee table will be on sale for $149 off.

In the following exercises, find

1. the amount of discount and
2. the sale price.

Exercise 13.6.7.33

Emmett bought a pair of shoes on sale at 40% off from an original price of $138.

Answer

1. $55.20
2. $82.80

Exercise 13.6.7.34

Anastasia bought a dress on sale at 75% off from an original price of $280.

In the following exercises, find ⓐ the amount of discount and ⓑ the discount rate. (Round to the nearest tenth of a percent, if needed.)

Exercise 13.6.7.35

Zack bought a printer for his office that was on sale for $380. The original price of the printer was $450.

Answer

1. $70
2. 15.6%

Exercise 13.6.7.36

Lacey bought a pair of boots on sale for $95. The original price of the boots was $200.

In the following exercises, find

1. the amount of the mark-up and
2. the list price.

Exercise 13.6.7.37

Nga and Lauren bought a chest at a flea market for $50. They re-finished it and then added a 350% mark-up.

Answer

1. $175
2. $225

Exercise 13.6.7.38

Carly bought bottled water for $0.24 per bottle at the discount store. She added a 75% mark-up before selling them at the football game.

3.3 Solve Mixture Applications

Solve Coin Word Problems

In the following exercises, solve each coin word problem.

Exercise 13.6.7.39

Francie has $4.35 in dimes and quarters. The number of dimes is five more than the number of quarters. How many of each coin does she have?

Answer

16 dimes, 11 quarters

Exercise 13.6.7.40

Scott has $0.39 in pennies and nickels. The number of pennies is eight times the number of nickels. How many of each coin does he have?

Exercise 13.6.7.41

Paulette has $140 in $5 and $10 bills. The number of $10 bills is one less than twice the number of $5 bills. How many of each does she have?

Answer

six $5 bills, 11 $10 bills

Exercise 13.6.7.42

Lenny has $3.69 in pennies, dimes, and quarters. The number of pennies is three more than the number of dimes. The number of quarters is twice the number of dimes. How many of each coin does he have?

Solve Ticket and Stamp Word Problems

In the following exercises, solve each ticket or stamp word problem.

Exercise 13.6.7.43

A church luncheon made $842. Adult tickets cost $10 each and children's tickets cost $6 each. The number of children was 12 more than twice the number of adults. How many of each ticket were sold?

Answer

35 adults, 82 children

Exercise 13.6.7.44

Tickets for a basketball game cost $2 for students and $5 for adults. The number of students was three less than 10 times the number of adults. The total amount of money from ticket sales was $619. How many of each ticket were sold?

Exercise 13.6.7.45

125 tickets were sold for the jazz band concert for a total of $1,022. Student tickets cost $6 each and general admission tickets cost $10 each. How many of each kind of ticket were sold?

Answer

57 students, 68 adults

Exercise 13.6.7.46

One afternoon the water park sold 525 tickets for a total of $13,545. Child tickets cost $19 each and adult tickets cost $40 each. How many of each kind of ticket were sold?

Exercise 13.6.7.47

Ana spent $4.06 buying stamps. The number of $0.41 stamps she bought was five more than the number of $0.26 stamps. How many of each did she buy?

Answer

three $0.26 stamps, eight $0.41 stamps

Exercise 13.6.7.48

Yumi spent $34.15 buying stamps. The number of $0.56 stamps she bought was 10 less than four times the number of $0.41 stamps. How many of each did she buy?

Solve Mixture Word Problems

In the following exercises, solve each mixture word problem.

Exercise 13.6.7.49

Marquese is making 10 pounds of trail mix from raisins and nuts. Raisins cost $3.45 per pound and nuts cost $7.95 per pound. How many pounds of raisins and how many pounds of nuts should Marquese use for the trail mix to cost him $6.96 per pound?

Answer

2.2 lb. of raisins, 7.8 lb. of nuts

Exercise 13.6.7.50

Amber wants to put tiles on the backsplash of her kitchen counters. She will need 36 square feet of tile. She will use basic tiles that cost $8 per square foot and decorator tiles that cost $20 per square foot. How many square feet of each tile should she use so that the overall cost of the backsplash will be $10 per square foot?

Exercise 13.6.7.51

Shawn has $15,000 to invest. She will put some of it into a fund that pays 4.5% annual interest and the rest in a certificate of deposit that pays 1.8% annual interest. How much should she invest in each account if she wants to earn 4.05% annual interest on the total amount?

Answer

$12,500 at 4.5%, $2,500 at 1.8%

Exercise 13.6.7.52

Enrique borrowed $23,500 to buy a car. He pays his uncle 2% interest on the $4,500 he borrowed from him, and he pays the bank 11.5% interest on the rest. What average interest rate does he pay on the total $23,500? (Round your answer to the nearest tenth of a percent.)

3.4 Solve Geometry Applications: Triangles, Rectangles and the Pythagorean Theorem

Solve Applications Using Triangle Properties

In the following exercises, solve using triangle properties.

Exercise 13.6.7.53

The measures of two angles of a triangle are 22 and 85 degrees. Find the measure of the third angle.

Answer

73°

Exercise 13.6.7.54

The playground at a shopping mall is a triangle with perimeter 48 feet. The lengths of two sides are 19 feet and 14 feet. How long is the third side?

Exercise 13.6.7.55

A triangular road sign has base 30 inches and height 40 inches. What is its area?

Answer

600 square inches

Exercise 13.6.7.56

What is the height of a triangle with area 67.5 square meters and base 9 meters?

Exercise 13.6.7.57

One angle of a triangle is 30° more than the smallest angle. The largest angle is the sum of the other angles. Find the measures of all three angles.

Answer

30°,60°,90°

Exercise 13.6.7.58

One angle of a right triangle measures 58°. What is the measure of the other angles of the triangle?

Exercise 13.6.7.59

The measure of the smallest angle in a right triangle is 45° less than the measure of the next larger angle. Find the measures of all three angles.

Answer

22.5°,67.5°,90°

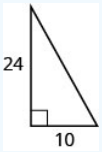
Exercise 13.6.7.60

The perimeter of a triangle is 97 feet. One side of the triangle is eleven feet more than the smallest side. The third side is six feet more than twice the smallest side. Find the lengths of all sides.

Use the Pythagorean Theorem

In the following exercises, use the Pythagorean Theorem to find the length of the hypotenuse.

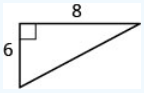
Exercise 13.6.7.61



Answer

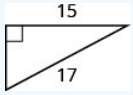
26

Exercise 13.6.7.62



In the following exercises, use the Pythagorean Theorem to find the length of the missing side. Round to the nearest tenth, if necessary.

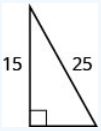
Exercise 13.6.7.63



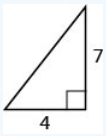
Answer

8

Exercise 13.6.7.64



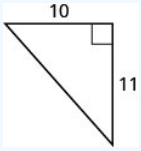
Exercise 13.6.7.65



Answer

8.1

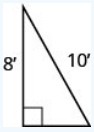
Exercise 13.6.7.66



In the following exercises, solve. Approximate to the nearest tenth, if necessary.

Exercise 13.6.7.67

Sergio needs to attach a wire to hold the antenna to the roof of his house, as shown in the figure. The antenna is 8 feet tall and Sergio has 10 feet of wire. How far from the base of the antenna can he attach the wire?

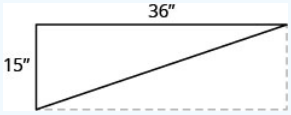


Answer

$6'$

Exercise 13.6.7.68

Seong is building shelving in his garage. The shelves are 36 inches wide and 15 inches tall. He wants to put a diagonal brace across the back to stabilize the shelves, as shown. How long should the brace be?



Solve Applications Using Rectangle Properties

In the following exercises, solve using rectangle properties.

Exercise 13.6.7.69

The length of a rectangle is 36 feet and the width is 19 feet. Find the

1. perimeter
2. area.

Answer

1. 110 ft.
2. 684 sq. ft.

Exercise 13.6.7.70

A sidewalk in front of Kathy's house is in the shape of a rectangle four feet wide by 45 feet long. Find the

1. perimeter
2. area.

Exercise 13.6.7.71

The area of a rectangle is 2356 square meters. The length is 38 meters. What is the width?

Answer

62 m

Exercise 13.6.7.72

The width of a rectangle is 45 centimeters. The area is 2,700 square centimeters. What is the length?

Exercise 13.6.7.73

The length of a rectangle is 12 cm more than the width. The perimeter is 74 cm. Find the length and the width.

Answer

24.5 cm, 12.5 cm

Exercise 13.6.7.74

The width of a rectangle is three more than twice the length. The perimeter is 96 inches. Find the length and the width.

3.5 Solve Uniform Motion Applications

Solve Uniform Motion Applications

In the following exercises, solve.

Exercise 13.6.7.75

When Gabe drives from Sacramento to Redding it takes him 2.2 hours. It takes Elsa 2 hours to drive the same distance. Elsa's speed is seven miles per hour faster than Gabe's speed. Find Gabe's speed and Elsa's speed.

Answer

Gabe 70 mph, Elsa 77 mph

Exercise 13.6.7.76

Louellen and Tracy met at a restaurant on the road between Chicago and Nashville. Louellen had left Chicago and drove 3.2 hours towards Nashville. Tracy had left Nashville and drove 4 hours towards Chicago, at a speed one mile per hour faster than Louellen's speed. The distance between Chicago and Nashville is 472 miles. Find Louellen's speed and Tracy's speed.

Exercise 13.6.7.77

Two busses leave Amarillo at the same time. The Albuquerque bus heads west on the I-40 at a speed of 72 miles per hour, and the Oklahoma City bus heads east on the I-40 at a speed of 78 miles per hour. How many hours will it take them to be 375 miles apart?

Answer

2.5 hours

Exercise 13.6.7.78

Kyle rowed his boat upstream for 50 minutes. It took him 30 minutes to row back downstream. His speed going upstream is two miles per hour slower than his speed going downstream. Find Kyle's upstream and downstream speeds.

Exercise 13.6.7.79

At 6:30, Devon left her house and rode her bike on the flat road until 7:30. Then she started riding uphill and rode until 8:00. She rode a total of 15 miles. Her speed on the flat road was three miles per hour faster than her speed going uphill. Find Devon's speed on the flat road and riding uphill.

Answer

flat road 11 mph, uphill 8 mph

Exercise 13.6.7.80

Anthony drove from New York City to Baltimore, a distance of 192 miles. He left at 3:45 and had heavy traffic until 5:30. Traffic was light for the rest of the drive, and he arrived at 7:30. His speed in light traffic was four miles per hour more than twice his speed in heavy traffic. Find Anthony's driving speed in heavy traffic and light traffic.

3.6 Solve Applications with Linear Inequalities

Solve Applications with Linear Inequalities

In the following exercises, solve.

Exercise 13.6.7.81

Julianne has a weekly food budget of $231 for her family. If she plans to budget the same amount for each of the seven days of the week, what is the maximum amount she can spend on food each day?

Answer

$33 per day

Exercise 13.6.7.82

Rogelio paints watercolors. He got a $100 gift card to the art supply store and wants to use it to buy $12'' \times 16''$ canvases. Each canvas costs $10.99. What is the maximum number of canvases he can buy with his gift card?

Exercise 13.6.7.83

Briana has been offered a sales job in another city. The offer was for $42,500 plus 8% of her total sales. In order to make it worth the move, Briana needs to have an annual salary of at least $66,500. What would her total sales need to be for her to move?

Answer

at least $300,000

Exercise 13.6.7.84

Renee's car costs her $195 per month plus $0.09 per mile. How many miles can Renee drive so that her monthly car expenses are no more than $250?

Exercise 13.6.7.85

Costa is an accountant. During tax season, he charges $125 to do a simple tax return. His expenses for buying software, renting an office, and advertising are $6,000. How many tax returns must he do if he wants to make a profit of at least $8,000?

Answer

at least 112 jobs

Exercise 13.6.7.86

Jenna is planning a 5-day resort vacation with three of her friends. It will cost her $279 for airfare, $300 for food and entertainment, and $65 per day for her share of the hotel. She has $550 saved towards her vacation and can earn $25 per hour as an assistant in her uncle's photography studio. How many hours must she work in order to have enough money for her vacation?

Practice Test

Exercise 13.6.7.87

Four-fifths of the people on a hike are children. If there are 12 children, what is the total number of people on the hike?

Answer

15

Exercise 13.6.7.88

One number is three more than twice another. Their sum is −63. Find the numbers.

Exercise 13.6.7.89

The sum of two consecutive odd integers is −96. Find the numbers.

Answer

−49,−47

Exercise 13.6.7.90

Marla's breakfast was 525 calories. This was 35% of her total calories for the day. How many calories did she have that day?

Exercise 13.6.7.91

Humberto's hourly pay increased from $16.25 to $17.55. Find the percent increase.

Answer

8%

Exercise 13.6.7.92

Melinda deposited $5,985 in a bank account with an interest rate of 1.9%. How much interest was earned in 2 years?

Exercise 13.6.7.93

Dotty bought a freezer on sale for $486.50. The original price of the freezer was $695. Find

1. the amount of discount and
2. the discount rate.

Answer

1. $208.50
2. 30%

Exercise 13.6.7.94

Bonita has $2.95 in dimes and quarters in her pocket. If she has five more dimes than quarters, how many of each coin does she have?

Exercise 13.6.7.95

At a concert, $1,600 in tickets were sold. Adult tickets were $9 each and children's tickets were $4 each. If the number of adult tickets was 30 less than twice the number of children's tickets, how many of each kind were sold?

Answer

140 adult, 85 children

Exercise 13.6.7.96

Kim is making eight gallons of punch from fruit juice and soda. The fruit juice costs $6.04 per gallon and the soda costs $4.28 per gallon. How much fruit juice and how much soda should she use so that the punch costs $5.71 per gallon?

Exercise 13.6.7.97

The measure of one angle of a triangle is twice the measure of the smallest angle. The measure of the third angle is 14 more than the measure of the smallest angle. Find the measures of all three angles.

Answer

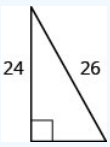
41.5°,55.5°,83°

Exercise 13.6.7.98

What is the height of a triangle with area 277.2 square inches and base 44 inches?

In the following exercises, use the Pythagorean Theorem to find the length of the missing side. Round to the nearest tenth, if necessary.

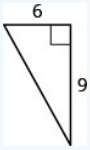
Exercise 13.6.7.99



Answer

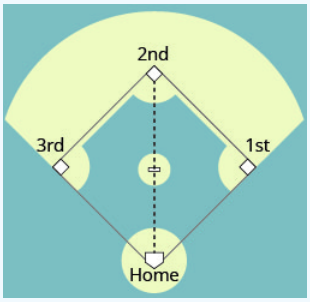
10

Exercise 13.6.7.100



Exercise 13.6.7.101

A baseball diamond is really a square with sides of 90 feet. How far is it from home plate to second base, as shown?



Answer

127.3 ft.

Exercise 13.6.7.102

The length of a rectangle is two feet more than five times the width. The perimeter is 40 feet. Find the dimensions of the rectangle.

Exercise 13.6.7.103

Two planes leave Dallas at the same time. One heads east at a speed of 428 miles per hour. The other plane heads west at a speed of 382 miles per hour. How many hours will it take them to be 2,025 miles apart?

Answer

2.5 hours

Exercise 13.6.7.104

Leon drove from his house in Cincinnati to his sister's house in Cleveland, a distance of 252 miles. It took him 412412 hours. For the first half hour he had heavy traffic, and the rest of the time his speed was five miles per hour less than twice his speed in heavy traffic. What was his speed in heavy traffic?

Exercise 13.6.7.105

Chloe has a budget of $800 for costumes for the 18 members of her musical theater group. What is the maximum she can spend for each costume?

Answer

at most $44.44 per costume

Exercise 13.6.7.106

Frank found a rental car deal online for $49 per week plus $0.24 per mile. How many miles could he drive if he wants the total cost for one week to be no more than $150?

13.7.1: Prelude to the Foundations of Algebra

For years, doctors and engineers have worked to make artificial limbs, such as this hand for people who need them. This particular product is different, however, because it was developed using a 3D printer. As a result, it can be printed much like you print words on a sheet of paper. This makes producing the limb less expensive and faster than conventional methods.

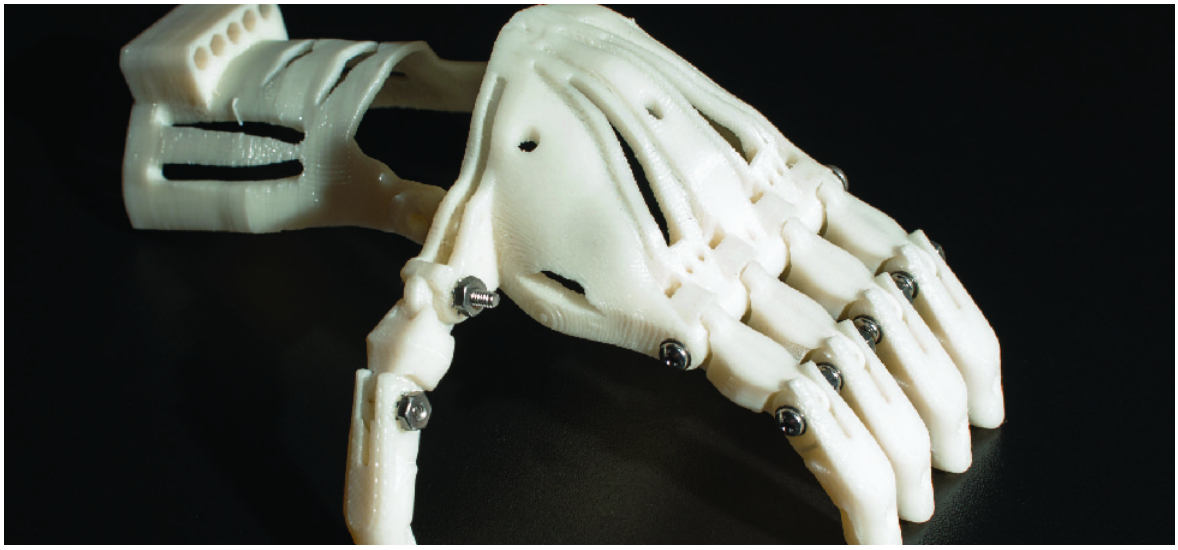

Figure 13.7.1.1: This hand may change someone's life. Amazingly, it was created using a special kind of printer known as a 3D printer. (credit: U.S. Food and Drug Administration/Wikimedia Commons)

Biomedical engineers are working to develop organs that may one day save lives. Scientists at NASA are designing ways to use 3D printers to build on the moon or Mars. Already, animals are benefiting from 3D-printed parts, including a tortoise shell and a dog leg. Builders have even constructed entire buildings using a 3D printer. The technology and use of 3D printers depends on the ability to understand the language of algebra. Engineers must be able to translate observations and needs in the natural world to complex mathematical commands that can provide directions to a printer. In this chapter, you will review the language of algebra and take your first steps toward working with algebraic concepts.

13.7.2: Use the Language of Algebra

Learning Objectives

By the end of this section, you will be able to:

- Find factors, prime factorizations, and least common multiples
- Use variables and algebraic symbols
- Simplify expressions using the order of operations
- Evaluate an expression
- Identify and combine like terms
- Translate an English phrase to an algebraic expression

This chapter is intended to be a brief review of concepts that will be needed in an Intermediate Algebra course. A more thorough introduction to the topics covered in this chapter can be found in the *Elementary Algebra* chapter, Foundations.

Find Factors, Prime Factorizations, and Least Common Multiples

The numbers 2, 4, 6, 8, 10, 12 are called multiples of 2. A **multiple** of 2 can be written as the product of a counting number and 2.

Multiples of 2:

2,	4,	6,	8,	10,	12, ...
$2 \cdot 1$	$2 \cdot 2$	$2 \cdot 3$	$2 \cdot 4$	$2 \cdot 5$	$2 \cdot 6$

Similarly, a multiple of 3 would be the product of a counting number and 3.

Multiples of 3:

3,	6,	9,	12,	15,	18, ...
$3 \cdot 1$	$3 \cdot 2$	$3 \cdot 3$	$3 \cdot 4$	$3 \cdot 5$	$3 \cdot 6$

We could find the multiples of any number by continuing this process.

Counting Number	1	2	3	4	5	6	7	8	9	10	11	12
Multiples of 2	2	4	6	8	10	12	14	16	18	20	22	24
Multiples of 3	3	6	9	12	15	18	21	24	27	30	33	36
Multiples of 4	4	8	12	16	20	24	28	32	36	40	44	48
Multiples of 5	5	10	15	20	25	30	35	40	45	50	55	60
Multiples of 6	6	12	18	24	30	36	42	48	54	60	66	72
Multiples of 7	7	14	21	28	35	42	49	56	63	70	77	84
Multiples of 8	8	16	24	32	40	48	56	64	72	80	88	96
Multiples of 9	9	18	27	36	45	54	63	72	81	90	99	108

MULTIPLE OF A NUMBER

A number is a **multiple** of n if it is the product of a counting number and n.

Another way to say that 15 is a multiple of 3 is to say that 15 is **divisible** by 3. That means that when we divide 3 into 15, we get a counting number. In fact, $15 \div 3$ is 5, so 15 is $5 \cdot 3$.

DIVISIBLE BY A NUMBER

If a number m is a multiple of n, then m is **divisible** by n.

If we were to look for patterns in the multiples of the numbers 2 through 9, we would discover the following divisibility tests:

DIVISIBILITY TESTS

A number is divisible by:

- 2 if the last digit is 0, 2, 4, 6, or 8.
- 3 if the sum of the digits is divisible by 3.
- 5 if the last digit is 5 or 0.
- 6 if it is divisible by both 2 and 3.
- 10 if it ends with 0.

Example 13.7.2.1

Is 5,625 divisible by

a. 2?
b. 3?
c. 5 or 10?
d. 6?

Answer

a.

Is 5,625 divisible by 2?

Does it end in 0, 2, 4, 6 or 8?	No. 5,625 is not divisible by 2.

b.

5,625 divisible by 3?

What is the sum of the digits?	$5+6+2+5=18$
Is the sum divisible by 3?	Yes. 5,625 is divisible by 3.

c.

Is 5,625 divisible by 5 or 10?

What is the last digit? It is 5.	5,625 is divisible by 5 but not by 10.

d.

Is 5,625 divisible by 6?

Is it divisible by both 2 and 3?	No, 5,625 is not divisible by 2, so 5,625 is not divisible by 6.

Example 13.7.2.2

Is 4,962 divisible by a. 2? b. 3? c. 5? d. 6? e. 10?

Answer

a. yes b. yes c. no d. yes e. no

Example 13.7.2.3

Is 3,765 divisible by a. 2? b. 3? c. 5? d. 6? e. 10?

Answer

a. no b. yes c. yes d. no e. no

In mathematics, there are often several ways to talk about the same ideas. So far, we've seen that if m is a multiple of n, we can say that m is divisible by n. For example, since 72 is a multiple of 8, we say 72 is divisible by 8. Since 72 is a multiple of 9, we say 72 is divisible by 9. We can express this still another way.

Since $8 \cdot 9 = 72$, we say that 8 and 9 are factors of 72. When we write $72 = 8 \cdot 9$, we say we have factored 72.

$$\underbrace{8 \cdot 9}_{\text{factors}} = \underbrace{72}_{\text{product}}$$

Other ways to factor 72 are $1 \cdot 72$, $2 \cdot 36$, $3 \cdot 24$, $4 \cdot 18$, and $6 \cdot 12$. The number 72 has many factors: 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, and 72.

FACTORS

If a and b are counting numbers, and $a \cdot b = m$, then a and b are **factors** of m.

Some numbers, such as 72, have many factors. Other numbers have only two factors. A **prime number** is a counting number greater than 1 whose only factors are 1 and itself.

PRIME NUMBER AND COMPOSITE NUMBER

A **prime number** is a counting number greater than 1 whose only factors are 1 and the number itself.

A **composite number** is a counting number that is not prime. A composite number has factors other than 1 and the number itself.

The counting numbers from 2 to 20 are listed in the table with their factors. Make sure to agree with the "prime" or "composite" label for each!

Number	Factors	Prime or Composite?
2	1,2	Prime
3	1,3	Prime
4	1,2,4	Composite
5	1,5	Prime
6	1,2,3,6	Composite
7	1,7	Prime
8	1,2,4,8	Composite
9	1,3,9	Composite
10	1,2,5,10	Composite
11	1,11	Prime

Number	Factors	Prime or Composite?
12	1,2,3,4,6,12	Composite
13	1,13	Prime
14	1,2,7,14	Composite
15	1,3,5,15	Composite
16	1,2,4,8,16	Composite
17	1,17	Prime
18	1,2,3,6,9,18	Composite
19	1,19	Prime
20	1,2,4,5,10,20	Composite

The prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, and 19. Notice that the only even prime number is 2.

A composite number can be written as a unique product of primes. This is called the **prime factorization** of the number. Finding the prime factorization of a composite number will be useful in many topics in this course.

PRIME FACTORIZATION

The **prime factorization** of a number is the product of prime numbers that equals the number.

To find the prime factorization of a composite number, find any two factors of the number and use them to create two branches. If a factor is prime, that branch is complete. Circle that prime. Otherwise it is easy to lose track of the prime numbers.

If the factor is not prime, find two factors of the number and continue the process. Once all the branches have circled primes at the end, the factorization is complete. The composite number can now be written as a product of prime numbers.

Example 13.7.2.4: How to Find the Prime Factorization of a Composite Number

Factor 48.

Answer

Step 1. Find two factors whose product is the given number. Use these numbers to create two branches.	$48 = 2 \cdot 24$	
Step 2. If a factor is prime, that branch is complete. Circle the prime.	2 is prime. Circle the prime.	
Step 3. If a factor is not prime, write it as the product of two factors and continue the process.	24 is not prime. Break it into 2 more factors. 4 and 6 are not prime. Break them each into two factors. 2 and 3 are prime, so circle them.	 
We say $2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$ is the prime factorization of 48. We generally write the primes in ascending order. Be sure to multiply the factors to verify your answer.$2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$ is the prime factorization of 48. We generally write the primes in ascending order. Be sure to multiply the factors to verify your answer.

If we first factored 48 in a different way, for example as $6 \cdot 8$, the result would still be the same. Finish the prime factorization and verify this for yourself.

Exercise 13.7.2.4

Find the prime factorization of 80.

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 5$

Example 13.7.2.6

Find the prime factorization of 60.

Answer

$2 \cdot 2 \cdot 3 \cdot 5$

FIND THE PRIME FACTORIZATION OF A COMPOSITE NUMBER

1. Find two factors whose product is the given number, and use these numbers to create two branches.
2. If a factor is prime, that branch is complete. Circle the prime, like a leaf on the tree.
3. If a factor is not prime, write it as the product of two factors and continue the process.
4. Write the composite number as the product of all the circled primes.

One of the reasons we look at primes is to use these techniques to find the **least common multiple** of two numbers. This will be useful when we add and subtract fractions with different denominators.

LEAST COMMON MULTIPLE

The **least common multiple (LCM)** of two numbers is the smallest number that is a multiple of both numbers.

To find the least common multiple of two numbers we will use the Prime Factors Method. Let's find the LCM of 12 and 18 using their prime factors.

Example 13.7.2.7: How to Find the Least Common Multiple Using the Prime Factors Method

Find the least common multiple (LCM) of 12 and 18 using the prime factors method.

Answer

Step 1. Write each number as a product of primes.		Step 2. List the primes of each number. Match primes vertically when possible.	List the primes of 12. List the primes of 18. Line up with the primes of 12 when possible. If not create a new column.	$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$
Step 3. Bring down the number from each column.		$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$ $\text{LCM} = 2 \cdot 2 \cdot 3 \cdot 3$
Step 4. Multiply the factors.		LCM = 36

Notice that the prime factors of 12 $(2 \cdot 2 \cdot 3)$ and the prime factors of 18 $(2 \cdot 3 \cdot 3)$ are included in the LCM $(2 \cdot 2 \cdot 3 \cdot 3)$. So 36 is the least common multiple of 12 and 18.

By matching up the common primes, each common prime factor is used only once. This way you are sure that 36 is the *least* common multiple.

Find the LCM of 9 and 12 using the Prime Factors Method.

Answer

36

Example 13.7.2.9

Find the LCM of 18 and 24 using the Prime Factors Method.

Answer

72

FIND THE LEAST COMMON MULTIPLE USING THE PRIME FACTORS METHOD

1. Write each number as a product of primes.
2. List the primes of each number. Match primes vertically when possible.
3. Bring down the columns.
4. Multiply the factors.

Use Variables and Algebraic Symbols

In algebra, we use a letter of the alphabet to represent a number whose value may change. We call this a **variable** and letters commonly used for variables are x, y, a, b, and c.

VARIABLE

A **variable** is a letter that represents a number whose value may change.

A number whose value always remains the same is called a **constant**.

CONSTANT

A **constant** is a number whose value always stays the same.

To write algebraically, we need some operation symbols as well as numbers and variables. There are several types of symbols we will be using. There are four basic arithmetic operations: addition, subtraction, multiplication, and division. We'll list the symbols used to indicate these operations below.

OPERATION SYMBOLS

Operation	Notation	Say:	The result is…
Addition	$a+b$	a plus b	the sum of a and b
Subtraction	$a-b$	a minus b	the difference of a and b
Multiplication	$a \cdot b$, ab, $(a)(b)$, $(a)b$, $a(b)$	a times b	the product of a and b
Division	$a \div b$, a/b, $\frac{a}{b}$, $b\overline{)a}$	a divided by b	the quotient of a and b; a is called the dividend, and b is called the divisor

When two quantities have the same value, we say they are equal and connect them with an equal sign.

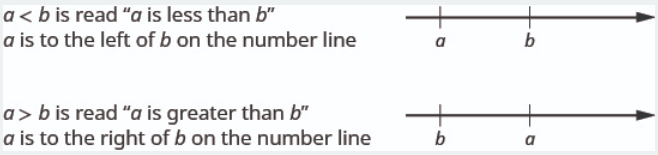
EQUALITY SYMBOL

$a = b$ is read "a is equal to b."

The symbol "$=$" is called the equal sign.

On the number line, the numbers get larger as they go from left to right. The number line can be used to explain the symbols "<" and ">".

INEQUALITY



The expressions $a < b$ or $a > b$ can be read from left to right or right to left, though in English we usually read from left to right. In general,

$$a < b \text{ is equivalent to } b > a. \text{ For example, } 7 < 11 \text{ is equivalent to } 11 > 7. \tag{13.7.2.1}$$

$$a > b \text{ is equivalent to } b < a. \text{ For example, } 17 > 4 \text{ is equivalent to } 4 < 17. \tag{13.7.2.2}$$

INEQUALITY SYMBOLS

Inequality Symbols	Words
$a \neq b$	a is *not equal to* b.
$a < b$	a is *less than* b.
$a \leq b$	a is *less than or equal to* b.
$a > b$	a is *greater than* b.
$a \geq b$	a is *greater than or equal to* b.

Grouping symbols in algebra are much like the commas, colons, and other punctuation marks in English. They help identify an expression, which can be made up of number, a variable, or a combination of numbers and variables using operation symbols. We will introduce three types of grouping symbols now.

GROUPING SYMBOLS

$$\begin{array}{ll} \text{Parentheses} & () \\ \text{Brackets} & [] \\ \text{Braces} & \{\} \end{array} \tag{13.7.2.3}$$

Here are some examples of expressions that include grouping symbols. We will simplify expressions like these later in this section.

$$8(14-8) \qquad 21-3[2+4(9-8)] \qquad 24 \div \{13-2[1(6-5)+4]\} \tag{13.7.2.4}$$

What is the difference in English between a phrase and a sentence? A phrase expresses a single thought that is incomplete by itself, but a sentence makes a complete statement. A sentence has a subject and a verb. In algebra, we have *expressions* and *equations*.

EXPRESSION

An **expression** is a number, a variable, or a combination of numbers and variables using operation symbols.

Expression	**Words**	**English Phrase**
$3+5$	3 plus 5	the sum of three and five
$n-1$	n minus one	the difference of n and one
$6 \cdot 7$	6 times 7	the product of six and seven
$\frac{x}{y}$	x divided by y	the quotient of x and y

(13.7.2.5)

Notice that the English phrases do not form a complete sentence because the phrase does not have a verb.

An equation is two expressions linked by an equal sign. When you read the words the symbols represent in an equation, you have a complete sentence in English. The equal sign gives the verb.

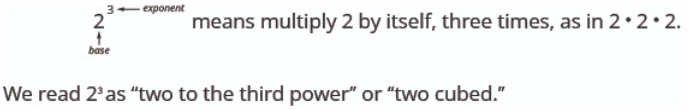
EQUATION

An **equation** is two expressions connected by an equal sign.

Equation	English Sentence
$3+5=8$	The sum of three and five is equal to eight.
$n-1=14$	n minus one equals fourteen.
$6\cdot 7=42$	The product of six and seven is equal to forty-two.
$x=53$	x is equal to fifty-three.
$y+9=2y-3$	y plus nine is equal to two y minus three.

(13.7.2.6)

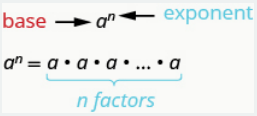
Suppose we need to multiply 2 nine times. We could write this as $2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2$. This is tedious and it can be hard to keep track of all those 2s, so we use exponents. We write $2\cdot 2\cdot 2$ as 2^3 and $2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2\cdot 2$ as 2^9. In expressions such as 2^3, the 2 is called the *base* and the 3 is called the *exponent*. The **exponent** tells us how many times we need to multiply the **base**.



EXPONENTIAL NOTATION

We say 2^3 is in *exponential notation* and $2\cdot 2\cdot 2$ is in *expanded notation*.

a^n means multiply n factors of the number a.



The expression a^n is read a to the n^{th} power.

While we read a^n as "a to the n^{th} power", we usually read:

a^2 "a squared"
a^3 "a cubed"

(13.7.2.7)

We'll see later why a^2 and a^3 have special names.

Table shows how we read some expressions with exponents.

Expression	In Words	
7^2	7 to the second power or	7 squared
5^3	5 to the third power or	5 cubed
9^4	9 to the fourth power	
12^5	12 to the fifth power	

Simplify Expressions Using the Order of Operations

To **simplify an expression** means to do all the math possible. For example, to simplify $4\cdot 2+1$ we would first multiply $4\cdot 2$ to get 8 and then add the 1 to get 9. A good habit to develop is to work down the page, writing each step of the process below the previous step. The example just described would look like this:

$$\begin{array}{l} 4 \cdot 2+1 \\ 8+1 \\ 9 \end{array} \tag{13.7.2.8}$$

By not using an equal sign when you simplify an expression, you may avoid confusing expressions with equations.

SIMPLIFY AN EXPRESSION

To **simplify an expression**, do all operations in the expression.

We've introduced most of the symbols and notation used in algebra, but now we need to clarify the **order of operations**. Otherwise, expressions may have different meanings, and they may result in different values.

For example, consider the expression $4+3 \cdot 7$. Some students simplify this getting 49, by adding $4+3$ and then multiplying that result by 7. Others get 25, by multiplying $3 \cdot 7$ first and then adding 4.

The same expression should give the same result. So mathematicians established some guidelines that are called the order of operations.

USE THE ORDER OF OPERATIONS.

1. Parentheses and Other Grouping Symbols
   - Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. Exponents
   - Simplify all expressions with exponents.
3. Multiplication and Division
   - Perform all multiplication and division in order from left to right. These operations have equal priority.
4. Addition and Subtraction
   - Perform all addition and subtraction in order from left to right. These operations have equal priority.

Students often ask, "How will I remember the order?" Here is a way to help you remember: Take the first letter of each key word and substitute the silly phrase "Please Excuse My Dear Aunt Sally".

$$\begin{array}{ll} \text{Parentheses} & \text{Please} \\ \text{Exponents} & \text{Excuse} \\ \text{Multiplication Division} & \text{My Dear} \\ \text{Addition Subtraction} & \text{Aunt Sally} \end{array} \tag{13.7.2.9}$$

It's good that "**M**y **D**ear" goes together, as this reminds us that **m**ultiplication and **d**ivision have equal priority. We do not always do multiplication before division or always do division before multiplication. We do them in order from left to right.

Similarly, "**A**unt **S**ally" goes together and so reminds us that **a**ddition and **s**ubtraction also have equal priority and we do them in order from left to right.

Example 13.7.2.10

Simplify: $18 \div 6+4(5-2)$.

Answer

	$18 \div 6+4(5-2)$
Parentheses? Yes, subtract first.	$18 \div 6+4(3)$
Exponents? No.	
Multiplication or division? Yes.	
Divide first because we multiply and divide left to right.	$3+4(3)$

Any other multiplication or division? Yes.	
Multiply.	$3 + 12$
Any other multiplication of division? No.	
Any addition or subtraction? Yes.	
Add.	15

Example 13.7.2.11

Simplify: $30 \div 5 + 10(3 - 2)$.

Answer

16

Example 13.7.2.12

Simplify: $70 \div 10 + 4(6 - 2)$.

Answer

23

When there are multiple grouping symbols, we simplify the innermost parentheses first and work outward.

Example 13.7.2.13

Simplify: $5 + 2^3 + 3[6 - 3(4 - 2)]$.

Answer

	$5 + 2^3 + 3[6 - 3(4 - 2)]$
Are there any parentheses (or other grouping symbols)? Yes.	$5 + 2^3 + 3[6 - 3(4 - 2)]$
Focus on the parentheses that are inside the brackets. Subtract.	$5 + 2^3 + 3[6 - 3(2)]$
Continue inside the brackets and multiply.	$5 + 2^3 + 3[6 - 6]$
Continue inside the brackets and subtract.	$5 + 2^3 + 3[0]$
The expression inside the brackets requires no further simplification.	
Are there any exponents? Yes. Simplify exponents.	$5 + 8 + 3[0]$
Is there any multiplication or division? Yes.	
Multiply.	$5 + 8 + 0$
Is there any addition of subtraction? Yes.	
Add.	$13 + 0$
Add.	13

Example 13.7.2.14

Simplify: $9+5^3-[4(9+3)]$.

Answer

86

Example 13.7.2.15

Simplify: $7^2-2[4(5+1)]$.

Answer

1

Evaluate an Expression

In the last few examples, we simplified expressions using the order of operations. Now we'll evaluate some expressions—again following the order of operations. To **evaluate an expression** means to find the value of the expression when the variable is replaced by a given number.

EVALUATE AN EXPRESSION

To **evaluate an expression** means to find the value of the expression when the variable is replaced by a given number.

To evaluate an expression, substitute that number for the variable in the expression and then simplify the expression.

Evaluate when $x=4$: a. x^2 b. 3^x c. $2x^2+3x+8$.

Answer

a.

	x^2
Replace x with 4.	4^2
Use definition of exponent.	$4 \cdot 4$
Simplify.	16

b.

	3^x
Replace x with 4.	3^4
Use definition of exponent.	$3 \cdot 3 \cdot 3 \cdot 3$
Simplify.	81

c.

	$2x^2+3x+8$
Replace x with 4.	$2(4)^2+3(4)+8$
Follow the order of operations.	$2(16)+3(4)+8$
	$32+12+8$

52

Evaluate when $x = 3$, a. x^2 b. 4^x c. $3x^2 + 4x + 1$.

Answer

a. 9
b. 64
c. 40

Example 13.7.2.18

Evaluate when $x = 6$, a. x^3 b. 2^x c. $6x^2 - 4x - 7$.

Answer

a. 216
b. 64
c. 185

Identify and Combine Like Terms

Algebraic expressions are made up of terms. A **term** is a constant, or the product of a constant and one or more variables.

TERM

A **term** is a constant or the product of a constant and one or more variables.

Examples of terms are 7, y, $5x^2$, $9a$, and b^5.

The constant that multiplies the variable is called the **coefficient**.

COEFFICIENT

The **coefficient** of a term is the constant that multiplies the variable in a term.

Think of the coefficient as the number in front of the variable. The coefficient of the term $3x$ is 3. When we write x, the coefficient is 1, since $x = 1 \cdot x$.

Some terms share common traits. When two terms are constants or have the same variable and exponent, we say they are **like terms**.

Look at the following 6 terms. Which ones seem to have traits in common?

$$5x \quad 7 \quad n^2 \quad 4 \quad 3x \quad 9n^2 \tag{13.7.2.10}$$

We say,

7 and 4 are like terms.

$5x$ and $3x$ are like terms.

n^2 and $9n^2$ are like terms.

LIKE TERMS

Terms that are either constants or have the same variables raised to the same powers are called **like terms.**

If there are like terms in an expression, you can simplify the expression by combining the like terms. We add the coefficients and keep the same variable.

$$\begin{array}{ll} \text{Simplify.} & 4x+7x+x \\ \text{Add the coefficients.} & 12x \end{array} \qquad (13.7.2.11)$$

ExAMPLE 13.7.2.19: How To Combine Like Terms

Simplify: $2x^2+3x+7+x^2+4x+5$.

Answer

Step 1. Identify the like terms.	$2x^2+3x+7+x^2+4x+5$ $2x^2+3x+7+x^2+4x+5$ $2x^2+3x+7+x^2+4x+5$
Step 2. Rearrange the expression so the like terms are together.	$2x^2+x^2+3x+4x+7+5$ $2x^2+x^2+3x+4x+7+5$
Step 3. Combine like terms.	$3x^2+7x+12$

Simplify: $3x^2+7x+9+7x^2+9x+8$.

Answer

$10x^2+16x+17$

ExAMPLE 13.7.2.21

Simplify: $4y^2+5y+2+8y^2+4y+5$.

Answer

$12y^2+9y+7$

COMBINE LIKE TERMS.

1. Identify like terms.
2. Rearrange the expression so like terms are together.
3. Add or subtract the coefficients and keep the same variable for each group of like terms.

Translate an English Phrase to an Algebraic Expression

We listed many operation symbols that are used in algebra. Now, we will use them to translate English phrases into algebraic expressions. The symbols and variables we've talked about will help us do that. Table summarizes them.

Operation	Phrase	Expression

Operation	Phrase	Expression
Addition	a plus b the sum of a and b a increased by b b more than a the total of a and b b added to a	$a+b$
Subtraction	a minus b the difference of a and b a decreased by b b less than a b subtracted from a	$a-b$
Multiplication	a times b the product of a and b twice a	$a \cdot b,\ ab,\ a(b),\ (a)(b)$ $2a$
Division	a divided by b the quotient of a and b the ratio of a and b b divided into a	$a \div b,\ a/b,\ \frac{a}{b},\ b\overline{)a}$

Look closely at these phrases using the four operations:

the **sum** *of a and b*

the **difference** *of a and b*

the **product** *of a and b*

the **quotient** *of a and b*

Each phrase tells us to operate on two numbers. Look for the words *of* and *and* to find the numbers.

? Example 13.7.2.22

Each phrase tells us to operate on two numbers. Look for the words *of* and *and* to find the numbers.

Translate each English phrase into an algebraic expression:

a. the difference of $14x$ and 9

b. the quotient of $8y^2$ and 3

c. twelve more than y

d. seven less than $49x^2$

Answer

a. The key word is *difference*, which tells us the operation is subtraction. Look for the words *of* and *and* to find the numbers to subtract.

the *difference of* 14*x* *and* 9

14*x* minus 9

14*x* – 9

b. The key word is *quotient*, which tells us the operation is division.

the *quotient of* $8y^2$ *and* 3
divide $8y^2$ by 3
$8y^2 \div 3$
This can also be written $8y^2/3$ or $\frac{8y^2}{3}$.

c. The key words are *more than*. They tell us the operation is addition. *More than* means "added to."

$$\begin{gathered} \text{twelve more than } y \\ \text{twelve added to } y \\ y+12 \end{gathered} \tag{13.7.2.12}$$

d. The key words are *less than*. They tell us to subtract. *Less than* means "subtracted from."

$$\begin{gathered} \text{seven less than } 49x^2 \\ \text{seven subtracted from } 49x^2 \\ 49x^2-7 \end{gathered} \tag{13.7.2.13}$$

? Exercise 13.7.2.23

Translate the English phrase into an algebraic expression:

a. the difference of $14x^2$ and 13

b. the quotient of $12x$ and 2

c. 13 more than z

d. 18 less than $8x$

Answer

a. $14x^2-13$ b. $12x \div 2$

c. $z+13$ d. $8x-18$

? Example 13.7.2.24

Translate the English phrase into an algebraic expression:

a. the sum of $17y^2$ and 19

b. the product of 7 and y

c. Eleven more than x

d. Fourteen less than $11a$

Answer

a. $17y^2+19$ b. $7y$

c. $x+11$ d. $11a-14$

We look carefully at the words to help us distinguish between multiplying a sum and adding a product.

? Example 13.7.2.25

Translate the English phrase into an algebraic expression:

a. eight times the sum of x and y

b. the sum of eight times x and y

Answer

There are two operation words—*times* tells us to multiply and *sum* tells us to add.

a. Because we are multiplying 8 times the sum, we need parentheses around the sum of x and y, $(x+y)$. This forces us to determine the sum first. (Remember the order of operations.)

$$\begin{array}{c}\text{eight times the sum of } x \text{ and } y \\ 8(x+y)\end{array} \tag{13.7.2.14}$$

b. To take a sum, we look for the words *of* and *and* to see what is being added. Here we are taking the sum *of* eight times x and y.

the sum *of* eight times *x and y*

$8x + y$

? Example 13.7.2.26

Translate the English phrase into an algebraic expression:

a. four times the sum of p and q

b. the sum of four times p and q

Answer

a. $4(p+q)$ b. $4p+q$

? Example 13.7.2.27

Translate the English phrase into an algebraic expression:

a. the difference of two times x and 8

b. two times the difference of x and 8

Answer

a. $2x-8$ b. $2(x-8)$

Later in this course, we'll apply our skills in algebra to solving applications. The first step will be to translate an English phrase to an algebraic expression. We'll see how to do this in the next two examples.

? Example 13.7.2.28

The length of a rectangle is 14 less than the width. Let w represent the width of the rectangle. Write an expression for the length of the rectangle.

Answer

$$\begin{array}{ll}\text{Write a phrase about the length of the rectangle.} & 14 \text{ less than the width} \\ \text{Substitute } w \text{ for "the width."} & w \\ \text{Rewrite less than as subtracted from.} & 14 \text{ subtracted from } w \\ \text{Translate the phrase into algebra.} & w-14\end{array} \tag{13.7.2.15}$$

Example 13.7.2.29

The length of a rectangle is 7 less than the width. Let w represent the width of the rectangle. Write an expression for the length of the rectangle.

Answer

$w-7$

Example 13.7.2.30

The width of a rectangle is 6 less than the length. Let l represent the length of the rectangle. Write an expression for the width of the rectangle.

Answer

$l-6$

The expressions in the next example will be used in the typical coin mixture problems we will see soon.

Example 13.7.2.31

June has dimes and quarters in her purse. The number of dimes is seven less than four times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Answer

Write a phrase about the number of dimes.	7 less than 4 times q	
Translate 4 times q.	7 less than $4q$	(13.7.2.16)
Translate the phrase into algebra.	$4q-7$	

Example 13.7.2.32

Geoffrey has dimes and quarters in his pocket. The number of dimes is eight less than four times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Answer

$4q-8$

Example 13.7.2.33

Lauren has dimes and nickels in her purse. The number of dimes is three more than seven times the number of nickels. Let n represent the number of nickels. Write an expression for the number of dimes.

Answer

$7n+3$

Key Concepts

- **Divisibility Tests**
  A number is divisible by:
  2 if the last digit is 0, 2, 4, 6, or 8.
  3 if the sum of the digits is divisible by 3.
  5 if the last digit is 5 or 0.

6 if it is divisible by both 2 and 3.
10 if it ends with 0.

- **How to find the prime factorization of a composite number.**
  1. Find two factors whose product is the given number, and use these numbers to create two branches.
  2. If a factor is prime, that branch is complete. Circle the prime, like a bud on the tree.
  3. If a factor is not prime, write it as the product of two factors and continue the process.
  4. Write the composite number as the product of all the circled primes.
- **How To Find the least common multiple using the prime factors method.**
  1. Write each number as a product of primes.
  2. List the primes of each number. Match primes vertically when possible.
  3. Bring down the columns.
  4. Multiply the factors.
- **Equality Symbol**
  $a = b$ is read " a is equal to b." The symbol "=" is called the equal sign.
- $a < b$ is read "a is less than b"
  a is to the left of b on the number line

- $a > b$ is read "a is greater than b"
  a is to the right of b on the number line

- **Inequality Symbols**

Inequality Symbols	Words
$a \neq b$	a is *not equal to* b.
$a < b$	a is *less than* b.
$a \leq b$	a is *less than or equal to* b.
$a > b$	a is *greater than* b.
$a \geq b$	a is *greater than or equal to* b.

- **Grouping Symbols**

Parentheses	$()$
Brackets	$[]$
Braces	$\{\}$

- **Exponential Notation** a^n means multiply a by itself, n times. The expression an is read a to the n^{th} power.
- **Simplify an Expression**
  To simplify an expression, do all operations in the expression.
- **How to use the order of operations.**
  1. Parentheses and Other Grouping Symbols
     - Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
  2. Exponents
     - Simplify all expressions with exponents.
  3. Multiplication and Division
     - Perform all multiplication and division in order from left to right. These operations have equal priority.
  4. Addition and Subtraction
     - Perform all addition and subtraction in order from left to right. These operations have equal priority.
- **How to combine like terms.**
  1. Identify like terms.
  2. Rearrange the expression so like terms are together.
  3. Add or subtract the coefficients and keep the same variable for each group of like terms.

Operation	Phrase	Expression
Addition	a plus b the sum of a and b a increased by b b more than a the total of a and b b added to a	$a+b$
Subtraction	a minus b the difference of a and b a decreased by b b less than a b subtracted from a	$a-b$
Multiplication	a times b the product of a and b twice a	$a \cdot b,\ ab,\ a(b),\ (a)(b)$ $2a$
Division	a divided by b the quotient of a and b the ratio of a and b b divided into a	$a \div b,\ a/b,\ \frac{a}{b},\ b\overline{)a}$

Glossary

coefficient

The coefficient of a term is the constant that multiplies the variable in a term.

composite number

A composite number is a counting number that is not prime. It has factors other than 1 and the number itself.

constant

A constant is a number whose value always stays the same.

divisible by a number

If a number m is a multiple of n, then m is divisible by n.

equation

An equation is two expressions connected by an equal sign.

evaluate an expression

To evaluate an expression means to find the value of the expression when the variables are replaced by a given number.

expression

An expression is a number, a variable, or a combination of numbers and variables using operation symbols.

factors

If $a \cdot b = m$, then a and b are factors of m.

least common multiple

The least common multiple (LCM) of two numbers is the smallest number that is a multiple of both numbers.

like terms

Terms that are either constants or have the same variables raised to the same powers are called like terms.

multiple of a number

A number is a multiple of n if it is the product of a counting number and n.

order of operations

The order of operations are established guidelines for simplifying an expression.

prime factorization

The prime factorization of a number is the product of prime numbers that equals the number.

prime number

A prime number is a counting number greater than 1 whose only factors are 1 and the number itself.

simplify an expression

To simplify an expression means to do all the math possible.

term

A term is a constant, or the product of a constant and one or more variables.

variable

A variable is a letter that represents a number whose value may change.

13.7.2E: Exercises

Practice Makes Perfect

Identify Multiples and Factors

In the following exercises, use the divisibility tests to determine whether each number is divisible by 2, by 3, by 5, by 6, and by 10.

1. 84

Answer

Divisible by 2, 3, 6

2. 96

3. 896

Answer

Divisible by 2

4. 942

5. $22,335$

Answer

Divisible by 3, 5

6. $39,075$

Find Prime Factorizations and Least Common Multiples

In the following exercises, find the prime factorization.

7. 86

Answer

$2 \cdot 43$

8. 78

9. 455

Answer

$5 \cdot 7 \cdot 13$

10. 400

11. 432

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 3 \cdot 3 \cdot 3$

12. 627

In the following exercises, find the least common multiple of each pair of numbers using the prime factors method.

13. $8,\ 12$

Answer

24

14. $12,\ 16$

15. $28,\ 40$

Answer

280

16. $84,\ 90$

17. $55,\ 88$

Answer

440

18. $60,\ 72$

Simplify Expressions Using the Order of Operations

In the following exercises, simplify each expression.

19. $2^3 - 12 \div (9 - 5)$

Answer

5

20. $3^2 - 18 \div (11 - 5)$

21. $2 + 8(6 + 1)$

Answer

58

22. $4 + 6(3 + 6)$

23. $20 \div 4 + 6(5 - 1)$

Answer

29

24. $33 \div 3 + 4(7 - 2)$

25. $3(1 + 9 \cdot 6) - 4^2$

Answer

149

26. $5(2+8\cdot 4)-7^2$

27. $2[1+3(10-2)]$

Answer

50

28. $5[2+4(3-2)]$

29. $8+2[7-2(5-3)]-3^2$

Answer

5

30. $10+3[6-2(4-2)]-2^4$

Evaluate an Expression

In the following exercises, evaluate the following expressions.

31. When $x=2$,

a. x^6

b. 4^x

c. $2x^2+3x-7$

Answer

a. 64
b. 16
c. 7

32. When $x=3$,

a. x^5

b. $5x$

c. $3x^2-4x-8$

33. When $x=4$ and $y=1$

$x^2+3xy-7y^2$

Answer

21

34. When $x=3$ and $y=2$

$6x^2+3xy-9y^2$

35. When $x=10$ and $y=7$

$(x-y)^2$

Answer

9

36. When $a=3$ and $b=8$

a^2+b^2

Simplify Expressions by Combining Like Terms

In the following exercises, simplify the following expressions by combining like terms.

37. $7x+2+3x+4$

Answer

$10x+6$

38. $8y+5+2y-4$

39. $10a+7+5a-2+7a-4$

Answer

$22a+1$

40. $7c+4+6c-3+9c-1$

41. $3x^2+12x+11+14x^2+8x+5$

Answer

$17x^2+20x+16$

42. $5b^2+9b+10+2b^2+3b-4$

Translate an English Phrase to an Algebraic Expression

In the following exercises, translate the phrases into algebraic expressions.

43. a. the difference of $5x^2$ and $6xy$

b. the quotient of $6y^2$ and $5x$

c. Twenty-one more than y^2

d. $6x$ less than $81x^2$

Answer

a. $5x^2-6xy$ b. $\frac{6y^2}{5x}$

c. y^2+21 d. $81x^2-6x$

44. a. the difference of $17x^2$ and $17x^2$ and $5xy$

b. the quotient of $8y^3$ and $3x$

c. Eighteen more than a^2;

d. $11b$ less than $100b^2$

45. a. the sum of $4ab^2$ and $3a^2b$

b. the product of $4y^2$ and $5x$

c. Fifteen more than m

d. $9x$ less than $121x^2$

Answer

a. $4ab^2+3a^2b$ b. $20xy^2$

c. $m+15$ d. $121x^2-9x$

46. a. the sum of $3x^2y$ and $7xy^2$

b. The product of $6xy^2$ and $4z$

c. Twelve more than $3x^2$

d. $7x^2$ less than $63x^3$

47. a. eight times the difference of y and nine

b. the difference of eight times y and 9

Answer

a. $8(y-9)$
b. $8y-9$

48. a. seven times the difference of y and one

b. the difference of seven times y and 1

49. a. five times the sum of $3x$ and y

b. the sum of five times $3x$ and y

Answer

a. $5(3x+y)$
b. $15x+y$

50. a. eleven times the sum of $4x^2$ and $5x$

b. the sum of eleven times $4x^2$ and $5x$

51. Eric has rock and country songs on his playlist. The number of rock songs is 14 more than twice the number of country songs. Let c represent the number of country songs. Write an expression for the number of rock songs.

Answer

$2c-14$

52. The number of women in a Statistics class is 8 more than twice the number of men. Let m represent the number of men. Write an expression for the number of women.

53. Greg has nickels and pennies in his pocket. The number of pennies is seven less than three times the number of nickels. Let n represent the number of nickels. Write an expression for the number of pennies.

Answer

$3n-7$

54. Jeannette has $\$5$ and $\$10$ bills in her wallet. The number of fives is three more than six times the number of tens. Let t represent the number of tens. Write an expression for the number of fives.

Writing Exercises

55. Explain in your own words how to find the prime factorization of a composite number.

Answer

Answers will vary.

56. Why is it important to use the order of operations to simplify an expression?

57. Explain how you identify the like terms in the expression $8a^2+4a+9-a^2-1$.

Answer

Answers will vary.

58. Explain the difference between the phrases "4 times the sum of x and y" and "the sum of 4 times x and y".

Self Check

a. Use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
identify multiples and apply divisibility tests.			
find prime factorizations and least common multiples.			
use variables and algebraic symbols.			
simplify expressions using the order of operations.			
evaluate an expression.			
identify and combine like terms.			
translate English phrases to algebraic expressions.			

b. If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

13.7.3: Integers

summary

By the end of this section, you will be able to:

- Simplify expressions with absolute value
- Add and subtract integers
- Multiply and divide integers
- Simplify expressions with integers
- Evaluate variable expressions with integers
- Translate phrases to expressions with integers
- Use integers in applications

A more thorough introduction to the topics covered in this section can be found in the *Elementary Algebra* chapter, Foundations.

Simplify Expressions with Absolute Value

A negative number is a number less than 0. The negative numbers are to the left of zero on the number line (Figure 13.7.3.1).

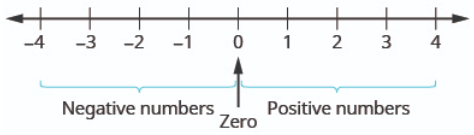

***Figure* 13.7.3.1.** *The number line shows the location of positive and negative numbers.*

You may have noticed that, on the number line, the negative numbers are a mirror image of the positive numbers, with zero in the middle. Because the numbers 2 and -2 are the same distance from zero, each one is called the **opposite** of the other. The opposite of 2 is -2, and the opposite of -2 is 2.

OPPOSITE

The **opposite** of a number is the number that is the same distance from zero on the number line but on the opposite side of zero.

Figure 13.7.3.2illustrates the definition.

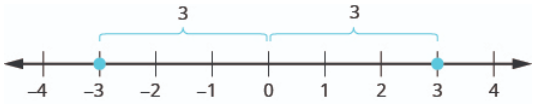

***Figure* 13.7.3.2.** *The opposite of 3 is* -3.

OPPOSITE NOTATION

$$-a \text{ means the opposite of the number } a \qquad (13.7.3.1)$$

$$\text{The notation } -a \text{ is read as "the opposite of } a\text{."} \qquad (13.7.3.2)$$

We saw that numbers such as 3 and -3 are opposites because they are the same distance from 0 on the number line. They are both three units from 0. The distance between 0 and any number on the number line is called the **absolute value** of that number.

Definition: ABSOLUTE VALUE

The **absolute value** of a number is its distance from 0 on the number line.

The absolute value of a number n is written as $|n|$ and $|n| \geq 0$ for all numbers.

> Absolute values are always greater than or equal to zero.

For example,

$$-5 \text{ is } 5 \text{ units away from } 0, \text{ so } |-5| = 5. \tag{13.7.3.3}$$
$$5 \text{ is } 5 \text{ units away from } 0, \text{ so } |5| = 5. \tag{13.7.3.4}$$

Figure 13.7.3.3illustrates this idea.

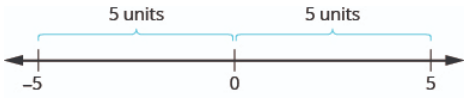

Figure 13.7.3.3: The numbers 5 and −5 are 5 units away from 0.

The absolute value of a number is never negative because distance cannot be negative. The only number with absolute value equal to zero is the number zero itself because the distance from 0 to 0 on the number line is zero units.

In the next example, we'll order expressions with absolute values.

? EXAMPLE 13.7.3.1

Fill in $<$, $>$, or $=$ for each of the following pairs of numbers:

a. $|-5|__-|-5|__-|5|$
b. $8__-|-8|$
c. $-9__-|-9|$
d. (\text{−(−16)__|−16|}\).

Answer

a.

	$\lvert-5\rvert$	__	$-\lvert-5\rvert$
Simplify.	5	__	-5
Order.	5	$>$	-5
	$\lvert-5\rvert$	$>$	$-\lvert-5\rvert$

b.

	8	__	$-\lvert-8\rvert$
Simplify.	8	__	-8
Order.	8	$>$	-8
	8	$>$	$-\lvert-8\rvert$

c.

	-9	__	$-\lvert-9\rvert$
Simplify.	-9	__	-9
Order.	-9	$=$	-9
	-9	$=$	$-\lvert-9\rvert$

d.

	$-(-16)$	__	$-\lvert-16\rvert$
Simplify.	16	__	16
Order.	16	$=$	16
	$-(-16)$	$=$	$\lvert-16\rvert$

EXAMPLE 13.7.3.2

Fill in $<$, $>$, or $=$ for each of the following pairs of numbers:

ⓐ $-9__-|-9|$ ⓑ $2__-|-2|$ ⓒ $-8__|-8|$ ⓓ $-(-9)__|-9|$.

Answer

ⓐ $>$ ⓑ $>$ ⓒ $<$

ⓓ $=$

EXAMPLE 13.7.3.3

Fill in $<$, $>$, or $=$ for each of the following pairs of numbers:

a. $7__-|-7|$
b. $-(-10)__|-10|$
c. $|-4|__-|-4|$
d. $-1__|-1|$.

Answer

ⓐ $>$ ⓑ $=$ ⓒ $>$

ⓓ $<$

We now add absolute value bars to our list of grouping symbols. When we use the order of operations, first we simplify inside the absolute value bars as much as possible, then we take the absolute value of the resulting number.

GROUPING SYMBOLS

Parentheses	()	Braces	{}
Brackets	[]	Absolute value	||

(13.7.3.5)

In the next example, we simplify the expressions inside absolute value bars first just like we do with parentheses.

EXAMPLE 13.7.3.4

Simplify: $24-|19-3(6-2)|$.

Answer

$$24-|19-3(6-2)|$$

Work inside parentheses first:	
subtract 2 from 6.	$24-\|19-3(4)\|$
Multiply $3(4)$.	$24-\|19-12\|$
Subtract inside the absolute value bars.	$24-\|7\|$
Take the absolute value.	$24-7$
Subtract.	17

EXAMPLE 13.7.3.5

Simplify: $19-|11-4(3-1)|$.

Answer

16

? EXAMPLE 13.7.3.6

Simplify: $9-|8-4(7-5)|$.

Answer

9

Add and Subtract Integers

So far in our examples, we have only used the counting numbers and the whole numbers.

$$\begin{array}{ll}\text{Counting numbers} & 1,2,3\ldots \\ \text{Whole numbers} & 0,1,2,3\ldots .\end{array} \tag{13.7.3.6}$$

Our work with opposites gives us a way to define the **integers**. The whole numbers and their opposites are called the integers. The integers are the numbers $\ldots -3,-2,-1,0,1,2,3\ldots$

Definition: INTEGERS

The whole numbers and their opposites are called the **integers**.

The integers are the numbers

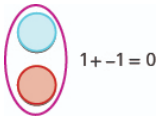
$$\ldots -3,-2,-1,0,1,2,3\ldots , \tag{13.7.3.7}$$

Most students are comfortable with the addition and subtraction facts for positive numbers. But doing addition or subtraction with both positive and negative numbers may be more challenging.

We will use two color counters to model addition and subtraction of negatives so that you can visualize the procedures instead of memorizing the rules.

We let one color (blue) represent positive. The other color (red) will represent the negatives.

If we have one positive counter and one negative counter, the value of the pair is zero. They form a neutral pair. The value of this neutral pair is zero.



We will use the counters to show how to add:

$$5+3 \qquad -5+(-3) \qquad -5+3 \qquad 5+(-3) \tag{13.7.3.8}$$

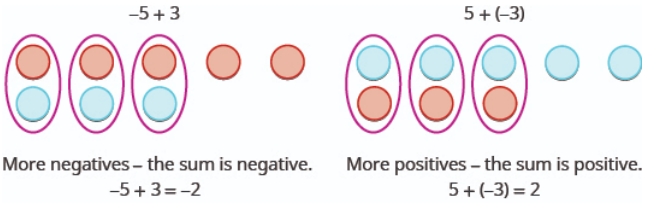
The first example, $5+3,$ adds 5 positives and 3 positives—both positives.

The second example, $-5+(-3),$ adds 5 negatives and 3 negatives—both negatives.

When the signs are the same, the counters are all the same color, and so we add them. In each case we get 8—either 8 positives or 8 negatives.

So what happens when the signs are different? Let's add $-5+3$ and $5+(-3)$.

When we use counters to model addition of positive and negative integers, it is easy to see whether there are more positive or more negative counters. So we know whether the sum will be positive or negative.



EXAMPLE 13.7.3.7

Add: ⓐ $-1+(-4)$ ⓑ $-1+5$ ⓒ $1+(-5)$.

Answer

ⓐ

	–1 + (–4)
1 negative plus 4 negatives is 5 negatives	–5

ⓑ

	–1 + 5
There are more positives, so the sum is positive.	4

ⓒ

	1 + (–5)
	There are more negatives, so the sum is negative.	–4

EXAMPLE 13.7.3.8

Add: ⓐ $-2+(-4)$ ⓑ $-2+4$ ⓒ $2+(-4)$.

Answer

ⓐ -6 ⓑ 2 ⓒ -2

EXAMPLE 13.7.3.9

Add: ⓐ $-2+(-5)$ ⓑ $-2+5$ ⓒ $2+(-5)$.

Answer

ⓐ -7 ⓑ 3 ⓒ -3

We will continue to use counters to model the subtraction. Perhaps when you were younger, you read "$5-3$" as "5 take away 3." When you use counters, you can think of subtraction the same way!

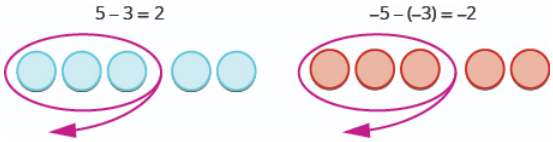
We will use the counters to show to subtract:

$$5-3 \qquad -5-(-3) \qquad -5-3 \qquad 5-(-3) \tag{13.7.3.9}$$

The first example, $5-3$, we subtract 3 positives from 5 positives and end up with 2 positives.

In the second example, $-5-(-3)$, we subtract 3 negatives from 5 negatives and end up with 2 negatives.

Each example used counters of only one color, and the "take away" model of subtraction was easy to apply.



What happens when we have to subtract one positive and one negative number? We'll need to use both blue and red counters as well as some neutral pairs. If we don't have the number of counters needed to take away, we add neutral pairs. Adding a neutral pair does not change the value. It is like changing quarters to nickels—the value is the same, but it looks different.

Let's look at $-5-3$ and $5-(-3)$.

	–5 – 3	5 – (–3)
Model the first number.		
We now add the needed neutral pairs.		
We remove the number of counters modeled by the second number.		Count what is left.		
	–5 – 3 = –8	5 – (–3) = –8
	–8	8

EXAMPLE 13.7.3.10

Subtract: ⓐ $3-1$ ⓑ $-3-(-1)$ ⓒ $-3-1$ ⓓ $3-(-1)$.

Answer

ⓐ

		3 – 1
Take 1 positive from 3 positives and get 2 positives.		2

ⓑ

		–3 – (–1)
Take 1 positive from 3 negatives and get 2 negatives.		–2

ⓒ

		–3 – 1
Take 1 positive from the one added neutral pair.		–4

ⓓ

		3 – (–1)
Take 1 negative from the one added neutral pair.		4

? EXAMPLE 13.7.3.11

Subtract: ⓐ $6-4$ ⓑ $-6-(-4)$ ⓒ $-6-4$ ⓓ $6-(-4)$.

Answer

ⓐ 2 ⓑ -2 ⓒ -10 ⓓ 10

? EXAMPLE 13.7.3.12

Subtract: ⓐ $7-4$ ⓑ $-7-(-4)$ ⓒ $-7-4$ ⓓ $7-(-4)$.

Answer

ⓐ 3 ⓑ -3 ⓒ -11 ⓓ 11

Have you noticed that *subtraction of signed numbers can be done by adding the opposite*? In the last example, $-3-1$ is the same as $-3+(-1)$ and $3-(-1)$ is the same as $3+1$. You will often see this idea, the Subtraction Property, written as follows:

Definition: SUBTRACTION PROPERTY

$$a-b=a+(-b) \tag{13.7.3.10}$$

Subtracting a number is the same as adding its opposite.

EXAMPLE 13.7.3.13

Simplify: ⓐ $13-8$ and $13+(-8)$ ⓑ $-17-9$ and $-17+(-9)$ ⓒ $9-(-15)$ and $9+15$ ⓓ $-7-(-4)$ and $-7+4$.

Answer

ⓐ

	$13-8$	and	$13+(-8)$
Subtract.	5		5

ⓑ

	$-17-9$	and	$-17+(-9)$
Subtract.	-26		-26

ⓒ

	$9-(-15)$	and	$9+15$
Subtract.	24		24

ⓓ

	$-7-(-4)$	and	$-7+4$
Subtract.	-3		-3

EXAMPLE 13.7.3.14

Simplify: ⓐ $21-13$ and $21+(-13)$ ⓑ $-11-7$ and $-11+(-7)$ ⓒ $6-(-13)$ and $6+13$ ⓓ $-5-(-1)$ and $-5+1$.

Answer

ⓐ $8, 8$ ⓑ $-18, -18$

ⓒ $19, 19$ ⓓ $-4, -4$

EXAMPLE 13.7.3.15

Simplify: ⓐ $15-7$ and $15+(-7)$ ⓑ $-14-8$ and $-14+(-8)$ ⓒ $4-(-19)$ and $4+19$ ⓓ $-4-(-7)$ and $-4+7$.

Answer

ⓐ $8, 8$ ⓑ $-22, -22$

ⓒ $23, 23$ ⓓ $3, 3$

What happens when there are more than three integers? We just use the order of operations as usual.

EXAMPLE 13.7.3.16

Simplify: $7-(-4-3)-9$.

Answer

	$7-(-4-3)-9$
Simplify inside the parentheses first.	$7-(-7)-9$
Subtract left to right.	$14-9$
Subtract.	5

Simplify: $8-(-3-1)-9$.

Answer

3

EXAMPLE 13.7.3.18

Simplify: $12-(-9-6)-14$.

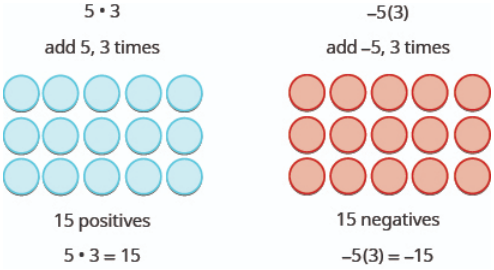
Answer

13

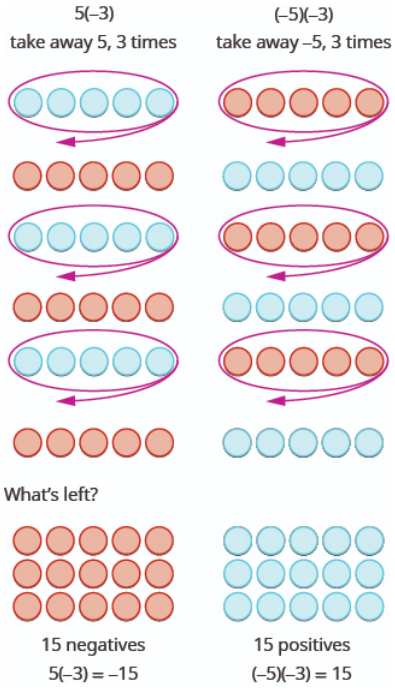
Multiply and Divide Integers

Since multiplication is mathematical shorthand for repeated addition, our model can easily be applied to show multiplication of integers. Let's look at this concrete model to see what patterns we notice. We will use the same examples that we used for addition and subtraction. Here, we are using the model just to help us discover the pattern.

We remember that a·ba·b means **add** *a*, *b* **times**.



The next two examples are more interesting. What does it mean to multiply 5 by −3? It means subtract 5,3 times. Looking at subtraction as "taking away", it means to take away 5, 3 times. But there is nothing to take away, so we start by adding neutral pairs on the workspace.



In summary:

$$\begin{aligned} 5 \cdot 3 &= 15 \qquad -5(3) = -15 \\ 5(-3) &= -15 \quad (-5)(-3) = 15 \end{aligned} \tag{13.7.3.11}$$

Notice that for multiplication of two signed numbers, when the

$$\begin{aligned} &\text{signs are the } \textbf{same}\text{, the product is } \textbf{positive.} \\ &\text{signs are } \textbf{different}\text{, the product is } \textbf{negative.} \end{aligned} \tag{13.7.3.12}$$

What about division? Division is the inverse operation of multiplication. So, $15 \div 3 = 5$ because $15 \cdot 3 = 15$. In words, this expression says that 15 can be divided into 3 groups of 5 each because adding five three times gives 15. If you look at some examples of multiplying integers, you might figure out the rules for dividing integers.

$$\begin{aligned} 5 \cdot 3 &= 15 \quad \text{so} \quad 15 \div 3 = 5 \qquad -5(3) = -15 \quad \text{so} \quad -15 \div 3 = -5 \\ (-5)(-3) &= 15 \quad \text{so} \quad 15 \div (-3) = -5 \qquad 5(-3) = -15 \quad \text{so} \quad -15 \div (-3) = 5 \end{aligned} \tag{13.7.3.13}$$

Division follows the same rules as multiplication with regard to signs.

MULTIPLICATION AND DIVISION OF SIGNED NUMBERS

For multiplication and division of two signed numbers:

Same signs	Result
• Two positives	Positive
• Two negatives	Positive

If the signs are the same, the result is positive.

Different signs	Result
• Positive and negative	Negative
• Negative and positive	Negative

If the signs are different, the result is negative.

EXAMPLE 13.7.3.19

Multiply or divide: ⓐ $-100 \div (-4)$ ⓑ $7 \cdot 6$ ⓒ $4(-8)$ ⓓ $-27 \div 3$.

Answer

ⓐ

$$-100 \div (-4)$$

Divide, with signs that are the same the quotient is positive. 25

ⓑ

$$7 \cdot 6$$

Multiply, with same signs. 42

ⓒ

$$4(-8)$$

Multiply, with different signs. -32

ⓓ

$$-27 \div 3$$

Divide, with different signs, the quotient is negative. -9

EXAMPLE 13.7.3.20

Multiply or divide: ⓐ $-115 \div (-5)$ ⓑ $5 \cdot 12$ ⓒ $9(-7)$ ⓓ $-63 \div 7$.

Answer

ⓐ 23 ⓑ 60 ⓒ −63 ⓓ −9

?

Multiply or divide: ⓐ $-117 \div (-3)$ ⓑ $3 \cdot 13$ ⓒ $7(-4)$ ⓓ $-42 \div 6$.

Answer

ⓐ 39 ⓑ 39 ⓒ −28 ⓓ −7

When we multiply a number by 1, the result is the same number. Each time we multiply a number by -1, we get its opposite!

MULTIPLICATION BY −1

$$-1a = -a \tag{13.7.3.14}$$

Multiplying a number by -1 gives its opposite.

Simplify Expressions with Integers

What happens when there are more than two numbers in an expression? The order of operations still applies when negatives are included. Remember Please Excuse My Dear Aunt Sally?

Let's try some examples. We'll simplify expressions that use all four operations with integers—addition, subtraction, multiplication, and division. Remember to follow the order of operations.

EXAMPLE 13.7.3.22

Simplify: ⓐ $(-2)^4$ ⓑ -2^4.

Answer

Notice the difference in parts (a) and (b). In part (a), the exponent means to raise what is in the parentheses, the −2 to the 4^{th}power. In part (b), the exponent means to raise just the 2 to the 4^{th} power and then take the opposite.

ⓐ

	$(-2)^4$
Write in expanded form.	$(-2)(-2)(-2)(-2)$
Multiply.	$4(-2)(-2)$
Multiply.	$-8(-2)$
Multiply.	16

ⓑ

	-2^4
Write in expanded form.	$-(2\cdot 2\cdot 2\cdot 2)$
We are asked to find the opposite of 24.	
Multiply.	$-(4\cdot 2\cdot 2)$
Multiply.	$-(8\cdot 2)$
Multiply.	-16

?

Simplify: ⓐ $(-3)^4$ ⓑ -3^4.

Answer

ⓐ 81 ⓑ −81

EXAMPLE 13.7.3.24

Simplify: ⓐ $(-7)^2$ ⓑ -7^2.

Answer

ⓐ 49 ⓑ −49

The last example showed us the difference between $(-2)^4$ and -2^4. This distinction is important to prevent future errors. The next example reminds us to multiply and divide in order left to right.

EXAMPLE 13.7.3.25

Simplify: ⓐ $8(-9)\div(-2)^3$ ⓑ $-30\div 2+(-3)(-7)$.

Answer

ⓐ

	$8(-9)\div(-2)^3$
Exponents first.	$8(-9)\div(-8)$
Multiply.	$-72\div(-8)$
Divide.	9

ⓑ

	$-30 \div 2 + (-3)(-7)$
Multiply and divide left to right, so divide first.	$-15 + (-3)(-7)$
Multiply.	$-15 + 21$
Add.	6

?

Simplify: ⓐ $12(-9) \div (-3)^3$ ⓑ $-27 \div 3 + (-5)(-6)$.

Answer

ⓐ 4 ⓑ 21

? EXAMPLE 13.7.3.27

Simplify: ⓐ $18(-4) \div (-2)^3$ ⓑ $-32 \div 4 + (-2)(-7)$.

Answer

ⓐ 9 ⓑ 6

Evaluate Variable Expressions with Integers

Remember that to evaluate an expression means to substitute a number for the variable in the expression. Now we can use negative numbers as well as positive numbers.

? EXAMPLE 13.7.3.28

Evaluate $4x^2 - 2xy + 3y^2$ when $x = 2, y = -1$.

Answer

	$4x^2 - 2xy + 3y^2$
Substitute $x = 2$, $y = -1$. Use parentheses to show multiplication.	$4(2)^2 - 2(2)(-1) + 3(-1)^2$
Simplify exponents.	$4 \cdot 4 - (-4) + 3 \cdot 1$
Multiply.	$16 - (-4) + 3$
Subtract.	$20 + 3$
Add.	23

? EXAMPLE 13.7.3.29

Evaluate: $3x^2 - 2xy + 6y^2$ when $x = 1, y = -2$.

Answer

31

? EXAMPLE 13.7.3.30

Evaluate: $4x^2 - xy + 5y^2$ when $x = -2, y = 3$.

Answer

67

Translate Phrases to Expressions with Integers

Our earlier work translating English to algebra also applies to phrases that include both positive and negative numbers.

? EXAMPLE 13.7.3.31

Translate and simplify: the sum of 8 and −12, increased by 3.

Answer

	the **sum** of -8 and -12 increased by 3
Translate.	$[8 + (-12)] + 3$
Simplify. Be careful not to confuse the brackets with an absolute value sign.	$(-4) + 3$
Add.	-1

? EXAMPLE 13.7.3.32

Translate and simplify the sum of 9 and −16, increased by 4.

Answer

$(9 + (-16)) + 4; -3$

? EXAMPLE 13.7.3.33

Translate and simplify the sum of −8 and −12, increased by 7.

Answer

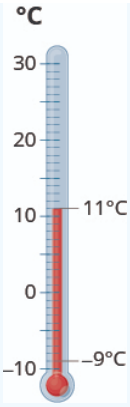
$(-8 + (-12)) + 7; -13$

Use Integers in Applications

We'll outline a plan to solve applications. It's hard to find something if we don't know what we're looking for or what to call it! So when we solve an application, we first need to determine what the problem is asking us to find. Then we'll write a phrase that gives the information to find it. We'll translate the phrase into an expression and then simplify the expression to get the answer. Finally, we summarize the answer in a sentence to make sure it makes sense.

? EXAMPLE 13.7.3.34: How to Solve Application Problems Using Integers

The temperature in Kendallville, Indiana one morning was 11 degrees. By mid-afternoon, the temperature had dropped to −9−9degrees. What was the difference in the morning and afternoon temperatures?



Answer

Step 1. Read the problem. Make sure all the words and ideas are understood.	
Step 2. Identify what we are asked to find.	The difference of the morning and afternoon temperatures
Step 3. Write a phrase that gives the information to find it.	the difference *of* 11 *and* –9
Step 4. Translate the phrase to an expression.	11 – (–9)
Step 5. Simplify the expression.	20
Step 6. Answer the question with a complete sentence.	The difference in temperatures was 20 degrees.

EXAMPLE 13.7.3.35

The temperature in Anchorage, Alaska one morning was 15 degrees. By mid-afternoon the temperature had dropped to 30 degrees below zero. What was the difference in the morning and afternoon temperatures?

Answer

The difference in temperatures was 45 degrees Fahrenheit.

EXAMPLE 13.7.3.36

The temperature in Denver was −6 degrees at lunchtime. By sunset the temperature had dropped to −15 degrees. What was the difference in the lunchtime and sunset temperatures?

Answer

The difference in temperatures was 9 degrees.

USE INTEGERS IN APPLICATIONS.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are asked to find.
3. **Write a phrase** that gives the information to find it.

4. **Translate** the phrase to an expression.
5. **Simplify** the expression.
6. **Answer** the question with a complete sentence.

Access this online resource for additional instruction and practice with integers.

- Subtracting Integers with Counters

Key Concepts

- $$-a \text{ means the opposite of the number } a \quad (13.7.3.15)$$
  $$\text{The notation } -a \text{ is read as "the opposite of } a." \quad (13.7.3.16)$$
- The absolute value of a number is its distance from 0 on the number line.

  The absolute value of a number *n* is written as $|n|$ and $|n| \geq 0$ for all numbers.

  Absolute values are always greater than or equal to zero.
- $$\begin{array}{llll} \text{Parentheses} & () & \text{Braces} & \{\} \\ \text{Brackets} & [] & \text{Absolute value} & || \end{array} \quad (13.7.3.17)$$
- **Subtraction Property**
  $a-b=a+(-b)$
  Subtracting a number is the same as adding its opposite.
- For multiplication and division of two signed numbers:

Same signs	Result
• Two positives	Positive
• Two negatives	Positive

If the signs are the same, the result is positive.

Different signs	Result
• Positive and negative	Negative
• Negative and positive	Negative

If the signs are different, the result is negative.

- **Multiplication by** -1

  $-1a=-a$

  Multiplying a number by -1 gives its opposite.
- **How to Use Integers in Applications.**
  1. **Read** the problem. Make sure all the words and ideas are understood
  2. **Identify** what we are asked to find.
  3. **Write a phrase** that gives the information to find it.
  4. **Translate** the phrase to an expression.
  5. **Simplify** the expression.
  6. **Answer** the question with a complete sentence.

Glossary

absolute value

The absolute value of a number is its distance from 0 on the number line.

integers

The whole numbers and their opposites are called the integers.

negative numbers

Numbers less than 0 are negative numbers.

opposite

The opposite of a number is the number that is the same distance from zero on the number line but on the opposite side of zero.

13.7.3E: Exercises

Practice Makes Perfect

Simplify Expressions with Absolute Value

In the following exercises, fill in $<, >$, or $=$ for each of the following pairs of numbers.

1. ⓐ $|-7|$ ___ $-|-7|$
   ⓑ 6 ___ $-|-6|$
   ⓒ $|-11|$ ___ -11
   ⓓ $-(-13)$ ___ $-|-13|$

   Answer

   ⓐ $>$ ⓑ $>$ ⓒ $>$ ⓓ $>$

2. ⓐ $-|-9|$ ___ $|-9|$
   ⓑ -8 ___ $|-8|$
   ⓒ $|-1|$ ___ -1
   ⓓ $-(-14)$ ___ $-|-14|$

3. ⓐ $-|2|$ ___ $-|-2|$
   ⓑ -12 ___ $-|-12|$
   ⓒ $|-3|$ ___ -3
   ⓓ $|-19|$ ___ $-(-19)$

   Answer

   ⓐ $=$ ⓑ $=$ ⓒ $>$ ⓓ $=$

4. ⓐ $-|-4|$ ___ $-|4|$
   ⓑ 5 ___ $-|-5|$
   ⓒ $-|-10|$ ___ -10
   ⓓ $-|-0|$ ___ $-(-0)$

In the following exercises, simplify.

5. $|15-7|-|14-6|$

   Answer

   0

6. $|17-8|-|13-4|$

7. $18-|2(8-3)|$

   Answer

   8

8. $15-|3(8-5)|$

9. $18-|12-4(4-1)+3|$

Answer

15

10. $27-|19+4(3-1)-7|$

11. $10-3|9-3(3-1)|$

Answer

1

12. $13-2|11-2(5-2)|$

Add and Subtract Integers

In the following exercises, simplify each expression.

13. ⓐ $-7+(-4)$
ⓑ $-7+4$
ⓒ $7+(-4)$.

Answer

ⓐ -11 ⓑ -3 ⓒ 3

14. ⓐ $-5+(-9)$
ⓑ $-5+9$
ⓒ $5+(-9)$

15. $48+(-16)$

Answer

32

16. $34+(-19)$

17. $-14+(-12)+4$

Answer

36. $32-[5-(15-20)]$

Multiply and Divide Integers

In the following exercises, multiply or divide.

37. ⓐ $-4\cdot 8$
ⓑ $13(-5)$
ⓒ $-24\div 6$
ⓓ $-52\div(-4)$

Answer

ⓐ -32 ⓑ -65 ⓒ -4 ⓓ 13

38. ⓐ $-3\cdot 9$
ⓑ $9(-7)$
ⓒ $35\div(-7)$
ⓓ $-84\div(-6)$

39. ⓐ $-28\div 7$
ⓑ $-180\div 15$
ⓒ $3(-13)$
ⓓ $-1(-14)$

Answer

ⓐ -4 ⓑ -12 ⓒ -39 ⓓ 14

40. ⓐ $-36\div 4$
ⓑ $-192\div 12$
ⓒ $9(-7)$
ⓓ $-1(-19)$

Simplify and Evaluate Expressions with Integers

In the following exercises , simplify each expression.

41. ⓐ $(-2)^6$ ⓑ -2^6

Answer

ⓐ 64 ⓑ -64

42. ⓐ $(-3)^5$ ⓑ -3^5

43. $5(-6)+7(-2)-3$

Answer

-47

44. $8(-4)+5(-4)-6$

45. $-3(-5)(6)$

Answer

90

46. $-4(-6)(3)$

47. $(8-11)(9-12)$

Answer

9

48. $(6-11)(8-13)$

49. $26-3(2-7)$

Answer

41

50. $23-2(4-6)$

51. $65\div(-5)+(-28)\div(-7)$

Answer

-9

52. $52\div(-4)+(-32)\div(-8)$

53. $9-2[3-8(-2)]$

Answer

-29

54. $11-3[7-4(-2)]$

55. $8-|2-4(4-1)+3|$

Answer

1

56. $7-|5-3(4-1)-6|$

57. $9-3|2(2-6)-(3-7)|$

Answer

-3

58. $5-2|2(1-4)-(2-5)|$

59. $(-3)^2-24\div(8-2)$

Answer

5

60. $(-4)^2-32\div(12-4)$

In the following exercises , evaluate each expression.

61. $y+(-14)$ when ⓐ $y=-33$ ⓑ $y=30$

Answer

ⓐ -47 ⓑ 16

62. $x+(-21)$ when ⓐ $x=-27$ ⓑ $x=44$

63. $(x+y)^2$ when $x=-3$ and $y=14$

Answer

121

64. $(y+z)^2$ when $y=-3$ and $z=15$

65. $9a-2b-8$ when $a=-6$ and $b=-3$

Answer

-56

66. $7m-4n-2$ when $m=-4$ and $n=-9$

67. $3x^2-4xy+2y^2$ when $x=-2$ and $y=-3$

Answer

6

68. $4x^2 - xy + 3y^2$ when $x = -3$ and $y = -2$

Translate English Phrases to Algebraic Expressions

In the following exercises, translate to an algebraic expression and simplify if possible.

69. the sum of 3 and −15, increased by 7

Answer

$(3 + (-15)) + 7; -5$

70. the sum of -8 and -9, increased by 23

71. ⓐ the difference of 10 and -18

ⓑ subtract 11 from -25

Answer

ⓐ $10 - (-18); 28$

ⓑ $-25 - 11; -36$

72. ⓐ the difference of -5 and -30

ⓑ subtract -6 from -13

73. the quotient of -6 and the sum of a and b

Answer

$$\frac{-6}{a+b}$$

74. the product of -13 and the difference of c and d

Use Integers in Applications

In the following exercises, solve.

75. Temperature On January 15, the high temperature in Anaheim, California, was 84°. That same day, the high temperature in Embarrass, Minnesota, was -12°. What was the difference between the temperature in Anaheim and the temperature in Embarrass?

Answer

96°

76. Temperature On January 21, the high temperature in Palm Springs, California, was 89°, and the high temperature in Whitefield, New Hampshire, was -31°. What was the difference between the temperature in Palm Springs and the temperature in Whitefield?

77. Football On the first down, the Chargers had the ball on their 25-yard line. On the next three downs, they lost 6 yards, gained 10 yards, and lost 8 yards. What was the yard line at the end of the fourth down?

Answer

21

78. Football On the first down, the Steelers had the ball on their 30-yard line. On the next three downs, they gained 9 yards, lost 14 yards, and lost 2 yards. What was the yard line at the end of the fourth down?

79. Checking Account Mayra has $124 in her checking account. She writes a check for $152. What is the new balance in her checking account?

Answer

$-\$28$

80. Checking Account Reymonte has a balance of $-\$49$ in his checking account. He deposits $281 to the account. What is the new balance?

Writing Exercises

81. Explain why the sum of -8 and 2 is negative, but the sum of 8 and -2 is positive.

Answer

Answers will vary.

82. Give an example from your life experience of adding two negative numbers.

83. In your own words, state the rules for multiplying and dividing integers.

Answer

Answers will vary.

84. Why is $-4^3 = (-4)^3$?

Self Check

ⓐ After completing the EXAMPLEs, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with absolute value.			
add and subtract integers.			
multiply and divide integers.			
simplify and evaluate expressions with integers.			
translate English phrases to algebraic expressions.			
use integers in applications.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

13.7.4: Fractions

Learning Objectives

By the end of this section, you will be able to:

- Simplify fractions
- Multiply and divide fractions
- Add and subtract fractions
- Use the order of operations to simplify fractions
- Evaluate variable expressions with fractions

A more thorough introduction to the topics covered in this section can be found in the *Elementary Algebra* chapter, Foundations.

Simplify Fractions

A fraction is a way to represent parts of a whole. The fraction $\frac{2}{3}$ represents two of three equal parts (Figure 13.7.4.1). In the fraction $\frac{2}{3}$, the 2 is called the **numerator** and the 3 is called the **denominator**. The line is called the fraction bar.

Figure $\boldsymbol{13.7.4.1}$ *In the circle, $\frac{2}{3}$ of the circle is shaded—2 of the 3 equal parts.*

FRACTION

A **fraction** is written $\frac{a}{b}$, where $b \neq 0$ and

a is the **numerator** and b is the **denominator**.

A fraction represents parts of a whole. The denominator b is the number of equal parts the whole has been divided into, and the numerator a indicates how many parts are included.

Fractions that have the same value are **equivalent fractions**. The Equivalent Fractions

Property allows us to find equivalent fractions and also simplify fractions.

If a, b, and c are numbers where $b \neq 0, c \neq 0$,

then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$ and $\frac{a \cdot c}{b \cdot c} = \frac{a}{b}$.

A fraction is considered simplified if there are no common factors, other than 1, in its numerator and denominator.

For example,

$\frac{2}{3}$ is simplified because there are no common factors of 2 and 3.

$\frac{10}{15}$ is not simplified because 5 is a common factor of 10 and 15.

We simplify, or reduce, a fraction by removing the common factors of the numerator and denominator. A fraction is not simplified until all common factors have been removed. If an expression has fractions, it is not completely simplified until the fractions are simplified.

Sometimes it may not be easy to find common factors of the numerator and denominator. When this happens, a good idea is to factor the numerator and the denominator into prime numbers. Then divide out the common factors using the Equivalent Fractions Property.

Simplify $\frac{-315}{770}$.

Answer

Step 1. Rewrite the numerator and denominator to show the common factors. If needed, use a factor tree.	Rewrite 315 and 770 as the product of the primes.	$-\frac{315}{770}$ $-\frac{3 \cdot 3 \cdot 5 \cdot 7}{2 \cdot 5 \cdot 7 \cdot 11}$
Step 2. Simplify using the equivalent fractions property by dividing out common factors.	Mark the common factors 5 and 7. Divide out the common factors	$-\frac{3 \cdot 3 \cdot \cancel{5} \cdot \cancel{7}}{2 \cdot \cancel{5} \cdot \cancel{7} \cdot 11}$ $-\frac{3 \cdot 3}{2 \cdot 11}$
Step 3. Multiply the remaining factors, if necessary.		$-\frac{9}{22}$

Simplify $-\frac{69}{120}$.

Answer

$-\frac{23}{40}$

EXAMPLE 13.7.4.3

Simplify $-\frac{120}{192}$.

Answer

$-\frac{5}{8}$

We now summarize the steps you should follow to simplify fractions.

SIMPLIFY A FRACTION.

1. Rewrite the numerator and denominator to show the common factors.
   If needed, factor the numerator and denominator into prime numbers first.
2. Simplify using the Equivalent Fractions Property by dividing out common factors.
3. Multiply any remaining factors.

Multiply and Divide Fractions

Many people find multiplying and dividing fractions easier than adding and subtracting fractions.

To multiply fractions, we multiply the numerators and multiply the denominators.

FRACTION MULTIPLICATION

If a, b, c, and d are numbers where $b \neq 0$, and $d \neq 0$, then

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd} \tag{13.7.4.1}$$

To multiply fractions, multiply the numerators and multiply the denominators.

When multiplying fractions, the properties of positive and negative numbers still apply, of course. It is a good idea to determine the sign of the product as the first step. In Example, we will multiply negative and a positive, so the product will be negative.

When multiplying a fraction by an integer, it may be helpful to write the integer as a fraction. Any integer, a, can be written as $\frac{a}{1}$. So, for example, $3 = \frac{3}{1}$.

Exercise 13.7.4.4

Multiply: $-\frac{12}{5}(-20x)$.

Answer

The first step is to find the sign of the product. Since the signs are the same, the product is positive.

	$-\frac{12}{5}(-20x)$
Determine the sign of the product. The signs are the same, so the product is positive.	$\frac{12}{5}(20x)$
Write $20x$ as a fraction.	$\frac{12}{5}\left(\frac{20x}{1}\right)$
Multiply.	$\frac{12 \cdot 20x}{5 \cdot 1}$
Rewrite 20 to show the common factor 5 and divide it out.	$\frac{12 \cdot 4 \cdot \cancel{5} \cdot x}{\cancel{5} \cdot 1}$
Simplify.	$48x$

Exercise 13.7.4.5

Multiply: $\frac{1}{13}(-9a)$.

Answer

$-33a$

Exercise 13.7.4.6

Multiply: $\frac{13}{7}(-14b)$.

Answer

$-26b$

Now that we know how to multiply fractions, we are almost ready to divide. Before we can do that, we need some vocabulary. The **reciprocal** of a fraction is found by inverting the fraction, placing the numerator in the denominator and the denominator in the

numerator. The reciprocal of $\frac{2}{3}$ is $\frac{3}{2}$. Since 4 is written in fraction form as $\frac{4}{1}$, the reciprocal of 4 is $\frac{1}{4}$.

To divide fractions, we multiply the first fraction by the reciprocal of the second.

FRACTION DIVISION

If a, b, c, and d are numbers where $b \neq 0, c \neq 0$, and $d \neq 0$, then

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} \tag{13.7.4.2}$$

To divide fractions, we multiply the first fraction by the **reciprocal** of the second.

We need to say $b \neq 0$, $c \neq 0$, and $d \neq 0$, to be sure we don't divide by zero!

Exercise 13.7.4.7

Find the quotient: $-\frac{7}{18} \div (-\frac{14}{27})$.

Answer

	$-\frac{7}{18} \div (-\frac{14}{27})$
To divide, multiply the first fraction by the reciprocal of the second.	$-\frac{7}{18}\left(-\frac{27}{14}\right)$
Determine the sign of the product, and then multiply.	$\frac{7 \cdot 27}{18 \cdot 14}$
Rewrite showing common factors.	$\frac{\cancel{7} \cdot \cancel{9} \cdot 3}{\cancel{9} \cdot 2 \cdot \cancel{7} \cdot 2}$
Remove common factors.	$\frac{3}{2 \cdot 2}$
Simplify.	$\frac{3}{4}$

?

Divide: $-\frac{7}{27} \div (-\frac{35}{36})$.

Answer

$\frac{4}{15}$

Exercise 13.7.4.9

Divide: $-\frac{5}{14} \div (-\frac{15}{28})$.

Answer

$\frac{2}{3}$

The numerators or denominators of some fractions contain fractions themselves. A fraction in which the numerator or the denominator is a fraction is called a **complex fraction**.

Definition: COMPLEX FRACTION

A **complex fraction** is a fraction in which the numerator or the denominator contains a fraction.

Some examples of complex fractions are:

$$\frac{\frac{6}{7}}{3} \quad \frac{\frac{3}{4}}{\frac{5}{8}} \quad \frac{\frac{x}{2}}{\frac{5}{6}} \tag{13.7.4.3}$$

To simplify a complex fraction, remember that the fraction bar means division. For example, the complex fraction $\frac{\frac{3}{4}}{\frac{5}{8}}$ means $\frac{3}{4} \div \frac{5}{8}$.

Exercise 13.7.4.10

Simplify: $\frac{\frac{x}{2}}{\frac{xy}{6}}$.

Answer

$\frac{\frac{x}{2}}{\frac{xy}{6}}$

Rewrite as division. $\frac{x}{2} \div \frac{xy}{6}$

Multiply the first fraction by the reciprocal of the second. $\frac{x}{2} \cdot \frac{6}{xy}$

Multiply. $\frac{x \cdot 6}{2 \cdot xy}$

Look for common factors. $\frac{\cancel{x} \cdot 3 \cdot \cancel{2}}{\cancel{2} \cdot \cancel{x} \cdot y}$

Divide common factors and simplify. $\frac{3}{y}$

Simplify: $\frac{\frac{a}{8}}{\frac{ab}{6}}$.

Answer

$\frac{3}{4b}$

Simplify: $\dfrac{\frac{p}{2}}{\frac{pq}{8}}$.

Answer

$\dfrac{4}{q}$

Add and Subtract Fractions

When we multiplied fractions, we just multiplied the numerators and multiplied the denominators right straight across. To add or subtract fractions, they must have a common denominator.

FRACTION ADDITION AND SUBTRACTION

If a, b, and c are numbers where $c \neq 0$, then

$$\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c} \text{ and } \frac{a}{c}-\frac{b}{c}=\frac{a-b}{c} \tag{13.7.4.4}$$

To add or subtract fractions, add or subtract the numerators and place the result over the common denominator.

The **least common denominator** (LCD) of two fractions is the smallest number that can be used as a common denominator of the fractions. The LCD of the two fractions is the least common multiple (LCM) of their denominators.

LEAST COMMON DENOMINATOR

The **least common denominator** (LCD) of two fractions is the least common multiple (LCM) of their denominators.

After we find the least common denominator of two fractions, we convert the fractions to equivalent fractions with the LCD. Putting these steps together allows us to add and subtract fractions because their denominators will be the same!

EXAMPLE 13.7.4.13: How to Add or Subtract Fractions

Add: $\frac{7}{12}+\frac{5}{18}$.

Answer

Step 1. Do they have a common denominator? • No—rewrite each fraction with the LCD (least common denominator).	No. Find the LCD of 12, 18. We multiply the numerator and denominator of each fraction by the factor needed to get the denominator to be 36. Do not simplify the equivalent fractions! If you do, you'll get back to the original fractions and lose the common denominator!	$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$ $LCD = 2 \cdot 2 \cdot 3 \cdot 3$ $LCD = 36$ LCD is 36. $\frac{7}{12} + \frac{5}{18}$ $\frac{7 \cdot 3}{12 \cdot 3} + \frac{5 \cdot 2}{18 \cdot 2}$ $\frac{21}{36} + \frac{10}{36}$
Step 2. Add or subtract the fractions.	Add.	$\frac{31}{36}$
Step 3. Simplify, if possible.	Since 31 is prime, its only factors are 1 and 31. Since 31 does not go into 36, the answer is simplified.	

? EXAMPLE 13.7.4.14

Add: $\frac{7}{12} + \frac{11}{15}$.

Answer

$\frac{79}{60}$

? EXAMPLE 13.7.4.15

Add: $\frac{13}{15} + \frac{17}{20}$.

Answer

$\frac{103}{60}$

ADD OR SUBTRACT FRACTIONS.

1. Do they have a common denominator?
   - Yes—go to step 2.
   - No—rewrite each fraction with the LCD (least common denominator).
     - Find the LCD.
     - Change each fraction into an equivalent fraction with the LCD as its denominator.
2. Add or subtract the fractions.
3. Simplify, if possible.

We now have all four operations for fractions. Table summarizes fraction operations.

Fraction Multiplication	Fraction Division
$\frac{a}{b}\cdot\frac{c}{d}=\frac{ac}{bd}$	$\frac{a}{b}\div\frac{c}{d}=\frac{a}{b}\cdot\frac{d}{c}$
Multiply the numerators and multiply the denominators	Multiply the first fraction by the reciprocal of the second.
Fraction Addition	**Fraction Subtraction**
$\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c}$	$\frac{a}{c}-\frac{b}{c}=\frac{a-b}{c}$
Add the numerators and place the sum over the common denominator.	Subtract the numerators and place the difference over the common denominator.
To multiply or divide fractions, an LCD is NOT needed. To add or subtract fractions, an LCD is needed.	

When starting an exercise, always identify the operation and then recall the methods needed for that operation.

?

Simplify: ⓐ $\frac{5x}{6}-\frac{3}{10}$ ⓑ $\frac{5x}{6}\cdot\frac{3}{10}$.

Answer

First ask, "What is the operation?" Identifying the operation will determine whether or not we need a common denominator. Remember, we need a common denominator to add or subtract, but not to multiply or divide.

ⓐ

What is the operation? The operation is subtraction.

Do the fractions have a common denominator? No. $\frac{5x}{6}-\frac{3}{10}$

Find the LCD of 6 and 10 The LCD is 30.

$6=2\cdot 3$

$10=2\cdot 5$

$\text{LCD}=2\cdot 3\cdot 5$

$\text{LCD}=30$

Rewrite each fraction as an equivalent fraction with the LCD. $\frac{5x\cdot 5}{6\cdot 5}-\frac{3\cdot 3}{10\cdot 3}$

$\frac{25x}{30}-\frac{9}{30}$

Subtract the numerators and place the

difference over the common denominators. $\frac{25x-9}{30}$

Simplify,if possible.There are no common factors.

The fraction is simplified.

ⓑ

What is the operation? Multiplication. $\frac{25x}{6} \cdot \frac{3}{10}$

To multiply fractions,multiply the numerators and multiply the denominators. $\frac{25x \cdot 3}{6 \cdot 10}$

Rewrite, showing common factors.

Remove common factors. $\frac{\cancel{5}x \cdot \cancel{3}}{2 \cdot \cancel{3} \cdot 2 \cdot \cancel{5}}$

Simplify. $\frac{x}{4}$

Notice, we needed an LCD to add $\frac{25x}{6} - \frac{3}{10}$, but not to multiply $\frac{25x}{6} \cdot \frac{3}{10}$.

? EXAMPLE 13.7.4.17

Simplify: ⓐ $\frac{3a}{4} - \frac{8}{9}$ ⓑ $\frac{3a}{4} \cdot \frac{8}{9}$.

Answer

ⓐ $\frac{27a-32}{36}$ ⓑ $\frac{2a}{3}$

? EXAMPLE 13.7.4.18

Simplify: ⓐ $\frac{4k}{5} - \frac{1}{6}$ ⓑ $\frac{4k}{5} \cdot \frac{1}{6}$.

Answer

ⓐ $\frac{24k-5}{30}$ ⓑ $\frac{2k}{15}$

Use the Order of Operations to Simplify Fractions

The fraction bar in a fraction acts as grouping symbol. The order of operations then tells us to simplify the numerator and then the denominator. Then we divide.

SIMPLIFY AN EXPRESSION WITH A FRACTION BAR.

1. Simplify the expression in the numerator. Simplify the expression in the denominator.
2. Simplify the fraction.

Where does the negative sign go in a fraction? Usually the negative sign is in front of the fraction, but you will sometimes see a fraction with a negative numerator, or sometimes with a negative denominator. Remember that fractions represent division. When the numerator and denominator have different signs, the quotient is negative.

$$\frac{-1}{3} = -\frac{1}{3} \quad \frac{\text{negative}}{\text{positive}} = \text{negative} \tag{13.7.4.5}$$

$$\frac{1}{-3} = -\frac{1}{3} \quad \frac{\text{positive}}{\text{negative}} = \text{negative} \tag{13.7.4.6}$$

PLACEMENT OF NEGATIVE SIGN IN A FRACTION

For any positive numbers a and b,

$$\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b} \tag{13.7.4.7}$$

EXAMPLE 13.7.4.19

Simplify: $\frac{4(-3)+6(-2)}{-3(2)-2}$.

Answer

The fraction bar acts like a grouping symbol. So completely simplify the numerator and the denominator separately.

$$\frac{4(-3)+6(-2)}{-3(2)-2}$$

Multiply. $\frac{-12+(-12)}{-6-2}$

Simplify. $\frac{-24}{-8}$

Divide. 3

EXAMPLE 13.7.4.20

Simplify: $\frac{8(-2)+4(-3)}{-5(2)+3}$.

Answer

4

EXAMPLE 13.7.4.21

Simplify: $\frac{7(-1)+9(-3)}{-5(3)-2}$.

Answer

2

Now we'll look at complex fractions where the numerator or denominator contains an expression that can be simplified. So we first must completely simplify the numerator and denominator separately using the order of operations. Then we divide the numerator by the denominator as the fraction bar means division.

EXAMPLE 13.7.4.22: How to Simplify Complex Fractions

Simplify: $\frac{\left(\frac{1}{2}\right)^2}{4+3^2}$.

Answer

Step 1. Simplify the numerator.	$\frac{\left(\frac{1}{2}\right)^2}{4+3^2}$ $\frac{\frac{1}{4}}{4+3^2}$
Step 2. Simplify the denominator.	$\frac{\frac{1}{4}}{4+9}$ $\frac{\frac{1}{4}}{13}$
Step 3. Divide the numerator by the denominator. Simplify if possible	$\frac{1}{4} \div \frac{13}{1}$ $\frac{1}{4} \cdot \frac{1}{13}$ $\frac{1}{52}$

? EXAMPLE 13.7.4.23

Simplify: $\frac{\left(\frac{1}{3}\right)^2}{2^3+2}$.

Answer

$\frac{1}{90}$

? EXAMPLE 13.7.4.24

Simplify: $\frac{1+4^2}{\left(\frac{1}{4}\right)^2}$.

Answer

272

SIMPLIFY COMPLEX FRACTIONS.

1. Simplify the numerator.
2. Simplify the denominator.
3. Divide the numerator by the denominator. Simplify if possible.

? EXAMPLE 13.7.4.25

Simplify: $\frac{\frac{1}{2}+\frac{2}{3}}{\frac{3}{4}-\frac{1}{6}}$.

Answer

It may help to put parentheses around the numerator and the denominator.

$$\frac{\frac{1}{2}+\frac{2}{3}}{\frac{3}{4}-\frac{1}{6}}$$

Simplify the numerator ($LCD = 6$) and simplify the denominator ($LCD = 12$). $$\frac{\left(\frac{3}{6}+\frac{4}{6}\right)}{\left(\frac{9}{12}-\frac{2}{12}\right)}$$

Simplify. $$\left(\frac{7}{6}\right)\left(\frac{7}{12}\right)$$

Divide the numerator by the denominator. $$\frac{7}{6} \div \frac{7}{12}$$

Simplify. $$\frac{7}{6} \cdot \frac{12}{7}$$

Divide out common factors. $$\frac{\cancel{7} \cdot \cancel{6} \cdot 2}{\cancel{6} \cdot \cancel{7} \cdot 1}$$

Simplify. $$2$$

? EXAMPLE 13.7.4.26

Simplify: $\dfrac{\frac{1}{3}+\frac{1}{2}}{\frac{3}{4}-\frac{1}{3}}$.

Answer

2

? EXAMPLE 13.7.4.27

Simplify: $\dfrac{\frac{2}{3}-\frac{1}{2}}{\frac{1}{4}+\frac{1}{3}}$.

Answer

$\frac{2}{7}$

Evaluate Variable Expressions with Fractions

We have evaluated expressions before, but now we can evaluate expressions with fractions. Remember, to evaluate an expression, we substitute the value of the variable into the expression and then simplify.

? EXAMPLE 13.7.4.28

Evaluate $2x^2y$ when $x = \frac{1}{4}$ and $y = -\frac{2}{3}$.

Answer

Substitute the values into the expression.

	$2x^2y$
Substitute $\frac{1}{4}$ for x and $-\frac{2}{3}$ for y.	$2\left(\frac{1}{4}\right)^2\left(-\frac{2}{3}\right)$
Simplify exponents first.	$2\left(\frac{1}{16}\right)\left(-\frac{2}{3}\right)$
Multiply; divide out the common factors. Notice we write 16 as $2\cdot2\cdot4\cdot2\cdot4$ to make it easy to remove common factors.	$-\frac{\cancel{2}\cdot1\cdot\cancel{2}}{\cancel{2}\cdot\cancel{2}\cdot4\cdot3}$
Simplify.	$-\frac{1}{12}$

? EXAMPLE 13.7.4.29

Evaluate $3ab^2$ when $a=-\frac{2}{3}$ and $b=-\frac{1}{2}$.

Answer

$-\frac{1}{2}$

? EXAMPLE 13.7.4.30

Evaluate $4c^3d$ when $c=-\frac{1}{2}$ and $d=-\frac{4}{3}$.

Answer

$\frac{2}{3}$

Access this online resource for additional instruction and practice with fractions.

- Adding Fractions with Unlike Denominators

Key Concepts

- If a, b, and c are numbers where $b\neq0, c\neq0$, then
  $\frac{a}{b}=\frac{a\cdot c}{b\cdot c}$ and $\frac{a\cdot c}{b\cdot c}=\frac{a}{b}$.
- **How to simplify a fraction.**
  1. Rewrite the numerator and denominator to show the common factors.
     If needed, factor the numerator and denominator into prime numbers first.
  2. Simplify using the Equivalent Fractions Property by dividing out common factors.
  3. Multiply any remaining factors.
- If a, b, c, and d are numbers where $b\neq0$, and $d\neq0$, then
  $\frac{a}{b}\cdot\frac{c}{d}=\frac{ac}{bd}$
  To multiply fractions, multiply the numerators and multiply the denominators.
- If a, b, c, and d are numbers where $b\neq0, c\neq0$, and $d\neq0$, then
  $\frac{a}{b}\div\frac{c}{d}=\frac{a}{b}\cdot\frac{d}{c}$
  To divide fractions, we multiply the first fraction by the reciprocal of the second.
- If a, b, and c are numbers where $c\neq0$, then

$$\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c} \text{ and } \frac{a}{c}-\frac{b}{c}=\frac{a-b}{c}$$

To add or subtract fractions, add or subtract the numerators and place the result over the common denominator.

- **How to add or subtract fractions.**
  1. Do they have a common denominator?
     - Yes—go to step 2.
     - No—rewrite each fraction with the LCD (least common denominator).
       - Find the LCD.
       - Change each fraction into an equivalent fraction with the LCD as its denominator.
  2. Add or subtract the fractions.
  3. Simplify, if possible.
- **How to simplify an expression with a fraction bar.**
  1. Simplify the expression in the numerator. Simplify the expression in the denominator.
  2. Simplify the fraction.
- For any positive numbers a and b,

  $$\frac{-a}{b}=\frac{a}{-b}=-\frac{a}{b}$$
- **How to simplify complex fractions.**
  1. Simplify the numerator.
  2. Simplify the denominator.
  3. Divide the numerator by the denominator. Simplify if possible.

Glossary

complex fraction

A fraction in which the numerator or the denominator is a fraction is called a complex fraction.

denominator

In a fraction, written $\frac{a}{b}$, where $b \neq 0$, the denominator b is the number of equal parts the whole has been divided into.

equivalent fractions

Equivalent fractions are fractions that have the same value.

fraction

A fraction is written $\frac{a}{b}$, where $b \neq 0$, and a is the numerator and b is the denominator. A fraction represents parts of a whole.

least common denominator

The least common denominator (LCD) of two fractions is the least common multiple (LCM) of their denominators.

numerator

In a fraction, written $\frac{a}{b}$, where $b \neq 0$, the numerator a indicates how many parts are included.

reciprocal

The reciprocal of a fraction is found by inverting the fraction, placing the numerator in the denominator and the denominator in the numerator.

13.7.4E: Exercises

Practice Makes Perfect

Simplify Fractions

In the following exercises, simplify.

1. $-\frac{108}{63}$

Answer

$-\frac{12}{7}$

2. $-\frac{104}{48}$

3. $\frac{120}{252}$

Answer

$\frac{10}{21}$

4. $\frac{182}{294}$

5. $\frac{14x^2}{21y}$

Answer

$\frac{2x^2}{3y}$

6. $\frac{24a}{32b^2}$

7. $-\frac{210a^2}{110b^2}$

Answer

$-\frac{21a^2}{11b^2}$

8. $-\frac{30x^2}{105y^2}$

Multiply and Divide Fractions

In the following exercises, perform the indicated operation.

9. $-\frac{3}{4}\left(-\frac{4}{9}\right)$

Answer

$\frac{1}{3}$

10. $-\frac{3}{8} \cdot \frac{4}{15}$

11. $\left(-\frac{14}{15}\right)\left(\frac{9}{20}\right)$

Answer

$-\frac{21}{50}$

12. $\left(-\frac{9}{10}\right)\left(\frac{25}{33}\right)$

13. $\left(-\frac{63}{84}\right)\left(-\frac{44}{90}\right)$

Answer

$\frac{11}{30}$

14. $\left(-\frac{33}{60}\right)\left(-\frac{40}{88}\right)$

15. $\frac{3}{7} \cdot 21n$

Answer

$9n$

16. $\frac{5}{6} \cdot 30m$

17. $\frac{3}{4} \div \frac{x}{11}$

Answer

$\frac{33}{4x}$

18. $\frac{2}{5} \div \frac{y}{9}$

19. $\frac{5}{18} \div \left(-\frac{15}{24}\right)$

Answer

$-\frac{4}{9}$

20. $\frac{7}{18} \div \left(-\frac{14}{27}\right)$

21. $\frac{8u}{15} \div \frac{12v}{25}$

Answer

$\frac{10u}{9v}$

22. $\frac{12r}{25} \div \frac{18s}{35}$

23. $\frac{3}{4} \div (-12)$

Answer

$-\frac{1}{16}$

24. $-15 \div \left(-\frac{5}{3}\right)$

In the following exercises, simplify.

25. $-\frac{\frac{8}{21}}{\frac{12}{35}}$

Answer

$-\frac{10}{9}$

26. $-\frac{\frac{9}{16}}{\frac{33}{40}}$

27. $-\frac{\frac{4}{5}}{2}$

Answer

$-\frac{2}{5}$

28. $\frac{\frac{5}{3}}{10}$

29. $\frac{\frac{m}{3}}{\frac{n}{2}}$

Answer

$\frac{2m}{3n}$

30. $\frac{-\frac{3}{8}}{-\frac{y}{12}}$

Add and Subtract Fractions

In the following exercises, add or subtract.

31. $\frac{7}{12}+\frac{5}{8}$

Answer

$\frac{29}{24}$

32. $\frac{5}{12}+\frac{3}{8}$

33. $\frac{7}{12}-\frac{9}{16}$

Answer

$\frac{1}{48}$

34. $\frac{7}{16}-\frac{5}{12}$

35. $-\frac{13}{30}+\frac{25}{42}$

Answer

$\frac{17}{105}$

36. $-\frac{23}{30}+\frac{5}{48}$

37. $-\frac{39}{56}-\frac{22}{35}$

Answer

$-\frac{53}{40}$

38. $-\frac{33}{49}-\frac{18}{35}$

39. $-\frac{2}{3}-\left(-\frac{3}{4}\right)$

Answer

$\frac{1}{12}$

40. $-\frac{3}{4}-\left(-\frac{4}{5}\right)$

41. $\frac{x}{3}+\frac{1}{4}$

Answer

$\frac{4x+3}{12}$

42. $\frac{x}{5}-\frac{1}{4}$

43. ⓐ $\frac{2}{3}+\frac{1}{6}$
ⓑ $\frac{2}{3}\div\frac{1}{6}$

Answer

ⓐ $\frac{5}{6}$ ⓑ 4

44. ⓐ $-\frac{2}{5}-\frac{1}{8}$
ⓑ $-\frac{2}{5}\cdot\frac{1}{8}$

45. ⓐ $\frac{5n}{6}\div\frac{8}{15}$
ⓑ $\frac{5n}{6}-\frac{8}{15}$

Answer

ⓐ $\frac{25n}{16}$ ⓑ $\frac{25n-16}{30}$

46. ⓐ $\frac{3a}{8}\div\frac{7}{12}$
ⓑ $\frac{3a}{8}-\frac{7}{12}$

47. ⓐ $-\frac{4x}{9}-\frac{5}{6}$
ⓑ $-\frac{4k}{9}\cdot\frac{5}{6}$

Answer

ⓐ $\frac{-8x-15}{18}$ ⓑ $-\frac{10k}{27}$

48. ⓐ $-\frac{3y}{8}-\frac{4}{3}$

ⓑ $-\frac{3y}{8}\cdot\frac{4}{3}$

49. ⓐ $-\frac{5a}{3}+\left(-\frac{10}{6}\right)$

ⓑ $-\frac{5a}{3}\div\left(-\frac{10}{6}\right)$

Answer

ⓐ $\frac{-5(a+1)}{3}$ ⓑ a

50. ⓐ $\frac{2b}{5}+\frac{8}{15}$

ⓑ $\frac{2b}{5}\div\frac{8}{15}$

Use the Order of Operations to Simplify Fractions

In the following exercises, simplify.

51. $\frac{5\cdot 6-3\cdot 4}{4\cdot 5-2\cdot 3}$

Answer

$\frac{9}{7}$

52. $\frac{8\cdot 9-7\cdot 6}{5\cdot 6-9\cdot 2}$

53. $\frac{5^2-3^2}{3-5}$

Answer

-8

54. $\frac{6^2-4^2}{4-6}$

55. $\frac{7\cdot 4-2(8-5)}{9\cdot 3-3\cdot 5}$

Answer

$\frac{11}{6}$

56. $\frac{9\cdot 7-3(12-8)}{8\cdot 7-6\cdot 6}$

57. $\dfrac{9(8-2)-3(15-7)}{6(7-1)-3(17-9)}$

Answer

$\dfrac{5}{2}$

58. $\dfrac{8(9-2)-4(14-9)}{7(8-3)-3(16-9)}$

59. $\dfrac{2^3+4^2}{\left(\frac{2}{3}\right)^2}$

Answer

54

60. $\dfrac{3^3-3^2}{\left(\frac{3}{4}\right)^2}$

61. $\dfrac{\left(\frac{3}{5}\right)^2}{\left(\frac{3}{7}\right)^2}$

Answer

$\dfrac{49}{25}$

62. $\dfrac{\left(\frac{3}{4}\right)^2}{\left(\frac{5}{8}\right)^2}$

63. $\dfrac{2}{\frac{1}{3}+\frac{1}{5}}$

Answer

$\dfrac{15}{4}$

64. $\dfrac{5}{\frac{1}{4}+\frac{1}{3}}$

65. $\dfrac{\frac{7}{8}-\frac{2}{3}}{\frac{1}{2}+\frac{3}{8}}$

Answer

$\frac{5}{21}$

66. $\dfrac{\frac{3}{4}-\frac{3}{5}}{\frac{1}{4}+\frac{2}{5}}$

Mixed Practice

In the following exercises, simplify.

67. $-\frac{3}{8} \div \left(-\frac{3}{10}\right)$

Answer

$\frac{5}{4}$

68. $-\frac{3}{12} \div \left(-\frac{5}{9}\right)$

69. $-\frac{3}{8}+\frac{5}{12}$

Answer

$\frac{1}{24}$

70. $-\frac{1}{8}+\frac{7}{12}$

71. $-\frac{7}{15}-\frac{y}{4}$

Answer

$\frac{-28-15y}{60}$

72. $-\frac{3}{8}-\frac{x}{11}$

73. $\frac{11}{12a} \cdot \frac{9a}{16}$

Answer

$\frac{33}{64}$

74. $\frac{10y}{13} \cdot \frac{8}{15y}$

75. $\frac{1}{2}+\frac{2}{3} \cdot \frac{5}{12}$

Answer

$\frac{7}{9}$

76. $\frac{1}{3}+\frac{2}{5}\cdot\frac{3}{4}$

77. $1-\frac{3}{5}\div\frac{1}{10}$

Answer

-5

78. $1-\frac{5}{6}\div\frac{1}{12}$

79. $\frac{3}{8}-\frac{1}{6}+\frac{3}{4}$

Answer

$\frac{23}{24}$

80. $\frac{2}{5}+\frac{5}{8}-\frac{3}{4}$

81. $12\left(\frac{9}{20}-\frac{4}{15}\right)$

Answer

$\frac{11}{5}$

82. $8\left(\frac{15}{16}-\frac{5}{6}\right)$

83. $\frac{\frac{5}{8}+\frac{1}{6}}{\frac{19}{24}}$

Answer

1

84. $\frac{\frac{1}{6}+\frac{3}{10}}{\frac{14}{30}}$

85. $\left(\frac{5}{9}+\frac{1}{6}\right)\div\left(\frac{2}{3}-\frac{1}{2}\right)$

Answer

$\frac{13}{3}$

86. $\left(\frac{3}{4}+\frac{1}{6}\right) \div \left(\frac{5}{8}-\frac{1}{3}\right)$

Evaluate Variable Expressions with Fractions

In the following exercises, evaluate.

87. $\frac{7}{10}-w$ when ⓐ $w=\frac{1}{2}$ ⓑ $w=-\frac{1}{2}$

Answer

ⓐ $\frac{1}{5}$ ⓑ $\frac{6}{5}$

88. $512-w$ when ⓐ $w=\frac{1}{4}$ ⓑ $w=-\frac{1}{4}$

89. $2x^2y^3$ when $x=-\frac{2}{3}$ and $y=-\frac{1}{2}$

Answer

$-\frac{1}{9}$

90. $8u^2v^3$ when $u=-\frac{3}{4}$ and $v=-\frac{1}{2}$

91. $\frac{a+b}{a-b}$ when $a=-3$ and $b=8$

Answer

$-\frac{5}{11}$

92. $\frac{r-s}{r+s}$ when $r=10$ and $s=-5$

Writing Exercises

93. Why do you need a common denominator to add or subtract fractions? Explain.

Answer

Answers will vary.

94. How do you find the LCD of 2 fractions?

95. Explain how you find the reciprocal of a fraction.

Answer

Answers will vary.

96. Explain how you find the reciprocal of a negative number.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify fractions.			
multiply and divide fractions.			
add and subtract fractions.			
use the order of operations to simplify fractions.			
evaluate variable expressions with fractions.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 13.7.4E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

- **1.4E: Exercises** by OpenStax is licensed CC BY 4.0. Original source: https://openstax.org/details/books/intermediate-algebra-2e.

13.7.5: Decimals

Learning Objectives

By the end of this section, you will be able to:

- Round decimals
- Add and subtract decimals
- Multiply and divide decimals
- Convert decimals, fractions, and percents
- Simplify expressions with square roots
- Identify integers, rational numbers, irrational numbers, and real numbers
- Locate fractions and decimals on the number line

A more thorough introduction to the topics covered in this section can be found in the *Elementary Algebra* chapter, Foundations.

Round Decimals

Decimals are another way of writing fractions whose denominators are powers of ten.

$$\begin{aligned} 0.1 &= \frac{1}{10} && \text{is “one tenth”} \\ 0.01 &= \frac{1}{100} && \text{is “one hundredth”} \\ 0.001 &= \frac{1}{1000} && \text{is “one thousandth”} \\ 0.0001 &= \frac{1}{10,000} && \text{is “one ten-thousandth”} \end{aligned} \tag{13.7.5.1}$$

Just as in whole numbers, each digit of a decimal corresponds to the place value based on the powers of ten. Figure shows the names of the place values to the left and right of the decimal point.

Place Value											
Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones		Tenths	Hundredths	Thousandths	Ten-thousandths	Hundred-thousandths
						.					

Figure 1.

When we work with decimals, it is often necessary to round the number to the nearest required place value. We summarize the steps for rounding a decimal here.

ROUND DECIMALS.

1. Locate the given place value and mark it with an arrow.
2. Underline the digit to the right of the place value.
3. Is the underlined digit greater than or equal to 5?
   - Yes: add 1 to the digit in the given place value.
   - No: do not change the digit in the given place value
4. Rewrite the number, deleting all digits to the right of the rounding digit.

EXAMPLE 13.7.5.1

Round 18.379 to the nearest ⓐ hundredth ⓑ tenth ⓒ whole number.

Answer

Round 18.379.

ⓐ to the nearest hundredth

Locate the hundredths place with an arrow.	hundredths place ↓ 18.379
Underline the digit to the right of the given place value.	hundredths place ↓ 18.379
Because 9 is greater than or equal to 5, add 1 to the 7.	18.379 add 1 ↗ delete
Rewrite the number, deleting all digits to the right of the rounding digit.	18.38
Notice that the deleted digits were NOT replaced with zeros.	So, 18.379 rounded to the nearest hundredth is 18.38.

ⓑ to the nearest tenth

Locate the tenths place with an arrow.	tenths place ↓ 18.379
Underline the digit to the right of the given place value.	tenths place ↓ 18.379
Because 7 is greater than or equal to 5, add 1 to the 3.	18.379 add 1 ↗ delete
Rewrite the number, deleting all digits to the right of the rounding digit.	18.4
Notice that the deleted digits were NOT replaced with zeros.	So, 18.379 rounded to the nearest tenth is 18.4.

ⓒ to the nearest whole number

Locate the ones place with an arrow.	ones place ↓ 18.379
Underline the digit to the right of the given place value.	ones place ↓ 18.379
Since 3 is not greater than or equal to 5, do not add 1 to the 8.	18.379 do not add 1 ↗ delete
Rewrite the number, deleting all digits to the right of the rounding digit.	18

So, 18.379 rounded to the nearest whole number is 18.

EXAMPLE 13.7.5.2

Round 6.582 to the nearest ⓐ hundredth ⓑ tenth ⓒ whole number.

Answer

ⓐ 6.58 ⓑ 6.6 ⓒ 7

EXAMPLE 13.7.5.3

Round 15.2175 to the nearest ⓐ thousandth ⓑ hundredth ⓒ tenth.

Answer

ⓐ 15.218 ⓑ 15.22

ⓒ 15.2

Add and Subtract Decimals

To add or subtract decimals, we line up the decimal points. By lining up the decimal points this way, we can add or subtract the corresponding place values. We then add or subtract the numbers as if they were whole numbers and then place the decimal point in the sum.

ADD OR SUBTRACT DECIMALS.

1. Determine the sign of the sum or difference.
2. Write the numbers so the decimal points line up vertically.
3. Use zeros as placeholders, as needed.
4. Add or subtract the numbers as if they were whole numbers. Then place the decimal point in the answer under the decimal points in the given numbers.
5. Write the sum or difference with the appropriate sign.

EXAMPLE 13.7.5.4

Add or subtract: ⓐ $-23.5-41.38$ ⓑ $14.65-20$.

Answer

ⓐ

$-23.5-41.38$

The difference will be negative. To subtract, we add the numerals. Write the numbers so the decimal points line up vertically.

$$\begin{array}{r} 23.5 \\ +41.38 \\ \hline \end{array}$$

Put 0 as a placeholder after the 5 in 23.5.
Remember, $\frac{5}{10}=\frac{50}{100}$ so $0.5=0.50$.

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline \end{array}$$

Add the numbers as if they were whole numbers. Then place the decimal point in the sum.

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline 64.88 \end{array}$$

Write the result with the correct sign. $64.88-23.5-41.38=-64.88$

ⓑ

$14.65-20$

The difference will be negative. To subtract, we subtract 14.65 from 20.

Write the numbers so the decimal points line up vertically.

$$\begin{array}{r} 20 \\ -14.65 \\ \hline \end{array}$$

Remember, 20 is a whole number, so place the decimal point after the 0.

Put in zeros to the right as placeholders.

$$\begin{array}{r} 20.00 \\ -14.65 \\ \hline \end{array}$$

Subtract and place the decimal point in the answer.

$$\begin{array}{rrrrr} & 9 & & 9 & \\ 1 & \cancel{0} & & \cancel{0} & 10 \\ 2 & 0 & . & 0 & 0 \\ -1 & 4 & . & 6 & 5 \\ \hline & 5 & . & 3 & 5 \end{array}$$

Write the result with the correct sign. $14.65-20=-5.35$

? EXAMPLE 13.7.5.5

Add or subtract: ⓐ $-4.8-11.69$ ⓑ $9.58-10$.

Answer

ⓐ -16.49 ⓑ -0.42

? EXAMPLE 13.7.5.6

Add or subtract: ⓐ $-5.123-18.47$ ⓑ $37.42-50$.

Answer

ⓐ -23.593 ⓑ -12.58

Multiply and Divide Decimals

When we multiply signed decimals, first we determine the sign of the product and then multiply as if the numbers were both positive. We multiply the numbers temporarily ignoring the decimal point and then count the number of decimal points in the factors and that sum tells us the number of decimal places in the product. Finally, we write the product with the appropriate sign.

MULTIPLY DECIMALS.

1. Determine the sign of the product.
2. Write in vertical format, lining up the numbers on the right. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
3. Place the decimal point. The number of decimal places in the product is the sum of the number of decimal places in the factors.
4. Write the product with the appropriate sign.

?

Multiply: $(-3.9)(4.075)$.

Answer

	$(-3.9)(4.075)$
The signs are different. The product will be negative.	The product will be negative.
Write in vertical format, lining up the numbers on the right.	4.075 × 3.9
Multiply.	4.075 × 3.9 36675 12225 158925
Add the number of decimal places in the factors (1 + 3). Place the decimal point 4 places from the right. (–3.9) (4.075) 1 place 3 places	4.075 × 3.9 36675 12225 15.8925 4 places
The signs are the different, so the product is negative.	$(-3.9)(4.075)=-15.8925$

Multiply: $-4.5(6.107)$

Answer

-27.4815

EXAMPLE 13.7.5.9

Multiply: $-10.79(8.12)$

Answer

-87.6148

Often, especially in the sciences, you will multiply decimals by powers of 10 (10, 100, 1000, etc). If you multiply a few products on paper, you may notice a pattern relating the number of zeros in the power of 10 to number of decimal places we move the decimal point to the right to get the product.

MULTIPLY A DECIMAL BY A POWER OF TEN.

1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
2. Add zeros at the end of the number as needed.

EXAMPLE 13.7.5.10

Multiply: 5.63 by ⓐ 10 ⓑ 100 ⓒ 1000.

Answer

By looking at the number of zeros in the multiple of ten, we see the number of places we need to move the decimal to the right.

ⓐ

	5.63 (10)
There is 1 zero in 10, so move the decimal point 1 place to the right.	5.63
	5.63

ⓑ

	5.63(100)
There are 2 zeroes in 100, so move the decimal point 2 places to the right.	5.63
	563

ⓒ

	5.63(1,000)
There are 3 zeroes in 1,000, so move the decimal point 3 place to the right.	5.63

A zero must be added to the end.	5,630

? EXAMPLE 13.7.5.11

Multiply 2.58 by ⓐ 10 ⓑ 100 ⓒ 1000.

Answer

ⓐ 25.8 ⓑ 258 ⓒ 2,580

? EXAMPLE 13.7.5.12

Multiply 14.2 by ⓐ 10 ⓑ 100 ⓒ 1000.

Answer

ⓐ 142 ⓑ 1,420 ⓒ 14,200

Just as with multiplication, division of signed decimals is very much like dividing whole numbers. We just have to figure out where the decimal point must be placed and the sign of the quotient. When dividing signed decimals, first determine the sign of the quotient and then divide as if the numbers were both positive. Finally, write the quotient with the appropriate sign.

We review the notation and vocabulary for division:

$$\underset{\text{dividend}}{a} \div \underset{\text{divisor}}{b} = \underset{\text{quotient}}{c} \qquad \begin{array}{r} \overset{\text{quotient}}{c} \\ \text{divisor } b \overline{)\, a} \\ \text{dividend} \end{array}$$

We'll write the steps to take when dividing decimals for easy reference.

DIVIDE DECIMALS.

1. Determine the sign of the quotient.
2. Make the divisor a whole number by "moving" the decimal point all the way to the right. "Move" the decimal point in the dividend the same number of places—adding zeros as needed.
3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
4. Write the quotient with the appropriate sign.

? EXAMPLE 13.7.5.13

Divide: $-25.65 \div (-0.06)$.

Answer

Remember, you can "move" the decimals in the divisor and dividend because of the Equivalent Fractions Property.

	–25.65 ÷ (–0.06)
The signs are the same.	The quotient is positive.
Make the divisor a whole number by "moving" the decimal point all the way to the right.	
"Move" the decimal point in the dividend the same number of places.	$0.06\overline{)25.65}$

Divide. Place the decimal point in the quotient above the decimal point in the dividend.	427.5 006.)2565.0 −24 16 −12 45 −42 30 30
Write the quotient with the appropriate sign.	−25.65 ÷ (−0.06) = 427.5

EXAMPLE 13.7.5.14

Divide: $-23.492 \div (-0.04)$.

Answer

587.3

EXAMPLE 13.7.5.15

Divide: $-4.11 \div (-0.12)$.

Answer

34.25

Convert Decimals, Fractions, and Percents

In our work, it is often necessary to change the form of a number. We may have to change fractions to decimals or decimals to percent.

We convert decimals into fractions by identifying the place value of the last (farthest right) digit. In the decimal 0.03. the 3 is in the hundredths place, so 100 is the denominator of the fraction equivalent to 0.03.

$$0.03 = \frac{3}{100} \tag{13.7.5.2}$$

The steps to take to convert a decimal to a fraction are summarized in the procedure box.

CONVERT A DECIMAL TO A PROPER FRACTION AND A FRACTION TO A DECIMAL.

1. To convert a decimal to a proper fraction, determine the place value of the final digit.
2. Write the fraction.
   - numerator—the "numbers" to the right of the decimal point
   - denominator—the place value corresponding to the final digit
3. To convert a fraction to a decimal, divide the numerator of the fraction by the denominator of the fraction.

EXAMPLE 13.7.5.16

Write: ⓐ 0.374 as a fraction ⓑ $-\frac{5}{8}$ as a decimal.

Answer

ⓐ

	0.374
Determine the place value of the final digit.	0.3 tenths, 7 hundredths, 4 thousandths

Write the fraction for 0.374: The numerator is 374. The denominator is 1,000.	$\frac{374}{1000}$
Simplify the fraction.	$\frac{2 \cdot 187}{2 \cdot 500}$
Divide out the common factors.	$\frac{187}{500}$
	so, $0.374 = \frac{187}{500}$

ⓑ Since a fraction bar means division, we begin by writing the fraction $\frac{5}{8}$ as $8\overline{)5}$. Now divide.

$$\begin{array}{r} 0.625 \\ 8\overline{)5.000} \\ \underline{48} \\ 20 \\ \underline{16} \\ 40 \\ \underline{40} \\ \end{array}$$

so, $-\frac{5}{8} = -0.625$

? EXAMPLE 13.7.5.17

Write: ⓐ 0.234 as a fraction ⓑ $-\frac{7}{8}$ as a decimal.

Answer

ⓐ $\frac{117}{500}$ ⓑ -0.875

? EXAMPLE 13.7.5.18

Write: ⓐ 0.024 as a fraction ⓑ $-\frac{3}{8}$ as a decimal.

Answer

ⓐ $\frac{3}{125}$ ⓑ -0.375

A **percent** is a ratio whose denominator is 100. Percent means per hundred. We use the percent symbol, %, to show percent. Since a percent is a ratio, it can easily be expressed as a fraction. Percent means per 100, so the denominator of the fraction is 100. We then change the fraction to a decimal by dividing the numerator by the denominator. After doing this many times, you may see the pattern.

To convert a percent number to a decimal number, we move the decimal point two places to the left.

6%	78%	2.7%	135%
0.06	0.78	0.027	1.35

To convert a decimal to a percent, remember that percent means per hundred. If we change the decimal to a fraction whose denominator is 100, it is easy to change that fraction to a percent. After many conversions, you may recognize the pattern.

To convert a decimal to a percent, we move the decimal point two places to the right and then add the percent sign.

0.05	0.83	1.05	0.075	0.3
5%	83%	105%	7.5%	30%

CONVERT A PERCENT TO A DECIMAL AND A DECIMAL TO A PERCENT.

1. To convert a percent to a decimal, move the decimal point two places to the left after removing the percent sign.
2. To convert a decimal to a percent, move the decimal point two places to the right and then add the percent sign.

EXAMPLE 13.7.5.19

Convert each:

ⓐ percent to a decimal: 62%, 135%, and 13.7%.

ⓑ decimal to a percent: 0.51, 1.25, and 0.093.

Answer

ⓐ

	62%	135%	35.7%
Move the decimal point two places to the left.	0.62	1.35	0.357

ⓑ

	0.51	1.25	0.093
Move the decimal point two places to the right.	51%	125%	9.3%

EXAMPLE 13.7.5.20

Convert each:

ⓐ percent to a decimal: 9%, 87%, and 3.9%.

ⓑ decimal to a percent: 0.17, 1.75, and 0.0825.

Answer

ⓐ 0.09, 0.87, 0.039 ⓑ 17%, 175%, 8.25%

EXAMPLE 13.7.5.21

Convert each:

ⓐ percent to a decimal: 3%, 91%, and 8.3%.

ⓑ decimal to a percent: 0.41, 2.25, and 0.0925.

Answer

ⓐ 0.03, 0.91, 0.083 ⓑ 41%, 225%, 9.25%

Simplify Expressions with Square Roots

Remember that when a number n is multiplied by itself, we write n^2 and read it "n squared." The result is called the **square of a number** n. For example, $\frac{8}{2}$ is read "8 squared" and 64 is called the *square* of 8. Similarly, 121 is the square of 11 because 11^2 is 121. It will be helpful to learn to recognize the perfect square numbers.

SQUARE OF A NUMBER

If $n^2 = m$, then m is the **square** of n.

What about the squares of negative numbers? We know that when the signs of two numbers are the same, their product is positive. So the square of any negative number is also positive.

$$(-3)^2 = 9 \qquad (-8)^2 = 64 \qquad (-11)^2 = 121 \qquad (-15)^2 = 225 \tag{13.7.5.3}$$

Because $10^2 = 100$, we say 100 is the square of 10. We also say that 10 is a *square root* of 100. A number whose square is m is called a **square root of a number** m.

SQUARE ROOT OF A NUMBER

If $n^2 = m$, then n is a **square root** of m.

Notice $(-10)^2 = 100$ also, so -10 is also a square root of 100. Therefore, both 10 and -10 are square roots of 100. So, every positive number has two square roots—one positive and one negative. The radical sign, $\sqrt{m}$, denotes the positive square root. The positive square root is called the **principal square root**. When we use the radical sign that always means we want the principal square root.

SQUARE ROOT NOTATION

$\sqrt{m}$ is read "the square root of mm."

radical sign → $\sqrt{m}$ ← radicand

If $m = n^2$, then $\sqrt{m} = n$, for $n \geq 0$.

The square root of m, $\sqrt{m}$, is the positive number whose square is m.

We know that every positive number has two square roots and the radical sign indicates the positive one. We write $\sqrt{100} = 10$. If we want to find the negative square root of a number, we place a negative in front of the radical sign. For example, $-\sqrt{100} = -10$. We read $-\sqrt{100}$ as "the opposite of the principal square root of 10."

Exercise 13.7.5.22

Simplify: ⓐ $\sqrt{25}$ ⓑ $\sqrt{121}$ ⓒ $-\sqrt{144}$.

Answer

ⓐ

	$\sqrt{25}$
Since $5^2 = 25$	5

ⓑ

	$\sqrt{121}$
Since $11^2 = 121$	11

ⓒ

	$-\sqrt{144}$
The negative is in front of the radical sign.	-12

Exercise 13.7.5.23

Simplify: ⓐ $\sqrt{36}$ ⓑ $\sqrt{169}$ ⓒ $-\sqrt{225}$

Answer

ⓐ 6 ⓑ 13 ⓒ −15

Exercise 13.7.5.24

Simplify: ⓐ $\sqrt{16}$ ⓑ $\sqrt{196}$ ⓒ $-\sqrt{100}$

Answer

ⓐ 4 ⓑ 14 ⓒ −10

Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

We have already described numbers as *counting numbers*, *whole numbers*, and *integers*. What is the difference between these types of numbers? Difference could be confused with subtraction. How about asking how we distinguish between these types of numbers?

$$\begin{array}{ll} \text{Counting numbers} & 1, 2, 3, 4, \ldots . \\ \text{Whole numbers} & 0, 1, 2, 3, 4, \ldots . \\ \text{Integers} & \ldots . -3, -2, -1, 0, 1, 2, 3, \ldots . \end{array} \tag{13.7.5.4}$$

What type of numbers would we get if we started with all the integers and then included all the fractions? The numbers we would have form the set of rational numbers. A **rational number** is a number that can be written as a ratio of two integers.

In general, any decimal that ends after a number of digits (such as 7.3 or −1.2684) is a rational number. We can use the place value of the last digit as the denominator when writing the decimal as a fraction. The decimal for $\frac{1}{3}$ is the number $0.\overline{3}$. The bar over the 3 indicates that the number 3 repeats infinitely. Continuously has an important meaning in calculus. The number(s) under the bar is called the repeating block and it repeats continuously.

Since all integers can be written as a fraction whose denominator is 1, the integers (and so also the counting and whole numbers. are rational numbers.

Every rational number can be written both as a ratio of integers $\frac{p}{q}$, where p and q are integers and $q \neq 0$, and as a decimal that stops or repeats.

RATIONAL NUMBER

A **rational number** is a number of the form $\frac{p}{q}$, where p and q are integers and $q \neq 0$.

Its decimal form stops or repeats.

Are there any decimals that do not stop or repeat? Yes! The number $\pi\pi$ (the Greek letter *pi*, pronounced “pie”), which is very important in describing circles, has a decimal form that does not stop or repeat. We use three dots (…) to indicate the decimal does not stop or repeat.

$$\pi = 3.141592654... \tag{13.7.5.5}$$

The square root of a number that is not a perfect square is a decimal that does not stop or repeat.

A numbers whose decimal form does not stop or repeat cannot be written as a fraction of integers. We call this an **irrational number**.

IRRATIONAL NUMBER

An **irrational number** is a number that cannot be written as the ratio of two integers.

Its decimal form does not stop and does not repeat.

Let's summarize a method we can use to determine whether a number is rational or irrational.

RATIONAL OR IRRATIONAL

If the decimal form of a number

- *repeats or stops*, the number is a **rational number**.
- *does not repeat and does not stop*, the number is an **irrational number.**

We have seen that all counting numbers are whole numbers, all whole numbers are integers, and all integers are rational numbers. The irrational numbers are numbers whose decimal form does not stop and does not repeat. When we put together the rational numbers and the irrational numbers, we get the set of **real numbers**.

REAL NUMBER

A **real number** is a number that is either rational or irrational.

Later in this course we will introduce numbers beyond the real numbers. Figure illustrates how the number sets we've used so far fit together.

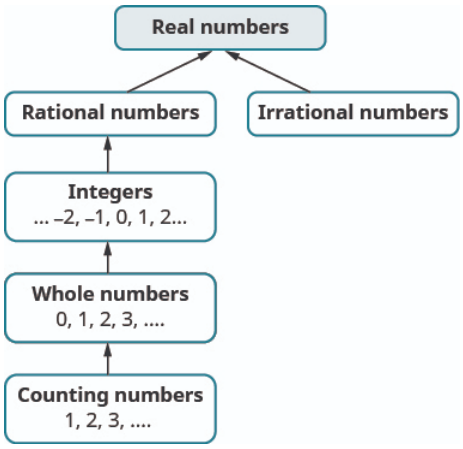

Figure 2. This chart shows the number sets that make up the set of real numbers.

Does the term "real numbers" seem strange to you? Are there any numbers that are not "real," and, if so, what could they be? Can we simplify $-\sqrt{25}$? Is there a number whose square is -25?

$$()^2 = -25? \tag{13.7.5.6}$$

None of the numbers that we have dealt with so far has a square that is -25. Why? Any positive number squared is positive. Any negative number squared is positive. So we say there is no real number equal to $\sqrt{-25}$. The square root of a negative number is not a real number.

Exercise 13.7.5.25

Given the numbers $-7, \frac{14}{5}, 8, \sqrt{5}, 5.9, -\sqrt{64}$ list the ⓐ whole numbers ⓑ integers ⓒ rational numbers ⓓ irrational numbers ⓔreal numbers.

Answer

ⓐ Remember, the whole numbers are $0, 1, 2, 3, \ldots$,so 8 is the only whole number given.

ⓑ The integers are the whole numbers and their opposites (which includes 0). So the whole number 8 is an integer, and -7 is the opposite of a whole number so it is an integer, too. Also, notice that 64 is the square of 8 so $-\sqrt{64}=-8$. So the integers are $-7, 8$, and $-\sqrt{64}$.

ⓒ Since all integers are rational, then $-7, 8$, and $-\sqrt{64}$ are rational. Rational numbers also include fractions and decimals that repeat or stop, so $\frac{14}{5}$ and 5.9 are rational. So the list of rational numbers is -7, $\frac{14}{5}, 8, 5.9$,and $-\sqrt{64}$.

ⓓ Remember that 5 is not a perfect square, so $\sqrt{5}$ is irrational.

ⓔ All the numbers listed are real numbers.

? Exercise 13.7.5.26

Given the numbers $-3, -\sqrt{2}, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$, list the ⓐ whole numbers ⓑ integers ⓒ rational numbers ⓓ irrational numbers ⓔ real numbers.

Answer

ⓐ $4, \sqrt{49}$ ⓑ $-3, 4, \sqrt{49}$

ⓒ $-3, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$ⓓ $-\sqrt{2}$

ⓔ $-3, -\sqrt{2}, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$

? Exercise 13.7.5.27

Given numbers $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}, 2.041975\ldots$, list the ⓐ whole numbers ⓑ integers ⓒ rational numbers ⓓ irrational numbers ⓔ real numbers.

Answer

ⓐ $6, \sqrt{121}$

ⓑ $-\sqrt{25}, -1, 6, \sqrt{121}$

ⓒ $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}$

ⓓ $2.041975\ldots$

ⓔ $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}, 2.041975\ldots$

Locate Fractions and Decimals on the Number Line

We now want to include fractions and decimals on the number line. Let's start with fractions and locate $\frac{1}{5}, -\frac{4}{5}, 3, \frac{7}{4}, -\frac{9}{2}, -5$ and $\frac{8}{3}$ on the number line.

We'll start with the whole numbers 3 and -5 because they are the easiest to plot. See Figure.

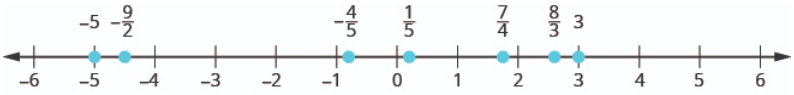
The proper fractions listed are $\frac{1}{5}$ and $-\frac{4}{5}$. We know the proper fraction $\frac{1}{5}$ has value less than one and so would be located between 0 and 1. The denominator is 5, so we divide the unit from 0 to 1 into 5 equal parts $\frac{1}{5}, \frac{2}{5}, \frac{3}{5}, \frac{4}{5}$. We plot $\frac{1}{5}$.

Similarly, $-\frac{4}{5}$ is between 0 and -1. After dividing the unit into 5 equal parts we plot $-\frac{4}{5}$.

Finally, look at the improper fractions $\frac{7}{4}, \frac{9}{2}, \frac{8}{3}$. Locating these points may be easier if you change each of them to a mixed number.

$$\frac{7}{4}=1\frac{3}{4} \qquad -\frac{9}{2}=-4\frac{1}{2} \qquad \frac{8}{3}=2\frac{2}{3} \tag{13.7.5.7}$$

Figure shows the number line with all the points plotted.



Exercise 13.7.5.28

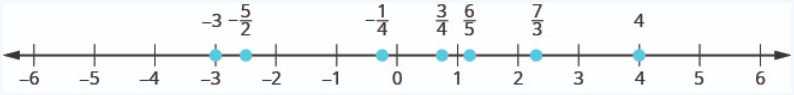
Locate and label the following on a number line: $4, \frac{3}{4}, -\frac{1}{4}, -3, \frac{6}{5}, -\frac{5}{2}$, and $\frac{7}{3}$.

Answer

Locate and plot the integers, $4, -3$.

Locate the proper fraction $\frac{3}{4}$ first. The fraction $\frac{3}{4}$ is between 0 and 1. Divide the distance between 0 and 1 into four equal parts, then we plot $\frac{3}{4}$. Similarly plot $-\frac{1}{4}$.

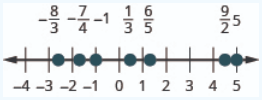
Now locate the improper fractions $\frac{6}{5}, -\frac{5}{2}$, and $\frac{7}{3}$. It is easier to plot them if we convert them to mixed numbers and then plot them as described above: $\frac{6}{5} = 1\frac{1}{5}, -\frac{5}{2} = -2\frac{1}{2}, \frac{7}{3} = 2\frac{1}{3}$.



Exercise 13.7.5.29

Locate and label the following on a number line: $-1, \frac{1}{3}, \frac{6}{5}, -\frac{7}{4}, \frac{9}{2}, 5, -\frac{8}{3}$.

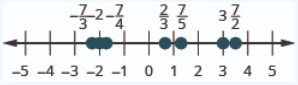
Answer



Exercise 13.7.5.30

Locate and label the following on a number line: $-2, \frac{2}{3}, \frac{7}{5}, -\frac{7}{4}, \frac{7}{2}, 3, -\frac{7}{3}$.

Answer



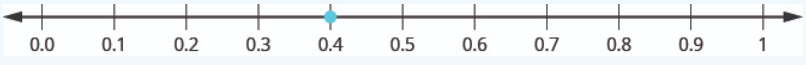
Exercise 13.7.5.31

Since decimals are forms of fractions, locating decimals on the number line is similar to locating fractions on the number line.

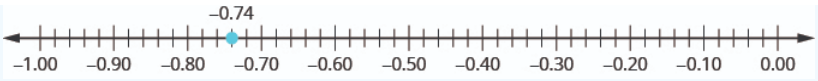
Locate on the number line: ⓐ 0.4 ⓑ −0.74.

Answer

ⓐ The decimal number 0.4 is equivalent to $\frac{4}{10}$, a proper fraction, so 0.4 is located between 0 and 1. On a number line, divide the interval between 0 and 1 into 10 equal parts. Now label the parts 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0. We write 0 as 0.0 and 1 as 1.0, so that the numbers are consistently in tenths. Finally, mark 0.4 on the number line.



ⓑ The decimal -0.74 is equivalent to $-\frac{74}{100}$, so it is located between 0 and .−1. On a number line, mark off and label the hundredths in the interval between 0 and −1.



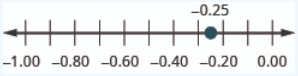
Exercise 13.7.5.32

Locate on the number line: ⓐ 0.6 ⓑ -0.25.

Answer

ⓐ

ⓑ



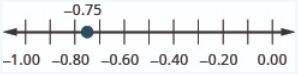
Exercise 13.7.5.33

Locate on the number line: ⓐ $0.90.9$ ⓑ $-0.75.-0.75$.

Answer

ⓐ

ⓑ



Access this online resource for additional instruction and practice with decimals.

- Arithmetic Basics: Dividing Decimals

Key Concepts

- **How to round decimals.**
  1. Locate the given place value and mark it with an arrow.
  2. Underline the digit to the right of the place value.
  3. Is the underlined digit greater than or equal to 5?
     - Yes: add 1 to the digit in the given place value.
     - No: do not change the digit in the given place value
  4. Rewrite the number, deleting all digits to the right of the rounding digit.
- **How to add or subtract decimals.**
  1. Determine the sign of the sum or difference.
  2. Write the numbers so the decimal points line up vertically.
  3. Use zeros as placeholders, as needed.
  4. Add or subtract the numbers as if they were whole numbers. Then place the decimal point in the answer under the decimal points in the given numbers.
  5. Write the sum or difference with the appropriate sign
- **How to multiply decimals.**
  1. Determine the sign of the product.

2. Write in vertical format, lining up the numbers on the right. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
3. Place the decimal point. The number of decimal places in the product is the sum of the number of decimal places in the factors.
4. Write the product with the appropriate sign.

- **How to multiply a decimal by a power of ten.**
  1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
  2. Add zeros at the end of the number as needed.
- **How to divide decimals.**
  1. Determine the sign of the quotient.
  2. Make the divisor a whole number by "moving" the decimal point all the way to the right. "Move" the decimal point in the dividend the same number of places—adding zeros as needed.
  3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
  4. Write the quotient with the appropriate sign.
- **How to convert a decimal to a proper fraction and a fraction to a decimal.**
  1. To convert a decimal to a proper fraction, determine the place value of the final digit.
  2. Write the fraction.
     - numerator—the "numbers" to the right of the decimal point
     - denominator—the place value corresponding to the final digit
  3. To convert a fraction to a decimal, divide the numerator of the fraction by the denominator of the fraction.
- **How to convert a percent to a decimal and a decimal to a percent.**
  1. To convert a percent to a decimal, move the decimal point two places to the left after removing the percent sign.
  2. To convert a decimal to a percent, move the decimal point two places to the right and then add the percent sign.
- **Square Root Notation** $\sqrt{m}$ is read "the square root of *m*." If $m = n^2$, then $\sqrt{m} = n$, for $n \geq 0$. The square root of *m*, $\sqrt{m}$, is the positive number whose square is *m*.
- **Rational or Irrational** If the decimal form of a number
  - *repeats or stops*, the number is a rational number.
  - *does not repeat and does not stop*, the number is an irrational number.
- **Real Numbers**

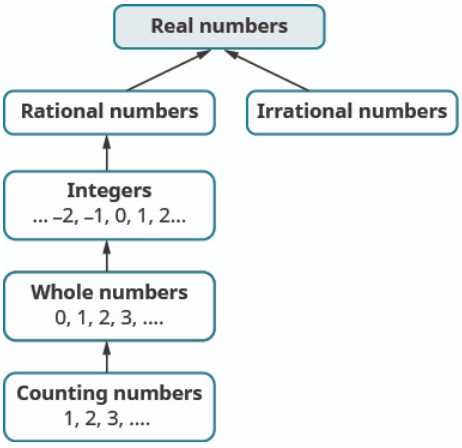


Figure 4.

Glossary

irrational number

An irrational number is a number that cannot be written as the ratio of two integers. Its decimal form does not stop and does not repeat.

percent

A percent is a ratio whose denominator is 100.

principal square root

The positive square root is called the principal square root.

rational number

A rational number is a number of the form $\frac{p}{q}$, where p and q are integers and $q \neq 0$. Its decimal form stops or repeats.

real number

A real number is a number that is either rational or irrational.

square of a number

If $n^2 = m$, then m is the square of n.

square root of a number

If $n^2 = m$, then n is a square root of m.

13.7.5E: Exercises

Practice Makes Perfect

Round Decimals

In the following exercises, round each number to the nearest ⓐ hundredth ⓑ tenth ⓒ whole number.

1. 5.781

Answer

ⓐ 5.78 ⓑ 5.8 ⓒ 6

2. 1.638

3. 0.299

Answer

ⓐ 0.30 ⓑ 0.3 ⓒ 0

4. 0.697

5. 63.479

Answer

ⓐ 63.48 ⓑ 63.5 ⓒ 63

6. 84.281

Add and Subtract Decimals

In the following exercises, add or subtract.

7. $-16.53-24.38$

Answer

-40.91

8. $-19.47-32.58$

9. $-38.69+31.47$

Answer

-7.22

10. $-29.83+19.76$

11. $72.5-100$

Answer

-27.5

12. $86.2 - 100$

13. $91.75 - (-10.462)$

Answer

02.212

14. $94.69 - (-12.678)$

15. $55.01 - 3.7$

Answer

51.31

16. $59.08 - 4.6$

17. $2.51 - 7.4$

Answer

-4.89

18. $3.84 - 6.1$

Multiply and Divide Decimals

In the following exercises, multiply.

19. $94.69 - (-12.678)$

Answer

-11.653

20. $(-8.5)(1.69)$

21. $(-5.18)(-65.23)$

Answer

337.8914

22. $(-9.16)(-68.34)$

23. $(0.06)(21.75)$

Answer

1.305

24. $(0.08)(52.45)$

25. $(9.24)(10)$

Answer

92.4

27. $(0.025)(100)$

Answer

2.5

28. $(0.037)(100)$

29. $(55.2)(1000)$

Answer

55200

30. $(99.4)(1000)$

In the following exercises, divide. Round money monetary answers to the nearest cent.

31. $\$117.25 \div 48$

Answer

$\$2.44$

32. $\$109.24 \div 36$

33. $1.44 \div (-0.3)$

Answer

-4.8

34. $-1.15 \div (-0.05)$

35. $5.2 \div 2.5$

Answer

2.08

36. $14 \div 0.35$

Convert Decimals, Fractions and Percents

In the following exercises, write each decimal as a fraction.

37. 0.04

Answer

$\frac{1}{25}$

38. 1.464

39. 0.095

Answer

$\frac{19}{200}$

40. -0.375

In the following exercises, convert each fraction to a decimal.

41. $\frac{17}{20}$

Answer

0.85

42. $\frac{17}{4}$

43. $-\frac{310}{25}$

Answer

-12.4

44. $-\frac{18}{11}$

In the following exercises, convert each percent to a decimal.

45. 71%

Answer

0.71

46. 150%

47. 39.3%

Answer

0.393

48. 7.8%

In the following exercises, convert each decimal to a percent.

49. 1.56

Answer

156%

50. 3

51. 0.0625

Answer

6.25%

52. 2.254

Simplify Expressions with Square Roots

In the following exercises, simplify.

53. $\sqrt{64}$

Answer

8

54. $\sqrt{169}$

55. $\sqrt{144}$

Answer

12

56. $-\sqrt{4}$

57. $-\sqrt{100}$

Answer

-10

58. $-\sqrt{121}$

Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

In the following exercises, list the ⓐ whole numbers, ⓑ integers, ⓒ rational numbers, ⓓ irrational numbers, ⓔ real numbers for each set of numbers.

59. $-8, 0, 1.95286\ldots, \frac{12}{5}, \sqrt{36}, 9$

Answer

ⓐ Whole numbers: $0, \sqrt{36}, 9$
ⓑ Integers: $-8, 0, \sqrt{36}, 9$
ⓒ Rational numbers: $-8, 0, \sqrt{36}, 9$
ⓓ Irrational numbers: $1.95286\ldots,$
ⓔ Real numbers: $-8, 0, 1.95286\ldots, \frac{12}{5}, \sqrt{36}, 9$

60. $-9, -3\frac{4}{9}, -\sqrt{9}, 0.40\overline{9}, \frac{11}{6}, 7$

61. $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$

Answer

ⓐ Whole numbers: none
ⓑ Integers: $-\sqrt{100}, -7, -1$
ⓒ Rational numbers: $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$
ⓓ Irrational numbers: none
ⓔ Real numbers: $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$

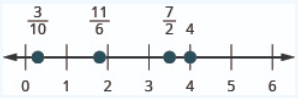
62. $-6, -\frac{5}{2}, 0, 0.\overline{714285}, 2\frac{1}{5}, \sqrt{14}$

Locate Fractions and Decimals on the Number Line

In the following exercises, locate the numbers on a number line.

63. $\frac{3}{10}, \frac{7}{2}, \frac{11}{6}, 4$

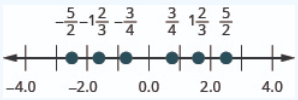
Answer



64. $\frac{7}{10}, \frac{5}{2}, \frac{13}{8}, 3$

65. $\frac{3}{4}, -\frac{3}{4}, 1\frac{2}{3}, -1\frac{2}{3}, \frac{5}{2}, -\frac{5}{2}$

Answer



66. $\frac{2}{5}, -\frac{2}{5}, 1\frac{3}{4}, -1\frac{3}{4}, \frac{8}{3}, -\frac{8}{3}$

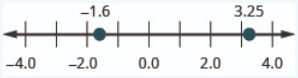
67. ⓐ 0.8 ⓑ -1.25

Answer

68. ⓐ -0.9 ⓑ -2.75

69. ⓐ -1.6 ⓑ 3.25

Answer



70. ⓐ 3.1 ⓑ -3.65

Writing Exercises

71. How does knowing about U.S. money help you learn about decimals?

Answer

Answers will vary.

72. When the Szetos sold their home, the selling price was 500% of what they had paid for the house 30 years ago. Explain what 500% means in this context.Szetos sold their home, the selling price was 500% of what they had paid for the house 30 years ago. Explain what 500% means in this context.

73. In your own words, explain the difference between a rational number and an irrational number.

Answer

Answers will vary.

74. Explain how the sets of numbers (counting, whole, integer, rational, irrationals, reals) are related to each other.

Self Check

ⓐ Use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
round decimals.			
add and subtract decimals.			
multiply and divide decimals.			
convert decimals, fractions and percents.			
simplify expressions with square roots.			
identify integers, rational numbers, irrational numbers and real numbers.			
locate fractions and decimals on the number line.			

ⓑ On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

This page titled 13.7.5E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

13.7.6: Properties of Real Numbers

Learning Objectives

By the end of this section, you will be able to:

- Use the commutative and associative properties
- Use the properties of identity, inverse, and zero
- Simplify expressions using the Distributive Property

Use the Commutative and Associative Properties

The order we add two numbers doesn't affect the result. If we add $8+9$ or $9+8$, the results are the same—they both equal 17. So, $8+9=9+8$. The order in which we add does not matter!

Similarly, when multiplying two numbers, the order does not affect the result. If we multiply $9 \cdot 8$ or $8 \cdot 9$ the results are the same —they both equal 72. So, $9 \cdot 8=8 \cdot 9$. The order in which we multiply does not matter! These examples illustrate the **Commutative Property**.

COMMUTATIVE PROPERTY

of Addition	If a and $b$are real numbers, then	$a+b=b+a$.	(13.7.6.1)
of Multiplication	If a and $b$are real numbers, then	$a \cdot b=b \cdot a$.	

When adding or multiplying, changing the *order* gives the same result.

The Commutative Property has to do with order. We subtract $9-8$ and $8-9$, and see that $9-8 \neq 8-9$. Since changing the order of the subtraction does not give the same result, we know that *subtraction is not commutative*.

Division is not commutative either. Since $12 \div 3 \neq 3 \div 12$, changing the order of the division did not give the same result. The commutative properties apply only to addition and multiplication!

- Addition and multiplication *are* commutative.
- Subtraction and division are *not* commutative.

When adding three numbers, changing the grouping of the numbers gives the same result. For example, $(7+8)+2=7+(8+2)$, since each side of the equation equals 17.

This is true for multiplication, too. For example, $\left(5 \cdot \frac{1}{3}\right) \cdot 3=5 \cdot\left(\frac{1}{3} \cdot 3\right)$, since each side of the equation equals 5.

These examples illustrate the **Associative Property**.

ASSOCIATIVE PROPERTY

of Addition	If $a, b,$ and c are real numbers, then	$(a+b)+c=a+(b+c)$.	(13.7.6.2)
of Multiplication	If $a, b,$ and c are real numbers, then	$(a \cdot b) \cdot c=a \cdot(b \cdot c)$.	

When adding or multiplying, changing the *grouping* gives the same result.

The Associative Property has to do with grouping. If we change how the numbers are grouped, the result will be the same. Notice it is the same three numbers in the same order—the only difference is the grouping.

We saw that subtraction and division were not commutative. They are not associative either.

$$\begin{array}{ll} (10-3)-2 \neq 10-(3-2) & (24 \div 4) \div 2 \neq 24 \div(4 \div 2) \\ 7-2 \neq 10-1 & 6 \div 2 \neq 24 \div 2 \\ 5 \neq 9 & 3 \neq 12 \end{array} \quad (13.7.6.3)$$

When simplifying an expression, it is always a good idea to plan what the steps will be. In order to combine like terms in the next example, we will use the Commutative Property of addition to write the like terms together.

Example 13.7.6.1

Simplify: $18p+6q+15p+5q$.

Answer

	$18p+6q+15p+5q$	
Use the Commutative Property of addition to reorder so that like terms are together.	$18p+15p+6q+5q$	(13.7.6.4)
Add like terms.	$33p+11q$	

Example 13.7.6.2

Simplify: $23r+14s+9r+15s$.

Answer

$32r+29s$

Example 13.7.6.3

Simplify: $37m+21n+4m-15n$.

Answer

$41m+6n$

When we have to simplify algebraic expressions, we can often make the work easier by applying the Commutative Property or Associative Property first.

EXAMPLE 13.7.6.4

Simplify: $(\frac{5}{13}+\frac{3}{4})+\frac{1}{4}$.

Answer

	$(\frac{5}{13}+\frac{3}{4})+\frac{1}{4}$
Notice that the last 2 terms have a common denominator, so change the grouping.	$\frac{5}{13}+(\frac{3}{4}+\frac{1}{4})$
Add in parentheses first.	$\frac{5}{13}+(\frac{4}{4})$
Simplify the fraction.	$\frac{5}{13}+1$
Add.	$1\frac{5}{13}$
Convert to an improper fraction.	$\frac{18}{13}$

EXAMPLE 13.7.6.5

Simplify: $(\frac{7}{15}+\frac{5}{8})+\frac{3}{8}$.

Answer

$1\frac{7}{15}$

EXAMPLE 13.7.6.6

Simplify: $(\frac{2}{9}+\frac{7}{12})+\frac{5}{12}$.

Answer

$1\frac{2}{9}$

Use the Properties of Identity, Inverse, and Zero

What happens when we add 0 to any number? Adding 0 doesn't change the value. For this reason, we call 0 the **additive identity**. The **Identity Property of Addition** that states that for any real number $a, a+0=a$ and $0+a=a$.

What happens when we multiply any number by one? Multiplying by 1 doesn't change the value. So we call 1 the multiplicative identity. The **Identity Property of Multiplication** that states that for any real number $a, a\cdot 1=a$ and $1\cdot a=a$.

We summarize the Identity Properties here.

IDENTITY PROPERTY

of Addition For any real number a : $a+0=a$ $\quad 0+a=a$

0 is the **additive identity**

of Multiplication For any real number a : $a\cdot 1=a$ $\quad 1\cdot a=a$ (13.7.6.5)

1 is the **multiplicative identity**

What number added to 5 gives the additive identity, 0? We know

$$5+(-5)=0$$

The missing number was the opposite of the number!

We call $-a$ the additive inverse of a. *The opposite of a number is its additive inverse.* A number and its opposite add to zero, which is the additive identity. This leads to the **Inverse Property of Addition** that states for any real number $a, a+(-a)=0$.

What number multiplied by $\frac{2}{3}$ gives the multiplicative identity, 1? In other words, $\frac{2}{3}$ times what results in 1? We know

$$\frac{2}{3}\cdot\frac{3}{2}=1$$

The missing number was the reciprocal of the number!

We call $\frac{1}{a}$ the **multiplicative inverse** of a. *The reciprocal of a number is its multiplicative inverse.* This leads to the **Inverse Property of Multiplication** that states that for any real number $a, a\neq 0, a\cdot\frac{1}{a}=1$.

We'll formally state the inverse properties here.

INVERSE PROPERTY

of addition For any real number a, $a+(-a)=0$

$-a$ is the **additive inverse** of a

A number and its *opposite* add to zero.

of multiplication For any real number $a, a \neq 0$ $a \cdot \frac{1}{a}=1$

$\frac{1}{a}$ is the **multiplicative inverse** of a

A number and its *reciprocal* multiply to one. (13.7.6.6)

The Identity Property of addition says that when we add 0 to any number, the result is that same number. What happens when we multiply a number by 0? Multiplying by 0 makes the product equal zero.

What about division involving zero? What is $0 \div 3$? Think about a real example: If there are no cookies in the cookie jar and 3 people are to share them, how many cookies does each person get? There are no cookies to share, so each person gets 0 cookies. So, $0 \div 3 = 0$.

We can check division with the related multiplication fact. So we know $0 \div 3 = 0$ because $0 \cdot 3 = 0$.

Now think about dividing *by* zero. What is the result of dividing 4 by 0? Think about the related multiplication fact:

$4 \div 0 = \square$ means $\square \cdot 0 = 4$

Is there a number that multiplied by 0 gives 4? Since any real number multiplied by 0 gives 0, there is no real number that can be multiplied by 0 to obtain 4. We conclude that there is no answer to $4 \div 0$ and so we say that division by 0 is **undefined**.

We summarize the properties of zero here.

PROPERTIES OF ZERO

Multiplication by Zero: For any real number a,

$a \cdot 0 = 0 \quad 0 \cdot a = 0$ The product of any number and 0 is 0. (13.7.6.7)

Division by Zero: For any real number a, $a \neq 0$

$\frac{0}{a} = 0$ Zero divided by any real number, except itself, is zero.

$\frac{a}{0}$ is undefined Division by zero is undefined. (13.7.6.8)

We will now practice using the properties of identities, inverses, and zero to simplify expressions.

EXAMPLE 13.7.6.7

Simplify: $-84n+(-73n)+84n$.

Answer

	$-84n+(-73n)+84n$
Notice that the first and third terms are opposites; use the Commutative Property of addition to re-order the terms.	$-84n+84n+(-73n)$
Add left to right.	$0+(-73n)$
Add.	$-73n$

EXAMPLE 13.7.6.8

Simplify: $-27a+(-48a)+27a$.

Answer

$-48a$

EXAMPLE 13.7.6.9

Simplify: $39x+(-92x)+(-39x)$.

Answer

$-92x$

Now we will see how recognizing reciprocals is helpful. Before multiplying left to right, look for reciprocals—their product is 1.

EXAMPLE 13.7.6.10

Simplify: $\frac{7}{15}\cdot\frac{8}{23}\cdot\frac{15}{7}$.

Answer

	$\frac{7}{15}\cdot\frac{8}{23}\cdot\frac{15}{7}$
Notice the first and third terms are reciprocals, so use the Commutative Property of multiplication to re-order the factors.	$\frac{7}{15}\cdot\frac{15}{7}\cdot\frac{8}{23}$
Multiply left to right.	$1\cdot\frac{8}{23}$
Multiply.	$\frac{8}{23}$

EXAMPLE 13.7.6.11

Simplify: $\frac{9}{16}\cdot\frac{5}{49}\cdot\frac{16}{9}$.

Answer

$\frac{5}{49}$

Simplify: $\frac{6}{17}\cdot\frac{11}{25}\cdot\frac{17}{6}$.

Answer

$\frac{11}{25}$

The next example makes us aware of the distinction between dividing 0 by some number or some number being divided by 0.

Simplify: a. $\frac{0}{n+5}$, where $n\neq -5$ b. $\frac{10-3p}{0}$ where $10-3p\neq 0$.

Answer

a.

	$\frac{0}{n+5}$
Zero divided by any real number except itself is 0.	0

b.

	$\frac{10-3p}{0}$
Division by 0 is undefined.	undefined

EXAMPLE 13.7.6.14

Simplify: a. $\frac{0}{m+7}$, where $m \neq -7$ b. $\frac{18-6c}{0}$, where $18-6c \neq 0$.

Answer

a. 0
b. undefined

EXAMPLE 13.7.6.15

Simplify: a. $\frac{0}{d-4}$, where $d \neq 4$ b. $\frac{15-4q}{0}$, where $15-4q \neq 0$.

Answer

a. 0
b. undefined

Simplify Expressions Using the Distributive Property

Suppose that three friends are going to the movies. They each need $9.25—that's 9 dollars and 1 quarter—to pay for their tickets. How much money do they need all together?

You can think about the dollars separately from the quarters. They need 3 times $9 so $27 and 3 times 1 quarter, so 75 cents. In total, they need $27.75. If you think about doing the math in this way, you are using the Distributive Property.

DISTRIBUTIVE PROPERTY

If $a, b,$ and c are real numbers, then

$$a(b+c) = ab+ac$$
$$(b+c)a = ba+ca$$
$$a(b-c) = ab-ac$$
$$(b-c)a = ba-ca$$

In algebra, we use the Distributive Property to remove parentheses as we simplify expressions.

EXAMPLE 13.7.6.16

Simplify: $3(x+4)$.

Answer

	$3(x+4)$
Distribute.	$3 \cdot x+3 \cdot 4$
Multiply.	$3x+12$

Simplify: $4(x+2)$.

Answer

$4x8$

EXAMPLE 13.7.6.18

Simplify: $6(x+7)$.

Answer

$6x42$

Some students find it helpful to draw in arrows to remind them how to use the Distributive Property. Then the first step in Example would look like this:

EXAMPLE 13.7.6.19

Simplify: $8(\frac{3}{8}x+\frac{1}{4})$.

Answer

	Distribute.	$8\cdot\frac{3}{8}x+8\cdot\frac{1}{4}$
Multiply.	$3x+2$

EXAMPLE 13.7.6.20

Simplify: $6(\frac{5}{6}y+\frac{1}{2})$.

Answer

$5y+3$

EXAMPLE 13.7.6.21

Simplify: $12(\frac{1}{3}n+\frac{3}{4})$

Answer

$4n+9$

Using the Distributive Property as shown in the next example will be very useful when we solve money applications in later chapters.

EXAMPLE 13.7.6.22

Simplify: $100(0.3+0.25q)$.

Answer

	
Distribute.	$100(0.3) + 100(0.25q)$
Multiply.	$30 + 25q$

EXAMPLE 13.7.6.23

Simplify: $100(0.7+0.15p)$.

Answer

$70+15p$

EXAMPLE 13.7.6.24

Simplify: $100(0.04+0.35d)$.

Answer

$4+35d$

When we distribute a negative number, we need to be extra careful to get the signs correct!

EXAMPLE 13.7.6.25

Simplify: $-11(4-3a)$.

Answer

	$-11(4-3a)$
Distribute.	$-11\cdot 4-(-11)\cdot 3a$
Multiply.	$-44-(-33a)$
Simplify.	$-44+33a$

Notice that you could also write the result as $33a-44$. Do you know why?

Simplify: $-5(2-3a)$.

Answer

$-10+15a$

EXAMPLE 13.7.6.27

Simplify: $-7(8-15y)$.

Answer

$-56+105y$

In the next example, we will show how to use the Distributive Property to find the opposite of an expression.

Simplify: $-(y+5)$.

Answer

	$-(y+5)$
Multiplying by -1 results in the opposite.	$-1(y+5)$
Distribute.	$-1\cdot y+(-1)\cdot 5$
Simplify.	$-y+(-5)$
Simplify.	$-y-5$

? EXAMPLE 13.7.6.29

Simplify: $-(z-11)$.

Answer

$-z+11$

? EXAMPLE 13.7.6.30

Simplify: $-(x-4)$.

Answer

$-x+4$

There will be times when we'll need to use the Distributive Property as part of the order of operations. Start by looking at the parentheses. If the expression inside the parentheses cannot be simplified, the next step would be multiply using the Distributive Property, which removes the parentheses. The next two examples will illustrate this.

? EXAMPLE 13.7.6.31

Simplify: $8-2(x+3)$

Answer

We follow the order of operations. Multiplication comes before subtraction, so we will distribute the 2 first and then subtract.

	$8-2(x+3)$
Distribute.	$8-2\cdot x-2\cdot 3$
Multiply.	$8-2x-6$
Combine like terms.	$-2x+2$

? EXAMPLE 13.7.6.32

Simplify: $9-3(x+2)$.

Answer

$3-3x$

? EXAMPLE 13.7.6.33

Simplify: $7x-5(x+4)$.

Answer

$2x-20$

? EXAMPLE 13.7.6.34

Simplify: $4(x-8)-(x+3)$.

Answer

	$4(x-8)-(x+3)$
Distribute.	$4x-32-x-3$
Combine like terms.	$3x-35$

? EXAMPLE 13.7.6.35

Simplify: $6(x-9)-(x+12)$.

Answer

$5x-66$

? EXAMPLE 13.7.6.36

Simplify: $8(x-1)-(x+5)$.

Answer

$7x-13$

All the properties of real numbers we have used in this chapter are summarized here.

Commutative Property

When adding or multiplying, changing the *order* gives the same result

of Addition	If a and $b$are real numbers, then	$a+b=b+a$.	(13.7.6.9)
of Multiplication	If a and $b$are real numbers, then	$a\cdot b=b\cdot a$.	

Associative Property

When adding or multiplying, changing the *grouping* gives the same result.

of Addition	If $a, b,$ and c are real numbers, then	$(a+b)+c=a+(b+c)$.	(13.7.6.10)
of Multiplication	If $a, b,$ and c are real numbers, then	$(a\cdot b)\cdot c=a\cdot(b\cdot c)$.	

Distributive Property

If $a, b,$and $c$are real numbers, then

$$a(b+c)=ab+ac$$
$$(b+c)a=ba+ca$$
$$a(b-c)=ab-ac$$
$$(b-c)a=ba-ca$$

(13.7.6.11)

Identity Property

of Addition For any real number a : $a+0=a$	$0+a=a$	(13.7.6.12)
0 is the **additive identity**		
of Multiplication For any real number a : $a\cdot 1=a$	$1\cdot a=a$	
1 is the **multiplicative identity**		

Inverse Property

of addition For any real number a, $a+(-a)=0$

$-a$ is the **additive inverse** of a

A number and its *opposite* add to zero.

of multiplication For any real number $a, a \neq 0$ $a \cdot \frac{1}{a} = 1$

$\frac{1}{a}$ is the **multiplicative inverse** of a

A number and its *reciprocal* multiply to one.

(13.7.6.13)

Properties of Zero

For any real number a, $a \cdot 0 = 0$

$0 \cdot a = 0$

For any real number $a, a \neq 0$, $\frac{0}{a} = 0$

For any real number a, $\frac{a}{0}$ is undefined

(13.7.6.14)

Key Concepts

Commutative Property

When adding or multiplying, changing the *order* gives the same result

of Addition If a and $b$are real numbers, then $a+b=b+a$.

of Multiplication If a and $b$are real numbers, then $a \cdot b = b \cdot a$.

(13.7.6.15)

Associative Property When adding or multiplying, changing the *grouping* gives the same result.

of Addition If $a, b,$ and c are real numbers, then $(a+b)+c=a+(b+c)$.

of Multiplication If $a, b,$ and c are real numbers, then $(a \cdot b) \cdot c = a \cdot (b \cdot c)$.

(13.7.6.16)

Distributive Property

If $a, b,$and $c$are real numbers, then

$a(b+c)=ab+ac$

$(b+c)a=ba+ca$

$a(b-c)=ab-ac$

$(b-c)a=ba-ca$

(13.7.6.17)

Identity Property

of Addition For any real number $a: a+0=a$ $0+a=a$

0 is the **additive identity**

of Multiplication For any real number $a: a \cdot 1 = a$ $1 \cdot a = a$

1 is the **multiplicative identity**

(13.7.6.18)

Inverse Property

of addition For any real number a, $-a$ is the **additive inverse** of a A number and its *opposite* add to zero.	$a+(-a)=0$	(13.7.6.19)
of multiplication For any real number a, $a \neq 0$ $\frac{1}{a}$ is the **multiplicative inverse** of a A number and its *reciprocal* multiply to one.	$a \cdot \frac{1}{a}=1$	

Properties of Zero

For any real number a,	$a \cdot 0=0$ $0 \cdot a=0$	(13.7.6.20)
For any real number a, $a \neq 0$,	$\frac{0}{a}=0$	
For any real number a,	$\frac{a}{0}$ is undefined	

Glossary

additive identity

The number 0 is the additive identity because adding 0 to any number does not change its value.

additive inverse

The opposite of a number is its additive inverse.

multiplicative identity

The number 1 is the multiplicative identity because multiplying 1 by any number does not change its value.

multiplicative inverse

The reciprocal of a number is its multiplicative inverse.

13.7.6E: Exercises

Practice Makes Perfect

Use the Commutative and Associative Properties

In the following exercises, simplify.

1. $43m+(-12n)+(-16m)+(-9n)$

Answer

$27m+(-21n)$

2. $-22p+17q+(-35p)+(-27q)$

3. $\frac{3}{8}g+\frac{1}{12}h+\frac{7}{8}g+\frac{5}{12}h$

Answer

$\frac{5}{4}g+\frac{1}{2}h$

4. $\frac{5}{6}a+\frac{3}{10}b+\frac{1}{6}a+\frac{9}{10}b$

5. $6.8p+9.14q+(-4.37p)+(-0.88q)$

Answer

$2.43p+8.26q$

6. $9.6m+7.22n+(-2.19m)+(-0.65n)$

7. $-24\cdot 7\cdot \frac{3}{8}$

Answer

-63

8. $-36\cdot 11\cdot \frac{4}{9}$

9. $\left(\frac{5}{6}+\frac{8}{15}\right)+\frac{7}{15}$

Answer

$1\frac{5}{6}$

10. $\left(\frac{11}{12}+\frac{4}{9}\right)+\frac{5}{9}$

11. $17(0.25)(4)$

Answer

17

12. $36(0.2)(5)$

13. $[2.48(12)](0.5)$

Answer

14.88

14. $[9.731(4)](0.75)$

15. $12\left(\frac{5}{6}p\right)$

Answer

$10p$

16. $20\left(\frac{3}{5}q\right)$

Use the Properties of Identity, Inverse and Zero

In the following exercises, simplify.

17. $19a+44-19a$

Answer

44

18. $27c+16-27c$

19. $\frac{1}{2}+\frac{7}{8}+\left(-\frac{1}{2}\right)$

Answer

$\frac{7}{8}$

20. $\frac{2}{5}+\frac{5}{12}+\left(-\frac{2}{5}\right)$

21. $10(0.1d)$

Answer

d

22. $100(0.01p)$

23. $\frac{3}{20}\cdot\frac{49}{11}\cdot\frac{20}{3}$

Answer

$\frac{49}{11}$

24. $\frac{13}{18}\cdot\frac{25}{7}\cdot\frac{18}{13}$

25. $\frac{0}{u-4.99}$, where $u\neq 4.99$

Answer

0

26. $0 \div (y - \frac{1}{6})$, where $x \neq 16$

27. $\frac{32-5a}{0}$, where $32 - 5a \neq 0$

Answer

undefined

28. $\frac{28-9b}{0}$, where $28 - 9b \neq 0$

29. $(\frac{3}{4} + \frac{9}{10}m) \div 0$, where $\frac{3}{4} + \frac{9}{10}m \neq 0$

Answer

undefined

30. $(\frac{5}{16}n - \frac{3}{7}) \div 0$, where $\frac{5}{16}n - \frac{3}{7} \neq 0$

Simplify Expressions Using the Distributive Property

In the following exercises, simplify using the Distributive Property.

31. $8(4y + 9)$

Answer

$32y + 72$

32. $9(3w + 7)$

33. $6(c - 13)$

Answer

$6c - 78$

34. $7(y - 13)$

35. $\frac{1}{4}(3q + 12)$

Answer

$\frac{3}{4}q + 3$

36. $\frac{1}{5}(4m + 20)$

37. $9(\frac{5}{9}y - \frac{1}{3})$

Answer

$5y - 3$

38. $10(\frac{3}{10}x - \frac{2}{5})$

39. $12\left(\frac{1}{4}+\frac{2}{3}r\right)$

Answer

$3+8r$

40. $12\left(\frac{1}{6}+\frac{3}{4}s\right)$

41. $15\cdot\frac{3}{5}(4d+10)$

Answer

$36d+90$

42. $18\cdot\frac{5}{6}(15h+24)$

43. $r(s-18)$

Answer

$rs-18r$

44. $u(v-10)$

45. $(y+4)p$

Answer

$yp+4p$

46. $(a+7)x$

47. $-7(4p+1)$

Answer

$-28p-7$

48. $-9(9a+4)$

49. $-3(x-6)$

Answer

$-3x+18$

50. $-4(q-7)$

51. $-(3x-7)$

Answer

$-3x+7$

52. $-(5p-4)$

https://math.libretexts.org/@go/page/46355

53. $16-3(y+8)$

Answer

$-3y-8$

54. $18-4(x+2)$

55. $4-11(3c-2)$

Answer

$-33c+26$

56. $9-6(7n-5)$

57. $22-(a+3)$

Answer

$-a+19$

58. $8-(r-7)$

59. $(5m-3)-(m+7)$

Answer

$4m-10$

60. $(4y-1)-(y-2)$

61. $9(8x-3)-(-2)$

Answer

$72x-25$

62. $4(6x-1)-(-8)$

63. $5(2n+9)+12(n-3)$

Answer

$22n+9$

64. $9(5u+8)+2(u-6)$

65. $14(c-1)-8(c-6)$

Answer

$6c+34$

66. $11(n-7)-5(n-1)$

https://math.libretexts.org/@go/page/46355

67. $6(7y+8)-(30y-15)$

Answer

$12y+63$

68. $7(3n+9)-(4n-13)$

Writing Exercises

69. In your own words, state the Associative Property of addition.

Answer

Answers will vary.

70. What is the difference between the additive inverse and the multiplicative inverse of a number

71. Simplify $8(x-\frac{1}{4})$ using the Distributive Property and explain each step.

Answer

Answers will vary.

72. Explain how you can multiply $4(\$5.97)$ without paper or calculator by thinking of $\$5.97$ as $6-0.03$ and then using the Distributive Property.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the commutative and associative properties.			
use the properties of identity, inverse and zero.			
simplify expressions using the distributive property.			

b. After reviewing this checklist, what will you do to become confident for all objectives?

13.7.7: Chapter 1 Review Exercises

Chapter Review Exercises

Use the Language of Algebra

Identify Multiples and Factors

1. Use the divisibility tests to determine whether 180 is divisible by 2, by 3, by 5, by 6, and by 10.

Answer

Divisible by $2, 3, 5, 6$

2. Find the prime factorization of 252.

3. Find the least common multiple of 24 and 40.

Answer

120

In the following exercises, simplify each expression.

4. $24 \div 3 + 4(5 - 2)$

5. $7 + 3[6 - 4(5 - 4)] - 3^2$

Answer

4

Evaluate an Expression

In the following exercises, evaluate the following expressions.

6. When $x = 4$, ⓐ x^3 ⓑ $5x$ ⓒ $2x^2 - 5x + 3$

7. $2x^2 - 4xy - 3y^2$ when $x = 3$ and $y = 1$

Answer

3

Simplify Expressions by Combining Like Terms

In the following exercises, simplify the following expressions by combining like terms.

8. $12y + 7 + 2y - 5$

9. $14x^2 - 9x + 11 - 8x^2 + 8x - 6$

Answer

$6x^2 - x + 5$

Translate an English Phrase to an Algebraic Expression

In the following exercises, translate the phrases into algebraic expressions.

10. ⓐ the sum of $4ab^2$ and $7a3b24ab^2$ and $7a^3b^2$

ⓑ the product of $6y^2$ and $3y$

ⓒ twelve more than $5x$

ⓓ $5y$ less than $8y^2$

11. ⓐ eleven times the difference of y and two

ⓑ the difference of eleven times y and two

Answer

ⓐ $11(y-2)$
ⓑ $11y-2$

12. Dushko has nickels and pennies in his pocket. The number of pennies is four less than five the number of nickels. Let nn represent the number of nickels. Write an expression for the number of pennies.

Integers

Simplify Expressions with Absolute Value

In the following exercise, fill in $<, >$, or $=$ for each of the following pairs of numbers.

13. ⓐ $-|7|___-|-7|$

ⓑ $-8___-|-8|$

ⓒ $|-13|___-13$

ⓓ $|-12|___-(-12)$

Answer

ⓐ $=$
ⓑ $=$
ⓒ $>$
ⓓ $=$

In the following exercises, simplify.

14. $9-|3(4-8)|$

15. $12-3|1-4(4-2)|$

Answer

-9

Add and Subtract Integers

In the following exercises, simplify each expression.

16. $-12+(-8)+7$

17. ⓐ $15-7$

ⓑ $-15-(-7)$

ⓒ $-15-7$

ⓓ $15-(-7)$

Answer

ⓐ 8
ⓑ -8
ⓒ -22
ⓓ 22

18. $-11-(-12)+5$

19. ⓐ $23-(-17)$ ⓑ $23+17$

Answer

ⓐ 40 ⓑ 40

20. $-(7-11)-(3-5)$

Multiply and Divide Integers

In the following exercise, multiply or divide.

21. ⓐ $-27\div 9$ ⓑ $120\div(-8)$ ⓒ $4(-14)$ ⓓ $-1(-17)$

Answer

ⓐ -3 ⓑ -15 ⓒ -56 ⓓ 17

Simplify and Evaluate Expressions with Integers

In the following exercises, simplify each expression.

22. ⓐ $(-7)^3$ ⓑ -7^3

23. $(7-11)(6-13)$

Answer

16

24. $63\div(-9)+(-36)\div(-4)$

25. $6-3|4(1-2)-(7-5)|$

Answer

-12

26. $(-2)^4-24\div(13-5)$

For the following exercises, evaluate each expression.

27. $(y+z)^2$ when $y=-4$ and $z=7$

Answer

9

28. $3x^2 - 2xy + 4y^2$ when $x = -2$ and $y = -3$

Translate English Phrases to Algebraic Expressions

In the following exercises, translate to an algebraic expression and simplify if possible.

29. the sum of -4 and -9, increased by 23

Answer

$(-4 + (-9)) + 23; 10$

30. ⓐ the difference of 17 and −8 ⓑ subtract 17 from −25

Use Integers in Applications

In the following exercise, solve.

31. Temperature On July 10, the high temperature in Phoenix, Arizona, was 109°, and the high temperature in Juneau, Alaska, was 63°. What was the difference between the temperature in Palm Springs and the temperature in Whitefield?

Answer

46°

Fractions

Simplify Fractions

In the following exercises, simplify.

32. $\frac{204}{228}$

33. $-\frac{270x^3}{198y^2}$

Answer

$-\frac{15x^3}{11y^2}$

Multiply and Divide Fractions

In the following exercises, perform the indicated operation.

34. $\left(-\frac{14}{15}\right)\left(\frac{10}{21}\right)$

35. $\frac{6x}{25} \div \frac{9y}{20}$

Answer

$\frac{8x}{15y}$

36. $\frac{-\frac{4}{9}}{\frac{8}{21}}$

Add and Subtract Fractions

In the following exercises, perform the indicated operation.

37. $\frac{5}{18}+\frac{7}{12}$

Answer

$\frac{31}{36}$

38. $\frac{11}{36}-\frac{15}{48}$

39. ⓐ $\frac{5}{8}+\frac{3}{4}$ ⓑ $\frac{5}{8}\div\frac{3}{4}$

Answer

ⓐ $\frac{11}{8}$ ⓑ $\frac{5}{6}$

40. ⓐ $-\frac{3y}{10}-\frac{5}{6}$ ⓑ $-\frac{3y}{10}\cdot\frac{5}{6}$

Use the Order of Operations to Simplify Fractions

In the following exercises, simplify.

41. $\frac{4\cdot 3-2\cdot 5}{-6\cdot 3+2\cdot 3}$

Answer

$-\frac{1}{6}$

42. $\frac{4(7-3)-2(4-9)}{-3(4+2)+7(3-6)}$

43. $\frac{4^3-4^2}{(\frac{4}{5})^2}$

Answer

75

Evaluate Variable Expressions with Fractions

In the following exercises, evaluate.

44. $4x^2y^2$ when $x=\frac{2}{3}$ and $y=-\frac{3}{4}$

45. $\frac{a+b}{a-b}$ when $a=-4$ and $b=6$

Answer

-15

Decimals

Round Decimals

46. Round 6.738 to the nearest ⓐ hundredth ⓑ tenth ⓒ whole number.

Add and Subtract Decimals

In the following exercises, perform the indicated operation.

47. $-23.67+29.84$

Answer

6.17

48. $54.3-100$

49. $79.38-(-17.598)$

Answer

96.978

Multiply and Divide Decimals

In the following exercises, perform the indicated operation.

50. $(-2.8)(3.97)$

51. $(-8.43)(-57.91)$

Answer

488.1813

52. $(53.48)(10)$

53. $(0.563)(100)$

Answer

56.3

54. $\$118.35 \div 2.6$

55. $1.84 \div (-0.8)$

Answer

-23

Convert Decimals, Fractions and Percents

In the following exercises, write each decimal as a fraction.

56. $\frac{13}{20}$

57. $-\frac{240}{25}$

Answer

-9.6

In the following exercises, convert each fraction to a decimal.

58. $-\frac{5}{8}$

59. $\frac{14}{11}$

Answer

$1.\overline{27}$

In the following exercises, convert each decimal to a percent.

60. 2.43

61. 0.0475

Answer

4.75%

Simplify Expressions with Square Roots

In the following exercises, simplify.

62. $\sqrt{289}$

63. $\sqrt{-121}$

Answer

no real number

Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

In the following exercise, list the ⓐ whole numbers ⓑ integers ⓒ rational numbers ⓓ irrational numbers ⓔ real numbers for each set of numbers

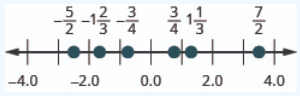
64. $-8, 0, 1.95286\ldots, \frac{12}{5}, \sqrt{36}, 9$

Locate Fractions and Decimals on the Number Line

In the following exercises, locate the numbers on a number line.

65. $\frac{3}{4}, -\frac{3}{4}, 1\frac{1}{3}, -1\frac{2}{3}, \frac{7}{2}, -\frac{5}{2}$

Answer



66. ⓐ 3.2 ⓑ -1.35

Properties of Real Numbers

Use the Commutative and Associative Properties

In the following exercises, simplify.

67. $\frac{5}{8}x+\frac{5}{12}y+\frac{1}{8}x+\frac{7}{12}y$

Answer

$\frac{3}{4}x+y$

68. $-32\cdot 9\cdot \frac{5}{8}$

69. $\left(\frac{11}{15}+\frac{3}{8}\right)+\frac{5}{8}$

Answer

$1\frac{11}{15}$

Use the Properties of Identity, Inverse and Zero

In the following exercises, simplify.

70. $\frac{4}{7}+\frac{8}{15}+\left(-\frac{4}{7}\right)$

71. $\frac{13}{15}\cdot\frac{9}{17}\cdot\frac{15}{13}$

Answer

$\frac{9}{17}$

72. $\frac{0}{x-3}, x\neq 3$

73. $\frac{5x-7}{0}, 5x-7\neq 0$

Answer

undefined

Simplify Expressions Using the Distributive Property

In the following exercises, simplify using the Distributive Property.

74. $8(a-4)$

75. $12\left(\frac{2}{3}b+\frac{5}{6}\right)$

Answer

$8b+10$

76. $18 \cdot \frac{5}{6}(2x-5)$

77. $(x-5)p$

Answer

$xp-5p$

78. $-4(y-3)$

79. $12-6(x+3)$

Answer

$-6x-6$

80. $6(3x-4)-(-5)$

81. $5(2y+3)-(4y-1)$

Answer

$y+16$

Practice Test

1. Find the prime factorization of 756.

2. Combine like terms: $5n+8+2n-1$

Answer

$7n+7$

3. Evaluate when $x=-2$ and $y=3$: $\frac{|3x-4y|}{6}$

4. Translate to an algebraic expression and simplify:

ⓐ eleven less than negative eight

ⓑ the difference of -8 and -3, increased by 5

Answer

$-8-11=-19$
$(-8-(-3))+5=0$

5. Dushko has nickels and pennies in his pocket. The number of pennies is seven less than four times the number of nickels. Let nn represent the number of nickels. Write an expression for the number of pennies.

6. Round $28.1458$to the nearest

ⓐ hundredth ⓑ thousandth

Answer

ⓐ 28.15 ⓑ 28.146

7. Convert

ⓐ $\frac{5}{11}$ to a decimal ⓑ 1.15 to a percent

8. Locate $\frac{3}{5}, 2.8, and -\frac{5}{2}$ on a number line.

Answer

In the following exercises, simplify each expression.

9. $8+3[6-3(5-2)]-4^2$

10. $-(4-9)-(9-5)$

Answer

1

11. $56 \div (-8)+(-27) \div (-3)$

12. $16-2|3(1-4)-(8-5)|$

Answer

-8

13. $-5+2(-3)^2-9$

14. $\frac{180}{204}$

Answer

$\frac{15}{17}$

15. $-\frac{7}{18}+\frac{5}{12}$

16. $\frac{4}{5} \div (-\frac{12}{25})$

Answer

$-\frac{5}{3}$

17. $\dfrac{9-3\cdot 9}{15-9}$

18. $\dfrac{4(-3+2(3-6))}{3(11-3(2+3))}$

Answer

3

19. $\dfrac{5}{13}\cdot\dfrac{4}{7}\cdot\dfrac{13}{5}$

20. $\dfrac{-\dfrac{5}{9}}{\dfrac{10}{21}}$

Answer

$-\dfrac{7}{6}$

21. $-4.8+(-6.7)$

22. $34.6-100$

Answer

-65.4

23. $-12.04\cdot(4.2)$

24. $-8\div 0.05$

Answer

160

25. $-\sqrt{121}$

26. $(\dfrac{8}{13}+\dfrac{5}{7})+\dfrac{2}{7}$

Answer

$1\dfrac{8}{13}$

27. $5x+(-8y)-6x+3y$

28. ⓐ $\dfrac{0}{9}$ ⓑ $\dfrac{11}{0}$

Answer

ⓐ 0 ⓑ undefined

29. $-3(8x-5)$

30. $6(3y-1)-(5y-3)$

Answer

$13y-3$

13.8.1: Simplify and Use Square Roots

Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with square roots
- Estimate square roots
- Approximate square roots
- Simplify variable expressions with square roots

BE PREPARED

Before you get started, take this readiness quiz.

1. Simplify: ⓐ 9^2 ⓑ $(-9)^2$ ⓒ -9^2.
   If you missed this problem, review [link].
2. Round 3.846 to the nearest hundredth.
   If you missed this problem, review [link].
3. For each number, identify whether it is a real number or not a real number:
   ⓐ $-\sqrt{100}$ ⓑ $\sqrt{-100}$.
   If you missed this problem, review [link].

Simplify Expressions with Square Roots

Remember that when a number n is multiplied by itself, we write n^2 and read it "n squared." For example, 15^2 reads as "15 squared," and 225 is called the square of 15, since $15^2 = 225$.

Definition: SQUARE OF A NUMBER

If $n^2 = m$, then m is the square of n.

Sometimes we will need to look at the relationship between numbers and their squares in reverse. Because 225 is the square of 15, we can also say that 15 is a square root of 225. A number whose square is m is called a *square root* of m.

Definition: SQUARE ROOT OF A NUMBER

If $n^2 = m$, then n is a square root of m.

Notice $(-15)^2 = 225$ also, so −15 is also a square root of 225. Therefore, both 15 and −15 are square roots of 225.

So, every positive number has two square roots—one positive and one negative. What if we only wanted the positive square root of a positive number? The *radical sign*, $\sqrt{m}$, denotes the positive square root. The positive square root is also called the principal square root.

We also use the radical sign for the square root of zero. Because $0^2 = 0$, $\sqrt{0} = 0$. Notice that zero has only one square root.

Definition: SQUARE ROOT NOTATION

radical sign → $\sqrt{m}$ ← radicand

$\sqrt{m}$ is read as "the square root of m."

If $m = n^2$, then $\sqrt{m} = n$, for $n \geq 0$.

The square root of m, $\sqrt{m}$, is the positive number whose square is m.

Since 15 is the positive square root of 225, we write $\sqrt{225}=15$. Fill in Figure to make a table of square roots you can refer to as you work this chapter.

$\sqrt{1}$	$\sqrt{4}$	$\sqrt{9}$	$\sqrt{16}$	$\sqrt{25}$	$\sqrt{36}$	$\sqrt{49}$	$\sqrt{64}$	$\sqrt{81}$	$\sqrt{100}$	$\sqrt{121}$	$\sqrt{144}$	$\sqrt{169}$	$\sqrt{196}$	$\sqrt{225}$
														15

We know that every positive number has two square roots and the radical sign indicates the positive one. We write $\sqrt{225}=15$. If we want to find the negative square root of a number, we place a negative in front of the radical sign. For example, $-\sqrt{225}=-15$.

? Example 13.8.1.1

Simplify:

1. $\sqrt{36}$
2. $\sqrt{196}$
3. $-\sqrt{81}$
4. $-\sqrt{289}$.

Answer

1.

$$\begin{array}{ll} & \sqrt{36} \\ \text{Since} 6^2=36 & 6 \end{array} \tag{13.8.1.1}$$

2.

$$\begin{array}{ll} & \sqrt{196} \\ \text{Since} 14^2=196 & 14 \end{array} \tag{13.8.1.2}$$

3.

$$\begin{array}{ll} & -\sqrt{81} \\ \text{The negative is in front of the radical sign} & -9 \end{array} \tag{13.8.1.3}$$

4.

$$\begin{array}{ll} & -\sqrt{289} \\ \text{The negative is in front of the radical sign} & -17 \end{array} \tag{13.8.1.4}$$

? Example 13.8.1.2

Simplify:

1. $-\sqrt{49}$
2. $\sqrt{225}$.

Answer

1. -7
2. 15

Example 13.8.1.3

implify:

1. $\sqrt{64}$
2. $-\sqrt{121}$.

Answer

1. 8
2. −11

Example 13.8.1.4

Simplify:

1. $\sqrt{-169}$
2. $-\sqrt{64}$

Answer

1.

$$\begin{array}{ll} \text{There is no real number whose square is} s-169 & \sqrt{-169} \\ & \sqrt{-169}\text{is not a real number.} \end{array} \tag{13.8.1.5}$$

2.

$$\begin{array}{ll} \text{The negative is in front of the radical sign} & -\sqrt{64} \\ & -8 \end{array} \tag{13.8.1.6}$$

Example 13.8.1.5

Simplify:

1. $\sqrt{-196}$
2. $-\sqrt{81}$.

Answer

1. not a real number
2. −9

Example 13.8.1.6

Simplify:

1. $-\sqrt{49}$
2. $\sqrt{-121}$.

Answer

1. −7
2. not a real number

When using the order of operations to simplify an expression that has square roots, we treat the radical as a grouping symbol.

Example 13.8.1.7

Simplify:

1. $\sqrt{25}+\sqrt{144}$
2. $\sqrt{25+144}$.

Answer

1.

$$\begin{array}{ll} & \sqrt{25}+\sqrt{144} \\ \text{Use the order of operations} & 5+12 \\ \text{Simplify.} & 17 \end{array} \tag{13.8.1.7}$$

2.

$$\begin{array}{ll} & \sqrt{25+144} \\ \text{Simplify under the radical sign.} & \sqrt{169} \\ \text{Simplify.} & 13 \end{array} \tag{13.8.1.8}$$

Notice the different answers in parts 1 and 2!

Example 13.8.1.8

Simplify:

1. $\sqrt{9}+\sqrt{16}$
2. $\sqrt{9+16}$.

Answer

1. 7
2. 5

Example 13.8.1.9

Simplify:

1. $\sqrt{64+225}$
2. $\sqrt{64}+\sqrt{225}$.

Answer

1. 17
2. 23

Estimate Square Roots

So far we have only considered square roots of perfect square numbers. The square roots of other numbers are not whole numbers. Look at Table below.

Number	Square Root
4	$\sqrt{4}=2$
5	$\sqrt{5}$

Number	Square Root
6	$\sqrt{6}$
7	$\sqrt{7}$
8	$\sqrt{8}$
9	$\sqrt{9} = 3$

The square roots of numbers between 4 and 9 must be between the two consecutive whole numbers 2 and 3, and they are not whole numbers. Based on the pattern in the table above, we could say that $\sqrt{5}$ must be between 2 and 3. Using inequality symbols, we write:

$2 < \sqrt{5} < 3$

Example 13.8.1.10

Estimate $\sqrt{60}$ between two consecutive whole numbers.

Answer

Think of the perfect square numbers closest to 60. Make a small table of these perfect squares and their squares roots.

Number	Square root
36	6
49	7
64	8
81	9

60 $\sqrt{60}$

Locate 60 between two consecutive perfect squares.	$49 < 60 < 64$
$\sqrt{60}$ is between their square roots.	$7 < \sqrt{60} < 8$

Example 13.8.1.11

Estimate the square root $\sqrt{38}$ between two consecutive whole numbers.

Answer

$6 < \sqrt{38} < 7$

Example 13.8.1.12

Estimate the square root $\sqrt{84}$ between two consecutive whole numbers.

Answer

$9 < \sqrt{84} < 10$

Approximate Square Roots

There are mathematical methods to approximate square roots, but nowadays most people use a calculator to find them. Find the $\sqrt{x}$ key on your calculator. You will use this key to approximate square roots.

When you use your calculator to find the square root of a number that is not a perfect square, the answer that you see is not the exact square root. It is an approximation, accurate to the number of digits shown on your calculator's display. The symbol for an approximation is $\approx$ and it is read 'approximately.'

Suppose your calculator has a 10-digit display. You would see that

$\sqrt{5} \approx 2.236067978$

If we wanted to round $\sqrt{5}$ to two decimal places, we would say

$\sqrt{5} \approx 2.24$

How do we know these values are approximations and not the exact values? Look at what happens when we square them:

$$\begin{aligned} (2.236067978)^2 &= 5.000000002 \\ (2.24)^2 &= 5.0176 \end{aligned} \tag{13.8.1.9}$$

Their squares are close to 5, but are not exactly equal to 5.

Using the square root key on a calculator and then rounding to two decimal places, we can find:

$$\begin{aligned} \sqrt{4} &= 2 \\ \sqrt{5} &\approx 2.24 \\ \sqrt{6} &\approx 2.45 \\ \sqrt{7} &\approx 2.65 \\ \sqrt{8} &\approx 2.83 \\ \sqrt{9} &= 3 \end{aligned} \tag{13.8.1.10}$$

Example 13.8.1.13

Round $\sqrt{17}$ to two decimal places.

Answer

	$\sqrt{17}$
Use the calculator square root key.	$4.123105626\ldots$
Round to two decimal places.	4.12
	$\sqrt{17} \approx 4.12$

(13.8.1.11)

Example 13.8.1.14

Round $\sqrt{11}$ to two decimal places.

Answer

≈ 3.32

Example 13.8.1.15

Round $\sqrt{13}$ to two decimal places.

Answer

≈ 3.61

Simplify Variable Expressions with Square Roots

What if we have to find a square root of an expression with a variable? Consider $\sqrt{9x^2}$. Can you think of an expression whose square is $9x^2$?

$$\begin{aligned} (?)^2 &= 9x^2 \\ (3x)^2 &= 9x^2 \quad \text{so} \sqrt{9x^2} = 3x \end{aligned} \tag{13.8.1.12}$$

When we use the radical sign to take the square root of a variable expression, we should specify that x≥0x≥0 to make sure we get the *principal square root*.

However, in this chapter we will assume that each variable in a square-root expression represents a non-negative number and so we will not write $x \geq 0$ next to every radical.

What about square roots of higher powers of variables? Think about the Power Property of Exponents we used in Chapter 6.

$(a^m)^n = a^{m \cdot n}$

If we square a^m, the exponent will become 2m.

$(a^m)^2 = a^{2m}$

How does this help us take square roots? Let's look at a few:

$$\begin{aligned} \sqrt{25u^8} &= 5u^4 \quad \text{Because} (5u^4)^2 = 25u^8 \\ \sqrt{16r^{20}} &= 4r^{10} \quad \text{Because} (4r^{10})^2 = 16r^{20} \\ \sqrt{196q^{36}} &= 14q^{18} \quad \text{Because} (14r^{18})^2 = 196q^{36} \end{aligned} \tag{13.8.1.13}$$

? Example 13.8.1.16

Simplify:

1. $\sqrt{x^6}$
2. $\sqrt{y^{16}}$

Answer

1.

$$\begin{aligned} & \sqrt{x^6} \\ \text{Since} (x^3)^2 = x^6 \quad & x^3 \end{aligned} \tag{13.8.1.14}$$

2.

$$\begin{aligned} & \sqrt{y^{16}} \\ \text{Since} (y^8)^2 = y^{16} \quad & y^8 \end{aligned} \tag{13.8.1.15}$$

? Example 13.8.1.17

Simplify:

1. $\sqrt{y^8}$
2. $\sqrt{z^{12}}$.

Answer

1. y^4
2. z^6

? Example 13.8.1.18

Simplify:

1. $\sqrt{m^4}$
2. $\sqrt{b^{10}}$.

Answer

1. m^2
2. b^5

Example 13.8.1.19

Simplify: $\sqrt{16n^2}$

Answer

$$\begin{array}{cc} & \sqrt{16n^2} \\ \text{Since} (4n)^2 = 16n^2 & 4n \end{array} \quad (13.8.1.16)$$

Example 13.8.1.20

Simplify: $\sqrt{64x^2}$.

Answer

$8x$

Example 13.8.1.21

Simplify: $\sqrt{169y^2}$.

Answer

$13y$

Example 13.8.1.22

Simplify: $-\sqrt{81c^2}$.

Answer

$$\begin{array}{cc} & -\sqrt{81c^2} \\ \text{Since} (9c)^2 = 81c^2 & -9c \end{array} \quad (13.8.1.17)$$

Example 13.8.1.23

Simplify: $-\sqrt{121y^2}$.

Answer

$-11y$

Example 13.8.1.24

Simplify: $-\sqrt{100p^2}$.

Answer

$-10p$

Example 13.8.1.25

Simplify: $\sqrt{36x^2y^2}$.

Answer

$$\text{Since} (6xy)^2 = \sqrt{36x^2y^2} \quad \begin{matrix} \sqrt{36x^2y^2} \\ 6xy \end{matrix} \tag{13.8.1.18}$$

Example 13.8.1.26

Simplify: $\sqrt{100a^2b^2}$.

Answer

10ab

Example 13.8.1.27

Simplify: $\sqrt{225m^2n^2}$.

Answer

15mn

Example 13.8.1.28

Simplify: $\sqrt{64p^{64}}$.

Answer

$$\text{Since} (8p^8)^2 = \sqrt{64p^{64}} \quad \begin{matrix} \sqrt{64p^{64}} \\ 8p^8 \end{matrix} \tag{13.8.1.19}$$

Example 13.8.1.29

Simplify: $\sqrt{49x^{30}}$.

Answer

$7x^{15}$

Example 13.8.1.30

Simplify: $\sqrt{81w^{36}}$

Answer

$9w^{18}$

Example 13.8.1.31

Simplify: $\sqrt{121a^6b^8}$

Answer

$$\text{Since}(11a^3b^4)^2 = \sqrt{121a^6b^8} \quad \begin{matrix}\sqrt{121a^6b^8} \\ 11a^3b^4\end{matrix} \tag{13.8.1.20}$$

? Example 13.8.1.32

Simplify: $\sqrt{169x^{10}y^{14}}$

Answer

$13x^5y^7$

? Example 13.8.1.33

Simplify: $\sqrt{144p^{12}q^{20}}$

Answer

$\sqrt{12p^6q^{10}}$

Access this online resource for additional instruction and practice with square roots.

- Square Roots

Key Concepts

- Note that the square root of a negative number is not a real number.
- Every positive number has two square roots, one positive and one negative. The positive square root of a positive number is the principal square root.
- We can estimate square roots using nearby perfect squares.
- We can approximate square roots using a calculator.
- When we use the radical sign to take the square root of a variable expression, we should specify that $x \geq 0$ to make sure we get the principal square root.

Glossary

square of a number

- If $n^2 = m$, then m is the square of n

square root of a number

- If $n^2 = m$, then n is a square root of m

square root notation

- If $m = n^2$, then $\sqrt{m} = n$. We read $\sqrt{m}$ as 'the square root of m.'

13.8.1E: Exercises

Practice Makes Perfect

Simplify Expressions with Square Roots

In the following exercises, simplify.

Example 13.8.1E.34

$\sqrt{36}$

Answer

6

Example 13.8.1E.35

$\sqrt{4}$

Example 13.8.1E.36

$\sqrt{64}$

Answer

8

Example 13.8.1E.37

$\sqrt{169}$

Example 13.8.1E.38

$\sqrt{9}$

Answer

3

Example 13.8.1E.39

$\sqrt{16}$

Example 13.8.1E.40

$\sqrt{100}$

Answer

10

Example 13.8.1E.41

$\sqrt{144}$

Example 13.8.1E.42

$-\sqrt{4}$

Answer

-2

Example 13.8.1E.43

$-\sqrt{100}$

Example 13.8.1E.44

$-\sqrt{1}$

Answer

-1

Example 13.8.1E.45

$-\sqrt{121}$

Example 13.8.1E.46

$\sqrt{-121}$

Answer

not a real number

Example 13.8.1E.47

$\sqrt{-36}$

Example 13.8.1E.48

$\sqrt{-9}$

Answer

not a real number

Example 13.8.1E.49

$\sqrt{-49}$

Example 13.8.1E.50

$\sqrt{9+16}$

Answer

5

Example 13.8.1E.51

$\sqrt{25+144}$

Example 13.8.1E.52

$\sqrt{9}+\sqrt{16}$

Answer

7

Example 13.8.1E.53

$\sqrt{25}+\sqrt{144}$

Estimate Square Roots

In the following exercises, estimate each square root between two consecutive whole numbers.

Example 13.8.1E.54

$\sqrt{70}$

Answer

$8<\sqrt{70}<9$

Example 13.8.1E.55

$\sqrt{55}$

Example 13.8.1E.56

$\sqrt{200}$

Answer

$14<\sqrt{200}<15$

Example 13.8.1E.57

$\sqrt{172}$

Approximate Square Roots

In the following exercises, approximate each square root and round to two decimal places.

Example 13.8.1E.58

$\sqrt{19}$

Answer

4.36

Example 13.8.1E.59

$\sqrt{21}$

Example 13.8.1E.60

$\sqrt{53}$

Answer

7.28

Example 13.8.1E.61

$\sqrt{47}$

Simplify Variable Expressions with Square Roots

In the following exercises, simplify.

Example 13.8.1E.62

$\sqrt{y^2}$

Answer

y

Example 13.8.1E.63

$\sqrt{b^2}$

Example 13.8.1E.64

$\sqrt{a^{14}}$

Answer

a^7

Example 13.8.1E.77

$\sqrt{196a^2b^2}$

Example 13.8.1E.78

$\sqrt{169w^8y^{10}}$

Answer

$13w^4y^5$

Example 13.8.1E.79

$\sqrt{81p^{24}q^6}$

Example 13.8.1E.80

$\sqrt{9c^8d^{12}}$

Answer

$3c^4d^6$

Examlpe 13.8.1E.81

$\sqrt{36r^6s^{20}}$

Everyday Math

Example 13.8.1E.82

Decorating Denise wants to have a square accent of designer tiles in her new shower. She can afford to buy 625 square centimeters of the designer tiles. How long can a side of the accent be?

Answer

25 centimeters

Example 13.8.1E.83

Decorating Morris wants to have a square mosaic inlaid in his new patio. His budget allows for 2025 square inch tiles. How long can a side of the mosaic be?

Writing Exercises

Example 13.8.1E.84

Why is there no real number equal to $\sqrt{-64}$?

Answer

Answers will vary.

? Example 13.8.1E. 85

What is the difference between 9^2 and $\sqrt{9}$?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with square roots.			
estimate square roots.			
approximate square roots.			
simplify variable expressions with square roots.			

ⓑ On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.8.2: Simplify Square Roots

Learning Objectives

By the end of this section, you will be able to:

- Use the Product Property to simplify square roots
- Use the Quotient Property to simplify square roots

BE PREPARED

Before you get started take this readiness quiz.

1. Simplify: $\frac{80}{176}$.
   If you missed this problem, review [link].
2. Simplify: $\frac{n^9}{n^3}$.
   If you missed this problem, review [link].
3. Simplify: $\frac{q^4}{q^{12}}$.
   If you missed this problem, review [link].

In the last section, we estimated the square root of a number between two consecutive whole numbers. We can say that $\sqrt{50}$ is between 7 and 8. This is fairly easy to do when the numbers are small enough that we can use [link].

But what if we want to estimate $\sqrt{500}$? If we simplify the square root first, we'll be able to estimate it easily. There are other reasons, too, to simplify square roots as you'll see later in this chapter.

A square root is considered *simplified* if its radicand contains no perfect square factors.

Definition: SIMPLIFIED SQUARE ROOT

$\sqrt{a}$ is considered simplified if a has no perfect square factors.

So $\sqrt{31}$ is simplified. But $\sqrt{32}$ is not simplified, because 16 is a perfect square factor of 32.

Use the Product Property to Simplify Square Roots

The properties we will use to simplify expressions with square roots are similar to the properties of exponents. We know that $(ab)^m = a^m b^m$. The corresponding property of square roots says that $\sqrt{ab} = \sqrt{a} \cdot \sqrt{b}$.

Definition: PRODUCT PROPERTY OF SQUARE ROOTS

If *a*, *b* are non-negative real numbers, then $\sqrt{ab} = \sqrt{a} \cdot \sqrt{b}$.

We use the Product Property of Square Roots to remove all perfect square factors from a radical. We will show how to do this in Example.

How To Use the Product Property to Simplify a Square Root

Example 13.8.2.1

Simplify: $\sqrt{50}$.

Answer

Step 1. Find the largest perfect square factor of the radicand.	25 is the largest perfect square factor of 50.	$\sqrt{50}$
Rewrite the radicand as a product using the perfect square factor.	$50 = 25 \cdot 2$	
	Always write the perfect square factor first.	$\sqrt{25 \cdot 2}$
Step 2. Use the product rule to rewrite the radical as the product of two radicals.		$\sqrt{25} \cdot \sqrt{2}$
Step 3. Simplify the square root of the perfect square.		$5\sqrt{2}$

Example 13.8.2.2

Simplify: $\sqrt{48}$.

Answer

$4\sqrt{3}$

Example 13.8.2.3

Simplify: $\sqrt{45}$.

Answer

$3\sqrt{5}$

Notice in the previous example that the simplified form of $\sqrt{50}$ is $5\sqrt{2}$, which is the product of an integer and a square root. We always write the integer in front of the square root.

Definition: SIMPLIFY A SQUARE ROOT USING THE PRODUCT PROPERTY.

1. Find the largest perfect square factor of the radicand. Rewrite the radicand as a product using the perfect-square factor.
2. Use the product rule to rewrite the radical as the product of two radicals.
3. Simplify the square root of the perfect square.

Example 13.8.2.4

Simplify: $\sqrt{500}$.

Answer

	$\sqrt{500}$	
Rewrite the radicand as a product using the largest perfect square factor	$\sqrt{100 \cdot 5}$	
Rewrite the radical as the product of two radicals	$\sqrt{100} \cdot \sqrt{5}$	(13.8.2.1)
Simplify	$10\sqrt{5}$	

Example 13.8.2.5

Simplify: $\sqrt{288}$.

Answer

$12\sqrt{2}$

Example 13.8.2.6

Simplify: $\sqrt{432}$.

Answer

$12\sqrt{3}$

We could use the simplified form $10\sqrt{5}$ to estimate $\sqrt{500}$. We know $\sqrt{5}$ is between 2 and 3, and $\sqrt{500}$ is $10\sqrt{5}$. So $\sqrt{500}$ is between 20 and 30.

The next example is much like the previous examples, but with variables.

Example 13.8.2.7

Simplify: $\sqrt{x^3}$.

Answer

	$\sqrt{x^3}$	
Rewrite the radicand as a product using the largest perfect square factor	$\sqrt{x^2 \cdot x}$	
Rewrite the radical as the product of two radicals	$\sqrt{x^2} \cdot \sqrt{x}$	(13.8.2.2)
Simplify	$x\sqrt{x}$	

Example 13.8.2.8

Simplify: $\sqrt{b^5}$.

Answer

$b^2\sqrt{b}$

Example 13.8.2.9

Simplify: $\sqrt{p^9}$.

Answer

$p^4\sqrt{p}$

We follow the same procedure when there is a coefficient in the radical, too.

Example 13.8.2.10

Simplify: $\sqrt{25y^5}$.

Answer

	$\sqrt{25y^5}$	
Rewrite the radicand as a product using the largest perfect square factor.	$\sqrt{25y^4 \cdot y}$	
Rewrite the radical as the product of two radicals.	$\sqrt{25y^4} \cdot \sqrt{y}$	(13.8.2.3)
Simplify.	$5y^2\sqrt{y}$	

Example 13.8.2.11

Simplify: $\sqrt{16x^7}$.

Answer

$4x^3\sqrt{x}$

Example 13.8.2.12

Simplify: $\sqrt{49v^9}$.

Answer

$7v^4\sqrt{v}$

In the next example both the constant and the variable have perfect square factors.

Example 13.8.2.13

Simplify: $\sqrt{72n^7}$.

Answer

	$\sqrt{72n^7}$	
Rewrite the radicand as a product using the largest perfect square factor.	$\sqrt{36n^6 \cdot 2n}$	
Rewrite the radical as the product of two radicals.	$\sqrt{36n^6} \cdot \sqrt{2n}$	(13.8.2.4)
Simplify.	$6n^3\sqrt{2n}$	

Example 13.8.2.14

Simplify: $\sqrt{32y^5}$.

Answer

$4y^2\sqrt{2y}$

? Example 13.8.2.15

Simplify: $\sqrt{75a^9}$.

Answer

$5a^4\sqrt{3a}$

? Example 13.8.2.16

Simplify: $\sqrt{63u^3v^5}$.

Answer

	$\sqrt{63u^3v^5}$
Rewrite the radicand as a product using the largest perfect square factor.	$\sqrt{9u^2v^4 \cdot 7uv}$
Rewrite the radical as the product of two radicals.	$\sqrt{9u^2v^4} \cdot \sqrt{7uv}$
Simplify.	$3uv^2\sqrt{7uv}$

(13.8.2.5)

? Example 13.8.2.17

Simplify: $\sqrt{98a^7b^5}$.

Answer

$7a^3b^2\sqrt{2ab}$

? Example 13.8.2.18

Simplify: $\sqrt{180m^9n^{11}}$.

Answer

$6m^4n^5\sqrt{5mn}$

We have seen how to use the Order of Operations to simplify some expressions with radicals. To simplify $\sqrt{25}+\sqrt{144}$ we must simplify each square root separately first, then add to get the sum of 17.

The expression $\sqrt{17}+\sqrt{7}$ cannot be simplified—to begin we'd need to simplify each square root, but neither 17 nor 7 contains a perfect square factor.

In the next example, we have the sum of an integer and a square root. We simplify the square root but cannot add the resulting expression to the integer.

? Example 13.8.2.19

Simplify: $3+\sqrt{32}$.

Answer

	$3+\sqrt{32}$
Rewrite the radicand as a product using the largest perfect square factor.	$3+\sqrt{16 \cdot 2}$
Rewrite the radical as the product of two radicals.	$3+\sqrt{16} \cdot \sqrt{2}$
Simplify.	$3+4\sqrt{2}$

(13.8.2.6)

The terms are not like and so we cannot add them. Trying to add an integer and a radical is like trying to add an integer and a variable—they are not like terms!

? Example 13.8.2.20

Simplify: $5+\sqrt{75}$.

Answer

$5+5\sqrt{3}$

Example 13.8.2.21

Simplify: $2+\sqrt{98}$.

Answer

$2+7\sqrt{2}$

The next example includes a fraction with a radical in the numerator. Remember that in order to simplify a fraction you need a common factor in the numerator and denominator.

Example 13.8.2.22

Simplify: $\frac{4-\sqrt{48}}{2}$.

Answer

	$\frac{4-\sqrt{48}}{2}$	
Rewrite the radicand as a product using thelargest perfect square factor.	$\frac{4-\sqrt{16\cdot 3}}{2}$	
Rewrite the radical as the product of two radicals.	$\frac{4-\sqrt{16}\cdot\sqrt{3}}{2}$	(13.8.2.7)
Simplify.	$\frac{4-4\sqrt{3}}{2}$	
Factor the common factor from thenumerator.	$\frac{4(1-\sqrt{3})}{2}$	
Remove the common factor, 2, from thenumerator and denominator.	$2(1-\sqrt{3})$	

Example 13.8.2.23

Simplify: $\frac{10-\sqrt{75}}{5}$.

Answer

$2-\sqrt{3}$

Example 13.8.2.24

Simplify: $\frac{6-\sqrt{45}}{3}$.

Answer

$2-\sqrt{5}$

Use the Quotient Property to Simplify Square Roots

Whenever you have to simplify a square root, the first step you should take is to determine whether the radicand is a perfect square. A *perfect square fraction* is a fraction in which both the numerator and the denominator are perfect squares.

Example 13.8.2.25

Simplify: $\sqrt{\frac{9}{64}}$.

Answer

	$\sqrt{\frac{9}{64}}$	
Since$(\frac{3}{8})^2$	$\frac{3}{8}$	(13.8.2.8)

Example 13.8.2.26

Simplify: $\sqrt{\frac{25}{16}}$.

Answer

$\frac{5}{4}$

? Example 13.8.2.27

Simplify: $\sqrt{\frac{49}{81}}$.

Answer

$\frac{7}{9}$

If the numerator and denominator have any common factors, remove them. You may find a perfect square fraction!

? Example 13.8.2.28

Simplify: $\sqrt{\frac{45}{80}}$.

Answer

	$\sqrt{\frac{45}{80}}$
Simplify inside the radical first. Rewrite showing the common factors of the numerator and denominator.	$\sqrt{\frac{5 \cdot 9}{5 \cdot 16}}$
Simplify the fraction by removing common factors.	$\sqrt{\frac{9}{16}}$
Simplify. $(\frac{3}{4})^2 = \frac{9}{16}$	$\frac{3}{4}$

(13.8.2.9)

? Example 13.8.2.29

Simplify: $\sqrt{\frac{75}{48}}$.

Answer

$\frac{5}{4}$

? Example 13.8.2.30

Simplify: $\sqrt{\frac{98}{162}}$.

Answer

$\frac{7}{9}$

In the last example, our first step was to simplify the fraction under the radical by removing common factors. In the next example we will use the Quotient Property to simplify under the radical. We divide the like bases by subtracting their exponents, $\frac{a^m}{a^n} = a^{m-n}$, $a \neq 0$.

? Example 13.8.2.31

Simplify: $\sqrt{\frac{m^6}{m^4}}$.

Answer

	$\sqrt{\frac{m^6}{m^4}}$
Simplify the fraction inside the radical first	$\sqrt{m^2}$
Divide the like bases by subtracting the exponents.	
Simplify.	m

(13.8.2.10)

? Example 13.8.2.32

Simplify: $\sqrt{\frac{a^8}{a^6}}$.

Answer

a

Example 13.8.2.33

Simplify: $\sqrt{\frac{x^{14}}{x^{10}}}$.

Answer

x^2

Example 13.8.2.34

Simplify: $\sqrt{\frac{48p^7}{3p^3}}$.

Answer

$$\begin{array}{ll} & \sqrt{\frac{48p^7}{3p^3}} \\ \text{Simplify the fraction inside the radical first.} & \sqrt{16p^4} \\ \text{Simplify.} & 4p^2 \end{array} \qquad (13.8.2.11)$$

Example 13.8.2.35

Simplify: $\sqrt{\frac{75x^5}{3x}}$.

Answer

$5x^2$

Example 13.8.2.36

Simplify: $\sqrt{\frac{72z^{12}}{2z^{10}}}$.

Answer

6z

Remember the Quotient to a Power Property? It said we could raise a fraction to a power by raising the numerator and denominator to the power separately.

$(\frac{a}{b})^m = \frac{a^m}{b^m}$, $b \neq 0$

We can use a similar property to simplify a square root of a fraction. After removing all common factors from the numerator and denominator, if the fraction is not a perfect square we simplify the numerator and denominator separately.

Definition: QUOTIENT PROPERTY OF SQUARE ROOTS

If a, b are non-negative real numbers and $b \neq 0$, then

$\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$

Example 13.8.2.37

Simplify: $\sqrt{\frac{21}{64}}$.

Answer

$$\begin{array}{ll} & \sqrt{\frac{21}{64}} \\ \text{We cannot simplify the fraction inside the radical. Rewrite using the quotient property.} & \frac{\sqrt{21}}{\sqrt{64}} \\ \text{Simplify the square root of 64. The numerator cannot be simplified.} & \frac{\sqrt{21}}{8} \end{array} \qquad (13.8.2.12)$$

Example 13.8.2.38

Simplify: $\sqrt{\frac{19}{49}}$.

Answer

$\frac{\sqrt{19}}{7}$

Example 13.8.2.39

Simplify: $\sqrt{\frac{28}{81}}$

Answer

$\frac{2\sqrt{7}}{9}$

How to Use the Quotient Property to Simplify a Square Root

Example 13.8.2.40

Simplify: $\sqrt{\frac{27m^3}{196}}$.

Answer

Step 1. Simplify the fraction in the radicand, if possible.	$\frac{27m^3}{196}$ cannot be simplified.	$\sqrt{\frac{27m^3}{196}}$
Step 2. Use the Quotient Property to rewrite the radical as the quotient of two radicals.	We rewrite $\sqrt{\frac{27m^3}{196}}$ as the quotient of $\sqrt{27m^3}$ and $\sqrt{196}$.	$\frac{\sqrt{27m^3}}{\sqrt{196}}$
Step 3. Simplify the radicals in the numerator and the denominator.	$9m^2$ and 196 are perfect squares.	$\frac{\sqrt{9m^2}\cdot\sqrt{3m}}{\sqrt{196}}$ $\frac{3m\sqrt{3m}}{14}$

Example 13.8.2.41

Simplify: $\sqrt{\frac{24p^3}{49}}$

Answer

$\frac{2p\sqrt{6p}}{7}$

Example 13.8.2.42

Simplify: $\sqrt{\frac{48x^5}{100}}$

Answer

$\frac{2x^2\sqrt{3x}}{5}$

Definition: SIMPLIFY A SQUARE ROOT USING THE QUOTIENT PROPERTY.

1. Simplify the fraction in the radicand, if possible.
2. Use the Quotient Property to rewrite the radical as the quotient of two radicals.
3. Simplify the radicals in the numerator and the denominator.

Example 13.8.2.43

Simplify: $\sqrt{\frac{45x^5}{y^4}}$.

Answer

We cannot simplify the fraction inside the radical. Rewrite using the quotient property. $\frac{\sqrt{45x^5}}{\sqrt{y^4}}$

Simplify the radicals in the numerator and the denominator. $\frac{\sqrt{9x^4}\sqrt{5x}}{y^2}$

Simplify. $\frac{3x^2\sqrt{5x}}{y^2}$

(13.8.2.13)

Example 13.8.2.44

Simplify: $\sqrt{\frac{80m^3}{n^6}}$

Answer

$\frac{4m\sqrt{5m}}{n^3}$

Example 13.8.2.45

Simplify: $\sqrt{\frac{54u^7}{v^8}}$.

Answer

$\frac{3u^3\sqrt{6u}}{v^4}$

Be sure to simplify the fraction in the radicand first, if possible.

Example 13.8.2.46

Simplify: $\sqrt{\frac{81d^9}{25d^4}}$.

Answer

Simplify the fraction in the radicand. $\sqrt{\frac{81d^5}{25}}$

Rewrite using the quotient property. $\frac{\sqrt{81d^5}}{\sqrt{25}}$

Simplify the radicals in the numerator and the denominator. $\frac{\sqrt{81d^4}\sqrt{d}}{5}$

Simplify. $\frac{9d^2\sqrt{d}}{5}$

(13.8.2.14)

Example 13.8.2.47

Simplify: $\sqrt{\frac{64x^7}{9x^3}}$.

Answer

$\frac{8x^2}{3}$

Example 13.8.2.48

Simplify: $\sqrt{\frac{16a^9}{100a^5}}$.

Answer

$\frac{2a^2}{5}$

? Example 13.8.2.49

Simplify: $\sqrt{\frac{18p^5q^7}{32pq^2}}$.

Answer

	$\sqrt{\frac{18p^5q^7}{32pq^2}}$
Simplify the fraction in the radicand.	$\sqrt{\frac{9p^4q^5}{16}}$
Rewrite using the quotient property.	$\frac{\sqrt{9p^4q^5}}{\sqrt{16}}$
Simplify the radicals in the numerator and the denominator.	$\frac{\sqrt{9p^4q^4}\sqrt{q}}{4}$
Simplify.	$\frac{3p^2q^2\sqrt{q}}{4}$

(13.8.2.15)

? ExAMPLe 13.8.2.50

Simplify: $\sqrt{\frac{50x^5y^3}{72x^4y}}$.

Answer

$\frac{5y\sqrt{x}}{6}$

? Example 13.8.2.51

Simplify: $\sqrt{\frac{48m^7n^2}{125m^5n^9}}$.

Answer

$\frac{4m\sqrt{3}}{5n^3\sqrt{5n}}$

Key Concepts

- **Simplified Square Root** $\sqrt{a}$ is considered simplified if a has no perfect-square factors.
- **Product Property of Square Roots** If a, b are non-negative real numbers, then

  $\sqrt{ab} = \sqrt{a} \cdot \sqrt{b}$
- **Simplify a Square Root Using the Product Property** To simplify a square root using the Product Property:
  1. Find the largest perfect square factor of the radicand. Rewrite the radicand as a product using the perfect square factor.
  2. Use the product rule to rewrite the radical as the product of two radicals.
  3. Simplify the square root of the perfect square.
- **Quotient Property of Square Roots** If a, b are non-negative real numbers and $b \neq 0$, then

  $\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$
- **Simplify a Square Root Using the Quotient Property** To simplify a square root using the Quotient Property:
  1. Simplify the fraction in the radicand, if possible.
  2. Use the Quotient Rule to rewrite the radical as the quotient of two radicals.
  3. Simplify the radicals in the numerator and the denominator.

13.8.2E: Exercises

Practice Makes Perfect

Use the Product Property to Simplify Square Roots

In the following exercises, simplify.

Example 13.8.2E.52

$\sqrt{27}$

Answer

$3\sqrt{3}$

Example 13.8.2E.53

$\sqrt{80}$

Example 13.8.2E.54

$\sqrt{125}$

Answer

$5\sqrt{5}$

Example 13.8.2E.55

$\sqrt{96}$

Example 13.8.2E.56

$\sqrt{200}$

Answer

$10\sqrt{2}$

Example 13.8.2E.57

$\sqrt{147}$

Example 13.8.2E.58

$\sqrt{450}$

Answer

$15\sqrt{2}$

Example 13.8.2E.59

$\sqrt{252}$

Example 13.8.2E.60

$\sqrt{800}$

Answer

$20\sqrt{2}$

Example 13.8.2E.61

$\sqrt{288}$

Example 13.8.2E.62

$\sqrt{675}$

Answer

$15\sqrt{3}$

Example 13.8.2E.63

$\sqrt{1250}$

Example 13.8.2E.64

$\sqrt{x^7}$

Answer

$x^3\sqrt{x}$

Example 13.8.2E.65

$\sqrt{y^{11}}$

Example 13.8.2E.66

$\sqrt{p^3}$

Answer

$p\sqrt{p}$

Example 13.8.2E.67

$\sqrt{q^5}$

Example 13.8.2E.68

$\sqrt{m^{13}}$

Answer

$m^6\sqrt{m}$

Example 13.8.2E.69

$\sqrt{n^{21}}$

Example 13.8.2E.70

$\sqrt{r^{25}}$

Answer

$r^{12}\sqrt{r}$

Example 13.8.2E.71

$\sqrt{s^{33}}$

Example 13.8.2E.72

$\sqrt{49n^{17}}$

Answer

$7n^{8}\sqrt{n}$

Example 13.8.2E.73

$\sqrt{25m^{9}}$

Example 13.8.2E.74

$\sqrt{81r^{15}}$

Answer

$9r^{7}\sqrt{r}$

Example 13.8.2E.75

$\sqrt{100s^{19}}$

Example 13.8.2E.76

$\sqrt{98m^{5}}$

Answer

$7m^{2}\sqrt{2m}$

Example 13.8.2E.77

$\sqrt{32n^{11}}$

Example 13.8.2E.78

$\sqrt{125r^{13}}$

Answer

$5r^6\sqrt{5r}$

Example 13.8.2E.79

$\sqrt{80s^{15}}$

Example 13.8.2E.80

$\sqrt{200p^{13}}$

Answer

$10p^6\sqrt{2p}$

Example 13.8.2E.81

$\sqrt{128q^3}$

Example 13.8.2E.82

$\sqrt{242m^{23}}$

Answer

$11m^{11}\sqrt{2m}$

Example 13.8.2E.83

$\sqrt{175n^{13}}$

Exercise 13.8.2E.84

$\sqrt{147m^7n^{11}}$

Answer

$7m^3n^5\sqrt{3mn}$

Example 13.8.2E.85

$\sqrt{48m^7n^5}$

Example 13.8.2E.86

$\sqrt{75r^{13}s^9}$

Answer

$5r^6s^4\sqrt{3rs}$

https://math.libretexts.org/@go/page/46319

Example 13.8.2E.87

$\sqrt{96r^3s^3}$

Example 13.8.2E.88

$\sqrt{300p^9q^{11}}$

Answer

$10p^4q^5\sqrt{3pq}$

Example 13.8.2E.89

$\sqrt{192q^3r^7}$

Example 13.8.2E.90

$\sqrt{242m^{13}n^{21}}$

Answer

$11m^6n^{10}\sqrt{2mn}$

Example 13.8.2E.91

$\sqrt{150m^9n^3}$

Example 13.8.2E.92

$5+\sqrt{12}$

Answer

$5+2\sqrt{3}$

Example 13.8.2E.93

$8+\sqrt{96}$

Example 13.8.2E.94

$1+\sqrt{45}$

Answer

$1+3\sqrt{5}$

Example 13.8.2E.95

$3+\sqrt{125}$

https://math.libretexts.org/@go/page/46319

Example 13.8.2E.96

$\frac{10-\sqrt{24}}{2}$

Answer

$5-\sqrt{6}$

Example 13.8.2E.97

$\frac{8-\sqrt{80}}{4}$

Example 13.8.2E.98

$\frac{3+\sqrt{90}}{3}$

Answer

$1+\sqrt{10}$

Example 13.8.2E.99

$\frac{15+\sqrt{75}}{5}$

Use the Quotient Property to Simplify Square Roots

In the following exercises, simplify.

Example 13.8.2E.100

$\sqrt{\frac{49}{64}}$

Answer

$\frac{7}{8}$

Example 13.8.2E.101

$\sqrt{\frac{100}{36}}$

Example 13.8.2E.102

$\sqrt{\frac{121}{16}}$

Answer

$\frac{11}{4}$

Example 13.8.2E.103

$\sqrt{\frac{144}{169}}$

Example 13.8.2E.104

$\sqrt{\frac{72}{98}}$

Answer

$\frac{6}{7}$

Example 13.8.2E.105

$\sqrt{\frac{75}{12}}$

Example 13.8.2E.106

$\sqrt{\frac{45}{125}}$

Answer

$\frac{3}{5}$

Example 13.8.2E.107

$\sqrt{\frac{300}{243}}$

Example 13.8.2E.108

$\sqrt{\frac{x^{10}}{x^6}}$

Answer

x^2

Example 13.8.2E.109

$\sqrt{\frac{p^{20}}{p^{10}}}$

Example 13.8.2E.110

$\sqrt{\frac{y^4}{y^8}}$

Answer

$\frac{1}{y^2}$

Example 13.8.2E.111

$\sqrt{\frac{q^8}{q^{14}}}$

Example 13.8.2E.112

$\sqrt{\frac{200x^7}{2x^3}}$

Answer

$10x^2$

Example 13.8.2E.113

$\sqrt{\frac{98y^{11}}{2y^5}}$

Example 13.8.2E.114

$\sqrt{\frac{96p^9}{6p}}$

Answer

$4p^4$

Example 13.8.2E.115

$\sqrt{\frac{108q^{10}}{3q^2}}$

Example 13.8.2E.116

$\sqrt{\frac{36}{35}}$

Answer

$\frac{6}{\sqrt{35}}$

Example 13.8.2E.117

$\sqrt{\frac{144}{65}}$

Example 13.8.2E.118

$\sqrt{\frac{20}{81}}$

Answer

$\frac{2\sqrt{5}}{9}$

Example 13.8.2E.119

$\sqrt{\frac{211}{96}}$

https://math.libretexts.org/@go/page/46319

Example 13.8.2E.120

$\sqrt{\frac{96x^7}{121}}$

Answer

$\frac{4x^3\sqrt{6x}}{11}$

Example 13.8.2E.121

$\sqrt{\frac{108y^4}{49}}$

Example 13.8.2E.122

$\sqrt{\frac{300m^5}{64}}$

Answer

$\frac{5m^2\sqrt{3m}}{4}$

Example 13.8.2E.123

$\sqrt{\frac{125n^7}{169}}$

Example 13.8.2E.124

$\sqrt{\frac{98r^5}{100}}$

Answer

$\frac{7r^2\sqrt{2r}}{10}$

Example 13.8.2E.125

$\sqrt{\frac{180s^{10}}{144}}$

Example 13.8.2E.126

$\sqrt{\frac{28q^6}{225}}$

Answer

$\frac{2q^3\sqrt{7}}{15}$

Example 13.8.2E.127

$\sqrt{\frac{150r^3}{256}}$

https://math.libretexts.org/@go/page/46319

Example 13.8.2E.128

$\sqrt{\frac{75r^9}{s^8}}$

Answer

$\frac{5r^4\sqrt{3r}}{s^4}$

Example 13.8.2E.129

$\sqrt{\frac{72x^5}{y^6}}$

Example 13.8.2E.130

$\sqrt{\frac{28p^7}{q^2}}$

Answer

$\frac{4p^3\sqrt{7p}}{q}$

Example 13.8.2E.131

$\sqrt{\frac{45r^3}{s^{10}}}$

Example 13.8.2E.132

$\sqrt{\frac{100x^5}{36x^3}}$

Answer

$\frac{5x}{3}$

Example 13.8.2E.133

$\sqrt{\frac{49r^{12}}{16r^6}}$

Example 13.8.2E.134

$\sqrt{\frac{121p^5}{81p^2}}$

Answer

$\frac{11p\sqrt{p}}{9}$

Example 13.8.2E.135

$\sqrt{\frac{25r^8}{64r}}$

Example 13.8.2E.136

$\sqrt{\frac{32x^5y^3}{18x^3y}}$.

Answer

$\frac{4xy}{3}$

Example 13.8.2E.137

$\sqrt{\frac{75r^6s^8}{48rs^4}}$

Example 13.8.2E.138

$\sqrt{\frac{27p^2q^{10}}{8p^5q^3}}$

Answer

$\frac{1}{2pq\sqrt{p}}$

Example 13.8.2E.139

$\sqrt{\frac{50r^5s^2}{128r^2s^5}}$

Everyday Math

Example 13.8.2E.140

1. Elliott decides to construct a square garden that will take up 288 square feet of his yard. Simplify $\sqrt{288}$ to determine the length and the width of his garden. Round to the nearest tenth of a foot.
2. Suppose Elliott decides to reduce the size of his square garden so that he can create a 5-foot-wide walking path on the north and east sides of the garden. Simplify $\sqrt{288}-5$ to determine the length and width of the new garden. Round to the nearest tenth of a foot.

Answer

1. 17.0 feet
2. 15.0 feet

Example 13.8.2E.141

1. Melissa accidentally drops a pair of sunglasses from the top of a roller coaster, 64 feet above the ground. Simplify $\sqrt{\frac{64}{16}}$ to determine the number of seconds it takes for the sunglasses to reach the ground.
2. Suppose the sunglasses in the previous example were dropped from a height of 144 feet. Simplify $\sqrt{\frac{144}{16}}$ to determine the number of seconds it takes for the sunglasses to reach the ground.

Writing Exercises

? Example $13.8.2E.142$

Explain why $\sqrt{x^4} = x^2$. Then explain why $\sqrt{x^{16}} = x^8$.

Answer

Answers will vary.

? Example $13.8.2E.143$

Explain why $7 + \sqrt{9}$ is not equal to $\sqrt{7+9}$.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the Product Property to simplify square roots.			
use the Quotient Property to simplify square roots.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 13.8.2E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

13.8.3: Add and Subtract Square Roots

Learning Objectives

By the end of this section, you will be able to:

- Add and subtract like square roots
- Add and subtract square roots that need simplification

BE PREPARED

Before you get started, take this readiness quiz.

1. Add: ⓐ $3x+9x$ ⓑ $5m+5n$.
   If you missed this problem, review [link].
2. Simplify: $\sqrt{50x^3}$.
   If you missed this problem, review [link].

We know that we must follow the order of operations to simplify expressions with square roots. The radical is a grouping symbol, so we work inside the radical first. We simplify $\sqrt{2+7}$ in this way:

$$\begin{array}{ll} & \sqrt{2+7} \\ \text{Add inside the radical.} & \sqrt{9} \\ \text{Simplify.} & 3 \end{array} \tag{13.8.3.1}$$

So if we have to add $\sqrt{2}+\sqrt{7}$, we must not combine them into one radical.

$\sqrt{2}+\sqrt{7} \neq \sqrt{2+7}$

Trying to add square roots with different radicands is like trying to add unlike terms.

$$\begin{array}{llll} \text{But, just like we can} & x+x & \text{we can add} & \sqrt{3}+\sqrt{3} \\ & x+x=2x & & \sqrt{3}+\sqrt{3}=2\sqrt{3} \end{array} \tag{13.8.3.2}$$

Adding square roots with the same radicand is just like adding like terms. We call square roots with the same radicand like square roots to remind us they work the same as like terms.

Definition: LIKE SQUARE ROOTS

Square roots with the same radicand are called **like square roots**.

We add and subtract like square roots in the same way we add and subtract like terms. We know that 3x+8x is 11x. Similarly we add $3\sqrt{x}+8\sqrt{x}$ and the result is $11\sqrt{x}$.

Add and Subtract Like Square Roots

Think about adding like terms with variables as you do the next few examples. When you have like radicands, you just add or subtract the coefficients. When the radicands are not like, you cannot combine the terms.

Example 13.8.3.1

Simplify: $2\sqrt{2}-7\sqrt{2}$.

Answer

$$\begin{array}{ll} & 2\sqrt{2}-7\sqrt{2} \\ \text{Since the radicals are like, we subtract the coefficients.} & -5\sqrt{2} \end{array} \tag{13.8.3.3}$$

Example 13.8.3.2

Simplify: $8\sqrt{2}-9\sqrt{2}$.

Answer

$-\sqrt{2}$

Example 13.8.3.3

Simplify: $5\sqrt{3}-9\sqrt{3}$.

Answer

$-4\sqrt{3}$

Example 13.8.3.4

Simplify: $3\sqrt{y}+4\sqrt{y}$.

Answer

$$\begin{array}{ll} & 3\sqrt{y}+4\sqrt{y} \\ \text{Since the radicals are like, we add the coefficients.} & 7\sqrt{y} \end{array} \tag{13.8.3.4}$$

Example 13.8.3.5

Simplify: $2\sqrt{x}+7\sqrt{x}$.

Answer

$9\sqrt{x}$

Example 13.8.3.6

Simplify: $5\sqrt{u}+3\sqrt{u}$.

Answer

$8\sqrt{u}$

Example 13.8.3.7

Simplify: $4\sqrt{x}-2\sqrt{y}$

Answer

$$\begin{array}{ll} & 4\sqrt{x}-2\sqrt{y} \\ \text{Since the radicals are not like, we cannot subtract them. We leave the expression as is.} & 4\sqrt{x}-2\sqrt{y} \end{array} \tag{13.8.3.5}$$

Example 13.8.3.8

Simplify: $7\sqrt{p}-6\sqrt{q}$.

Answer

$7\sqrt{p}-6\sqrt{q}$

Example 13.8.3.9

Simplify: $6\sqrt{a}-3\sqrt{b}$.

Answer

$6\sqrt{a}-3\sqrt{b}$

Example 13.8.3.10

Simplify: $5\sqrt{13}+4\sqrt{13}+2\sqrt{13}$.

Answer

$$\begin{array}{ll} & 5\sqrt{13}+4\sqrt{13}+2\sqrt{13} \\ \text{Since the radicals are like, we add the coefficients.} & 11\sqrt{13} \end{array} \tag{13.8.3.6}$$

Example 13.8.3.11

Simplify: $4\sqrt{11}+2\sqrt{11}+3\sqrt{11}$.

Answer

$9\sqrt{11}$

Example 13.8.3.12

Simplify: $6\sqrt{10}+2\sqrt{10}+3\sqrt{10}$.

Answer

$11\sqrt{10}$

Example 13.8.3.13

Simplify: $2\sqrt{6}-6\sqrt{6}+3\sqrt{3}$.

Answer

$$\begin{array}{ll} & 2\sqrt{6}-6\sqrt{6}+3\sqrt{3} \\ \text{Since the first two radicals are like, we subtract their coefficients.} & -4\sqrt{6}+3\sqrt{3} \end{array} \tag{13.8.3.7}$$

Example 13.8.3.14

Simplify: $5\sqrt{5}-4\sqrt{5}+2\sqrt{6}$.

Answer

$\sqrt{5}+2\sqrt{6}$

Example 13.8.3.15

Simplify: $3\sqrt{7}-8\sqrt{7}+2\sqrt{5}$.

Answer

$-5\sqrt{7}+2\sqrt{5}$

Example 13.8.3.16

Simplify: $2\sqrt{5n}-6\sqrt{5n}+4\sqrt{5n}$.

Answer

$$\begin{array}{ll} & 2\sqrt{5n}-6\sqrt{5n}+4\sqrt{5n} \\ \text{Since the radicals are like, we combine them.} & -0\sqrt{5n} \\ \text{Simplify.} & 0 \end{array} \tag{13.8.3.8}$$

Example 13.8.3.17

Simplify: $\sqrt{7x}-7\sqrt{7x}+4\sqrt{7x}$.

Answer

$-2\sqrt{7x}$

Example 13.8.3.18

Simplify: $4\sqrt{3y}-7\sqrt{3y}+2\sqrt{3y}$.

Answer

$-3\sqrt{y}$

When radicals contain more than one variable, as long as all the variables and their exponents are identical, the radicals are like.

Example 13.8.3.19

Simplify: $\sqrt{3xy}+5\sqrt{3xy}-4\sqrt{3xy}$.

Answer

$$\begin{array}{ll} & \sqrt{3xy}+5\sqrt{3xy}-4\sqrt{3xy} \\ \text{Since the radicals are like, we combine them.} & 2\sqrt{3xy} \end{array} \tag{13.8.3.9}$$

Example 13.8.3.20

Simplify: $\sqrt{5xy}+4\sqrt{5xy}-7\sqrt{5xy}$.

Answer

$-2\sqrt{5xy}$

Example 13.8.3.21

Simplify: $3\sqrt{7mn}+\sqrt{7mn}-4\sqrt{7mn}$.

Answer

0

Add and Subtract Square Roots that Need Simplification

Remember that we always simplify square roots by removing the largest perfect-square factor. Sometimes when we have to add or subtract square roots that do not appear to have **like radicals**, we find like radicals after simplifying the square roots.

Example 13.8.3.22

Simplify: $\sqrt{20}+3\sqrt{5}$.

Answer

$$\begin{array}{ll} & \sqrt{20}+3\sqrt{5} \\ \text{Simplify the radicals, when possible.} & \sqrt{4}\cdot\sqrt{5}+3\sqrt{5} \\ & 2\sqrt{5}+3\sqrt{5} \\ \text{Combine the like radicals.} & 5\sqrt{5} \end{array} \tag{13.8.3.10}$$

Example 13.8.3.23

Simplify: $\sqrt{18}+6\sqrt{2}$.

Answer

$9\sqrt{2}$

Example 13.8.3.24

Simplify: $\sqrt{27}+4\sqrt{3}$.

Answer

$7\sqrt{3}$

Example 13.8.3.25

Simplify: $\sqrt{48}-\sqrt{75}$

Answer

$$\begin{aligned} & & \sqrt{48}-\sqrt{75} \\ & \text{Simplify the radicals.} & \sqrt{16}\cdot\sqrt{3}-\sqrt{25}\cdot\sqrt{3} \\ & & 4\sqrt{3}-5\sqrt{3} \\ & \text{Combine the like radicals.} & -\sqrt{3} \end{aligned} \tag{13.8.3.11}$$

Example 13.8.3.26

Simplify: $\sqrt{32}-\sqrt{18}$.

Answer

$\sqrt{2}$

Example 13.8.3.27

Simplify: $\sqrt{20}-\sqrt{45}$.

Answer

$-\sqrt{5}$

Just like we use the Associative Property of Multiplication to simplify 5(3x) and get 15x, we can simplify $5(3\sqrt{x})$ and get $15\sqrt{x}$. We will use the Associative Property to do this in the next example.

Example 13.8.3.28

Simplify: $5\sqrt{18}-2\sqrt{8}$.

Answer

$$\begin{aligned} & & 5\sqrt{18}-2\sqrt{8} \\ & \text{Simplify the radicals.} & 5\cdot\sqrt{9}\cdot\sqrt{2}-2\cdot\sqrt{4}\cdot\sqrt{2} \\ & & 5\cdot 3\cdot\sqrt{2}-2\cdot 2\cdot\sqrt{2} \\ & & 15\sqrt{2}-4\sqrt{2} \\ & \text{Combine the like radicals.} & 11\sqrt{2} \end{aligned} \tag{13.8.3.12}$$

Example 13.8.3.29

Simplify: $4\sqrt{27}-3\sqrt{12}$.

Answer

$6\sqrt{3}$

Example 13.8.3.30

Simplify: $3\sqrt{20}-7\sqrt{45}$.

Answer

$-15\sqrt{5}$

Example 13.8.3.31

Simplify: $\frac{3}{4}\sqrt{192}-\frac{5}{6}\sqrt{108}$.

Answer

$$\begin{aligned} & \frac{3}{4}\sqrt{192}-\frac{5}{6}\sqrt{108} \\ \text{Simplify the radicals.} \quad & \frac{3}{4}\sqrt{64}\cdot\sqrt{3}-\frac{5}{6}\sqrt{36}\cdot\sqrt{3} \\ & \frac{3}{4}\cdot 8\cdot\sqrt{3}-\frac{5}{6}\cdot 6\cdot\sqrt{3} \\ & 6\sqrt{3}-5\sqrt{3} \\ \text{Combine the like radicals.} \quad & \sqrt{3} \end{aligned} \tag{13.8.3.13}$$

Example 13.8.3.32

Simplify: $\frac{2}{3}\sqrt{108}-\frac{5}{7}\sqrt{147}$.

Answer

$-\sqrt{3}$

Example 13.8.3.33

Simplify: $\frac{3}{5}\sqrt{200}-\frac{3}{4}\sqrt{128}$.

Answer

0

Example 13.8.3.34

Simplify: $\frac{2}{3}\sqrt{48}-\frac{3}{4}\sqrt{12}$.

Answer

$$\begin{aligned} & \frac{2}{3}\sqrt{48}-\frac{3}{4}\sqrt{12} \\ \text{Simplify the radicals.} \quad & \frac{2}{3}\sqrt{16}\cdot\sqrt{3}-\frac{3}{4}\sqrt{4}\cdot\sqrt{3} \\ & \frac{2}{3}\cdot 4\cdot\sqrt{3}-\frac{3}{4}\cdot 2\cdot\sqrt{3} \\ & \frac{8}{3}\sqrt{3}-\frac{3}{2}\sqrt{3} \\ \text{Find a common denominator to subtract the coefficients of the like radicals.} \quad & \frac{16}{6}\sqrt{3}-\frac{9}{6}\sqrt{3} \\ \text{Simplify.} \quad & \frac{7}{6}\sqrt{3} \end{aligned} \tag{13.8.3.14}$$

Example 13.8.3.35

Simplify: $\frac{2}{5}\sqrt{32}-\frac{1}{3}\sqrt{8}$

Answer

$\frac{14}{15}\sqrt{2}$

Example 13.8.3.36

Simplify: $\frac{1}{3}\sqrt{80}-\frac{1}{4}\sqrt{125}$

Answer

$\frac{1}{12}[\sqrt{5}$

In the next example, we will remove constant and variable factors from the square roots.

Example 13.8.3.37

Simplify: $\sqrt{18n^5}-\sqrt{32n^5}$

Answer

$$\begin{array}{ll} & \sqrt{18n^5}-\sqrt{32n^5} \\ \text{Simplify the radicals.} & \sqrt{9n^4}\cdot\sqrt{2n}-\sqrt{16n^4}\cdot\sqrt{2n} \\ & 3n^2\sqrt{2n}-4n^2\sqrt{2n} \\ \text{Combine the like radicals.} & -n^2\sqrt{2n} \end{array} \tag{13.8.3.15}$$

Example 13.8.3.38

Simplify: $\sqrt{32m^7}-\sqrt{50m^7}$.

Answer

$-m^3\sqrt{2m}$

Example 13.8.3.39

Simplify: $\sqrt{27p^3}-\sqrt{48p^3}$

Answer

$-p^3\sqrt{p}$

Example 13.8.3.40

Simplify: $9\sqrt{50m^2}-6\sqrt{48m^2}$.

Answer

\[\begin{array}{ll} {}&{9\sqrt{50m^{2}}-6\sqrt{48m^{2}}}\\ {\text{Simplify the radicals.}}&{9\sqrt{25m^{2}}\cdot\sqrt{2}-6\cdot\sqrt{16m^{2}}\cdot\sqrt{3}}\\ {}&{9\cdot 5m\cdot\sqrt{2}-6\cdot 4m\cdot\sqrt{3}}\\ {}&{45m\sqrt{2}-24m\sqrt{3}}\\ \end{array}\]

Example 13.8.3.41

Simplify: $5\sqrt{32x^2}-3\sqrt{48x^2}$.

Answer

$20x\sqrt{2}-12x\sqrt{3}$

Example 13.8.3.42

Simplify: $7\sqrt{48y^2}-4\sqrt{72y^2}$.

Answer

$28y\sqrt{3}-24y\sqrt{2}$

Example 13.8.3.43

Simplify: $2\sqrt{8x^2}-5x\sqrt{32}+5\sqrt{18x^2}$.

Answer

$$\begin{array}{ll} & 2\sqrt{8x^2}-5x\sqrt{32}+5\sqrt{18x^2} \\ \text{Simplify the radicals.} & 2\sqrt{4x^2}\cdot\sqrt{2}-5x\sqrt{16}\cdot\sqrt{2}+5\sqrt{9x^2}\cdot\sqrt{2} \\ & 2\cdot 2x\cdot\sqrt{2}-5x\cdot 4\cdot\sqrt{2}+5\cdot 3x\cdot\sqrt{2} \\ & 4x\sqrt{2}-20x\sqrt{2}+15x\sqrt{2} \\ \text{Combine the like radicals.} & -x\sqrt{2} \end{array} \qquad (13.8.3.16)$$

Example 13.8.3.44

Simplify: $3\sqrt{12x^2}-2x\sqrt{48}+4\sqrt{27x^2}$

Answer

$10x\sqrt{3}$

Example 13.8.3.45

Simplify: $3\sqrt{18x^2}-6x\sqrt{32}+2\sqrt{50x^2}$.

Answer

$-5x\sqrt{2}$

Access this online resource for additional instruction and practice with the adding and subtracting square roots.

13.8.3E: Exercises

Practice Makes Perfect

Add and Subtract Like Square Roots

In the following exercises, simplify.

Example 13.8.3E.46

$8\sqrt{2}-5\sqrt{2}$

Answer

$3\sqrt{2}$

Example 13.8.3E.47

$7\sqrt{2}-3\sqrt{2}$

Example 13.8.3E.48

$3\sqrt{5}+6\sqrt{5}$

Answer

$9\sqrt{5}$

Example 13.8.3E.49

$4\sqrt{5}+8\sqrt{5}$

Example 13.8.3E.50

$9\sqrt{7}-10\sqrt{7}$

Answer

$-\sqrt{7}$

Example 13.8.3E.51

$11\sqrt{7}-12\sqrt{7}$

Example 13.8.3E.52

$7\sqrt{y}+2\sqrt{y}$

Answer

$9\sqrt{y}$

Example 13.8.3E.53

$9\sqrt{n}+3\sqrt{n}$

Example 13.8.3E.54

$\sqrt{a}-4\sqrt{a}$

Answer

$-3\sqrt{a}$

Example 13.8.3E.55

$\sqrt{b}-6\sqrt{b}$

Example 13.8.3E.56

$5\sqrt{c}+2\sqrt{c}$

Answer

$7\sqrt{c}$

Example 13.8.3E.57

$7\sqrt{d}+2\sqrt{d}$

Example 13.8.3E.58

$8\sqrt{a}-2\sqrt{b}$

Answer

$8\sqrt{a}-2\sqrt{b}$

Example 13.8.3E.59

$5\sqrt{c}-3\sqrt{d}$

Example 13.8.3E.60

$5\sqrt{m}+\sqrt{n}$

Answer

$5\sqrt{m}+\sqrt{n}$

Example 13.8.3E.61

$\sqrt{n}+3\sqrt{p}$

Example 13.8.3E.62

$8\sqrt{7}+2\sqrt{7}+3\sqrt{7}$

Answer

$13\sqrt{7}$

Example 13.8.3E.63

$6\sqrt{5}+3\sqrt{5}+\sqrt{5}$

Example 13.8.3E.64

$3\sqrt{11}+2\sqrt{11}-8\sqrt{11}$

Answer

$-3\sqrt{11}$

Example 13.8.3E.65

$2\sqrt{15}+5\sqrt{15}-9\sqrt{15}$

Example 13.8.3E.66

$3\sqrt{3}-8\sqrt{3}+7\sqrt{5}$

Answer

$-5\sqrt{3}+7\sqrt{5}$

Example 13.8.3E.67

$5\sqrt{7}-8\sqrt{7}+6\sqrt{3}$

Example 13.8.3E.68

$6\sqrt{2}+2\sqrt{2}-3\sqrt{5}$

Answer

$8\sqrt{2}-3\sqrt{5}$

Example 13.8.3E.69

$7\sqrt{5}+\sqrt{5}-8\sqrt{10}$

Example 13.8.3E.70

$3\sqrt{2a}-4\sqrt{2a}+5\sqrt{2a}$

Answer

$4\sqrt{2a}$

Example 13.8.3E.71

$\sqrt{11b}-5\sqrt{11b}+3\sqrt{11b}$

https://math.libretexts.org/@go/page/46321

Example 13.8.3E.72

$8\sqrt{3c}+2\sqrt{3c}-9\sqrt{3c}$

Answer

$\sqrt{3c}$

Example 13.8.3E.73

$3\sqrt{5d}+8\sqrt{5d}-11\sqrt{5d}$

Example 13.8.3E.74

$5\sqrt{3ab}+\sqrt{3ab}-2\sqrt{3ab}$

Answer

\(4\sqrt{3ab}\

Example 13.8.3E.75

$8\sqrt{11cd}+5\sqrt{11cd}-9\sqrt{11cd}$

Example 13.8.3E.76

$2\sqrt{pq}-5\sqrt{pq}+4\sqrt{pq}$

Answer

$\sqrt{pq}$

Example 13.8.3E.77

$11\sqrt{2rs}-9\sqrt{2rs}+3\sqrt{2rs}$

Add and Subtract Square Roots that Need Simplification

In the following exercises, simplify.

Example 13.8.3E.78

$\sqrt{50}+4\sqrt{2}$

Answer

$9\sqrt{2}$

Example 13.8.3E.79

$\sqrt{48}+2\sqrt{3}$

Example 13.8.3E.80

$\sqrt{80}-3\sqrt{5}$

Answer

$\sqrt{5}$

Example 13.8.3E.81

$\sqrt{28}-4\sqrt{7}$

Example 13.8.3E.82

$\sqrt{27}-\sqrt{75}$

Answer

$-2\sqrt{3}$

Example 13.8.3E.83

$\sqrt{72}-\sqrt{98}$

Example 13.8.3E.84

$\sqrt{48}+\sqrt{27}$

Answer

$7\sqrt{3}$

Example 13.8.3E.85

$\sqrt{45}+\sqrt{80}$

Example 13.8.3E.86

$2\sqrt{50}-3\sqrt{72}$

Answer

$-8\sqrt{2}$

Example 13.8.3E.87

$3\sqrt{98}-\sqrt{128}$

Example 13.8.3E.88

$2\sqrt{12}+3\sqrt{48}$

Answer

$16\sqrt{3}$

Example 13.8.3E.89

$4\sqrt{75}+2\sqrt{108}$

Example 13.8.3E.90

$\frac{2}{3}\sqrt{72}+\frac{1}{5}\sqrt{50}$

Answer

$5\sqrt{2}$

Example 13.8.3E.91

$\frac{2}{5}\sqrt{75}+\frac{3}{4}\sqrt{48}$

Example 13.8.3E.92

$\frac{1}{2}\sqrt{20}-\frac{2}{3}\sqrt{45}$

Answer

$-\sqrt{5}$

Example 13.8.3E.93

$\frac{2}{3}\sqrt{54}-\frac{3}{4}\sqrt{96}$

Example 13.8.3E.94

$\frac{1}{6}\sqrt{27}-\frac{3}{8}\sqrt{48}$

Answer

$-\sqrt{3}$

Example 13.8.3E.95

$\frac{1}{8}\sqrt{32}-\frac{1}{10}\sqrt{50}$

Example 13.8.3E.96

$\frac{1}{4}\sqrt{98}-\frac{1}{3}\sqrt{128}$

Answer

$-\frac{3}{4}\sqrt{2}$

Example 13.8.3E.97

$\frac{1}{3}\sqrt{24}+\frac{1}{4}\sqrt{54}$

Example 13.8.3E.98

$\sqrt{72a^5}-\sqrt{50a^5}$

Answer

$a^2\sqrt{2a}$

https://math.libretexts.org/@go/page/46321

Example 13.8.3E.99

$\sqrt{48b^5} - \sqrt{75b^5}$

Example 13.8.3E.100

$\sqrt{80c^7} - \sqrt{20c^7}$

Answer

$2c^3\sqrt{5c}$

Example 13.8.3E.101

$\sqrt{96d^9} - \sqrt{24d^9}$

Example 13.8.3E.102

$9\sqrt{80p^4} - 6\sqrt{98p^4}$

Answer

$36p^2\sqrt{5} - 42p^2\sqrt{2}$

Example 13.8.3E.103

$8\sqrt{72q^6} - 3\sqrt{75q^6}$

Example 13.8.3E.104

$2\sqrt{50r^8} + 4\sqrt{54r^8}$

Answer

$10r^4\sqrt{2} + 12r^4\sqrt{6}$

Example 13.8.3E.105

$5\sqrt{27s^6} + 2\sqrt{20s^6}$

Example 13.8.3E.106

$3\sqrt{20x^2} - 4\sqrt{45x^2} + 5x\sqrt{80}$

Answer

$14x\sqrt{5}$

Example 13.8.3E.107

$2\sqrt{28x^2} - 6\sqrt{3x^2} + 6x\sqrt{7}$

https://math.libretexts.org/@go/page/46321

Example 13.8.3E.108

$3\sqrt{128y^2}+4y\sqrt{162}-8\sqrt{98y^2}$

Answer

$-12y\sqrt{2}$

Example 13.8.3E.109

$3\sqrt{75y^2}+8y\sqrt{48}-\sqrt{300y^2}$

Mixed Practice

Example 13.8.3E.110

$2\sqrt{8}+6\sqrt{8}-5\sqrt{8}$

Answer

$3\sqrt{8}$

Example 13.8.3E.111

$\frac{2}{3}\sqrt{27}+\frac{3}{4}\sqrt{48}$

Example 13.8.3E.112

$\sqrt{175k^4}-\sqrt{63k^4}$

Answer

$2k^2\sqrt{7}$

Example 13.8.3E.113

$\frac{5}{6}\sqrt{162}+\frac{3}{16}\sqrt{128}$

Example 13.8.3E.114

$2\sqrt{363}-2\sqrt{300}$

Answer

$2\sqrt{3}$

Example 13.8.3E.115

$\sqrt{150}+4\sqrt{6}$

Example 13.8.3E.116

$9\sqrt{2}-8\sqrt{2}$

Answer

$\sqrt{2}$

Example 13.8.3E.117

$5\sqrt{x}-8\sqrt{y}$

Example 13.8.3E.118

$8\sqrt{13}-4\sqrt{13}-3\sqrt{13}$

Answer

$\sqrt{13}$

Example 13.8.3E.119

$5\sqrt{12c^4}-3\sqrt{27c^6}$

Example 13.8.3E.120

$\sqrt{80a^5}-\sqrt{45a^5}$

Answer

$a^2\sqrt{5a}$

Example 13.8.3E.121

$\frac{3}{5}\sqrt{75}-\frac{1}{4}\sqrt{48}$

Example 13.8.3E.122

$21\sqrt{19}-2\sqrt{19}$

Answer

$19\sqrt{19}$

Example 13.8.3E.123

$\sqrt{500}+\sqrt{405}$

Example 13.8.3E.124

$\frac{5}{6}\sqrt{27}+\frac{5}{8}\sqrt{48}$

Answer

$5\sqrt{3}$

Example 13.8.3E.125

$11\sqrt{11}-10\sqrt{11}$

https://math.libretexts.org/@go/page/46321

Example 13.8.3E.126

$\sqrt{75}-\sqrt{108}$

Answer

$-\sqrt{3}$

Example 13.8.3E.127

$2\sqrt{98}-4\sqrt{72}$

Example 13.8.3E.128

$4\sqrt{24x^2}-\sqrt{54x^2}+3x\sqrt{6}$

Answer

$8x\sqrt{6}$

Example 13.8.3E.129

$8\sqrt{80y^6}-6\sqrt{48y^6}$

Everyday Math

Example 13.8.3E.130

A decorator decides to use square tiles as an accent strip in the design of a new shower, but she wants to rotate the tiles to look like diamonds. She will use 9 large tiles that measure 8 inches on a side and 8 small tiles that measure 2 inches on a side. Determine the width of the accent strip by simplifying the expression $9(8\sqrt{2})+8(2\sqrt{2})$. (Round to the nearest tenth of an inch.)

Answer

124.5 inches

Example 13.8.3E.131

Suzy wants to use square tiles on the border of a spa she is installing in her backyard. She will use large tiles that have area of 12 square inches, medium tiles that have area of 8 square inches, and small tiles that have area of 4 square inches. Once section of the border will require 4 large tiles, 8 medium tiles, and 10 small tiles to cover the width of the wall. Simplify the expression $4\sqrt{12}+8\sqrt{8}+10\sqrt{4}$ to determine the width of the wall.

Writing Exercises

Example 13.8.3E.132

Explain the difference between like radicals and unlike radicals. Make sure your answer makes sense for radicals containing both numbers and variables.

Answer

Answers will vary.

? Example 13.8.3E.133

Explain the process for determining whether two radicals are like or unlike. Make sure your answer makes sense for radicals containing both numbers and variables.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add and subtract like square roots.			
add and subtract square roots that need simplification.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

13.8.4: Multiply Square Roots

Learning Objectives

By the end of this section, you will be able to:

- Multiply square roots
- Use polynomial multiplication to multiply square roots

Note

Before you get started, take this readiness quiz.

1. Simplify: (3u)(8v).
   If you missed this problem, review Example 6.2.31.
2. Simplify: 6(12−7n).
   If you missed this problem, review Example 6.3.1.
3. Simplify: (2+a)(4−a).
   If you missed this problem, review Example 6.3.34.

Multiply Square Roots

We have used the Product Property of Square Roots to simplify square roots by removing the perfect square factors. The Product Property of Square Roots says

$$\sqrt{ab} = \sqrt{a} \cdot \sqrt{b}$$

We can use the Product Property of Square Roots 'in reverse' to multiply square roots.

$$\sqrt{a} \cdot \sqrt{b} = \sqrt{ab}$$

Remember, we assume all variables are greater than or equal to zero.

We will rewrite the Product Property of Square Roots so we see both ways together.

Definition: PRODUCT PROPERTY OF SQUARE ROOTS

If a, b are nonnegative real numbers, then

$\sqrt{ab} = \sqrt{a} \cdot \sqrt{b}$ and $\sqrt{a} \cdot \sqrt{b} = \sqrt{ab}$.

So we can multiply $\sqrt{3} \cdot \sqrt{5}$ in this way:

$$\sqrt{3} \cdot \sqrt{5}$$
$$\sqrt{3 \cdot 5}$$
$$\sqrt{15}$$

Sometimes the product gives us a perfect square:

$$\sqrt{2} \cdot \sqrt{8}$$
$$\sqrt{2 \cdot 8}$$
$$\sqrt{16}$$
$$4$$

Even when the product is not a perfect square, we must look for perfect-square factors and simplify the radical whenever possible.

Multiplying radicals with coefficients is much like multiplying variables with coefficients. To multiply 4x·3y we multiply the coefficients together and then the variables. The result is 12xy. Keep this in mind as you do these examples.

Example 13.8.4.1

Simplify:

1. $\sqrt{2} \cdot \sqrt{6}$
2. $(4\sqrt{3})(2\sqrt{12})$.

Answer

1.	$\sqrt{2} \cdot \sqrt{6}$
Multiply using the Product Property.	$\sqrt{12}$
Simplify the radical.	$\sqrt{4} \cdot \sqrt{3}$
Simplify.	$2\sqrt{3}$
2.	$(4\sqrt{3})(2\sqrt{12})$
Multiply using the Product Property.	$8\sqrt{36}$
Simplify the radical.	$8 \cdot 6$
Simplify.	48

Example 13.8.4.2

Simplify:

1. $\sqrt{3} \cdot \sqrt{6}$
2. $(2\sqrt{6})(3\sqrt{12})$.

Answer

1. $3\sqrt{2}$
2. $36\sqrt{2}$

Example 13.8.4.3

Simplify:

1. $\sqrt{5} \cdot \sqrt{10}$
2. $(6\sqrt{3})(5\sqrt{6})$

Answer

1. $5\sqrt{2}$
2. $90\sqrt{2}$

Example 13.8.4.4

Simplify: $(6\sqrt{2})(3\sqrt{10})$

Answer

	$(6\sqrt{2})(3\sqrt{10})$
Multiply using the Product Property.	$18\sqrt{20}$
Simplify the radical.	$18\sqrt{4} \cdot \sqrt{5}$
Simplify.	$18 \cdot 2 \cdot \sqrt{5}$

	$36\sqrt{5}$

Example 13.8.4.5

Simplify: $(3\sqrt{2})(2\sqrt{30})$

Answer

$12\sqrt{15}$

Example 13.8.4.6

Simplify: $(3\sqrt{3})(3\sqrt{6})$.

Answer

$27\sqrt{2}$

When we have to multiply square roots, we first find the product and then remove any perfect square factors.

Example 13.8.4.7

Simplify:

1. $(\sqrt{8x^3})(\sqrt{3x})$
2. $(\sqrt{20y^2})(\sqrt{5y^3})$

Answer

1.	$(\sqrt{8x^3})(\sqrt{3x})$
Multiply using the Product Property.	$\sqrt{24x^4}$
Simplify the radical.	$\sqrt{4x^4}\cdot\sqrt{6}$
Simplify.	$2x^2\sqrt{6}$
2.	$(\sqrt{20y^2})(\sqrt{5y^3})$
Multiply using the Product Property.	$\sqrt{100y^5}$
Simplify the radical.	$10y^2\sqrt{y}$

Example 13.8.4.8

Simplify:

1. $(\sqrt{6x^3})(\sqrt{3x})$
2. $(\sqrt{2y^3})(\sqrt{50y^2})$.

Answer

1. $3x^2\sqrt{2}$
2. $10y^2\sqrt{y}$

Example 13.8.4.9

Simplify:

1. $(\sqrt{6x^5})(\sqrt{2x})$
2. $(\sqrt{12y^2})(\sqrt{3y^5})$

Answer

1. $2x^3\sqrt{3}$
2. $6y^2\sqrt{y}$

Example 13.8.4.10

Simplify: $(10\sqrt{6p^3})(3\sqrt{18p})$

Answer

	$(10\sqrt{6p^3})(3\sqrt{18p})$
Multiply.	$30\sqrt{108p^4}$
Simplify the radical.	$30\sqrt{36p^4}\cdot\sqrt{3}$
	$30\cdot 6p^2\cdot\sqrt{3}$
	$180p^2\sqrt{3}$

Example 13.8.4.11

Simplify: $(\sqrt{62x^2})(8\sqrt{45x^4})$

Answer

$144x^3\sqrt{10}$

Example 13.8.4.12

Simplify: $(2\sqrt{6y^4})(12\sqrt{30y})$.

Answer

$144y^2\sqrt{5y}$

Example 13.8.4.13

Simplify:

1. $(\sqrt{2})^2$
2. $(-\sqrt{11})^2$.

Answer

1.	$(\sqrt{2})^2$
Rewrite as a product.	$(\sqrt{2})(\sqrt{2})$
Multiply.	$\sqrt{4}$
Simplify.	2

2.	$(-\sqrt{11})^2$
Rewrite as a product.	$(-\sqrt{11})(-\sqrt{11})$
Multiply.	$\sqrt{121}$
Simplify.	11

? Example 13.8.4.14

Simplify:

1. $(\sqrt{12})^2$
2. $(-\sqrt{15})^2$.

Answer

1. 12
2. 15

? Example 13.8.4.15

Simplify:

1. $(\sqrt{16})^2$
2. $(-\sqrt{20})^2$.

Answer

1. 16
2. 20

The results of the previous example lead us to this property.

Definition: SQUARING A SQUARE ROOT

If a is a nonnegative real number, then

$(\sqrt{a})^2 = a$

By realizing that squaring and taking a square root are 'opposite' operations, we can simplify $(\sqrt{2})^2$ and get 2 right away. When we multiply the two **like square roots** in part (a) of the next example, it is the same as squaring.

? Example 13.8.4.16

Simplify:

1. $(2\sqrt{3})(8\sqrt{3})$
2. $(3\sqrt{6})^2$.

Answer

1.	$(2\sqrt{3})(8\sqrt{3})$
Multiply. Remember, $(\sqrt{3^2})$	16·3
Simplify.	48
2.	$(3\sqrt{6})^2$
Multiply.	9·6

Simplify.	54

Example 13.8.4.17

Simplify:

1. $(6\sqrt{11})(5\sqrt{11})$
2. $(5\sqrt{8})^2$.

Answer

1. 330
2. 200

Example 13.8.4.18

Simplify:

1. $(3\sqrt{7})(10\sqrt{7})$
2. $(-4\sqrt{6})^2$.

Answer

1. 210
2. 96

Use Polynomial Multiplication to Multiply Square Roots

In the next few examples, we will use the Distributive Property to multiply expressions with square roots.

We will first distribute and then simplify the square roots when possible.

Example 13.8.4.19

Simplify:

1. $3(5-\sqrt{2})$
2. $\sqrt{2}(4-\sqrt{10})$.

Answer

1.	$3(5-\sqrt{2})$
Distribute.	$15-3\sqrt{2})$
2.	$\sqrt{2}(4-\sqrt{10})$
Distribute.	$4\sqrt{2}-\sqrt{20}$
Simplify.	$4\sqrt{2}-2\sqrt{5}$

Example 13.8.4.20

Simplify:

1. $2(3-\sqrt{5})$
2. $\sqrt{3}(2-\sqrt{18})$.

Answer

1. $6-2\sqrt{5}$
2. $2\sqrt{3}-3\sqrt{6}$

Example 13.8.4.21

Simplify:

1. $6(2+\sqrt{6})$
2. $\sqrt{7}(1+\sqrt{14})$.

Answer

1. $12+\sqrt{6}$
2. $\sqrt{7}+7\sqrt{2}$

Example 13.8.4.22

Simplify:

1. $\sqrt{5}(7+2\sqrt{5})$
2. $\sqrt{6}(\sqrt{2}+\sqrt{18})$.

Answer

1.	$\sqrt{5}(7+2\sqrt{5})$
Distribute.	$7\sqrt{5}+2\cdot 5$
Simplify.	$7\sqrt{5}+10$
	$10+7\sqrt{5}$
2.	$\sqrt{6}(\sqrt{2}+\sqrt{18})$
Multiply.	$\sqrt{12}+\sqrt{108}$
Simplify.	$(\sqrt{4}\cdot\sqrt{3}+\sqrt{36}\cdot\sqrt{3})$
	$2\sqrt{3}+6\sqrt{3}$
Combine like radicals.	$8\sqrt{3}$

Example 13.8.4.23

Simplify:

1. $\sqrt{6}(1+3\sqrt{6})$
2. $\sqrt{12}(\sqrt{3}+\sqrt{24})$

Answer

1. $18+\sqrt{6}$
2. $6+12\sqrt{2}$

Example 13.8.4.24

Simplify:

1. $\sqrt{8}(2-5\sqrt{8})$
2. $\sqrt{14}(\sqrt{2}+\sqrt{42})$

Answer

1. $-40+4\sqrt{2}$
2. $2\sqrt{7}+14\sqrt{3}$

When we worked with polynomials, we multiplied binomials by binomials. Remember, this gave us four products before we combined any like terms. To be sure to get all four products, we organized our work—usually by the FOIL method.

Example 13.8.4.25

Simplify: $(2+\sqrt{3})(4-\sqrt{3})$

Answer

	$(2+\sqrt{3})(4-\sqrt{3})$
Multiply.	$8-2\sqrt{3}+4\sqrt{3}-3$
Combine like terms.	$5+2\sqrt{3}$

Example 13.8.4.26

Simplify: $(1+\sqrt{6})(3-\sqrt{6})$.

Answer

$-3+2\sqrt{6}$

Example 13.8.4.27

Simplify: $(4-\sqrt{10})(2+\sqrt{10})$.

Answer

$-2+2\sqrt{10}$

Example 13.8.4.28

Simplify: $(3-2\sqrt{7})(4-2\sqrt{7})$.

Answer

	$(3-2\sqrt{7})(4-2\sqrt{7})$
Multiply.	$12-6\sqrt{7}-8\sqrt{7}+4\cdot 7$
Simplify.	$12-6\sqrt{7}-8\sqrt{7}+28$
Combine like terms.	$40-14\sqrt{7}$

Example 13.8.4.29

Simplify: $(6-3\sqrt{7})(3+4\sqrt{7})$.

Answer

$-66+15\sqrt{7}$

Example 13.8.4.30

Simplify: $(2-3\sqrt{11})(4-\sqrt{11})$

Answer

$41+14\sqrt{11}$

Example 13.8.4.31

Simplify: $(3\sqrt{2}-\sqrt{5})(\sqrt{2}+4\sqrt{5})$.

Answer

	$3\sqrt{2}-\sqrt{5})(\sqrt{2}+4\sqrt{5})$
Multiply.	$3\cdot 2+12\sqrt{10}-\sqrt{10}-4\cdot 5$
Simplify.	$6+12\sqrt{10}-\sqrt{10}-20$
Combine like terms.	$-14+11\sqrt{10}$

Example 13.8.4.32

Simplify: $(5\sqrt{3}-\sqrt{7})(\sqrt{3}+2\sqrt{7})$

Answer

$1+9\sqrt{21}$

Example 13.8.4.33

Simplify: $(\sqrt{6}-3\sqrt{8})(2\sqrt{6}+\sqrt{8})$

Answer

$-12-20\sqrt{3}$

Example 13.8.4.34

Simplify: $(4-2\sqrt{x})(1+3\sqrt{x})$.

Answer

	$(4-2\sqrt{x})(1+3\sqrt{x})$.
Multiply.	$4+12\sqrt{x}-2\sqrt{x}-6x$
Combine like terms.	$4+10\sqrt{x}-6x$

Example 13.8.4.35

Simplify: $(6-5\sqrt{m})(2+3\sqrt{m})$.

Answer

$12+8\sqrt{m}-15m$

Example 13.8.4.36

Simplify: $(10+3\sqrt{n})(1-5\sqrt{n})$

Answer

$10-47\sqrt{n}-15n$

Note that some special products made our work easier when we multiplied binomials earlier. This is true when we multiply square roots, too. The special product formulas we used are shown below.

Definition: SPECIAL PRODUCT FORMULAS

Binomial Squares	Product of Conjugates
$(a+b)^2=a^2+2ab+b^2$	$(a-b)(a+b)=a^2-b^2$
$(a-b)^2=a^2-2ab+b^2$	

We will use the special product formulas in the next few examples. We will start with the Binomial Squares formula.

Example 13.8.4.37

Simplify:

1. $(2+\sqrt{3})^2$
2. $(4-2\sqrt{5})^2$.

Answer

Be sure to include the 2ab term when squaring a binomial.

1.

	$\overset{(a+b)^2}{(2+\sqrt{3})^2}$
Multiply using the binomial square pattern.	$\overset{a^2+2ab+b^2}{2^2+2\cdot 2\cdot\sqrt{3}+(\sqrt{3})^2}$
Simplify.	$4+4\sqrt{3}+3$
Combine like terms.	$7+4\sqrt{3}$

2.

	$\overset{(a-b)^2}{(4-2\sqrt{5})^2}$
Multiply using the binomial square pattern.	$\overset{a^2-2ab+b^2}{4^2-2\cdot 4\cdot 2\sqrt{5}+(2\sqrt{5})^2}$
Simplify.	$16-16\sqrt{5}+4\cdot 5$ $16-16\sqrt{5}+20$
Combine like terms.	$36-16\sqrt{5}$

Example 13.8.4.38

Simplify:

1. $(10+\sqrt{2})^2$
2. $(1+3\sqrt{6})^2$.

Answer

1. $102+20\sqrt{2}$
2. $55+6\sqrt{6}$

Exercise 13.8.4.39

Simplify:

1. $(6-\sqrt{5})^2$
2. $(9-2\sqrt{10})^2$.

Answer

1. $41-12\sqrt{5}$
2. $121-36\sqrt{10}$

Example 13.8.4.40

Simplify: $(1+3\sqrt{x})^2$.

Answer

	$\overset{(a+b)^2}{(1+3\sqrt{x})^2}$
Multiply using the binomial square pattern.	$\overset{a^2+2ab+b^2}{1^2+2\cdot 1\cdot 3\sqrt{x}+(3\sqrt{x})^2}$
Simplify.	$1+6\sqrt{x}+9x$

Example 13.8.4.41

Simplify: $(2+5\sqrt{m})^2$.

Answer

$4+20\sqrt{m}+25m$

Example 13.8.4.42

Simplify: $(3-4\sqrt{n})^2$.

Answer

$9-24\sqrt{n}+16n$

In the next two examples, we will find the product of conjugates.

Example 13.8.4.43

Simplify: $(4-\sqrt{2})(4+\sqrt{2})$.

Answer

	$\overset{(a-b)(a+b)}{(4-\sqrt{2})(4+\sqrt{2})}$
Multiply using the binomial square pattern.	$\overset{a^2-b^2}{4^2-(\sqrt{2})^2}$

Simplify.	$16-2$ 14

Example 13.8.4.44

Simplify: $(2-\sqrt{3})(2+\sqrt{3})$

Answer

1

ExAMPLe 13.8.4.45

Simplify: $(1+\sqrt{5})(1-\sqrt{5})$

Answer

-4

Example 13.8.4.46

Simplify: $(5-2\sqrt{3})(5+2\sqrt{3})$

Answer

	$(a-b)(a+b)$ $(5-2\sqrt{3})(5+2\sqrt{3})$
Multiply using the binomial square pattern.	a^2-b^2 $5^2-(2\sqrt{3})^2$
Simplify.	$25-4\cdot 3$ 13

Example 13.8.4.47

Simplify: $(3-2\sqrt{5})(3+2\sqrt{5})$.

Answer

-11

Example 13.8.4.48

Simplify: $(4+5\sqrt{7})(4-5\sqrt{7})$.

Answer

-159

Access these online resources for additional instruction and practice with multiplying square roots.

- Product Property
- Multiply Binomials with Square Roots

Key Concepts

- **Product Property of Square Roots** If a, b are nonnegative real numbers, then

  $\sqrt{ab}=\sqrt{a\cdot b}$ and $\sqrt{a}\cdot\sqrt{b}=\sqrt{ab}$

- **Special formulas** for multiplying binomials and conjugates:

$$(a+b)^2 = a^2 + 2ab + b^2 \qquad (a-b)(a+b) = a^2 - b^2$$
$$(a-b)^2 = a^2 - 2ab + b^2$$

- The FOIL method can be used to multiply binomials containing radicals.

13.8.4E: Exercises

Practice Makes Perfect

Multiply Square Roots

In the following exercises, simplify.

Example 13.8.4E.48

1. $\sqrt{2} \cdot \sqrt{8}$
2. $(3\sqrt{3})(2\sqrt{18})$

Answer

1. 44
2. $18\sqrt{6}$

Example 13.8.4E.49

1. $\sqrt{6} \cdot \sqrt{6}$
2. $(3\sqrt{2})(2\sqrt{32})$

Example 13.8.4E.50

1. $\sqrt{7} \cdot \sqrt{14}$
2. $(4\sqrt{8})(5\sqrt{8})$

Answer

1. $7\sqrt{2}$
2. 160

Example 13.8.4E.51

1. $\sqrt{6} \cdot \sqrt{12}$
2. $(2\sqrt{5})(2\sqrt{10})$

Example 13.8.4E.52

$(5\sqrt{2})(3\sqrt{6})$

Answer

$30\sqrt{3}$

Example 13.8.4E.53

$(2\sqrt{3})(4\sqrt{6})$

Example 13.8.4E.54

$(-2\sqrt{3})(3\sqrt{18})$

Answer

$-18\sqrt{6}$

Example 13.8.4E.55

$(-4\sqrt{5})(5\sqrt{10})$

Example 13.8.4E.56

$(5\sqrt{6})(-\sqrt{12})$

Answer

$-30\sqrt{2}$

Example 13.8.4E.57

$(6\sqrt{2})(-\sqrt{10})$

Example 13.8.4E.58

$(-2\sqrt{7})(-2\sqrt{14})$

Answer

$28\sqrt{2}$

Example 13.8.4E.59

$(-2\sqrt{11})(-4\sqrt{22})$

Example 13.8.4E.60

1. $(\sqrt{15y})(\sqrt{5y^3})$
2. $(\sqrt{2n^2})(\sqrt{18n^3})$

Answer

1. $5y^2\sqrt{3}$
2. $6n^2\sqrt{n}$

Example 13.8.4E.61

1. $(\sqrt{14x^3})(\sqrt{7x^3})$
2. $(\sqrt{3q^2})(\sqrt{48q^3})$

Example 13.8.4E.62

1. $(\sqrt{16y^2})(\sqrt{8y^4})$
2. $(\sqrt{11s^6})(\sqrt{11s})$

Answer

1. $8y^3\sqrt{2}$
2. $11s^3\sqrt{s}$

Example 13.8.4E.63

ⓐ $(\sqrt{8x^3})(\sqrt{3x})$
ⓑ $(\sqrt{7r})(\sqrt{7r^8})$

Example 13.8.4E.64

$(2\sqrt{5b^3})(4\sqrt{15b})$

Answer

$40b^2\sqrt{3}$

Example 13.8.4E.65

$(\sqrt{38c^5})(\sqrt{26c^3})$

Example 13.8.4E.66

$(6\sqrt{3d^3})(4\sqrt{12d^5})$

Answer

$144d^4$

Example 13.8.4E.67

$(2\sqrt{5b^3})(4\sqrt{15b})$

Example 13.8.4E.68

$(2\sqrt{5d^6})(3\sqrt{20d^2})$

Answer

$60d^4$

Example 13.8.4E.69

$(-2\sqrt{7z^3})(3\sqrt{14z^8})$

Example 13.8.4E.70

$(4\sqrt{2k^5})(-3\sqrt{32k^6})$

Answer

$-96k^5\sqrt{k}$

Example 13.8.4E.71

1. $(\sqrt{7})^2$
2. $(-\sqrt{15})^2$

https://math.libretexts.org/@go/page/46323

Example 13.8.4E.72

1. $(\sqrt{11})^2$
2. $(-\sqrt{21})^2$

Answer

1. 11
2. 21

Example 13.8.4E.73

1. $(\sqrt{19})^2$
2. $(-\sqrt{5})^2$

Exercise 13.8.4E.74

1. $(\sqrt{23})^2$
2. $(-\sqrt{3})^2$

Answer

1. 23
2. 3

Example 13.8.4E.75

1. $(4\sqrt{11})(-3\sqrt{11})$
2. $(5\sqrt{3})^2$

Example 13.8.4E.76

1. $(2\sqrt{13})(-9\sqrt{13})$
2. $(6\sqrt{5})^2$

Answer

1. -234
2. 180

Example 13.8.4E.77

1. $(-3\sqrt{12})(-2\sqrt{6})$
2. $(-4\sqrt{10})^2$

Example 13.8.4E.78

1. $(-7\sqrt{5})(-3\sqrt{10})$
2. $(-2\sqrt{14})^2$

Answer

1. $105\sqrt{2}$
2. 56

Use Polynomial Multiplication to Multiply Square Roots

In the following exercises, simplify.

Example 13.8.4E.79

1. $3(4-\sqrt{3})$
2. $\sqrt{2}(4-\sqrt{6})$

Example 13.8.4E.80

1. $4(6-\sqrt{11})$
2. $\sqrt{2}(5-\sqrt{12})$

Answer

1. $24-4\sqrt{11}$
2. $5\sqrt{2}-2\sqrt{6}$

Example 13.8.4E.81

1. $5(3-\sqrt{7})$
2. $\sqrt{3}(4-\sqrt{15})$

Example 13.8.4E.82

1. $7(-2-\sqrt{11})$
2. $\sqrt{7}(6-\sqrt{14})$

Answer

1. $-14-7\sqrt{11}$
2. $6\sqrt{7}-7\sqrt{2}$

Example 13.8.4E.83

1. $\sqrt{7}(5+2\sqrt{7})$
2. $\sqrt{5}(\sqrt{10}+\sqrt{18})$

Example 13.8.4E.84

1. $\sqrt{11}(8+4\sqrt{11})$
2. $\sqrt{3}(\sqrt{12}+\sqrt{27})$

Answer

1. $44+8\sqrt{11}$
2. 15

Example 13.8.4E.85

1. $\sqrt{11}(-3+4\sqrt{1})$
2. $\sqrt{3}(\sqrt{15}-\sqrt{18})$

Example 13.8.4E.86

1. $\sqrt{2}(-5+9\sqrt{2})$
2. $\sqrt{7}(\sqrt{3}-\sqrt{21})$

Answer

1. $18-5\sqrt{2}$

2. $\sqrt{21}-7\sqrt{3}$

Example 13.8.4E.87

$(8+\sqrt{3})(2-\sqrt{3})$

Example 13.8.4E.88

$(7+\sqrt{3})(9-\sqrt{3})$

Answer

$60+2\sqrt{3}$

Example 13.8.4E.89

$(8-\sqrt{2})(3+\sqrt{2})$

Example 13.8.4E.90

$(9-\sqrt{2})(6+\sqrt{2})$

Answer

$52+3\sqrt{2}$

Example 13.8.4E.91

$(3-\sqrt{7})(5-\sqrt{7})$

Example 13.8.4E.92

$(5-\sqrt{7})(4-\sqrt{7})$

Answer

$27-9\sqrt{7}$

Example 13.8.4E.93

$(1+3\sqrt{10})(5-2\sqrt{10})$

Exercise 13.8.4E.94

$(7-2\sqrt{5})(4+9\sqrt{5})$

Answer

$-62+55\sqrt{5}$

Example 13.8.4E.95

$(\sqrt{3}+\sqrt{10})(\sqrt{3}+2\sqrt{10})$

Example 13.8.4E.96

$(\sqrt{11}+\sqrt{5})(\sqrt{11}+6\sqrt{5})$

Answer

$41+7\sqrt{55}$

Example 13.8.4E.97

$(2\sqrt{7}-5\sqrt{11})(4\sqrt{7}+9\sqrt{11})$

Example 13.8.4E.98

$(4\sqrt{6}+7\sqrt{13})(8\sqrt{6}-3\sqrt{13})$

Answer

$-81+44\sqrt{78}$

Example 13.8.4E.99

$(5-\sqrt{u})(3+\sqrt{u})$

Example 13.8.4E.100

$(9-\sqrt{w})(2+\sqrt{w})$

Answer

$18+7\sqrt{w}$

Example 13.8.4E.101

$(7+2\sqrt{m})(4+9\sqrt{m})$

Example 13.8.4E.102

$(6+5\sqrt{n})(11+3\sqrt{n})$

Answer

$66+73\sqrt{n}+15n$

Example 13.8.4E.103

1. $(3+\sqrt{5})^2$
2. $(2-5\sqrt{3})^2$

Example 13.8.4E.104

1. $(4+\sqrt{11})^2$
2. $(3-2\sqrt{5})^2$

Answer

1. $27+8\sqrt{11}$

2. $29-12\sqrt{5}$

Example 13.8.4E.105

1. $(9-\sqrt{6})^2$
2. $(10+3\sqrt{7})^2$

Example 13.8.4E.106

1. $(5-\sqrt{10})^2$
2. $(8+3\sqrt{2})^2$

Answer

1. $35-10\sqrt{10}$
2. $82+48\sqrt{2}$

Example 13.8.4E.107

$(3-\sqrt{5})(3+\sqrt{5})$

Example 13.8.4E.108

$(10-\sqrt{3})(10+\sqrt{3})$

Answer

97

Example 13.8.4E.109

$(4+\sqrt{2})(4-\sqrt{2})$

Example 13.8.4E.110

$(7+\sqrt{10})(7-\sqrt{10})$

Answer

39

Example 13.8.4E.111

$(4+9\sqrt{3})(4-9\sqrt{3})$

Example 13.8.4E.112

$(1+8\sqrt{2})(1-8\sqrt{2})$

Answer

-127

Example 13.8.4E.113

$(12-5\sqrt{5})(12+5\sqrt{5})$

Example 13.8.4E.114

$(9-4\sqrt{3})(9+4\sqrt{3})$

Answer

33

Mixed Practice

In the following exercises, simplify.

Example 13.8.4E.115

$\sqrt{3}\cdot\sqrt{21}$

Example 13.8.4E.116

$(4\sqrt{6})(-\sqrt{18})$

Answer

$-24\sqrt{3}$

Example 13.8.4E.117

$(-5+\sqrt{7})(6+\sqrt{21})$

Example 13.8.4E.118

$(-5\sqrt{7})(6\sqrt{21})$

Answer

$-210\sqrt{3}$

Example 13.8.4E.119

$(-4\sqrt{2})(2\sqrt{18})$

Example 13.8.4E.120

$(\sqrt{35y^3})(\sqrt{7y^3})$

Answer

$7y^3\sqrt{5}$

Example 13.8.4E.121

$(4\sqrt{12x^5})(2\sqrt{6x^3})$

https://math.libretexts.org/@go/page/46323

Example 13.8.4E.122

$(\sqrt{29})^2$

Answer

29

Example 13.8.4E.123

$(-4\sqrt{17})(-3\sqrt{17})$

Example 13.8.4E.124

$(-4+\sqrt{17})(-3+\sqrt{17})$

Answer

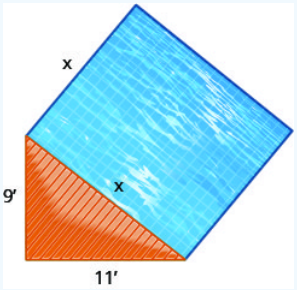
$29-7\sqrt{17}$

Everyday Math

Example 13.8.4E.125

A landscaper wants to put a square reflecting pool next to a triangular deck, as shown below. The triangular deck is a right triangle, with legs of length 9 feet and 11 feet, and the pool will be adjacent to the hypotenuse.

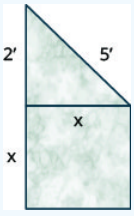
1. Use the Pythagorean Theorem to find the length of a side of the pool. Round your answer to the nearest tenth of a foot.
2. Find the exact area of the pool.



Example 13.8.4E.126

An artist wants to make a small monument in the shape of a square base topped by a right triangle, as shown below. The square base will be adjacent to one leg of the triangle. The other leg of the triangle will measure 2 feet and the hypotenuse will be 5 feet.

1. Use the Pythagorean Theorem to find the length of a side of the square base. Round your answer to the nearest tenth of a foot.



2. Find the exact area of the face of the square base.

Answer

1. 4.6feet
2. 21 sq. feet

Example 13.8.4E.127

A square garden will be made with a stone border on one edge. If only $3+\sqrt{10}$ feet of stone are available, simplify $(3+\sqrt{10})^2$ to determine the area of the largest such garden.

Example 13.8.4E.128

A garden will be made so as to contain two square sections, one section with side length $\sqrt{5}+\sqrt{6}$ yards and one section with side length $\sqrt{2}+\sqrt{3}$ yards. Simplify $(\sqrt{5}+\sqrt{6})(\sqrt{2}+\sqrt{3})$ to determine the total area of the garden.

Example 13.8.4E.129

Suppose a third section will be added to the garden in the previous exercise. The third section is to have a width of $\sqrt{432}$ feet. Write an expression that gives the total area of the garden.

Writing Exercises

Example 13.8.4E.130

1. Explain why $(-\sqrt{n})^2$ is always positive, for $n \geq 0$.
2. Explain why $-(\sqrt{n})^2$ is always negative, for $n \geq 0$.

Answer

1. when squaring a negative, it becomes a positive
2. since the negative is not included in the parenthesis, it is not squared, and remains negative

Example 13.8.4E.131

Use the binomial square pattern to simplify $(3+\sqrt{2})^2$. Explain all your steps.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
multiply square roots.			
use polynomial multiplication to multiply square roots.			

ⓑ On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.8.5: Divide Square Roots

Learning Objectives

By the end of this section, you will be able to:

- Divide square roots
- Rationalize a one-term denominator
- Rationalize a two-term denominator

Note

Before you get started, take this readiness quiz.

1. Find a fraction equivalent to $\frac{5}{8}$ with denominator 48.
   If you missed this problem, review Exercise 1.6.1.
2. Simplify: $(\sqrt{5})^2$.
   If you missed this problem, review Example 9.4.13.
3. Multiply: (7+3x)(7−3x).
   If you missed this problem, review Exercise 6.4.22.

Divide Square Roots

We know that we simplify fractions by removing factors common to the numerator and the denominator. When we have a fraction with a square root in the numerator, we first simplify the square root. Then we can look for common factors.

Common Factors	No common factors
$\frac{3\sqrt{2}}{3 \cdot 5}$	$\frac{2\sqrt{3}}{3 \cdot 5}$

Example 13.8.5.1

Simplify: $\frac{\sqrt{54}}{6}$

Answer

	$\frac{\sqrt{54}}{6}$
Simplify the radical.	$\frac{\sqrt{9} \cdot \sqrt{6}}{6}$
Simplify.	$\frac{3\sqrt{6}}{6}$
Remove the common factors.	$\frac{3\sqrt{6}}{3 \cdot 2}$
Simplify.	$\frac{\sqrt{6}}{2}$

Example 13.8.5.2

Simplify: $\frac{\sqrt{32}}{8}$.

Answer

$\frac{\sqrt{2}}{2}$

Example 13.8.5.3

Simplify: $\frac{\sqrt{75}}{15}$.

Answer

$\frac{\sqrt{3}}{3}$

Example 13.8.5.4

Simplify: $\frac{6-\sqrt{24}}{12}$.

Answer

	$\frac{6-\sqrt{24}}{12}$
Simplify the radical.	$\frac{6-\sqrt{4}\cdot\sqrt{6}}{12}$
Simplify.	$\frac{6-2\sqrt{6}}{12}$
Factor the common factor from the numerator.	$\frac{2(3-\sqrt{6})}{12}$
Remove the common factors.	$\frac{2(3-\sqrt{6})}{2\cdot 6}$
Simplify.	$\frac{3-\sqrt{6}}{6}$

Example 13.8.5.5

Simplify: $\frac{8-\sqrt{40}}{10}$.

Answer

$\frac{4-\sqrt{10}}{5}$

Example 13.8.5.6

Simplify: $\frac{10-\sqrt{75}}{20}$.

Answer

$\frac{5-\sqrt{3}}{4}$

We have used the Quotient Property of Square Roots to simplify square roots of fractions. The Quotient Property of Square Roots says

$$\sqrt{\frac{a}{b}}=\frac{\sqrt{a}}{\sqrt{b}}, b\neq 0.$$

Sometimes we will need to use the Quotient Property of Square Roots 'in reverse' to simplify a fraction with square roots.

$$\frac{\sqrt{a}}{\sqrt{b}}=\sqrt{\frac{a}{b}}, b\neq 0.$$

We will rewrite the Quotient Property of Square Roots so we see both ways together. Remember: we assume all variables are greater than or equal to zero so that their square roots are real numbers.

Definition: QUOTIENT PROPERTY OF SQUARE ROOTS

If a, b are non-negative real numbers and $b \neq 0$, then

$\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$ and $\frac{\sqrt{a}}{\sqrt{b}} = \sqrt{\frac{a}{b}}$

We will use the Quotient Property of Square Roots 'in reverse' when the fraction we start with is the quotient of two square roots, and neither radicand is a perfect square. When we write the fraction in a single square root, we may find common factors in the numerator and denominator.

Example 13.8.5.7

Simplify: $\frac{\sqrt{27}}{\sqrt{75}}$

Answer

	$\frac{\sqrt{27}}{\sqrt{75}}$
Neither radicand is a perfect square, so rewrite using the quotient property of square root.	$\sqrt{\frac{27}{75}}$
Remove common factors in the numerator and denominator.	$\sqrt{\frac{9}{25}}$
Simplify.	$\frac{3}{5}$

Example 13.8.5.8

Simplify: $\frac{\sqrt{48}}{\sqrt{108}}$

Answer

$\frac{2}{3}$

Example 13.8.5.9

Simplify: $\frac{\sqrt{96}}{\sqrt{54}}$

Answer

$\frac{4}{3}$

We will use the Quotient Property for Exponents, $\frac{a^m}{a^n} = a^{m-n}$, when we have variables with exponents in the radicands.

Example 13.8.5.10

Simplify: $\frac{\sqrt{6y^5}}{\sqrt{2y}}$

Answer

	$\frac{\sqrt{6y^5}}{\sqrt{2y}}$
Neither radicand is a perfect square, so rewrite using the quotient property of square root.	$\sqrt{\frac{6y^5}{2y}}$

Remove common factors in the numerator and denominator.	$\sqrt{3y^4}$
Simplify.	$y^2\sqrt{3}$

Example 13.8.5.11

Simplify: $\frac{\sqrt{12r^3}}{\sqrt{6r}}$.

Answer

$r\sqrt{2}$

Example 13.8.5.12

Simplify: $\frac{\sqrt{14p^9}}{\sqrt{2p^5}}$

Answer

$p^2\sqrt{7}$

Example 13.8.5.13

Simplify: $\frac{\sqrt{72x^3}}{\sqrt{162x}}$

Answer

	$\frac{\sqrt{72x^3}}{\sqrt{162x}}$
Rewrite using the quotient property of square roots.	$\sqrt{\frac{72x^3}{162x}}$
Remove common factors.	$\sqrt{\frac{18\cdot4\cdot x^2\cdot x}{18\cdot9\cdot x}}$
Simplify.	$\sqrt{\frac{4x^2}{9}}$
Simplify the radical.	$\frac{2x}{3}$

ExAMPLe 13.8.5.14

Simplify: $\frac{\sqrt{50s^3}}{\sqrt{128s}}$.

Answer

$\frac{5s}{8}$

Example 13.8.5.15

Simplify: $\frac{\sqrt{75q^5}}{\sqrt{108q}}$.

Answer

$\frac{5q^2}{6}$

Example 13.8.5.16

Simplify: $\frac{\sqrt{147ab^8}}{\sqrt{3a^3b^4}}$.

Answer

	$\frac{\sqrt{147ab^8}}{\sqrt{3a^3b^4}}$
Rewrite using the quotient property of square roots.	$\sqrt{\frac{147ab^8}{3a^3b^4}}$
Remove common factors.	\(\sqrt{\frac{49b^4}{a^2}}\
Simplify the radical.	$\frac{7b^2}{a}$

Example 13.8.5.17

Simplify: $\frac{\sqrt{162x^{10}y^2}}{\sqrt{2x^6y^6}}$.

Answer

$\frac{9x^2}{y^2}$

Example 13.8.5.18

Simplify: $\frac{\sqrt{300m^3n^7}}{\sqrt{3m^5n}}$.

Answer

$\frac{10n^3}{m}$

Rationalize a One Term Denominator

Before the calculator became a tool of everyday life, tables of square roots were used to find approximate values of square roots. Figure shows a portion of a table of squares and square roots. Square roots are approximated to five decimal places in this table.

n	n^2	$\sqrt{n}$
200	40,000	14.14214
201	40,401	14.17745
202	40,804	14.21267
203	41,209	14.24781
204	41,616	14.28286
205	42,025	14.31782
206	42,436	14.35270
207	42,849	14.38749
208	43,264	14.42221
209	43,681	14.45683
210	44,100	14.49138

A table of square roots was used to find approximate values of square roots before there were calculators.

If someone needed to approximate a fraction with a square root in the denominator, it meant doing long division with a five decimal-place divisor. This was a very cumbersome process.

For this reason, a process called rationalizing the denominator was developed. A fraction with a radical in the denominator is converted to an equivalent fraction whose denominator is an integer. This process is still used today and is useful in other areas of mathematics, too.

Definition: RATIONALIZING THE DENOMINATOR

The process of converting a fraction with a radical in the denominator to an equivalent fraction whose denominator is an integer is called **rationalizing the denominator**.

Square roots of numbers that are not perfect squares are irrational numbers. When we **rationalize the denominator**, we write an equivalent fraction with a rational number in the denominator.

Let's look at a numerical example.

Suppose we need an approximate value for the fraction.	$\frac{1}{\sqrt{2}}$
A five decimal place approximation to $\sqrt{2}$ is 1.41421	$\frac{1}{1.41421}$
Without a calculator, would you want to do this division?	$1.41421\overline{)1.0}$

But we can find a fraction equivalent to $\frac{1}{\sqrt{2}}$ by multiplying the numerator and denominator by $\sqrt{2}$.

$$\frac{1}{\sqrt{2}}$$
$$\frac{1 \cdot \sqrt{2}}{\sqrt{2} \cdot \sqrt{2}}$$
$$\frac{\sqrt{2}}{2}$$

Now if we need an approximate value, we divide $2\overline{)1.41421}$. This is much easier.

Even though we have calculators available nearly everywhere, a fraction with a radical in the denominator still must be rationalized. It is not considered simplified if the denominator contains a square root.

Similarly, a square root is not considered simplified if the radicand contains a fraction.

Definition: SIMPLIFIED SQUARE ROOTS

A square root is considered simplified if there are

- no perfect-square factors in the radicand
- no fractions in the radicand
- no square roots in the denominator of a fraction

To rationalize a denominator, we use the property that $(\sqrt{a})^2 = a$. If we square an irrational square root, we get a rational number.

We will use this property to rationalize the denominator in the next example.

Example 13.8.5.19

Simplify: $\frac{4}{\sqrt{3}}$.

Answer

To remove the square root from the denominator, we multiply it by itself. To keep the fractions equivalent, we multiply both the numerator and denominator by the same factor.

	$\frac{4}{\sqrt{3}}$
Multiply both the numerator and denominator by $\sqrt{3}$	$\frac{4 \cdot \sqrt{3}}{\sqrt{3} \cdot \sqrt{3}}$
Simplify.	$\frac{4\sqrt{3}}{3}$

Example 13.8.5.20

Simplify: $\frac{5}{\sqrt{3}}$.

Answer

$\frac{5\sqrt{3}}{3}$

Example 13.8.5.21

Simplify: $\frac{6}{\sqrt{5}}$.

Answer

$\frac{6\sqrt{5}}{5}$

Example 13.8.5.22

Simplify: $-\frac{8}{3\sqrt{6}}$

Answer

To remove the square root from the denominator, we multiply it by itself. To keep the fractions equivalent, we multiply both the numerator and denominator by $\sqrt{6}$.

	$-\frac{8}{3\sqrt{6}}$
Multiply both the numerator and the denominator by $\sqrt{6}$.	$-\frac{8 \cdot \sqrt{6}}{3\sqrt{6} \cdot \sqrt{6}}$
Simplify.	$-\frac{8\sqrt{6}}{3 \cdot 6}$
Remove common factors.	$-\frac{4 \cdot \cancel{2}\sqrt{6}}{3 \cdot \cancel{2} \cdot 3}$
Simplify.	$-\frac{4\sqrt{6}}{9}$

Example 13.8.5.23

Simplify: $\frac{5}{2\sqrt{5}}$.

Answer

$\frac{\sqrt{5}}{2}$

Example 13.8.5.24

Simplify: $-\frac{9}{4\sqrt{3}}$.

Answer

$-\frac{3\sqrt{3}}{4}$

Always simplify the radical in the denominator first, before you rationalize it. This way the numbers stay smaller and easier to work with.

Example 13.8.5.25

Simplify: $\sqrt{\frac{5}{12}}$.

Answer

	$\sqrt{\frac{5}{12}}$
The fraction is not a perfect square, so rewrite using the Quotient Property.	$\frac{\sqrt{5}}{\sqrt{12}}$
Simplify the denominator.	$\frac{\sqrt{5}}{2\sqrt{3}}$
Rationalize the denominator.	$\frac{\sqrt{5}\cdot\sqrt{3}}{2\sqrt{3}\cdot\sqrt{3}}$
Simplify.	$\frac{\sqrt{15}}{2\cdot 3}$
Simplify.	$\frac{\sqrt{15}}{6}$

Example 13.8.5.26

Simplify: $\sqrt{\frac{7}{18}}$.

Answer

$\frac{\sqrt{14}}{6}$

Example 13.8.5.27

Simplify: $\sqrt{\frac{3}{32}}$.

Answer

$\frac{\sqrt{6}}{8}$

Example 13.8.5.28

Simplify: $\sqrt{\frac{11}{28}}$

Answer

	$\sqrt{\frac{11}{28}}$
Rewrite using the Quotient Property.	$\frac{\sqrt{11}}{\sqrt{28}}$
Simplify the denominator.	$\frac{\sqrt{11}}{2\sqrt{7}}$

Rationalize the denominator.	$\frac{\sqrt{11}\cdot\sqrt{7}}{2\sqrt{7}\cdot\sqrt{7}}$
Simplify.	$\frac{\sqrt{77}}{2\cdot 7}$
Simplify.	$\frac{\sqrt{77}}{14}$

Example 13.8.5.29

Simplify: $\sqrt{\frac{3}{27}}$.

Answer

$\frac{1}{3}$

Example 13.8.5.30

Simplify: $\sqrt{\frac{10}{50}}$

Answer

$\frac{\sqrt{5}}{5}$

Rationalize a Two-Term Denominator

When the denominator of a fraction is a sum or difference with square roots, we use the Product of Conjugates pattern to rationalize the denominator.

$$\begin{array}{ll} (a-b)(a+b) & (2-\sqrt{5})(2+\sqrt{5}) \\ a^2-b^2 & 2^2-(\sqrt{5})^2 \\ & 4-5 \\ & -1 \end{array}$$

When we multiply a binomial that includes a square root by its conjugate, the product has no square roots.

Example 13.8.5.31

Simplify: $\frac{4}{4+\sqrt{2}}$.

Answer

	$\frac{4}{4+\sqrt{2}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{4(4-\sqrt{2})}{(4+\sqrt{2})(4-\sqrt{2})}$
Multiply the conjugates in the denominator.	$\frac{4(4-\sqrt{2})}{4^2-(\sqrt{2})^2}$
Simplify the denominator.	$\frac{4(4-\sqrt{2})}{16-2}$
Simplify the denominator.	$\frac{4(4-\sqrt{2})}{14}$

Remove common factors from the numerator and denominator.	$\frac{2(4-\sqrt{2})}{7}$
We leave the numerator in factored form to make it easier to look for common factors after we have simplified the denominator.	

Example 13.8.5.32

Simplify: $\frac{2}{2+\sqrt{3}}$.

Answer

$\frac{2(2-\sqrt{3})}{1}$

Example 13.8.5.33

Simplify: $\frac{5}{5+\sqrt{3}}$.

Answer

$\frac{5(5-\sqrt{3})}{22}$

Example 13.8.5.34

Simplify: $\frac{5}{2-\sqrt{3}}$.

Answer

	$\frac{5}{2-\sqrt{3}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{5(2+\sqrt{3})}{(2-\sqrt{3})(2+\sqrt{3})}$
Multiply the conjugates in the denominator.	$\frac{5(2+\sqrt{3})}{2^2-(\sqrt{3})^2}$
Simplify the denominator.	$\frac{5(2+\sqrt{3})}{4-3}$
Simplify the denominator.	$\frac{5(2+\sqrt{3})}{1}$
Simplify.	$5(2+\sqrt{3})$

Example 13.8.5.35

Simplify: $\frac{3}{1-\sqrt{5}}$.

Answer

$-\frac{3(1+\sqrt{5})}{4}$

Example 13.8.5.36

Simplify: $\frac{2}{4-\sqrt{6}}$.

Answer

$\frac{4+\sqrt{6}}{5}$

Example 13.8.5.37

Simplify: $\frac{\sqrt{3}}{\sqrt{u}-\sqrt{6}}$.

Answer

	$\frac{\sqrt{3}}{\sqrt{u}-\sqrt{6}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{\sqrt{3}(\sqrt{u}+\sqrt{6})}{(\sqrt{u}-\sqrt{6})(\sqrt{u}+\sqrt{6})}$
Multiply the conjugates in the denominator.	$\frac{\sqrt{3}(\sqrt{u}+\sqrt{6})}{(\sqrt{u})^2-(\sqrt{6})^2}$
Simplify the denominator.	$\frac{\sqrt{3}(\sqrt{u}+\sqrt{6})}{u-6}$

Example 13.8.5.38

Simplify: $\frac{\sqrt{5}}{\sqrt{x}+\sqrt{2}}$.

Answer

$\frac{\sqrt{5}(\sqrt{x}-\sqrt{2})}{x-2}$

Example 13.8.5.39

Simplify: $\frac{\sqrt{10}}{\sqrt{y}-\sqrt{3}}$.

Answer

$\frac{\sqrt{10}(\sqrt{y}+\sqrt{3})}{y-3}$

Example 13.8.5.40

Simplify: $\frac{\sqrt{x}+\sqrt{7}}{\sqrt{x}-\sqrt{7}}$.

Answer

	$\frac{\sqrt{x}+\sqrt{7}}{\sqrt{x}-\sqrt{7}}$
Multiply the numerator and denominator by the conjugate of the denominator.	$\frac{(\sqrt{x}+\sqrt{7})(\sqrt{x}+\sqrt{7})}{(\sqrt{x}-\sqrt{7})(\sqrt{x}+\sqrt{7})}$

Multiply the conjugates in the denominator.	$\frac{(\sqrt{x}+\sqrt{7})(\sqrt{x}+\sqrt{7})}{(\sqrt{x})^2-(\sqrt{7})^2}$
Simplify the denominator.	$\frac{(\sqrt{x}+\sqrt{7})^2}{x-7}$
We do not square the numerator. In factored form, we can see there are no common factors to remove from the numerator and denominator.	

Example 13.8.5.41

Simplify: $\frac{\sqrt{p}+\sqrt{2}}{\sqrt{p}-\sqrt{2}}$.

Answer

$\frac{(\sqrt{p}+\sqrt{2})^2}{p-2}$

Example 13.8.5.42

Simplify: $\frac{\sqrt{q}-\sqrt{10}}{\sqrt{q}+\sqrt{10}}$.

Answer

$\frac{(\sqrt{q}-\sqrt{10})^2}{q-10}$

Access this online resource for additional instruction and practice with dividing and rationalizing.

- Dividing and Rationalizing

Key Concepts

- **Quotient Property of Square Roots**
  - If a, b are non-negative real numbers and $b \neq 0$, then

    $\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}$ and $\frac{\sqrt{a}}{\sqrt{b}} = \sqrt{\frac{a}{b}}$
- **Simplified Square Roots**
  A square root is considered simplified if there are
  - no perfect square factors in the radicand
  - no fractions in the radicand
  - no square roots in the denominator of a fraction

Glossary

rationalizing the denominator

The process of converting a fraction with a radical in the denominator to an equivalent fraction whose denominator is an integer is called rationalizing the denominator.

13.8.6: Solve Equations with Square Roots

Learning Objectives

By the end of this section, you will be able to:

- Solve radical equations
- Use square roots in applications

Note

Before you get started, take this readiness quiz.

1. Simplify: ⓐ $\sqrt{9}$ ⓑ 9^2.
   If you missed this problem, review Example 9.1.1 and Exercise 1.3.22.
2. Solve: 5(x+1)−4=3(2x−7).
   If you missed this problem, review Exercise 2.4.16.
3. Solve: $n^2 - 6n + 8 = 0$.
   If you missed this problem, review Exercise 7.6.13.

Solve Radical Equations

In this section we will solve equations that have the variable in the radicand of a square root. Equations of this type are called radical equations.

Definition: RADICAL EQUATION

An equation in which the variable is in the radicand of a square root is called a **radical equation**.

As usual, in solving these equations, what we do to one side of an equation we must do to the other side as well. Since squaring a quantity and taking a square root are 'opposite' operations, we will square both sides in order to remove the radical sign and solve for the variable inside.

But remember that when we write $\sqrt{a}$ we mean the principal square root. So $\sqrt{a} \geq 0$ always. When we solve radical equations by squaring both sides we may get an algebraic solution that would make $\sqrt{a}$ negative. This algebraic solution would not be a solution to the original **radical equation**; it is an *extraneous solution.* We saw extraneous solutions when we solved rational equations, too.

Example 13.8.6.1

For the equation $\sqrt{x+2} = x$:

1. Is x=2 a solution?
2. Is x=−1 a solution?

Answer

1. Is x=2 a solution?

	$\sqrt{x+2} = x$
Let x = 2.	$\sqrt{2+2} \stackrel{?}{=} 2$
Simplify.	$\sqrt{4} \stackrel{?}{=} 2$
	$2 = 2$ ✓
	2 is a solution.

2. Is x=−1 a solution?

	$\sqrt{x+2}=x$
Let $x=-1$.	$\sqrt{-1+2}\stackrel{?}{=}-1$
Simplify.	$\sqrt{1}\stackrel{?}{=}-1$
	$1\neq -1$
	-1 is not a solution.
	-1 is an extraneous solution to the equation.

Example 13.8.6.2

For the equation $\sqrt{x+6}=x$:

1. Is x=−2 a solution?
2. Is x=3 a solution?

Answer

1. no
2. yes

Example 13.8.6.3

For the equation $\sqrt{-x+2}=x$:

1. Is x=−2 a solution?
2. Is x=1 a solution?

Answer

1. no
2. yes

Now we will see how to solve a radical equation. Our strategy is based on the relation between taking a square root and squaring.

For$a\geq 0$, $(\sqrt{a})^2=a$

How to Solve Radical Equations

Example 13.8.6.4

Solve: $\sqrt{2x-1}=7$

Answer

Step 1. Isolate the radical on one side of the equation.	$\sqrt{2x-1}$ is already isolated on the left side.	$\sqrt{2x-1}=7$
Step 2. Square both sides of the equation.	Remember, $(\sqrt{a})^2=a$	$(\sqrt{2x-1})^2=(7)^2$

Step 3. Solve the new equation.		$2x-1=49$ $2x=50$ $x=25$
Step 4. Check the answer.		Check: $\sqrt{2x-1}=7$ $\sqrt{2(25)-1}\stackrel{?}{=}7$ $\sqrt{50-1}\stackrel{?}{=}7$ $\sqrt{49}\stackrel{?}{=}7$ $7=7$ ✓ The solution is $x=25$.

Example 13.8.6.5

Solve: $\sqrt{3x-5}=5$.

Answer

10

Example 13.8.6.6

Solve: $\sqrt{4x+8}=6$.

Answer

7

Definition: SOLVE A RADICAL EQUATION.

1. Isolate the radical on one side of the equation.
2. Square both sides of the equation.
3. Solve the new equation.
4. Check the answer.

Example 13.8.6.7

Solve: $\sqrt{5n-4}-9=0$.

Answer

	$\sqrt{5n-4}-9=0$
To isolate the radical, add 9 to both sides.	$\sqrt{5n-4}-9+9=0+9$
Simplify.	$\sqrt{5n-4}=9$
Square both sides of the equation.	$(\sqrt{5n-4})^2=(9)^2$
Solve the new equation.	$5n-4=81$
	$5n=85$
	$n=17$

Check the answer. $\sqrt{5n-4}-9=0$ $\sqrt{5(17)-4}-9\stackrel{?}{=}0$ $\sqrt{85-4}-9\stackrel{?}{=}0$ $\sqrt{81}-9\stackrel{?}{=}0$ $9-9\stackrel{?}{=}0$ $0=0$ ✓	
	The solution is $n = 17$.

Example 13.8.6.8

Solve: $\sqrt{3m+2}-5=0$.

Answer

$\frac{23}{3}$

Example 13.8.6.9

Solve: $\sqrt{10z+1}-2=0$.

Answer

$\frac{3}{10}$

Example 13.8.6.10

Solve: $\sqrt{3y+5}+2=5$.

Answer

	$\sqrt{3y+5}+2=5$
To isolate the radical, subtract 2 from both sides.	$\sqrt{3y+5}+2-2=5-2$
Simplify.	$\sqrt{3y+5}=3$
Square both sides of the equation.	$(\sqrt{3y+5})^2=(3)^2$
Solve the new equation.	$3y+5=9$
	$3y=4$
	$y=\frac{4}{3}$
Check the answer. $\sqrt{3y+5}+2=5$ $\sqrt{3\left(\frac{4}{3}\right)+5}+2\stackrel{?}{=}5$ $\sqrt{4+5}+2\stackrel{?}{=}5$ $\sqrt{9}+2\stackrel{?}{=}5$ $3+2\stackrel{?}{=}5$ $5=5$ ✓	

	The solution is $y = \frac{4}{3}$

Example 13.8.6.11

Solve: $\sqrt{3p+3}+3=5$.

Answer

$\frac{1}{3}$

Example 13.8.6.12

Solve: $\sqrt{5q+1}+4=6$.

Answer

$\frac{3}{5}$

When we use a radical sign, we mean the principal or positive root. If an equation has a square root equal to a negative number, that equation will have no solution.

Example 13.8.6.13

Solve: $\sqrt{9k-2}+1=0$.

Answer

	$\sqrt{9k-2}+1=0$
To isolate the radical, subtract 1 from both sides.	$\sqrt{9k-2}+1-1=0-1$
Simplify.	$\sqrt{9k-2}=-1$
Since the square root is equal to a negative number, the equation has no solution.	

Example 13.8.6.14

Solve: $\sqrt{2r-3}+5=0$

Answer

no solution

Example 13.8.6.15

Solve: $\sqrt{7s-3}+2=0$.

Answer

no solution

If one side of the equation is a binomial, we use the binomial squares formula when we square it.

Definition: BINOMIAL SQUARES

$$(a+b)^2 = a^2 + 2ab + b^2 \qquad (a-b)^2 = a^2 - 2ab + b^2$$

Don't forget the middle term!

Example 13.8.6.16

Solve: $\sqrt{p-1}+1=p$.

Answer

	$\sqrt{p-1}+1=p$
To isolate the radical, subtract 1 from both sides.	$\sqrt{p-1}+1-1=p-1$
Simplify.	$\sqrt{p-1}=p-1$
Square both sides of the equation.	$\left(\sqrt{p-1}\right)^2=(p-1)^2$
Simplify, then solve the new equation.	$p-1=p^2-2p+1$
It is a quadratic equation, so get zero on one side.	$0=p^2-3p+2$
Factor the right side.	$0=(p-1)(p-2)$
Use the zero product property.	$0=p-1 \quad 0=p-2$
Solve each equation.	$p=1 \quad p=2$
Check the answers. $p=1$: $\sqrt{p-1}+1=p$; $\sqrt{1-1}+1\stackrel{?}{=}1$; $\sqrt{0}+1\stackrel{?}{=}1$; $1=1$ ✓ — $p=2$: $\sqrt{p-1}+1=p$; $\sqrt{2-1}+1\stackrel{?}{=}2$; $\sqrt{1}+1\stackrel{?}{=}2$; $2=2$ ✓	
	The solutions are $p = 1$, $p = 2$.

Example 13.8.6.17

Solve: $\sqrt{x-2}+2=x$.

Answer

2, 3

Example 13.8.6.18

Solve: $\sqrt{y-5}+5=y$.

Answer

5, 6

Example 13.8.6.19

Solve: $\sqrt{r+4}-r+2=0$.

Answer

	$\sqrt{r+4}-r+2=0$
Isolate the radical.	$\sqrt{r+4}=r-2$
Square both sides of the equation.	$(\sqrt{r+4})^2=(r-2)^2$
Solve the new equation.	$r+4=r^2-4r+4$
It is a quadratic equation, so get zero on one side.	$0=r^2-5r$
Factor the right side.	$0=r(r-5)$
Use the zero product property.	0=r 0=r−5
Solve the equation.	r=0 r=5
Check the answer. $r=0$ $\sqrt{r+4}-r+2=0$ $\sqrt{0+4}-0+2\stackrel{?}{=}0$ $\sqrt{4}+2\stackrel{?}{=}0$ $4\neq 0$ $r=5$ $\sqrt{r+4}-r+2=0$ $\sqrt{5+4}-5+2\stackrel{?}{=}0$ $\sqrt{9}-3\stackrel{?}{=}0$ $0=0$ ✓	r=5
	r=0 is an extraneous solution.

Example 13.8.6.20

Solve: $\sqrt{m+9}-m+3=0$.

Answer

7

Example 13.8.6.21

Solve: $\sqrt{n+1}-n+1=0$

Answer

3

When there is a coefficient in front of the radical, we must square it, too.

Example 13.8.6.22

Solve: $3\sqrt{3x-5}-8=4$.

Answer

	$3\sqrt{3x-5}-8=4$
Isolate the radical.	$3\sqrt{3x-5}=12$
Square both sides of the equation.	$(3\sqrt{3x-5})^2=(12)^2$

Simplify, then solve the new equation.	9(3x−5)=144
Distribute.	27x−45=144
Solve the equation.	27x=189
	x=7
Check the answer. $x=7 \quad 3\sqrt{3x-5}-8=4$ $3\sqrt{3(7)-5}-8\stackrel{?}{=}4$ $3\sqrt{21-5}-8\stackrel{?}{=}4$ $3\sqrt{16}-8\stackrel{?}{=}4$ $3(4)-8\stackrel{?}{=}4$ $4=4\checkmark$	The solution is x=7.

? Example 13.8.6.23

Solve: $\sqrt{24a+2}-16=16$.

Answer

$\frac{127}{2}$

? Example 13.8.6.24

Solve: $\sqrt{36b+3}-25=50$.

Answer

$\frac{311}{3}$

? Example 13.8.6.25

Solve: $\sqrt{4z-3}=\sqrt{3z+2}$.

Answer

	$\sqrt{4z-3}=\sqrt{3z+2}$
The radical terms are isolated	$\sqrt{4z-3}=\sqrt{3z+2}$
Square both sides of the equation.	$(\sqrt{4z-3})^2=(\sqrt{3z+2})^2$
Simplify, then solve the new equation	4z−3=3z+2
	z−3=2
	z=5
	x=7
Check the answer. We leave it to you to show that 5 checks!	The solution is z=5.

Example 13.8.6.26

Solve: $\sqrt{2x-5}=\sqrt{5x+3}$.

Answer

no solution

Example 13.8.6.27

Solve: $\sqrt{7y+1}=\sqrt{2y-5}$.

Answer

no solution

Sometimes after squaring both sides of an equation, we still have a variable inside a radical. When that happens, we repeat Step 1 and Step 2 of our procedure. We isolate the radical and square both sides of the equation again.

Example 13.8.6.28

Solve: $\sqrt{m}+1=\sqrt{m+9}$.

Answer

	$\sqrt{m}+1=\sqrt{m+9}$
The radical on the right side is isolated. Square both sides	$(\sqrt{m}+1)^2=(\sqrt{m+9})^2$
Simplify—be very careful as you multiply!	$m+2\sqrt{m}+1=m+9$
There is still a radical in the equation. So we must repeat the previous steps. Isolate the radical.	$2\sqrt{m}=8$
Square both sides.	$(2\sqrt{m})^2=(8)^2$
Simplify, then solve the new equation.	4m=64
	m=16
Check the answer. We leave it to you to show that m=16 checks!	The solution is m=16.

Example 13.8.6.29

Solve: $\sqrt{x}+3=\sqrt{x+5}$.

Answer

no solution

Example 13.8.6.30

Solve: $\sqrt{m}+5=\sqrt{m+16}$.

Answer

no solution

Example 13.8.6.31

Solve: $\sqrt{q-2}+3=\sqrt{4q+1}$.

Answer

	$\sqrt{q-2}+3=\sqrt{4q+1}$
The radical on the right side is isolated. Square both sides	$(\sqrt{q-2}+3)^2=(\sqrt{4q+1})^2$
Simplify.	$q-2+6\sqrt{q-2}+9=4q+1$
There is still a radical in the equation. So we must repeat the previous steps. Isolate the radical.	$6\sqrt{q-2}=3q-6$
Square both sides.	$(6\sqrt{q-2})^2=(3q-6)^2$
Simplify, then solve the new equation.	$36(q-2)=9q^2-36q+36$
Distribute.	$36q-72=9q^2-36q+36$
It is a quadratic equation, so get zero on one side.	$0=9q^2-72q+108$
Factor the right side.	$0=9(q^2-8q+12)$ $0=9(q-6)(q-2)$
Use the zero product property	$q-6=0 \quad q-2=0$ $q=6 \quad q=2$
The checks are left to you. (Both solutionsshould work.)	The solutions are q=6 and q=2.

Example 13.8.6.32

Solve: $\sqrt{y-3}+2=\sqrt{4y+2}$.

Answer

no solution

Example 13.8.6.33

Solve: $\sqrt{n-4}+5=\sqrt{3n+3}$.

Answer

no solution

Use Square Roots in Applications

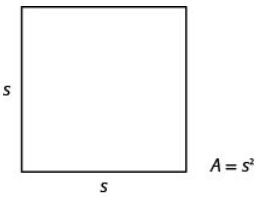
As you progress through your college courses, you'll encounter formulas that include square roots in many disciplines. We have already used formulas to solve geometry applications.

We will use our Problem Solving Strategy for Geometry Applications, with slight modifications, to give us a plan for solving applications with formulas from any discipline.

Definition: SOLVE APPLICATIONS WITH FORMULAS.

1. **Read** the problem and make sure all the words and ideas are understood. When appropriate, draw a figure and label it with the given information.
2. **Identify** what we are looking for.
3. **Name** what we are looking for by choosing a variable to represent it.
4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. **Solve the equation** using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

We used the formula A=L·W to find the area of a rectangle with length *L* and width *W*. A square is a rectangle in which the length and width are equal. If we let *s* be the length of a side of a square, the area of the square is \(s^2\).

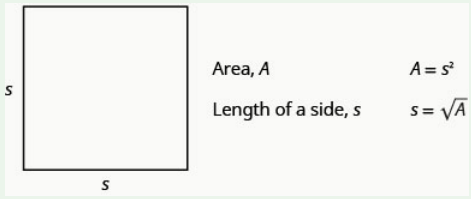


The formula $A = s^2$ gives us the area of a square if we know the length of a side. What if we want to find the length of a side for a given area? Then we need to solve the equation for *s*.

	$A = s^2$
Take the square root of both sides.	$\sqrt{A} = \sqrt{s^2}$
Simplify.	$s = \sqrt{A}$

We can use the formula $s = \sqrt{A}$ to find the length of a side of a square for a given area.

Definition: AREA OF A SQUARE



We will show an example of this in the next example.

Example 13.8.6.34

Mike and Lychelle want to make a square patio. They have enough concrete to pave an area of 200 square feet. Use the formula $s = \sqrt{A}$ to find the length of each side of the patio. Round your answer to the nearest tenth of a foot.

Answer

Step 1. Read the problem. Draw a figure and label it with the given information.		A = 200 square feet

Step 2. Identify what you are looking for.	The length of a side of the square patio.
Step 3. Name what you are looking for by choosing a variable to represent it.	Let s = the length of a side.
Step 4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute the given information.	$s = \sqrt{A}$, and $A = 200$ $s = \sqrt{200}$
Step 5. Solve the equation using good algebra techniques. Round to one decimal place.	$s = 14.14213...$ $s \approx 14.1$
Step 6. Check the answer in the problem and make sure it makes sense.	
$14.1^2 \stackrel{?}{\approx} 200$ $14.1^2 \approx 198.81$ ✓	
This is close enough because we rounded the square root. Is a patio with side 14.1 feet reasonable? Yes.	
Step 7. Answer the question with a complete sentence.	Each side of the patio should be 14.1 feet.

? Example 13.8.6.35

Katie wants to plant a square lawn in her front yard. She has enough sod to cover an area of 370 square feet. Use the formula $s = \sqrt{A}$ to find the length of each side of her lawn. Round your answer to the nearest tenth of a foot.

Answer

19.2 feet

? Example 13.8.6.36

Sergio wants to make a square mosaic as an inlay for a table he is building. He has enough tile to cover an area of 2704 square centimeters. Use the formula $s = \sqrt{A}$ to find the length of each side of his mosaic. Round your answer to the nearest tenth of a foot.

Answer

52.0 cm

Another application of square roots has to do with gravity.

Definition: FALLING OBJECTS

On Earth, if an object is dropped from a height of hh feet, the time in seconds it will take to reach the ground is found by using the formula,

$t = \frac{\sqrt{h}}{4}$

For example, if an object is dropped from a height of 64 feet, we can find the time it takes to reach the ground by substituting h=64 into the formula.

	$t=\frac{\sqrt{h}}{4}$
	$t=\frac{\sqrt{64}}{4}$
Take the square root of 64.	$t=\frac{8}{4}$
Simplify the fraction.	$t=2$

It would take 2 seconds for an object dropped from a height of 64 feet to reach the ground.

? Example 13.8.6.37

Christy dropped her sunglasses from a bridge 400 feet above a river. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the sunglasses to reach the river.

Answer

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	The time it takes for the sunglasses to reach the river.
Step 3. Name what you are looking for by choosing a variable to represent it.	Let t = time.
Step 4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.	$t=\frac{\sqrt{h}}{4}$, and $h=400$ $t=\frac{\sqrt{400}}{4}$
Step 5. Solve the equation using good algebra techniques.	$t=\frac{20}{4}$ $t=5$
Step 6. Check the answer in the problem and make sure it makes sense.	
$5\stackrel{?}{=}\frac{\sqrt{400}}{4}$ $5\stackrel{?}{=}\frac{20}{4}$ 5=5✓	
Does 5 seconds seem reasonable? Yes.	
Step 7. Answer the question with a complete sentence.	It will take 5 seconds for the sunglasses to hit the water.

? Exercise 13.8.6.38

A helicopter dropped a rescue package from a height of 1,296 feet. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the package to reach the ground.

Answer

9 seconds

Example 13.8.6.39

A window washer dropped a squeegee from a platform 196 feet above the sidewalk Use the formula $t = \frac{\sqrt{h}}{4}$ to find how many seconds it took for the squeegee to reach the sidewalk.

Answer

3.5 seconds

Police officers investigating car accidents measure the length of the skid marks on the pavement. Then they use square roots to determine the speed, in miles per hour, a car was going before applying the brakes.

Definition: SKID MARKS AND SPEED OF A CAR

If the length of the skid marks is *d* feet, then the speed, *s*, of the car before the brakes were applied can be found by using the formula,

$s = \sqrt{24d}$

Example 13.8.6.40

After a car accident, the skid marks for one car measured 190 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.

Answer

Step 1. **Read** the problem.	
Step 2. **Identify** what we are looking for.	The speed of a car.
Step 3. **Name** what we are looking for.	Let s = the speed.
Step 4. **Translate** into an equation by writing the appropriate formula.	$s = \sqrt{24d}$, and $d = 190$
Substitute the given information.	$s = \sqrt{24(190)}$
Step 5. **Solve the equation**.	$s = \sqrt{4560}$
	$s = 67.52777...$
Round to 1 decimal place.	$s \approx 67.5$
Step 6. **Check** the answer in the problem. $67.5 \approx ?\sqrt{24(190)}$ $67.5 \approx ?\sqrt{4560}$ $67.5 \approx ?67.5277...$	
Is 67.5 mph a reasonable speed?	Yes.
Step 7. **Answer** the question with a complete sentence.	The speed of the car was approximately 67.5 miles per hour.

Example 13.8.6.41

An accident investigator measured the skid marks of the car. The length of the skid marks was 76 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.

Answer

42.7 feet

Example 13.8.6.42

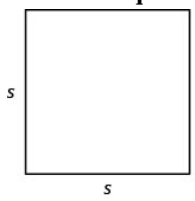
The skid marks of a vehicle involved in an accident were 122 feet long. Use the formula $s = \sqrt{24d}$ to find the speed of the vehicle before the brakes were applied. Round your answer to the nearest tenth.

Answer

54.1 feet

Key Concepts

- **To Solve a Radical Equation:**
  1. Isolate the radical on one side of the equation.
  2. Square both sides of the equation.
  3. Solve the new equation.
  4. Check the answer. Some solutions obtained may not work in the original equation.
- **Solving Applications with Formulas**
  1. **Read** the problem and make sure all the words and ideas are understood. When appropriate, draw a figure and label it with the given information.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for by choosing a variable to represent it.
  4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
  5. **Solve the equation** using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.
- **Area of a Square**



Area, A	$A = s^2$
Length of a side, s	$s = \sqrt{A}$

- **Falling Objects**
  - On Earth, if an object is dropped from a height of hh feet, the time in seconds it will take to reach the ground is found by using the formula$t = \frac{\sqrt{h}}{4}$.
- **Skid Marks and Speed of a Car**
  - If the length of the skid marks is *d* feet, then the speed, *s*, of the car before the brakes were applied can be found by using the formula $s = \sqrt{24d}$.

Glossary

radical equation

An equation in which the variable is in the radicand of a square root is called a radical equation

This page titled 13.8.6: Solve Equations with Square Roots is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

13.8.6E: Exercises

Practice Makes Perfect

Solve Radical Equations

In the following exercises, check whether the given values are solutions.

Example 13.8.6E.43

For the equation $\sqrt{x+12}=x$:

1. Is x=4 a solution?
2. Is x=−3 a solution?

Answer

1. yes
2. no

Example 13.8.6E.44

For the equation $\sqrt{-y+20}=y$

1. Is y=4 a solution?
2. Is y=−5 a solution?

Example 13.8.6E.45

For the equation $\sqrt{t+6}=t$:

1. Is t=−2 a solution?
2. Is t=3 a solution?

Answer

1. no
2. yes

Example 13.8.6E.46

For the equation $\sqrt{u+42}=u$:

1. Is u=−6 a solution?
2. Is u=7 a solution?

In the following exercises, solve.

Example 13.8.6E.47

$\sqrt{5y+1}=4$

Answer

3

Example 13.8.6E.48

$\sqrt{7z+15}=6$

Example 13.8.6E.49

$\sqrt{5x-6}=8$

Answer

14

Example 13.8.6E.50

$\sqrt{4x-3}=7$

Example 13.8.6E.51

$\sqrt{2m-3}-5=0$

Answer

14

Example 13.8.6E.52

$\sqrt{2n-1}-3=0$

Example 13.8.6E.53

$\sqrt{6v-2}-10=0$

Answer

17

Example 13.8.6E.54

$\sqrt{4u+2}-6=0$

Example 13.8.6E.55

$\sqrt{5q+3}-4=0$

Answer

$\frac{13}{5}$

Example 13.8.6E.56

$\sqrt{4m+2}+2=6$

Example 13.8.6E.57

$\sqrt{6n+1}+4=8$

Answer

$\frac{5}{2}$

Example 13.8.6E.58

$\sqrt{2u-3}+2=0$

Example 13.8.6E.59

$\sqrt{5v-2}+5=0$

Answer

no solution

Example 13.8.6E.60

$\sqrt{3z-5}+2=0$

Example 13.8.6E.61

$\sqrt{2m+1}+4=0$

Answer

no solution

Example 13.8.6E.62

1. $\sqrt{u-3}+3=u$
2. $\sqrt{x+1}-x+1=0$

Example 13.8.6E.63

1. $\sqrt{v-10}+10=v$
2. $\sqrt{y+4}-y+2=0$

Answer

1. 10, 11
2. 5

Example 13.8.6E.64

1. $\sqrt{r-1}-r=-1$
2. $\sqrt{z+100}-z+10=0$

https://math.libretexts.org/@go/page/46326

Example 13.8.6E.65

1. $\sqrt{s-8}-s=-8$
2. $\sqrt{w+25}-w+5=0$

Answer

1. 8,9
2. 11

Example 13.8.6E.66

$3\sqrt{2x-3}-20=7$

Example 13.8.6E.67

$2\sqrt{5x+1}-8=0$

Answer

3

Example 13.8.6E.68

$2\sqrt{8r+1}-8=2$

Example 13.8.6E.69

$3\sqrt{7y+1}-10=8$

Answer

5

Example 13.8.6E.70

$\sqrt{3u-2}=\sqrt{5u+1}$

Example 13.8.6E.71

$\sqrt{4v+3}=\sqrt{v-6}$

Answer

not a real number

Example 13.8.6E.72

$\sqrt{8+2r}=\sqrt{3r+10}$

Example 13.8.6E.73

$\sqrt{12c+6}=\sqrt{10-4c}$

Answer

$\frac{1}{4}$

Example 13.8.6E.74

1. $\sqrt{a}+2=\sqrt{a+4}$
2. $\sqrt{b-2}+1=\sqrt{3b+2}$

Example 13.8.6E.75

1. $\sqrt{r}+6=\sqrt{r+8}$
2. $\sqrt{s-3}+2=\sqrt{s+4}$

Answer

1. no solution
2. $\frac{57}{16}$

Example 13.8.6E.76

1. $\sqrt{u}+1=\sqrt{u+4}$
2. $\sqrt{n-5}+4=\sqrt{3n+7}$

Example 13.8.6E.77

1. $\sqrt{x}+10=\sqrt{x+2}$
2. $\sqrt{y-2}+2=\sqrt{2y+4}$

Answer

1. no solution
2. 6

Example 13.8.6E.78

$\sqrt{2y+4}+6=0$

Example 13.8.6E.79

$\sqrt{8u+1}+9=0$

Answer

no solution

Example 13.8.6E.80

$\sqrt{a}+1=\sqrt{a+5}$

Example 13.8.6E.81

$\sqrt{d}-2=\sqrt{d-20}$

Answer

36

Example 13.8.6E.82

$\sqrt{6s+4} = \sqrt{8s-28}$

Example 13.8.6E.83

$\sqrt{9p+9} = \sqrt{10p-6}$

Answer

15

Use Square Roots in Applications

In the following exercises, solve. Round approximations to one decimal place.

Example 13.8.6E.84

Landscaping Reed wants to have a square garden plot in his backyard. He has enough compost to cover an area of 75 square feet. Use the formula $s = \sqrt{A}$ to find the length of each side of his garden. Round your answer to the nearest tenth of a foot.

Example 13.8.6E.85

Landscaping Vince wants to make a square patio in his yard. He has enough concrete to pave an area of 130 square feet. Use the formula $s = \sqrt{A}$ to find the length of each side of his patio. Round your answer to the nearest tenth of a foot.

Answer

11.4 feet

Example 13.8.6E.86

Gravity While putting up holiday decorations, Renee dropped a light bulb from the top of a 64 foot tall tree. Use the formula $t = \frac{\sqrt{h}}{4}$ to find how many seconds it took for the light bulb to reach the ground.

Example 13.8.6E.87

Gravity An airplane dropped a flare from a height of 1024 feet above a lake. Use the formula $t = \frac{\sqrt{h}}{4}$ to find how many seconds it took for the flare to reach the water.

Answer

8 seconds

Example 13.8.6E.88

Gravity A hang glider dropped his cell phone from a height of 350 feet. Use the formula $t = \frac{\sqrt{h}}{4}$ to find how many seconds it took for the cell phone to reach the ground.

Example 13.8.6E.89

Gravity A construction worker dropped a hammer while building the Grand Canyon skywalk, 4000 feet above the Colorado River. Use the formula $t = \frac{\sqrt{h}}{4}$ to find how many seconds it took for the hammer to reach the river.

Answer

15.8 seconds

Example 13.8.6E.90

Accident investigation The skid marks for a car involved in an accident measured 54 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.

Example 13.8.6E.91

Accident investigation The skid marks for a car involved in an accident measured 216 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied. Round your answer to the nearest tenth.

Answer

72 feet

Example 13.8.6E.92

Accident investigation An accident investigator measured the skid marks of one of the vehicles involved in an accident. The length of the skid marks was 175 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the vehicle before the brakes were applied. Round your answer to the nearest tenth.

Example 13.8.6E.93

Accident investigation An accident investigator measured the skid marks of one of the vehicles involved in an accident. The length of the skid marks was 117 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the vehicle before the brakes were applied. Round your answer to the nearest tenth.

Answer

53.0 feet

Writing Exercises

Example 13.8.6E.94

Explain why an equation of the form $\sqrt{x} + 1 = 0$ has no solution.

Example 13.8.6E.95

1. ⓐ Solve the equation $\sqrt{r+4} - r + 2 = 0$.
2. ⓑ Explain why one of the "solutions" that was found was not actually a solution to the equation.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use square roots in applications.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 13.8.6E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

- **9.6E: Exercises** by OpenStax is licensed CC BY 4.0. Original source: https://openstax.org/details/books/elementary-algebra-2e.

13.8.7: Higher Roots

Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with higher roots
- Use the Product Property to simplify expressions with higher roots
- Use the Quotient Property to simplify expressions with higher roots
- Add and subtract higher roots

Note

1. Simplify: $y^5 y^4$.
   If you missed this problem, review Example 6.2.7.
2. Simplify: $(n^2)^6$.
   If you missed this problem, review Example 6.2.19.
3. Simplify: $\frac{x^8}{x^3}$.
   If you missed this problem, review Example 6.5.1.

Simplify Expressions with Higher Roots

Up to now, in this chapter we have worked with squares and square roots. We will now extend our work to include higher powers and higher roots.

Let's review some vocabulary first.

We write:	We say:
n^2	n squared
n^3	n cubed
n^4	n to the fourth
n^5	n to the fifth

The terms 'squared' and 'cubed' come from the formulas for area of a square and volume of a cube.

It will be helpful to have a table of the powers of the integers from -5to5. See Figure \PageIdnex1.

Number	Square	Cube	Fourth power	Fifth power
n	n^2	n^3	n^4	n^5
1	1	1	1	1
2	4	8	16	32
3	9	27	81	243
4	16	64	256	1024
5	25	125	625	3125
x	x^2	x^3	x^4	x^5
x^2	x^4	x^6	x^8	x^{10}

Number	Square	Cube	Fourth power	Fifth power
n	n^2	n^3	n^4	n^5
–1	1	–1	1	–1
–2	4	–8	16	–32
–3	9	–27	81	–243
–4	16	–64	256	–1024
–5	25	–125	625	–3125

Figure 13.8.7.1: First through fifth powers of integers from −5 to 5.

Notice the signs in Figure 13.8.7.1. All powers of positive numbers are positive, of course. But when we have a negative number, the even powers are positive and the odd powers are negative. We'll copy the row with the powers of −2 below to help you see this.

n	n^2	n^3	n^4	n^5
–2	4	–8	16	–32

Earlier in this chapter we defined the square root of a number.

If $n^2 = m$,then n is a square root of m.

And we have used the notation $\sqrt{m}$ to denote the **principal square root**. So $\sqrt{m} \geq 0$ always.

We will now extend the definition to higher roots.

Definition: *N*TH ROOT OF A NUMBER

If $b^n = a$, then b is an ***n*th root of a number** a.

The principal *n*th root of a is written $\sqrt[n]{a} = b$

n is called the **index** of the radical.

We do not write the index for a square root. Just like we use the word 'cubed' for b^3, we use the term 'cube root' for $\sqrt[3]{a}$.

We refer to Figure 13.8.7.1to help us find higher roots.

$$\begin{aligned} 4^3 &= 64 & \sqrt[3]{64} &= 4 \\ 3^4 &= 81 & \sqrt[4]{81} &= 3 \\ (-2)^5 &= -32 & \sqrt[5]{-32} &= -2 \end{aligned}$$

Could we have an even root of a negative number? No. We know that the square root of a negative number is not a real number. The same is true for any even root. Even roots of negative numbers are not real numbers. Odd roots of negative numbers are real numbers.

Definition: PROPERTIES OF $\sqrt[n]{a}$

When n is an even number and

- $a \geq 0$, then $\sqrt[n]{a}$ is a real number
- $a < 0$, then $\sqrt[n]{a}$ is not a real number

When n is an odd number, $\sqrt[n]{a}$ is a real number for all values of a.

Example 13.8.7.1

Simplify:

1. $\sqrt[3]{8}$
2. $\sqrt[4]{81}$
3. $\sqrt[5]{32}$.

Answer

1.	$\sqrt[3]{8}$
Since $(2)^3 = 8$.	2
2.	$\sqrt[4]{81}$
Since $(3)^4 = 81$.	3
3.	$\sqrt[5]{32}$
Since $(2)^5 = 32$.	2

Example 13.8.7.2

Simplify:

1. $\sqrt[3]{27}$
2. $\sqrt[4]{256}$
3. $\sqrt[5]{243}$.

Answer

1. 3

2. 4
3. 3

Example 13.8.7.3

Simplify:

1. $\sqrt[3]{1000}$
2. $\sqrt[4]{16}$
3. $\sqrt[5]{32}$.

Answer

1. 10
2. 2
3. 2

Example 13.8.7.4

Simplify:

1. $\sqrt[3]{-64}$
2. $\sqrt[4]{-16}$
3. $\sqrt[5]{-243}$.

Answer

1.	$\sqrt[3]{-64}$
Since $(-4)^3 = -64$.	-4
2.	$\sqrt[4]{-16}$
Think, $(?)^4 = -16$.No real number raised to the fourth power is positive.	Not a real number.
3.	$\sqrt[5]{-243}$
Since $(-3)^5 = -243$.	-3

Example 13.8.7.5

Simplify:

1. $\sqrt[3]{-125}$
2. $\sqrt[4]{-16}$
3. $\sqrt[5]{-32}$.

Answer

1. -5
2. not real
3. -2

Example 13.8.7.6

Simplify:

1. $\sqrt[3]{-216}$

2. $\sqrt[4]{-81}$
3. $\sqrt[5]{-1024}$.

Answer

1. −6
2. not real
3. −4

When we worked with square roots that had variables in the radicand, we restricted the variables to non-negative values. Now we will remove this restriction.

The odd root of a number can be either positive or negative. We have seen that $\sqrt[3]{-64} = -4$.

But the even root of a non-negative number is always non-negative, because we take the **principal *n*th root**.

Suppose we start with a=−5.

$$(-5)^4 = 625 \quad \sqrt[4]{625} = 5$$

How can we make sure the fourth root of −5 raised to the fourth power, $(-5)^4$ is 5? We will see in the following property.

Definition: SIMPLIFYING ODD AND EVEN ROOTS

For any integer $n \geq 2$,

$$\begin{array}{ll} \text{when n is odd} & \sqrt[n]{a^n} = a \\ \text{when n is even} & \sqrt[n]{a^n} = |a| \end{array}$$

We must use the absolute value signs when we take an even root of an expression with a variable in the radical.

Example 13.8.7.7

Simplify:

1. $\sqrt{x^2}$
2. $\sqrt[3]{n^3}$
3. $\sqrt[4]{p^4}$
4. $\sqrt[5]{y^5}$.

Answer

We use the absolute value to be sure to get the positive root.

1.	$\sqrt{x^2}$
Since $(x)^2 = x^2$ and we want the positive root.	|x|
2.	$\sqrt[3]{n^3}$
Since $(n)^3 = n^3$. It is an odd root so there is no need for an absolute value sign.	n
3.	$\sqrt[4]{p^4}$
Since $(p)^4 = p^4$ and we want the positive root.	|p|
4.	$\sqrt[5]{y^5}$
Since $(y)^5 = y^5$. It is an odd root so there is no need for an absolute value sign.	y

Example 13.8.7.8

Simplify:

1. $\sqrt{b^2}$
2. $\sqrt[3]{w^3}$
3. $\sqrt[4]{m^4}$
4. $\sqrt[5]{q^5}$.

Answer

1. |b|
2. w
3. |m|
4. q

Example 13.8.7.9

Simplify:

1. $\sqrt{y^2}$
2. $\sqrt[3]{p^3}$
3. $\sqrt[4]{z^4}$
4. $\sqrt[5]{q^5}$

Answer

1. |y|
2. p
3. |z|
4. q

Example 13.8.7.10

Simplify:

1. $\sqrt[3]{y^{18}}$
2. $\sqrt[4]{z^8}$.

Answer

1.	$\sqrt[3]{y^{18}}$
Since $(y^6)^3 = y^18$.	$\sqrt[3]{(y^6)^3}$
	y^6
2.	$\sqrt[4]{z^8}$
Since $(z^2)^4 = z^8$.	$\sqrt[4]{(z^2)^4}$
Since z^2 is positive, we do not need an absolute value sign.	z^2

Example 13.8.7.11

Simplify:

1. $\sqrt[4]{u^{12}}$
2. $\sqrt[3]{v^{15}}$.

Answer

1. u^3
2. v^5

Example 13.8.7.12

Simplify:

1. $\sqrt[5]{c^{20}}$
2. $\sqrt[6]{d^{24}}$.

Answer

1. c^4
2. d^4

Example 13.8.7.13

Simplify:

1. $\sqrt[3]{64p^6}$
2. $\sqrt[4]{16q^{12}}$.

Answer

1.	$\sqrt[3]{64p^6}$
Rewrite $64p^6$ as $(4p^2)^3$.	$\sqrt[3]{(4p^2)^3}$
Take the cube root.	$4p^2$
2.	$\sqrt[4]{16q^{12}}$
Rewrite the radicand as a fourth power.	$\sqrt[4]{(2q^3)^4}$
Take the fourth root.	$2\lvert q^3\rvert$

Example 13.8.7.14

Simplify:

1. $\sqrt[3]{27x^{27}}$
2. $\sqrt[4]{81q^{28}}$.

Answer

1. $3x^9$
2. $3 \mid q^7\rvert$

Example 13.8.7.15

Simplify:

1. $\sqrt[3]{125p^9}$
2. $\sqrt[5]{243q^{25}}$

Answer

1. $5p^3$
2. $3q^5$

Use the Product Property to Simplify Expressions with Higher Roots

We will simplify expressions with higher roots in much the same way as we simplified expressions with square roots. An *n*th root is considered simplified if it has no factors of m^n.

Definition: SIMPLIFIED *N*TH ROOT

$\sqrt[n]{a}$ is considered simplified if a has no factors of m^n.

We will generalize the Product Property of Square Roots to include any integer root $n \geq 2$.

Definition: PRODUCT PROPERTY OF *N*TH ROOTS

$\sqrt[n]{ab} = \sqrt[n]{a} \cdot \sqrt[n]{b}$ and $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$

when $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers and for any integer $n \geq 2$

Example 13.8.7.16

Simplify:

1. $\sqrt[3]{x^4}$
2. $\sqrt[4]{x^7}$.

Answer

1.	$\sqrt[3]{x^4}$
Rewrite the radicand as a product using the largest perfect cube factor.	$\sqrt[3]{x^3 \cdot x}$
Rewrite the radical as the product of two radicals.	$\sqrt[3]{x^3} \cdot \sqrt[3]{x}$
Simplify.	$x\sqrt[3]{x}$
2.	$\sqrt[4]{x^7}$
Rewrite the radicand as a product using the greatest perfect fourth power factor.	$\sqrt[4]{x^4 \cdot x^3}$
Rewrite the radical as the product of two radicals.	$\sqrt[4]{x^4} \cdot \sqrt[4]{x^3}$
Simplify.	$\lvert x \rvert \sqrt[4]{x^3}$

Example 13.8.7.17

Simplify:

1. $\sqrt[4]{y^6}$
2. $\sqrt[3]{z^5}$.

Answer

1. $\lvert y \rvert \sqrt[4]{y^2}$
2. $z\sqrt[3]{z^2}$

Example 13.8.7.18

Simplify:

1. $\sqrt[5]{p^8}$
2. $\sqrt[6]{q^{13}}$.

Answer

1. $p\sqrt[5]{p^3}$
2. $q^2\sqrt[6]{q}$

Example 13.8.7.19

Simplify:

1. $\sqrt[3]{16}$
2. $\sqrt[4]{243}$.

Answer

1.	$\sqrt[3]{16}$
	$\sqrt[3]{2^4}$
Rewrite the radicand as a product using the largest perfect cube factor.	$\sqrt[3]{2^3 \cdot 2}$
Rewrite the radical as the product of two radicals.	$\sqrt[3]{2^3} \cdot \sqrt[3]{2}$
Simplify.	$2\sqrt[3]{2}$
2.	$\sqrt[4]{243}$
	$\sqrt[4]{3^5}$
Rewrite the radicand as a product using the greatest perfect fourth power factor.	$\sqrt[4]{3^4 \cdot 3}$
Rewrite the radical as the product of two radicals.	$\sqrt[4]{3^4} \cdot \sqrt[4]{3}$
Simplify.	$3\sqrt[4]{3}$

Example 13.8.7.20

Simplify:

1. $\sqrt[3]{81}$
2. $\sqrt[4]{64}$.

Answer

1. $3\sqrt[3]{3}$
2. $2\sqrt[4]{4}$

Example 13.8.7.21

Simplify:

1. $\sqrt[3]{625}$
2. $\sqrt[4]{729}$.

Answer

1. $5\sqrt[3]{5}$
2. $3\sqrt[4]{9}$

Don't forget to use the absolute value signs when taking an even root of an expression with a variable in the radical.

? Example 13.8.7.22

Simplify:

1. $\sqrt[3]{24x^7}$
2. $\sqrt[4]{80y^{14}}$.

Answer

1.	$\sqrt[3]{24x^7}$
Rewrite the radicand as a product using perfect cube factors.	$\sqrt[3]{2^3x^6\cdot 3x}$
Rewrite the radical as the product of two radicals.	$\sqrt[3]{2^3x^6}\cdot\sqrt[3]{3x}$
Rewrite the first radicand as $(2x^2)^3$	$\sqrt[3]{(2x^2)^3}\cdot\sqrt[3]{3x}$
Simplify.	$2x^2\sqrt[3]{3x}$
2.	$\sqrt[4]{80y^{14}}$
Rewrite the radicand as a product using perfect fourth power factors.	$\sqrt[4]{2^4y^{12}\cdot 5y^2}$
Rewrite the radical as the product of two radicals.	$\sqrt[4]{2^4y^{12}}\cdot\sqrt[4]{5y^2}$
Rewrite the first radicand as $(2y^3)^4$	$\sqrt[4]{(2y^3)^4}\cdot\sqrt[4]{5y^2}$
Simplify.	$2\lvert y^3\rvert\sqrt[4]{5y^2}$

? Example 13.8.7.23

Simplify:

1. $\sqrt[3]{54p^{10}}$
2. $\sqrt[4]{64q^{10}}$.

Answer

1. $3p^3\sqrt[3]{2p}$
2. $2q^2\sqrt[4]{4q^2}$

? Example 13.8.7.24

Simplify:

1. $\sqrt[3]{128m^{11}}$
2. $\sqrt[4]{162n^7}$.

Answer

1. $4m^3\sqrt[3]{2m^2}$
2. $3\lvert n\rvert\sqrt[4]{2n^3}$

Example 13.8.7.25

Simplify:

1. $\sqrt[3]{-27}$
2. $\sqrt[4]{-16}$.

Answer

1.	$\sqrt[3]{-27}$
Rewrite the radicand as a product using perfect cube factors.	$\sqrt[3]{(-3)^3}$
Take the cube root.	-3
2.	$\sqrt[4]{-16}$
There is no real number n where $n^4 = -16$.	Not a real number.

Example 13.8.7.26

Simplify:

1. $\sqrt[3]{-108}$
2. $\sqrt[4]{-48}$.

Answer

1. $-3\sqrt[3]{4}$
2. not real

Example 13.8.7.27

Simplify:

1. $\sqrt[3]{-625}$
2. $\sqrt[4]{-324}$.

Answer

1. $-5\sqrt[3]{5}$
2. not real

Use the Quotient Property to Simplify Expressions with Higher Roots

We can simplify higher roots with quotients in the same way we simplified square roots. First we simplify any fractions inside the radical.

Example 13.8.7.28

Simplify:

1. $\sqrt[3]{\frac{a^8}{a^5}}$
2. $\sqrt[4]{\frac{a^{10}}{a^2}}$.

Answer

1.	$\sqrt[3]{\frac{a^8}{a^5}}$
Simplify the fraction under the radical first.	$\sqrt[3]{a^3}$

Simplify.	a
2.	$\sqrt[4]{\frac{a^{10}}{a^2}}$
Simplify the fraction under the radical first.	$\sqrt[4]{a^8}$
Rewrite the radicand using perfect fourth power factors.	$\sqrt[4]{(a^2)^4}$
Simplify.	a^2

Example 13.8.7.29

Simplify:

1. $\sqrt[4]{\frac{x^7}{x^3}}$
2. $\sqrt[4]{\frac{y^{17}}{y^5}}$.

Answer

1. |x|
2. y^3

Example 13.8.7.30

Simplify:

1. $\sqrt[3]{\frac{m^{13}}{m^7}}$
2. $\sqrt[5]{\frac{n^{12}}{n^2}}$.

Answer

1. m^2
2. n^2

Previously, we used the Quotient Property 'in reverse' to simplify square roots. Now we will generalize the formula to include higher roots.

Definition: QUOTIENT PROPERTY OF *N*TH ROOTS

$\sqrt[n]{\frac{a}{b}} = \frac{\sqrt[n]{a}}{\sqrt[n]{b}}$ and $\frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$

when $\sqrt[n]{a}$ and $\sqrt[n]{b}$ are real numbers, $b \neq 0$, and for any integer $n \geq 2$

Exercise 13.8.7.31

Simplify:

1. $\frac{\sqrt[3]{-108}}{\sqrt[3]{2}}$
2. $\frac{\sqrt[4]{96x^7}}{\sqrt[4]{3x^2}}$

Answer

1.	$\frac{\sqrt[3]{-108}}{\sqrt[3]{2}}$

Neither radicand is a perfect cube, so use the Quotient Property to write as one radical.	$\sqrt[3]{\frac{-108}{2}}$
Simplify the fraction under the radical.	$\sqrt[3]{-54}$
Rewrite the radicand as a product using perfect cube factors.	$\sqrt[3]{(-3)^3 \cdot 2}$
Rewrite the radical as the product of two radicals.	$\sqrt[3]{(-3)^3} \cdot \sqrt[3]{2}$
Simplify.	$-3\sqrt[3]{2}$
2.	$\frac{\sqrt[4]{96x^7}}{\sqrt[4]{3x^2}}$
Neither radicand is a perfect fourth power, so use the Quotient Property to write as one radical	$\sqrt[4]{\frac{96x^7}{3x^2}}$
Simplify the fraction under the radical.	$\sqrt[4]{32x^5}$
Rewrite the radicand as a product using perfect fourth power factors.	$\sqrt[4]{2^4x^4 \cdot 2x}$
Rewrite the radical as the product of two radicals.	$\sqrt[4]{(2x)^4} \cdot \sqrt[4]{2x}$
Simplify.	$2\lvert x\rvert\sqrt[4]{2x}$

? Example 13.8.7.32

Simplify:

1. $\frac{\sqrt[3]{-532}}{\sqrt[3]{2}}$
2. $\frac{\sqrt[4]{486m^{11}}}{\sqrt[4]{3m^5}}$

Answer

1. not real
2. $3\lvert m\rvert\sqrt[4]{2m^2}$

? Example 13.8.7.33

Simplify:

1. $\frac{\sqrt[3]{-192}}{\sqrt[3]{3}}$
2. $\frac{\sqrt[4]{324n^7}}{\sqrt[4]{2n^3}}$.

Answer

1. -4
2. $3\lvert n\rvert\sqrt[4]{2}$

If the fraction inside the radical cannot be simplified, we use the first form of the Quotient Property to rewrite the expression as the quotient of two radicals.

? Example 13.8.7.34

Simplify:

1. $\sqrt[3]{\frac{24x^7}{y^3}}$

2. $\sqrt[4]{\frac{48x^{10}}{y^8}}$.

Answer

1.	$\sqrt[3]{\frac{24x^7}{y^3}}$
The fraction in the radicand cannot be simplified. Use the Quotient Property to write as two radicals.	$\frac{\sqrt[3]{24x^7}}{\sqrt[3]{y^3}}$
Rewrite each radicand as a product using perfect cube factors.	$\frac{\sqrt[3]{8x^6 \cdot 3x}}{\sqrt[3]{y^3}}$
Rewrite the numerator as the product of two radicals.	$\frac{\sqrt[3]{(2x^2)^3} \cdot \sqrt[3]{3x}}{\sqrt[3]{y^3}}$
Simplify.	$\frac{2x^2\sqrt[3]{3x}}{y}$
2.	$\sqrt[4]{\frac{48x^{10}}{y^8}}$
The fraction in the radicand cannot be simplified. Use the Quotient Property to write as two radicals.	$\frac{\sqrt[4]{48x^{10}}}{\sqrt[4]{y^8}}$
Rewrite each radicand as a product using perfect cube factors.	$\frac{\sqrt[4]{16x^8 \cdot 3x^2}}{\sqrt[4]{y^8}}$
Rewrite the numerator as the product of two radicals.	$\frac{\sqrt[4]{(2x^2)^4} \cdot \sqrt[4]{3x^2}}{\sqrt[4]{(y^2)^4}}$
Simplify.	$\frac{2x^2\sqrt[4]{3x^2}}{y^2}$

Example 13.8.7.35

Simplify:

1. $\sqrt[3]{\frac{108c^{10}}{d^6}}$
2. $\sqrt[4]{\frac{80x^{10}}{y^5}}$.

Answer

1. $\frac{3c^3\sqrt[3]{4c}}{d^2}$
2. $\frac{x^2}{|y|}\sqrt[4]{\frac{80x^2}{y}}$

Example 13.8.7.36

Simplify:

1. $\sqrt[3]{\frac{40r^3}{s}}$
2. $\sqrt[4]{\frac{162m^{14}}{n^{12}}}$

Answer

1. $r\sqrt[3]{\frac{40}{s}}$
2. $\frac{3m^3\sqrt[4]{2m^2}}{|n^3|}$

Add and Subtract Higher Roots

We can add and subtract higher roots like we added and subtracted square roots. First we provide a formal definition of **like radicals**.

Definition: LIKE RADICALS

Radicals with the same index and same radicand are called **like radicals**.

Like radicals have the same index and the same radicand.

- $9\sqrt[4]{42x}$ and $-2\sqrt[4]{42x}$ are like radicals.
- $5\sqrt[3]{125x}$ and $6\sqrt[3]{125y}$ are not like radicals. The radicands are different.
- $2\sqrt[5]{1000q}$ and $-4\sqrt[4]{1000q}$ are not like radicals. The indices are different.

We add and subtract like radicals in the same way we add and subtract like terms. We can add $9\sqrt[4]{42x}+(-2\sqrt[4]{42x})$ and the result is $7\sqrt[4]{42x}$.

Example 13.8.7.37

Simplify:

1. $\sqrt[3]{4x}+\sqrt[3]{4x}$
2. $4\sqrt[4]{8}-2\sqrt[4]{8}$

Answer

1.	$\sqrt[3]{4x}+\sqrt[3]{4x}$
The radicals are like, so we add the coefficients	$2\sqrt[3]{4x}$
2.	$4\sqrt[4]{8}-2\sqrt[4]{8}$
The radicals are like, so we subtract the coefficients.	$2\sqrt[4]{8}$

Example 13.8.7.38

Simplify:

1. $\sqrt[5]{3x}+\sqrt[5]{3x}$
2. $3\sqrt[3]{9}-\sqrt[3]{9}$

Answer

1. $2\sqrt[5]{3x}$
2. $2\sqrt[3]{9}$

Example 13.8.7.39

Simplify:

1. $\sqrt[4]{10y}+\sqrt[4]{10y}$
2. $5\sqrt[6]{32}-3\sqrt[6]{32}$.

Answer

1. $2\sqrt[4]{10y}$
2. $2\sqrt[6]{32}$

When an expression does not appear to have like radicals, we will simplify each radical first. Sometimes this leads to an expression with like radicals.

Example 13.8.7.40

Simplify:

1. $\sqrt[3]{54}-\sqrt[3]{16}$
2. $\sqrt[4]{48}+\sqrt[4]{243}$.

Answer

1.	$\sqrt[3]{54}-\sqrt[3]{16}$
Rewrite each radicand using perfect cube factors.	$\sqrt[3]{27}\cdot\sqrt[3]{2}-\sqrt[3]{8}\cdot\sqrt[3]{2}$
Rewrite the perfect cubes.	$\sqrt[3]{(3)^3}\cdot\sqrt[3]{2}-\sqrt[3]{(2)^3}\cdot\sqrt[3]{2}$
Simplify the radicals where possible.	$3\sqrt[3]{2}-2\sqrt[3]{2}$
Combine like radicals.	$\sqrt[3]{2}$
2.	$\sqrt[4]{48}+\sqrt[4]{243}$
Rewrite using perfect fourth power factors.	$\sqrt[4]{16}\cdot\sqrt[4]{3}+\sqrt[4]{81}\cdot\sqrt[4]{3}$
Rewrite each radicand as a product using perfect cube factors.	$\sqrt[4]{(2)^4}\cdot\sqrt[4]{3}+\sqrt[4]{(3)^4}\cdot\sqrt[4]{3}$
Rewrite the numerator as the product of two radicals.	$2\sqrt[4]{3}+3\sqrt[4]{3}$
Simplify.	$5\sqrt[4]{3}$

Example 13.8.7.41

Simplify:

1. $\sqrt[3]{192}-\sqrt[3]{81}$
2. $\sqrt[4]{32}+\sqrt[4]{512}$.

Answer

1. $\sqrt[3]{3}$
2. $6\sqrt[4]{2}$

Example 13.8.7.42

Simplify:

1. $\sqrt[3]{108}-\sqrt[3]{250}$
2. $\sqrt[5]{64}+\sqrt[5]{486}$.

Answer

1. $-\sqrt[3]{2}$
2. $5\sqrt[5]{2}$

Example 13.8.7.43

Simplify:

1. $\sqrt[3]{24x^4}-\sqrt[3]{-81x^7}$
2. $\sqrt[4]{162y^9}+\sqrt[4]{512y^5}$.

Answer

1.	$\sqrt[3]{24x^4}-\sqrt[3]{-81x^7}$
Rewrite each radicand using perfect cube factors.	$\sqrt[3]{8x^3}\cdot\sqrt[3]{3x}-\sqrt[3]{-27x^6}\cdot\sqrt[3]{3x}$
Rewrite the perfect cubes.	$\sqrt[3]{(2x)^3}\cdot\sqrt[3]{3x}-\sqrt[3]{(-3x^2)^3}\cdot\sqrt[3]{3x}$
Simplify the radicals where possible.	$2x\sqrt[3]{3x}-(-3x^2\sqrt[3]{3x})$
2.	$\sqrt[4]{162y^9}+\sqrt[4]{516y^5}$
Rewrite using perfect fourth power factors.	$\sqrt[4]{81y^8}\cdot\sqrt[4]{2y}+\sqrt[4]{256y^4}\cdot\sqrt[4]{2y}$
Rewrite each radicand as a product using perfect cube factors.	$\sqrt[4]{(3y^2)^4}\cdot\sqrt[4]{2y}+\sqrt[4]{(4y)^4}\cdot\sqrt[4]{2y}$
Rewrite the numerator as the product of two radicals.	$3y^2\sqrt[4]{2y}+4\lvert y\rvert\sqrt[4]{2y}$

? Example 13.8.7.44

Simplify:

1. $\sqrt[3]{32y^5}-\sqrt[3]{-108y^8}$
2. $\sqrt[4]{243r^{11}}+\sqrt[4]{768r^{10}}$.

Answer

1. $2y\sqrt[3]{4y^2}+3y^2\sqrt[3]{4y^2}$
2. $3r^2\sqrt[4]{3r^3}+4r^2\sqrt[4]{3r^2}$

? Example 13.8.7.45

Simplify:

1. $\sqrt[3]{40z^7}-\sqrt[3]{-135z^4}$
2. $\sqrt[4]{80s^{13}}+\sqrt[4]{1280s^6}$.

Answer

1. $2z^2\sqrt[3]{5z}+3z^5\sqrt[3]{5z}$
2. $2\mid s^3\mid\sqrt[4]{5s}+4\lvert s\rvert\sqrt[4]{5s}$

Key Concepts

- **Properties of**
- $\sqrt[n]{a}$ when n is an even number and
  - $a\geq 0$, then $\sqrt[n]{a}$ is a real number
  - $a<0$, then $\sqrt[n]{a}$ is not a real number
  - When n is an odd number, $\sqrt[n]{a}$ is a real number for all values of a.
  - For any integer $n\geq 2$, when n is odd $\sqrt[n]{a^n}=a$
  - For any integer $n\geq 2$, when n is even $\sqrt[n]{a^n}=|a|$
- $\sqrt[n]{a}$ is considered simplified if a has no factors of m^n.
- $\sqrt[n]{ab}=\sqrt[n]{a}\cdot\sqrt[n]{b}$ and $\sqrt[n]{a}\cdot\sqrt[n]{b}=\sqrt[n]{ab}$
- $\sqrt[n]{\frac{a}{b}}=\frac{\sqrt[n]{a}}{\sqrt[n]{b}}$ and $\frac{\sqrt[n]{a}}{\sqrt[n]{b}}=\sqrt[n]{\frac{a}{b}}$

- To combine like radicals, simply add or subtract the coefficients while keeping the radical the same.

Glossary

_n_th root of a number

If $b^n = a$, then b is an *n*th root of a.

principal _n_th root

The principal *n*th root of a is written $\sqrt[n]{a}$.

index

$\sqrt[n]{a}$ *n* is called the *index* of the radical.

like radicals

Radicals with the same index and same radicand are called like radicals.

13.8.8: Rational Exponents

Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with $a^{\frac{1}{n}}$
- Simplify expressions with $a^{\frac{m}{n}}$
- Use the Laws of Exponents to simply expressions with rational exponents

Be Prepared

Before you get started, take this readiness quiz.

1. Add: $\frac{7}{15}+\frac{5}{12}$.
   If you missed this problem, review [link].
2. Simplify: $(4x^2y^5)^3$.
   If you missed this problem, review [link].
3. Simplify: 5^{-3}.
   If you missed this problem, review [link].

Simplify Expressions with $a^{\frac{1}{n}}$

Rational exponents are another way of writing expressions with radicals. When we use **rational exponents**, we can apply the properties of exponents to simplify expressions.

The Power Property for Exponents says that $(a^m)^n=a^{m\cdot n}$ when *m* and *n* are whole numbers. Let's assume we are now not limited to whole numbers.

Suppose we want to find a number *p* such that $(8^p)^3=8$. We will use the Power Property of Exponents to find the value of *p*.

	$(8^p)^3=8$
Multiply the exponents on the left.	$8^{3p}=8$
Write the exponent 1 on the right.	$8^{3p}=8^1$
The exponents must be equal.	$3p=1$
Solve for p.	$p=\frac{1}{3}$

But we know also $(\sqrt[3]{8})^3=8$. Then it must be that $8^{\frac{1}{3}}=\sqrt[3]{8}$

This same logic can be used for any positive integer exponent *n* to show that $a^{\frac{1}{n}}=\sqrt[n]{a}$.

Definition: RATIONAL EXPONENT $a^{\frac{1}{n}}$

If $\sqrt[n]{a}$ is a real number and $n\geq 2$, $a^{\frac{1}{n}}=\sqrt[n]{a}$.

There will be times when working with expressions will be easier if you use **rational exponents** and times when it will be easier if you use radicals. In the first few examples, you'll practice converting expressions between these two notations.

Example 13.8.8.1

Write as a radical expression:

1. $x^{\frac{1}{2}}$
2. $y^{\frac{1}{3}}$
3. $z^{\frac{1}{4}}$.

Answer

We want to write each expression in the form $\sqrt[n]{a}$.

1.	$x^{\frac{1}{2}}$
The denominator of the exponent is 2, so the index of the radical is 2. We do not show the index when it is 2.	$\sqrt{x}$
2.	$y^{\frac{1}{3}}$
The denominator of the exponent is 3, so the index is 3.	$\sqrt[3]{y}$
3.	z^\frac{1}{4}}
The denominator of the exponent is 4, sothe index is 4.	$\sqrt[4]{z}$

Example 13.8.8.2

Write as a radical expression:

1. $t^{\frac{1}{2}}$
2. $m^{\frac{1}{3}}$
3. $r^{\frac{1}{4}}$.

Answer

1. $\sqrt{t}$
2. $\sqrt[3]{m}$
3. $\sqrt[4]{r}$

Example 13.8.8.3

Write as a radical expression:

1. $b^{\frac{1}{2}}$
2. $z^{\frac{1}{3}}$
3. $p^{\frac{1}{4}}$.

Answer

1. $\sqrt{b}$
2. $\sqrt[3]{z}$
3. $\sqrt[4]{p}$

Example 13.8.8.4

Write with a rational exponent:

1. $\sqrt{x}$
2. $\sqrt[3]{y}$
3. $\sqrt[4]{z}$.

Answer

We want to write each radical in the form $a^{\frac{1}{n}}$.

1.	$\sqrt{x}$

No index is shown, so it is 2. The denominator of the exponent will be 2.	$x^{\frac{1}{2}}$
2.	$\sqrt[3]{y}$
The index is 3, so the denominator of the exponent is 3.	$y^{\frac{1}{3}}$
3.	$\sqrt[4]{z}$
The index is 4, so the denominator of the exponent is 4.	$z^{\frac{1}{4}}$

Example 13.8.8.5

Write with a rational exponent:

1. $\sqrt{s}$
2. $\sqrt[3]{x}$
3. $\sqrt[4]{b}$.

Answer

1. $s^{\frac{1}{2}}$
2. $x^{\frac{1}{3}}$
3. \(b^{\frac{1}{4}}\

Example 13.8.8.6

Write with a rational exponent:

1. $\sqrt{v}$
2. $\sqrt[3]{p}$
3. $\sqrt[4]{p}$.

Answer

1. $v^{\frac{1}{2}}$
2. $p^{\frac{1}{3}}$
3. $p^{\frac{1}{4}}$

Example 13.8.8.7

Write with a rational exponent:

1. $\sqrt{5y}$
2. $\sqrt[3]{4x}$
3. $3\sqrt[4]{5z}$.

Answer

1.	$\sqrt{5y}$
No index is shown, so it is 2. The denominator of the exponent will be 2.	$(5y)^{\frac{1}{2}}$
2.	$\sqrt[3]{4x}$
The index is 3, so the denominator of the exponent is 3.	$(4x)^{\frac{1}{3}}$

3.	$3\sqrt[4]{5z}$
The index is 4, so the denominator of the exponent is 4.	$3(5z)^{\frac{1}{4}}$

Example 13.8.8.8

Write with a rational exponent:

1. $\sqrt{10m}$
2. $\sqrt[5]{3n}$
3. $3\sqrt[4]{6y}$.

Answer

1. $(10^m)^{\frac{1}{2}}$
2. $(3n)^{\frac{1}{5}}$
3. $(486y)^{\frac{1}{4}}$

Example 13.8.8.9

Write with a rational exponent:

1. $\sqrt[7]{3k}$
2. $\sqrt[4]{5j}$
3. $\sqrt[3]{82a}$.

Answer

1. $(3k)^{\frac{1}{7}}$
2. $(5j)^{\frac{1}{4}}$
3. $(1024a)^{\frac{1}{3}}$

In the next example, you may find it easier to simplify the expressions if you rewrite them as radicals first.

Example 13.8.8.10

Simplify:

1. $25^{\frac{1}{2}}$
2. $64^{\frac{1}{3}}$
3. $256^{\frac{1}{4}}$.

Answer

1.	$25^{\frac{1}{2}}$
Rewrite as a square root.	$\sqrt{25}$
Simplify.	5
2.	$64^{\frac{1}{3}}$
Rewrite as a cube root.	$\sqrt[3]{64}$
Recognize 64 is a perfect cube.	$\sqrt[3]{4^3}$
Simplify.	4

3.	$256^{\frac{1}{4}}$
Rewrite as a fourth root.	$\sqrt[4]{256}$
Recognize 256 is a perfect fourth power.	$\sqrt[4]{4^4}$
Simplify.	4

Example 13.8.8.11

Simplify:

1. $36^{\frac{1}{2}}$
2. $8^{\frac{1}{3}}$
3. $16^{\frac{1}{4}}$.

Answer

1. 6
2. 2
3. 2

Example 13.8.8.12

Simplify:

1. $100^{\frac{1}{2}}$
2. $27^{\frac{1}{3}}$
3. $81^{\frac{1}{4}}$.

Answer

1. 10
2. 3
3. 3

Be careful of the placement of the negative signs in the next example. We will need to use the property $a^{-n} = \frac{1}{a^n}$ in one case.

Example 13.8.8.13

Simplify:

1. $(-64)^{\frac{1}{3}}$
2. $-64^{\frac{1}{3}}$
3. $(64)^{-\frac{1}{3}}$.

Answer

1.	$(-64)^{\frac{1}{3}}$
Rewrite as a cube root.	$\sqrt[3]{-64}$
Rewrite-64 as a perfect cube.	$\sqrt[3]{(-4)^3}$
Simplify.	-4
2.	$-64^{\frac{1}{3}}$

The exponent applies only to the 64.	$-(64^{\frac{1}{3}})$
Rewrite as a cube root.	$-\sqrt[3]{64}$
Rewrite 64 as 4^3.	$-\sqrt[3]{4^3}$
Simplify.	-4
3.	$(64)^{-\frac{1}{3}}$
Rewrite as a fraction with a positive exponent, using the property, $a^{-n}=\frac{1}{a^n}$. Write as a cube root.	$\frac{1}{\sqrt[3]{64}}$
Rewrite 64 as 4^3.	$\frac{1}{\sqrt[3]{4^3}}$
Simplify.	$\frac{1}{4}$

Example 13.8.8.14

Simplify:

1. $(-125)^{\frac{1}{3}}$
2. $-125^{\frac{1}{3}}$
3. $(125)^{-\frac{1}{3}}$.

Answer

1. -5
2. -5
3. $\frac{1}{5}$

Example 13.8.8.15

Simplify:

1. $(-32)^{\frac{1}{5}}$
2. $-32^{\frac{1}{5}}$
3. $(32)^{-\frac{1}{5}}$.

Answer

1. -2
2. -2
3. $\frac{1}{2}$

Example 13.8.8.16

Simplify:

1. $(-16)^{\frac{1}{4}}$
2. $-16^{\frac{1}{4}}$
3. $(16)^{-\frac{1}{4}}$.

Answer

1.	$(-16)^{\frac{1}{4}}$

Rewrite as a fourth root.	$\sqrt[4]{-16}$
There is no real number whose fourth power is −16.	
2.	$-16^{\frac{1}{4}}$
The exponent applies only to the 16.	$-(16^{\frac{1}{4}})$
Rewrite as a fourth root.	$-\sqrt[4]{16}$
Rewrite 16 as 2^4	$-\sqrt[4]{2^4}$
Simplify.	-2
3.	$(16)^{-\frac{1}{4}}$
Rewrite as a fraction with a positive exponent, using the property, $a^{-n}=\frac{1}{a^n}$.	$\frac{1}{(16)^{\frac{1}{4}}}$
Rewrite as a fourth root.	$\frac{1}{\sqrt[4]{16}}$
Rewrite 16 as 2^4.	$\frac{1}{\sqrt[4]{2^4}}$
Simplify.	$\frac{1}{2}$

? Example 13.8.8.17

Simplify:

1. $(-64)^{\frac{1}{2}}$
2. $-64^{\frac{1}{2}}$
3. $(64)^{-\frac{1}{2}}$.

Answer

1. −8
2. −8
3. $\frac{1}{8}$

? Example 13.8.8.18

Simplify:

1. $(-256)^{\frac{1}{4}}$
2. $-256^{\frac{1}{4}}$
3. $(256)^{-\frac{1}{4}}$.

Answer

1. −4
2. −4
3. $\frac{1}{4}$

Simplify Expressions with $a^{\frac{m}{n}}$

Let's work with the Power Property for Exponents some more.

Suppose we raise $a^{\frac{1}{n}}$ to the power *m*.

	$(a^{\frac{1}{n}})^m$
Multiply the exponents.	$a^{\frac{1}{n}\cdot m}$
Simplify.	$a^{\frac{m}{n}}$
So $a^{\frac{m}{n}} = (\sqrt[n]{a})^m$ also.	

Now suppose we take a^m to the $\frac{1}{n}$ power.

	$(a^m)^{\frac{1}{n}}$
Multiply the exponents.	$a^{m\cdot\frac{1}{n}}$
Simplify.	$a^{\frac{m}{n}}$
So $a^{\frac{m}{n}} = \sqrt[n]{a^m}$ also.	

Which form do we use to simplify an expression? We usually take the root first—that way we keep the numbers in the radicand smaller.

Definition: RATIONAL EXPONENT $a^{\frac{m}{n}}$

For any positive integers *m* and *n*,

$a^{\frac{m}{n}} = (\sqrt[n]{a})^m$

$a^{\frac{m}{n}} = \sqrt[n]{a^m}$

Example 13.8.8.19

Write with a rational exponent:

1. $\sqrt{y^3}$
2. $\sqrt[3]{x^2}$
3. $\sqrt[4]{z^3}$

Answer

We want to use $a^{\frac{m}{n}} = \sqrt[n]{a^m}$ to write each radical in the form $a^{\frac{m}{n}}$.

1. The numerator of the exponent is the exponent of *y*, 3. $\sqrt{y^3}$
   The denominator of the exponent is the index of the radical, 2. $y^{\frac{3}{2}}$
2. The numerator of the exponent is the exponent of *x*, 2. $\sqrt[3]{x^2}$
   The denominator of the exponent is the index of the radical, 3. $x^{\frac{2}{3}}$
3. The numerator of the exponent is the exponent of *z*, 3. $\sqrt[4]{z^3}$
   The denominator of the exponent is the index of the radical, 4. $z^{\frac{3}{4}}$

Example 13.8.8.20

Write with a rational exponent:

1. $\sqrt{x^5}$
2. $\sqrt[4]{z^3}$
3. $\sqrt[5]{y^2}$.

Answer

1. $x^{\frac{5}{2}}$
2. $z^{\frac{3}{4}}$

3. $y^{\frac{2}{5}}$

Example 13.8.8.21

Write with a rational exponent:

1. $\sqrt[5]{a^2}$
2. $\sqrt[3]{b^7}$
3. $\sqrt[4]{m^5}$.

Answer

1. $a^{\frac{2}{5}}$
2. $b^{\frac{7}{3}}$
3. $m^{\frac{5}{4}}$

Example 13.8.8.22

Simplify:

1. $9^{\frac{3}{2}}$
2. $125^{\frac{2}{3}}$
3. $81^{\frac{3}{4}}$.

Answer

We will rewrite each expression as a radical first using the property, $a^{\frac{m}{n}} = (\sqrt[n]{a})^m$. This form lets us take the root first and so we keep the numbers in the radicand smaller than if we used the other form.

1.	$9^{\frac{3}{2}}$
The power of the radical is the numerator of the exponent, 3. Since the denominator of the exponent is 2, this is a square root.	$(\sqrt{9})^3$
Simplify.	3^3
	27
2.	$125^{\frac{2}{3}}$
The power of the radical is the numerator of the exponent, 2. Since the denominator of the exponent is 3, this is a square root.	$(\sqrt[3]{125})^2$
Simplify.	5^2
	25
3.	$81^{\frac{3}{4}}$
The power of the radical is the numerator of the exponent, 2. Since the denominator of the exponent is 3, this is a square root.	$(\sqrt[4]{81})^3$
Simplify.	3^3
	27

Example 13.8.8.23

Simplify:

1. $4^{\frac{3}{2}}$
2. $27^{\frac{2}{3}}$
3. $625^{\frac{3}{4}}$.

Answer

1. 8
2. 9
3. 125

Example 13.8.8.24

Simplify:

1. $8^{\frac{5}{3}}$
2. $81^{\frac{3}{2}}$
3. $16^{\frac{3}{4}}$.

Answer

1. 32
2. 729
3. 8

Remember that $b^{-p}=\frac{1}{b^p}$. The negative sign in the exponent does not change the sign of the expression.

Example 13.8.8.25

Simplify:

1. $16^{-\frac{3}{2}}$
2. $32^{-\frac{2}{5}}$
3. $4^{-\frac{5}{2}}$

Answer

We will rewrite each expression first using $b^{-p}=\frac{1}{b^p}$ and then change to radical form.

1.	$16^{-\frac{3}{2}}$
Rewrite using $b^{-p}=\frac{1}{b^p}$.	$\frac{1}{16^{\frac{3}{2}}}$
Change to radical form. The power of the radical is the numerator of the exponent, 3. The index is the denominator of the exponent, 2.	$\frac{1}{(\sqrt{16})^3}$
Simplify.	$\frac{1}{4^3}$
	$\frac{1}{64}$
2.	$32^{-\frac{2}{5}}$
Rewrite using $b^{-p}=\frac{1}{b^p}$.	$\frac{1}{32^{\frac{2}{5}}}$

Change to radical form.	$\frac{1}{(\sqrt[5]{32})^2}$
Rewrite the radicand as a power.	$\frac{1}{(\sqrt[5]{2^5})^2}$
Simplify.	$\frac{1}{2^2}$
	$\frac{1}{4}$
3.	$4^{-\frac{5}{2}}$
Rewrite using $b^{-p}=\frac{1}{b^p}$.	$\frac{1}{4^{\frac{5}{2}}}$
Change to radical form.	$\frac{1}{(\sqrt{4})^5}$
Simplify.	$\frac{1}{2^5}$
	$\frac{1}{32}$

Example 13.8.8.26

Simplify:

1. $8^{-\frac{5}{3}}8$
2. $81^{-\frac{3}{2}}$
3. $16^{-\frac{3}{4}}$.

Answer

1. $\frac{1}{32}$
2. $\frac{1}{729}$
3. $\frac{1}{8}$

Example 13.8.8.27

Simplify:

1. $4^{-\frac{3}{2}}$
2. $27^{-\frac{2}{3}}$
3. $625^{-\frac{3}{4}}$.

Answer

1. $\frac{1}{8}$
2. $\frac{1}{9}$
3. $\frac{1}{125}$

Example 13.8.8.28

Simplify:

1. $-25^{\frac{3}{2}}$
2. $-25^{-\frac{3}{2}}$
3. $(-25)^{\frac{3}{2}}$.

Answer

1.	$-25^{\frac{3}{2}}$
Rewrite in radical form.	$-(\sqrt{25})^3$
Simplify the radical	-5^3
Simplify.	-125
2.	$-25^{-\frac{3}{2}}$
Rewrite using $b^{-p}=\frac{1}{b^p}$.	$-(\frac{1}{25^{\frac{3}{2}}})$
Rewrite in radical form.	$-(\frac{1}{(\sqrt{25})^3})$
Simplify the radical.	$-(\frac{1}{5^3})$
Simplify.	$-\frac{1}{125}$
3.	$(-25)^{\frac{3}{2}}$.
Rewrite in radical form.	$(\sqrt{-25})^3$
There is no real number whose square root is -25.	Not a real number.

? Example 13.8.8.29

Simplify:

1. $-16^{\frac{3}{2}}$
2. $-16^{-\frac{3}{2}}$
3. $(-16)^{-\frac{3}{2}}$.

Answer

1. -64
2. $-\frac{1}{64}$
3. not a real number

? Example 13.8.8.30

Simplify:

1. $-81^{\frac{3}{2}}$
2. $-81^{-\frac{3}{2}}$
3. $(-81)^{-\frac{3}{2}}$.

Answer

1. -729
2. $-\frac{1}{729}$
3. not a real number

Use the Laws of Exponents to Simplify Expressions with Rational Exponents

The same laws of exponents that we already used apply to rational exponents, too. We will list the Exponent Properties here to have them for reference as we simplify expressions.

SUMMARY OF EXPONENT PROPERTIES

If a,b are real numbers and m,n are rational numbers, then

Product Property	$a^m \cdot a^n = a^{m+n}$
Power Property	$(a^m)^n = a^{m \cdot n}$
Product to a Power	$(ab)^m = a^m b^m$
Quotient Property	$\frac{a^m}{a^n} = a^{m-n}, a \neq 0, m > n$
	$\frac{a^m}{a^n} = \frac{1}{a^{n-m}}, a \neq 0, n > m$
Zero Exponent Definition	$a^0 = 1, a \neq 0$
Quotient to a Power Property	$(\frac{a}{b})^m = \frac{a^m}{b^m}, b \neq 0$

When we multiply the same base, we add the exponents.

Example 13.8.8.31

Simplify:

1. $2^{\frac{1}{2}} \cdot 2^{\frac{5}{2}}$
2. $x^{\frac{2}{3}} \cdot x^{\frac{4}{3}}$
3. $z^{\frac{3}{4}} \cdot z^{\frac{5}{4}}$.

Answer

1.	$2^{\frac{1}{2}} \cdot 2^{\frac{5}{2}}$
The bases are the same, so we add the exponents.	$2^{\frac{1}{2}+\frac{5}{2}}$
Add the fractions.	$2^{\frac{6}{2}}$
Simplify the exponent.	2^3
Simplify.	8
2.	$x^{\frac{2}{3}} \cdot x^{\frac{4}{3}}$
The bases are the same, so we add the exponents.	$x^{\frac{2}{3}+\frac{4}{3}}$
Add the fractions.	$x^{\frac{6}{3}}$
Simplify.	x^2
3.	$z^{\frac{3}{4}} \cdot z^{\frac{5}{4}}$
The bases are the same, so we add the exponents.	$z^{\frac{3}{4}+\frac{5}{4}}$
Add the fractions.	$z^{\frac{8}{4}}$
Simplify.	z^2

Example 13.8.8.32

Simplify:

1. $3^{\frac{2}{3}} \cdot 3^{\frac{4}{3}}$
2. $y^{\frac{1}{3}} \cdot y^{\frac{8}{3}}$
3. $m^{\frac{1}{4}} \cdot m^{\frac{3}{4}}$.

Answer

1. 9
2. y^3
3. m

Example 13.8.8.33

Simplify:

1. $5^{\frac{3}{5}} \cdot 5^{\frac{7}{5}}$
2. $z^{\frac{1}{8}} \cdot z^{\frac{7}{8}}$
3. $n^{\frac{2}{7}} \cdot n^{\frac{5}{7}}$.

Answer

1. 25
2. z
3. n

We will use the Power Property in the next example.

Example 13.8.8.34

Simplify:

1. $(x^4)^{\frac{1}{2}}$
2. $(y^6)^{\frac{1}{3}}$
3. $(z^9)^{\frac{2}{3}}$.

Answer

1.	$(x^4)^{\frac{1}{2}}$
To raise a power to a power, we multiply the exponents.	$x^{4 \cdot \frac{1}{2}}$
Simplify.	x^2
2.	$(y^6)^{\frac{1}{3}}$
To raise a power to a power, we multiply the exponents.	$y^{6 \cdot \frac{1}{3}}$
Simplify.	y^2
3.	$(z^9)^{\frac{2}{3}}$
To raise a power to a power, we multiply the exponents.	$z^{9 \cdot \frac{2}{3}}$
Simplify.	z^6

Example 13.8.8.35

Simplify:

1. $(p^{10})^{\frac{1}{5}}$
2. $(q^8)^{\frac{3}{4}}$
3. $(x^6)^{\frac{4}{3}}$

Answer

1. p^
2. q^6
3. x^8

Example 13.8.8.36

Simplify:

1. $(r^6)^{\frac{5}{3}}$
2. $(s^{12})^{\frac{3}{4}}$
3. $(m^9)^{\frac{2}{9}}$

Answer

1. r^{10}
2. s^9
3. m^2

The Quotient Property tells us that when we divide with the same base, we subtract the exponents.

Example 13.8.8.37

Simplify:

1. $\frac{x^{\frac{4}{3}}}{x^{\frac{1}{3}}}$
2. $\frac{y^{\frac{3}{4}}}{y^{\frac{1}{4}}}$
3. $\frac{z^{\frac{2}{3}}}{z^{\frac{5}{3}}}$.

Answer

1.	$\frac{x^{\frac{4}{3}}}{x^{\frac{1}{3}}}$
To divide with the same base, we subtract the exponents.	$x^{\frac{4}{3}-\frac{1}{3}}$
Simplify.	x
2.	$\frac{y^{\frac{3}{4}}}{y^{\frac{1}{4}}}$
To divide with the same base, we subtract the exponents.	$y^{\frac{3}{4}-\frac{1}{4}}$
Simplify.	$y^{\frac{1}{2}}$
3.	$\frac{z^{\frac{2}{3}}}{z^{\frac{5}{3}}}$
To divide with the same base, we subtract the exponents.	$z^{\frac{2}{3}-\frac{5}{3}}$
Rewrite without a negative exponent.	$\frac{1}{z}$

Example 13.8.8.38

Simplify:

1. $\frac{u^{\frac{5}{4}}}{u^{\frac{1}{4}}}$
2. $\frac{v^{\frac{3}{5}}}{v^{\frac{2}{5}}}$
3. $\frac{x^{\frac{2}{3}}}{x^{\frac{5}{3}}}$.

Answer

1. u
2. $v^{\frac{1}{5}}$
3. $\frac{1}{x}$

Example 13.8.8.39

Simplify:

1. $\frac{c^{\frac{12}{5}}}{c^{\frac{2}{5}}}$
2. $\frac{m^{\frac{5}{4}}}{m^{\frac{9}{4}}}$
3. $\frac{d^{\frac{1}{5}}}{d^{\frac{6}{5}}}$.

Answer

1. c^2
2. $\frac{1}{m}$
3. $\frac{1}{d}$

Sometimes we need to use more than one property. In the next two examples, we will use both the Product to a Power Property and then the Power Property.

Example 13.8.8.40

Simplify:

1. $(27u^{\frac{1}{2}})^{\frac{2}{3}}$
2. $(8v^{\frac{1}{4}})^{\frac{2}{3}}$.

Answer

1.	$(27u^{\frac{1}{2}})^{\frac{2}{3}}$
First we use the Product to a Power Property.	$(27)^{\frac{2}{3}}(u^{\frac{1}{2}})^{\frac{2}{3}}$
Rewrite 27 as a power of 3.	$(3^3)^{\frac{2}{3}}(u^{\frac{1}{2}})^{\frac{2}{3}}$
To raise a power to a power, we multiply the exponents.	$(3^2)(u^{\frac{1}{3}})$
Simplify.	$9u^{\frac{1}{3}}$
2.	$(8v^{\frac{1}{4}})^{\frac{2}{3}}$.

First we use the Product to a Power Property.	$(8)^{\frac{2}{3}}(v^{\frac{1}{4}})^{\frac{2}{3}}$
Rewrite 8 as a power of 2.	$(2^3)^{\frac{2}{3}}(v^{\frac{1}{4}})^{\frac{2}{3}}$
To raise a power to a power, we multiply the exponents.	$(2^2)(v^{\frac{1}{6}})$
Simplify.	$4v^{\frac{1}{6}}$

Example 13.8.8.41

Simplify:

1. $32x^{\frac{1}{3}})^{\frac{3}{5}}$
2. $(64y^{\frac{2}{3}})^{\frac{1}{3}}$.

Answer

1. $8x^{\frac{1}{5}}$
2. $4y^{\frac{2}{9}}$

Example 13.8.8.42

Simplify:

1. $(16m^{\frac{1}{3}})^{\frac{3}{2}}$
2. $(81n^{\frac{2}{5}})^{\frac{3}{2}}$.

Answer

1. $64m^{\frac{1}{2}}$
2. $729n^{\frac{3}{5}}$

Example 13.8.8.43

Simplify:

1. $(m^3n^9)^{\frac{1}{3}}$
2. $(p^4q^8)^{\frac{1}{4}}$.

Answer

1.	$(m^3n^9)^{\frac{1}{3}}$
First we use the Product to a Power Property.	$(m^3)^{\frac{1}{3}}(n^9)^{\frac{1}{3}}$
To raise a power to a power, we multiply the exponents.	mn^3
2.	$(p^4q^8)^{\frac{1}{4}}$
First we use the Product to a Power Property.	$(p^4)^{\frac{1}{4}}(q^8)^{\frac{1}{4}}$
To raise a power to a power, we multiply the exponents.	pq^2

We will use both the Product and Quotient Properties in the next example.

Exercise 13.8.8.44

Simplify:

1. $\frac{x^{\frac{3}{4}} \cdot x^{-\frac{1}{4}}}{x^{-\frac{6}{4}}}$
2. $\frac{y^{\frac{4}{3}} \cdot y}{y^{-\frac{2}{3}}}$.

Answer

1.	$\frac{x^{\frac{3}{4}} \cdot x^{-\frac{1}{4}}}{x^{-\frac{6}{4}}}$
Use the Product Property in the numerator, add the exponents.	$\frac{x^{\frac{2}{4}}}{x^{-\frac{6}{4}}}$
Use the Quotient Property, subtract the exponents.	$x^{\frac{8}{4}}$
Simplify.	x^2
2.	$\frac{y^{\frac{4}{3}} \cdot y}{y^{-\frac{2}{3}}}$
Use the Product Property in the numerator, add the exponents.	$\frac{y^{\frac{7}{3}}}{y^{-\frac{2}{3}}}$
Use the Quotient Property, subtract the exponents.	$y^{\frac{9}{3}}$
Simplify.	y^3

Example 13.8.8.45

Simplify:

1. $\frac{m^{\frac{2}{3}} \cdot m^{-\frac{1}{3}}}{m^{-\frac{5}{3}}}$
2. $\frac{n^{\frac{1}{6}} \cdot n}{n^{-\frac{11}{6}}}$.

Answer

1. m^2
2. n^3

Example 13.8.8.46

Simplify:

1. $\frac{u^{\frac{4}{5}} \cdot u^{-\frac{2}{5}}}{u^{-\frac{13}{5}}}$
2. $\frac{v^{\frac{1}{2}} \cdot v}{v^{-\frac{7}{2}}}$.

Answer

1. u^3
2. v^5

Key Concepts

- **Summary of Exponent Properties**
- If a,b are real numbers and m,n are rational numbers, then
  - **Product Property** $a^m \cdot a^n = a^{m+n}$
  - **Power Property** $(a^m)^n = a^{m \cdot n}$
  - **Product to a Power** $(ab)^m = a^m b^m$
  - **Quotient Property**:

    $\frac{a^m}{a^n} = a^{m-n}, a \neq 0, m > n$

    $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}, a \neq 0, n > m$
  - **Zero Exponent Definition** $a^0 = 1, a \neq 0$
  - **Quotient to a Power Property** $(\frac{a}{b})^m = \frac{a^m}{b^m}, b \neq 0$

Glossary

rational exponents

- If $\sqrt[n]{a}$ is a real number and $n \geq 2$, $a^{\frac{1}{n}} = \sqrt[n]{a}$
- For any positive integers *m* and *n*, $a^{\frac{m}{n}} = (\sqrt[n]{a})^m$ and $a^{\frac{m}{n}} = \sqrt[n]{a^m}$

13.8.8E: Exercises

Practice Makes Perfect

Simplify Expressions with $a^{\frac{1}{n}}$

In the following exercises, write as a radical expression.

Example 13.8.8E.47

1. $x^{\frac{1}{2}}$
2. $y^{\frac{1}{3}}$
3. $z^{\frac{1}{4}}$

Example 13.8.8E.48

1. $r^{\frac{1}{2}}$
2. $s^{\frac{1}{3}}$
3. $t^{\frac{1}{4}}$

Answer

1. $\sqrt{r}$
2. $\sqrt[3]{s}$
3. $\sqrt[4]{t}$

Example 13.8.8E.49

1. $u^{\frac{1}{5}}$
2. $v^{\frac{1}{9}}$
3. $w^{\frac{1}{20}}$

Example 13.8.8E.50

1. $g^{\frac{1}{7}}$
2. $h^{\frac{1}{5}}$
3. $j^{\frac{1}{25}}$

Answer

1. $\sqrt[7]{g}$
2. $\sqrt[5]{h}$
3. $\sqrt[25]{j}$

In the following exercises, write with a rational exponent.

Example 13.8.8E.51

1. $-\sqrt[7]{x}$
2. $\sqrt[9]{y}$
3. $\sqrt[5]{f}$

Example 13.8.8E.52

1. $\sqrt[8]{r}$
2. $\sqrt[10]{s}$
3. \(\sqrt[4]{t}\)

Answer

1. $r^{\frac{1}{8}}$
2. $s^{\frac{1}{10}}$
3. $t^{\frac{1}{4}}$

Example 13.8.8E.53

1. \(\sqrt[3]{a}\
2. $\sqrt[12]{b}$
3. $\sqrt{c}$

Example 13.8.8E.54

1. $\sqrt[5]{u}$
2. $\sqrt{v}$
3. $\sqrt[16]{w}$

Answer

1. $u^{\frac{1}{5}}$
2. $v^{\frac{1}{2}}$
3. $w^{\frac{1}{16}}$

Example 13.8.8E.55

1. $\sqrt[3]{7c}$
2. $\sqrt[7]{12d}$
3. $3\sqrt[4]{5f}$

Example 13.8.8E.56

1. $\sqrt[4]{5x}$
2. $\sqrt[8]{9y}$
3. $7\sqrt[5]{3z}$

Answer

1. $(5x)^{\frac{1}{4}}$
2. $(9y)^{\frac{1}{8}}$
3. $7(3z)^{\frac{1}{5}}$

https://math.libretexts.org/@go/page/46329

Example 13.8.8E.57

1. $\sqrt{21p}$
2. $\sqrt[4]{8q}$
3. $\sqrt[6]{436r}$

Example 13.8.8E.58

1. $\sqrt[3]{25a}$
2. $\sqrt{3b}$
3. $\sqrt[10]{40c}$

Answer

1. $(25a)^{\frac{1}{3}}$
2. $(3b)^{\frac{1}{2}}$
3. $(40c)^{\frac{1}{10}}$

In the following exercises, simplify.

Example 13.8.8E.59

1. $81^{\frac{1}{2}}$
2. $125^{\frac{1}{3}}$
3. $64^{\frac{1}{2}}$

Example 13.8.8E.60

1. $625^{\frac{1}{4}}$
2. $243^{\frac{1}{5}}$
3. $32^{\frac{1}{5}}$

Answer

1. 5
2. 3
3. 2

Example 13.8.8E.61

1. $16^{\frac{1}{4}}$
2. $16^{\frac{1}{2}}$
3. $3125^{\frac{1}{5}}$

Example 13.8.8E.62

1. $216^{\frac{1}{3}}$
2. $32^{\frac{1}{5}}$
3. $81^{\frac{1}{4}}$

Answer

1. 6
2. 2
3. 3

Example 13.8.8E.63

1. $(-216)^{\frac{1}{3}}$
2. $-216^{\frac{1}{3}}$
3. $(216)^{-\frac{1}{3}}$

Example 13.8.8E.64

1. $(-243)^{\frac{1}{5}}$
2. $-243^{\frac{1}{5}}$
3. $(243)^{-\frac{1}{5}}$

Answer

1. -3
2. -3
3. $\frac{1}{3}$

Example 13.8.8E.65

1. $(-1)^{\frac{1}{3}}$
2. $-1^{\frac{1}{3}}$
3. $(1)^{-\frac{1}{3}}$

Example 13.8.8E.66

1. $(-1000)^{\frac{1}{3}}$
2. $-1000^{\frac{1}{3}}$
3. $(1000)^{-\frac{1}{3}}$

Answer

1. -10
2. -10
3. \(\frac{1}{10}

Example 13.8.8E.67

1. $(-81)^{\frac{1}{4}}$
2. $-81^{\frac{1}{4}}$
3. $(81)^{-\frac{1}{4}}$

Example 13.8.8E.68

1. $(-49)^{\frac{1}{2}}$
2. $-49^{\frac{1}{2}}$
3. $(49)^{-\frac{1}{2}}$

Answer

1. not a real number
2. -7
3. $\frac{1}{7}$

Example 13.8.8E.69

1. $(-36)^{\frac{1}{2}}$
2. $-36^{\frac{1}{2}}$
3. $(36)^{-\frac{1}{2}}$

Example 13.8.8E.70

1. $(-1)^{\frac{1}{4}}$
2. $(1)^{-\frac{1}{4}}$
3. $-1^{\frac{1}{4}}$

Answer

1. not a real number
2. 1
3. -1

Example 13.8.8E.71

1. $(-100)^{\frac{1}{2}}$
2. $-100^{\frac{1}{2}}$
3. $(100)^{-\frac{1}{2}}$

Example 13.8.8E.72

1. $(-32)^{\frac{1}{5}}$
2. $(243)^{-\frac{1}{5}}$
3. $-125^{\frac{1}{3}}$

Answer

1. -2
2. $\frac{1}{3}$
3. -5

Simplify Expressions with $a^{\frac{m}{n}}$

In the following exercises, write with a rational exponent.

Example 13.8.8E.73

1. $\sqrt{m^5}$
2. $\sqrt[3]{n^2}$
3. $\sqrt[4]{p^3}$

https://math.libretexts.org/@go/page/46329

Example 13.8.8E.74

1. $\sqrt[4]{r^7}$
2. $\sqrt[5]{s^3}$
3. $\sqrt[3]{t^7}$

Answer

1. $r^{\frac{7}{4}}$
2. $s^{\frac{3}{5}}$
3. $t^{\frac{7}{3}}$

Exercise 13.8.8E.75

1. $\sqrt[5]{u^2}$
2. $\sqrt[5]{v^8}$
3. $\sqrt[9]{w^4}$

Example 13.8.8E.76

1. $\sqrt[3]{a}$
2. $\sqrt[5]{b}$
3. $\sqrt[3]{c^5}$

Answer

1. $a^{\frac{1}{3}}$
2. $b^{\frac{1}{5}}$
3. $c^{\frac{5}{3}}$

In the following exercises, simplify.

Example 13.8.8E.77

1. $16^{\frac{3}{2}}$
2. $8^{\frac{2}{3}}$
3. $10,000^{\frac{3}{4}}$

Example 13.8.8E.78

1. $1000^{\frac{2}{3}}$
2. $25^{\frac{3}{2}}$
3. $32^{\frac{3}{5}}$

Answer

1. 100
2. 125
3. 8

https://math.libretexts.org/@go/page/46329

Example 13.8.8E.79

1. $275^{\frac{3}{2}}$
2. $16^{\frac{5}{4}}$
3. $32^{\frac{2}{5}}$

Example 13.8.8E.80

1. $16^{\frac{3}{2}}$
2. $125^{\frac{5}{3}}$
3. $64^{\frac{4}{3}}$

Answer

1. 64
2. 3125
3. 256

Example 13.8.8E.81

1. $32^{\frac{2}{5}}$
2. $27^{-\frac{2}{3}}$
3. $25^{-\frac{3}{2}}$

Example 13.8.8E.82

1. $64^{\frac{5}{2}}$
2. $81^{-\frac{3}{2}}$
3. $27^{-\frac{4}{3}}$

Answer

1. 32,768
2. $\frac{1}{729}$
3. $\frac{1}{81}$

Example 13.8.8E.83

1. $25^{\frac{3}{2}}$
2. $9^{-\frac{3}{2}}$
3. $(-64)^{\frac{2}{3}}$

Example 13.8.8E.84

1. $100^{\frac{3}{2}}$
2. $49^{-\frac{5}{2}}$
3. $(-100)^{\frac{3}{2}}$

Answer

1. 1000
2. $\frac{1}{16,807}$

3. not a real numbe

Example 13.8.8E.85

1. $-9^{\frac{3}{2}}$
2. $-9^{-\frac{3}{2}}$
3. $(-9)^{\frac{3}{2}}$

Example 13.8.8E.86

1. $-64^{\frac{3}{2}}$
2. $-64^{-\frac{3}{2}}$
3. $(-64)^{\frac{3}{2}}$

Answer

1. -512
2. $-\frac{1}{512}$
3. not a real number

Example 13.8.8E.87

1. $-100^{\frac{3}{2}}$
2. $-100^{-\frac{3}{2}}$
3. $(-100)^{\frac{3}{2}}$

Example 13.8.8E.88

1. $-49^{\frac{3}{2}}$
2. $-49^{-\frac{3}{2}}$
3. $(-49)^{\frac{3}{2}}$

Answer

1. -343
2. $-\frac{1}{343}$
3. not a real number

Use the Laws of Exponents to Simplify Expressions with Rational Exponents

In the following exercises, simplify.

Example 13.8.8E.89

1. $4^{\frac{5}{8}} \cdot 4^{\frac{11}{8}}$
2. $m^{\frac{7}{12}} \cdot m^{\frac{17}{12}}$
3. $p^{\frac{3}{7}} \cdot p^{\frac{18}{7}}$

Example 13.8.8E.90

1. $6^{\frac{5}{2}} \cdot 6^{\frac{12}{6}}$
2. $n^{\frac{2}{10}} \cdot n^{\frac{8}{10}}$

3. $q^{\frac{2}{5}} \cdot q^{\frac{13}{5}}$

Answer

1. 216
2. n
3. q^3

Example 13.8.8E.91

1. $5^{\frac{1}{2}} \cdot 5^{\frac{7}{2}}$
2. $c^{\frac{3}{4}} \cdot c^{\frac{9}{4}}$
3. $d^{\frac{3}{5}} \cdot d^{\frac{2}{5}}$

Example 13.8.8E.92

1. $10^{\frac{1}{3}} \cdot 10^{\frac{5}{3}}$
2. $x^{\frac{5}{6}} \cdot x^{\frac{7}{6}}$
3. $y^{\frac{11}{8}} \cdot y^{\frac{21}{8}}$

Answer

1. 100
2. x^2
3. y^4

Example 13.8.8E.93

1. $(m^6)^{\frac{5}{2}}$
2. $(n^9)^{\frac{4}{3}}$
3. $(p^{12})^{\frac{3}{4}}$

Example 13.8.8E.94

1. $(a^{12})^{\frac{1}{6}}$
2. $(b^{15})^{\frac{3}{5}}$
3. $(c^{11})^{\frac{1}{11}}$

Answer

1. a^2
2. b^9
3. c

Example 13.8.8E.95

1. $(x^{12})^{\frac{2}{3}}$
2. $(y^{20})^{\frac{2}{5}}$
3. $(z^{16})^{\frac{1}{16}}$

Example 13.8.8E.96

1. $(h^6)^{\frac{4}{3}}$
2. $(k^{12})^{\frac{3}{4}}$
3. $(j^{10})^{\frac{7}{5}}$

Answer

1. h^8
2. k^9
3. j^{14}

Example 13.8.8E.97

1. $\frac{x^{\frac{7}{2}}}{x^{\frac{5}{2}}}$
2. $\frac{y^{\frac{5}{2}}}{y^{\frac{1}{2}}}$
3. $\frac{r^{\frac{4}{5}}}{r^{\frac{9}{5}}}$

Example 13.8.8E.98

1. $\frac{s^{\frac{11}{5}}}{s^{\frac{6}{5}}}$
2. $\frac{z^{\frac{7}{3}}}{z^{\frac{1}{3}}}$
3. $\frac{w^{\frac{2}{7}}}{w^{\frac{9}{7}}}$

Answer

1. s
2. z^2
3. $\frac{1}{w}$

Example 13.8.8E.99

1. $\frac{t^{\frac{12}{5}}}{t^{\frac{7}{5}}}$
2. $\frac{x^{\frac{3}{2}}}{x^{\frac{1}{2}}}$
3. $\frac{m^{\frac{13}{8}}}{m^{\frac{5}{8}}}$

Example 13.8.8E.100

1. $\frac{u^{\frac{13}{9}}}{u^{\frac{4}{9}}}$
2. $\frac{r^{\frac{15}{7}}}{r^{\frac{8}{7}}}$
3. $\frac{n^{\frac{3}{5}}}{n^{\frac{8}{5}}}$

Answer

1. u
2. r
3. $\frac{1}{n}$

Example 13.8.8E.101

1. $(9p^{\frac{2}{3}})^{\frac{5}{2}}$
2. $(27q^{\frac{3}{2}})^{\frac{4}{3}}$

Example 13.8.8E.102

1. $(81r^{\frac{4}{5}})^{\frac{1}{4}}$
2. $(64s^{\frac{3}{7}})^{\frac{1}{6}}$

Answer

1. $3r^{\frac{1}{5}}$
2. $2s^{\frac{1}{14}}$

Example 13.8.8E.103

1. $(16u^{\frac{1}{3}})^{\frac{3}{4}}$
2. $(100v^{\frac{2}{5}})^{\frac{3}{2}}$

Example 13.8.8E.104

1. $(27m^{\frac{3}{4}})^{\frac{2}{3}}$
2. $(625n^{\frac{8}{3}})^{\frac{3}{4}}$

Answer

1. $9m^{\frac{1}{2}}$
2. $125n^2$

Example 13.8.8E.105

1. $(x^8y^{10})^{\frac{1}{2}}$
2. $(a^9by^{12})^{\frac{1}{3}}$

Example 13.8.8E.106

1. $(r^8s^4)^{\frac{1}{4}}$
2. $(u^{15}v^{20})^{\frac{1}{5}}$

Answer

1. r^2s
2. u^3v^4

Example 13.8.8E.107

1. $(a^6 b^{16})^{\frac{1}{2}}$
2. $(j^9 k^6)^{\frac{2}{3}}$

Example 13.8.8E.108

1. $(r^{16} s^{10})^{\frac{1}{2}}$
2. $(u^{10} v^5)^{\frac{4}{5}}$

Answer

1. $r^8 s^5$
2. $u^8 v^4$

Example 13.8.8E.109

1. $\frac{r^{\frac{5}{2}} \cdot r^{-\frac{1}{2}}}{r^{-\frac{3}{2}}}$
2. $\frac{s^{\frac{1}{5}} \cdot s}{s^{-\frac{9}{5}}}$

Example 13.8.8E.110

1. $\frac{a^{\frac{3}{4}} \cdot a^{-\frac{1}{4}}}{a^{-\frac{10}{4}}}$
2. $\frac{b^{\frac{2}{3}} \cdot b}{b^{-\frac{7}{3}}}$

Answer

1. a^3
2. b^4

Example 13.8.8E.111

1. $\frac{c^{\frac{5}{3}} \cdot c^{-\frac{1}{3}}}{c^{-\frac{2}{3}}}$
2. $\frac{d^{\frac{3}{5}} \cdot d}{d^{-\frac{2}{5}}}$

Example 13.8.8E.112

1. $\frac{m^{\frac{7}{4}} \cdot m^{-\frac{5}{4}}}{m^{-\frac{2}{4}}}$
2. $\frac{n^{\frac{3}{7}} \cdot n}{n^{-\frac{4}{7}}}$

Answer

1. m
2. n^2

https://math.libretexts.org/@go/page/46329

Example 13.8.8E.113

$4^{\frac{5}{2}} \cdot 4^{\frac{1}{2}}$

Example 13.8.8E.114

$n^{\frac{2}{6}} \cdot n^{\frac{4}{6}}$

Answer

n

Example 13.8.8E.115

$(a^2 4)^{\frac{1}{6}}$

Example 13.8.8E.116

$(b^{10})^{\frac{3}{5}}$

Answer

b^6

Example 13.8.8E.117

$\frac{w^{\frac{2}{5}}}{w^{\frac{7}{5}}}$

Example 13.8.8E.118

$\frac{z^{\frac{2}{3}}}{z^{\frac{8}{3}}}$

Answer

$\frac{1}{z^2}$

Example 13.8.8E.119

$(27r^{\frac{3}{5}})^{\frac{1}{3}}$

Example 13.8.8E.120

$(64s^{\frac{3}{5}})^{\frac{1}{6}}$

Answer

$2s^{\frac{1}{10}}$

Example 13.8.8E.121

$(r^9 s^{12})^{\frac{1}{3}}$

Example 13.8.8E.122

$(u^{12} v^{18})^{\frac{1}{6}}$

Answer

$u^2 v^3$

Everyday Math

Example 13.8.8E.123

Landscaping Joe wants to have a square garden plot in his backyard. He has enough compost to cover an area of 144 square feet. Simplify $144^{\frac{1}{2}}$ to find the length of each side of his garden.

Example 13.8.8E.124

Landscaping Elliott wants to make a square patio in his yard. He has enough concrete to pave an area of 242 square feet. Simplify $242^{\frac{1}{2}}$ to find the length of each side of his patio.Round to the nearest tenth of a foot.

Answer

15.6 feet

Example 13.8.8E.125

Gravity While putting up holiday decorations, Bob dropped a decoration from the top of a tree that is 12 feet tall. Simplify $\frac{12^{\frac{1}{2}}}{16^{\frac{1}{2}}}$ to find how many seconds it took for the decoration to reach the ground. Round to the nearest tenth of a second.

Example 13.8.8E.126

Gravity An airplane dropped a flare from a height of 1024 feet above a lake. Simplify $\frac{1024^{\frac{1}{2}}}{16^{\frac{1}{2}}}$ to find how many seconds it took for the flare to reach the water.

Answer

8 seconds

Writing Exercises

Example 13.8.8E.127

Show two different algebraic methods to simplify $4^{\frac{3}{2}}$. Explain all your steps.

Example 13.8.8E.128

Explain why the expression $(-16)^{\frac{3}{2}}$ cannot be evaluated.

This page titled 13.8.8E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

13.8.9: Chapter 9 Review Exercises

Chapter 9 Review Exercises

Simplify and Use Square Roots

Simplify Expressions with Square Roots

In the following exercises, simplify.

Exercise 13.8.9.1

$\sqrt{64}$

Exercise 13.8.9.2

$\sqrt{144}$

Answer

12

Exercise 13.8.9.3

$-\sqrt{25}$

Exercise 13.8.9.4

$-\sqrt{81}$

Answer

-9

Exercise 13.8.9.5

$\sqrt{-9}$

Exercise 13.8.9.6

$\sqrt{-36}$

Answer

not a real number

Exercise 13.8.9.7

$\sqrt{64}+\sqrt{225}$

Exercise 13.8.9.8

$\sqrt{64+225}$

Answer

17

Estimate Square Roots

In the following exercises, estimate each square root between two consecutive whole numbers.

Exercise 13.8.9.9

$\sqrt{28}$

Exercise 13.8.9.10

$\sqrt{155}$

Answer

$12 < \sqrt{155} < 13$

Approximate Square Roots

In the following exercises, approximate each square root and round to two decimal places.

Exercise 13.8.9.11

$\sqrt{15}$

Example 13.8.9.12

$\sqrt{57}$

Answer

7.55

Simplify Variable Expressions with Square Roots

In the following exercises, simplify.

Exercise 13.8.9.13

$\sqrt{q^2}$

Exercise 13.8.9.14

$\sqrt{64b^2}$

Answer

8b

Exercis\e 13.8.9.15

$-\sqrt{121a^2}$

Exercise 13.8.9.16

$\sqrt{225m^2n^2}$

Answer

15mn

Exercise 13.8.9.17

$-\sqrt{100q^2}$

Exercise 13.8.9.18

$\sqrt{49y^2}$

Answer

7y

Exercise 13.8.9.19

$\sqrt{4a^2b^2}$

Exercise 13.8.9.20

$\sqrt{121c^2d^2}$

Answer

11cd

Simplify Square Roots

Use the Product Property to Simplify Square Roots

In the following exercises, simplify.

Exercise 13.8.9.21

$\sqrt{300}$

Exercise 13.8.9.22

$\sqrt{98}$

Answer

$7\sqrt{2}$

Exercise 13.8.9.23

$\sqrt{x^{13}}$

Exercise 13.8.9.24

$\sqrt{y^{19}}$

Answer

$y^9\sqrt{y}$

Exercise 13.8.9.25

$\sqrt{16m^4}$

Exercise 13.8.9.26

$\sqrt{36n^{13}}$

Answer

$6n^6\sqrt{n}$

Exercise 13.8.9.27

$\sqrt{288m^{21}}$

Exercise 13.8.9.28

$\sqrt{150n^7}$

Answer

$5n^3\sqrt{6n}$

Exercise 13.8.9.29

$\sqrt{48r^5s^4}$

Exercise 13.8.9.30

$\sqrt{108r^5s^3}$

Answer

$6r^2s\sqrt{3rs}$

Exercise 13.8.9.31

$\frac{10-\sqrt{50}}{5}$

Exercise 13.8.9.32

$\frac{6+\sqrt{72}}{6}$

Answer

$1+\sqrt{2}$

Use the Quotient Property to Simplify Square Roots

In the following exercises, simplify.

Exercise 13.8.9.33

$\sqrt{\frac{16}{25}}$

Exercise 13.8.9.34

$\sqrt{\frac{81}{36}}$

Answer

$\frac{3}{2}$

Exercise 13.8.9.35

$\sqrt{\frac{x^8}{x^4}}$

Exercise 13.8.9.36

$\sqrt{\frac{y^6}{y^2}}$

Answer

y^2

Exercise 13.8.9.37

$\sqrt{\frac{98p^6}{2p^2}}$

Exercise 13.8.9.38

$\sqrt{\frac{72q^8}{2q^4}}$

Answer

$6q^2$

Exercise 13.8.9.39

$\sqrt{\frac{65}{121}}$

Exercise 13.8.9.40

$\sqrt{\frac{26}{169}}$

Answer

$\frac{\sqrt{26}}{13}$

Exercise 13.8.9.41

$\sqrt{\frac{64x^4}{25x^2}}$

Exercise 13.8.9.42

$\sqrt{\frac{36r^{10}}{16r^5}}$

Answer

$\frac{3r^2\sqrt{r}}{2}$

Exercise 13.8.9.43

$\sqrt{\frac{48p^3q^5}{27pq}}$

Exercise 13.8.9.44

$\sqrt{\frac{12r^5s^7}{75r^2s}}$

Answer

$\frac{2rs^3\sqrt{r}}{5}$

Add and Subtract Square Roots

Add and Subtract Like Square Roots

In the following exercises, simplify.

Exercise 13.8.9.45

$3\sqrt{2}+\sqrt{2}$

Exercise 13.8.9.46

$5\sqrt{5}+7\sqrt{5}$

Answer

$12\sqrt{5}$

Exercise 13.8.9.47

$4\sqrt{y}+4\sqrt{y}$

Exercise 13.8.9.48

$6\sqrt{m}-2\sqrt{m}$

Answer

$4\sqrt{m}$

Exercise 13.8.9.49

$-3\sqrt{7}+2\sqrt{7}-\sqrt{7}$

Exercise 13.8.9.50

$8\sqrt{13}+2\sqrt{3}+3\sqrt{13}$

Answer

$11\sqrt{13}+2\sqrt{3}$

Exercise 13.8.9.51

$3\sqrt{5xy}-\sqrt{5xy}+3\sqrt{5xy}$

Exercise 13.8.9.52

$2\sqrt{3rs}+\sqrt{3rs}-5\sqrt{rs}$

Answer

$3\sqrt{3rs}-5\sqrt{rs}$

Add and Subtract Square Roots that Need Simplification

In the following exercises, simplify.

Exercise 13.8.9.53

$\sqrt{32}+3\sqrt{2}$

Exercise 13.8.9.54

$\sqrt{8}+\sqrt{32}$

Answer

$5\sqrt{2}$

Exercise 13.8.9.55

$\sqrt{72}+\sqrt{50}$

Exercise 13.8.9.56

$\sqrt{48}+\sqrt{75}$

Answer

$9\sqrt{3}$

Exercise 13.8.9.57

$3\sqrt{32}+\sqrt{98}$

Exercise 13.8.9.58

$\frac{1}{3}\sqrt{27}-\frac{1}{8}\sqrt{192}$

Answer

0

Exercise 13.8.9.59

$\sqrt{50y^5}-\sqrt{72y^5}$

Exercise 13.8.9.60

Add exercises text here.

Answer

$17n^2\sqrt{2}$

Multiply Square Roots

Multiply Square Roots

In the following exercises, simplify.

Exercise 13.8.9.61

$\sqrt{2}\cdot\sqrt{20}$

Exercise 13.8.9.62

$2\sqrt{2}\cdot 6\sqrt{14}$

Answer

$24\sqrt{7}$

Exercise 13.8.9.63

$\sqrt{2m^2}\cdot\sqrt{20m^4}$

Exercise 13.8.9.64

$(\sqrt{62y})(\sqrt{350y^3})$

Answer

$180y^2$

Exercise 13.8.9.65

$(6\sqrt{3v^4})(5\sqrt{30v})$

Exercise 13.8.9.66

$(\sqrt{8})^2$

Answer

8

Exercise 13.8.9.67

$(-\sqrt{10})^2$

Exercise 13.8.9.68

$(2\sqrt{5})(5\sqrt{5})$

Answer

50

Exercise 13.8.9.69

$(-3\sqrt{3})(5\sqrt{18})$

Use Polynomial Multiplication to Multiply Square Roots

In the following exercises, simplify.

Exercise 13.8.9.70

$10(2-\sqrt{7})$

Answer

$20-10\sqrt{7}$

Exercise 13.8.9.71

$\sqrt{3}(4+\sqrt{12})$

Exercise 13.8.9.72

$(5+\sqrt{2})(3-\sqrt{2})$

Answer

$13-2\sqrt{2}$

Exercise 13.8.9.73

$(5-3\sqrt{7})(1-2\sqrt{7})$

Exercise 13.8.9.74

$(1-3\sqrt{x})(5+2\sqrt{x})$

Answer

$5-13\sqrt{x}-6x$

Exercise 13.8.9.75

$(3+4\sqrt{y})(10-\sqrt{y})$

Exercise 13.8.9.76

$(1+6\sqrt{p})^2$

Answer

$1+12\sqrt{p}+36p$

Exercise 13.8.9.77

$(2-6\sqrt{5})^2$

Exercise 13.8.9.78

$(3+2\sqrt{7})(3-2\sqrt{7})$

Answer

-19

Exercise 13.8.9.79

$(6-\sqrt{11})(6+\sqrt{11})$

Divide Square Roots

Divide Square Roots

In the following exercises, simplify.

Exercise 13.8.9.80

$\frac{\sqrt{75}}{10}$

Answer

$\frac{\sqrt{3}}{2}$

Exercise 13.8.9.81

$\frac{2-\sqrt{12}}{6}$

Exercise 13.8.9.82

$\frac{\sqrt{48}}{\sqrt{27}}$

Answer

$\frac{4}{3}$

Exercise 13.8.9.83

$\frac{\sqrt{75x^7}}{\sqrt{3x^3}}$

Exercise 13.8.9.84

$\frac{\sqrt{20y^5}}{\sqrt{2y}}$

Answer

$y^2\sqrt{10}$

Exercise 13.8.9.85

$\frac{\sqrt{98p^6q^4}}{\sqrt{2p^4q^8}}$

Rationalize a One Term Denominator

In the following exercises, rationalize the denominator.

Exercise 13.8.9.86

$\frac{10}{\sqrt{15}}$

Answer

$\frac{2\sqrt{15}}{3}$

Exercise 13.8.9.87

$\frac{6}{\sqrt{6}}$

Exercise 13.8.9.88

$\frac{5}{3\sqrt{5}}$

Answer

$\frac{\sqrt{5}}{3}$

Exercise 13.8.9.89

$\frac{10}{2\sqrt{6}}$

Exercise 13.8.9.90

$\sqrt{\frac{3}{28}}$

Answer

$\frac{\sqrt{21}}{14}$

Exercise 13.8.9.91

$\sqrt{\frac{9}{75}}$

Rationalize a Two Term Denominator

In the following exercises, rationalize the denominator.

Exercise 13.8.9.92

$\frac{4}{4+\sqrt{27}}$

Answer

$\frac{16-12\sqrt{3}}{-11}$

Exercise 13.8.9.93

$\frac{5}{2-\sqrt{10}}$

Exercise 13.8.9.94

$\frac{4}{2-\sqrt{5}}$

Answer

$-8-4\sqrt{5}$

Exercise 13.8.9.95

$\frac{5}{4-\sqrt{8}}$

Exercise 13.8.9.96

$\frac{\sqrt{2}}{\sqrt{p}+\sqrt{3}}$

Answer

$\frac{\sqrt{2p}-\sqrt{6}}{p-3}$

Exercise 13.8.9.97

$\frac{\sqrt{x}-\sqrt{2}}{\sqrt{x}+\sqrt{2}}$

Solve Equations with Square Roots

Solve Radical Equations

In the following exercises, solve the equation.

Exercise 13.8.9.98

$\sqrt{7z+1}=6$

Answer

5

Exercise 13.8.9.99

$\sqrt{4u-2}-4=0$

Exercise 13.8.9.100

$\sqrt{6m+4}-5=0$

Answer

$\frac{7}{2}$

Exercise 13.8.9.101

$\sqrt{2u-3}+2=0$

Exercise 13.8.9.102

$\sqrt{u-4}+4=u$

Answer

no solution

Exercise 13.8.9.103

$\sqrt{v-9}+9=0$

Exercise 13.8.9.104

$\sqrt{r-4}-r=-10$

Answer

13

Exercise 13.8.9.105

$\sqrt{s-9}-s=-9$

Exercise 13.8.9.106

$2\sqrt{2x-7}-4=8$

Answer

$\frac{43}{2}$

Exercise 13.8.9.107

$\sqrt{2-x} = \sqrt{2x-7}$

Exercise 13.8.9.108

$\sqrt{a}+3 = \sqrt{a+9}$

Answer

0

Exercise 13.8.9.109

$\sqrt{r}+3 = \sqrt{r+4}$

Exercise 13.8.9.110

$\sqrt{u}+2 = \sqrt{u+5}$

Answer

$\frac{11}{6}$

Exercise 13.8.9.111

$\sqrt{n+11}-1 = \sqrt{n+4}$

Exercise 13.8.9.112

$\sqrt{y+5}+1 = \sqrt{2y+3}$

Answer

11

Use Square Roots in Applications

In the following exercises, solve. Round approximations to one decimal place.

Exercise 13.8.9.113

A pallet of sod will cover an area of about 600 square feet. Trinh wants to order a pallet of sod to make a square lawn in his backyard. Use the formula $s = \sqrt{A}$ to find the length of each side of his lawn.

Exercise 13.8.9.114

A helicopter dropped a package from a height of 900 feet above a stranded hiker. Use the formula $t = \frac{\sqrt{h}}{4}$ to find how many seconds it took for the package to reach the hiker.

Answer

7.5 seconds

Exercise 13.8.9.115

Officer Morales measured the skid marks of one of the cars involved in an accident. The length of the skid marks was 245 feet. Use the formula $s = \sqrt{24d}$ to find the speed of the car before the brakes were applied.

Higher Roots

Simplify Expressions with Higher Roots

In the following exercises, simplify.

Exercise 13.8.9.116

1. $\sqrt[6]{64}$
2. $\sqrt[3]{64}$

Answer

1. 2
2. 4

Exercise 13.8.9.117

1. $\sqrt[3]{-27}$
2. $\sqrt[4]{-64}$

Exercise 13.8.9.118

1. $\sqrt[9]{d^9}$
2. $\sqrt[8]{v^8}$

Answer

1. d
2. |v|

Exercise 13.8.9.119

1. $\sqrt[5]{a^{10}}$
2. $\sqrt[3]{b^{27}}$

Exercise 13.8.9.120

1. $\sqrt[4]{16x^8}$
2. $\sqrt[6]{64y^{12}}$

Answer

1. $2x^2$
2. $2y^2$

Exercise 13.8.9.121

1. $\sqrt[7]{128r^{14}}$
2. $\sqrt[4]{81s^{24}}$

Use the Product Property to Simplify Expressions with Higher Roots

In the following exercises, simplify.

Exercise 13.8.9.122

1. $\sqrt[9]{d^9}$
2. $\sqrt[11]{m^{17}}$

Answer

1. d
2. $m\sqrt[11]{m^6}$

Exercise 13.8.9.123

1. $\sqrt[3]{54}$
2. $\sqrt[4]{128}$

Exercise 13.8.9.124

1. $\sqrt[5]{64c^8}$
2. $\sqrt[4]{48d^7}$

Answer

1. $2c\sqrt[5]{2c^3}$
2. $2d\sqrt[4]{3d^3}$

Exercise 13.8.9.125

1. $\sqrt[3]{343q^7}$
2. $\sqrt[6]{192r^9}$

Exercise 13.8.9.126

1. $\sqrt[3]{-500}$
2. $\sqrt[4]{-16}$

Answer

1. $-5\sqrt[3]{4}$
2. not a real number

Use the Quotient Property to Simplify Expressions with Higher Roots

In the following exercises, simplify.

Exercise 13.8.9.127

$\sqrt[5]{\frac{r^{10}}{r^5}}$

Exercise 13.8.9.128

$\sqrt[3]{\frac{w^{12}}{w^2}}$

Answer

$w^3\sqrt[3]{w}$

Exercise 13.8.9.129

$\sqrt[4]{\frac{64y^8}{4y^5}}$

Exercise 13.8.9.130

$\sqrt[3]{\frac{54z^9}{2z^3}}$

Answer

$3z^2$

Exercise 13.8.9.131

$\sqrt[6]{\frac{64a^7}{b^2}}$

Add and Subtract Higher Roots

In the following exercises, simplify.

Exercise 13.8.9.132

$4\sqrt[5]{20}-2\sqrt[5]{20}$

Answer

$2\sqrt[5]{20}$

Exercise 13.8.9.133

$4\sqrt[3]{18}+3\sqrt[3]{18}$

Exercise 13.8.9.134

$\sqrt[4]{1250}-\sqrt[4]{162}$

Answer

$2\sqrt[4]{2}$

Exercise 13.8.9.135

$\sqrt[3]{640c^5}-\sqrt[3]{-80c^3}$

Exercise 13.8.9.136

$\sqrt[5]{96t^8} + \sqrt[5]{486t^4}$

Answer

$2t\sqrt[5]{3t^3} + 3\sqrt[5]{2t^4}$

Rational Exponents

Simplify Expressions with $a^{\frac{1}{n}}$

In the following exercises, write as a radical expression.

Exercise 13.8.9.137

$r^{\frac{1}{8}}$

Exercise 13.8.9.138

$s^{\frac{1}{10}}$

Answer

$\sqrt[10]{s}$

In the following exercises, write with a rational exponent.

Exercise 13.8.9.139

$\sqrt[5]{u}$

Exercise 13.8.9.140

$\sqrt[6]{v}$

Answer

$v^{\frac{1}{6}}$

Exercise 13.8.9.141

$\sqrt[3]{9m}$

Exercise 13.8.9.142

$\sqrt[6]{10z}$

Answer

$(10z)^{\frac{1}{6}}$

In the following exercises, simplify.

Exercise 13.8.9.143

$16^{\frac{1}{4}}$

Exercise 13.8.9.144

$32^{\frac{1}{5}}$

Answer

2

Exercise 13.8.9.145

$(-125)^{\frac{1}{3}}$

Exercise 13.8.9.146

$(125)^{-\frac{1}{3}}$

Answer

$\frac{1}{5}$

Exercise 13.8.9.147

$(-9)^{\frac{1}{2}}$

Exercise 13.8.9.148

$(36)^{-\frac{1}{2}}$

Answer

$\frac{1}{6}$

Simplify Expressions with $a^{\frac{m}{n}}$

In the following exercises, write with a rational exponent.

Exercise 13.8.9.149

$\sqrt[3]{q^5}$

Exercise 13.8.9.150

$\sqrt[5]{n^8}$

Answer

$n^{\frac{8}{5}}$

In the following exercises, simplify.

Exercise 13.8.9.151

$27^{-\frac{2}{3}}$

Exercise 13.8.9.152

$64^{\frac{5}{2}}$

Answer

32,768

Exercise 13.8.9.153

$36^{\frac{3}{2}}$

Exercise 13.8.9.154

$81^{-\frac{5}{2}}$

Answer

$\frac{1}{59,049}$

Use the Laws of Exponents to Simplify Expressions with Rational Exponents

In the following exercises, simplify.

Exercise 13.8.9.155

$3^{\frac{4}{5}} \cdot 3^{\frac{6}{5}}$

Exercise 13.8.9.156

$(x^6)^{\frac{4}{3}}$

Answer

x^8

Exercise 13.8.9.157

$\frac{z^{\frac{5}{2}}}{z^{\frac{7}{5}}}$

Exercise 13.8.9.158

$(16s^{\frac{9}{4}})^{\frac{1}{4}}$

Answer

$2s^{\frac{9}{16}}$

Exercise 13.8.9.159

$(m^8 n^{12})^{\frac{1}{4}}$

Exercise 13.8.9.160

$\frac{z^{\frac{2}{3}} \cdot z^{-\frac{1}{3}}}{z^{-\frac{5}{3}}}$

Answer

z^2

Practice Test

In the following exercises, simplify.

Exercise 13.8.9.161

$\sqrt{81+144}$

Exercise 13.8.9.162

$\sqrt{169m^4n^2}$

Answer

$13m^2|n|$

Exercise 13.8.9.163

$\sqrt{36n^{13}}$

Exercise 13.8.9.164

$3\sqrt{13}+5\sqrt{2}+\sqrt{13}$

Answer

$4\sqrt{13}+5\sqrt{2}$

Exercise 13.8.9.165

$5\sqrt{20}+2\sqrt{125}$

Exercise 13.8.9.166

$(3\sqrt{6y})(\sqrt{250y^3})$

Answer

$180y^2\sqrt{3}$

Exercise 13.8.9.167

$(2-5\sqrt{x})(3+\sqrt{x})$

Exercise 13.8.9.168

$(1-2\sqrt{q})^2$

Answer

$1-4\sqrt{q}+4q$

Exercise 13.8.9.169

1. $\sqrt{a^{12}}$
2. $\sqrt[3]{b^{21}}$

Exercise 13.8.9.170

1. $\sqrt[4]{81x^{12}}$
2. $\sqrt[6]{64y^{18}}$

Answer

1. $3x^3$
2. $2y^3$

Exercise 13.8.9.171

$\sqrt[6]{\frac{64r^{12}}{25r^6}}$

Exercise 13.8.9.172

$\sqrt{\frac{14y^3}{7y}}$

Answer

$y\sqrt{2}$

Exercise 13.8.9.173

$\frac{\sqrt{256x^7}}{\sqrt{54x^2}}$

Exercise 13.8.9.174

$\sqrt[4]{512}-2\sqrt[4]{32}$

Answer

0

Exercise 13.8.9.175

1. $256^{\frac{1}{4}}$
2. $243^{\frac{1}{5}}$

Exercise 13.8.9.176

$49^{\frac{3}{2}}$

Answer

343

Exercise 13.8.9.177

$25^{-\frac{5}{2}}$

Exercise 13.8.9.178

$\frac{w^{\frac{3}{4}}}{w^{\frac{7}{4}}}$

Answer

$\frac{1}{w}$

Exercise 13.8.9.179

$(27s^{\frac{3}{5}})^{\frac{1}{3}}$

In the following exercises, rationalize the denominator.

Exercise 13.8.9.180

$\frac{3}{2\sqrt{6}}$

Answer

$\frac{\sqrt{6}}{4}$

Exercise 13.8.9.181

$\frac{\sqrt{3}}{\sqrt{x}+\sqrt{5}}$

In the following exercises, solve.

Exercise 13.8.9.182

$3\sqrt{2x-3}-20=7$

Answer

42

Exercise 13.8.9.183

$\sqrt{3u-2}=\sqrt{5u+1}$

In the following exercise, solve.

Exercise 13.8.9.184

A helicopter flying at an altitude of 600 feet dropped a package to a lifeboat. Use the formula $t=\frac{\sqrt{h}}{4}$ to find how many seconds it took for the package to reach the hiker. Round your answer to the nearest tenth of a second.

Answer

6.1 seconds

13.9.1: Simplify Rational Expressions

Summary

By the end of this section, you will be able to:

- Determine the values for which a rational expression is undefined
- Evaluate rational expressions
- Simplify rational expressions
- Simplify rational expressions with opposite factors

Are you Ready?

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Simplify: $\frac{90y}{15y^2}$.
   If you missed this problem, review [link].
2. Factor: $6x^2-7x+2$.
   If you missed this problem, review [link].
3. Factor: n^3+8.
   If you missed this problem, review [link].

In Chapter 1, we reviewed the properties of fractions and their operations. We introduced rational numbers, which are just fractions where the numerators and denominators are integers, and the denominator is not zero.

In this chapter, we will work with fractions whose numerators and denominators are polynomials. We call these rational expressions.

Definition: RATIONAL EXPRESSION

A **rational expression** is an expression of the form $\frac{p(x)}{q(x)}$, where p and q are polynomials and $q \neq 0$.

Remember, division by 0 is undefined.

Here are some examples of rational expressions:

$$-\frac{13}{42} \quad \frac{7y}{8z} \quad \frac{5x+2}{x^2-7} \quad \frac{4x^2+3x-1}{2x-8}$$

Notice that the first rational expression listed above, $-\frac{13}{42}$, is just a fraction. Since a constant is a polynomial with degree zero, the ratio of two constants is a rational expression, provided the denominator is not zero.

We will perform same operations with rational expressions that we do with fractions. We will simplify, add, subtract, multiply, divide, and use them in applications.

Determine the Values for Which a Rational Expression is Undefined

When we work with a numerical fraction, it is easy to avoid dividing by zero, because we can see the number in the denominator. In order to avoid dividing by zero in a rational expression, we must not allow values of the variable that will make the denominator be zero.

If the denominator is zero, the rational expression is undefined. The numerator of a rational expression may be 0—but not the denominator.

So before we begin any operation with a rational expression, we examine it first to find the values that would make the denominator zero. That way, when we solve a rational equation for example, we will know whether the algebraic solutions we find are allowed or not.

Definition: DETERMINE THE VALUES FOR WHICH A RATIONAL EXPRESSION IS UNDEFINED.

1. Set the denominator equal to zero.
2. Solve the equation in the set of reals, if possible.

Example 13.9.1.1

Determine the values for which the rational expression is undefined:

1. $\frac{9y}{x}$
2. $\frac{4b-3}{2b+5}$
3. $\frac{x+4}{x^2+5x+6x}$

Solution

The expression will be undefined when the denominator is zero.

1.	$\frac{9y}{x}$
Set the denominator equal to zero. Solve for the variable.	x=0
	$\frac{9y}{x}$ is undefined for x=0.
2.	$\frac{4b-3}{2b+5}$
Set the denominator equal to zero. Solve for the variable.	2b+5=0
	2b=−5
	$b=-\frac{5}{2}$
	$\frac{4b-3}{2b+5}$ is undefined for $b=-\frac{5}{2}$.
3.	$\frac{x+4}{x^2+5x+6x}$
Set the denominator equal to zero. Solve for the variable.	$x^2+5x+6x=0$
	$(x+2)(x+3)=0$
	x+2=0 or x+3=0
	x=−2 or x=−3
	$\frac{x+4}{x^2+5x+6x}$ is undefined for x=−2 or x=−3.

Saying that the rational expression $\frac{x+4}{x^2+5x+6x}$ is undefined for x=−2orx=−3 is similar to writing the phrase “void where prohibited” in contest rules.

Try It 13.9.1.2

Determine the values for which the rational expression is undefined:

1. $\frac{3y}{x}$
2. $\frac{8n-5}{3n+1}$
3. $\frac{a+10}{a^2+4a+3a}$

Answer

1. x=0
2. $n=-\frac{1}{3}$
3. a=−1, a=−3

Try It 13.9.1.3

Determine the values for which the rational expression is undefined:

1. $\frac{4p}{5q}$
2. $\frac{y-1}{3y+2}$
3. $\frac{m-5}{m^2+m-6}$

Answer

1. q=0
2. $y=-\frac{2}{3}$
3. m=2, m=−3

Evaluate Rational Expressions

To evaluate a rational expression, we substitute values of the variables into the expression and simplify, just as we have for many other expressions in this book.

Example 13.9.1.4

Evaluate $\frac{2x+3}{3x-5}$ for each value:

1. x=0
2. x=2
3. x=−3

Solution

1.	$\frac{2x+3}{3x-5}$
Substitute 0 for x.	$\frac{2(0)+3}{3(0)-5}$
Simplify.	$-\frac{3}{5}$
2.	$\frac{2x+3}{3x-5}$
Substitute 2 for x.	$\frac{2(2)+3}{3(2)-5}$
Simplify.	$\frac{4+3}{6-5}$
	$\frac{7}{1}$
	7
3.	$\frac{2x+3}{3x-5}$
Substitute –3 for x.	$\frac{2(-3)+3}{3(-3)-5}$
Simplify.	$\frac{-6+3}{-9-5}$
	$\frac{-3}{-14}$
	$\frac{3}{14}$

Try It 13.9.1.5

Evaluate $\frac{y+1}{2y-3}$ for each value:

1. y=1
2. y=−3
3. y=0

Answer

1. −2
2. $\frac{2}{9}$
3. $-\frac{1}{3}$

Try It 13.9.1.6

Evaluate $\frac{5x-1}{2x+1}$ for each value:

1. x=1
2. x=−1
3. x=0

Answer

1. $\frac{4}{3}$
2. 6
3. −1

Example 13.9.1.7

Evaluate $\frac{x^2+8x+7}{x^2-4}$ for each value:

1. x=0
2. x=2
3. x=−1

Solution

1.	$\frac{x^2+8x+7}{x^2-4}$
Substitute 0 for x.	$\frac{(0)^2+8(0)+7}{(0)^2-4}$
Simplify.	$\frac{7}{-4}$
	$-\frac{7}{4}$
2.	$\frac{x^2+8x+7}{x^2-4}$
Substitute 2 for x.	$\frac{(2)^2+8(2)+7}{(2)^2-4}$
Simplify.	$\frac{4+16+7}{4-4}$
	$\frac{27}{0}$
This rational expression is undefined for x = 2.	

3.	$\frac{x^2+8x+7}{x^2-4}$
Substitute -1 for x.	$\frac{(-1)^2+8(-1)+7}{(-1)^2-4}$
Simplify.	$\frac{1-8+7}{1-4}$
	$\frac{-7+7}{-3}$
	$\frac{0}{-3}$
	0

Try It 13.9.1.8

Evaluate $\frac{x^2+1}{x^2-3x+2}$ for each value:

1. x=0
2. x=−1
3. x=3

Answer

1. $\frac{1}{2}$
2. $\frac{1}{3}$
3. 2

Try It 13.9.1.9

Evaluate $\frac{x^2+x-6}{x^2-9}$ for each value.

1. x=0
2. x=−2
3. x=1

Answer

1. $\frac{2}{3}$
2. $\frac{4}{5}$
3. $\frac{1}{2}$

Remember that a fraction is simplified when it has no common factors, other than 1, in its numerator and denominator. When we evaluate a rational expression, we make sure to simplify the resulting fraction.

Example 13.9.1.10

Evaluate $\frac{a^2+2ab+b^2}{3ab}$ for each value.

1. a=1, b=2
2. a=−2, b=−1
3. $a=\frac{1}{3}$, b=0

Solution

1.	$\frac{a^2+2ab+b^2}{3ab}$ when a=1, b=2

Substitute 1 for a and 2 for b.	$\frac{(1)^2+2(1)(2)+(2)^2}{3(1)(2)^2}$
Simplify.	$\frac{1+4+4}{3(4)}$
	$\frac{9}{12}$
	$\frac{3}{4}$
2.	$\frac{a^2+2ab+b^2}{3ab}$ when a=−2, b=−1
Substitute −2 for a and −1 for b.	$\frac{(-2)^2+2(-2)(-1)+(-1)^2}{3(-2)(-1)^2}$
Simplify.	$\frac{4+4+1}{-6}$
	$-\frac{9}{6}$
	$-\frac{3}{2}$
3.	$\frac{a^2+2ab+b^2}{3ab}$ when $a=\frac{1}{3}$, b=0
Substitute $\frac{1}{3}$ for a and 0 for b.	$\frac{\left(\frac{1}{3}\right)^2+2\left(\frac{1}{3}\right)(0)+(0)^2}{3\left(\frac{1}{3}\right)(0)^2}$
Simplify.	$\frac{\frac{1}{9}+0+0}{0}$
	$\frac{\frac{1}{9}}{0}$

Try It 13.9.1.11

Evaluate $\frac{2a^3b}{a^2+2ab+b^2}$ for each value.

1. a=−1, b=2
2. a=0, b=−1
3. a=1, $b=\frac{1}{2}$

Answer

1. −4
2. 0
3. $\frac{4}{9}$

Try It 13.9.1.12

Evaluate $\frac{a^2-b^2}{8ab^3}$ for each value:

1. a=1, b=−1
2. $a=\frac{1}{2}$, b=−1
3. a=−2, b=1

Answer

1. 0
2. $\frac{3}{16}$

3. $\frac{3}{16}$

Simplify Rational Expressions

Just like a fraction is considered simplified if there are no common factors, other than 1, in its numerator and denominator, a rational expression is *simplified* if it has no common factors, other than 1, in its numerator and denominator.

Definition: SIMPLIFIED RATIONAL EXPRESSION

A rational expression is considered simplified if there are no common factors in its numerator and denominator.

For example:

- $\frac{2}{3}$ is simplified because there are no common factors of 2 and 3.
- $\frac{2x}{3x}$ is not simplified because x is a common factor of $2x$ and $3x$.

We use the Equivalent Fractions Property to simplify numerical fractions. We restate it here as we will also use it to simplify **rational expression**s.

Definition: EQUIVALENT FRACTIONS PROPERTY

If a, b, and c are numbers where $b \neq 0$, $c \neq 0$, then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$ and $\frac{a \cdot c}{b \cdot c} = \frac{a}{b}$

Notice that in the Equivalent Fractions Property, the values that would make the denominators zero are specifically disallowed. We see $b \neq 0$, $c \neq 0$ clearly stated. Every time we write a rational expression, we should make a similar statement disallowing values that would make a denominator zero. However, to let us focus on the work at hand, we will omit writing it in the examples.

Let's start by reviewing how we simplify numerical fractions.

Example 13.9.1.13

Simplify: $-\frac{36}{63}$.

Solution

	$-\frac{36}{63}$
Rewrite the numerator and denominator showing the common factors.	$-\frac{4 \cdot 9}{7 \cdot 9}$
Simplify using the Equivalent Fractions Property.	$-\frac{4}{7}$

Notice that the fraction $-\frac{4}{7}$ is simplified because there are no more common factors.

Try It 13.9.1.14

Simplify: $-\frac{45}{81}$.

Answer

$-\frac{5}{9}$

Try It 13.9.1.15

Simplify: $-\frac{42}{54}$.

Answer

$-\frac{7}{9}$

Throughout this chapter, we will assume that all numerical values that would make the denominator be zero are excluded. We will not write the restrictions for each rational expression, but keep in mind that the denominator can never be zero. So in this next example, $x \neq 0$ and $y \neq 0$.

Example 13.9.1.16

Simplify: $\frac{3xy}{18x^2y^2}$.

Solution

	$\frac{3xy}{18x^2y^2}$
Rewrite the numerator and denominator showing the common factors.	$\frac{1 \cdot 3xy}{6xy \cdot 3xy}$
Simplify using the Equivalent Fractions Property.	$\frac{1}{6xy}$

Did you notice that these are the same steps we took when we divided monomials in Polynomials?

Try It 13.9.1.17

Simplify: $\frac{4x^2y}{12xy^2}$.

Answer

$\frac{x}{3y}$

Try It $PageIndex18

Simplify: $\frac{16x^2y}{2xy^2}$.

Answer

$\frac{8x}{y}$

To simplify rational expressions we first write the numerator and denominator in factored form. Then we remove the common factors using the Equivalent Fractions Property.

Be very careful as you remove common factors. Factors are multiplied to make a product. You can remove a factor from a product. You cannot remove a term from a sum.

$\frac{2 \cdot \cancel{3} \cdot \cancel{7}}{\cancel{3} \cdot 5 \cdot \cancel{7}}$	$\frac{3x(x-9)}{5(x-9)}$	$\frac{x+5}{x}$
$\frac{2}{5}$	$\frac{3x}{5}$	NO COMMON FACTORS
We removed the common factors 3 and 7. They are factors of the product.	We removed the common factor $(x-9)$. It is a factor of the product.	While there is an x in both the numerator and denominator, the x in the numerator is a term of a sum!

Note that removing the x's from $\frac{x+5}{x}$ would be like cancelling the 2's in the fraction $\frac{2+5}{2}$!

Example 13.9.1.19

Simplify: $\frac{2x+8}{5x+20}$.

Solution

Step 1. Factor the numerator and denominator completely.	Factor $2x + 8$ and $5x - 20$.	$\frac{2x+8}{5x+20}$ $\frac{2(x+4)}{5(x+4)}$
Step 2. Simplify by dividing out common factors.	Divide out the common factors.	$\frac{2(\cancel{x+4})}{5(\cancel{x+4})}$ $\frac{2}{5}$

Try It 13.9.1.20

Simplify: $\frac{3x-6}{2x-4}$.

Answer

$\frac{3}{2}$

Try It 13.9.1.21

Simplify: $\frac{7y+35}{5y+25}$.

Answer

$\frac{7}{5}$

We now summarize the steps you should follow to simplify rational expressions.

Definition: SIMPLIFY A RATIONAL EXPRESSION.

1. Factor the numerator and denominator completely.
2. Simplify by dividing out common factors.

Usually, we leave the simplified rational expression in factored form. This way it is easy to check that we have removed all the common factors!

We'll use the methods we covered in Factoring to factor the polynomials in the numerators and denominators in the following examples.

Example 13.9.1.22

Simplify: $\frac{x^2+5x+6}{x^2+8x+12}$.

Solution

	$\frac{x^2+5x+6}{x^2+8x+12}$
Factor the numerator and denominator.	$\frac{(x+2)(x+3)}{(x+2)(x+6)}$

Remove the common factor x+2 from the numerator and the denominator.	$\frac{x+3}{x+6}$

Can you tell which values of *x* must be excluded in this example?

Try It 13.9.1.23

Simplify: $\frac{x^2-x-2}{x^2-3x+2}$.

Answer

$\frac{x+1}{x-1}$

Try It 13.9.1.24

Simplify: $\frac{x^2-3x-10}{x^2+x-2}$.

Answer

$\frac{x-5}{x-1}$

Example 13.9.1.25

Simplify: $\frac{y^2+y-42}{y^2-36}$.

Solution

	$\frac{y^2+y-42}{y^2-36}$.
Factor the numerator and denominator.	$\frac{(y+7)(y-6)}{(y+6)(y-6)}$
Remove the common factor y−6 from the numerator and the denominator.	$\frac{y+7}{y+6}$

Try It 13.9.1.26

Simplify: $\frac{x^2+x-6}{x^2-4}$.

Answer

$\frac{x+3}{x+2}$

Try It 13.9.1.27

Simplify: $\frac{x^2+8x+7}{x^2-49}$.

Answer

$\frac{x+1}{x-7}$

Example 13.9.1.28

Simplify: $\frac{p^3-2p^2+2p-4}{p^2-7p+10}$.

Solution

	$\frac{p^3-2p^2+2p-4}{p^2-7p+10}$
Factor the numerator and denominator, using grouping to factor the numerator.	$\frac{p^2(p-2)+2(p-2)}{(p-5)(p-2)}$
	$\frac{(p^2+2)(p-2)}{(p-5)(p-2)}$
Remove the common factor p−2 from the numerator and the denominator.	$\frac{p^2+2}{p-5}$

Try It 13.9.1.29

Simplify: $\frac{y^3-3y^2+y-3}{y^2-y-6}$.

Answer

$\frac{y^2+1}{y+2}$

Try It 13.9.1.30

Simplify: $\frac{p^3-p^2+2p-2}{p^2+4p-5}$.

Answer

$\frac{p^2+2}{p+5}$

Example 13.9.1.31

Simplify: $\frac{2n^2-14n}{4n^2-16n-48}$.

Solution

	$\frac{2n^2-14n}{4n^2-16n-48}$
Factor the numerator and denominator, first factoring out the GCF.	$\frac{2n(n-7)}{4(n^2-4n-12)}$
	$\frac{2n(n-7)}{4(n-6)(n+2)}$
Remove the common factor, 2.	$\frac{n(n-7)}{2(n-6)(n+2)}$

Try It 13.9.1.32

Simplify: $\frac{2n^2-10n}{4n^2-16n-20}$.

Answer

$\frac{n}{2(n+1)}$

Try It 13.9.1.33

Simplify: $\frac{4x^2-16x}{8x^2-16x-64}$.

Answer

$\frac{x}{2(x+2)}$

Example 13.9.1.34

Simplify: $\frac{3b^2-12b+12}{6b^2-24}$.

Solution

	$\frac{3b^2-12b+12}{6b^2-24}$
Factor the numerator and denominator, first factoring out the GCF.	$\frac{3(b^2-4b+4)}{6(b^2-4)}$
	$\frac{3(b-2)(b-2)}{6(b-2)(b+2)}$
Remove the common factors of b−2 and 3.	$\frac{3(b-2)}{2(b+2)}$

Try It 13.9.1.35

Simplify: $\frac{2x^2-12x+18}{3x^2-27}$.

Answer

$\frac{2(x-3)}{3(x+3)}$

Try It $PageIndex36$

Simplify: $\frac{5y^2-30y+25}{2y^2-50}$.

Answer

$\frac{5(x-1)}{2(x+5)}$

Example 13.9.1.37

Simplify: $\frac{m^3+8}{m^2-4}$.

Solution

	$\frac{m^3+8}{m^2-4}$
Factor the numerator and denominator, using the formulas for sum of cubes and difference of squares.	$\frac{(m+2)(m^2-2m+4)}{(m+2)(m-2)}$

Remove the common factors of m+2.	$\frac{m^2-2m+4}{m-2}$

Try It 13.9.1.38

Simplify: $\frac{p^3-64}{p^2-16}$.

Answer

$\frac{p^2+4p+16}{p+4}$

Try It 13.9.1.39

Simplify: $\frac{x^3+8}{x^2-4}$.

Answer

$\frac{x^2-2x+4}{x-2}$

Simplify Rational Expressions with Opposite Factors

Now we will see how to simplify a rational expression whose numerator and denominator have opposite factors. Let's start with a numerical fraction, say $\frac{7}{-7}$.

We know this fraction simplifies to −1. We also recognize that the numerator and denominator are opposites.

In Foundations, we introduced opposite notation: the opposite of a is −a. We remember, too, that −a=−1·a

We simplify the fraction $\frac{a}{-a}$

	$\frac{a}{-a}$
We could rewrite this.	$\frac{1\cdot a}{-1\cdot a}$
Remove the common factors.	$\frac{1}{-1}$
Simplify.	-1

So, in the same way, we can simplify the fraction $\frac{x-3}{-(x-3)}$

	$\frac{x-3}{-(x-3)}$
We could rewrite this.	$\frac{1\cdot(x-3)}{-1\cdot(x-3)}$
Remove the common factors.	$\frac{1}{-1}$
Simplify.	-1

But the opposite of x−3 could be written differently:

	$-(x-3)$
Distribute.	$-x+3$
Rewrite.	$3-x$

This means the fraction $\frac{x-3}{3-x}$ simplifies to −1.

In general, we could write the opposite of a−b as b−a. So the rational expression $\frac{a-b}{b-a}$ simplifies to −1.

Definition: OPPOSITES IN A RATIONAL EXPRESSION

The opposite of a−b is b−a

$\frac{a-b}{b-a}=-1, a \neq b$

An expression and its opposite divide to −1

We will use this property to simplify rational expressions that contain opposites in their numerators and denominators.

Example 13.9.1.40

Simplify: $\frac{x-8}{8-x}$.

Solution

	$\frac{x-8}{8-x}$.
Recognize that x−8 and 8−x are opposites	−1

Try It 13.9.1.41

Simplify: $\frac{y-2}{2-y}$.

Answer

−1

Try It 13.9.1.42

Simplify: $\frac{n-9}{9-n}$.

Answer

−1

Remember, the first step in simplifying a rational expression is to factor the numerator and denominator completely.

Example 13.9.1.43

Simplify: $\frac{14-2x}{x^2-49}$.

Solution

	$\frac{14-2x}{x^2-49}$
Factor the numerator and denominator.	$\frac{2(7-x)}{(x+7)(x-7)}$
Recognize 7−x and x−7 are opposites.	$\frac{2(7-x)}{(x+7)(x-7)}(-1)$
Simplify.	$-\frac{2}{x+7}$

Try It 13.9.1.44

Simplify: $\frac{10-2y}{y^2-25}$.

Answer

$-\frac{2}{y+5}$

Try It 13.9.1.45

Simplify: $\frac{3y-27}{81-y^2}$.

Answer

$-\frac{3}{9+y}$

Example 13.9.1.46

Simplify: $\frac{x^2-4x-32}{64-x^2}$.

Solution

	$\frac{x^2-4x-32}{64-x^2}$
Factor the numerator and denominator.	$\frac{(x-8)(x+4)}{(8-x)(8+x)}$
Recognize the factors that are opposites.	$(-1)\frac{(x-8)(x+4)}{(8-x)(8+x)}$
Simplify.	$-\frac{x+4}{x+8}$

Try It 13.9.1.47

Simplify: $\frac{x^2-4x-5}{25-x^2}$.

Answer

$-\frac{x+1}{x+5}$

Try It 13.9.1.48

Simplify: $\frac{x^2+x-2}{1-x^2}$.

Answer

$-\frac{x+2}{x+1}$

Key Concepts

- **Determine the Values for Which a Rational Expression is Undefined**
  1. Set the denominator equal to zero.
  2. Solve the equation, if possible.
- **Simplified Rational Expression**

- A rational expression is considered simplified if there are no common factors in its numerator and denominator.

- **Simplify a Rational Expression**
  1. Factor the numerator and denominator completely.
  2. Simplify by dividing out common factors.

- **Opposites in a Rational Expression**
  - The opposite of a−b is b−a
    $\frac{a-b}{b-a} = -1 \; a \neq b, b \neq 0, a \neq b$

Practice Makes Perfect

In the following exercises, determine the values for which the rational expression is undefined.

Example 13.9.1.49

1. $\frac{2x}{z}$
2. $\frac{4p-1}{6p-5}$
3. $\frac{n-3}{n^2+2n-8}$

Answer

1. z=0
2. $p = \frac{5}{6}$
3. n=−4, n=2

Example 13.9.1.50

1. $\frac{10m}{11n}$
2. $\frac{6y+13}{4y-9}$
3. $\frac{b-8}{b^2-36}$

Example 13.9.1.51

1. $\frac{4x^2y}{3y}$
2. $\frac{3x-2}{2x+1}$
3. $\frac{u-1}{u^2-3u-28}$

Answer

1. y=0
2. $x = -\frac{1}{2}$
3. u=−4, u=7

Example 13.9.1.52

1. $\frac{5pq^2}{9q}$
2. $\frac{7a-4}{3a+5}$
3. $\frac{1}{x^2-4}$

Evaluate Rational Expressions

In the following exercises, evaluate the rational expression for the given values.

Example 13.9.1.53

$\frac{2x}{x-1}$

1. x=0
2. x=2
3. x=−1

Answer

1. 0
2. 4
3. 1

Example 13.9.1.54

$\frac{4y-1}{5y-3}$

1. y=0
2. y=2
3. y=−1

Example 13.9.1.55

$\frac{2p+3}{p^2+1}$

1. p=0
2. p=1
3. p=−2

Answer

1. 3
2. $\frac{5}{2}$
3. $-\frac{1}{5}$

Example 13.9.1.56

$\frac{x+3}{2-3x}$

1. x=0
2. x=1
3. x=−2

Example 13.9.1.57

$\frac{y^2+5y+6}{y^2-1}$

1. y=0
2. y=2
3. y=−2

Answer

1. −6
2. $\frac{20}{3}$
3. 0

Example 13.9.1.58

$\frac{z^2+3z-10}{z^2-1}$

1. z=0
2. z=2
3. z=−2

Example 13.9.1.59

$\frac{a^2-4}{a^2+5a+4}$

1. a=0
2. a=1
3. a=−2

Answer

1. −1
2. $-\frac{3}{10}$
3. 0

Example 13.9.1.60

$\frac{b^2+2}{b^2-3b-4}$

1. b=0
2. b=2
3. b=−2

Example 13.9.1.61

$\frac{x^2+3xy+2y^2}{2x^3y}$

1. x=1, y=−1
2. x=2, y=1
3. x=−1, y=−2

Answer

1. 0
2. $\frac{3}{4}$
3. $\frac{15}{4}$

Example 13.9.1.62

$\frac{c^2+cd-2d^2}{cd^3}$

1. c=2, d=−1
2. c=1, d=−1
3. c=−1, d=2

Example 13.9.1.63

$\frac{m^2-4n^2}{5mn^3}$

1. m=2, n=1
2. m=−1, n=−1
3. m=3, n=2

Answer

1. 0
2. $-\frac{3}{5}$
3. $-\frac{7}{20}$

Example 13.9.1.64

$\frac{2s^2t}{s^2-9t^2}$

1. s=4, t=1
2. s=−1, t=−1
3. s=0, t=2

Simplify Rational Expressions

In the following exercises, simplify.

Example 13.9.1.65

$-\frac{4}{52}$

Answer

$-\frac{1}{13}$

Example 13.9.1.66

$-\frac{44}{55}$

Example 13.9.1.67

$\frac{56}{63}$

Answer

$\frac{8}{9}$

Example 13.9.1.68

$\frac{65}{104}$

Example 13.9.1.69

$\frac{6ab^2}{12a^2b}$

Answer

$\frac{b}{2ab}$

Example 13.9.1.70

$\frac{15xy^3}{x^3y^3}$

Example 13.9.1.71

$\frac{8m^3n}{12mn^2}$

Answer

$\frac{2m^2}{3n}$

Example 13.9.1.72

$\frac{36v^3w^2}{27vw^3}$

Example 13.9.1.73

$\frac{3a+6}{4a+8}$

Answer

$\frac{3}{4}$

Example 13.9.1.74

$\frac{5b+5}{6b+6}$

Example 13.9.1.75

$\frac{3c-9}{5c-15}$

Answer

$\frac{3}{5}$

Example 13.9.1.76

$\frac{4d+8}{9d+18}$

Example 13.9.1.77

$\frac{7m+63}{5m+45}$

Answer

$\frac{7}{5}$

Example 13.9.1.78

$\frac{8n-96}{3n-36}$

Exercise 13.9.1.79

$\frac{12p-240}{5p-100}$

Answer

$\frac{12}{5}$

Example 13.9.1.80

$\frac{6q+210}{5q+175}$

Example 13.9.1.81

$\frac{a^2-a-12}{a^2-8a+16}$

Answer

$\frac{a+3}{a-4}$

Example 13.9.1.82

$\frac{x^2+4x-5}{x^2-2x+1}$

Example 13.9.1.83

$\frac{y^2+3y-4}{y^2-6y+5}$

Answer

$\frac{y+4}{y-5}$

Example 13.9.1.84

$\frac{v^2+8v+15}{v^2-v-12}$

Example 13.9.1.85

$\frac{x^2-25}{x^2+2x-15}$

Answer

$\frac{x-5}{x-3}$

Example 13.9.1.86

$\frac{a^2-4}{a^2+6a-16}$

Example 13.9.1.87

$\frac{y^2-2y-3}{y^2-9}$

Answer

$\frac{y+1}{y+3}$

Example 13.9.1.88

$\frac{b^2+9b+18}{b^2-36}$

Example 13.9.1.89

$\frac{y^3+y^2+y+1}{y^2+2y+1}$

Answer

$\frac{y^2+1}{y+1}$

Example 13.9.1.90

$\frac{p^3+3p^2+4p+12}{p^2+p-6}$

Example 13.9.1.91

$\frac{x^3-2x^2-25x+50}{x^2-25}$

Answer

x−2

Example 13.9.1.92

$\frac{q^3+3q^2-4q-12}{q^2-4}$

Example 13.9.1.93

$\frac{3a^2+15a}{6a^2+6a-36}$

Answer

$\frac{a(a+5)}{2(a+3)(a-2)}$

Example 13.9.1.94

$\frac{8b^2-32b}{2b^2-6b-80}$

Example 13.9.1.95

$\frac{-5c^2-10c}{-10c^2+30c+100}$

Answer

$\frac{c}{2(c-5)}$

Example 13.9.1.96

$\frac{4d^2-24d}{2d^2-4d-48}$

Example 13.9.1.97

$\frac{3m^2+30m+75}{4m^2-100}$

Answer

$\frac{3(m+5)}{4(m-5)}$

Example 13.9.1.98

$\frac{5n^2+30n+45}{2n^2-18}$

Example 13.9.1.99

$\frac{5r^2+30r-35}{r^2-49}$

Answer

$\frac{5(r-1)}{r+7}$

Example 13.9.1.100

$\frac{3s^2+30s+24}{3s^2-48}$

Example 13.9.1.101

$\frac{t^3-27}{t^2-9}$

Answer

$\frac{t^2+3t+9}{t+3}$

Example 13.9.1.102

$\frac{v^3-1}{v^2-1}$

Example 13.9.1.103

$\frac{w^3+216}{w^2-36}$

Answer

$\frac{w^2-6w+36}{w-6}$

Example 13.9.1.104

$\frac{v^3+125}{v^2-25}$

Simplify Rational Expressions with Opposite Factors

In the following exercises, simplify each rational expression.

Example 13.9.1.105

$\frac{a-5}{5-a}$

Answer

-1

Example 13.9.1.106

$\frac{b-12}{12-b}$

Example 13.9.1.107

$\frac{11-c}{c-11}$

Answer

-1

Example 13.9.1.108

$\frac{5-d}{d-5}$

Example 13.9.1.109

$\frac{12-2x}{x^2-36}$

Answer

$-\frac{2}{x+6}$

Example 13.9.1.110

$\frac{20-5y}{y^2-16}$

Example 13.9.1.111

$\frac{4v-32}{64-v^2}$

Answer

$-\frac{4}{8+v}$

Example 13.9.1.112

$\frac{7w-21}{9-w^2}$

Example 13.9.1.113

$\frac{y^2-11y+24}{9-y^2}$

Answer

$-\frac{y-8}{3+y}$

Example 13.9.1.114

$\frac{z^2-9z+20}{16-z^2}$

Example 13.9.1.115

$\frac{a^2-5a-36}{81-a^2}$

Answer

$-\frac{a+4}{9+a}$

Example 13.9.1.116

$\frac{b^2+b-42}{36-b^2}$

Everyday Math

Example 13.9.1.117

Tax Rates For the tax year 2015, the amount of tax owed by a single person earning between $37,450 and $90,750, can be found by evaluating the formula 0.25x−4206.25, where x is income. The average tax rate for this income can be found by evaluating the formula $\frac{0.25x-4206.25}{x}$. What would be the average tax rate for a single person earning $50,000?

Answer

16.5%

Example 13.9.1.118

Work The length of time it takes for two people for perform the same task if they work together can be found by evaluating the formula $\frac{xy}{x+y}$. If Tom can paint the den in x=45 minutes and his brother Bobby can paint it in y=60 minutes, how many minutes will it take them if they work together?

Writing Exercises

Example 13.9.1.119

Explain how you find the values of x for which the rational expression $\frac{x^2-x-20}{x^2-4}$ is undefined.

Example 13.9.1.120

Explain all the steps you take to simplify the rational expression $\frac{p^2+4p-21}{9-p^2}$.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine the values for which a rational expression is undefined.			
evaluate rational expressions.			
simplify rational expressions.			
simplify rational expressions with opposite factors.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved your goals in this section! Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific!

…no - I don't get it! This is critical and you must not ignore it. You need to get help immediately or you will quickly be overwhelmed. See your instructor as soon as possible to discuss your situation. Together you can come up with a plan to get you the help you need.

Glossary

rational expression

A rational expression is an expression of the form $\frac{p}{q}$, where p and q are polynomials and $q \neq 0$.

This page titled 13.9.1: Simplify Rational Expressions is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

13.9.1E: Exercises

Practice Makes Perfect

In the following exercises, determine the values for which the rational expression is undefined.

? Example 13.9.1E.49

1. $\frac{2x}{z}$
2. $\frac{4p-1}{6p-5}$
3. $\frac{n-3}{n^2+2n-8}$

Answer

1. z=0
2. $p=\frac{5}{6}$
3. n=−4, n=2

? Example 13.9.1E.50

1. $\frac{10m}{11n}$
2. $\frac{6y+13}{4y-9}$
3. $\frac{b-8}{b^2-36}$

? Example 13.9.1E.51

1. $\frac{4x^2y}{3y}$
2. $\frac{3x-2}{2x+1}$
3. $\frac{u-1}{u^2-3u-28}$

Answer

1. y=0
2. $x=-\frac{1}{2}$
3. u=−4, u=7

? Example 13.9.1E.52

1. $\frac{5pq^2}{9q}$
2. $\frac{7a-4}{3a+5}$
3. $\frac{1}{x^2-4}$

Evaluate Rational Expressions

In the following exercises, evaluate the rational expression for the given values.

Example 13.9.1E.53

$$\frac{2x}{x-1}$$

1. x=0
2. x=2
3. x=−1

Answer

1. 0
2. 4
3. 1

Example 13.9.1E.54

$$\frac{4y-1}{5y-3}$$

1. y=0
2. y=2
3. y=−1

Example 13.9.1E.55

$$\frac{2p+3}{p^2+1}$$

1. p=0
2. p=1
3. p=−2

Answer

1. 3
2. $\frac{5}{2}$
3. $-\frac{1}{5}$

Example 13.9.1E.56

$$\frac{x+3}{2-3x}$$

1. x=0
2. x=1
3. x=−2

Example 13.9.1E.57

$$\frac{y^2+5y+6}{y^2-1}$$

1. y=0
2. y=2
3. y=−2

Answer

1. -6
2. $\frac{20}{3}$
3. 0

Example 13.9.1E.58

$$\frac{z^2+3z-10}{z^2-1}$$

1. z=0
2. z=2
3. z=−2

Example 13.9.1E.59

$$\frac{a^2-4}{a^2+5a+4}$$

1. a=0
2. a=1
3. a=−2

Answer

1. -1
2. $-\frac{3}{10}$
3. 0

Example 13.9.1E.60

$$\frac{b^2+2}{b^2-3b-4}$$

1. b=0
2. b=2
3. b=−2

Example 13.9.1E.61

$$\frac{x^2+3xy+2y^2}{2x^3y}$$

1. x=1, y=−1
2. x=2, y=1
3. x=−1, y=−2

Answer

1. 0
2. $\frac{3}{4}$
3. $\frac{15}{4}$

https://math.libretexts.org/@go/page/46297

Example 13.9.1E.62

$$\frac{c^2+cd-2d^2}{cd^3}$$

1. c=2, d=−1
2. c=1, d=−1
3. c=−1, d=2

Example 13.9.1E.63

$$\frac{m^2-4n^2}{5mn^3}$$

1. m=2, n=1
2. m=−1, n=−1
3. m=3, n=2

Answer

1. 0
2. $-\frac{3}{5}$
3. $-\frac{7}{20}$

Example 13.9.1E.64

$$\frac{2s^2t}{s^2-9t^2}$$

1. s=4, t=1
2. s=−1, t=−1
3. s=0, t=2

Simplify Rational Expressions

In the following exercises, simplify.

Example 13.9.1E.65

$$-\frac{4}{52}$$

Answer

$$-\frac{1}{13}$$

Example 13.9.1E.66

$$-\frac{44}{55}$$

Example 13.9.1E.67

$$\frac{56}{63}$$

Answer

$\frac{8}{9}$

Example 13.9.1E.68

$\frac{65}{104}$

Example 13.9.1E.69

$\frac{6ab^2}{12a^2b}$

Answer

$\frac{b}{2a}$

Example 13.9.1E.70

$\frac{15xy^3}{x^3y^3}$

Example 13.9.1E.71

$\frac{8m^3n}{12mn^2}$

Answer

$\frac{2m^2}{3n}$

Example 13.9.1E.72

$\frac{36v^3w^2}{27vw^3}$

Example 13.9.1E.73

$\frac{3a+6}{4a+8}$

Answer

$\frac{3}{4}$

Example 13.9.1E.74

$\frac{5b+5}{6b+6}$

Example 13.9.1E.75

$$\frac{3c-9}{5c-15}$$

Answer

$$\frac{3}{5}$$

Example 13.9.1E.76

$$\frac{4d+8}{9d+18}$$

Example 13.9.1E.77

$$\frac{7m+63}{5m+45}$$

Answer

$$\frac{7}{5}$$

Example 13.9.1E.78

$$\frac{8n-96}{3n-36}$$

Exercise 13.9.1E.79

$$\frac{12p-240}{5p-100}$$

Answer

$$\frac{12}{5}$$

Example 13.9.1E.80

$$\frac{6q+210}{5q+175}$$

Example 13.9.1E.81

$$\frac{a^2-a-12}{a^2-8a+16}$$

Answer

$$\frac{a+3}{a-4}$$

https://math.libretexts.org/@go/page/46297

Example 13.9.1E.82

$$\frac{x^2+4x-5}{x^2-2x+1}$$

Example 13.9.1E.83

$$\frac{y^2+3y-4}{y^2-6y+5}$$

Answer

$$\frac{y+4}{y-5}$$

Example 13.9.1E.84

$$\frac{v^2+8v+15}{v^2-v-12}$$

Example 13.9.1E.85

$$\frac{x^2-25}{x^2+2x-15}$$

Answer

$$\frac{x-5}{x-3}$$

Example 13.9.1E.86

$$\frac{a^2-4}{a^2+6a-16}$$

Example 13.9.1E.87

$$\frac{y^2-2y-3}{y^2-9}$$

Answer

$$\frac{y+1}{y+3}$$

Example 13.9.1E.88

$$\frac{b^2+9b+18}{b^2-36}$$

Example 13.9.1E.89

$$\frac{y^3+y^2+y+1}{y^2+2y+1}$$

Answer

https://math.libretexts.org/@go/page/46297

$$\frac{y^2+1}{y+1}$$

Example 13.9.1E.90

$$\frac{p^3+3p^2+4p+12}{p^2+p-6}$$

Example 13.9.1E.91

$$\frac{x^3-2x^2-25x+50}{x^2-25}$$

Answer

x−2

Example 13.9.1E.92

$$\frac{q^3+3q^2-4q-12}{q^2-4}$$

Example 13.9.1E.93

$$\frac{3a^2+15a}{6a^2+6a-36}$$

Answer

$$\frac{a(a+5)}{2(a+3)(a-2)}$$

Example 13.9.1E.94

$$\frac{8b^2-32b}{2b^2-6b-80}$$

Example 13.9.1E.95

$$\frac{-5c^2-10c}{-10c^2+30c+100}$$

Answer

$$\frac{c}{2(c-5)}$$

Example 13.9.1E.96

$$\frac{4d^2-24d}{2d^2-4d-48}$$

Example 13.9.1E.97

$$\frac{3m^2+30m+75}{4m^2-100}$$

Answer

$$\frac{3(m+5)}{4(m-5)}$$

Example 13.9.1E.98

$$\frac{5n^2+30n+45}{2n^2-18}$$

Example 13.9.1E.99

$$\frac{5r^2+30r-35}{r^2-49}$$

Answer

$$\frac{5(r-1)}{r+7}$$

Example 13.9.1E.100

$$\frac{3s^2+30s+72}{3s^2-48}$$

Example 13.9.1E.101

$$\frac{t^3-27}{t^2-9}$$

Answer

$$\frac{t^2+3t+9}{t+3}$$

Example 13.9.1E.102

$$\frac{v^3-1}{v^2-1}$$

Example 13.9.1E.103

$$\frac{w^3+216}{w^2-36}$$

Answer

$$\frac{w^2-6w+36}{w-6}$$

https://math.libretexts.org/@go/page/46297

Example 13.9.1E.104

$$\frac{v^3+125}{v^2-25}$$

Simplify Rational Expressions with Opposite Factors

In the following exercises, simplify each rational expression.

Example 13.9.1E.105

$$\frac{a-5}{5-a}$$

Answer

-1

Example 13.9.1E.106

$$\frac{b-12}{12-b}$$

Example 13.9.1E.107

$$\frac{11-c}{c-11}$$

Answer

-1

Example 13.9.1E.108

$$\frac{5-d}{d-5}$$

Example 13.9.1E.109

$$\frac{12-2x}{x^2-36}$$

Answer

$$-\frac{2}{x+6}$$

Example 13.9.1E.110

$$\frac{20-5y}{y^2-16}$$

Example 13.9.1E.111

$$\frac{4v-32}{64-v^2}$$

Answer

$$-\frac{4}{8+v}$$

Example 13.9.1E.112

$$\frac{7w-21}{9-w^2}$$

Example 13.9.1E.113

$$\frac{y^2-11y+24}{9-y^2}$$

Answer

$$-\frac{y-8}{3+y}$$

Example 13.9.1E.114

$$\frac{z^2-9z+20}{16-z^2}$$

Example 13.9.1E.115

$$\frac{a^2-5a-36}{81-a^2}$$

Answer

$$-\frac{a+4}{9+a}$$

Example 13.9.1E.116

$$\frac{b^2+b-42}{36-b^2}$$

Everyday Math

Example 13.9.1E.117

Tax Rates For the tax year 2015, the amount of tax owed by a single person earning between $37,450 and $90,750, can be found by evaluating the formula 0.25x−4206.25, where x is income. The average tax rate for this income can be found by evaluating the formula $\frac{0.25x-4206.25}{x}$. What would be the average tax rate for a single person earning $50,000?

Answer

16.5%

Example 13.9.1E.118

Work The length of time it takes for two people for perform the same task if they work together can be found by evaluating the formula $\frac{xy}{x+y}$. If Tom can paint the den in x=45 minutes and his brother Bobby can paint it in y=60 minutes, how many

minutes will it take them if they work together?

Writing Exercises

Example 13.9.1E.119

Explain how you find the values of x for which the rational expression $\frac{x^2-x-20}{x^2-4}$ is undefined.

Answer

Answers will vary, but all should reference setting the denominator function to zero.

Example 13.9.1E.120

Explain all the steps you take to simplify the rational expression $\frac{p^2+4p-21}{9-p^2}$.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine the values for which a rational expression is undefined.			
evaluate rational expressions.			
simplify rational expressions.			
simplify rational expressions with opposite factors.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved your goals in this section! Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific!

…with some help. This must be addressed quickly as topics you do not master become potholes in your road to success. Math is sequential - every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is critical and you must not ignore it. You need to get help immediately or you will quickly be overwhelmed. See your instructor as soon as possible to discuss your situation. Together you can come up with a plan to get you the help you need.

13.9.2: Multiply and Divide Rational Expressions

Learning Objectives

By the end of this section, you will be able to:

- Multiply rational expressions
- Divide rational expressions

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Multiply: $\frac{14}{15} \cdot \frac{6}{35}$.
   If you missed this problem, review Exercise 1.6.13.
2. Divide: $\frac{14}{15} \div \frac{6}{35}$.
   If you missed this problem, review Exercise 1.6.22.
3. Factor completely: $2x^2 - 98$.
   If you missed this problem, review Exercise 7.5.10.
4. Factor completely: $10n^3 + 10$.
   If you missed this problem, review Exercise 7.5.19.
5. Factor completely: $10p^2 - 25pq - 15q^2$.
   If you missed this problem, review Exercise 7.5.28.

Multiply Rational Expressions

To multiply rational expressions, we do just what we did with numerical fractions. We multiply the numerators and multiply the denominators. Then, if there are any common factors, we remove them to simplify the result.

Definition: MULTIPLICATION OF RATIONAL EXPRESSIONS

If p,q,r,s are polynomials where $q \neq 0$ and $s \neq 0$

$\frac{p}{q} \cdot \frac{r}{s} = \frac{pr}{qs}$

To multiply rational expressions, multiply the numerators and multiply the denominators.

We'll do the first example with numerical fractions to remind us of how we multiplied fractions without variables.

Example 13.9.2.1

Multiply: $\frac{10}{28} \cdot \frac{8}{15}$.

Answer

	$\frac{10}{28} \cdot \frac{8}{15}$
Multiply the numerators and denominators.	$\frac{10 \cdot 8}{28 \cdot 15}$
Look for common factors, and then remove them.	$\frac{2 \cdot \cancel{5} \cdot 2 \cdot \cancel{4}}{7 \cdot \cancel{4} \cdot 3 \cdot \cancel{5}}$
Simplify.	$\frac{4}{21}$

Example 13.9.2.2

Mulitply: $\frac{6}{10} \cdot \frac{15}{12}$.

Answer

$\frac{3}{4}$

Example 13.9.2.3

Mulitply: $\frac{20}{15} \cdot \frac{6}{8}$.

Answer

1

Remember, throughout this chapter, we will assume that all numerical values that would make the denominator be zero are excluded. We will not write the restrictions for each rational expression, but keep in mind that the denominator can never be zero. So in this next example, $x \neq 0$ and $y \neq 0$.

Example 13.9.2.4

Mulitply: $\frac{2x}{3y^2} \cdot \frac{6xy^3}{x^2y}$.

Answer

	$\frac{2x}{3y^2} \cdot \frac{6xy^3}{x^2y}$
Multiply.	$\frac{2x \cdot 6xy^3}{3y^2 \cdot x^2y}$
Factor the numerator and denominator completely, and then remove common factors.	$\frac{2 \cdot x \cdot 2 \cdot 3 \cdot x \cdot y \cdot y \cdot y}{3 \cdot y \cdot y \cdot x \cdot x \cdot y}$
Simplify.	4

Example 13.9.2.5

Mulitply: $\frac{3pq}{q^2} \cdot \frac{5p^2q}{6pq}$.

Answer

$\frac{5p^2}{2q}$

Example 13.9.2.6

Mulitply: $\frac{6x^3y}{7x^2} \cdot \frac{2xy}{3x^2y}$.

Answer

$\frac{12y^3}{7}$

How to Multiply Rational Expressions

Example 13.9.2.7

Mulitply: $\frac{2x}{x^2-7x+12} \cdot \frac{x^2-9}{6x^2}$.

Answer

Step 1. Factor the numerator and denominator completely.	Factor $x^2 - 9$ and $x^2 + x + 12$.	$\frac{2x}{x^2-7x+12} \cdot \frac{x^2-9}{6x^2}$ $\frac{2x}{(x-3)(x-4)} \cdot \frac{(x-3)(x+3)}{6x^2}$
Step 2. Multiply the numerators and denominators.	Multiply the numerators and denominators. It is helpful to write the monomials first.	$\frac{2x(x-3)(x+3)}{6x^2(x-3)(x-4)}$
Step 3. Simplify by dividing out common factors.	Divide out the common factors. Leave the denominator in factored form.	$\frac{\cancel{2}x\cancel{(x-3)}(x+3)}{\cancel{2}\cdot 3\cdot x\cdot \cancel{(x-3)}(x-4)}$ $\frac{(x+3)}{3x(x-4)}$

Example 13.9.2.8

Mulitply: $\frac{5x}{x^2+5x+6} \cdot \frac{x^2-4}{10x}$.

Answer

$\frac{x-2}{2(x+3)}$

Example 13.9.2.9

Mulitply: $\frac{9x^2}{x^2+11x+30} \cdot \frac{x^2-36}{3x^2}$.

Answer

$\frac{3(x-6)}{x+5}$

Definition: MULTIPLY A RATIONAL EXPRESSION.

1. Factor each numerator and denominator completely.
2. Multiply the numerators and denominators.
3. Simplify by dividing out common factors.

Example 13.9.2.10

Multiply: $\frac{n^2-7n}{n^2+2n+1} \cdot \frac{n+1}{2n}$.

Answer

	$\frac{n^2-7n}{n^2+2n+1} \cdot \frac{n+1}{2n}$
Factor each numerator and denominator.	$\frac{n(n-7)}{(n+1)(n+1)} \cdot \frac{n+1}{2n}$
Multiply the numerators and the denominators.	$\frac{n(n-7)(n+1)}{(n+1)(n+1)2n}$
Simplify.	$\frac{n-7}{2(n+1)}$

Example 13.9.2.11

Multiply: $\frac{x^2-25}{x^2-3x-10} \cdot \frac{x+2}{x}$.

Answer

$\frac{x+5}{x}$

Example 13.9.2.12

Multiply: $\frac{x^2-4x}{x^2+5x+6} \cdot \frac{x+2}{x}$.

Answer

$\frac{x-4}{x+3}$

Example 13.9.2.13

Multiply: $\frac{16-4x}{2x-12} \cdot \frac{x^2-5x-6}{x^2-16}$.

Answer

	$\frac{16-4x}{2x-12} \cdot \frac{x^2-5x-6}{x^2-16}$
Factor each numerator and denominator.	$\frac{4(4-x)}{2(x-6)} \cdot \frac{(x-6)(x+1)}{(x-4)(x+4)}$
Multiply the numerators and the denominators.	$\frac{4(4-x)(x-6)(x+1)}{2(x-6)(x-4)(x+4)}$
Simplify.	$-\frac{2(x+1)}{(x+4)}$

Example 13.9.2.14

Multiply: $\frac{12x-6x^2}{x^2+8x} \cdot \frac{x^2+11x+24}{x^2-4}$.

Answer

$-\frac{6(x+3)}{x+2}$

Example 13.9.2.15

Multiply: $\frac{9v-3v^2}{9v+36} \cdot \frac{v^2+7v+12}{v^2-9}$.

Answer

$-\frac{v}{3}$

Example 13.9.2.16

Multiply: $\frac{2x-6}{x^2-8x+15} \cdot \frac{x^2-25}{2x+10}$.

Answer

	$\frac{2x-6}{x^2-8x+15} \cdot \frac{x^2-25}{2x+10}$
Factor each numerator and denominator.	$\frac{2(x-3)}{(x-3)(x-5)} \cdot \frac{(x-5)(x+5)}{2(x+5)}$
Multiply the numerators and denominators.	$\frac{2(x-3)(x-5)(x+5)}{2(x-3)(x-5)(x+5)}$
Remove common factors.	$\frac{\cancel{2}\cancel{(x-3)}\cancel{(x-5)}\cancel{(x+5)}}{\cancel{2}\cancel{(x-3)}\cancel{(x-5)}\cancel{(x+5)}}$
Simplify.	1

Example 13.9.2.17

Multiply: $\frac{3a-21}{a^2-9a+14} \cdot \frac{a^2-4}{3a+6}$.

Answer

1

Example 13.9.2.18

Multiply: $\frac{b^2-b}{b^2+9b-10} \cdot \frac{b^2-100}{b^2-10b}$.

Answer

1

Divide Rational Expressions

To divide rational expressions we multiply the first fraction by the reciprocal of the second, just like we did for numerical fractions.

Remember, the **reciprocal** of $\frac{a}{b}$ is $\frac{b}{a}$. To find the reciprocal we simply put the numerator in the denominator and the denominator in the numerator. We "flip" the fraction.

Definition: DIVISION OF RATIONAL EXPRESSIONS

If p,q,r,s are polynomials where $q \neq 0$, $r \neq 0$, $s \neq 0$

$\frac{p}{q} \div \frac{r}{s} = \frac{p}{q} \cdot \frac{s}{r}$

To divide rational expressions multiply the first fraction by the reciprocal of the second.

How to Divide Rational Expressions

Example 13.9.2.19

Divide: $\frac{x+9}{6-x} \div \frac{x^2-81}{x-6}$.

Answer

Step 1. Rewrite the division as the product of the first rational expression and the reciprocal of the second.	"Flip" the second fraction and change the division sign to multiplication.	$\frac{x+9}{6-x} \div \frac{x^2-81}{x-6}$ $\frac{x+9}{6-x} \cdot \frac{x-6}{x^2-81}$
Step 2. Factor the numerators and denominators completely.	Factor $x^2 - 81$.	$\frac{x+9}{6-x} \cdot \frac{x-6}{(x-9)(x+9)}$
Step 3. Multiply the numerators and denominators.		$\frac{(x+9)(x-6)}{(6-x)(x-9)(x+9)}$
Step 4. Simplify by dividing out common factors.	Divide out the common factors. Remember opposites divide to –1.	$(-1)\frac{\cancel{(x+9)}\cancel{(x-6)}}{\cancel{(6-x)}(x-9)\cancel{(x+9)}}$ $-\frac{1}{(x-9)}$

Example 13.9.2.20

Divide: $\frac{c+3}{5-c} \div \frac{c^2-9}{c-5}$.

Answer

$-\frac{1}{c-3}$

Example 13.9.2.21

Divide: $\frac{2-d}{d-4} \div \frac{4-d^2}{4-d}$.

Answer

$-\frac{1}{2+d}$

Definition: DIVIDE RATIONAL EXPRESSIONS.

1. Rewrite the division as the product of the first rational expression and the reciprocal of the second.
2. Factor the numerators and denominators completely.
3. Multiply the numerators and denominators together.
4. Simplify by dividing out common factors.

Example 13.9.2.22

Divide: $\frac{3n^2}{n^2-4n} \div \frac{9n^2-45n}{n^2-7n+10}$.

Answer

	$\frac{3n^2}{n^2-4n} \div \frac{9n^2-45n}{n^2-7n+10}$
Rewrite the division as the product of the first rational expression and the reciprocal of the second.	$\frac{3n^2}{n^2-4n} \cdot \frac{n^2-7n+10}{9n^2-45n}$
Factor the numerators and denominators and then multiply.	$\frac{3 \cdot n \cdot n \cdot (n-5)(n-2)}{n(n-4) \cdot 3 \cdot 3 \cdot n \cdot (n-5)}$
Simplify by dividing out common factors.	$\frac{\cancel{3} \cdot \cancel{n} \cdot \cancel{n(n-5)}(n-2)}{\cancel{n}(n-4)\cancel{3} \cdot 3 \cdot \cancel{n(n-5)}}$

	$\frac{n-2}{3(n-4)}$

Example 13.9.2.23

Divide: $\frac{2m^2}{m^2-8m} \div \frac{8m^2+24m}{m^2+m-6}$.

Answer

$\frac{(m-2)}{4(m-8)}$

Example 13.9.2.24

Divide: $\frac{15n^2}{3n^2+33n} \div \frac{5n-5}{n^2+9n-22}$.

Answer

$\frac{n(n-2)}{n-1}$

Remember, first rewrite the division as multiplication of the first expression by the reciprocal of the second. Then factor everything and look for common factors.

Example 13.9.2.25

Divide: $\frac{2x^2+5x-12}{x^2-16} \div \frac{2x^2-13x+15}{x^2-8x+16}$.

Answer

	$\frac{2x^2+5x-12}{x^2-16} \div \frac{2x^2-13x+15}{x^2-8x+16}$
Rewrite the division as the product of the first rational expression and the reciprocal of the second.	$\frac{2x^2+5x-12}{x^2-16} \cdot \frac{x^2-8x+16}{2x^2-13x+15}$
Factor the numerators and denominators and then multiply.	$\frac{(2x-3)(x+4)(x-4)(x-4)}{(x-4)(x+4)(2x-3)(x-5)}$
Simplify.	$\frac{(x-4)}{(x-5)}$

Example 13.9.2.26

Divide: $\frac{3a^2-8a-3}{a^2-25} \div \frac{3a^2-14a-5}{a^2+10a+25}$.

Answer

$\frac{(a-3)(a+5)}{(a-5)(a-5)}$

Exercise 13.9.2.27

Divide: $\frac{4b^2+7b-2}{1-b^2} \div \frac{4b^2+15b-4}{b^2-2b+1}$.

Answer

$-\frac{(b+2)(b-1)}{(1+b)(b+4)}$

Example 13.9.2.28

Divide: $\frac{p^3+q^3}{2p^2+2pq+2q^2} \div \frac{p^2-q^2}{6}$.

Answer

	$\frac{p^3+q^3}{2p^2+2pq+2q^2} \div \frac{p^2-q^2}{6}$
Rewrite the division as the product of the first rational expression and the reciprocal of the second.	$\frac{p^3+q^3}{2p^2+2pq+2q^2} \cdot \frac{6}{p^2-q^2}$
Factor the numerators and denominators and then multiply.	$\frac{(p+q)(p^2-pq+q^2)6}{2(p^2+pq+q^2)(p-q)(p+q)}$
Simplify.	$\frac{3(p^2-pq+q^2)}{(p-q)(p^2+pq+q^2)}$

Example 13.9.2.29

Divide: $\frac{x^3-8}{3x^2-6x+12} \div \frac{x^2-4}{6}$.

Answer

$$\frac{2(x^2+2x+4)}{(x+2)(x^2-2x+4)}$$

Example 13.9.2.30

Divide: $\frac{2z^2}{z^2-1} \div \frac{z^3-z^2+z}{z^3-1}$.

Answer

$$\frac{2z(z^2+z+1)}{(z+1)(z^2-z+1)}$$

Before doing the next example, let's look at how we divide a fraction by a whole number. When we divide $\frac{3}{5} \div 4$

$$\frac{3}{5} \div 4$$
$$\frac{3}{5} \div \frac{4}{1}$$
$$\frac{3}{5} \cdot \frac{1}{4}$$

We do the same thing when we divide rational expressions.

Example 13.9.2.31

$\frac{a^2-b^2}{3ab} \div (a^2+2ab+b^2)$.

Answer

	$\frac{a^2-b^2}{3ab} \div (a^2+2ab+b^2)$
Write the second expression as a fraction.	$\frac{a^2-b^2}{3ab} \div \frac{a^2+2ab+b^2}{1}$
Rewrite the division as the first expression times the reciprocal of the second expression.	$\frac{a^2-b^2}{3ab} \cdot \frac{1}{a^2+2ab+b^2}$
Factor the numerators and the denominators, and then multiply.	$\frac{(a-b)(a+b)1}{3ab \cdot (a+b)(a+b)}$

Simplify.	$\frac{a-b}{3ab(a+b)}$

Example 13.9.2.32

$\frac{2x^2-14x-16}{4} \div (x2+2x+1)$.

Answer

$\frac{x-8}{2(x+1)}$

Example 13.9.2.33

$\frac{y^2-6y+8}{y^2-4y} \div (3y2-12y)$.

Answer

$\frac{y-2}{3y(y-4)}$

Example 13.9.2.34

$\frac{\frac{6x^2-7x+2}{4x-8}}{\frac{2x^2-7x+3}{x^2-5x+6}}$.

Answer

	$\frac{\frac{6x^2-7x+2}{4x-8}}{\frac{2x^2-7x+3}{x^2-5x+6}}$
Rewrite with a division sign.	$\frac{6x^2-7x+2}{4x-8} \div \frac{2x^2-7x+3}{x^2-5x+6}$
Rewrite as product of first times reciprocal of second.	$\frac{6x^2-7x+2}{4x-8} \cdot \frac{x^2-5x+6}{2x^2-7x+3}$
Factor the numerators and the denominators, and then multiply	$\frac{(2x-1)(3x-2)(x-2)(x-3)}{4(x-2)(2x-1)(x-3)}$
Simplify.	$\frac{3x-2}{4}$

Example 13.9.2.35

$\frac{\frac{3x^2+7x+2}{4x+24}}{\frac{3x^2-14x-5}{x^2+x-30}}$.

Answer

$\frac{x+2}{4}$

Example 13.9.2.36

$\frac{\frac{y^2-36}{2y^2+11y-6}}{\frac{2y^2-2y-60}{8y-4}}$.

Answer

$\frac{2}{y+5}$

If we have more than two rational expressions to work with, we still follow the same procedure. The first step will be to rewrite any division as multiplication by the reciprocal. Then we factor and multiply.

Example 13.9.2.37

$\frac{3x-6}{4x-4} \cdot \frac{x^2+2x-3}{x^2-3x-10} \div \frac{2x+12}{8x+16}$.

Answer

	$\frac{3x-6}{4x-4} \cdot \frac{x^2+2x-3}{x^2-3x-10} \div \frac{2x+12}{8x+16}$
Rewrite the division as multiplication by the reciprocal.	$\frac{3x-6}{4x-4} \cdot \frac{x^2+2x-3}{x^2-3x-10} \cdot \frac{8x+16}{2x+12}$
Factor the numerators and the denominators, and then multiply.	$\frac{3 \cdot 8(x-2)(x+3)(x-1)(x+2)}{4 \cdot 2(x-1)(x+2)(x-5)(x+6)}$
Simplify by dividing out common factors.	$\frac{3 \cdot \cancel{8}(x-2)(x+3)\cancel{(x-1)(x+2)}}{\cancel{4} \cdot \cancel{2}\cancel{(x-1)(x+2)}(x-5)(x+6)}$
Simplify.	$\frac{3(x-2)(x+3)}{(x-5)(x+6)}$

Example 13.9.2.38

$\frac{4m+4}{3m-15} \cdot \frac{m^2-3m-10}{m^2-4m-32} \div \frac{12m-36}{6m-48}$.

Answer

$\frac{2(m+1)(m+2)}{3(m+4)(m-3)}$

Example 13.9.2.39

$\frac{2n^2+10n}{n-1} \div \frac{n^2+10n+24}{n^2+8n-9} \cdot \frac{n+4}{8n^2+12n}$.

Answer

$\frac{(n+5)(n+9)}{2(n+6)(2n+3)}$

Key Concepts

- **Multiplication of Rational Expressions**
  - If p,q,r,s are polynomials where $q \neq 0$ and $s \neq 0$, then $\frac{p}{q} \cdot \frac{r}{s} = \frac{pr}{qs}$
  - To multiply rational expressions, multiply the numerators and multiply the denominators
- **Multiply a Rational Expression**
  1. Factor each numerator and denominator completely.
  2. Multiply the numerators and denominators.
  3. Simplify by dividing out common factors.
- **Division of Rational Expressions**
  - If p,q,r,s are polynomials where $q \neq 0$, $r \neq 0$, $s \neq 0$, then $\frac{p}{q} \div \frac{r}{s} = \frac{p}{q} \cdot \frac{s}{r}$
  - To divide rational expressions multiply the first fraction by the reciprocal of the second.
- **Divide Rational Expressions**

1. Rewrite the division as the product of the first rational expression and the reciprocal of the second.
2. Factor the numerators and denominators completely.
3. Multiply the numerators and denominators together.
4. Simplify by dividing out common factors.

13.9.2E: Exersices

Practice Makes Perfect

Multiply Rational Expressions

In the following exercises, multiply.

Example 13.9.2E.40

$\frac{12}{16} \cdot \frac{4}{10}$

Answer

$\frac{3}{10}$

Example 13.9.2E.41

$\frac{32}{5} \cdot \frac{16}{24}$

Example 13.9.2E.42

$\frac{18}{10} \cdot \frac{4}{30}$

Answer

$\frac{6}{25}$

Example 13.9.2E.43

$\frac{21}{36} \cdot \frac{45}{24}$

Example 13.9.2E.44

$\frac{5x^2y^4}{12xy^3} \cdot \frac{6x^2}{20y^2}$

Answer

$\frac{x^3}{8y}$

Example 13.9.2E.45

$\frac{8w^3y^9}{y^2} \cdot \frac{3y}{4w^4}$

Example 13.9.2E.46

$\frac{12a^3b}{b^2} \cdot \frac{2ab^2}{9b^3}$

Answer

$\frac{8a^4}{3b^2}$

Example 13.9.2E.47

$\frac{4mn^2}{5n^3} \cdot \frac{mn^3}{8m^2}$

Example 13.9.2E.48

$\frac{5p^2}{p^2-5p-36} \cdot \frac{p^2-16}{10p}$

Answer

$\frac{p(p-4)}{2(p-9)}$

Example 13.9.2E.49

$\frac{3q^2}{q^2+q-6} \cdot \frac{q^2-9}{9q}$

Example 13.9.2E.50

$\frac{4r}{r^2-3r-10} \cdot \frac{r^2-25}{8r^2}$

Answer

$\frac{r+5}{2r(r+2)}$

Example 13.9.2E.51

$\frac{s}{s^2-9s+14} \cdot \frac{s^2-49}{7s^2}$

Example 13.9.2E.52

$\frac{x^2-7x}{x^2+6x+9} \cdot \frac{x+3}{4x}$

Answer

$\frac{x-7}{4(x+3)}$

Example 13.9.2E.53

$\frac{2y^2-10y}{y^2+10y+25} \cdot \frac{y+5}{6y}$

Example 13.9.2E.54

$\frac{z^2+3z}{z^2-3z-4} \cdot \frac{z-4}{z^2}$

Answer

$\frac{z+3}{z(z+1)}$

Example 13.9.2E.55

$\frac{2a^2+8a}{a^2-9a+20} \cdot \frac{a-5}{a^2}$

Example 13.9.2E.56

$\frac{28-4b}{3b-3} \cdot \frac{b^2+8b-9}{b^2-49}$

Answer

$-\frac{4(b+9)}{3(b+7)}$

Example 13.9.2E.57

$\frac{18c-2c^2}{6c+30} \cdot \frac{c^2+7c+10}{c^2-81}$

Example 13.9.2E.58

$\frac{35d-7d^2}{d^2+7d} \cdot \frac{d^2+12d+35}{d^2-25}$

Answer

-7

Example 13.9.2E.59

$\frac{72m-12m^2}{8m+32} \cdot \frac{m^2+10m+24}{m^2-36}$

Example 13.9.2E.60

$\frac{4n+20}{n^2+n-20} \cdot \frac{n^2-16}{4n+16}$

Answer

1

Example 13.9.2E.61

$\frac{6p^2-6p}{p^2+7p-18} \cdot \frac{p^2-81}{3p^2-27p}$

Example 13.9.2E.62

$\frac{q^2-2q}{q^2+6q-16} \cdot \frac{q^2-64}{q^2-8q}$

Answer

1

Example 13.9.2E.63

$\frac{2r^2-2r}{r^2+4r-5} \cdot \frac{r^2-25}{2r^2-10r}$

Divide Rational Expressions

In the following exercises, divide.

Example 13.9.2E.64

$\frac{t-6}{3-t} \div \frac{t^2-9}{t-5}$

Answer

$-\frac{2t}{t^3-5t-9}$

Example 13.9.2E.65

$\frac{v-5}{11-v} \div \frac{v^2-25}{v-11}$

Example 13.9.2E.66

$\frac{10+w}{w-8} \div \frac{100-w^2}{8-w}$

Answer

$-\frac{1}{10-w}$

Example 13.9.2E.67

$\frac{7+x}{x-6} \div \frac{49-x^2}{x+6}$

Example 13.9.2E.68

$\frac{27y^2}{3y-21} \div \frac{3y^2+18}{y^2+13y+42}$

Answer

$\frac{3y^2(y+6)(y+7)}{(y-7)(y2+6)}$

Example 13.9.2E.69

$\frac{24z^2}{2z-8} \div \frac{4z-28}{z^2-11z+28}$

Example 13.9.2E.70

$\frac{16a^2}{4a+36} \div \frac{4a^2-24a}{a^2+4a-45}$

Answer

$\frac{a(a-5)}{a-6}$

https://math.libretexts.org/@go/page/46299

Example 13.9.2E.71

$\frac{24b^2}{2b-4} \div \frac{12b^2+36b}{b^2-11b+18}$

Example 13.9.2E.72

$\frac{3c^2-16c+5}{c^2-25} \div \frac{3c^2-14c-5}{c^2+10c+25}$

Answer

$\frac{(3c-1)(c+5)}{(3c+1)(c-5)}$

Example 13.9.2E.73

$\frac{2d^2+d-3}{d^2-16} \div \frac{2d^2-9d-18}{d^2-8d+16}$

Example 13.9.2E.74

$\frac{6m^2-13m+2}{9-m^2} \div \frac{6m^2+23m-4}{m^2-6m+9}$

Answer

$-\frac{(m-2)(m-3)}{(3+m)(m+4)}$

Example 13.9.2E.75

$\frac{2n^2-3n-14}{25-n^2} \div \frac{2n^2-13n+21}{n^2-10n+25}$

Example 13.9.2E.76

$\frac{3s^2}{s^2-16} \div \frac{s^3+4s^2+16s}{s^3-64}$

Answer

$\frac{3s}{s+4}$

Example 13.9.2E.77

$\frac{r^2-9}{15} \div \frac{r^3-27}{5r^2+15r+45}$

Example 13.9.2E.78

$\frac{p^3+q^3}{3p^2+3pq+3q^2} \div \frac{p^2-q^2}{12}$

Answer

$\frac{4(p^2-pq+q^2)}{(p-q)(p^2+pq+q^2)}$

Example 13.9.2E.79

$\frac{v^3-8w^3}{2v^2+4vw+8w^2} \div \frac{v^2-4w^2}{4}$

Example 13.9.2E.80

$\frac{t^2-9}{2t} \div (t^2-6t+9)$

Answer

$\frac{t+3}{2t(t-3)}$

Example 13.9.2E.81

$\frac{x^2+3x-10}{4x} \div (2x^2+20x+50)$

Example 13.9.2E.82

$\frac{2y^2-10yz-48z^2}{2y-1} \div (4y^2-32yz)$

Answer

$\frac{y+3z}{2y(2y-1)}$

Example 13.9.2E.83

$\frac{2m^2-98n^2}{2m+6} \div (m^2-7mn)$

Example 13.9.2E.84

$\frac{\frac{2a^2-a-21}{5a+20}}{\frac{a^2+7a+12}{a^2+8a+16}}$

Answer

$\frac{2a-7}{5}$

Example 13.9.2E.85

$\frac{\frac{3b^2+2b-8}{12b+18}}{\frac{3b^2+2b-8}{2b^2-7b-15}}$

Example 13.9.2E.86

$\frac{\frac{12c^2-12}{2c^2-3c+14}}{\frac{c+4}{6c^2-13c+5}}$

Answer

3(3c−5)

https://math.libretexts.org/@go/page/46299

Example 13.9.2E.87

$$\frac{\frac{4d^2+7d-2}{35d+10}}{\frac{d^2-4}{7d^2-12d-4}}$$

Example 13.9.2E.88

$$\frac{10m^2+80m}{3m-9} \cdot \frac{m^2+4m-21}{m^2-9m+20} \div \frac{5m^2+10m}{2m-10}$$

Answer

$$\frac{4(m+8)(m+7)}{3(m-4)(m+2)}$$

Example 13.9.2E.89

$$\frac{4n^2+32n}{3n+2} \cdot \frac{3n^2-n-2}{n^2+n-30} \div \frac{108n^2-24n}{n+6}$$

Example 13.9.2E.90

$$\frac{12p^2+3p}{p+3} \div \frac{p^2+2p-63}{p^2-p-12} \cdot \frac{p-7}{9p^3-9p^2}$$

Answer

$$\frac{(4p+1)(p-7)}{3p(p+9)(p-1)}$$

Example 13.9.2E.91

$$\frac{6q+3}{9q^2-9q} \div \frac{q^2+14q+33}{q^2+4q-5} \cdot \frac{4q^2+12q}{12q+6}$$

Everyday Math

Example 13.9.2E.92

Probability The director of large company is interviewing applicants for two identical jobs. If w= the number of women applicants and m= the number of men applicants, then the probability that two women are selected for the jobs is $\frac{w}{w+m} \cdot \frac{w-1}{w+m-1}$.

1. Simplify the probability by multiplying the two rational expressions.
2. Find the probability that two women are selected when w=5 and m=10.

Answer

1. $\frac{w(w-1)}{(w+m)(w+m-1)}$
2. $\frac{2}{21}$

Example 13.9.2E.93

Area of a triangle The area of a triangle with base b and height h is $\frac{bh}{2}$. If the triangle is stretched to make a new triangle with base and height three times as much as in the original triangle, the area is $\frac{9bh}{2}$. Calculate how the area of the new triangle compares to the area of the original triangle by dividing $\frac{9bh}{2}$ by $\frac{bh}{2}$.

Writing Exercises

Example 13.9.2E.94

1. Multiply $\frac{7}{4} \cdot \frac{9}{10}$ and explain all your steps.
2. Multiply $\frac{n}{n-3} \cdot \frac{9n+3}{n}$ and explain all your steps.
3. Evaluate your answer to part (b) when n=7. Did you get the same answer you got in part (a)? Why or why not?

Answer

Answers will vary.

Example 13.9.2E.95

1. Divide $\frac{24}{5} \div 6$ and explain all your steps.
2. Divide $\frac{x^2-1}{x} \div (x+1)$ and explain all your steps.
3. Evaluate your answer to part (b) when x=5. Did you get the same answer you got in part (a)? Why or why not?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
multiply rational expressions.			
divide rational expressions.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

13.9.3: Add and Subtract Rational Expressions with a Common Denominator

Learning Objectives

By the end of this section, you will be able to:

- Add rational expressions with a common denominator
- Subtract rational expressions with a common denominator
- Add and subtract rational expressions whose denominators are opposites

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Add: $\frac{y}{3}+\frac{9}{3}$.
   If you missed this problem, review Exercise 1.7.1.
2. Subtract: $\frac{10}{x}-\frac{2}{x}$.
   If you missed this problem, review Exercise 1.7.7.
3. Factor completely: $8n^5-20n^3$.
   If you missed this problem, review Exercise 7.5.1.
4. Factor completely: $45a^3-5ab^2$.
   If you missed this problem, review Exercise 7.5.10.

Add Rational Expressions with a Common Denominator

What is the first step you take when you add numerical fractions? You check if they have a common denominator. If they do, you add the numerators and place the sum over the common denominator. If they do not have a common denominator, you find one before you add.

It is the same with rational expressions. To add rational expressions, they must have a common denominator. When the denominators are the same, you add the numerators and place the sum over the common denominator.

Definition: RATIONAL EXPRESSION ADDITION

If p, q, and r are polynomials where $r\neq 0$, then

$\frac{p}{r}+\frac{q}{r}=\frac{p+q}{r}$

To add rational expressions with a common denominator, add the numerators and place the sum over the common denominator.

We will add two numerical fractions first, to remind us of how this is done.

Example 13.9.3.1

Add: $\frac{5}{18}+\frac{7}{18}$.

Answer

	$\frac{5}{18}+\frac{7}{18}$
The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{5+7}{18}$
Add in the numerator.	$\frac{12}{18}$
Factor the numerator and denominator to show the common factors.	$\frac{6\cdot 2}{6\cdot 3}$

Simplify.	$\frac{2}{3}$

Example 13.9.3.2

Add: $\frac{7}{16}+\frac{5}{16}$.

Answer

$\frac{3}{4}$

Example 13.9.3.3

Add: $\frac{3}{10}+\frac{1}{10}$.

Answer

$\frac{2}{5}$

Remember, we do not allow values that would make the denominator zero. What value of yy should be excluded in the next example?

Example 13.9.3.4

Add: $\frac{3y}{4y-3}+\frac{7}{4y-3}$.

Answer

	$\frac{3y}{4y-3}+\frac{7}{4y-3}$.
The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{3y+7}{4y-3}$
The numerator and denominator cannot be factored. The fraction is simplified.	

Example 13.9.3.5

Add: $\frac{5x}{2x+3}+\frac{2}{2x+3}$.

Answer

$\frac{5x+2}{2x+3}$.

Example 13.9.3.6

Add: $\frac{x}{x-2}+\frac{1}{x-2}$.

Answer

$\frac{x+1}{x-2}$

Example 13.9.3.7

Add: $\frac{7x+12}{x+3}+\frac{x^2}{x+3}$.

Answer

	$\frac{7x+12}{x+3}+\frac{x^2}{x+3}$
The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{7x+12+x^2}{x+3}$
Write the degrees in descending order.	$\frac{x^2+7x+12}{x+3}$
Factor the numerator.	$\frac{(x+3)(x+4)}{x+3}$
Simplify.	x+4

Example 13.9.3.8

Add: $\frac{9x+14}{x+7}+\frac{x^2}{x+7}$.

Answer

x+2

Example 13.9.3.9

Add: $\frac{x^2+8x}{x+5}+\frac{15}{x+5}$.

Answer

x+3

Subtract Rational Expressions with a Common Denominator

To subtract rational expressions, they must also have a common denominator. When the denominators are the same, you subtract the numerators and place the difference over the common denominator.

Definition: RATIONAL EXPRESSION SUBTRACTION

If p, q, and r are polynomials where $r \neq 0$

$\frac{p}{r}-\frac{q}{r}=\frac{p-q}{r}$

To subtract rational expressions, subtract the numerators and place the difference over the common denominator.

We always simplify rational expressions. Be sure to factor, if possible, after you subtract the numerators so you can identify any common factors.

Example 13.9.3.10

Subtract: $\frac{n^2}{n-10}-\frac{100}{n-10}$.

Answer

	$\frac{n^2}{n-10}-\frac{100}{n-10}$

The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{n^2-100}{n-10}$
Factor the numerator.	$\frac{(n-10)(n+10)}{n-10}$
Simplify.	n+10

Example 13.9.3.11

Subtract: $\frac{x^2}{x+3}-\frac{9}{x+3}$.

Answer

x−3

Example 13.9.3.12

Subtract: $\frac{4x^2}{2x-5}-\frac{25}{2x-5}$.

Answer

2x+5

Be careful of the signs when you subtract a binomial!

Example 13.9.3.13

Subtract: $\frac{y^2}{y-6}-\frac{2y+24}{y-6}$.

Answer

	$\frac{y^2}{y-6}-\frac{2y+24}{y-6}$
The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{y^2-(2y+24)}{y-6}$
Distribute the sign in the numerator.	$\frac{y^2-2y-24}{y-6}$
Factor the numerator.	$\frac{(y-6)(y+4)}{y-6}$
Simplify.	y+4

Example 13.9.3.14

Subtract: $\frac{n^2}{n-4}-\frac{n+12}{n-4}$.

Answer

n+3

Example 13.9.3.15

Subtract: $\frac{y^2}{y-1}-\frac{9y-8}{y-1}$.

Answer

y−8

Example 13.9.3.16

Subtract: $\frac{5x^2-7x+3}{x^2-3x-18} - \frac{4x^2+x-9}{x^2-3x-18}$.

Answer

	$\frac{5x^2-7x+3}{x^2-3x+18} - \frac{4x^2+x-9}{x^2-3x+18}$
The fractions have a common denominator, so add the numerators and place the sum over the common denominator.	$\frac{5x^2-7x+3-(4x^2+x-9)}{x^2-3x+18}$
Distribute the sign in the numerator.	$\frac{5x^2-7x+3-4x^2-x+9}{x^2-3x+18}$
Combine like terms.	$\frac{x^2-8x+12}{x^2-3x+18}$
Factor the numerator and the denominator.	$\frac{(x-2)(x-6)}{(x+3)(x-6)}$
Simplify.	$\frac{x-2}{x+3}$

Example 13.9.3.17

Subtract: $\frac{4x^2-11x+8}{x^2-3x+2} - \frac{3x^2+x-3}{x^2-3x+2}$.

Answer

$\frac{x-11}{x-2}$

Example 13.9.3.18

Subtract: $\frac{6x^2-x+20}{x^2-81} - \frac{5x^2+11x-7}{x^2-81}$.

Answer

$\frac{x-3}{x+9}$

Add and Subtract Rational Expressions whose Denominators are Opposites

When the denominators of two rational expressions are opposites, it is easy to get a common denominator. We just have to multiply one of the fractions by $\frac{-1}{-1}$

Let's see how this works.

	$\frac{7}{d} + \frac{5}{-d}$
Multiply the second fraction by $\frac{-1}{-1}$.	$\frac{7}{d} + \frac{(-1)5}{(-1)(-d)}$
The denominators are the same.	$\frac{7}{d} + \frac{-5}{d}$
Simplify.	$\frac{2}{d}$

Example 13.9.3.19

Add: $\frac{4u-1}{3u-1}+\frac{u}{1-3u}$.

Answer

	$\frac{4u-1}{3u-1}+\frac{u}{1-3u}$
Multiply the second fraction by $\frac{-1}{-1}$.	$\frac{4u-1}{3u-1}+\frac{(-1)u}{(-1)(1-3u)}$
Simplify the second fraction.	$\frac{4u-1}{3u-1}+\frac{-u}{3u-1}$
The denominators are the same. Add the numerators.	$\frac{4u-1-u}{3u-1}$
Simplify.	$\frac{3u-1}{3u-1}$
Simplify.	1

Example 13.9.3.20

Add: $\frac{8x-15}{2x-5}+\frac{2x}{5-2x}$.

Answer

3

Example 13.9.3.21

Add: $\frac{6y^2+7y-10}{4y-7}+\frac{2y^2+2y+11}{7-4y}$.

Answer

y+3

Example 13.9.3.22

Subtract: $\frac{m^2-6m}{m^2-1}-\frac{3m+2}{1-m^2}$.

Answer

	$\frac{m^2-6m}{m^2-1}-\frac{3m+2}{1-m^2}$
Multiply the second fraction by $\frac{-1}{-1}$.	$\frac{m^2-6m}{m^2-1}-\frac{-1(3m+2)}{-1(1-m^2)}$
Simplify the second fraction.	$\frac{m^2-6m}{m^2-1}-\frac{-3m-2}{m^2-1}$
The denominators are the same. Subtract the numerators.	$\frac{m^2-6m-(-3m-2)}{m^2-1}$
Distribute.	m2−6m+3m+2m2−1
Combine like terms.	$\frac{m^2-3m+2}{m^2-1}$
Factor the numerator and denominator.	$\frac{(m-1)(m-2)}{(m-1)(m+1)}$
Simplify by removing common factors.	$\frac{\cancel{(m-1)}(m-2)}{\cancel{(m-1)}(m+1)}$

Simplify.	$\frac{m-2}{m+1}$

Example 13.9.3.23

Subtract: $\frac{y^2-5y}{y^2-4} - \frac{6y-6}{4-y^2}$.

Answer

$\frac{y+3}{y+2}$

Example 13.9.3.24

Subtract: $\frac{2n^2+8n-1}{n^2-1} - \frac{n^2-7n-1}{1-n^2}$.

Answer

$\frac{3n-2}{n-1}$

Key Concepts

- **Rational Expression Addition**
  - If p, q, and r are polynomials where $r \neq 0$, then

    $\frac{p}{r} + \frac{q}{r} = \frac{p+q}{r}$
  - To add rational expressions with a common denominator, add the numerators and place the sum over the common denominator.
- **Rational Expression Subtraction**
  - If p, q, and r are polynomials where $r \neq 0$

    $\frac{p}{r} - \frac{q}{r} = \frac{p-q}{r}$
  - To subtract rational expressions, subtract the numerators and place the difference over the common denominator.

13.9.3E: Exersices

Practice Makes Perfect

Add Rational Expressions with a Common Denominator

In the following exercises, add.

Example 13.9.3E.25

$\frac{2}{15}+\frac{7}{15}$

Answer

$\frac{3}{5}$

Example 13.9.3E.26

$\frac{4}{21}+\frac{3}{21}$

Example 13.9.3E.27

$\frac{7}{24}+\frac{11}{24}$

Answer

$\frac{3}{4}$

Example 13.9.3E.28

$\frac{7}{36}+\frac{13}{36}$

Example 13.9.3E.29

$\frac{3a}{a-b}+\frac{1}{a-b}$

Answer

$\frac{3a+1}{a-b}$

Example 13.9.3E.30

$\frac{3c}{4c-5}+\frac{5}{4c-5}$

Example 13.9.3E.31

$\frac{d}{d+8}+\frac{5}{d+8}$

Answer

$\frac{d+5}{d+8}$

Example 13.9.3E.32

$\frac{7m}{2m+n}+\frac{4}{2m+n}$

Example 13.9.3E.33

$\frac{p^2+10p}{p+2}+\frac{16}{p+2}$

Answer

p+8

Example 13.9.3E.34

$\frac{q^2+12q}{q+3}+\frac{27}{q+3}$

Example 13.9.3E.35

$\frac{2r^2}{2r-1}+\frac{15r-8}{2r-1}$

Answer

r+8

Example 13.9.3E.36

$\frac{3s^2}{3s-2}+\frac{13s-10}{3s-2}$

Example 13.9.3E.37

$\frac{8t^2}{t+4}+\frac{32t}{t+4}$

Answer

8t

Example 13.9.3E.38

$\frac{6v^2}{v+5}+\frac{30v}{v+5}$

Example 13.9.3E.39

$\frac{2w^2}{w^2-16}+\frac{8w}{w^2-16}$

Answer

$\frac{2w}{w-4}$

Example 13.9.3E.40

$\frac{7x^2}{x^2-9}+\frac{21x}{x^2-9}$

Subtract Rational Expressions with a Common Denominator

In the following exercises, subtract.

Example 13.9.3E.41

$\frac{y^2}{y+8} - \frac{64}{y+8}$

Answer

y−8

Example 13.9.3E.42

$\frac{z^2}{z+2} - \frac{4}{z+2}$

Example 13.9.3E.43

$\frac{9a^2}{3a-7} - \frac{49}{3a-7}$

Answer

3a+7

Example 13.9.3E.44

$\frac{25b^2}{5b-6} - \frac{36}{5b-6}$

Example 13.9.3E.45

$\frac{c^2}{c-8} - \frac{6c+16}{c-8}$

Answer

c+2

Example 13.9.3E.46

$\frac{d^2}{d-9} - \frac{6d+27}{d-9}$

Example 13.9.3E.47

$\frac{3m^2}{6m-30} - \frac{21m-30}{6m-30}$

Answer

$\frac{m-2}{3}$

Example 13.9.3E.48

$\frac{2n^2}{4n-32} - \frac{30n-16}{4n-32}$

Example 13.9.3E.49

$\frac{6p^2+3p+4}{p^2+4p-5} - \frac{5p^2+p+7}{p^2+4p-5}$

Answer

$\frac{p+3}{p+5}$

Example 13.9.3E.50

$\frac{5q^2+3q-9}{q^2+6q+8} - \frac{4q^2+9q+7}{q^2+6q+8}$

Example 13.9.3E.51

$\frac{5r^2+7r-33}{r^2-49} - \frac{4r^2-5r-30}{r^2-49}$

Answer

$\frac{r+9}{r+7}$

Example 13.9.3E.52

$\frac{7t^2-t-4}{t^2-25} - \frac{6t^2+2t-1}{t^2-25}$

Add and Subtract Rational Expressions whose Denominators are Opposites

In the following exercises, add.

Example 13.9.3E.53

$\frac{10v^2}{v-1} + \frac{2v+4}{1-2v}$

Answer

4

Example 13.9.3E.54

$\frac{20w}{5w-2} + \frac{5w+6}{2-5w}$

Example 13.9.3E.55

$\frac{10x^2+16x-7}{8x-3} + \frac{2x^2+3x-1}{3-8x}$

Answer

x+2

Example 13.9.3E.56

$\frac{6y^2+2y-11}{3y-7} + \frac{3y^2-3y+17}{7-3y}$

In the following exercises, subtract.

Example 13.9.3E.57

$\frac{z^2+6z}{z^2-25} - \frac{3z+20}{25-z^2}$

Answer

$\frac{z+4}{z-5}$

Example 13.9.3E.58

$\frac{a^2+3a}{a^2-9} - \frac{3a-27}{9-a^2}$

Example 13.9.3E.59

$\frac{2b^2+30b-13}{b^2-49} - \frac{2b^2-5b-8}{49-b^2}$

Answer

$\frac{4b-3}{b-7}$

Example 13.9.3E.60

$\frac{c^2+5c-10}{c^2-16} - \frac{c^2-8c-10}{16-c^2}$

Everyday Math

Example 13.9.3E.61

Sarah ran 8 miles and then biked 24 miles. Her biking speed is 4 mph faster than her running speed. If rr represents Sarah's speed when she ran, then her running time is modeled by the expression $\frac{8}{r}$ and her biking time is modeled by the expression $\frac{24}{r+4}$. Add the rational expressions $\frac{8}{r} + \frac{24}{r+4}$ to get an expression for the total amount of time Sarah ran and biked.

Answer

$\frac{32r+32}{r(r+4)}$

Example 13.9.3E.62

If Pete can paint a wall in pp hours, then in one hour he can paint $\frac{1}{p}$ of the wall. It would take Penelope 3 hours longer than Pete to paint the wall, so in one hour she can paint $\frac{1}{p+3}$ of the wall. Add the rational expressions $\frac{1}{p} + \frac{1}{p+3}$ to get an expression for the part of the wall Pete and Penelope would paint in one hour if they worked together.

Writing Exercises

Example 13.9.3E.63

Donald thinks that $\frac{3}{x} + \frac{4}{x}$ is $\frac{7}{2x}$. Is Donald correct? Explain.

Example 13.9.3E.64

Explain how you find the Least Common Denominator of x^2+5x+4 and x^2-16.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add rational expressions with a common denominator.			
subtract rational expressions with a common denominator.			
add and subtract rational expressions whose denominators are opposites.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

13.9.4: Add and Subtract Rational Expressions with Unlike Denominators

Learning Objectives

By the end of this section, you will be able to:

- Find the least common denominator of rational expressions
- Find equivalent rational expressions
- Add rational expressions with different denominators
- Subtract rational expressions with different denominators

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Add: $\frac{7}{10}+\frac{8}{15}$.
   If you missed this problem, review Exercise 1.7.13.
2. Subtract: $6(2x+1)-4(x-5)$.
   If you missed this problem, review Exercise 1.10.52.
3. Find the Greatest Common Factor of $9x^2y^3$ and $12xy^5$
   If you missed this problem, review Exercise 7.1.7.
4. Factor completely −48n−12
   If you missed this problem, review Exercise 7.1.31.

Find the Least Common Denominator of Rational Expressions

When we add or subtract rational expressions with unlike denominators we will need to get common denominators. If we review the procedure we used with numerical fractions, we will know what to do with rational expressions.

Let's look at the example $\frac{7}{12}+\frac{5}{18}$ from Foundations. Since the denominators are not the same, the first step was to find the least common denominator (LCD). Remember, the LCD is the least common multiple of the denominators. It is the smallest number we can use as a common denominator.

To find the LCD of 12 and 18, we factored each number into primes, lining up any common primes in columns. Then we "brought down" one prime from each column. Finally, we multiplied the factors to find the LCD.

12=2·2·3

18=2·3·3

LCD=2·2·3·3

LCD=36

We do the same thing for rational expressions. However, we leave the LCD in factored form.

Definition: FIND THE LEAST COMMON DENOMINATOR OF RATIONAL EXPRESSIONS.

1. Factor each expression completely.
2. List the factors of each expression. Match factors vertically when possible.
3. Bring down the columns.
4. Multiply the factors.

Remember, we always exclude values that would make the denominator zero. What values of *xv*should we exclude in this next example?

Example 13.9.4.1

Find the LCD for $\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$

Answer

	$\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$
Factor each expression completely, lining up common factors. Bring down the columns.	$x^2-2x-3=(x-3)(x+1)$
	$x^2+4x+3=(x+1)(x+3)$
Multiply the factors.	LCD=(x+1)(x−3)(x+3)
	The LCD is (x+1)(x−3)(x+3).

Example 13.9.4.2

Find the LCD for $\frac{2}{x^2-x-12}, \frac{1}{x^2-16}$

Answer

(x−4)(x+4)(x+3)

Example 13.9.4.3

Find the LCD for $\frac{x}{x^2+8x+15}, \frac{5}{x^2+9x+18}$

Answer

(x+3)(x+6)(x+5)

Find Equivalent Rational Expressions

When we add numerical fractions, once we find the LCD, we rewrite each fraction as an equivalent fraction with the LCD.

$$\frac{7}{12}+\frac{5}{18}$$

$$\frac{7\cdot 3}{12\cdot 3}+\frac{5\cdot 2}{18\cdot 2}$$

$$\frac{21}{36}+\frac{10}{36}$$

$$12=2\cdot 2\cdot 3$$
$$18=2\cdot \quad 3\cdot 3$$
$$\text{LCD}=2\cdot 2\cdot 3\cdot 3$$
$$\text{LCD}=36$$

We will do the same thing for rational expressions.

Example 13.9.4.4

Rewrite as equivalent rational expressions with denominator (x+1)(x−3)(x+3): $\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$.

Answer

	$\frac{8}{x^2-2x-3}, \frac{3x}{x^2+4x+3}$
Factor each denominator.	$\frac{8}{(x+1)(x-3)}, \frac{3x}{(x+1)(x+3)}$
Find the LCD. $x^2-2x-3=(x+1)(x-3)$, $x^2+4x+3=(x+1)(x+3)$, LCD $=(x+1)(x-3)(x+3)$	

Multiply each denominator by the 'missing' factor and multiply each numerator by the same factor.	$\frac{8(x+3)}{(x+1)(x-3)(x+3)}, \frac{3x(x-3)}{(x+1)(x+3)(x-3)}$
Simplify the numerators.	$\frac{8x+24}{(x+1)(x-3)(x+3)}, \frac{3x^2-9x}{(x+1)(x+3)(x-3)}$

Example 13.9.4.5

Rewrite as equivalent rational expressions with denominator (x+3)(x−4)(x+4):
$\frac{2}{x^2-x-12}, \frac{1}{x^2-16}$.

Answer

$\frac{2x+8}{(x-4)(x+3)(x+4)}, \frac{x+3}{(x-4)(x+3)(x+4)}$

Example 13.9.4.6

Rewrite as equivalent rational expressions with denominator (x+3)(x+5)(x+6)
$\frac{x}{x^2+8x+15}, \frac{5}{x^2+9x+18}$.

Answer

$\frac{x^2+6x}{(x+3)(x+5)(x+6)}, \frac{x+3}{(x+3)(x+5)(x+6)}$

Add Rational Expressions with Different Denominators

Now we have all the steps we need to add rational expressions with different denominators. As we have done previously, we will do one example of adding numerical fractions first.

Example 13.9.4.7

Add: $\frac{7}{12}+\frac{5}{18}$.

Answer

	$\frac{7}{12}+\frac{5}{18}$
Find the LCD of 12 and 18. $\begin{array}{l} 12=2\cdot 2\cdot 3 \\ 18=2\cdot \quad 3\cdot 3 \\ \hline \text{LCD}=2\cdot 2\cdot 3\cdot 3 \\ \text{LCD}=36 \end{array}$	
Rewrite each fraction as an equivalent fraction with the LCD.	$\frac{7\cdot 3}{12\cdot 3}+\frac{5\cdot 2}{18\cdot 2}$
Add the fractions.	$\frac{21}{36}+\frac{10}{36}$
The fraction cannot be simplified.	$\frac{31}{36}$

Example 13.9.4.8

Add: $\frac{11}{30}+\frac{7}{12}$.

Answer

$\frac{19}{20}$

Example 13.9.4.9

Add: $\frac{3}{8}+\frac{9}{20}$.

Answer

$\frac{33}{40}$

Now we will add rational expressions whose denominators are monomials.

Example 13.9.4.10

Add: $\frac{5}{12x^2y}+\frac{4}{21xy^2}$.

Answer

	$\frac{5}{12x^2y}+\frac{4}{21xy^2}$
Find the LCD of $12x^2y$ and $21xy^2$ $12x^2y = 2 \cdot 2 \cdot 3 \cdot x \cdot x \cdot y$ $21xy^2 = 3 \cdot 7 \cdot x \cdot y \cdot y$ $\text{LCD} = 2 \cdot 2 \cdot 3 \cdot 7 \cdot x \cdot x \cdot y \cdot y$ $\text{LCD} = 84x^2y^2$	
	$\frac{5}{12x^2y}+\frac{4}{21xy^2}$
Rewrite each rational expression as an equivalent fraction with the LCD.	$\frac{5 \cdot 7y}{12x^2y \cdot 7y}+\frac{4 \cdot 4x}{21xy^2 \cdot 4x}$
Simplify.	$\frac{35y}{84x^2y^2}+\frac{16x}{84x^2y^2}$
Add the rational expressions.	$\frac{16x+35y}{84x^2y^2}$
There are no factors common to the numerator and denominator. The fraction cannot be simplified.	

Example 13.9.4.11

Add: $\frac{2}{15a^2b}+\frac{5}{6ab^2}$.

Answer

$\frac{4b+25a}{30a^2b^2}$

Example 13.9.4.12

Add: $\frac{5}{16c}+\frac{3}{8cd^2}$.

Answer

$\frac{5d^2+6}{16cd^2}$

Now we are ready to tackle polynomial denominators.

How to Add Rational Expressions with Different Denominators

Example 13.9.4.13

Add: $\frac{3}{x-3}+\frac{2}{x-2}$.

Answer

Step 1. Determine if the expressions have a common denominator. • Yes – Go to step 2. • No – Rewrite each rational expression with the LCD. ○ Find the LCD. ○ Rewrite each rational expression as an equivalent rational expression with the LCD.	No Find the LCD of $(x-3), (x-2)$ Change into equivalent rational expressions with the LCD, $(x-3)(x-2)$. Keep the denominators factored!	$x-3 : (x-3)$ $x-2 : (x-2)$ LCD $: (x-3)(x-2)$ $\frac{3}{x-3}+\frac{2}{x-2}$ $\frac{3(x-2)}{(x-3)(x-2)}+\frac{2(x-3)}{(x-2)(x-3)}$ $\frac{3x-6}{(x-3)(x-2)}+\frac{2x-6}{(x-2)(x-3)}$
Step 2. Add the rational expressions.	Add the numerators and place the sum over the common denominator.	$\frac{3x-6+2x-6}{(x-3)(x-2)}$ $\frac{5x-12}{(x-3)(x-2)}$
Step 3. Simplify, if possible.	Because $5x-12$ cannot be factored, the answer is simplified.	

Example 13.9.4.14

Add: $\frac{2}{x-2}+\frac{5}{x+3}$.

Answer

$\frac{7x-4}{(x+3)(x-2)}$

Example 13.9.4.15

Add: $\frac{4}{m+3}+\frac{3}{m+4}$.

Answer

$\frac{7m+25}{(m+3)(m+4)}$

The steps to use to add rational expressions are summarized in the following procedure box.

Definition: ADD RATIONAL EXPRESSIONS.

1. Determine if the expressions have a common denominator.
   Yes – go to step 2.
   No – Rewrite each rational expression with the LCD.

Find the LCD.
Rewrite each rational expression as an equivalent rational expression with the LCD.
2. Add the rational expressions.
3. Simplify, if possible.

ExAMPLe 13.9.4.16

Add: $\frac{2a}{2ab+b^2}+\frac{3a}{4a^2-b^2}$.

Answer

	$\frac{2a}{2ab+b^2}+\frac{3a}{4a^2-b^2}$
Do the expressions have a common denominator? No. Rewrite each expression with the LCD.	
Find the LCD. $\begin{array}{rl} 2ab+b^2 &= b(2a+b) \\ 4a^2-b^2 &= (2a+b)(2a-b) \\ \text{LCD} &= b(2a+b)(2a-b) \end{array}$	
Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{2a(2a-b)}{b(2a+b)(2a-b)}+\frac{3a\cdot b}{(2a+b)(2a-b)\cdot b}$
Simplify the numerators.	$\frac{4a^2-2ab}{b(2a+b)(2a-b)}+\frac{3ab}{b(2a+b)(2a-b)}$
Add the rational expressions.	$\frac{4a^2-2ab+3ab}{b(2a+b)(2a-b)}$
Simplify the numerator.	$\frac{4a^2+ab}{b(2a+b)(2a-b)}$
Factor the numerator.	$\frac{a(4a+b)}{b(2a+b)(2a-b)}$
There are no factors common to the numerator and denominator. The fraction cannot be simplified.	

Example 13.9.4.17

Add: $\frac{5x}{xy-y^2}+\frac{2x}{x^2+y^2}$.

Answer

$\frac{x(5x+7y)}{y(x-y)(x+y)}$

Example 13.9.4.18

Add: $\frac{7}{2m+6}+\frac{4}{m^2+4m+3}$.

Answer

$\frac{7m+15}{2(m+3)(m+1)}$

Avoid the temptation to simplify too soon! In the example above, we must leave the first rational expression as $\frac{2a(2a-b)}{b(2a+b)(2a-b)}$ to be able to add it to $\frac{3a\cdot b}{(2a+b)(2a-b)\cdot b}$.

Example 13.9.4.19

Add: $\frac{8}{x^2-2x-3}+\frac{3x}{x^2+4x+3}$.

Answer

	$\frac{8}{x^2-2x-3}+\frac{3x}{x^2+4x+3}$
Do the expressions have a common denominator? No. Rewrite each expression with the LCD.	
Find the LCD. $\begin{array}{l} x^2-2x-3=(x+1)(x-3) \\ x^2+4x+3=(x+1)\quad\quad(x+3) \\ \text{LCD}\quad\quad=(x+1)(x-3)(x+3) \end{array}$	
Rewrite each rational expression as an equivalent fraction with the LCD.	$\frac{8(x+3)}{(x+1)(x-3)(x+3)}+\frac{3x(x-3)}{(x+1)(x+3)(x-3)}$
Simplify the numerators.	$\frac{8x+24}{(x+1)(x-3)(x+3)}+\frac{3x^2-9x}{(x+1)(x+3)(x-3)}$
Add the rational expressions.	$\frac{8x+24+3x^2+9x}{(x+1)(x-3)(x+3)}$
Simplify the numerator.	$\frac{3x^2-x^2+24}{(x+1)(x-3)(x+3)}$
The numerator is prime, so there are no common factors.	

Example 13.9.4.20

Add: $\frac{1}{m^2-m-2}+\frac{5m}{m^2+3m+2}$.

Answer

$\frac{5m^2-9m+2}{(m-2)(m+1)(m+2)}$

Example 13.9.4.21

Add: $\frac{2n}{n^2-3n-10}+\frac{6}{n^2+5n+6}$.

Answer

$\frac{2(n2+6n-15)}{(n+2)(n-5)(n+3)}$

Subtract Rational Expressions with Different Denominators

The process we use to subtract rational expressions with different denominators is the same as for addition. We just have to be very careful of the signs when subtracting the numerators.

How to Subtract Rational Expressions with Different Denominators

Example 13.9.4.22

Subtract: $\frac{x}{x-3}-\frac{x-2}{x+3}$.

Answer

Step 1. Determine if the expressions have a common denominator. • Yes – Go to step 2. • No – Rewrite each rational expression with the LCD. ○ Find the LCD. ○ Rewrite each rational expression as an equivalent rational expression with the LCD.	No Find the LCD of $(x-3), (x+3)$. Change into equivalent fractions with the LCD, $(x-3)(x+3)$. Keep the denominators factored!	$x-3$: $(x-3)$ $x+3$: $(x+3)$ LCD: $(x-3)(x+3)$ $\frac{x}{x-3} - \frac{x-2}{x+3}$ $\frac{x(x+3)}{(x-3)(x+3)} - \frac{(x-2)(x-3)}{(x+3)(x-3)}$ $\frac{x^2+3x}{(x-3)(x+3)} - \frac{x^2-5x+6}{(x-3)(x+3)}$
Step 2. Subtract the rational expressions.	Subtract the numerators and place the difference over the common denominator. Be careful with the signs!	$\frac{x^2+3x-(x^2-5x+6)}{(x-3)(x+3)}$ $\frac{x^2+3x-x^2+5x-6}{(x-3)(x+3)}$ $\frac{8x-6}{(x-3)(x+3)}$
Step 3. Simplify, if possible.	The numerator and denominator have no factors in common. The answer is simplified.	$\frac{2(4x-3)}{(x-3)(x+3)}$

? Example 13.9.4.23

Subtract: $\frac{y}{y+4} - \frac{y-2}{y-5}$.

Answer

$\frac{-7y+8}{(y+4)(y-5)}$

? Example 13.9.4.24

Subtract: $\frac{z+3}{z+2} - \frac{z}{z+3}$.

Answer

$\frac{4z+9}{(z+2)(z+3)}$

The steps to take to subtract rational expressions are listed below.

Definition: SUBTRACT RATIONAL EXPRESSIONS.

1. Determine if they have a common denominator.
   Yes – go to step 2.
   No – Rewrite each rational expression with the LCD.
   Find the LCD.
   Rewrite each rational expression as an equivalent rational expression with the LCD.
2. Subtract the rational expressions.
3. Simplify, if possible.

Example 13.9.4.25

Subtract: $\frac{8y}{y^2-16} - \frac{4}{y-4}$.

Answer

	$\frac{8y}{y^2-16} - \frac{4}{y-4}$
Do the expressions have a common denominator? No. Rewrite each expression with the LCD.	
Find the LCD. $\begin{array}{l} y^2-16=(y-4)(y+4) \\ y-4 \quad =y-4 \\ \hline \text{LCD} \quad =(y-4)(y+4) \end{array}$	
Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{8y}{(y-4)(y+4)} - \frac{4(y+4)}{(y-4)(y+4)}$
Simplify the numerators.	$\frac{8y}{(y-4)(y+4)} - \frac{4y+16}{(y-4)(y+4)}$
Subtract the rational expressions.	$\frac{8y-4y-16}{(y-4)(y+4)}$
Simplify the numerators.	$\frac{4y-16}{(y-4)(y+4)}$
Factor the numerator to look for common factors.	$\frac{4(y-4)}{(y-4)(y+4)}$
Remove common factors.	$\frac{4\cancel{(y-4)}}{\cancel{(y-4)}(y+4)}$
Simplify.	$\frac{4}{(y+4)}$

Example 13.9.4.26

Subtract: $\frac{2x}{x^2-4} - \frac{1}{x+2}$.

Answer

$\frac{1}{x-2}$

Example 13.9.4.27

Subtract: $\frac{3}{z+3} - \frac{6z}{z^2-9}$.

Answer

$\frac{-3}{z-3}$

There are lots of negative signs in the next example. Be extra careful!

Example 13.9.4.28

Subtract: $\frac{-3n-9}{n^2+n-6} - \frac{n+3}{2-n}$.

Answer

	$\frac{-3n-9}{n^2+n-6} - \frac{n+3}{2-n}$

Factor the denominator.	$\frac{-3n-9}{(n-2)(n+3)} - \frac{n+3}{2-n}$
Since n−2 and 2−n are opposites, we will multiply the second rational expression by $\frac{-1}{-1}$.	$\frac{-3n-9}{(n-2)(n+3)} - \frac{(-1)(n+3)}{(-1)(2-n)}$
Simplify.	$\frac{-3n-9}{(n-2)(n+3)} + \frac{(n+3)}{(n-2)}$
Do the expressions have a common denominator? No.	
Find the LCD. $\begin{array}{r} n^2+n-6=(n-2)(n+3) \\ n-2=(n-2) \\ \hline \text{LCD}=(n-2)(n+3) \end{array}$	
Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{-3n-9}{(n-2)(n+3)} + \frac{(n+3)(n+3)}{(n-2)(n+3)}$
Simplify the numerators.	$\frac{-3n-9}{(n-2)(n+3)} + \frac{n^2+6n+9}{(n-2)(n+3)}$
Simplify the rational expressions.	$\frac{-3n-9+n^2+6n+9}{(n-2)(n+3)}$
Simplify the numerator.	$\frac{n^2+3n}{(n-2)(n+3)}$
Factor the numerator to look for common factors.	$\frac{n(n+3)}{(n-2)(n+3)}$
Simplify.	$\frac{n}{(n-2)}$

Example 13.9.4.29

Subtract: $\frac{3x-1}{x^2-5x-6} - \frac{2}{6-x}$.

Answer

$\frac{1}{x-6}$

Example 13.9.4.30

Subtract: $\frac{-2y-2}{y^2+2y-8} - \frac{y-1}{2-y}$.

Answer

$\frac{y+3}{y+4}$

When one expression is not in fraction form, we can write it as a fraction with denominator 1.

Example 13.9.4.31

Subtract: $\frac{5c+4}{c-2} - 3$.

Answer

	$\frac{5c+4}{c-2} - 3$
Write 3 as $\frac{3}{1}$ to have 2 rational expressions.	$\frac{5c+4}{c-2} - \frac{3}{1}$
Do the rational expressions have a common denominator? No.	

Find the LCD of c−2 and 1. LCD = c−2.	
Rewrite $\frac{3}{1}$ as an equivalent rational expression with the LCD.	$\frac{5c+4}{c-2}-\frac{3(c-2)}{1(c-2)}$
Simplify.	$\frac{5c+4}{c-2}-\frac{3c-6}{(c-2)}$
Subtract the rational expressions.	$\frac{5c+4-(3c-6)}{c-2}$
Simplify.	$\frac{2c+10}{c-2}$
Factor to check for common factors.	$\frac{2(c+5)}{c-2}$
There are no common factors; the rational expression is simplified.	

Example 13.9.4.32

Subtract: $\frac{2x+1}{x-7}-3$.

Answer

$\frac{-x+22}{x-7}$

Example 13.9.4.33

Subtract: $\frac{4y+3}{2y-1}-5$.

Answer

$\frac{-2(3y-4)}{2y-1}$

Definition: ADD OR SUBTRACT RATIONAL EXPRESSIONS.

1. Determine if the expressions have a common denominator.
   Yes – go to step 2.
   No – Rewrite each rational expression with the LCD.
   Find the LCD.
   Rewrite each rational expression as an equivalent rational expression with the LCD.
2. Add or subtract the rational expressions.
3. Simplify, if possible.

We follow the same steps as before to find the LCD when we have more than two rational expressions. In the next example we will start by factoring all three denominators to find their LCD.

Example 13.9.4.34

Simplify: $\frac{2u}{u-1}+\frac{1}{u}-\frac{2u-1}{u^2-u}$.

Answer

	$\frac{2u}{u-1}+\frac{1}{u}-\frac{2u-1}{u^2-u}$
Do the rational expressions have a common denominator? No.	

$u-1=\quad u-1$ $u\quad\ =u$ $u^2-u=u(u-1)$ Find the LCD. $\text{LCD}=u(u-1)$	
Rewrite each rational expression as an equivalent rational expression with the LCD.	$\frac{2u\cdot u}{(u-1)u}+\frac{1\cdot(u-1)}{u\cdot(u-1)}-\frac{2u-1}{u(u-1)}$
	$\frac{2u^2}{(u-1)u}+\frac{u-1}{u\cdot(u-1)}-\frac{2u-1}{u(u-1)}$
Write as one rational expression.	$\frac{2u^2+u-1-2u+1}{u(u-1)}$
Simplify.	$\frac{2u^2-u}{u(u-1)}$
Factor the numerator, and remove common factors.	$\frac{u(2u-1)}{u(u-1)}$
Simplify.	$\frac{2u-1}{u-1}$

? Example 13.9.4.35

Simplify: $\frac{v}{v+1}+\frac{3}{v-1}-\frac{6}{v^2-1}$.

Answer

$\frac{v+3}{v+1}$

? Example 13.9.4.36

Add exercises text here.Simplify: $\frac{3w}{w+2}+\frac{2}{w+7}-\frac{17w+4}{w^2+9w+14}$.

Answer

$\frac{3w}{w+7}$

Key Concepts

- **Find the Least Common Denominator of Rational Expressions**
  1. Factor each expression completely.
  2. List the factors of each expression. Match factors vertically when possible.
  3. Bring down the columns.
  4. Multiply the factors.
- **Add or Subtract Rational Expressions**
  1. Determine if the expressions have a common denominator.
     Yes – go to step 2.
     No – Rewrite each rational expression with the LCD.
     - Find the LCD.
     - Rewrite each rational expression as an equivalent rational expression with the LCD.
  2. Add or subtract the rational expressions.
  3. Simplify, if possible.

13.9.4E: Exercises

Practice Makes Perfect

In the following exercises, find the LCD.

Example 13.9.4E.37

$\frac{5}{x^2-2x-8}, \frac{2x}{x^2-x-12}$

Answer

(x−4)(x+2)(x+3)

Example 13.9.4E.38

$\frac{8}{y^2+12y+35}, \frac{3y}{y^2+y-42}$

Example 13.9.4E.39

$\frac{9}{z^2+2z-8}, \frac{4z}{z^2-49}$

Answer

(z−2)(z+4)(z+2)

Example 13.9.4E.39

$\frac{6}{a^2+14a+45}, \frac{5a}{a^2-81}$

Example 13.9.4E.40

$\frac{4}{b^2+6b+9}, \frac{2b}{b^2-2b-15}$

Answer

(b+3)(b+3)(b−5)

Example 13.9.4E.41

$\frac{5}{c^2-4c+4}, \frac{3c}{c^2-10c+16}$

Example 13.9.4E.42

$\frac{2}{3d^2+14d-5}, \frac{5d}{3d^2-19d+6}$

Answer

(3d−1)(d+5)(d−6)

Example 13.9.4E.44

$\frac{3}{5m^2-3m-2}, \frac{6m}{5m^2+17m+6}$

In the following exercises, write as equivalent rational expressions with the given LCD.

Example 13.9.4E.45

$\frac{5}{x^2-2x-8}, \frac{2x}{x^2-x-12}$
LCD (x−4)(x+2)(x+3)

Answer

$\frac{5x+15}{(x-4)(x+2)(x+3)}, \frac{2x^2+4x}{(x-4)(x+2)(x+3)}$

Example 13.9.4E.46

$\frac{8}{y^2+12y+35}, \frac{3y}{y^2+y-42}$
LCD (y+7)(y+5)(y−6)

Example 13.9.4E.47

$\frac{9}{z^2+2z-8}, \frac{4z}{z^2-49}$
LCD (z−2)(z+4)(z+2)

Answer

$\frac{9z+18}{(z-2)(z+4)(z+2)}, \frac{4z^2+16}{(z-2)(z+4)(z+2)}$

Example 13.9.4E.48

$\frac{6}{a^2+14a+45}, \frac{5a}{a^2-81}$
LCD (a+9)(a+5)(a−9)

Example 13.9.4E.49

$\frac{4}{b^2+6b+9}, \frac{2b}{b^2-2b-15}$
LCD (b+3)(b+3)(b−5)

Answer

$\frac{4b-20}{(b+3)(b+3)(b-5)}, \frac{2b^2+6b}{(b+3)(b+3)(b-5)}$

Example 13.9.4E.50

$\frac{5}{c^2-4c+4}, \frac{3c}{c^2-10c+10}$
LCD (c−2)(c−2)(c−8)

Example 13.9.4E.51

$\frac{2}{3d^2+14d-5}, \frac{5d}{3d^2-19d+6}$
LCD (3d−1)(d+5)(d−6)

Answer

$\frac{2d-12}{(3d-1)(d+5)(d-6)}$, $\frac{5d^2+25d}{(3d-1)(d+5)(d-6)}$

Example 13.9.4E.52

$\frac{3}{5m^2-3m-2}$, $\frac{6m}{5m^2+17m+6}$

LCD (5m+2)(m−1)(m+3)

In the following exercises, add.

Example 13.9.4E.53

$\frac{5}{24}+\frac{11}{36}$

Answer

$\frac{37}{72}$

Example 13.9.4E.54

$\frac{7}{30}+\frac{13}{45}$

Example 13.9.4E.55

$\frac{9}{20}+\frac{11}{30}$

Answer

$\frac{49}{60}$

Example 13.9.4E.56

$\frac{8}{27}+\frac{7}{18}$

Example 13.9.4E.57

$\frac{7}{10x^2y}+\frac{4}{15xy^2}$

Answer

$\frac{21y+8x}{30x^2y^2}$

Example 13.9.4E.58

$\frac{1}{12a^3b^2}+\frac{5}{9a^2b^3}$

Example 13.9.4E.59

$\frac{1}{2m}+\frac{7}{8m^2n}$

Answer

$\frac{mn+14}{16m^2n}$

Example 13.9.4E.60

$\frac{5}{6p^2q}+\frac{1}{4p}$

Example 13.9.4E.61

$\frac{3}{r+4}+\frac{2}{r-5}$

Answer

$\frac{5r-7}{(r+4)(r-5)}$

Example 13.9.4E.62

$\frac{4}{s-7}+\frac{5}{s+3}$

Example 13.9.4E.63

$\frac{8}{t+5}+\frac{6}{t-5}$

Answer

$\frac{14t-10}{(t+5)(t-5)}$

Example 13.9.4E.64

$\frac{7}{v+5}+\frac{9}{v-5}$

Example 13.9.4E.65

$\frac{5}{3w-2}+\frac{2}{w+1}$

Answer

$\frac{11w+1}{(3w-2)(w+1)}$

Example 13.9.4E.66

$\frac{4}{2x+5}+\frac{2}{x-14}$

Example 13.9.4E.67

$\frac{2y}{y+3}+\frac{3}{y-12}$

Answer

$\frac{2y^2+y+9}{(y+3)(y-1)}$

Example 13.9.4E.68

$\frac{3z}{z-2}+\frac{1}{z+5}$

Example 13.9.4E.69

$\frac{5b}{a^2b-2a^2}+\frac{2b}{b^2-4}$

Answer

$\frac{b(5b+10+2a2)}{a^2(b-2)(b+2)}$

Example 13.9.4E.70

$\frac{4}{cd+3c}+\frac{1}{d^2-9}$

Example 13.9.4E.71

$\frac{2m}{3m-3}+\frac{5m}{m^2+3m-4}$

Answer

$\frac{2m^2+23m}{3(m-1)(m+4)}$

Example 13.9.4E.72

$\frac{3}{4n+4}+\frac{6}{n^2-n-2}$

Example 13.9.4E.73

$\frac{3}{n^2+3n-18}+\frac{4n}{n^2+8n+12}$

Answer

$\frac{4n^2-9n+6}{(n-3)(n+6)(n+2)}$

Example 13.9.4E.74

$\frac{6}{q^2-3q-10}+\frac{5q}{q^2-8q+15}$

Example 13.9.4E.75

$\frac{3r}{r^2+7r+6}+\frac{9}{r^2+4r+3}$

Answer

$\frac{3(r^2+6r+18)}{(r+1)(r+6)(r+3)}$

https://math.libretexts.org/@go/page/46303

Example 13.9.4E.76

$\frac{2s}{s^2+2s-8}+\frac{4}{s^2+3s-10}$

In the following exercises, subtract.

Example 13.9.4E.77

$\frac{t}{t-6}-\frac{t-2}{t+6}$

Answer

$\frac{2(7t-6)}{(t-6)(t+6)}$

Example 13.9.4E.78

$\frac{v}{v-3}-\frac{v-6}{v+1}$

Example 13.9.4E.79

$\frac{w+2}{w+4}-\frac{w}{w-2}$

Answer

$\frac{-4(1+w)}{(w+4)(w-2)}$

Example 13.9.4E.80

$\frac{x-3}{x+6}-\frac{x}{x+3}$

Example 13.9.4E.81

$\frac{y-4}{y+1}-\frac{1}{y+7}$

Answer

$\frac{y^2+2y-29}{(y+1)(y+7)}$

Example 13.9.4E.82

$\frac{z+8}{z-3}-\frac{z}{z-2}$

Example 13.9.4E.83

$\frac{5a}{a+3}-\frac{a+2}{a+6}$

Answer

$\frac{4a^2+25a-6}{(a+3)(a+6)}$

https://math.libretexts.org/@go/page/46303

Example 13.9.4E.84

$\frac{3b}{b-2} - \frac{b-6}{b-8}$

Example 13.9.4E.85

$\frac{6c}{c^2-25} - \frac{3}{c+5}$

Answer

$\frac{3}{c-5}$

Example 13.9.4E.86

$\frac{4d}{d^2-81} - \frac{2}{d+9}$

Example 13.9.4E.87

$\frac{6}{m+6} - \frac{12m}{m^2-36}$

Answer

$\frac{-6}{m-6}$

Example 13.9.4E.88

$\frac{4}{n+4} - \frac{8n}{n^2-16}$

Example 13.9.4E.89

$\frac{-9p-17}{p^2-4p-21} - \frac{p+1}{7-p}$

Answer

$\frac{p+2}{p+3}$

Example 13.9.4E.90

$\frac{7q+8}{q^2-2q-24} - \frac{q+2}{4-q}$

Example 13.9.4E.91

$\frac{-2r-16}{r^2+6r-16} - \frac{5}{2-r}$

Answer

$\frac{3}{r-2}$

Example 13.9.4E.92

$\frac{2t-30}{t^2+6t-27} - \frac{2}{3-t}$

https://math.libretexts.org/@go/page/46303

Example 13.9.4E.93

$\frac{5v-2}{v+3}-4$

Answer

$\frac{-v-14}{v+3}$

Example 13.9.4E.94

$\frac{6w+5}{w-1}+2$

Example 13.9.4E.95

$\frac{2x+7}{10x-1}+3$

Answer

$\frac{4(8x+1)}{10x-1}$

Example 13.9.4E.96

$\frac{8y-4}{5y+2}-6$

In the following exercises, add and subtract.

Example 13.9.4E.97

$\frac{5a}{a-2}+\frac{9}{a}-\frac{2a+18}{a^2-2a}$

Answer

$\frac{5a^2+7a-36}{a(a-2)}$

Example 13.9.4E.98

$\frac{2b}{b-5}+\frac{3}{2b}-\frac{2}{b-15}$

Example 13.9.4E.99

$\frac{c}{c+2}+\frac{5}{c-2}-\frac{10c}{c^2-4}$

Answer

$\frac{c-5}{c+2}$

Example 13.9.4E.100

$\frac{6d}{d-5}+\frac{1}{d+4}-\frac{7d-5}{d^2-d-20}$

In the following exercises, simplify.

Example 13.9.4E.101

$\frac{6a}{3ab+b^2}+\frac{3a}{9a^2-b^2}$

Answer

$\frac{3a(6a-b)}{b(3a+b)(3a-b)}$

Example 13.9.4E.102

$\frac{2c}{2c+10}+\frac{7c}{c^2+9c+20}$

Example 13.9.4E.103

$\frac{6d}{d^2-64}-\frac{3}{d-8}$

Answer

$\frac{3}{d+8}$

Example 13.9.4E.104

$\frac{5}{n+7}-\frac{10n}{n^2-49}$

Example 13.9.4E.105

$\frac{4m}{m^2+6m-7}+\frac{2}{m^2+10m+21}$

Answer

$\frac{2(2m^2+7m-1)}{(m+7)(m-1)(m+3)}$

Example 13.9.4E.106

$\frac{3p}{p^2+4p-12}+\frac{1}{p^2+p-30}$

Example 13.9.4E.107

$\frac{-5n-5}{n^2+n-6}+\frac{n+1}{2-n}$

Answer

$\frac{n+1}{n+3}$

Example 13.9.4E.108

$\frac{-4b-24}{b^2+b-30}+\frac{b+7}{5-b}$

https://math.libretexts.org/@go/page/46303

Example 13.9.4E.109

$\frac{7}{15p}+\frac{5}{18pq}$

Answer

$\frac{42q+25}{90pq}$

Example 13.9.4E.110

$\frac{3}{20a^2}+\frac{11}{12ab^2}$

Example 13.9.4E.111

$\frac{4}{x-2}+\frac{3}{x+5}$

Answer

$\frac{7(x+2)}{(x-2)(x+5)}$

Example 13.9.4E.112

$\frac{6}{m+4}+\frac{9}{m-8}$

Example 13.9.4E.113

$\frac{2q+7}{y+4}-2$

Answer

$\frac{17q+2}{3q-1}$

Example 13.9.4E.114

$\frac{3y-1}{y+4}-2$

Example 13.9.4E.115

$\frac{z+2}{z-5}-\frac{z}{z+1}$

Answer

$\frac{8z+2}{(z-5)(z+1)}$

Example 13.9.4E.116

$\frac{t}{t-5}-\frac{t-1}{t+5}$

Example 13.9.4E.117

$\frac{3d}{d+2}+\frac{4}{d}-\frac{d+8}{d^2+2d}$

Answer

$\frac{3(d+1)}{d+2}$

Example 13.9.4E.118

$\frac{2q}{q+5}+\frac{3}{q-3}-\frac{13q+15}{q^2+2q-15}$

Everyday Math

Example 13.9.4E.119

Decorating cupcakes Victoria can decorate an order of cupcakes for a wedding in tt hours, so in 1 hour she can decorate $\frac{1}{t}$ of the cupcakes. It would take her sister 3 hours longer to decorate the same order of cupcakes, so in 1 hour she can decorate $\frac{1}{t+3}$ of the cupcakes.

1. Find the fraction of the decorating job that Victoria and her sister, working together, would complete in one hour by adding the rational expressions $\frac{1}{t}+\frac{1}{t+3}$.
2. Evaluate your answer to part (a) when t=5.

Answer

1. $\frac{2t+3}{t(t+3)}$
2. $\frac{13}{40}$

Example 13.9.4E.120

Kayaking When Trina kayaks upriver, it takes her $\frac{5}{3-c}$ hours to go 5 miles, where cc is the speed of the river current. It takes her $\frac{5}{3+c}$ hours to kayak 5 miles down the river.

1. Find an expression for the number of hours it would take Trina to kayak 5 miles up the river and then return by adding $\frac{5}{3-c}+\frac{5}{3+c}$.
2. Evaluate your answer to part (a) when c=1 to find the number of hours it would take Trina if the speed of the river current is 1 mile per hour.

Writing Exercises

Example 13.9.4E.121

Felipe thinks $\frac{1}{x}+\frac{1}{y}$ is $\frac{2}{x+y}$.

1. Choose numerical values for x and y and evaluate $\frac{1}{x}+\frac{1}{y}$.
2. Evaluate $\frac{2}{x+y}$ for the same values of x and y you used in part (a).
3. Explain why Felipe is wrong.
4. Find the correct expression for $\frac{1}{x}+\frac{1}{y}$.

Answer

Answers may vary.

Example 13.9.4E.122

Simplify the expression $\frac{4}{n^2+6n+9}-\frac{1}{n^2-9}$ and explain all your steps.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find the least common denominator of rational expressions.			
find equivalent rational expressions.			
add rational expressions with different denominators.			
subtract rational expressions with different denominators.			

ⓑ On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.9.5: Simplify Complex Rational Expressions

Learning Objectives

By the end of this section, you will be able to:

- Simplify a complex rational expression by writing it as division
- Simplify a complex rational expression by using the LCD

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Simplify: $\frac{\frac{3}{5}}{\frac{9}{10}}$.
   If you missed this problem, review Exercise 1.6.25.
2. Simplify: $\frac{1-\frac{1}{3}}{4^2+4\cdot 5}$.
   If you missed this problem, review Exercise 1.6.31.

Complex fractions are fractions in which the numerator or denominator contains a fraction. In Chapter 1 we simplified complex fractions like these:

$$\frac{\frac{3}{4}}{\frac{5}{8}} \quad \frac{\frac{x}{2}}{\frac{xy}{6}}$$

In this section we will simplify *complex rational expressions*, which are rational expressions with rational expressions in the numerator or denominator.

Definition: COMPLEX RATIONAL EXPRESSION

A **complex rational expression** is a rational expression in which the numerator or denominator contains a rational expression.

Here are a few complex rational expressions:

$$\frac{\frac{4}{y-3}}{\frac{8}{y^2-9}}$$

$$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$$

$$\frac{\frac{2}{x+6}}{\frac{4}{x-6}-\frac{4}{x^2-36}}$$

Remember, we always exclude values that would make any denominator zero.

We will use two methods to simplify complex rational expressions.

Simplify a Complex Rational Expression by Writing it as Division

We have already seen this complex rational expression earlier in this chapter.

$$\frac{\frac{6x^2-7x+2}{4x-8}}{\frac{2x^2-8x+3}{x^2-5x+6}}$$

We noted that fraction bars tell us to divide, so rewrote it as the division problem

$$\left(\frac{6x^2-7x+2}{4x-8}\right) \div \left(\frac{2x^2-8x+3}{x^2-5x+6}\right)$$

Then we multiplied the first rational expression by the reciprocal of the second, just like we do when we divide two fractions.

This is one method to simplify rational expressions. We write it as if we were dividing two fractions.

Example 13.9.5.1

$\frac{\frac{4}{y-3}}{\frac{8}{y^2-9}}$.

Answer

	$\frac{\frac{4}{y-3}}{\frac{8}{y^2-9}}$
Rewrite the complex fraction as division.	$\frac{4}{y-3} \div \frac{8}{y^2-9}$
Rewrite as the product of first times the reciprocal of the second.	$\frac{4}{y-3} \cdot \frac{y^2-9}{8}$
Multiply.	$\frac{4(y^2-9)}{8(y-3)}$
Factor to look for common factors.	$\frac{4(y-3)(y+3)}{8(y-3)}$
Simplify.	$\frac{y+3}{2}$

Are there any value(s) of y that should not be allowed? The simplified rational expression has just a constant in the denominator. But the original **complex rational expression** had denominators of y−3 and y^2-9. This expression would be undefined if y=3 or y=−3

Example 13.9.5.2

$\frac{\frac{2}{x^2-1}}{\frac{3}{x+1}}$.

Answer

$\frac{2}{3(x-1)}$

Example 13.9.5.3

$\frac{\frac{1}{x^2-7x+12}}{\frac{2}{x-4}}$.

Answer

$\frac{1}{2(x-3)}$

Example 13.9.5.4

$\frac{\frac{1}{3}+\frac{1}{6}}{\frac{1}{2}-\frac{1}{3}}$.

Answer

	$\frac{\frac{1}{3}+\frac{1}{6}}{\frac{1}{2}-\frac{1}{3}}$
Simplify the numerator and denominator.	

Find the LCD and add the fractions in the numerator. Find the LCD and add the fractions in the denominator.	$\frac{1\cdot 2}{3\cdot 2}+\frac{1}{6}$ $\frac{1\cdot 3}{2\cdot 3}-\frac{1\cdot 2}{3\cdot 2}$
Simplify the numerator and denominator.	$\frac{\frac{2}{6}+\frac{1}{6}}{\frac{3}{6}-\frac{2}{6}}$
Simplify the numerator and denominator, again.	$\frac{\frac{3}{6}}{\frac{1}{6}}$
Rewrite the complex rational expression as a division problem.	$\frac{3}{6}\div\frac{1}{6}$
Multiply the first times by the reciprocal of the second.	$\frac{3}{6}\cdot\frac{6}{1}$
Simplify.	3

? Example 13.9.5.5

$\frac{\frac{1}{2}+\frac{2}{3}}{\frac{5}{6}+\frac{1}{12}}$.

Answer

$\frac{14}{11}$

? Example 13.9.5.6

$\frac{\frac{3}{4}-\frac{1}{3}}{\frac{1}{8}+\frac{5}{6}}$.

Answer

$\frac{10}{23}$

How to Simplify a Complex Rational Expression by Writing it as Division

? Example 13.9.5.7

$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$.

Answer

Step 1. Simplify the numerator and denominator.	We will simplify the sum in the numerator and difference in the denominator.	$\dfrac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$
	Find a common denominator and add the fractions in the numerator.	$\dfrac{\frac{1\cdot y}{x\cdot y}+\frac{1\cdot x}{y\cdot x}}{\frac{x\cdot x}{y\cdot x}-\frac{y\cdot y}{x\cdot y}}$
	Find a common denominator and subtract the fractions in the numerator.	$\dfrac{\frac{y}{xy}+\frac{x}{xy}}{\frac{x^2}{xy}-\frac{y^2}{xy}}$
	We now have just one rational expression in the numerator and one in the denominator.	$\dfrac{\frac{y+x}{xy}}{\frac{x^2-y^2}{xy}}$
Step 2. Rewrite the complex rational expression as a division problem.	We write the numerator divided by the denominator.	$\left(\frac{y+x}{xy}\right)\div\left(\frac{x^2-y^2}{xy}\right)$
Step 3. Divide the expressions.	Multiply the first by the reciprocal of the second.	$\left(\frac{y+x}{xy}\right)\cdot\left(\frac{xy}{x^2-y^2}\right)$
	Factor any expressions if possible.	$\dfrac{xy(y+x)}{xy(x-y)(x+y)}$
	Remove common factors.	$\dfrac{\cancel{xy}\cancel{(y+x)}}{\cancel{xy}(x-y)\cancel{(x+y)}}$
	Simplify.	$\dfrac{1}{x-y}$

Example 13.9.5.8

$\dfrac{\frac{1}{x}+\frac{1}{y}}{\frac{1}{x}-\frac{1}{y}}$.

Answer

$\dfrac{y+x}{y-x}$

Example 13.9.5.9

$\dfrac{\frac{1}{a}+\frac{1}{b}}{\frac{1}{a^2}-\frac{1}{b^2}}$.

Answer

$\dfrac{ab}{b-a}$

Definition: SIMPLIFY A COMPLEX RATIONAL EXPRESSION BY WRITING IT AS DIVISION.

1. Simplify the numerator and denominator.
2. Rewrite the complex rational expression as a division problem.
3. Divide the expressions.

Example 13.9.5.10

$$\frac{n-\frac{4n}{n+5}}{\frac{1}{n+5}+\frac{1}{n-5}}$$

Answer

	$\dfrac{n-\dfrac{4n}{n+5}}{\dfrac{1}{n+5}+\dfrac{1}{n-5}}$
Simplify the numerator and denominator.	
Find the LCD and add the fractions in the numerator. Find the LCD and add the fractions in the denominator.	$\dfrac{\dfrac{n(n+5)}{1(n+5)}-\dfrac{4n}{n+5}}{\dfrac{1(n-5)}{(n+5)(n-5)}+\dfrac{1(n+5)}{(n-5)(n+5)}}$
Simplify the numerators.	$\dfrac{\dfrac{n^2+5n}{n+5}-\dfrac{4n}{n+5}}{\dfrac{n-5}{(n+5)(n-5)}+\dfrac{n+5}{(n-5)(n+5)}}$
Subtract the rational expressions in the numerator and add in the denominator.	$\dfrac{\dfrac{n^2+n}{n+5}}{\dfrac{2n}{(n+5)(n-5)}}$
Rewrite as fraction division.	$\dfrac{n^2+n}{n+5}\div\dfrac{2n}{(n+5)(n-5)}$
Multiply the first times the reciprocal of the second.	$\dfrac{n^2+n}{n+5}\cdot\dfrac{(n+5)(n-5)}{2n}$
Factor any expressions if possible.	$\dfrac{n(n+1)(n+5)(n-5)}{(n+5)2n}$
Remove common factors.	$\dfrac{\cancel{n}(n+1)(\cancel{n+5})(n-5)}{(\cancel{n+5})2\cancel{n}}$
Simplify.	$\dfrac{(n+1)(n-5)}{2}$

Example 13.9.5.11

$$\frac{b-\frac{3b}{b+5}}{\frac{2}{b+5}+\frac{1}{b-5}}.$$

Answer

b(b+2)

Example 13.9.5.12

$$\frac{1-\frac{3}{c+4}}{\frac{1}{c+4}+\frac{c}{3}}.$$

Answer

3c+3

Simplify a Complex Rational Expression by Using the LCD

We “cleared” the fractions by multiplying by the LCD when we solved equations with fractions. We can use that strategy here to simplify complex rational expressions. We will multiply the numerator and denominator by LCD of all the rational expressions.

Let’s look at the complex rational expression we simplified one way in Example. We will simplify it here by multiplying the numerator and denominator by the LCD. When we multiply by $\frac{LCD}{LCD}$ we are multiplying by 1, so the value stays the same.

Example 13.9.5.13

Simplify: $\frac{\frac{1}{3}+\frac{1}{6}}{\frac{1}{2}-\frac{1}{3}}$.

Answer

	$\frac{\frac{1}{3}+\frac{1}{6}}{\frac{1}{2}-\frac{1}{3}}$
The LCD of all the fractions in the whole expression is 6.	
Clear the fractions by multiplying the numerator and denominator by that LCD.	$\frac{6\cdot\left(\frac{1}{3}+\frac{1}{6}\right)}{6\cdot\left(\frac{1}{2}-\frac{1}{3}\right)}$
Distribute.	$\frac{6\cdot\frac{1}{3}+6\cdot\frac{1}{6}}{6\cdot\frac{1}{2}-6\cdot\frac{1}{3}}$
Simplify.	$\frac{2+1}{3-2}$
	$\frac{3}{1}$
	3

Example 13.9.5.14

Simplify: $\frac{\frac{1}{2}+\frac{1}{5}}{\frac{1}{10}+\frac{1}{5}}$.

Answer

$\frac{7}{3}$

Example 13.9.5.15

Simplify: $\frac{\frac{1}{4}+\frac{3}{8}}{\frac{1}{2}-\frac{5}{16}}$.

Answer

$\frac{7}{3}$

How to Simplify a Complex Rational Expression by Using the LCD

Example 13.9.5.16

Simplify: $\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$.

Answer

Step 1. Find the LCD of all fractions in the complex rational expression.	The LCD of all the fractions is xy.	$\frac{\frac{1}{x}+\frac{1}{y}}{\frac{x}{y}-\frac{y}{x}}$
Step 2. Multiply the numerator and denominator by the LCD.	Multiply both the numerator and denominator by xy.	$\frac{xy\cdot\left(\frac{1}{x}+\frac{1}{y}\right)}{xy\cdot\left(\frac{x}{y}-\frac{y}{x}\right)}$
Step 3. Simplify the expression.	Distribute.	$\frac{xy\cdot\frac{1}{x}+xy\cdot\frac{1}{y}}{xy\cdot\frac{x}{y}-xy\cdot\frac{y}{x}}$
		$\frac{y+x}{x^2-y^2}$
	Simplify.	$\frac{(y+x)}{(x-y)(x+y)}$
	Remove common factors.	$\frac{1}{x-y}$

Example 13.9.5.17

Simplify: $\frac{\frac{1}{a}+\frac{1}{b}}{\frac{a}{b}-\frac{b}{a}}$.

Answer

$\frac{b+a}{a^2+b^2}$

Example 13.9.5.18

Simplify: $\frac{\frac{1}{x^2}-\frac{1}{y^2}}{\frac{1}{x}-\frac{1}{y}}$.

Answer

$\frac{y-x}{xy}$

Definition: SIMPLIFY A COMPLEX RATIONAL EXPRESSION BY USING THE LCD.

1. Find the LCD of all fractions in the complex rational expression.
2. Multiply the numerator and denominator by the LCD.
3. Simplify the expression.

Be sure to start by factoring all the denominators so you can find the LCD.

Example 13.9.5.19

Simplify: $\frac{\frac{2}{x+6}}{\frac{4}{x-6}-\frac{4}{x^2-36}}$.

Answer

	$\dfrac{\dfrac{2}{x+6}}{\dfrac{4}{x-6}-\dfrac{4}{x^2-36}}$
Find the LCD of all fractions in the complex rational expression. The LCD is (x+6)(x−6)	
Multiply the numerator and denominator by the LCD.	$\dfrac{(x+6)(x-6)\dfrac{2}{x+6}}{(x+6)(x-6)\left(\dfrac{4}{x-6}-\dfrac{4}{(x+6)(x-6)}\right)}$
Simplify the expression.	
Distribute in the denominator.	$\dfrac{(x+6)(x-6)\dfrac{2}{x+6}}{(x+6)(x-6)\left(\dfrac{4}{x-6}\right)-(x+6)(x-6)\left(\dfrac{4}{(x+6)(x-6)}\right)}$
Simplify.	$\dfrac{\cancel{(x+6)}(x-6)\dfrac{2}{\cancel{x+6}}}{\cancel{(x+6)}\cancel{(x-6)}\left(\dfrac{4}{\cancel{x-6}}\right)-\cancel{(x+6)}\cancel{(x-6)}\left(\dfrac{4}{\cancel{(x+6)}\cancel{(x-6)}}\right)}$
Simplify.	$\dfrac{2(x-6)}{4(x+6)-4}$
To simplify the denominator, distribute and combine like terms.	$\dfrac{2(x-6)}{4x+20}$
Remove common factors.	$\dfrac{\cancel{2}(x-6)}{\cancel{2}(2x+10)}$
Simplify.	$\dfrac{x-6}{2x+10}$
Notice that there are no more factors common to the numerator and denominator.	

? Example 13.9.5.20

Simplify: $\dfrac{\frac{3}{x+2}}{\frac{5}{x-2}-\frac{3}{x^2-4}}$.

Answer

$\dfrac{3x-6}{5x+7}$

? Example 13.9.5.21

Simplify: $\dfrac{\frac{2}{x-7}-\frac{1}{x+7}}{\frac{6}{x+7}-\frac{1}{x^2-49}}$.

Answer

$\dfrac{x+21}{6x+43}$

? Example 13.9.5.22

Simplify: $\dfrac{\frac{4}{m^2-7m+12}}{\frac{3}{m-3}-\frac{2}{m-4}}$.

Answer

	$\dfrac{\dfrac{4}{m^2-7m+12}}{\dfrac{3}{m-3}-\dfrac{2}{m-4}}$
Find the LCD of all fractions in the complex rational expression. The LCD is (m−3)(m−4)	
Multiply the numerator and denominator by the LCD.	$\dfrac{(m-3)(m-4)\dfrac{4}{(m-3)(m-4)}}{(m-3)(m-4)\left(\dfrac{3}{m-3}-\dfrac{2}{m-4}\right)}$
Simplify.	$\dfrac{\cancel{(m-3)}\cancel{(m-4)}\dfrac{4}{\cancel{(m-3)}\cancel{(m-4)}}}{\cancel{(m-3)}(m-4)\left(\dfrac{3}{\cancel{m-3}}\right)-(m-3)\cancel{(m-4)}\left(\dfrac{2}{\cancel{m-4}}\right)}$
Simplify.	$\dfrac{4}{3(m-4)-2(m-3)}$
Distribute.	$\dfrac{4}{3m-12-2m+6}$
Combine like terms.	$\dfrac{4}{m-6}$

Example 13.9.5.23

Simplify: $\dfrac{\frac{3}{x^2+7x+10}}{\frac{4}{x+2}+\frac{1}{x+5}}$.

Answer

$\dfrac{3}{5x+22}$

Example 13.9.5.24

Simplify: $\dfrac{\frac{4y}{y+5}+\frac{2}{y+6}}{\frac{3y}{y^2+11y+30}}$.

Answer

$\dfrac{6y+34}{3y}$

Example 13.9.5.25

Simplify: $\dfrac{\frac{y}{y+1}}{1+\frac{1}{y-1}}$.

Answer

	$\dfrac{\dfrac{y}{y+1}}{1+\dfrac{1}{y-1}}$
Find the LCD of all fractions in the complex rational expression.	
The LCD is (y+1)(y−1)	

Multiply the numerator and denominator by the LCD.	$\frac{(y+1)(y-1)\frac{y}{y+1}}{(y+1)(y-1)\left(1+\frac{1}{y-1}\right)}$
Distribute in the denominator and simplify.	$\frac{\cancel{(y+1)}(y-1)\left(\frac{y}{\cancel{y+1}}\right)}{(y+1)(y-1)(1)+(y+1)\cancel{(y-1)}\left(\frac{1}{\cancel{y-1}}\right)}$
Simplify.	$\frac{(y-1)y}{(y+1)(y-1)+(y+1)}$
Simplify the denominator, and leave the numerator factored.	$\frac{y(y-1)}{y^2-1+y+1}$
	$\frac{y(y-1)}{y^2+y}$
Factor the denominator, and remove factors common with the numerator.	$\frac{\cancel{y}(y-1)}{\cancel{y}(y+1)}$
Simplify.	$\frac{y-1}{y+1}$

? Example 13.9.5.26

Simplify: $\frac{\frac{x}{x+3}}{1+\frac{1}{x+3}}$.

Answer

$\frac{x}{x+4}$

? Example 13.9.5.27

Simplify: $\frac{1+\frac{1}{x-1}}{\frac{3}{x+1}}$.

Answer

$\frac{x(x+1)}{3(x-1)}$

Key Concepts

- **To Simplify a Rational Expression by Writing it as Division**
  1. Simplify the numerator and denominator.
  2. Rewrite the complex rational expression as a division problem.
  3. Divide the expressions.
- **To Simplify a Complex Rational Expression by Using the LCD**
  1. Find the LCD of all fractions in the complex rational expression.
  2. Multiply the numerator and denominator by the LCD.
  3. Simplify the expression.

Glossary

complex rational expression

A complex rational expression is a rational expression in which the numerator or denominator contains a rational expression.

This page titled 13.9.5: Simplify Complex Rational Expressions is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

- **8.5: Simplify Complex Rational Expressions** by OpenStax is licensed CC BY 4.0. Original source: https://openstax.org/details/books/elementary-algebra-2e.

13.9.5E: Exercises

Practice Makes Perfect

Simplify a Complex Rational Expression by Writing It as Division

In the following exercises, simplify.

Example 13.9.5E.28

$$\frac{\frac{2a}{a+4}}{\frac{4a^2}{a^2-16}}$$

Answer

$$\frac{a-4}{2a}$$

Example 13.9.5E.29

$$\frac{\frac{3b}{b-5}}{\frac{b^2}{b^2-25}}$$

Example 13.9.5E.30

$$\frac{\frac{5}{c^2+5c-14}}{\frac{10}{c+7}}$$

Answer

$$\frac{1}{2(c-2)}$$

Example 13.9.5E.31

$$\frac{\frac{8}{d^2+9d+18}}{\frac{12}{d+6}}$$

Example 13.9.5E.32

$$\frac{\frac{1}{2}+\frac{5}{6}}{\frac{2}{3}+\frac{7}{9}}$$

Answer

$$\frac{24}{26}$$

Example 13.9.5E.33

$$\frac{\frac{1}{2}+\frac{3}{4}}{\frac{3}{5}+\frac{7}{10}}$$

Example 13.9.5E.34

$$\frac{\frac{2}{3}-\frac{1}{9}}{\frac{3}{4}+\frac{5}{6}}$$

Answer

$\frac{20}{57}$

Example 13.9.5E.35

$\frac{\frac{1}{2}-\frac{1}{6}}{\frac{2}{3}+\frac{3}{4}}$

Example 13.9.5E.36

$\frac{\frac{n}{m}+\frac{1}{n}}{\frac{1}{n}-\frac{n}{m}}$

Answer

$\frac{n^2+m}{m-n^2}$

Example 13.9.5E.37

$\frac{\frac{1}{p}+\frac{p}{q}}{\frac{q}{p}-\frac{1}{q}}$

Example 13.9.5E.38

$\frac{\frac{1}{r}+\frac{1}{t}}{\frac{1}{r^2}-\frac{1}{t^2}}$

Answer

$\frac{rt}{t-r}$

Example 13.9.5E.39

$\frac{\frac{2}{v}+\frac{2}{w}}{\frac{1}{v^2}-\frac{1}{w^2}}$

Example 13.9.5E.40

$\frac{x-\frac{2x}{x+3}}{\frac{1}{x+3}+\frac{1}{x-3}}$

Answer

$\frac{(x+1)(x-3)}{2}$

Example 13.9.5E.41

$\frac{y-\frac{2y}{y-4}}{\frac{2}{y-4}-\frac{2}{y+4}}$

Example 13.9.5E.42

$$\frac{2-\frac{2}{a+3}}{\frac{1}{a+3}+\frac{a}{2}}$$

Answer

$$\frac{4}{a+1}$$

Example 13.9.5E.43

$$\frac{4-\frac{4}{b-5}}{\frac{1}{b-5}+\frac{b}{4}}$$

Simplify a Complex Rational Expression by Using the LCD

In the following exercises, simplify.

Example 13.9.5E.44

$$\frac{\frac{1}{3}+\frac{1}{8}}{\frac{1}{4}+\frac{1}{12}}$$

Answer

$$\frac{1}{18}$$

Example 13.9.5E.45

$$\frac{\frac{1}{4}+\frac{1}{9}}{\frac{1}{6}+\frac{1}{12}}$$

Example 13.9.5E.46

$$\frac{\frac{5}{6}+\frac{2}{9}}{\frac{7}{18}-\frac{1}{3}}$$

Answer

19

Example 13.9.5E.47

$$\frac{\frac{1}{6}+\frac{4}{15}}{\frac{3}{5}-\frac{1}{2}}$$

Example 13.9.5E.48

$$\frac{\frac{c}{d}+\frac{1}{d}}{\frac{1}{d}-\frac{d}{c}}$$

Answer

$$\frac{c^2+c}{c-d^2}$$

Example 13.9.5E.49

$$\frac{\frac{1}{m}+\frac{m}{n}}{\frac{n}{m}-\frac{1}{n}}$$

Example 13.9.5E.50

$$\frac{\frac{1}{p}+\frac{1}{q}}{\frac{1}{p^2}-\frac{1}{q^2}}$$

Answer

$$\frac{pq}{q-p}$$

Example 13.9.5E.51

$$\frac{\frac{2}{r}+\frac{2}{t}}{\frac{1}{r^2}-\frac{1}{t^2}}$$

Example 13.9.5E.52

$$\frac{\frac{2}{x+5}}{\frac{3}{x-5}+\frac{1}{x^2-25}}$$

Answer

$$\frac{2x-10}{3x+16}$$

Example 13.9.5E.53

$$\frac{\frac{5}{y-4}}{\frac{3}{y+4}+\frac{2}{y^2-16}}$$

Example 13.9.5E.54

$$\frac{\frac{5}{z^2-64}+\frac{3}{z+8}}{\frac{1}{z+8}+\frac{2}{z-8}}$$

Answer

$$\frac{3z-19}{3z+8}$$

Example 13.9.5E.55

$$\frac{\frac{3}{s+6}+\frac{5}{s-6}}{\frac{1}{s^2-36}+\frac{4}{s+6}}$$

Example 13.9.5E.56

$$\frac{\frac{4}{a^2-2a-15}}{\frac{1}{a-5}+\frac{2}{a+3}}$$

Answer

$$\frac{4}{3a-2}$$

Example 13.9.5E.57

$$\frac{\frac{5}{b^2-6b-27}}{\frac{3}{b-9}+\frac{1}{b+3}}$$

Example 13.9.5E.58

$$\frac{\frac{5}{c+2}-\frac{3}{c+7}}{\frac{5c}{c^2+9c+14}}$$

Answer

$$\frac{2c+29}{5c}$$

Example 13.9.5E.59

$$\frac{\frac{6}{d-4}-\frac{2}{d+7}}{\frac{2d}{d^2+3d-28}}$$

Example 13.9.5E.60

$$\frac{2+\frac{1}{p-3}}{\frac{5}{p-3}}$$

Answer

$$\frac{(2p-5)}{5}$$

Example 13.9.5E.61

$$\frac{\frac{n}{n-2}}{3+\frac{5}{n-2}}$$

Example 13.9.5E.62

$$\frac{\frac{m}{m+5}}{4+\frac{1}{m-5}}$$

Answer

$$\frac{m(m-5)}{4m^2+m-95}$$

Example 13.9.5E.63

$$\frac{7+\frac{2}{q-2}}{\frac{1}{q+2}}$$

Simplify

In the following exercises, use either method.

https://math.libretexts.org/@go/page/46305

Example 13.9.5E.64

$$\frac{\frac{3}{4}-\frac{2}{7}}{\frac{1}{2}+\frac{5}{14}}$$

Answer

$\frac{13}{24}$

Example 13.9.5E.65

$$\frac{\frac{v}{w}+\frac{1}{v}}{\frac{1}{v}-\frac{v}{w}}$$

Example 13.9.5E.66

$$\frac{\frac{2}{a+4}}{\frac{1}{a^2-16}}$$

Answer

2(a−4)

Example 13.9.5E.67

$$\frac{\frac{3}{b^2-3b-40}}{\frac{5}{b+5}-\frac{2}{b-8}}$$

Example 13.9.5E.68

$$\frac{\frac{3}{m}+\frac{3}{n}}{\frac{1}{m^2}-\frac{1}{n^2}}$$

Answer

$\frac{3mn}{n-m}$

Example 13.9.5E.69

$$\frac{\frac{2}{r-9}}{\frac{1}{r+9}+\frac{3}{r^2-81}}$$

Example 13.9.5E.70

$$\frac{x-\frac{3x}{x+2}}{\frac{3}{x+2}+\frac{3}{x-2}}$$

Answer

$\frac{(x-1)(x-2)}{6}$

https://math.libretexts.org/@go/page/46305

Example 13.9.5E.71

$\frac{\frac{y}{y+3}}{2+\frac{1}{y-3}}$

Everyday Math

Example 13.9.5E.72

Electronics The resistance of a circuit formed by connecting two resistors in parallel is $\frac{1}{\frac{1}{R1}+\frac{1}{R2}}$

1. Simplify the complex fraction $\frac{1}{\frac{1}{R1}+\frac{1}{R2}}$
2. Find the resistance of the circuit when R1=8 and R2=12

Answer

1. $\frac{R1R2}{R2+R1}$
2. $\frac{24}{5}$

Example 13.9.5E.73

Ironing Lenore can do the ironing for her family's business in hh hours. Her daughter would take h+2 hours to get the ironing done. If Lenore and her daughter work together, using 2 irons, the number of hours it would take them to do all the ironing is $\frac{1}{\frac{1}{h}+\frac{1}{h+2}}$

1. Simplify the complex fraction $\frac{1}{\frac{1}{h}+\frac{1}{h+2}}$
2. Find the number of hours it would take Lenore and her daughter, working together, to get the ironing done if h=4

Writing Exercises

Example 13.9.5E.74

In this section, you learned to simplify the complex fraction $\frac{\frac{3}{x+2}}{\frac{x}{x^2-4}}$ two ways:

rewriting it as a division problem

multiplying the numerator and denominator by the LCD

Which method do you prefer? Why?

Answer

Answers will vary.

Example 13.9.5E.75

Efraim wants to start simplifying the complex fraction $\frac{\frac{1}{a}+\frac{1}{b}}{\frac{1}{a}-\frac{1}{b}}$ by cancelling the variables from the numerator and denominator. Explain what is wrong with Efraim's plan.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify a complex rational expression by writing it as division.			
simplify a complex rational expression by using the LCD.			

ⓑ After looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

13.9.6: Solve Rational Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve rational equations
- Solve a rational equation for a specific variable

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Solve: $\frac{1}{6}x+\frac{1}{2}=\frac{1}{3}$.
   If you missed this problem, review Exercise 2.5.1.
2. Solve: $n^2-5n-36=0$.
   If you missed this problem, review Exercise 7.6.13.
3. Solve for y in terms of x: 5x+2y=10 for y.
   If you missed this problem, review Exercise 2.6.22.

After defining the terms *expression* and *equation* early in Foundations, we have used them throughout this book. We have *simplified* many kinds of *expressions* and *solved* many kinds of *equations*. We have simplified many rational expressions so far in this chapter. Now we will solve rational equations.

The definition of a rational equation is similar to the definition of equation we used in Foundations.

Definition: RATIONAL EQUATION

A **rational equation** is two rational expressions connected by an equal sign.

You must make sure to know the difference between rational expressions and rational equations. The equation contains an equal sign.

Rational Expression	Rational Equation
$\frac{1}{8}x+\frac{1}{2}$	$\frac{1}{8}x+\frac{1}{2}=\frac{1}{4}$
$\frac{y+6}{y^2-36}$	$\frac{y+6}{y^2-36}=y+1$
$\frac{1}{n-3}+\frac{1}{n+4}$	$\frac{1}{n-3}+\frac{1}{n+4}=\frac{15}{n^2+n-12}$

Solve Rational Equations

We have already solved linear equations that contained fractions. We found the LCD of all the fractions in the equation and then multiplied both sides of the equation by the LCD to “clear” the fractions.

Here is an example we did when we worked with linear equations:

	$\frac{1}{8}x+\frac{1}{2}=\frac{1}{4}$	LCD = 8
We multiplied both sides by the LCD.	$8\left(\frac{1}{8}x+\frac{1}{2}\right)=8\left(\frac{1}{4}\right)$	
Then we distributed.	$8\cdot\frac{1}{8}x+8\cdot\frac{1}{2}=8\cdot\frac{1}{4}$	
We simplified—and then we had an equation with no fractions.	$x+4=2$	
Finally, we solved that equation.	$x+4-4=2-4$	

	$x = -2$	

We will use the same strategy to solve rational equations. We will multiply both sides of the equation by the LCD. Then we will have an equation that does not contain rational expressions and thus is much easier for us to solve.

But because the original equation may have a variable in a denominator we must be careful that we don't end up with a solution that would make a denominator equal to zero.

So before we begin solving a rational equation, we examine it first to find the values that would make any denominators zero. That way, when we solve a **rational equation** we will know if there are any algebraic solutions we must discard.

An algebraic solution to a rational equation that would cause any of the rational expressions to be undefined is called an *extraneous solution*.

Definition: EXTRANEOUS Solution TO A RATIONAL EQUATION

An **extraneous solution to a rational equation** is an algebraic solution that would cause any of the expressions in the original equation to be undefined.

We note any possible extraneous solutions, c, by writing $x \neq c$ next to the equation.

How to Solve Equations with Rational Expressions

Example 13.9.6.1

Solve: $\frac{1}{x} + \frac{1}{3} = \frac{5}{6}$.

Answer

Step 1. Note any value of the variable that would make any denominator zero.	If $x = 0$, then $\frac{1}{x}$ is undefined. So we'll write $x \neq 0$ next to the equation.	$\frac{1}{x} + \frac{1}{3} = \frac{5}{6}, x \neq 0$
Step 2. Find the least common denominator of *all* denominators in the equation.	Find the LCD of $\frac{1}{x}$, $\frac{1}{3}$, and $\frac{5}{6}$.	The LCD is $6x$.
Step 3. Clear the fractions by multiplying both sides of the equation by the LCD.	Multiply both sides of the equation by the LCD, $6x$. Use the Distributive Property. Simplify – and notice, no more fractions!	$6x \cdot \left(\frac{1}{x} + \frac{1}{3}\right) = 6x \cdot \left(\frac{5}{6}\right)$ $6x \cdot \frac{1}{x} + 6x \cdot \frac{1}{3} = 6x \cdot \left(\frac{5}{6}\right)$ $6 + 2x = 5x$
Step 4. Solve the resulting equation.	Simplify.	$6 = 3x$ $2 = x$
Step 5. Check. • If any values found in Step 1 are algebraic solutions, discard them. • Check any remaining solutions in the original equation.	We did not get 0 as an algebraic solution. We substitute $x = 2$ into the original equation.	$\frac{1}{x} + \frac{1}{3} = \frac{5}{6}$ $\frac{1}{2} + \frac{1}{3} \stackrel{?}{=} \frac{5}{6}$ $\frac{3}{6} + \frac{2}{6} \stackrel{?}{=} \frac{5}{6}$ $\frac{5}{6} = \frac{5}{6}$ ✓

Example 13.9.6.2

Solve: $\frac{1}{y}+\frac{2}{3}=\frac{1}{5}$.

Answer

$-\frac{15}{7}$

Example 13.9.6.3

Solve: $\frac{2}{3}+\frac{1}{5}=\frac{1}{x}$.

Answer

$\frac{15}{13}$

The steps of this method are shown below.

Definition: SOLVE EQUATIONS WITH RATIONAL EXPRESSIONS.

1. Note any value of the variable that would make any denominator zero.
2. Find the least common denominator of *all* denominators in the equation.
3. Clear the fractions by multiplying both sides of the equation by the LCD.
4. Solve the resulting equation.
5. Check.
   - If any values found in Step 1 are algebraic solutions, discard them.
   - Check any remaining solutions in the original equation.

We always start by noting the values that would cause any denominators to be zero.

Example 13.9.6.4

Solve: $1-\frac{5}{y}=-\frac{6}{y^2}$.

Answer

	$1-\frac{5}{y}=-\frac{6}{y^2}$
Note any value of the variable that would make any denominator zero.	$1-\frac{5}{y}=-\frac{6}{y^2}, y\neq 0$
Find the least common denominator of all denominators in the equation. The LCD is y^2	
Clear the fractions by multiplying both sides of the equation by the LCD.	$y^2\left(1-\frac{5}{y}\right)=y^2\left(-\frac{6}{y^2}\right)$
Distribute.	$y^2\cdot 1-y^2\left(\frac{5}{y}\right)=y^2\left(-\frac{6}{y^2}\right)$
Multiply.	$y^2-5y=-6$
Solve the resulting equation. First write the quadratic equation in standard form.	$y^2-5y+6=0$
Factor.	$(y-2)(y-3)=0$
Use the Zero Product Property.	$y-2=0$ or $y-3=0$

Solve.	$y = 2$ or $y = 3$
Check.	
We did not get 0 as an algebraic solution.	
Check $y = 2$ and $y = 3$ in the original equation. $1 - \frac{5}{y} = -\frac{6}{y^2}$ $1 - \frac{5}{2} \stackrel{?}{=} -\frac{6}{2^2}$ $1 - \frac{5}{2} \stackrel{?}{=} -\frac{6}{4}$ $\frac{2}{2} - \frac{5}{2} \stackrel{?}{=} -\frac{6}{4}$ $-\frac{3}{2} \stackrel{?}{=} -\frac{6}{4}$ $-\frac{3}{2} = -\frac{3}{2}$ ✓ $1 - \frac{5}{y} = -\frac{6}{y^2}$ $1 - \frac{5}{3} \stackrel{?}{=} -\frac{6}{3^2}$ $1 - \frac{5}{3} \stackrel{?}{=} -\frac{6}{9}$ $\frac{3}{3} - \frac{5}{3} \stackrel{?}{=} -\frac{6}{9}$ $-\frac{2}{3} \stackrel{?}{=} -\frac{6}{9}$ $-\frac{2}{3} = -\frac{2}{3}$ ✓	

Example 13.9.6.5

Solve: $1 - \frac{2}{a} = \frac{15}{a^2}$.

Answer

5, −3

Example 13.9.6.6

Solve: $1 - \frac{4}{b} = \frac{12}{b^2}$.

Answer

6, −2

Example 13.9.6.7

Solve: $\frac{5}{3u-2} = \frac{3}{2u}$.

Answer

	$\frac{5}{3u-2} = \frac{3}{2u}$
Note any value of the variable that would make any denominator zero.	$\frac{5}{3u-2} = \frac{3}{2u}$, $u \neq \frac{2}{3}$, $u \neq 0$
Find the least common denominator of all denominators in the equation. The LCD is 2u(3u−2).	
Clear the fractions by multiplying both sides of the equation by the LCD.	$2u(3u-2)\left(\frac{5}{3u-2}\right) = 2u(3u-2)\left(\frac{3}{2u}\right)$
Remove common factors.	$2u\cancel{(3u-2)}\left(\frac{5}{\cancel{3u-2}}\right) = \cancel{2u}(3u-2)\left(\frac{3}{\cancel{2u}}\right)$
Simplify.	$2u(5) = (3u-2)(3)$
Multiply.	$10u = 9u - 6$

Solve the resulting equation.	$u = -6$
We did not get 0 or $\frac{2}{3}$ as algebraic solutions.	
Check $u = -6$ in the original equation. $\frac{5}{3u-2} = \frac{3}{2u}$ $\frac{5}{3(-6)-2} \stackrel{?}{=} \frac{3}{2(-6)}$ $\frac{5}{-20} \stackrel{?}{=} \frac{3}{-12}$ $-\frac{1}{4} = -\frac{1}{4}$ ✓	

Example 13.9.6.8

Solve: $\frac{1}{x-1} = \frac{2}{3x}$.

Answer

−2

Example 13.9.6.9

Solve: $\frac{3}{5n+1} = \frac{2}{3n}$.

Answer

−2

When one of the denominators is a quadratic, remember to factor it first to find the LCD.

Example 13.9.6.10

Solve: $\frac{2}{p+2} + \frac{4}{p-2} = \frac{p-1}{p^2-4}$.

Answer

	$\frac{2}{p+2} + \frac{4}{p-2} = \frac{p-1}{p^2-4}$
Note any value of the variable that would make any denominator zero.	$\frac{2}{p+2} + \frac{4}{p-2} = \frac{p-1}{(p+2)(p+2)}, p \neq -2, p \neq 2$
Find the least common denominator of all denominators in the equation. The LCD is (p+2)(p−2).	
Clear the fractions by multiplying both sides of the equation by the LCD.	$(p+2)(p-2)\left(\frac{2}{p+2} + \frac{4}{p-2}\right) = (p+2)(p-2)\left(\frac{p-1}{p^2-4}\right)$
Distribute.	$(p+2)(p-2)\frac{2}{p+2} + (p+2)(p-2)\frac{4}{p-2} = (p+2)(p-2)\left(\frac{p-1}{p^2-4}\right)$
Remove common factors.	$\cancel{(p+2)}(p-2)\frac{2}{\cancel{p+2}} + (p+2)\cancel{(p-2)}\frac{4}{\cancel{p-2}} = \cancel{(p+2)}\cancel{(p-2)}\left(\frac{p-1}{\cancel{p^2-4}}\right)$
Simplify.	$2(p-2) + 4(p+2) = p-1$
Distribute.	$2p - 4 + 4p + 8 = p - 1$
Solve.	$6p + 4 = p - 1$

	$5p = -5$
	$p = -1$
We did not get 2 or −2 as algebraic solutions.	
Check $p = -1$ in the original equation. $\frac{2}{p+2} + \frac{4}{p-2} = \frac{p-1}{p^2-4}$ $\frac{2}{(-1)+2} + \frac{4}{(-1)-2} \stackrel{?}{=} \frac{(-1)-1}{(-1)^2-4}$ $\frac{2}{1} + \frac{4}{-3} \stackrel{?}{=} \frac{-2}{-3}$ $\frac{6}{3} - \frac{4}{-3} \stackrel{?}{=} \frac{-2}{-3}$ $\frac{2}{3} = \frac{2}{3}$ ✓	

Example 13.9.6.11

Solve: $\frac{2}{x+1} + \frac{1}{x-1} = \frac{1}{x^2-1}$.

Answer

$\frac{2}{3}$

Example 13.9.6.12

Solve: $\frac{5}{y+3} + \frac{2}{y-3} = \frac{5}{y^2-9}$

Answer

2

Example 13.9.6.13

Solve: $\frac{4}{q-4} - \frac{3}{q-3} = 1$.

Answer

	$\frac{4}{q-4} - \frac{3}{q-3} = 1$
Note any value of the variable that would make any denominator zero.	$\frac{4}{q-4} + \frac{3}{q-3} = 1, \quad q \neq 4, q \neq 3$
Find the least common denominator of all denominators in the equation. The LCD is (q−4)(q−3).	
Clear the fractions by multiplying both sides of the equation by the LCD.	$(q-4)(q-3)\left(\frac{4}{q-4} - \frac{3}{q-3}\right) = (q-4)(q-3)(1)$
Distribute.	$(q-4)(q-3)\left(\frac{4}{q-4}\right) - (q-4)(q-3)\left(\frac{3}{q-3}\right) = (q-4)(q-3)(1)$
Remove common factors.	$\cancel{(q-4)}(q-3)\left(\frac{4}{\cancel{q-4}}\right) - (q-4)\cancel{(q-3)}\left(\frac{3}{\cancel{q-3}}\right) = (q-4)(q-3)(1)$
Simplify.	$4(q-3) - 3(q-4) = (q-4)(q-3)$
Simplify.	$4q - 12 - 3q + 12 = q^2 - 7q + 12$

Combine like terms.	$q = q^2 - 7q + 12$
Solve. First write in standard form.	$0 = q^2 - 8q + 12$
Factor.	$0 = (q-2)(q-6)$
Use the Zero Product Property.	$q = 2$ or $q = 6$
We did not get 4 or 3 as algebraic solutions.	
Check $q = 2$ and $q = 6$ in the original equation.	

$$\frac{4}{q-4} - \frac{3}{q-3} = 1 \qquad \frac{4}{q-4} - \frac{3}{q-3} = 1$$

$$\frac{4}{2-4} - \frac{3}{2-3} \stackrel{?}{=} 1 \qquad \frac{4}{6-4} - \frac{3}{6-3} \stackrel{?}{=} 1$$

$$\frac{4}{-2} - \frac{3}{-1} \stackrel{?}{=} 1 \qquad \frac{4}{2} - \frac{3}{1} \stackrel{?}{=} 1$$

$$-2 - (-3) \stackrel{?}{=} 1 \qquad 2 - 1 \stackrel{?}{=} 1$$

$$1 = 1 \checkmark \qquad 1 = 1 \checkmark$$

Example 13.9.6.14

Solve: $\frac{2}{x+5} - \frac{1}{x-1} = 1$.

Answer

$-1, -2$

Example 13.9.6.15

Solve: $\frac{3}{x+8} - \frac{2}{x-2} = 1$.

Answer

$-2, -3$

Example 13.9.6.16

Solve: $\frac{m+11}{m^2-5m+4} = \frac{5}{m-4} - \frac{3}{m-1}$.

Answer

	$\frac{m+11}{m^2-5m+4} = \frac{5}{m-4} = \frac{3}{m-1}$
Factor all the denominators, so we can note any value of the variable the would make any denominator zero.	$\frac{m+11}{(m-4)(m-1)} = \frac{5}{m-4} - \frac{3}{m-1},\ m \neq 4, m \neq 1$
Find the least common denominator of all denominators in the equation. The LCD is (m−4)(m−1)	
Clear the fractions.	$(m-4)(m-1)\left(\frac{m+11}{(m-4)(m-1)}\right) = (m-4)(m-1)\left(\frac{5}{m-4} - \frac{3}{m-1}\right)$
Distribute.	$(m-4)(m-1)\left(\frac{m+11}{(m-4)(m-1)}\right) = (m-4)(m-1)\frac{5}{m-4} - (m-4)(m-1)\frac{3}{m-1}$
Remove common factors.	$\cancel{(m-4)(m-1)}\left(\frac{m+11}{\cancel{(m-4)(m-1)}}\right) = \cancel{(m-4)}(m-1)\frac{5}{\cancel{m-4}} - (m-4)\cancel{(m-1)}\frac{3}{\cancel{m-1}}$
Simplify.	$m + 11 = 5(m-1) - 3(m-4)$
Solve the resulting equation.	$m + 11 = 5m - 5 - 3m + 12$

	$4 = m$
Check. The only algebraic solution was 4, but we said that 4 would make a denominator equal to zero. The algebraic solution is an extraneous solution. There is no solution to this equation.	

Example 13.9.6.17

Solve: $\frac{x+13}{x^2-7x+10} = \frac{6}{x-5} - \frac{4}{x-2}$.

Answer

no solution

Example 13.9.6.18

Solve: $\frac{y-14}{y^2+3y-4} = \frac{2}{y+4} + \frac{7}{y-1}$.

Answer

no solution

The equation we solved in Example had only one algebraic solution, but it was an extraneous solution. That left us with no solution to the equation. Some equations have no solution.

Example 13.9.6.19

Solve: $\frac{n}{12} + \frac{n+3}{3n} = \frac{1}{n}$.

Answer

	$\frac{n}{12} + \frac{n+3}{3n} = \frac{1}{n}$
Note any value of the variable that would make any denominator zero.	$\frac{n}{12} + \frac{n+3}{3n} = \frac{1}{n}, n \neq 0$
Find the least common denominator of all denominators in the equation. The LCD is 12n.	
Clear the fractions by multiplying both sides of the equation by the LCD.	$12n\left(\frac{n}{12} + \frac{n+3}{3n}\right) = 12n\left(\frac{1}{n}\right)$
Distribute.	$12n\left(\frac{n}{12}\right) + 12n\left(\frac{n+3}{3n}\right) = 12n\left(\frac{1}{n}\right)$
Remove common factors.	$\cancel{12}n\left(\frac{n}{\cancel{12}}\right) + 4 \cdot \cancel{3}n\left(\frac{n+3}{\cancel{3}n}\right) = 12\cancel{n}\left(\frac{1}{\cancel{n}}\right)$
Simplify.	$n \cdot n + 4(n+3) = 12 \cdot 1$
Solve the resulting equation.	$n^2 + 4n + 12 = 12$
	$n^2 + 4n = 0$
	$n(n+4) = 0$
	$n = 0$ or $n = -4$
Check.	

n=0 is an extraneous solution.

Check $n = -4$ in the original equation.

$$\frac{n}{12} + \frac{n+3}{3n} = \frac{1}{n}$$

$$\frac{-4}{12} + \frac{-4+3}{3(-4)} \stackrel{?}{=} \frac{1}{-4}$$

$$-\frac{4}{12} + \frac{1}{12} \stackrel{?}{=} -\frac{1}{4}$$

$$-\frac{3}{12} \stackrel{?}{=} -\frac{1}{4}$$

$$-\frac{1}{4} = -\frac{1}{4} \checkmark$$

Example 13.9.6.20

Solve: $\frac{x}{18} + \frac{x+6}{9x} = \frac{2}{3x}$.

Answer

−2

Example 13.9.6.21

Solve: $\frac{y+5}{5y} + \frac{y}{15} = \frac{1}{y}$.

Answer

−3

Example 13.9.6.22

Solve: $\frac{y}{y+6} = \frac{72}{y^2-36} + 4$.

Answer

	$\frac{y}{y+6} = \frac{72}{y^2-36} + 4$
Factor all the denominators, so we can note any value of the variable that would make any denominator zero.	$\frac{y}{y+6} = \frac{72}{(y-6)(y+6)} + 4, y \neq 6, y \neq -6$
Find the least common denominator. The LCD is (y−6)(y+6).	
Clear the fractions.	$(y-6)(y+6)\left(\frac{y}{y+6}\right) = (y-6)(y+6)\left(\frac{72}{(y-6)(y+6)} + 4\right)$
Simplify.	$(y-6) \cdot y = 72 + (y-6)(y+6) \cdot 4$
Simplify.	$y(y-6) = 72 + 4(y^2-36)$
Solve the resulting equation.	$y^2 - 6y = 72 + 4y^2 - 144$
	$0 = 3y^2 + 6y - 72$
	$0 = 3(y^2 + 2y - 24)$
	$0 = 3(y+6)(y-4)$
	$y = -6,\ y = 4$

Check.	
y=−6 is an extraneous solution.	
Check $y = 4$ in the original equation. $\frac{y}{y+6} = \frac{72}{y^2-36} + 4$ $\frac{4}{4+6} \stackrel{?}{=} \frac{72}{4^2-36} + 4$ $\frac{4}{10} \stackrel{?}{=} \frac{72}{-20} + 4$ $\frac{4}{10} \stackrel{?}{=} -\frac{36}{10} + \frac{40}{10}$ $\frac{4}{10} = \frac{4}{10}$ ✓	

Example 13.9.6.23

Solve: $\frac{x}{x+4} = \frac{32}{x^2-16} + 5$.

Answer

−4, 3

Example 13.9.6.24

Solve: $\frac{y}{y+8} = \frac{128}{y^2-64} + 9$.

Answer

7

Example 13.9.6.25

Solve: $\frac{x}{2x-2} - \frac{2}{3x+3} = \frac{5x^2-2x+9}{12x^2-12}$.

Answer

	$\frac{x}{2x-2} - \frac{2}{3x+3} = \frac{5x^2-2x+9}{12x^2-12}$
We will start by factoring all denominators, to make it easier to identify extraneous solutions and the LCD.	$\frac{x}{2(x-1)} - \frac{2}{3(x+1)} = \frac{5x^2-2x+9}{12(x-1)(x+1)}$
Note any value of the variable that would make any denominator zero.	$\frac{x}{2(x-1)} - \frac{2}{3(x+1)} = \frac{5x^2-2x+9}{12(x-1)(x+1)}, x \neq 1, x \neq -1$
Find the least common denominator.The LCD is 12(x−1)(x+1)	
Clear the fractions.	$12(x-1)(x+1)\left(\frac{x}{2(x-1)} - \frac{2}{3(x+1)}\right) = 12(x-1)(x+1)\left(\frac{5x^2-2x+9}{12(x-1)(x+1)}\right)$
Simplify.	$6(x+1) \cdot x - 4(x-1) \cdot 2 = 5x^2 - 2x + 9$
Simplify.	$6x(x+1) - 4 \cdot 2(x-1) = 5x^2 - 2x + 9$
Solve the resulting equation.	$6x^2 + 6x - 8x + 8 = 5x^2 - 2x + 9$
	$x^2 - 1 = 0$
	$(x-1)(x+1) = 0$

	$x = 1$ or $x = -1$
Check.	
x=1 and x=−1 are extraneous solutions. The equation has no solution.	

Example 13.9.6.26

Solve: $\frac{y}{5y-10} - \frac{5}{3y+6} = \frac{2y^2-19y+54}{15y^2-60}$.

Answer

no solution

Example 13.9.6.27

Solve: $\frac{z^2}{z+8} - \frac{3}{4z-8} = \frac{3z^2-16z-68}{z^2+8z-64}$.

Answer

no solution

Solve a Rational Equation for a Specific Variable

When we solved linear equations, we learned how to solve a formula for a specific variable. Many formulas used in business, science, economics, and other fields use rational equations to model the relation between two or more variables. We will now see how to solve a rational equation for a specific variable.

We'll start with a formula relating distance, rate, and time. We have used it many times before, but not usually in this form.

Example 13.9.6.28

Solve: $\frac{D}{T} = R$ for T.

Answer

	$\frac{D}{T} = R$ for T
Note any value of the variable that would make any denominator zero.	$\frac{D}{T} = R, T \neq 0$
Clear the fractions by multiplying both sides of the equations by the LCD, T.	$T\left(\frac{D}{T}\right) = T(R)$
Simplify.	$D = T \cdot R$
Divide both sides by R to isolate T.	$\frac{D}{R} = \frac{RT}{R}$
Simplify.	$\frac{D}{R} = T$

Example 13.9.6.29

Solve: $\frac{A}{L} = W$ for L.

Answer

$L = \frac{A}{W}$

Example 13.9.6.30

Solve: $\frac{F}{A} = M$ for A.

Answer

$A = \frac{F}{M}$

Example uses the formula for slope that we used to get the point-slope form of an equation of a line.

Example 13.9.6.31

Solve: $m = \frac{x-2}{y-3}$ for y.

Answer

	$m = \frac{x-2}{y-3}$ for y
Note any value of the variable that would make any denominator zero.	$m = \frac{x-2}{y-3},\ y \neq 3$
Clear the fractions by multiplying both sides of the equations by the LCD, y−3.	$(y-3)m = (y-3)\left(\frac{x-2}{y-3}\right)$
Simplify.	$ym - 3m = x - 2$
Isolate the term with y.	$ym = x - 2 + 3m$
Divide both sides by m to isolate y.	$\frac{ym}{m} = \frac{x-2+3m}{m}$
Simplify.	$y = \frac{x-2+3m}{m}$

Example 13.9.6.32

Solve: $\frac{y-2}{x+1} = \frac{2}{3}$ for x.

Answer

$x = \frac{3y-8}{2}$

Example 13.9.6.33

Solve: $x = \frac{y}{1-y}$ for y.

Answer

$y = \frac{x}{1+x}$

Be sure to follow all the steps in Example. It may look like a very simple formula, but we cannot solve it instantly for either denominator.

Example 13.9.6.34

Solve $\frac{1}{c}+\frac{1}{m}=1$ for c.

Answer

	$\frac{1}{c}+\frac{1}{m}=1$ for c
Note any value of the variable that would make any denominator zero.	$\frac{1}{c}+\frac{1}{m}=1, c\neq 0, m\neq 0$
Clear the fractions by multiplying both sides of the equations by the LCD, cm	$cm\left(\frac{1}{c}+\frac{1}{m}\right)=cm(1)$
Distribute.	$cm\left(\frac{1}{c}\right)+cm\,\frac{1}{m}=cm(1)$
Simplify.	$m+c=cm$
Collect the terms with c to the right.	$m=cm-c$
Factor the expression on the right.	$m=c(m-1)$
To isolate c, divide both sides by m−1.	$\frac{m}{m-1}=\frac{c(m-1)}{m-1}$
Simplify by removing common factors.	$\frac{m}{m-1}=c$

Notice that even though we excluded c=0 and m=0 from the original equation, we must also now state that $m\neq 1$.

Example 13.9.6.35

Solve: $\frac{1}{a}+\frac{1}{b}=c$ for a.

Answer

$a=\frac{b}{cb-1}$

Example 13.9.6.36

Solve: $\frac{2}{x}+\frac{1}{3}=\frac{1}{y}$ for y.

Answer

$y=\frac{3x}{6+x}$

Key Concepts

- **Strategy to Solve Equations with Rational Expressions**
  1. Note any value of the variable that would make any denominator zero.
  2. Find the least common denominator of *all* denominators in the equation.
  3. Clear the fractions by multiplying both sides of the equation by the LCD.
  4. Solve the resulting equation.
  5. Check.
     - If any values found in Step 1 are algebraic solutions, discard them.
     - Check any remaining solutions in the original equation.

Glossary

rational equation

A rational equation is two rational expressions connected by an equal sign.

extraneous solution to a rational equation

An extraneous solution to a rational equation is an algebraic solution that would cause any of the expressions in the original equation to be undefined.

13.9.6E: Exercises

Practice Makes Perfect

Solve Rational Equations

In the following exercises, solve.

Example 13.9.6E.37

$\frac{1}{a}+\frac{2}{5}=\frac{1}{2}$

Answer

10

Example 13.9.6E.38

$\frac{5}{6}+\frac{3}{b}=\frac{1}{3}$

Example 13.9.6E.39

$\frac{5}{2}-\frac{1}{c}=\frac{3}{4}$

Answer

$\frac{4}{7}$

Example 13.9.6E.40

$\frac{6}{3}-\frac{2}{d}=\frac{4}{9}$

Example 13.9.6E.41

$\frac{4}{5}+\frac{1}{4}=\frac{2}{v}$

Answer

$\frac{40}{21}$

Example 13.9.6E.42

$\frac{3}{7}+\frac{2}{3}=\frac{1}{w}$

Example 13.9.6E.43

$\frac{7}{9}+\frac{1}{x}=\frac{2}{3}$

Answer

−9

Example 13.9.6E.44

$\frac{3}{8}+\frac{2}{y}=\frac{1}{4}$

Example 13.9.6E.45

$1-\frac{2}{m}=\frac{8}{m^2}$

Answer

$-2, 4$

Example 13.9.6E.46

$1+\frac{4}{n}=\frac{21}{n^2}$

Example 13.9.6E.47

$1+\frac{9}{p}=-\frac{20}{p^2}$

Answer

$-5, -4$

Example 13.9.6E.48

$1-\frac{7}{q}=-\frac{6}{q^2}$

Example 13.9.6E.49

$\frac{1}{r+3}=\frac{4}{2r}$

Answer

-6

Example 13.9.6E.50

$\frac{3}{t-6}=\frac{1}{t}$

Example 13.9.6E.51

$\frac{5}{3v-2}=\frac{7}{4v}$

Answer

14

Example 13.9.6E.52

$\frac{8}{2w+1}=\frac{3}{w}$

Example 13.9.6E.53

$\frac{3}{x+4}+\frac{7}{x-4}=\frac{8}{x^2-16}$

Answer

$-\frac{4}{5}$

Example 13.9.6E.54

$\frac{5}{y-9}+\frac{1}{y+9}=\frac{18}{y^2-81}$

Example 13.9.6E.55

$\frac{8}{z-10}+\frac{7}{z+10}=\frac{5}{z^2-100}$

Answer

-13

Example 13.9.6E.56

$\frac{9}{a+11}+\frac{6}{a-11}=\frac{7}{a^2-121}$

Example 13.9.6E.57

$\frac{1}{q+4}-\frac{7}{q-2}=1$

Answer

no solution

Example 13.9.6E.58

$\frac{3}{r+10}-\frac{4}{r-4}=1$

Example 13.9.6E.59

$\frac{1}{t+7}-\frac{5}{t-5}=1$

Answer

$-5, -1$

Example 13.9.6E.60

$\frac{2}{s+7}-\frac{3}{s-3}=1$

Example 13.9.6E.61

$\frac{v-10}{v^2-5v+4}=\frac{3}{v-1}-\frac{6}{v-4}$

Answer

no solution

https://math.libretexts.org/@go/page/46307

Example 13.9.6E.62

$\frac{w+8}{w^2-11w+28} = \frac{5}{w-7} + \frac{2}{w-4}$

Example 13.9.6E.63

$\frac{x-10}{x^2+8x+12} = \frac{3}{x+2} + \frac{4}{x+6}$

Answer

no solution

Example 13.9.6E.64

$\frac{y-3}{y^2-4y-5} = \frac{1}{y+1} + \frac{8}{y-5}$

Example 13.9.6E.65

$\frac{z}{16} + \frac{z+2}{4z} = \frac{1}{2z}$

Answer

-4

Example 13.9.6E.66

$\frac{a}{9} + \frac{a+3}{3a} = \frac{1}{a}$

Example 13.9.6E.67

$\frac{b+3}{3b} + \frac{b}{24} = \frac{1}{b}$

Answer

-8

Example 13.9.6E.68

$\frac{c+3}{12c} + \frac{c}{36} = \frac{1}{4c}$

Example 13.9.6E.69

$\frac{d}{d+3} = \frac{18}{d^2-9} + 4$

Answer

2

Example 13.9.6E.70

$\frac{m}{m+5} = \frac{50}{m^2-25} + 6$

Example 13.9.6E.71

$\frac{n}{n+2}=\frac{8}{n^2-4}+3$

Answer

1

Example 13.9.6E.72

$\frac{p}{p+7}=\frac{98}{p^2-49}+8$

Example 13.9.6E.73

$\frac{q}{3q-9}-\frac{3}{4q+12}=\frac{7q^2+6q+63}{24q^2-216}$

Answer

no solution

Example 13.9.6E.74

$\frac{r}{3r-15}-\frac{1}{4r+20}=\frac{3r^2+17r+40}{12r^2-300}$

Example 13.9.6E.75

$\frac{s}{2s+6}-\frac{2}{5s+5}=\frac{5s^2-3s-7}{10s^2+40s+30}$

Answer

no solution

Example 13.9.6E.76

$\frac{t}{6t-12}-\frac{5}{2t+10}=\frac{t^2-23t+70}{12t^2+36t-120}$

Solve a Rational Equation for a Specific Variable

In the following exercises, solve.

Example 13.9.6E.77

$\frac{C}{r}=2\pi$ for r

Answer

$r=\frac{C}{2\pi}$

Example 13.9.6E.78

$\frac{I}{r}=P$ for r

Example 13.9.6E.79

$\frac{V}{h} = lw$ for h

Answer

$h = \frac{v}{lw}$

Example 13.9.6E.80

$\frac{2A}{b} = h$ for b

Example 13.9.6E.81

$\frac{v+3}{w-1} = \frac{1}{2}$ for w

Answer

w=2v+7

Example 13.9.6E.82

$\frac{x+5}{2-y} = \frac{4}{3}$ for y

Example 13.9.6E.83

$a = \frac{b+3}{c-2}$ for c

Answer

$c = \frac{b+3+2a}{a}$

Example 13.9.6E.84

$m = \frac{n}{2-n}$ for n

Example 13.9.6E.85

$\frac{1}{p} + \frac{2}{q} = 4$ for p

Answer

$p = \frac{q}{4q-2}$

Example 13.9.6E.86

$\frac{3}{s} + \frac{1}{t} = 2$ for s

Example 13.9.6E.87

$\frac{2}{v} + \frac{1}{5} = \frac{1}{2}$ for w

Answer

$w = \frac{15v}{10+v}$

Example 13.9.6E.88

$\frac{6}{x}+\frac{2}{3}=\frac{1}{y}$ for y

Example 13.9.6E.89

$\frac{m+3}{n-2}=\frac{4}{5}$ for n

Answer

$n=\frac{5m+23}{m}$

Example 13.9.6E.90

$\frac{E}{c}=m^2$ for c

Example 13.9.6E.91

$\frac{3}{x}-\frac{5}{y}=\frac{1}{4}$ for y

Answer

$y=\frac{20x}{12-x}$

Example 13.9.6E.92

$\frac{R}{T}=W$ for T

Example 13.9.6E.93

$r=\frac{s}{3-t}$ for t

Answer

$t=\frac{3r-s}{r}$

Example 13.9.6E.94

$c=\frac{2}{a}+\frac{b}{5}$ for a

Everyday Math

Example 13.9.6E.95

House Painting Alain can paint a house in 4 days. Spiro would take 7 days to paint the same house. Solve the equation $\frac{1}{4}+\frac{1}{7}=\frac{1}{t}$ for t to find the number of days it would take them to paint the house if they worked together.

Answer

$2\frac{6}{11}$ days

? Example 13.9.6E.96

Boating Ari can drive his boat 18 miles with the current in the same amount of time it takes to drive 10 miles against the current. If the speed of the boat is 7 knots, solve the equation $\frac{18}{7+c} = \frac{10}{7-c}$ for c to find the speed of the current.

Writing Exercises

? Example 13.9.6E.97

Why is there no solution to the equation $\frac{3}{x-2} = \frac{5}{x-2}$

Answer

Answers will vary.

? Example 13.9.6E.98

Pete thinks the equation $\frac{y}{y+6} = \frac{72}{y^2-36} + 4$ has two solutions, y=−6 and y=4. Explain why Pete is wrong.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve rational equations.			
solve rational equations for a specific variable.			

ⓑ After reviewing this checklist, what will you do to become confident for all objectives?

13.9.7: Solve Proportion and Similar Figure Applications

Learning Objectives

By the end of this section, you will be able to:

- Solve proportions
- Solve similar figure applications

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Solve $\frac{n}{3} = 30$.
   If you missed this problem, review Exercise 2.2.25.
2. The perimeter of a triangular window is 23 feet. The lengths of two sides are ten feet and six feet. How long is the third side?
   If you missed this problem, review Example 3.4.2

Solve Proportions

When two rational expressions are equal, the equation relating them is called a *proportion*.

Definition: PROPORTION

A **proportion** is an equation of the form $\frac{a}{b} = \frac{c}{d}$, where $b \neq 0$, $d \neq 0$.

The proportion is read “a is to b, as c is to d"

The equation $\frac{1}{2} = \frac{4}{8}$ is a proportion because the two fractions are equal.

The proportion $\frac{1}{2} = \frac{4}{8}$ is read “1 is to 2 as 4 is to 8.”

Proportions are used in many applications to ‘scale up’ quantities. We’ll start with a very simple example so you can see how proportions work. Even if you can figure out the answer to the example right away, make sure you also learn to solve it using proportions.

Suppose a school principal wants to have 1 teacher for 20 students. She could use proportions to find the number of teachers for 60 students. We let x be the number of teachers for 60 students and then set up the proportion:

$$\frac{1 \text{ teacher}}{20 \text{ students}} = \frac{x \text{ teachers}}{60 \text{ students}}$$

We are careful to match the units of the numerators and the units of the denominators—teachers in the numerators, students in the denominators.

Since a proportion is an equation with rational expressions, we will solve proportions the same way we solved equations in Solve Rational Equations. We’ll multiply both sides of the equation by the LCD to clear the fractions and then solve the resulting equation.

	$\frac{1}{20} = \frac{x}{60}$
Multiply both sides by the LCD, 60.	$\frac{1}{20} \cdot 60 = \frac{x}{60} \cdot 60$
Simplify.	$3 = x$

	The principal needs 3 teachers for 60 students.

Now we'll do a few examples of solving numerical proportions without any units. Then we will solve applications using proportions.

Example 13.9.7.1

$\frac{x}{63} = \frac{4}{7}$.

Solution

		$\frac{x}{63} = \frac{4}{7}$
To isolate x, multiply both sides by the LCD, 63.		$63\left(\frac{x}{63}\right) = 63\left(\frac{4}{7}\right)$
Simplify.		$x = \frac{9 \cdot 7 \cdot 4}{7}$
Divide the common factors.		$x = 36$
Check. To check our answer, we substitute into the original proportion.		
	$\frac{x}{63} = \frac{4}{7}$	
Substitute $x = 36$.	$\frac{36}{63} \stackrel{?}{=} \frac{4}{7}$	
Show common factors.	$\frac{4 \cdot 9}{7 \cdot 9} \stackrel{?}{=} \frac{4}{7}$	
Simplify.	$\frac{4}{7} = \frac{4}{7}$ ✓	

Try It 13.9.7.1

$\frac{n}{84} = \frac{11}{12}$.

Answer

77

Try It 13.9.7.2

$\frac{y}{96} = \frac{13}{12}$.

Answer

104

Example 13.9.7.2

$\frac{144}{a} = \frac{9}{4}$.

Solution

		$\frac{144}{a}=\frac{9}{4}$
Multiply both sides by the LCD.		$\frac{144}{a}\cdot 4a=\frac{9}{4}\cdot 4a$
Remove common factors on each side.		$4\cdot 144=a\cdot 9$
Simplify.		$576=9a$
Divide both sides by 9.		$\frac{576}{9}=\frac{9a}{9}$
Simplify.		$64=a$
Check.		
	$\frac{144}{a}=\frac{9}{4}$	
Substitute $a=64$.	$\frac{144}{64}\stackrel{?}{=}\frac{9}{4}$	
Show common factors.	$\frac{9\cdot 16}{4\cdot 16}\stackrel{?}{=}\frac{9}{4}$	
Simplify.	$\frac{9}{4}=\frac{9}{4}$ ✓	

Try It 13.9.7.3

$\frac{91}{b}=\frac{7}{5}$.

Answer

65

Try It 13.9.7.4

$\frac{39}{c}=\frac{13}{8}$.

Answer

24

Example 13.9.7.3

$\frac{n}{n+14}=\frac{5}{7}$.

Solution

		$\frac{n}{n+14}=\frac{5}{7}$
Multiply both sides by the LCD.		$7(n+14)\left(\frac{n}{n+14}\right)=7(n+14)\left(\frac{5}{7}\right)$
Remove common factors on each side.		$7n=5(n+14)$
Simplify.		$7n=5n+70$
Solve for n.		$2n=70$
		$n=35$

Check.		
	$\frac{n}{n+14}=\frac{5}{7}$	
Substitute $n=35$.	$\frac{35}{35+14}\stackrel{?}{=}\frac{5}{7}$	
Simplify.	$\frac{35}{49}\stackrel{?}{=}\frac{5}{7}$	
Show common factors.	$\frac{5\cdot 7}{7\cdot 7}\stackrel{?}{=}\frac{5}{7}$	
Simplify.	$\frac{5}{7}=\frac{5}{7}$ ✓	

Try It 13.9.7.5

$\frac{y}{y+55}=\frac{3}{8}$.

Answer

33

Try It 13.9.7.6

$\frac{z}{z-84}=-\frac{1}{5}$.

Answer

14

Example 13.9.7.4

$\frac{p+12}{9}=\frac{p-12}{6}$.

Solution

		$\frac{p+12}{9}=\frac{p-12}{6}$
Multiply both sides by the LCD, 18.		$18\cdot\frac{p+12}{9}=18\cdot\frac{p+12}{6}$
Simplify.		$2(p+12)=3(p-12)$
Distribute.		$2p+24=3p-36$
Solve fpr p.		$60=p$
Check.		
	$\frac{p+12}{9}=\frac{p-12}{6}$	
Substitute $p=60$.	$\frac{60+12}{9}\stackrel{?}{=}\frac{60-12}{6}$	
Simplify.	$\frac{72}{9}\stackrel{?}{=}\frac{48}{6}$	
Divide.	$8=8$ ✓	

Try It 13.9.7.7

$\frac{v+30}{8} = \frac{v+66}{12}$.

Answer

42

Try It 13.9.7.8

$\frac{2x+15}{9} = \frac{7x+3}{15}$.

Answer

6

To solve applications with proportions, we will follow our usual strategy for solving applications. But when we set up the proportion, we must make sure to have the units correct—the units in the numerators must match and the units in the denominators must match.

Example 13.9.7.5

When pediatricians prescribe acetaminophen to children, they prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of the child's weight. If Zoe weighs 80 pounds, how many milliliters of acetaminophen will her doctor prescribe?

Solution

Identify what we are asked to find, and choose a variable to represent it.	How many ml of acetaminophen will the doctor prescribe?
	Let a=ml of acetaminophen.
Write a sentence that gives the information to find it.	If 5 ml is prescribed for every 25 pounds, how much will be prescribed for 80 pounds?
Translate into a proportion–be careful of the units. $\frac{5}{25} = \frac{a}{80}$	
Multiply both sides by the LCD, 400.	$400\left(\frac{5}{25}\right) = 400\left(\frac{a}{80}\right)$
Remove common factors on each side.	$25 \cdot 16\left(\frac{5}{25}\right) = 80 \cdot 5\left(\frac{a}{80}\right)$
Simplify, but don't multiply on the left. Notice what the next step will be.	$16 \cdot 5 = 5a$
Solve for a.	$\frac{16 \cdot 5}{5} = \frac{5a}{5}$
Check.	$16 = a$
Is the answer reasonable?	
Yes, since 80 is about 3 times 25, the medicine should be about 3 times 5. So 16 ml makes sense.	

Substitute $a = 16$ in the original proportion. $\frac{5}{25} = \frac{a}{80}$ $\frac{5}{25} \stackrel{?}{=} \frac{16}{80}$ $\frac{1}{5} = \frac{1}{5}$ ✓	
Write a complete sentence.	The pediatrician would prescribe 16 ml of acetaminophen to Zoe.

Try It 13.9.7.9

Pediatricians prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of a child's weight. How many milliliters of acetaminophen will the doctor prescribe for Emilia, who weighs 60 pounds?

Answer

12 ml

Try It 13.9.7.10

For every 1 kilogram (kg) of a child's weight, pediatricians prescribe 15 milligrams (mg) of a fever reducer. If Isabella weighs 12 kg, how many milligrams of the fever reducer will the pediatrician prescribe?

Answer

180 ml

Example 13.9.7.6

A 16-ounce iced caramel macchiato has 230 calories. How many calories are there in a 24-ounce iced caramel macchiato?

Solution

Identify what we are asked to find, and choose a variable to represent it.	How many calories are in a 24 ounce iced caramel macchiato?
	Let c=calories in 24 ounces.
Write a sentence that gives the information to find it.	If there are 230 calories in 16 ounces, then how many calories are in 24 ounces?
Translate into a proportion–be careful of the units. $\frac{230}{16} = \frac{c}{24}$	
Multiply both sides by the LCD, 48.	$48\left(\frac{230}{16}\right) = 48\left(\frac{c}{24}\right)$
Remove common factors on each side.	$\cancel{16} \cdot 3\left(\frac{230}{\cancel{16}}\right) = \cancel{24} \cdot 2\left(\frac{c}{\cancel{24}}\right)$
Simplify.	$690 = 2c$
Solve for c.	$\frac{690}{2} = \frac{2c}{2}$
	$345 = c$
Check.	

Is the answer reasonable?	
Yes, 345 calories for 24 ounces is more than 290 calories for 16 ounces, but not too much more.	
Substitute $c = 345$ in the original proportion. $\frac{230}{16} = \frac{c}{24}$ $\frac{230}{16} \stackrel{?}{=} \frac{345}{24}$ $\frac{115}{8} = \frac{115}{8}$ ✓	
Write a complete sentence.	There are 345 calories in a 24-ounce iced caramel macchiato.

Try It 13.9.7.11

At a fast-food restaurant, a 22-ounce chocolate shake has 850 calories. How many calories are in their 12-ounce chocolate shake? Round your answer to nearest whole number.

Answer

464 calories

Try It 13.9.7.12

Yaneli loves Starburst candies, but wants to keep her snacks to 100 calories. If the candies have 160 calories for 8 pieces, how many pieces can she have in her snack?

Answer

5 pieces

Example 13.9.7.7

Josiah went to Mexico for spring break and changed $325 dollars into Mexican pesos. At that time, the exchange rate had $1 US is equal to 12.54 Mexican pesos. How many Mexican pesos did he get for his trip?

Solution

What are you asked to find?	How many Mexican pesos did Josiah get?
Assign a variable.	Let p=the number of Mexican pesos.
Write a sentence that gives the information to find it.	If $1 US is equal to 12.54 Mexican pesos, then $325 is how many pesos?
Translate into a proportion–be careful of the units. $\frac{1}{12.54} = \frac{325}{p}$	
Multiply both sides by the LCD, 12.54p.	$12.54p\left(\frac{1}{12.54}\right) = 12.54p\left(\frac{325}{p}\right)$
Remove common factors on each side.	$\cancel{12.54p}\left(\frac{1}{\cancel{12.54}}\right) = 12.54\cancel{p}\left(\frac{325}{\cancel{p}}\right)$
Simplify.	$p = 4075.5$
Check.	
Is the answer reasonable?	

Yes, $100 would be 1,254 pesos. $325 is a little more than 3 times this amount, so our answer of 4075.5 pesos makes sense.	
Substitute $p = 4075.5$ in the original proportion. Use a calculator. $\frac{1}{12.54} = \frac{325}{p}$ $\frac{1}{12.54} \stackrel{?}{=} \frac{325}{4075.5}$ $0.07874... = 0.07874...$ ✓	
Write a complete sentence.	Josiah got 4075.5 pesos for his spring break trip.

? Try It 13.9.7.13

Yurianna is going to Europe and wants to change $800 dollars into Euros. At the current exchange rate, $1 US is equal to 0.738 Euro. How many Euros will she have for her trip?

Answer

590.4 Euros

? Try It 13.9.7.14

Corey and Nicole are traveling to Japan and need to exchange $600 into Japanese yen. If each dollar is 94.1 yen, how many yen will they get?

Answer

56,460 yen

In the example above, we related the number of pesos to the number of dollars by using a proportion. We could say the number of pesos *is proportional to* the number of dollars. If two quantities are related by a proportion, we say that they are proportional.

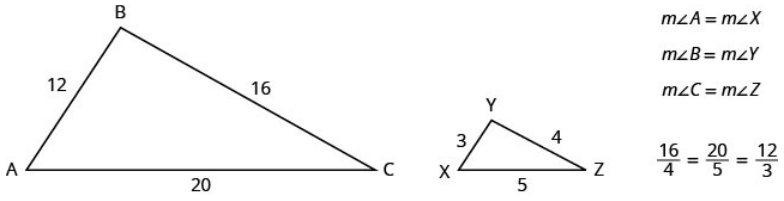
Solve Similar Figure Applications

When you shrink or enlarge a photo on a phone or tablet, figure out a distance on a map, or use a pattern to build a bookcase or sew a dress, you are working with **similar figures**. If two figures have exactly the same shape, but different sizes, they are said to be *similar.* One is a scale model of the other. All their corresponding angles have the same measures and their corresponding sides are in the same ratio.

Definition: SIMILAR FIGURES

Two figures are similar if the measures of their corresponding angles are equal and their corresponding sides are in the same ratio.

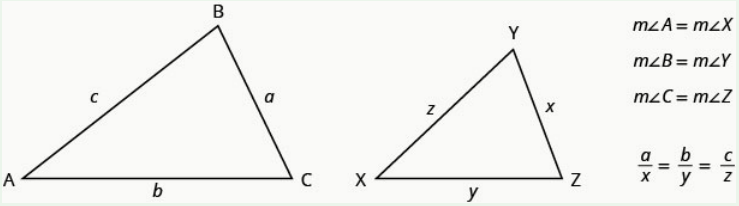
For example, the two triangles in the figure below are similar. Each side of ΔABC is 4 times the length of the corresponding side of ΔXYZ.



This is summed up in the Property of Similar Triangles.

Definition: PROPERTY OF SIMILAR TRIANGLES

If ΔABC is similar to ΔXYZ



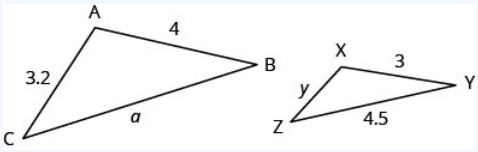
To solve applications with similar figures we will follow the Problem-Solving Strategy for Geometry Applications we used earlier.

Definition: SOLVE GEOMETRY APPLICATIONS.

1. **Read** the problem and make all the words and ideas are understood. Draw the figure and label it with the given information.
2. **Identify** what we are looking for.
3. **Name** what we are looking for by choosing a variable to represent it.
4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. **Solve the equation** using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Example 13.9.7.8

ΔABC is similar to ΔXYZ. The lengths of two sides of each triangle are given in the figure.



Find the length of the sides of the similar triangles.

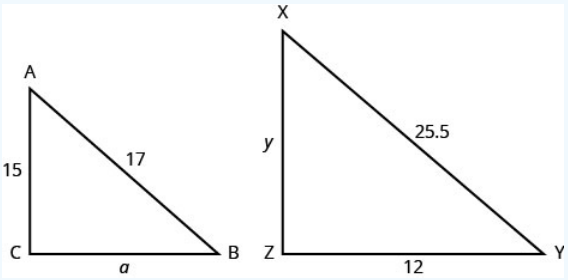
Solution

Step 1. Read the problem. Draw the figure and label it with the given information.	Figure is given.
Step 2. Identify what we are looking for.	the length of the sides of similar triangles.
Step 3. Name the variables.	Let a= length of the third side of ΔABC. y= length of the third side of ΔXYZ.
Step 4. Translate.	Since the triangles are similar, the corresponding sides are proportional.
We need to write an equation that compares the side we are looking for to a known ratio. Since the side $AB = 4$ corresponds to the side $XY = 3$ we know $\frac{AB}{XY} = \frac{4}{3}$. So we write equations with $\frac{AB}{XY}$ to find the sides we are looking for. Be careful to match up corresponding sides correctly.	$\frac{AB}{XY} = \frac{BC}{YZ} = \frac{AC}{XZ}$. To find *a*: $\frac{AB}{XY} = \frac{BC}{YZ}$ (sides of large triangle → sides of small triangle) To find *y*: $\frac{AB}{XY} = \frac{AC}{XZ}$
Substitute.	$\frac{4}{3} = \frac{a}{4.5}$ $\frac{4}{3} = \frac{3.2}{y}$

Step 5. Solve the equation.	$3a = 4(4.5)$ Figure_08_07_030f_img_new.jpg" />
	$a = 6$ $y = 2.4$
Step 6. Check.	
Step 7. Answer the question.	The third side of ΔABC is 6 and the third side of ΔXYZ is 2.4.

? Try It 13.9.7.15

ΔABC is similar to ΔXYZ. The lengths of two sides of each triangle are given in the figure.



Find the length of side a

Answer

8

? Try It 13.9.7.16

ΔABC is similar to ΔXYZ. The lengths of two sides of each triangle are given in the figure.

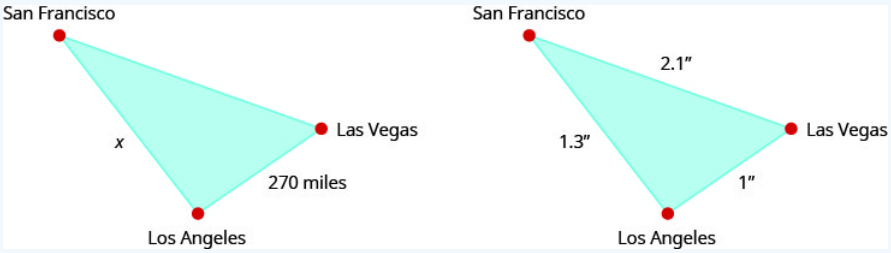
Answer

22.5

The next example shows how similar triangles are used with maps.

? Example 13.9.7.9

On a map, San Francisco, Las Vegas, and Los Angeles form a triangle whose sides are shown in the figure below. If the actual distance from Los Angeles to Las Vegas is 270 miles find the distance from Los Angeles to San Francisco.



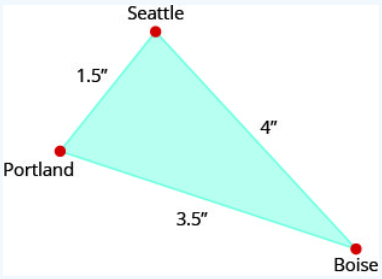
Solution

Read the problem. Draw the figures and label with the given information.	The figures are shown above.
Identify what we are looking for.	The actual distance from Los Angeles to San Francisco.

Name the variables.	Let x= distance from Los Angeles to San Francisco.
Translate into an equation. Since the triangles are similar, the corresponding sides are proportional. We'll make the numerators "miles" and the denominators "inches."	$\frac{x \text{ miles}}{1.3 \text{ inches}} = \frac{270 \text{ miles}}{1 \text{ inch}}$
	$1.3\left(\frac{x}{1.3}\right) = 1.3\left(\frac{270}{1}\right)$
Solve the equation.	$x = 351$
Check.	
On the map, the distance from Los Angeles to San Francisco is more than the distance from Los Angeles to Las Vegas. Since 351 is more than 270 the answer makes sense.	
Check $x = 351$ in the original proportion. Use a calculator. $\frac{x \text{ miles}}{1.3 \text{ inches}} = \frac{270 \text{ miles}}{1 \text{ inch}}$ $\frac{351 \text{ miles}}{1.3 \text{ inches}} \stackrel{?}{=} \frac{270 \text{ miles}}{1 \text{ inch}}$ $\frac{270 \text{ miles}}{1 \text{ inch}} = \frac{270 \text{ miles}}{1 \text{ inch}}$ ✓	
Answer the question.	The distance from Los Angeles to San Francisco is 351 miles.

Try It 13.9.7.17

On the map, Seattle, Portland, and Boise form a triangle whose sides are shown in the figure below. If the actual distance from Seattle to Boise is 400 miles, find the distance from Seattle to Portland.



Answer

150 miles

Try It 13.9.7.18

Using the map above, find the distance from Portland to Boise.

Answer

350 miles

We can use **similar figures** to find heights that we cannot directly measure.

Example 13.9.7.10

Tyler is 6 feet tall. Late one afternoon, his shadow was 8 feet long. At the same time, the shadow of a tree was 24 feet long. Find the height of the tree.

Solution

Read the problem and draw a figure.	We are looking for h, the height of the tree.	
We will use similar triangles to write an equation.	
The small triangle is similar to the large triangle.	$\frac{h}{24}=\frac{6}{8}$
Solve the proportion.	$24\left(\frac{6}{8}\right)=24\left(\frac{h}{24}\right)$
Simplify.	$18=h$
Check.	
Tyler's height is less than his shadow's length so it makes sense that the tree's height is less than the length of its shadow.	
Check $h=18$ in the original proportion. $\frac{6}{8}=\frac{h}{24}$ $\frac{6}{8}\stackrel{?}{=}\frac{18}{24}$ $\frac{3}{4}=\frac{3}{4}$ ✓	

Try It 13.9.7.19

A telephone pole casts a shadow that is 50 feet long. Nearby, an 8 foot tall traffic sign casts a shadow that is 10 feet long. How tall is the telephone pole?

Answer

40 feet

Try It 13.9.7.20

A pine tree casts a shadow of 80 feet next to a 30-foot tall building which casts a 40 feet shadow. How tall is the pine tree?

Answer

60 feet

Key Concepts

- **Property of Similar Triangles**
  - If ΔABC is similar to ΔXYZ
- **Problem Solving Strategy for Geometry Applications**

1. **Read** the problem and make sure all the words and ideas are understood. Draw the figure and label it with the given information.
2. **Identify** what we are looking for.
3. **Name** what we are looking for by choosing a variable to represent it.
4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. **Solve the equation** using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Glossary

proportion

A proportion is an equation of the form $\frac{a}{b}=\frac{c}{d}, where \(b \neq 0$, $d \neq 0$. The proportion is read “a is to b c is to d."

similar figures

Two figures are similar if the measures of their corresponding angles are equal and their corresponding sides are in the same ratio.

$$\frac{q-2}{2}=\frac{2q-7}{18}$$

Example 13.9.7E.50

Pediatricians prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of a child's weight. How many milliliters of acetaminophen will the doctor prescribe for Jocelyn, who weighs 45 pounds?

Answer

9 ml

Example 13.9.7E.51

Brianna, who weighs 6 kg, just received her shots and needs a pain killer. The pain killer is prescribed for children at 15 milligrams (mg) for every 1 kilogram (kg) of the child's weight. How many milligrams will the doctor prescribe?

Example 13.9.7E.52

A veterinarian prescribed Sunny, a 65 pound dog, an antibacterial medicine in case an infection emerges after her teeth were cleaned. If the dosage is 5 mg for every pound, how much medicine was Sunny given?

Answer

325 mg

Example 13.9.7E.53

Belle, a 13 pound cat, is suffering from joint pain. How much medicine should the veterinarian prescribe if the dosage is 1.8 mg per pound?

Example 13.9.7E.54

A new energy drink advertises 106 calories for 8 ounces. How many calories are in 12 ounces of the drink?

Answer

159 calories

Example 13.9.7E.55

One 12 ounce can of soda has 150 calories. If Josiah drinks the big 32 ounce size from the local mini-mart, how many calories does he get?

Example 13.9.7E.56

A new 7 ounce lemon ice drink is advertised for having only 140 calories. How many ounces could Sally drink if she wanted to drink just 100 calories?

Answer

5 oz

Example 13.9.7E.57

Reese loves to drink healthy green smoothies. A 16 ounce serving of smoothie has 170 calories. Reese drinks 24 ounces of these smoothies in one day. How many calories of smoothie is he consuming in one day?

Example 13.9.7E.58

Janice is traveling to Canada and will change $250 US dollars into Canadian dollars. At the current exchange rate, $1 US is equal to $1.01 Canadian. How many Canadian dollars will she get for her trip?

Answer

252.5 Canadian dollars

Example 13.9.7E.59

Todd is traveling to Mexico and needs to exchange $450 into Mexican pesos. If each dollar is worth 12.29 pesos, how many pesos will he get for his trip?

Example 13.9.7E.60

Steve changed $600 into 480 Euros. How many Euros did he receive for each US dollar?

Answer

0.80 Euros

Example 13.9.7E.61

Martha changed $350 US into 385 Australian dollars. How many Australian dollars did she receive for each US dollar?

Example 13.9.7E.62

When traveling to Great Britain, Bethany exchanged her $900 into 570 British pounds. How many pounds did she receive for each American dollar?

Answer

0.63 British pounds

Example 13.9.7E.63

A missionary commissioned to South Africa had to exchange his $500 for the South African Rand which is worth 12.63 for every dollar. How many Rand did he have after the exchange?

Example 13.9.7E.64

Ronald needs a morning breakfast drink that will give him at least 390 calories. Orange juice has 130 calories in one cup. How many cups does he need to drink to reach his calorie goal?

Answer

3 cups

Example 13.9.7E.65

Sarah drinks a 32-ounce energy drink containing 80 calories per 12 ounce. How many calories did she drink?

Example 13.9.7E.66

Elizabeth is returning to the United States from Canada. She changes the remaining 300 Canadian dollars she has to $230.05 in American dollars. What was $1 worth in Canadian dollars?

Answer

1.30 Canadian dollars

Example 13.9.7E.67

Ben needs to convert $1000 to the Japanese Yen. One American dollar is worth 123.3 Yen. How much Yen will he have?

Example 13.9.7E.68

A golden retriever weighing 85 pounds has diarrhea. His medicine is prescribed as 1 teaspoon per 5 pounds. How much medicine should he be given?

Answer

17 tsp

Example 13.9.7E.69

Five-year-old Lacy was stung by a bee. The dosage for the anti-itch liquid is 150 mg for her weight of 40 pounds. What is the dosage per pound?

Example 13.9.7E.70

Karen eats $\frac{1}{2}$ cup of oatmeal that counts for 2 points on her weight loss program. Her husband, Joe, can have 3 points of oatmeal for breakfast. How much oatmeal can he have?

Answer

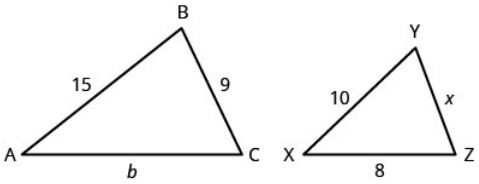
$\frac{3}{4}$ cup

Example 13.9.7E.71

An oatmeal cookie recipe calls for $\frac{1}{2}$ cup of butter to make 4 dozen cookies. Hilda needs to make 10 dozen cookies for the bake sale. How many cups of butter will she need?

Solve Similar Figure Applications

In the following exercises, ΔABC is similar to ΔXYZ



Example 13.9.7E.72

side *b*

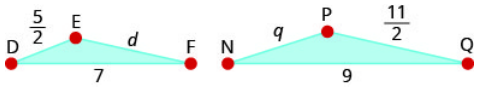
Answer

12

Example 13.9.7E.73

side *x*

In the following exercises, ΔDEF is similar to ΔNPQ



Example 13.9.7E.74

Find the length of side *d*.

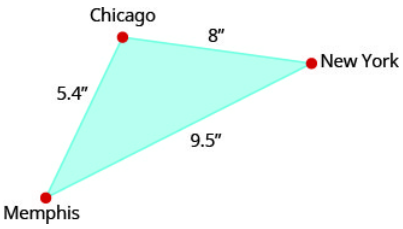
Answer

$\frac{77}{18}$

Example 13.9.7E.75

Find the length of side q.

In the following two exercises, use the map shown. On the map, New York City, Chicago, and Memphis form a triangle whose sides are shown in the figure below. The actual distance from New York to Chicago is 800 miles.



Example 13.9.7E.76

Find the actual distance from New York to Memphis.

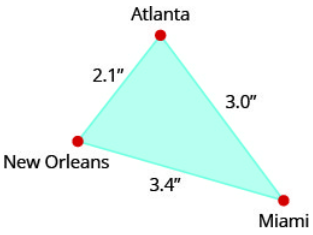
Answer

950 miles

Example 13.9.7E.77

Find the actual distance from Chicago to Memphis.

In the following two exercises, use the map shown. On the map, Atlanta, Miami, and New Orleans form a triangle whose sides are shown in the figure below. The actual distance from Atlanta to New Orleans is 420 miles.



Example 13.9.7E.78

Find the actual distance from New Orleans to Miami.

Answer

680 miles

Example 13.9.7E.79

Find the actual distance from Atlanta to Miami.

Example 13.9.7E.80

A 2 foot tall dog casts a 3 foot shadow at the same time a cat casts a one foot shadow. How tall is the cat?

Answer

$\frac{2}{3}$ foot (8in)

Example 13.9.7E.81

Larry and Tom were standing next to each other in the backyard when Tom challenged Larry to guess how tall he was. Larry knew his own height is 6.5 feet and when they measured their shadows, Larry's shadow was 8 feet and Tom's was 7.75 feet long. What is Tom's height?

Example 13.9.7E.82

The tower portion of a windmill is 212 feet tall. A six foot tall person standing next to the tower casts a seven foot shadow. How long is the windmill's shadow?

Answer

247.3 feet

Example 13.9.7E.83

The height of the Statue of Liberty is 305 feet. Nicole, who is standing next to the statue, casts a 6 foot shadow and she is 5 feet tall. How long should the shadow of the statue be?

Everyday Math

Example 13.9.7E.84

Heart Rate At the gym, Carol takes her pulse for 10 seconds and counts 19 beats.

1. How many beats per minute is this?
2. Has Carol met her target heart rate of 140 beats per minute?

Answer

1. 114 beats per minute
2. no

Example 13.9.7E.85

Heart Rate Kevin wants to keep his heart rate at 160 beats per minute while training. During his workout he counts 27 beats in 10 seconds.

1. How many beats per minute is this?
2. Has Kevin met his target heart rate?

Example 13.9.7E.86

Cost of a Road Trip Jesse's car gets 30 miles per gallon of gas.

1. If Las Vegas is 285 miles away, how many gallons of gas are needed to get there and then home?
2. If gas is $3.09 per gallon, what is the total cost of the gas for the trip?

Answer

1. 19 gallons
2. $58.71

Example 13.9.7E.87

Cost of a Road Trip Danny wants to drive to Phoenix to see his grandfather. Phoenix is 370 miles from Danny's home and his car gets 18.5 miles per gallon.

1. How many gallons of gas will Danny need to get to and from Phoenix?
2. If gas is $3.19 per gallon, what is the total cost for the gas to drive to see his grandfather?

Example 13.9.7E.88

Lawn Fertilizer Phil wants to fertilize his lawn. Each bag of fertilizer covers about 4,000 square feet of lawn. Phil's lawn is approximately 13,500 square feet. How many bags of fertilizer will he have to buy?

Answer

4 bags

Example 13.9.7E.89

House Paint April wants to paint the exterior of her house. One gallon of paint covers about 350 square feet, and the exterior of the house measures approximately 2000 square feet. How many gallons of paint will she have to buy?

Example 13.9.7E.90

Cooking Natalia's pasta recipe calls for 2 pounds of pasta for 1 quart of sauce. How many pounds of pasta should Natalia cook if she has 2.5 quarts of sauce?

Answer

5

Example 13.9.7E.91

Heating Oil A 275 gallon oil tank costs $400 to fill. How much would it cost to fill a 180 gallon oil tank?

Writing Exercises

Example 13.9.7E.92

Marisol solves the proportion $\frac{144}{a}=\frac{9}{4}$ by 'cross multiplying', so her first step looks like 4·144=9·a. Explain how this differs from the method of solution shown in Example.

Answer

Answers will vary.

Example 13.9.7E.93

Find a printed map and then write and solve an application problem similar to Example.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve proportions.			
solve similar figure applications.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

13.9.8: Solve Uniform Motion and Work Applications

Learning Objectives

By the end of this section, you will be able to:

- Solve uniform motion applications
- Solve work applications

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. An express train and a local bus leave Chicago to travel to Champaign. The express bus can make the trip in 2 hours and the local bus takes 5 hours for the trip. The speed of the express bus is 42 miles per hour faster than the speed of the local bus. Find the speed of the local bus.
   If you missed this problem, review [link].
2. Solve $\frac{1}{3}x+\frac{1}{4}x=\frac{5}{6}$.
   If you missed this problem, review [link].
3. Solve: $18t^2-30=-33t$.
   If you missed this problem, review [link].

Solve Uniform Motion Applications

We have solved uniform motion problems using the formula D=rt in previous chapters. We used a table like the one below to organize the information and lead us to the equation.

	Rate •	Time =	Distance

The formula D=rt assumes we know *r* and *t* and use them to find D. If we know D and *r* and need to find *t*, we would solve the equation for *t* and get the formula $t=\frac{D}{r}$

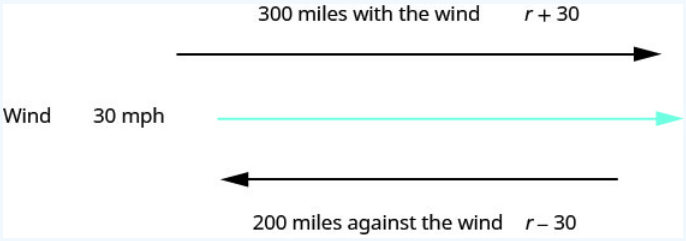
We have also explained how flying with or against a current affects the speed of a vehicle. We will revisit that idea in the next example.

Example 13.9.8.1

An airplane can fly 200 miles into a 30 mph headwind in the same amount of time it takes to fly 300 miles with a 30 mph tailwind. What is the speed of the airplane?

Solution

This is a uniform motion situation. A diagram will help us visualize the situation.



We fill in the chart to organize the information.

We are looking for the speed of the airplane.	Let r= the speed of the airplane.

When the plane flies with the wind, the wind increases its speed and the rate is r+30.	
When the plane flies against the wind, the wind decreases its speed and the rate is r−30.	
Write in the rates. Write in the distances. Since D=r·t , we solve for t and get $\frac{D}{r}$. We divide the distance by the rate in each row, and place the expression in the time column.	We know the times are equal and so we write our equation.	$\frac{200}{r-30}=\frac{300}{r+30}$
We multiply both sides by the LCD. 200(r+30)=300(r−30)	
Simplify.	(r+30)(200)=(r−30)(300)
	200r+6000=300r−9000
Solve.	15000=100r 150=r
Check.	
Is 150 mph a reasonable speed for an airplane? Yes. If the plane is traveling 150 mph and the wind is 30 mph:	
Tailwind 150+30=180 mph $\frac{300}{180}=\frac{5}{3}$ hours	
Headwind 150−30=120 mph $\frac{200}{120}=\frac{5}{3}$ hours	
The times are equal, so it checks.	The plane was traveling 150 mph.

? Try It 13.9.8.2

Link can ride his bike 20 miles into a 3 mph headwind in the same amount of time he can ride 30 miles with a 3 mph tailwind. What is Link's biking speed?

Answer

15 mph

? Try It 13.9.8.3

Judy can sail her boat 5 miles into a 7 mph headwind in the same amount of time she can sail 12 miles with a 7 mph tailwind. What is the speed of Judy's boat without a wind?

Answer

17 mph

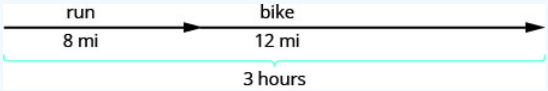
In the next example, we will know the total time resulting from travelling different distances at different speeds.

Example 13.9.8.4

Jazmine trained for 3 hours on Saturday. She ran 8 miles and then biked 24 miles. Her biking speed is 4 mph faster than her running speed. What is her running speed?

Solution

This is a uniform motion situation. A diagram will help us visualize the situation.



We fill in the chart to organize the information.

We are looking for Jazmine's running speed.	Let r= Jazmine's running sp
Her biking speed is 4 miles faster than her running speed.	r+4= her biking speed
The distances are given, enter them into the chart.	
Since D=r·t , we solve for t and get $t = \frac{D}{r}$ We divide the distance by the rate in each row, and place the expression in the time column.	<table><tr><th></th><th>Rate • Time = Distance</th></tr><tr><td>Run</td><td>r $\frac{8}{r}$ 8</td></tr><tr><td>Bike</td><td>$r+4$ $\frac{24}{r+4}$ 24</td></tr><tr><td></td><td>3</td></tr></table>
Write a word sentence.	Her time plus the time biking
Translate the sentence to get the equation.	$\frac{8}{r} + \frac{24}{r+4} = 3$
Solve.	$r(r+4)(\frac{8}{r} + \frac{24}{r+4}) = 3r(r+4)$ $8(r+4) + 24r = 3r^2 + 12r$ $8r + 32 + 24r = 3r^2 + 12r$ $32 + 32r = 3r^2 + 12r$ $0 = 3r^2 - 20r - 32$ $0 = (3r+4)(r-8)$
	(3r+4)=0, (r−8)=0
	$r = -\frac{4}{3}$, r=8
Check. r=8	
A negative speed does not make sense in this problem, so r=8 is the solution.	
Is 8 mph a reasonable running speed? Yes.	
Run 8 mph, $\frac{8miles}{8mph} = 1hour$ Bike 12 mph, $\frac{24miles}{12mph} = 2hours$ Total 3 hours. Jazmine's running speed is 8 mph.	

Try It 13.9.8.5

Dennis went cross-country skiing for 6 hours on Saturday. He skied 20 mile uphill and then 20 miles back downhill, returning to his starting point. His uphill speed was 5 mph slower than his downhill speed. What was Dennis' speed going uphill and his speed going downhill?

Answer

10 mph

Try It 13.9.8.6

Tony drove 4 hours to his home, driving 208 miles on the interstate and 40 miles on country roads. If he drove 15 mph faster on the interstate than on the country roads, what was his rate on the country roads?

Answer

50 mph

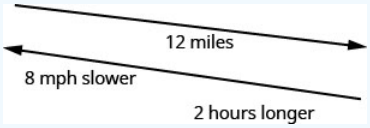
Once again, we will use the uniform motion formula solved for the variable *t*.

Example 13.9.8.7

Hamilton rode his bike downhill 12 miles on the river trail from his house to the ocean and then rode uphill to return home. His uphill speed was 8 miles per hour slower than his downhill speed. It took him 2 hours longer to get home than it took him to get to the ocean. Find Hamilton's downhill speed.

Solution

This is a uniform motion situation. A diagram will help us visualize the situation.



We fill in the chart to organize the information.

We are looking for Hamilton's downhill speed.	Let r= Hamilton's downhill speed.
His uphill speed is 8 miles per hour slower. Enter the rates into the chart.	h−8= Hamilton's uphill speed
The distance is the same in both directions, 12 miles. Since D=r·t , we solve for *t* and get $t = \frac{D}{r}$ We divide the distance by the rate in each row, and place the expression in the time column.	<table><tr><th></th><th>Rate • Time = Distance</th></tr><tr><td>Downhill</td><td>h	$\frac{12}{h}$	12</td></tr><tr><td>Uphill</td><td>$h-8$	$\frac{12}{h-8}$	12</td></tr></table>
Write a word sentence about the time.	He took 2 hours longer uphill than downhill. The uphill time is 2 more than the downhill time.
Translate the sentence to get the equation. Solve.	$\frac{12}{h-8} = \frac{12}{h} + 2$ $h(h-8)(\frac{12}{h-8}) = h(h-8)(\frac{12}{h} + 2)$ 12h=12(h−8)+2h(h−8) $12h = 12h - 96 + 2h^2 - 16h$ $0 = 2h^2 - 16h - 96$ $0 = 2(h^2 - 8h - 48)$ 0=2(h−12)(h+4) h−12=0, h+4=0 h=12, h=−4
Check. Is 12 mph a reasonable speed for biking downhill? Yes.	
Downhill 12 mph, $\frac{12miles}{12mph} = 1hour$	

Uphill 12−8=4 mph $\frac{12miles}{4mph} = 3hours$	
	The uphill time is 2 hours more than the downhill time. Hamilton's downhill speed is 12 mph.

? Try It 13.9.8.8

Kayla rode her bike 75 miles home from college one weekend and then rode the bus back to college. It took her 2 hours less to ride back to college on the bus than it took her to ride home on her bike, and the average speed of the bus was 10 miles per hour faster than Kayla's biking speed. Find Kayla's biking speed.

Answer

15 mph

? Try It 13.9.8.9

Victoria jogs 12 miles to the park along a flat trail and then returns by jogging on an 18 mile hilly trail. She jogs 1 mile per hour slower on the hilly trail than on the flat trail, and her return trip takes her two hours longer. Find her rate of jogging on the flat trail.

Answer

6 mph

Solve Work Applications

Suppose Pete can paint a room in 10 hours. If he works at a steady pace, in 1 hour he would paint $\frac{1}{10}$ of the room. If Alicia would take 8 hours to paint the same room, then in 1 hour she would paint $\frac{1}{8}$ of the room. How long would it take Pete and Alicia to paint the room if they worked together (and didn't interfere with each other's progress)?

This is a typical 'work' application. There are three quantities involved here – the time it would take each of the two people to do the job alone and the time it would take for them to do the job together.

Let's get back to Pete and Alicia painting the room. We will let t be the number of hours it would take them to paint the room together. So in 1 hour working together they have completed $\frac{1}{t}$ of the job.

In one hour Pete did $\frac{1}{10}$ of the job. Alicia did $\frac{1}{8}$ of the job. And together they did $\frac{1}{t}$ of the job.

We can model this with the word equation and then translate to a rational equation. To find the time it would take them if they worked together, we solve for t.

	Pete's part + Alicia's part = part of total $\frac{1}{10} + \frac{1}{8} = \frac{1}{t}$
	$\frac{1}{10}+\frac{1}{8}=\frac{1}{t}$
Multiply by the LCD, 40t	$40t\left(\frac{1}{10}+\frac{1}{8}\right)=40t\left(\frac{1}{t}\right)$
Distribute.	$40t\cdot\frac{1}{10}+40t\cdot\frac{1}{8}=40t\left(\frac{1}{t}\right)$
Simplify and solve.	$4t+5t=40$

	$9t = 40$
	$t = \frac{40}{9}$
We'll write as a mixed number so that we can convert it to hours and minutes.	$t = 4\frac{4}{9}$ hours
Remember, 1 hour = 60 minutes.	$t = 4$ hours $+ \frac{4}{9}(60$ minutes$)$
Multiply, and then round to the nearest minute.	$t = 4$ hours $+ 27$ minutes
	It would take Pete and Alica about 4 hours and 27 minutes to paint the room.

Keep in mind, it should take less time for two people to complete a job working together than for either person to do it alone.

Example 13.9.8.10

The weekly gossip magazine has a big story about the Princess' baby and the editor wants the magazine to be printed as soon as possible. She has asked the printer to run an extra printing press to get the printing done more quickly. Press #1 takes 6 hours to do the job and Press #2 takes 12 hours to do the job. How long will it take the printer to get the magazine printed with both presses running together?

Solution

This is a work problem. A chart will help us organize the information.

Let t= the number of hours needed to complete the job together.	
Enter the hours per job for Press #1, Press #2 and when they work together. If a job on Press #1 takes 6 hours, then in 1 hour $\frac{1}{6}$ of the job is completed. Similarly find the part of the job completed/hours for Press #2 and when they both work together.	<table><tr><th></th><th>Number of hours to complete the job</th><th>Part of job completed/ hour</th></tr><tr><td>Press #1</td><td>6</td><td>$\frac{1}{6}$</td></tr><tr><td>Press #2</td><td>12</td><td>$\frac{1}{12}$</td></tr><tr><td>Together</td><td>t</td><td>$\frac{1}{t}$</td></tr></table>
Write a word sentence.	
The part completed by Press #1 plus the part completed by Press #2 equals the amount completed together.	
Translate to an equation.	Work completed by Press #1 + Press #2 = Together $\frac{1}{6} + \frac{1}{12} = \frac{1}{t}$
Solve.	$\frac{1}{6} + \frac{1}{12} = \frac{1}{t}$
Multiply by the LCD, 12t.	$12t\left(\frac{1}{6} + \frac{1}{12}\right) = 12t\left(\frac{1}{t}\right)$
Simplify.	$2t + t = 12$
	$3t = 12$
	$t = 4$
	When both presses are running it takes 4 hours to do the job.

Try It 13.9.8.11

One gardener can mow a golf course in 4 hours, while another gardener can mow the same golf course in 6 hours. How long would it take if the two gardeners worked together to mow the golf course?

Answer

2 hours and 24 minutes

Try It 13.9.8.12

Carrie can weed the garden in 7 hours, while her mother can do it in 3. How long will it take the two of them working together?

Answer

2 hours and 6 minutes

Example 13.9.8.13

Corey can shovel all the snow from the sidewalk and driveway in 4 hours. If he and his twin Casey work together, they can finish shoveling the snow in 2 hours. How many hours would it take Casey to do the job by himself?

Solution

This is a work application. A chart will help us organize the information.	
We are looking for how many hours it would take Casey to complete the job by himself.	
Let t= the number of hours needed for Casey to complete.	
Enter the hours per job for Corey, Casey, and when they work together. If Corey takes 4 hours, then in 1 hour $\frac{1}{4}$ of the job is completed. Similarly find the part of the job completed/hours for Casey and when they both work together.	<table><tr><th></th><th>Number of hours needed to complete the job</th><th>Part of job completed/ hour</th></tr><tr><td>Corey</td><td>4</td><td>$\frac{1}{4}$</td></tr><tr><td>Casey</td><td>t</td><td>$\frac{1}{t}$</td></tr><tr><td>Together</td><td>2</td><td>$\frac{1}{2}$</td></tr></table>
Write a word sentence.	
The part completed by Corey plus the part completed by Casey equals the amount completed together.	
Translate to an equation:	$\overbrace{\text{Corey} + \text{Casey}}^{} = \text{Together}$ $\frac{1}{4} + \frac{1}{t} = \frac{1}{2}$
Solve.	$\frac{1}{4}+\frac{1}{t}=\frac{1}{2}$
Multiply by the LCD, 4t.	$4t\left(\frac{1}{4}+\frac{1}{t}\right)=4t\left(\frac{1}{2}\right)$
Simplify.	$t+4=2t$
	$4=t$
	It would take Casey 4 hours to do the job alone.

Try It 13.9.8.14

Two hoses can fill a swimming pool in 10 hours. It would take one hose 26 hours to fill the pool by itself. How long would it take for the other hose, working alone, to fill the pool?

Answer

16.25 hours

Try It 13.9.8.15

Cara and Cindy, working together, can rake the yard in 4 hours. Working alone, it takes Cindy 6 hours to rake the yard. How long would it take Cara to rake the yard alone?

Answer

12 hours

Practice Makes Perfect

Solve Uniform Motion Applications

In the following exercises, solve uniform motion applications

Try It 13.9.8.16

Mary takes a sightseeing tour on a helicopter that can fly 450 miles against a 35 mph headwind in the same amount of time it can travel 702 miles with a 35 mph tailwind. Find the speed of the helicopter.

Solution

160 mph

Exercise 13.9.8.17

A private jet can fly 1210 miles against a 25 mph headwind in the same amount of time it can fly 1694 miles with a 25 mph tailwind. Find the speed of the jet.

Try It 13.9.8.18

A boat travels 140 miles downstream in the same time as it travels 92 miles upstream. The speed of the current is 6mph. What is the speed of the boat?

Answer

29 mph

Exercise 13.9.8.19

Darrin can skateboard 2 miles against a 4 mph wind in the same amount of time he skateboards 6 miles with a 4 mph wind. Find the speed Darrin skateboards with no wind.

Try It 13.9.8.20

Jane spent 2 hours exploring a mountain with a dirt bike. When she rode the 40 miles uphill, she went 5 mph slower than when she reached the peak and rode for 12 miles along the summit. What was her rate along the summit?

Answer

30 mph

Exercise 13.9.8.21

Jill wanted to lose some weight so she planned a day of exercising. She spent a total of 2 hours riding her bike and jogging. She biked for 12 miles and jogged for 6 miles. Her rate for jogging was 10 mph less than biking rate. What was her rate when jogging?

Try It 13.9.8.22

Bill wanted to try out different water craft. He went 62 miles downstream in a motor boat and 27 miles downstream on a jet ski. His speed on the jet ski was 10 mph faster than in the motor boat. Bill spent a total of 4 hours on the water. What was his rate of speed in the motor boat?

Answer

20 mph

Exercise 13.9.8.23

Nancy took a 3 hour drive. She went 50 miles before she got caught in a storm. Then she drove 68 miles at 9 mph less than she had driven when the weather was good. What was her speed driving in the storm?

Try It 13.9.8.24

Chester rode his bike uphill 24 miles and then back downhill at 2 mph faster than his uphill. If it took him 2 hours longer to ride uphill than downhill, l, what was his uphill rate?

Answer

4 mph

Exercise 13.9.8.25

Matthew jogged to his friend's house 12 miles away and then got a ride back home. It took him 2 hours longer to jog there than ride back. His jogging rate was 25 mph slower than the rate when he was riding. What was his jogging rate?

Try It 13.9.8.26

Hudson travels 1080 miles in a jet and then 240 miles by car to get to a business meeting. The jet goes 300 mph faster than the rate of the car, and the car ride takes 1 hour longer than the jet. What is the speed of the car?

Answer

60 mph

Exercise 13.9.8.27

Nathan walked on an asphalt pathway for 12 miles. He walked the 12 miles back to his car on a gravel road through the forest. On the asphalt he walked 2 miles per hour faster than on the gravel. The walk on the gravel took one hour longer than the walk on the asphalt. How fast did he walk on the gravel?

? Try It 13.9.8.28

John can fly his airplane 2800 miles with a wind speed of 50 mph in the same time he can travel 2400 miles against the wind. If the speed of the wind is 50 mph, find the speed of his airplane.

Answer

650 mph

? Exercise 13.9.8.29

Jim's speedboat can travel 20 miles upstream against a 3 mph current in the same amount of time it travels 22 miles downstream with a 3 mph current speed. Find the speed of the Jim's boat.

? Try It 13.9.8.30

Hazel needs to get to her granddaughter's house by taking an airplane and a rental car. She travels 900 miles by plane and 250 miles by car. The plane travels 250 mph faster than the car. If she drives the rental car for 2 hours more than she rode the plane, find the speed of the car.

Answer

50 mph

? Exercise 13.9.8.31

Stu trained for 3 hours yesterday. He ran 14 miles and then biked 40 miles. His biking speed is 6 mph faster than his running speed. What is his running speed?

? Try It 13.9.8.32

When driving the 9 hour trip home, Sharon drove 390 miles on the interstate and 150 miles on country roads. Her speed on the interstate was 15 more than on country roads. What was her speed on country roads?

Answer

50 mph

? Exercise 13.9.8.33

Two sisters like to compete on their bike rides. Tamara can go 4 mph faster than her sister, Samantha. If it takes Samantha 1 hours longer than Tamara to go 80 miles, how fast can Samantha ride her bike?

Solve Work Applications

In the following exercises, solve work applications.

? Try It 13.9.8.34

Mike, an experienced bricklayer, can build a wall in 3 hours, while his son, who is learning, can do the job in 6 hours. How long does it take for them to build a wall together?

Answer

2 hours

Exercise 13.9.8.35

It takes Sam 4 hours to rake the front lawn while his brother, Dave, can rake the lawn in 2 hours. How long will it take them to rake the lawn working together?

Try It 13.9.8.36

Mary can clean her apartment in 6 hours while her roommate can clean the apartment in 5 hours. If they work together, how long would it take them to clean the apartment?

Answer

2 hours and 44 minutes

Exercise 13.9.8.37

Brian can lay a slab of concrete in 6 hours, while Greg can do it in 4 hours. If Brian and Greg work together, how long will it take?

Try It 13.9.8.38

Leeson can proofread a newspaper copy in 4 hours. If Ryan helps, they can do the job in 3 hours. How long would it take for Ryan to do his job alone?

Answer

12 hours

Exercise 13.9.8.39

Paul can clean a classroom floor in 3 hours. When his assistant helps him, the job takes 2 hours. How long would it take the assistant to do it alone?

Try It 13.9.8.40

Josephine can correct her students' test papers in 5 hours, but if her teacher's assistant helps, it would take them 3 hours. How long would it take the assistant to do it alone?

Answer

7 hours and 30 minutes

Exercise 13.9.8.41

Washing his dad's car alone, eight year old Levi takes 2.5 hours. If his dad helps him, then it takes 1 hour. How long does it take the Levi's dad to wash the car by himself?

Try It 13.9.8.42

Jackson can remove the shingles off of a house in 7 hours, while Martin can remove the shingles in 5 hours. How long will it take them to remove the shingles if they work together?

Answer

2 hours and 55 minutes

Exercise 13.9.8.43

At the end of the day Dodie can clean her hair salon in 15 minutes. Ann, who works with her, can clean the salon in 30 minutes. How long would it take them to clean the shop if they work together?

Try It 13.9.8.44

Ronald can shovel the driveway in 4 hours, but if his brother Donald helps it would take 2 hours. How long would it take Donald to shovel the driveway alone?

Answer

4 hours

Exercise 13.9.8.45

It takes Tina 3 hours to frost her holiday cookies, but if Candy helps her it takes 2 hours. How long would it take Candy to frost the holiday cookies by herself?

Everyday Math

Try It 13.9.8.46

Dana enjoys taking her dog for a walk, but sometimes her dog gets away and she has to run after him. Dana walked her dog for 7 miles but then had to run for 1 mile, spending a total time of 2.5 hours with her dog. Her running speed was 3 mph faster than her walking speed. Find her walking speed.

Answer

3 mph

Exercise 13.9.8.47

Ken and Joe leave their apartment to go to a football game 45 miles away. Ken drives his car 30 mph faster Joe can ride his bike. If it takes Joe 2 hours longer than Ken to get to the game, what is Joe's speed?

Writing Exercises

Exercise 13.9.8.48

In Example, the solution $h=-4$ is crossed out. Explain why.

Exercise 13.9.8.49

Paula and Yuki are roommates. It takes Paula 3 hours to clean their apartment. It takes Yuki 4 hours to clean the apartment. The equation $\frac{1}{3}+\frac{1}{4}=\frac{1}{t}$ can be used to find t, the number of hours it would take both of them, working together, to clean their apartment. Explain how this equation models the situation.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve uniform motion applications.			
solve work applications.			

ⓑ On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.9.8E: Exercises

Practice Makes Perfect

Solve Uniform Motion Applications

In the following exercises, solve uniform motion applications

Exercise 1

Mary takes a sightseeing tour on a helicopter that can fly 450 miles against a 35 mph headwind in the same amount of time it can travel 702 miles with a 35 mph tailwind. Find the speed of the helicopter.

Answer

160 mph

Exercise 2

A private jet can fly 1210 miles against a 25 mph headwind in the same amount of time it can fly 1694 miles with a 25 mph tailwind. Find the speed of the jet.

Exercise 3

A boat travels 140 miles downstream in the same time as it travels 92 miles upstream. The speed of the current is 6mph. What is the speed of the boat?

Answer

29 mph

Exercise 4

Darrin can skateboard 2 miles against a 4 mph wind in the same amount of time he skateboards 6 miles with a 4 mph wind. Find the speed Darrin skateboards with no wind.

Exercise 5

Jane spent 2 hours exploring a mountain with a dirt bike. When she rode the 40 miles uphill, she went 5 mph slower than when she reached the peak and rode for 12 miles along the summit. What was her rate along the summit?

Answer

30 mph

Exercise 6

Jill wanted to lose some weight so she planned a day of exercising. She spent a total of 2 hours riding her bike and jogging. She biked for 12 miles and jogged for 6 miles. Her rate for jogging was 10 mph less than biking rate. What was her rate when jogging?

Exercise 7

Bill wanted to try out different water craft. He went 62 miles downstream in a motor boat and 27 miles downstream on a jet ski. His speed on the jet ski was 10 mph faster than in the motor boat. Bill spent a total of 4 hours on the water. What was his rate of speed in the motor boat?

Answer

20 mph

Exercise 8

Nancy took a 3 hour drive. She went 50 miles before she got caught in a storm. Then she drove 68 miles at 9 mph less than she had driven when the weather was good. What was her speed driving in the storm?

Exercise 9

Chester rode his bike uphill 24 miles and then back downhill at 2 mph faster than his uphill. If it took him 2 hours longer to ride uphill than downhill, l, what was his uphill rate?

Answer

4 mph

Exercise 10

Matthew jogged to his friend's house 12 miles away and then got a ride back home. It took him 2 hours longer to jog there than ride back. His jogging rate was 25 mph slower than the rate when he was riding. What was his jogging rate?

Exercise 11

Hudson travels 1080 miles in a jet and then 240 miles by car to get to a business meeting. The jet goes 300 mph faster than the rate of the car, and the car ride takes 1 hour longer than the jet. What is the speed of the car?

Answer

60 mph

Exercise 12

Nathan walked on an asphalt pathway for 12 miles. He walked the 12 miles back to his car on a gravel road through the forest. On the asphalt he walked 2 miles per hour faster than on the gravel. The walk on the gravel took one hour longer than the walk on the asphalt. How fast did he walk on the gravel?

Exercise 13

John can fly his airplane 2800 miles with a wind speed of 50 mph in the same time he can travel 2400 miles against the wind. If the speed of the wind is 50 mph, find the speed of his airplane.

Answer

650 mph

Exercise 14

Jim's speedboat can travel 20 miles upstream against a 3 mph current in the same amount of time it travels 22 miles downstream with a 3 mph current speed. Find the speed of the Jim's boat.

Exercise 15

Hazel needs to get to her granddaughter's house by taking an airplane and a rental car. She travels 900 miles by plane and 250 miles by car. The plane travels 250 mph faster than the car. If she drives the rental car for 2 hours more than she rode the plane, find the speed of the car.

Answer

50 mph

Exercise 16

Stu trained for 3 hours yesterday. He ran 14 miles and then biked 40 miles. His biking speed is 6 mph faster than his running speed. What is his running speed?

Exercise 17

When driving the 9 hour trip home, Sharon drove 390 miles on the interstate and 150 miles on country roads. Her speed on the interstate was 15 more than on country roads. What was her speed on country roads?

Answer

50 mph

Exercise 18

Two sisters like to compete on their bike rides. Tamara can go 4 mph faster than her sister, Samantha. If it takes Samantha 1 hours longer than Tamara to go 80 miles, how fast can Samantha ride her bike?

Solve Work Applications

In the following exercises, solve work applications.

Exercise 19

Mike, an experienced bricklayer, can build a wall in 3 hours, while his son, who is learning, can do the job in 6 hours. How long does it take for them to build a wall together?

Answer

2 hours

Exercise 20

It takes Sam 4 hours to rake the front lawn while his brother, Dave, can rake the lawn in 2 hours. How long will it take them to rake the lawn working together?

Exercise 21

Mary can clean her apartment in 6 hours while her roommate can clean the apartment in 5 hours. If they work together, how long would it take them to clean the apartment?

Answer

2 hours and 44 minutes

Exercise 22

Brian can lay a slab of concrete in 6 hours, while Greg can do it in 4 hours. If Brian and Greg work together, how long will it take?

Exercise 23

Leeson can proofread a newspaper copy in 4 hours. If Ryan helps, they can do the job in 3 hours. How long would it take for Ryan to do his job alone?

Answer

12 hours

Exercise 24

Paul can clean a classroom floor in 3 hours. When his assistant helps him, the job takes 2 hours. How long would it take the assistant to do it alone?

Exercise 25

Josephine can correct her students' test papers in 5 hours, but if her teacher's assistant helps, it would take them 3 hours. How long would it take the assistant to do it alone?

Answer

7 hours and 30 minutes

Exercise 26

Washing his dad's car alone, eight year old Levi takes 2.5 hours. If his dad helps him, then it takes 1 hour. How long does it take the Levi's dad to wash the car by himself?

Exercise 27

Jackson can remove the shingles off of a house in 7 hours, while Martin can remove the shingles in 5 hours. How long will it take them to remove the shingles if they work together?

Answer

2 hours and 55 minutes

Exercise 28

At the end of the day Dodie can clean her hair salon in 15 minutes. Ann, who works with her, can clean the salon in 30 minutes. How long would it take them to clean the shop if they work together?

Exercise 29

Ronald can shovel the driveway in 4 hours, but if his brother Donald helps it would take 2 hours. How long would it take Donald to shovel the driveway alone?

Answer

4 hours

Exercise 30

It takes Tina 3 hours to frost her holiday cookies, but if Candy helps her it takes 2 hours. How long would it take Candy to frost the holiday cookies by herself?

Everyday Math

Exercise 31

Dana enjoys taking her dog for a walk, but sometimes her dog gets away and she has to run after him. Dana walked her dog for 7 miles but then had to run for 1 mile, spending a total time of 2.5 hours with her dog. Her running speed was 3 mph faster than her walking speed. Find her walking speed.

Answer

3 mph

Exercise 32

Ken and Joe leave their apartment to go to a football game 45 miles away. Ken drives his car 30 mph faster Joe can ride his bike. If it takes Joe 2 hours longer than Ken to get to the game, what is Joe's speed?

Writing Exercises

Exercise 33

In Example, the solution $h=-4$ is crossed out. Explain why.

Exercise 34

Paula and Yuki are roommates. It takes Paula 3 hours to clean their apartment. It takes Yuki 4 hours to clean the apartment. The equation $\frac{1}{3}+\frac{1}{4}=\frac{1}{t}$ can be used to find t, the number of hours it would take both of them, working together, to clean their apartment. Explain how this equation models the situation.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve uniform motion applications.			
solve work applications.			

ⓑ On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

13.9.9: Use Direct and Inverse Variation

Learning Objectives

By the end of this section, you will be able to:

- Solve direct variation problems
- Solve inverse variation problems

Note

Before you get started, take this readiness quiz.

If you miss a problem, go back to the section listed and review the material.

1. Find the multiplicative inverse of −8
   If you missed this problem, review Exercise 1.10.13.
2. Solve for n: 45=20n
   If you missed this problem, review Exercise 2.2.1.
3. Evaluate $5x^2$ when x=10
   If you missed this problem, review Exercise 1.3.25.

When two quantities are related by a proportion, we say they are *proportional* to each other. Another way to express this relation is to talk about the *variation* of the two quantities. We will discuss direct variation and inverse variation in this section.

Solve Direct Variation Problems

Lindsay gets paid $15 per hour at her job. If we let *s* be her salary and *h* be the number of hours she has worked, we could model this situation with the equation

s=15h

Lindsay's salary is the product of a constant, 15, and the number of hours she works. We say that Lindsay's salary *varies directly* with the number of hours she works. Two variables vary directly if one is the product of a constant and the other.

Definition: DIRECT VARIATION

For any two variables *x* and *y*, *y* varies directly with *x* if

y=kx, where $n \neq 0$

In applications using direct variation, generally we will know values of one pair of the variables and will be asked to find the equation that relates *x* and *y*. Then we can use that equation to find values of *y* for other values of *x*.

How to Solve Direct Variation Problems

Example 13.9.9.1

If y varies directly with x and y=20 when x=8, find the equation that relates *x* and *y*.

Answer

Step 1. Write the formula for direct variation.	The direct variation formula is $y = kx$.	$y = kx$	**Step 2.** Substitute the given values for the variables.	We are given $y = 20$, $x = 8$.	$20 = k \cdot 8$
Step 3. Solve for the constant of variation.	Divide both sides of the equation by 8, then simplify.	$\frac{20}{8} = k$ $k = 2.5$	**Step 4.** Write the equation that relates *x* and *y*.	Rewrite the general equation with the value we found for *k*.	$y = 2.5x$

Example 13.9.9.2

If y varies directly as x and y=3, when x=10, find the equation that relates *x* and *y*.

Answer

$y = \frac{3}{10}x$

Example 13.9.9.3

If y varies directly as x and y=12 when x=4, find the equation that relates *x* and *y*.

Answer

y=3x

We'll list the steps below.

Definition: SOLVE DIRECT VARIATION PROBLEMS

1. Write the formula for direct variation.
2. Substitute the given values for the variables.
3. Solve for the constant of variation.
4. Write the equation that relates x and y.

Now we'll solve a few applications of direct variation.

Example 13.9.9.4

When Raoul runs on the treadmill at the gym, the number of calories, c, he burns varies directly with the number of minutes, m, he uses the treadmill. He burned 315 calories when he used the treadmill for 18 minutes.

1. Write the equation that relates c and m.
2. How many calories would he burn if he ran on the treadmill for 25 minutes?

Answer

1.

	The number of calories, c varies directly with the number of minutes, m, on the treadmill, and c=315 when m=18
Write the formula for direct variation.	$y = kx$
We will use c in place of y and mm in place of x.	$c = km$
Substitute the given values for the variables.	$315 = k \cdot 18$
Solve for the constant of variation.	$\frac{315}{18} = \frac{k \cdot 18}{18}$
	$17.5 = k$
Write the equation that relates c and m.	$c = km$
Substitute in the constant of variation.	$c = 17.5m$

2.

	Find c when m=25.
Write the equation that relates c and m.	$c = 17.5m$
Substitute the given value for m.	$c = 17.5(25)$
Simplify.	$c = 437.5$
	Raoul would burn 437.5 calories if he used the treadmill for 25 minutes.

Example 13.9.9.5

The number of calories, c, burned varies directly with the amount of time, t, spent exercising. Arnold burned 312 calories in 65 minutes exercising.

1. Write the equation that relates c and t.
2. How many calories would he burn if he exercises for 90 minutes?

Answer

1. c=4.8t
2. 432 calories

Example 13.9.9.6

The distance a moving body travels, d, varies directly with time, t, it moves. A train travels 100 miles in 2 hours

1. Write the equation that relates d and t.
2. How many miles would it travel in 5 hours?

Answer

1. d=50t
2. 250 miles

In the previous example, the variables c and m were named in the problem. Usually that is not the case. We will have to name the variables in the next example as part of the solution, just like we do in most applied problems.

Example 13.9.9.7

The number of gallons of gas Eunice's car uses varies directly with the number of miles she drives. Last week she drove 469.8 miles and used 14.5 gallons of gas.

1. Write the equation that relates the number of gallons of gas used to the number of miles driven.
2. How many gallons of gas would Eunice's car use if she drove 1000 miles?

Answer

1.

	The number of gallons of gas varies directly with the number of miles driven.
First we will name the variables.	Let g= number of gallons of gas. m= number of miles driven.
Write the formula for direct variation.	$y = kx$
We will use g in place of y and m in place of x.	$g = km$
Substitute the given values for the variables	$g = 14.5$ when $m = 469.8$
	$14.5 = k(469.8)$
Solve for the constant of variation.	$\frac{14.5}{469.8} = \frac{k(469.8)}{469.8}$
We will round to the nearest thousandth.	$0.031 = k$
Write the equation that relates g and m.	$g = km$
Substitute in the constant of variation.	$g = 0.031m$

2.

	Find g when m=1000.
Write the equation that relates g and m.	g=0.031m
Substitute the given value for m.	g=0.031(1000)
Simplify.	g=31
	Eunice's car would use 31 gallons of gas if she drove it 1,000 miles.

Notice that in this example, the units on the constant of variation are gallons/mile. In everyday life, we usually talk about miles/gallon.

? Example 13.9.9.8

The distance that Brad travels varies directly with the time spent traveling. Brad travelled 660 miles in 12 hours,

1. Write the equation that relates the number of miles travelled to the time.
2. How many miles could Brad travel in 4 hours?

Answer

1. m=55h
2. 220 miles

? Example 13.9.9.9

The weight of a liquid varies directly as its volume. A liquid that weighs 24 pounds has a volume of 4 gallons.

1. Write the equation that relates the weight to the volume.
2. If a liquid has volume 13 gallons, what is its weight?

Answer

1. w=6v
2. 78 pounds

In some situations, one variable varies directly with the square of the other variable. When that happens, the equation of direct variation is $y = kx^2$.

? Example 13.9.9.10

The maximum load a beam will support varies directly with the square of the diagonal of the beam's cross-section. A beam with diagonal 4" will support a maximum load of 75 pounds.

1. Write the equation that relates the maximum load to the cross-section.
2. What is the maximum load that can be supported by a beam with diagonal 8"?

Answer

1.

	The maximum load varies directly with the square of the diagonal of the cross-section.
Name the variables.	Let L= maximum load. c= the diagonal of the cross-section
Write the formula for direct variation, where y varies directly with the square of x.	$y = kx^2$
We will use L in place of y and c in place of x.	$L = kc^2$

Substitute the given values for the variables.	$L = 75$ when $c = 4$
	$75 = k \cdot 4^2$
Solve for the constant of variation.	$\frac{75}{16} = \frac{k \cdot 16}{16}$
	$4.6875 = k$
Write the equation that relates L and c.	$L = kc^2$
Substitute in the constant of variation.	$L = 4.6875c^2$

2.

	Find L when c=8.
Write the equation that relates L and c.	$L = 4.6875c^2$
Substitute the given value for c.	$L = 4.6875(8)^2$
Simplify.	L=300
	A beam with diagonal 8” could supporta maximum load of 300 pounds.

Example 13.9.9.11

The distance an object falls is directly proportional to the square of the time it falls. A ball falls 144 feet in 3 seconds.

1. Write the equation that relates the distance to the time.
2. How far will an object fall in 4 seconds?

Answer

1. $d = 16t^2$
2. 256 feet

Example 13.9.9.12

The area of a circle varies directly as the square of the radius. A circular pizza with a radius of 6 inches has an area of 113.04 square inches.

1. Write the equation that relates the area to the radius.
2. What is the area of a pizza with a radius of 9 inches?

Answer

1. $A = 3.14r^2$
2. 254.34 square inches

Solve Inverse Variation Problems

Many applications involve two variable that *vary inversely*. As one variable increases, the other decreases. The equation that relates them is $y = \frac{k}{x}$.

Definition: INVERSE VARIATION

For any two variables x and y, y varies inversely with x if

$y=\frac{k}{x}$,where $k \neq 0$

The word ‘inverse’ in inverse variation refers to the multiplicative inverse. The multiplicative inverse of x is $\frac{1}{x}$.

We solve inverse variation problems in the same way we solved direct variation problems. Only the general form of the equation has changed. We will copy the procedure box here and just change ‘direct’ to ‘inverse’.

Definition: SOLVE INVERSE VARIATION PROBLEMS

1. Write the formula for inverse variation.
2. Substitute the given values for the variables.
3. Solve for the constant of variation.
4. Write the equation that relates x and y.

Example 13.9.9.13

If y varies inversely with x and y=20 when x=8 x and y.

Answer

Write the formula for inverse variation.	$y = \frac{k}{x}$
Substitute the given values for the variables.	$y = 20$ when $x = 8$
	$20 = \frac{k}{8}$

Solve for the constant of variation.	$8(20) = 8\left(\frac{k}{8}\right)$
	$160 = k$
Write the equation that relates x and y.	$y = \frac{k}{x}$
Substitute in the constant of variation.	$y = \frac{160}{x}$

Example 13.9.9.14

If p varies inversely with q and p=30 when q=12 find the equation that relates p and q.

Answer

$p = \frac{360}{q}$

Example 13.9.9.15

If y varies inversely with x and y=8 when x=2 find the equation that relates x and y.

Answer

$y = \frac{16}{x}$

Example 13.9.9.16

The fuel consumption (mpg) of a car varies inversely with its weight. A car that weighs 3100 pounds gets 26 mpg on the highway.

1. Write the equation of variation.
2. What would be the fuel consumption of a car that weighs 4030 pounds?

Answer

1.

	The fuel consumption varies inversely with the weight.
First we will name the variables.	Let f= fuel consumption. w= weight.
Write the formula for inverse variation.	$y = \frac{k}{x}$
We will use f in place of y and w in place of x.	$f = \frac{k}{w}$
Substitute the given values for the variables.	$f = 26$ when $w = 3100$
	$26 = \frac{k}{3100}$
Solve for the constant of variation.	$3100(26) = 3100\left(\frac{k}{3100}\right)$
	$80{,}600 = k$
Write the equation that relates f and w.	$f = \frac{k}{w}$
Substitute in the constant of variation.	$f = \frac{80{,}600}{w}$

2.

	Find f when w=4030.
Write the equation that relates f and w.	$f = \frac{80{,}600}{w}$
Substitute the given value for w.	$f = \frac{80{,}600}{4030}$
Simplify.	f=20
	A car that weighs 4030 pounds would have fuel consumption of 20 mpg.

Example 13.9.9.17

A car's value varies inversely with its age. Elena bought a two-year-old car for $20,000.

1. Write the equation of variation.
2. What will be the value of Elena's car when it is 5 years old?

Answer

1. $v = \frac{40{,}000}{a}$
2. $8,000

Example 13.9.9.18

The time required to empty a pool varies inversely as the rate of pumping. It took Lucy 2.5 hours to empty her pool using a pump that was rated at 400 gpm (gallons per minute).

1. Write the equation of variation.
2. How long will it take her to empty the pool using a pump rated at 500 gpm?

Answer

1. $t = \frac{1000}{r}$
2. 2 hours

Example 13.9.9.19

The frequency of a guitar string varies inversely with its length. A 26” long string has a frequency of 440 vibrations per second.

1. Write the equation of variation.
2. How many vibrations per second will there be if the string’s length is reduced to 20” by putting a finger on a fret?

Answer

1.

	The frequency varies inversely with the length.
Name the variables.	Let f= frequency. L=length.
Write the formula for inverse variation.	$y = \frac{k}{x}$
We will use f in place of y and L in place of x	$f = \frac{k}{L}$
Substitute the given values for the variables.	$f = 440$ when $L = 26$
	$440 = \frac{k}{26}$
Solve for the constant of variation.	$26(440) = 26\left(\frac{k}{26}\right)$
	$11{,}440 = k$
Write the equation that relates f and L.	$f = \frac{k}{L}$
Substitute in the constant of variation.	$f = \frac{11{,}440}{L}$

2.

	Find f when L=20.
Write the equation that relates f and L.	$f = \frac{11{,}440}{L}$
Substitute the given value for L.	$f = \frac{11{,}440}{20}$
Simplify.	f=572
	A 20” guitar string has frequency 572 vibrations per second.

Example 13.9.9.20

The number of hours it takes for ice to melt varies inversely with the air temperature. Suppose a block of ice melts in 2 hours when the temperature is 65 degrees.

1. Write the equation of variation.
2. How many hours would it take for the same block of ice to melt if the temperature was 78 degrees?

Answer

1. $h = \frac{130}{t}$
2. $1\frac{2}{3}$ hours

Example 13.9.9.21

The force needed to break a board varies inversely with its length. Richard uses 24 pounds of pressure to break a 2-foot long board.

1. Write the equation of variation.
2. How many pounds of pressure is needed to break a 5-foot long board?

Answer

1. $F = \frac{48}{L}$
2. 9.6 pounds

13.9.9E: Exercises

Practice Makes Perfect

Solve Direct Variation Problems

In the following exercises, solve.

Example 13.9.9E.22

If y varies directly as x and y=14, when x=3, find the equation that relates x and y.

Answer

$y = \frac{14}{3}x$

Example 13.9.9E.23

If p varies directly as q and p=5, when q=2, find the equation that relates p and q.

Example 13.9.9E.24

If v varies directly as w and v=24, when w=8, find the equation that relates v and w.

Answer

v=3w

Example 13.9.9E.25

If a varies directly as b and a=16, when b=4, find the equation that relates a and b.

Example 13.9.9E.26

If p varies directly as q and p=9.6, when q=3, find the equation that relates p and q.

Answer

p=3.2q

Example 13.9.9E.27

If y varies directly as x and y=12.4, when x=4, find the equation that relates x and y.

Example 13.9.9E.28

If a varies directly as b and a=6, when $b = \frac{1}{3}$, find the equation that relates a and b.

Answer

a=18b

Example 13.9.9E.29

If v varies directly as w and v=8, when $w = \frac{1}{2}$, find the equation that relates v and w.

Exercise 13.9.9E.30

The amount of money Sally earns, P, varies directly with the number, n, of necklaces she sells. When Sally sells 15 necklaces she earns $150.

1. Write the equation that relates P and n.
2. How much money would she earn if she sold 4 necklaces?

Answer

1. P=10n
2. $40

Example 13.9.9E.31

The price, P, that Eric pays for gas varies directly with the number of gallons, g, he buys. It costs him $50 to buy 20 gallons of gas.

1. Write the equation that relates P and g.
2. How much would 33 gallons cost Eric?

Example 13.9.9E.32

Terri needs to make some pies for a fundraiser. The number of apples, a, varies directly with number of pies, p. It takes nine apples to make two pies.

1. Write the equation that relates a and p.
2. How many apples would Terri need for six pies?

Answer

1. a=4.5p
2. 27 apples

Example 13.9.9E.33

Joseph is traveling on a road trip. The distance, d, he travels before stopping for lunch varies directly with the speed, v, he travels. He can travel 120 miles at a speed of 60 mph.

1. Write the equation that relates d and v.
2. How far would he travel before stopping for lunch at a rate of 65 mph?

Example 13.9.9E.34

The price of gas that Jesse purchased varies directly to how many gallons he purchased. He purchased 10 gallons of gas for $39.80.

1. Write the equation that relates the price to the number of gallons.
2. How much will it cost Jesse for 15 gallons of gas?

Answer

1. p=3.98g
2. $59.70

Example 13.9.9E.35

The distance that Sarah travels varies directly to how long she drives. She travels 440 miles in 8 hours.

1. Write the equation that relates the distance to the number of hours.
2. How far can Sally travel in 6 hours?

Example 13.9.9E.36

The mass of a liquid varies directly with its volume. A liquid with mass 16 kilograms has a volume of 2 liters.

1. Write the equation that relates the mass to the volume.
2. What is the volume of this liquid if its mass is 128 kilograms?

Answer

1. m=8v
2. 16 liters

Example 13.9.9E.37

The length that a spring stretches varies directly with a weight placed at the end of the spring. When Sarah placed a 10 pound watermelon on a hanging scale, the spring stretched 5 inches.

1. Write the equation that relates the length of the spring to the weight.
2. What weight of watermelon would stretch the spring 6 inches?

Example 13.9.9E.38

The distance an object falls varies directly to the square of the time it falls. A ball falls 45 feet in 3 seconds.

1. Write the equation that relates the distance to the time.
2. How far will the ball fall in 7 seconds?

Answer

1. $d = 5t^2$
2. 245 feet

Example 13.9.9E.39

The maximum load a beam will support varies directly with the square of the diagonal of the beam's cross-section. A beam with diagonal 6 inch will support a maximum load of 108 pounds.

1. Write the equation that relates the load to the diagonal of the cross-section.
2. What load will a beam with a 10 inch diagonal support?

Example 13.9.9E.40

The area of a circle varies directly as the square of the radius. A circular pizza with a radius of 6 inches has an area of 113.04 square inches.

1. Write the equation that relates the area to the radius.
2. What is the area of a personal pizza with a radius 4 inches?

Answer

1. $A = 3.14r^2$
2. 50.24sq. in.

Example 13.9.9E.41

The distance an object falls varies directly to the square of the time it falls. A ball falls 72 feet in 3 seconds,

1. Write the equation that relates the distance to the time.
2. How far will the ball have fallen in 8 seconds?

Solve Inverse Variation Problems

In the following exercises, solve.

Example 13.9.9E.42

If y varies inversely with x and y=5 when x=4, find the equation that relates x and y.

Answer

$y = \frac{20}{x}$

Example 13.9.9E.43

If p varies inversely with q and p=2 when q=1, find the equation that relates p and q.

Example 13.9.9E.44

If v varies inversely with w and v=6 when $w = \frac{1}{2}$, find the equation that relates v and w.

Answer

$v = \frac{3}{w}$

Example 13.9.9E.45

If a varies inversely with b and a=12 when $b = \frac{1}{3}$, find the equation that relates a and b.

Write an inverse variation equation to solve the following problems.

Example 13.9.9E.46

The fuel consumption (mpg) of a car varies inversely with its weight. A Toyota Corolla weighs 2800 pounds and gets 33 mpg on the highway.

1. Write the equation that relates the mpg to the car's weight.
2. What would the fuel consumption be for a Toyota Sequoia that weighs 5500 pounds?

Answer

1. $g = \frac{92{,}400}{w}$
2. 16.8 mpg

Example 13.9.9E.47

A car's value varies inversely with its age. Jackie bought a 10 year old car for $2,400.

1. Write the equation that relates the car's value to its age.
2. What will be the value of Jackie's car when it is 15 years old ?

Example 13.9.9E.48

The time required to empty a tank varies inversely as the rate of pumping. It took Janet 5 hours to pump her flooded basement using a pump that was rated at 200 gpm (gallons per minute),

1. Write the equation that relates the number of hours to the pump rate.
2. How long would it take Janet to pump her basement if she used a pump rated at 400 gpm?

Answer

1. $t = \frac{1000}{r}$
2. 2.5 hours

Example 13.9.9E.49

The volume of a gas in a container varies inversely as pressure on the gas. A container of helium has a volume of 370 cubic inches under a pressure of 15 psi.

1. Write the equation that relates the volume to the pressure.
2. What would be the volume of this gas if the pressure was increased to 20 psi?

Example 13.9.9E.50

On a string instrument, the length of a string varies inversely as the frequency of its vibrations. An 11-inch string on a violin has a frequency of 400 cycles per second.

1. Write the equation that relates the string length to its frequency.
2. What is the frequency of a 10-inch string?

Answer

1. $L = \frac{4,400}{f}$
2. 440 cycles per second

Example 13.9.9E.51

Paul, a dentist, determined that the number of cavities that develops in his patient's mouth each year varies inversely to the number of minutes spent brushing each night. His patient, Lori, had 4 cavities when brushing her teeth 30 seconds (0.5 minutes) each night.

1. Write the equation that relates the number of cavities to the time spent brushing.
2. How many cavities would Paul expect Lori to have if she had brushed her teeth for 2 minutes each night?

Example 13.9.9E.52

The number of tickets for a sports fundraiser varies inversely to the price of each ticket. Brianna can buy 25 tickets at $5 each.

1. Write the equation that relates the number of tickets to the price of each ticket.
2. How many tickets could Brianna buy if the price of each ticket was $2.50?

Answer

1. $t = \frac{125}{p}$
2. 50 tickets

Example 13.9.9E.53

Boyle's Law states that if the temperature of a gas stays constant, then the pressure varies inversely to the volume of the gas. Braydon, a scuba diver, has a tank that holds 6 liters of air under a pressure of 220 psi.

1. Write the equation that relates pressure to volume.
2. If the pressure increases to 330 psi, how much air can Braydon's tank hold?

Mixed practice

Example 13.9.9E.54

If y varies directly as x and y=5, when x=3, find the equation that relates x and y.

Answer

$y = \frac{5}{3}x$

Example 13.9.9E.55

If v varies directly as w and v=21, when w=8, find the equation that relates v and w.

Example 13.9.9E.56

If p varies inversely with q and p=5 when q=6, find the equation that relates q and p.

Answer

$p = \frac{30}{q}$

Example 13.9.9E.57

If y varies inversely with x and y=11 when x=3, find the equation that relates x and y.

Example 13.9.9E.58

If p varies directly as q and p=10, when q=2, find the equation that relates p and q.

Answer

p=5q

Example 13.9.9E.59

If v varies inversely with w and v=18 when $w = \frac{1}{3}$, find the equation that relates v and w.

Example 13.9.9E.60

The force needed to break a board varies inversely with its length. If Tom uses 20 pounds of pressure to break a 1.5-foot long board, how many pounds of pressure would he need to use to break a 6 foot long board?

Answer

5 pounds

Example 13.9.9E.61

The number of hours it takes for ice to melt varies inversely with the air temperature. A block of ice melts in 2.5 hours when the temperature is 54 degrees. How long would it take for the same block of ice to melt if the temperature was 45 degrees?

Example 13.9.9E.62

The length a spring stretches varies directly with a weight placed at the end of the spring. When Meredith placed a 6-pound cantaloupe on a hanging scale, the spring stretched 2 inches. How far would the spring stretch if the cantaloupe weighed 9 pounds?

Answer

3 inches

Example 13.9.9E.63

The amount that June gets paid varies directly the number of hours she works. When she worked 15 hours, she got paid $111. How much will she be paid for working 18 hours?

Example 13.9.9E.64

The fuel consumption (mpg) of a car varies inversely with its weight. A Ford Focus weighs 3000 pounds and gets 28.7 mpg on the highway. What would the fuel consumption be for a Ford Expedition that weighs 5,500 pounds? Round to the nearest tenth.

Answer

15.6 mpg

Example 13.9.9E.65

The volume of a gas in a container varies inversely as the pressure on the gas. If a container of argon has a volume of 336 cubic inches under a pressure of 2,500 psi, what will be its volume if the pressure is decreased to 2,000 psi?

Example 13.9.9E.66

The distance an object falls varies directly to the square of the time it falls. If an object falls 52.8 feet in 4 seconds, how far will it fall in 9 seconds?

Answer

267.3 feet

Example 13.9.9E.67

The area of the face of a Ferris wheel varies directly with the square of its radius. If the area of one face of a Ferris wheel with diameter 150 feet is 70,650 square feet, what is the area of one face of a Ferris wheel with diameter of 16 feet?

Everyday Math

Example 13.9.9E.68

Ride Service It costs $35 for a ride from the city center to the airport, 14 miles away.

1. Write the equation that relates the cost, *c*, with the number of miles, *m*.
2. What would it cost to travel 22 miles with this service?

Answer

1. c=2.5m
2. $55

Example 13.9.9E.69

Road Trip The number of hours it takes Jack to drive from Boston to Bangor is inversely proportional to his average driving speed. When he drives at an average speed of 40 miles per hour, it takes him 6 hours for the trip.

1. Write the equation that relates the number of hours, *h*, with the speed, *s*.
2. How long would the trip take if his average speed was 75 miles per hour?

Writing Exercises

Example 13.9.9E.70

In your own words, explain the difference between direct variation and inverse variation.

Answer

Answers will vary.

Example 13.9.9E.71

Make up an example from your life experience of inverse variation.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve direct variation problems.			
solve inverse variation problems.			

ⓑ After looking at the checklist, do you think you are well-prepared for the next chapter? Why or why not?

13.9.10: Chapter 8 Review Exercises

Chapter Review Exercises

Simplify Rational Expressions

Determine the Values for Which a Rational Expression is Undefined

In the following exercises, determine the values for which the rational expression is undefined.

Exercise 13.9.10.1

$$\frac{2a+1}{3a-2}$$

Answer

$$a \neq \frac{2}{3}$$

Exercise 13.9.10.2

$$\frac{b-3}{b^2-16}$$

Exercise 13.9.10.3

$$\frac{3xy^2}{5y}$$

Answer

$$y \neq 0$$

Exercise 13.9.10.4

$$\frac{u-3}{u^2-u-30}$$

Evaluate Rational Expressions

In the following exercises, evaluate the rational expressions for the given values.

Exercise 13.9.10.5

$\frac{4p-1}{p^2+5}$ when $p=-1$

Answer

$$-\frac{5}{6}$$

Exercise 13.9.10.6

$\frac{q^2-5}{q+3}$ when $q=7$

Exercise 13.9.10.7

$\frac{y^2-8}{y^2-y-2}$ when $y=1$

Answer

$\frac{7}{2}$

Example 13.9.10.8

$\frac{z^2+2}{4z-z^2}$ when $z=3$

Simplify Rational Expressions

In the following exercises, simplify.

Exercise 13.9.10.9

$\frac{10}{24}$

Answer

$\frac{5}{12}$

Exercise 13.9.10.10

$\frac{8m^4}{16mn^3}$

Exercise 13.9.10.11

$\frac{14a-14}{a-1}$

Answer

14

Exercise 13.9.10.12

$\frac{b^2+7b+12}{b^2+8b+16}$

Simplify Rational Expressions with Opposite Factors

In the following exercises, simplify.

Exercise 13.9.10.13

$\frac{c^2-c-2}{4-c^2}$

Answer

$$-\frac{c+1}{c+2}$$

Exercise 13.9.10.14

$$\frac{d-16}{16-d}$$

Exercise 13.9.10.15

$$\frac{7v-35}{25-v^2}$$

Answer

$$-\frac{7}{5+v}$$

Exercise 13.9.10.16

$$\frac{w^2-3w-28}{49-w^2}$$

Multiply and Divide Rational Expressions

Multiply Rational Expressions

In the following exercises, multiply.

Exercise 13.9.10.17

$$\frac{3}{8}\cdot\frac{2}{15}$$

Answer

$$\frac{1}{20}$$

Exercise 13.9.10.18

$$\frac{2xy^2}{8y^3}\cdot\frac{16y}{24x}$$

Exercise 13.9.10.19

$$\frac{3a^2+21a}{a^2+6a-7}\cdot\frac{a-1}{ab}$$

Answer

$$\frac{3}{b}$$

Exercise 13.9.10.20

$$\frac{5z^2}{5z^2+40z+35}\cdot\frac{z^2-1}{3z}$$

Divide Rational Expressions

In the following exercises, divide.

Exercise 13.9.10.21

$$\frac{t^2-4t-12}{t^2+8t+12}\div\frac{t^2-36}{6t}$$

Answer

$$\frac{6t}{(t+6)^2}$$

Exercise 13.9.10.22

$$\frac{r^2-16}{4}\div\frac{r^3-64}{2r^2-8r+32}$$

Exercise 13.9.10.23

$$\frac{11+w}{w-9}\div\frac{121-w^2}{9-w}$$

Answer

$$\frac{1}{11+w}$$

Exercise 13.9.10.24

$$\frac{3y^2-12y-63}{4y+3}\div(6y^2-42y)$$

Exercise 13.9.10.25

$$\frac{\frac{c^2-64}{3c^2+26c+16}}{\frac{c^2-4c-32}{15c+10}}$$

Answer

$$5c+4$$

Exercise 13.9.10.26

$$\frac{8m^2-8m}{m-4}\cdot\frac{m^2+2m-24}{m^2+7m+10}\div\frac{2m^2-6m}{m+5}$$

Add and Subtract Rational Expressions with a Common Denominator

Add Rational Expressions with a Common Denominator

In the following exercises, add.

Exercise 13.9.10.27

$$\frac{3}{5}+\frac{2}{5}$$

Answer

1

Exercise 13.9.10.28

$$\frac{4a^2}{2a-1}-\frac{1}{2a-1}$$

Exercise 13.9.10.29

$$\frac{p^2+10p}{p+5}+\frac{25}{p+5}$$

Answer

$p+5$

Exercise 13.9.10.30

$$\frac{3x}{x-1}+\frac{2}{x-1}$$

Subtract Rational Expressions with a Common Denominator

In the following exercises, subtract.

Exercise 13.9.10.31

$$\frac{d^2}{d+4}-\frac{3d+28}{d+4}$$

Answer

$d-7$

Exercise 13.9.10.32

$$\frac{z^2}{z+10}-\frac{100}{z+10}$$

Exercise 13.9.10.33

$$\frac{4q^2-q+3}{q^2+6q+5}-\frac{3q^2+q+6}{q^2+6q+5}$$

Answer

$$\frac{q-3}{q+5}$$

Exercise 13.9.10.34

$$\frac{5t+4t+3}{t^2-25}-\frac{4t^2-8t-32}{t^2-25}$$

Add and Subtract Rational Expressions whose Denominators are Opposites

In the following exercises, add and subtract.

Exercise 13.9.10.35

$$\frac{18w}{6w-1}+\frac{3w-2}{1-6w}$$

Answer

$$\frac{15w+2}{6w-1}$$

Exercise 13.9.10.36

$$\frac{a^2+3a}{a^2-4}-\frac{3a-8}{4-a^2}$$

Exercise 13.9.10.37

$$\frac{2b^2+3b-15}{b^2-49}-\frac{b^2+16b-1}{49-b^2}$$

Answer

$$\frac{3b-2}{b+7}$$

Exercise 13.9.10.38

$$\frac{8y^2-10y+7}{2y-5}+\frac{2y^2+7y+2}{5-2y}$$

Add and Subtract Rational Expressions With Unlike Denominators

Find the Least Common Denominator of Rational Expressions

In the following exercises, find the LCD.

Exercise 13.9.10.38

$$\frac{4}{m^2-3m-10}, \quad \frac{2m}{m^2-m-20}$$

Answer

$$(m+2)(m-5)(m+4)$$

Exercise 13.9.10.39

$$\frac{6}{n^2-4}, \quad \frac{2n}{n^2-4n+4}$$

Exercise 13.9.10.40

$$\frac{5}{3p^2+17p-6}, \quad \frac{2m}{3p^2-23p-8}$$

Answer

$$(3p+1)(p+6)(p+8)$$

Find Equivalent Rational Expressions

In the following exercises, rewrite as equivalent rational expressions with the given denominator.

Exercise 13.9.10.41

Rewrite as equivalent rational expressions with denominator $(m+2)(m-5)(m+4)$

$$\frac{4}{m^2-3m-10}, \quad \frac{2m}{m^2-m-20}.$$

Exercise 13.9.10.42

Rewrite as equivalent rational expressions with denominator $(n-2)(n-2)(n+2)$

$$\frac{6}{n^2-4n+4}, \quad \frac{2n}{n^2-4}.$$

Answer

$$\frac{6n+12}{(n-2)(n-2)(n+2)}, \quad \frac{2n^2-4n}{(n-2)(n-2)(n+2)}$$

Exercise 13.9.10.43

Rewrite as equivalent rational expressions with denominator $(3p+1)(p+6)(p+8)$

$$\frac{5}{3p^2+19p+6}, \quad \frac{7p}{3p^2+25p+8}$$

Add Rational Expressions with Different Denominators

In the following exercises, add.

Exercise 13.9.10.44

$$\frac{2}{3}+\frac{3}{5}$$

Answer

$$\frac{19}{15}$$

Exercise 13.9.10.45

$$\frac{7}{5a}+\frac{3}{2b}$$

Exercise 13.9.10.46

$$\frac{2}{c-2}+\frac{9}{c+3}$$

Answer

$$\frac{11c-12}{(c-2)(c+3)}$$

Exercise 13.9.10.47

$$\frac{3d}{d^2-9}+\frac{5}{d^2+6d+9}$$

Exercise 13.9.10.48

$$\frac{2x}{x^2+10x+24}+\frac{3x}{x^2+8x+16}$$

Answer

$$\frac{5x^2+26x}{(x+4)(x+4)(x+6)}$$

Exercise 13.9.10.49

$$\frac{5q}{p^2q-p^2}+\frac{4q}{q^2-1}$$

Subtract Rational Expressions with Different Denominators

In the following exercises, subtract and add.

Exercise 13.9.10.50

$$\frac{3v}{v+2}-\frac{v+2}{v+8}$$

Answer

$$\frac{2(v^2+10v-2)}{(v+2)(v+8)}$$

Exercise 13.9.10.51

$$\frac{-3w-15}{w^2+w-20}-\frac{w+2}{4-w}$$

Exercise 13.9.10.52

$$\frac{7m+3}{m+2}-5$$

Answer

$$\frac{2m-7}{m+2}$$

Exercise 13.9.10.53

$$\frac{n}{n+3}+\frac{2}{n-3}-\frac{n-9}{n^2-9}$$

Exercise 13.9.10.54

$$\frac{8d}{d^2-64}-\frac{4}{d+8}$$

Answer

$$4d-8$$

Exercise 13.9.10.55

$$\frac{5}{12x^2y}+\frac{7}{20xy^3}$$

Simplify Complex Rational Expressions

Simplify a Complex Rational Expression by Writing it as Division

In the following exercises, simplify.

Exercise 13.9.10.56

$$\frac{\frac{5a}{a+2}}{\frac{10a^2}{a^2-4}}$$

Answer

$$\frac{a-2}{2a}$$

Exercise 13.9.10.57

$$\frac{\frac{2}{5}+\frac{5}{6}}{\frac{1}{3}+\frac{1}{4}}$$

Exercise 13.9.10.58

$$\frac{x-\frac{3x}{x+5}}{\frac{1}{x+5}+\frac{1}{x-5}}$$

Answer

$$\frac{(x-8)(x-5)}{2}$$

Exercise 13.9.10.59

$$\frac{\frac{2}{m}+\frac{m}{n}}{\frac{n}{m}-\frac{1}{n}}$$

Simplify a Complex Rational Expression by Using the LCD

In the following exercises, simplify.

Exercise 13.9.10.60

$$\frac{6+\frac{2}{q-4}}{\frac{5}{q}+4}$$

Answer

$$\frac{(q-2)(q+4)}{5(q-4)}$$

Exercise 13.9.10.61

$$\frac{\frac{3}{a^2}-\frac{1}{b}}{\frac{1}{a}+\frac{1}{b^2}}$$

Exercise 13.9.10.62

$$\frac{\frac{2}{z^2-49}+\frac{1}{z+7}}{\frac{9}{z+7}+\frac{12}{z-7}}$$

Answer

$$\frac{z-5}{21z+21}$$

Exercise 13.9.10.63

$$\frac{\frac{3}{y^2-4y-32}}{\frac{2}{y-8}+\frac{1}{y+4}}$$

Solve Rational Equations

Solve Rational Equations

In the following exercises, solve.

Exercise 13.9.10.64

$$\frac{1}{2}+\frac{2}{3}=\frac{1}{x}$$

Answer

$$\frac{6}{7}$$

Exercise 13.9.10.65

$$1-\frac{2}{m}=\frac{8}{m^2}$$

Exercise 13.9.10.66

$$\frac{1}{b-2}+\frac{1}{b+2}=\frac{3}{b^2-4}$$

Answer

$$\frac{3}{2}$$

Exercise 13.9.10.67

$$\frac{3}{q+8}-\frac{2}{q-2}=1$$

Exercise 13.9.10.68

$$\frac{v-15}{v^2-9v+18}=\frac{4}{v-3}+\frac{2}{v-6}$$

Answer

no solution

Exercise 13.9.10.69

$$\frac{z}{12}+\frac{z+3}{3z}=\frac{1}{z}$$

Solve a Rational Equation for a Specific Variable

In the following exercises, solve for the indicated variable.

Exercise 13.9.10.70

$\frac{V}{l} = hw$ for l

Answer

$$l = \frac{V}{hw}$$

Exercise 13.9.10.71

$\frac{1}{x} - \frac{2}{y} = 5$ for y

Exercise 13.9.10.72

$x = \frac{y+5}{z-7}$ for z

Answer

$$z = \frac{y+5+7x}{x}$$

Exercise 13.9.10.73

$P = \frac{k}{V}$ for V

Solve Proportion and Similar Figure Applications Similarity

Solve Proportions

In the following exercises, solve.

Exercise 13.9.10.74

$\frac{x}{4} = \frac{3}{5}$

Answer

$$\frac{12}{5}$$

Exercise 13.9.10.75

$\frac{3}{y} = \frac{9}{5}$

Exercise 13.9.10.76

$$\frac{s}{s+20}=\frac{3}{7}$$

Answer

15

Exercise 13.9.10.77

$$\frac{t-3}{5}=\frac{t+2}{9}$$

In the following exercises, solve using proportions.

Exercise 13.9.10.78

Rachael had a 21 ounce strawberry shake that has 739 calories. How many calories are there in a 32 ounce shake?

Answer

1161 calories

Exercise 13.9.10.79

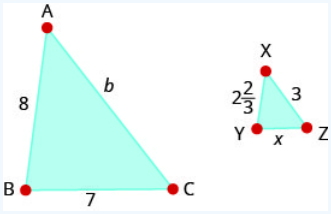
Leo went to Mexico over Christmas break and changed $525 dollars into Mexican pesos. At that time, the exchange rate had $1 US is equal to 16.25 Mexican pesos. How many Mexican pesos did he get for his trip?

Solve Similar Figure Applications

In the following exercises, solve.

Exercise 13.9.10.80

ΔABC is similar to ΔXYZ. The lengths of two sides of each triangle are given in the figure. Find the lengths of the third sides.



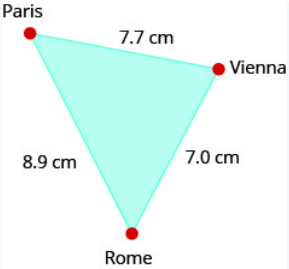
Answer

$b=9;\ x=2\frac{1}{3}$

Exercise 13.9.10.81

On a map of Europe, Paris, Rome, and Vienna form a triangle whose sides are shown in the figure below. If the actual distance from Rome to Vienna is 700 miles, find the distance from

1. a. Paris to Rome
2. b. Paris to Vienna



Exercise 13.9.10.82

Tony is 5.75 feet tall. Late one afternoon, his shadow was 8 feet long. At the same time, the shadow of a nearby tree was 32 feet long. Find the height of the tree.

Answer

23 feet

Exercise 13.9.10.83

The height of a lighthouse in Pensacola, Florida is 150 feet. Standing next to the statue, 5.5 foot tall Natalie cast a 1.1 foot shadow How long would the shadow of the lighthouse be?

Solve Uniform Motion and Work Applications Problems

Solve Uniform Motion Applications

In the following exercises, solve.

Exercise 13.9.10.84

When making the 5-hour drive home from visiting her parents, Lisa ran into bad weather. She was able to drive 176 miles while the weather was good, but then driving 10 mph slower, went 81 miles in the bad weather. How fast did she drive when the weather was bad?

Answer

45 mph

Exercise 13.9.10.85

Mark is riding on a plane that can fly 490 miles with a tailwind of 20 mph in the same time that it can fly 350 miles against a tailwind of 20 mph. What is the speed of the plane?

Exercise 13.9.10.86

John can ride his bicycle 8 mph faster than Luke can ride his bike. It takes Luke 3 hours longer than John to ride 48 miles. How fast can John ride his bike?

Answer

16 mph

Exercise 13.9.10.87

Mark was training for a triathlon. He ran 8 kilometers and biked 32 kilometers in a total of 3 hours. His running speed was 8 kilometers per hour less than his biking speed. What was his running speed?

Solve Work Applications

In the following exercises, solve.

Exercise 13.9.10.88

Jerry can frame a room in 1 hour, while Jake takes 4 hours. How long could they frame a room working together?

Answer

$\frac{4}{5}$ hour

Exercise 13.9.10.89

Lisa takes 3 hours to mow the lawn while her cousin, Barb, takes 2 hours. How long will it take them working together?

Exercise 13.9.10.90

Jeffrey can paint a house in 6 days, but if he gets a helper he can do it in 4 days. How long would it take the helper to paint the house alone?

Answer

12 days

Exercise 13.9.10.91

Sue and Deb work together writing a book that takes them 90 days. If Sue worked alone it would take her 120 days. How long would it take Deb to write the book alone?

Use Direct and Inverse Variation

Solve Direct Variation Problems

In the following exercises, solve.

Exercise 13.9.10.92

If y varies directly as x, when $y = 9$ and $x = 3$, find x when $y = 21$.

Answer

7

Exercise 13.9.10.93

If y varies directly as x, when $y = 20$ and $x = 2$, find y when $x = 4$.

Exercise 13.9.10.94

If m varies inversely with the square of n, when $m = 4$ and $n = 6$, find m when $n = 2$.

Answer

36

Exercise 13.9.10.95

Vanessa is traveling to see her fiancé. The distance, d, varies directly with the speed, v, she drives. If she travels 258 miles driving 60 mph, how far would she travel going 70 mph?

Exercise 13.9.10.96

If the cost of a pizza varies directly with its diameter, and if an 8” diameter pizza costs $\$12$, how much would a 6” diameter pizza cost?

Answer

$\$9$

Exercise 13.9.10.97

The distance to stop a car varies directly with the square of its speed. It takes 200 feet to stop a car going 50 mph. How many feet would it take to stop a car going 60 mph?

Solve Inverse Variation Problems

In the following exercises, solve.

Exercise 13.9.10.98

The number of tickets for a music fundraiser varies inversely with the price of the tickets. If Madelyn has just enough money to purchase 12 tickets for $\$6$, how many tickets can Madelyn afford to buy if the price increased to $\$8$?

Answer

97 tickets

Exercise 13.9.10.99

On a string instrument, the length of a string varies inversely with the frequency of its vibrations. If an 11-inch string on a violin has a frequency of 360 cycles per second, what frequency does a 12-inch string have?

Practice Test

In the following exercises, simplify.

Exercise 13.9.10.1

$\dfrac{3a^2b}{6ab^2}$

Answer

$\dfrac{a}{2b}$

Exercise 13.9.10.2

$$\frac{5b-25}{b^2-25}$$

In the following exercises, perform the indicated operation and simplify.

Exercise 13.9.10.3

$$\frac{4x}{x+2}\cdot\frac{x^2+5x+6}{12x^2}$$

Answer

$$\frac{x+3}{3x}$$

Exercise 13.9.10.4

$$\frac{5y}{4y-8}\cdot\frac{y^2-4}{10}$$

Exercise 13.9.10.5

$$\frac{4p}{q}+\frac{5}{p}$$

Answer

$$\frac{4+5q}{pq}$$

Exercise 13.9.10.6

$$\frac{1}{z-9}-\frac{3}{z+9}$$

Exercise 13.9.10.7

$$\frac{\frac{2}{3}+\frac{3}{5}}{\frac{2}{5}}$$

Answer

$$\frac{19}{16}$$

Exercise 13.9.10.8

$$\frac{\frac{1}{m}-\frac{1}{n}}{\frac{1}{n}+\frac{1}{m}}$$

In the following exercises, solve each equation.

Exercise 13.9.10.9

$$\frac{1}{2}+\frac{2}{7}=\frac{1}{x}$$

Answer

$$x=\frac{14}{11}$$

Exercise 13.9.10.10

$$\frac{5}{y-6}=\frac{3}{y+6}$$

Exercise 13.9.10.11

$$\frac{1}{z-5}+\frac{1}{z+5}=\frac{1}{z^2-25}$$

Answer

$$z=\frac{1}{2}$$

Exercise 13.9.10.12

$$\frac{t}{4}=\frac{3}{5}$$

Exercise 13.9.10.13

$$\frac{2}{r-2}=\frac{3}{r-1}$$

Answer

$$r=4$$

In the following exercises, solve.

Exercise 13.9.10.14

If y varies directly with x, and $x=5$ when $y=30$, find x when $y=42$.

Exercise 13.9.10.15

If y varies inversely with x and $x=6$ when $y=20$, find y when $x=2$.

Answer

$$y=60$$

Exercise 13.9.10.16

If y varies inversely with the square of x and $x=3$ when $y=9$, find y when $x=4$.

Exercise 13.9.10.17

The recommended erythromycin dosage for dogs, is 5 mg for every pound the dog weighs. If Daisy weighs 25 pounds, how many milligrams of erythromycin should her veterinarian prescribe?

Answer

125 mg

Exercise 13.9.10.18

Julia spent 4 hours Sunday afternoon exercising at the gym. She ran on the treadmill for 10 miles and then biked for 20 miles. Her biking speed was 5 mph faster than her running speed on the treadmill. What was her running speed?

Exercise 13.9.10.19

Kurt can ride his bike for 30 miles with the wind in the same amount of time that he can go 21 miles against the wind. If the wind's speed is 6 mph, what is Kurt's speed on his bike?

Answer

14 mph

Exercise 13.9.10.20

Amanda jogs to the park 8 miles using one route and then returns via a 14-mile route. The return trip takes her 1 hour longer than her jog to the park. Find her jogging rate.

Exercise 13.9.10.21

An experienced window washer can wash all the windows in Mike's house in 2 hours, while a new trainee can wash all the windows in 7 hours. How long would it take them working together?

Answer

$1\frac{5}{9}$ hour

Exercise 13.9.10.22

Josh can split a truckload of logs in 8 hours, but working with his dad they can get it done in 3 hours. How long would it take Josh's dad working alone to split the logs?

Exercise 13.9.10.23

The price that Tyler pays for gas varies directly with the number of gallons he buys. If 24 gallons cost him \$59.76, what would 30 gallons cost?

Answer

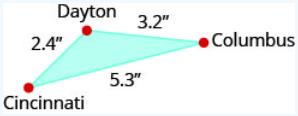
\$74.70

Exercise 13.9.10.24

The volume of a gas in a container varies inversely with the pressure on the gas. If a container of nitrogen has a volume of 29.5 liters with 2000 psi, what is the volume if the tank has a 14.7 psi rating? Round to the nearest whole number.

Exercise 13.9.10.25

The cities of Dayton, Columbus, and Cincinnati form a triangle in southern Ohio, as shown on the figure below, that gives the map distances between these cities in inches.



The actual distance from Dayton to Cincinnati is 48 miles. What is the actual distance between Dayton and Columbus?

Answer

64 miles

This page titled 13.9.10: Chapter 8 Review Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

13.E: Review Exercises 2

Exercise 13.E.1

Evaluate

1. Given $f(x) = 2x^2 - x + 6$, find $f(-3)$, $f(0)$, and $f(10)$.
2. Given $g(x) = -x^2 + 4x - 1$, find $g(-1)$, $g(0)$, and $g(3)$.
3. Given $h(t) = -t^3 - 2t^2 + 3$, find $h(-3)$, $h(0)$, and $h(2)$.
4. Given $p(x) = x^4 - 2x^2 + x$, find $p(-1)$, $p(0)$, and $p(2)$.
5. The following graph gives the height $h(t)$ in feet of a projectile over time t in seconds

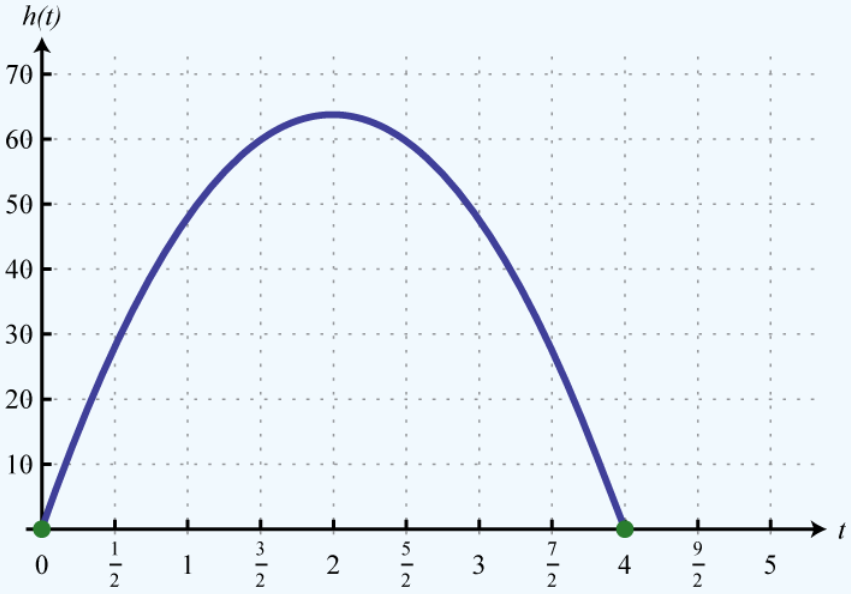

Figure 4.E.1

(a) Use the graph to determine the height of the projectile at 2.5 seconds.

(b) At what time does the projectile reach its maximum height?

(c) How long does it take the projectile to return to the ground?

6. Given the graph of the function f, find $f(-9)$, $f(-3)$, and $f(12)$.

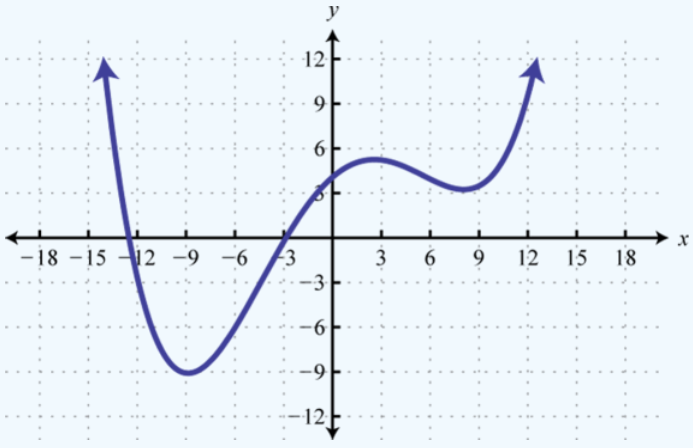

Figure 4.E.2

7. From the ground, a bullet is fired straight up into the air at 340 meters per second. Ignoring the effects of air friction, write a function that models the height of the bullet and use it to calculate the bullet's height after one-quarter of a second. (Round off to the nearest meter.)

8. An object is tossed into the air at an initial speed of 30 feet per second from a rooftop 10 feet high. Write a function that models the height of the object and use it to calculate the height of the object after 1 second.

Answer

1. $f(-3)=27; f(0)=6; f(10)=196$
3. $h(-3)=12; h(0)=3; h(2)=-13$
5. (a) 60 feet; (b) 2 seconds; (c) 4 seconds
7. $h(t)=-4.9t^2+340t$; at 0.25second, the bullet's height is about 85 meters.

Exercise $13.E.2$

Perform the operations.

1. Given $f(x)=5x^2-3x+1$ and $g(x)=2x^2-x-1$, find $(f+g)(x)$.
2. Given $f(x)=x^2+3x-8$ and $g(x)=x^2-5x-7$, find $(f-g)(x)$.
3. Given $f(x)=3x^2-x+2$ and $g(x)=2x-3$, find $(f\cdot g)(x)$.
4. Given $f(x)=27x^5-15x^3-3x^2$ and $g(x)=3x^2$, find $(f/g)(x)$.
5. Given $g(x)=x^2-x+1$, find $g(-3u)$.
6. GIven $g(x)=x^3-1$, find $g(x-1)$.

Answer

1. $(f+g)(x)=7x^2-4x$
3. $(f\cdot g)(x)=6x^3-11x^2+7x-6$
5. $g(-3u)=9u^2+3u+1$

Exercise $13.E.3$

Given $f(x)=16x^3-12x^2+4x, g(x)=x^2-x+1$, and $h(x)=4x$, find the following:

1. $(g\cdot h)(x)$
2. $(f-g)(x)$
3. $(g+f)(x)$
4. $(f/h)(x)$
5. $(f\cdot h)(-1)$
6. $(g+h)(-3)$
7. $(g-f)(2)$
8. $(f/h)\left(\frac{3}{2}\right)$

Answer

1. $(g\cdot h)(x)=4x^3-4x^2+4x$
3. $(g+f)(x)=16x^3-11x^2+3x+1$
5. $(f\cdot h)(-1)=128$
7. $(g-f)(2)=-85$

Exercise $13.E.4$

Factor our the greatest common factor (GCF).

1. $2x^4-12x^3-2x^2$
2. $18a^3b-3a^2b^2+3ab^3$

3. $x^4y^3 - 3x^3y + x^2y$
4. $x^{3n} - x^{2n} - x^n$

Answer

1. $2x^2\left(x^2 - 6x - 1\right)$
3. $x^2y\left(x^2y^2 - 3x + 1\right)$

Exercise 13.E.5

Factor by grouping.

1. $2x^3 - x^2 + 2x - 1$
2. $3x^3 - x^2 - 6x + 2$
3. $x^3 - 5x^2y + xy^2 - 5y^3$
4. $a^2b - a + ab^3 - b^2$
5. $2x^4 - 4xy^3 + 2x^2y^2 - 4x^3y$
6. $x^4y^2 - xy^5 + x^3y^4 - x^2y^3$

Answer

1. $\left(x^2 + 1\right)(2x - 1)$
3. $\left(x^2 + y^2\right)(x - 5y)$
5. $2x(x - 2y)\left(x^2 + y^2\right)$

Exercise 13.E.6

Factor the special binomials.

1. $64x^2 - 1$
2. $9 - 100y^2$
3. $x^2 - 36y^2$
4. $4 - (2x - 1)^2$
5. $a^3b^3 + 125$
6. $64x^3 - y^3$
7. $81x^4 - y^4$
8. $x^8 - 1$
9. $x^6 - 64y^6$
10. $1 - a^6b^6$

Answer

1. $(8x + 1)(8x - 1)$
3. $(x + 6y)(x - 6y)$
5. $(ab + 5)\left(a^2b^2 - 5ab + 25\right)$
7. $\left(9x^2 + y^2\right)(3x + y)(3x - y)$
9. $(x + 2y)\left(x^2 - 2xy + 4y^2\right)(x - 2y)\left(x^2 + 2xy + 4y^2\right)$

Exercise 13.E.7

Factor.

1. $x^2 - 8x - 48$
2. $x^2 - 15x + 54$

3. x^2-4x-6
4. $x^2-12xy+36y^2$
5. $x^2+20xy+75y^2$
6. $-x^2+5x+150$
7. $-2y^2+20y+48$
8. $28x^2+20x+3$
9. $150x^2-100x+6$
10. $24a^2-38ab+3b^2$
11. $27u^2-3uv-4v^2$
12. $16x^2y^2-78xy+27$
13. $16m^2+72mn+81n^2$
14. $4x^2-5x+20$
15. $25x^4-35x^2+6$
16. $2x^4+7x^2+3$
17. $x^6+3x^3y^3-10y^6$
18. $a^6-8a^3b^3+15b^6$
19. $x^{2n}-2x^n+1$
20. $6x^{2n}-x^n-2$

Answer

1. $(x-12)(x+4)$
3. Prime
5. $(x+5y)(x+15y)$
7. $-2(y-12)(y+2)$
9. $2(15x-1)(5x-3)$
11. $(3u+v)(9u-4v)$
13. $(4m+9n)^2$
15. $\left(5x^2-6\right)\left(5x^2-1\right)$
17. $\left(x^3+5y^3\right)\left(x^3-2y^3\right)$
19. $\left(x^n-1\right)^2$

Exercise 13.E.8

Factor completely.

1. $45x^3-20x$
2. $12x^4-70x^3+50x^2$
3. $-20x^2+32x-3$
4. $-x^3y+9xy^3$
5. $24a^4b^2+3ab^5$
6. $64a^6b^6-1$
7. $64x^2+1$
8. $x^3+x^2y-xy^2-y^3$

Answer

1. $5x(3x+2)(3x-2)$
3. $-(10x-1)(2x-3)$
5. $3ab^2(2a+b)\left(4a^2-2ab+b^2\right)$

7. Prime

Exercise 13.E.9

Solve by factoring.

1. $9x^2+8x=0$
2. $x^2-1=0$
3. $x^2-12x+20=0$
4. $x^2-2x-48=0$
5. $(2x+1)(x-2)=3$
6. $2-(x-4)^2=-7$
7. $(x-6)(x+3)=-18$
8. $(x+5)(2x-1)=3(2x-1)$
9. $\frac{1}{2}x^2+\frac{2}{3}x-\frac{1}{8}=0$
10. $\frac{1}{4}x^2-\frac{19}{12}x+\frac{1}{2}=0$
11. $x^3-2x^2-24x=0$
12. $x^4-5x^2+4=0$

Answer

1. $-\frac{8}{9}, 0$
3. $2, 10$
5. $-1, \frac{5}{2}$
7. $0, 3$
9. $-\frac{3}{2}, \frac{1}{6}$
11. $-4, 0, 6$

Exercise 13.E.10

Find the roots of the given functions.

1. $f(x)=12x^2-8x$
2. $g(x)=2x^3-18x$
3. $h(t)=-16t^2+64$
4. $p(x)=5x^2-21x+4$
5.

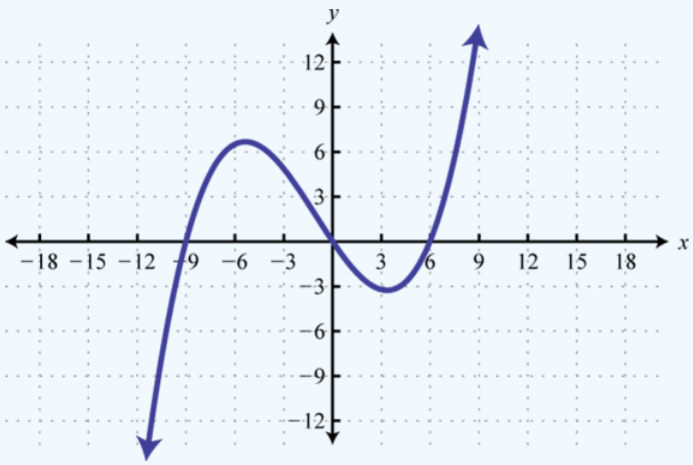

Figure 4.E.3

https://math.libretexts.org/@go/page/46396

6.

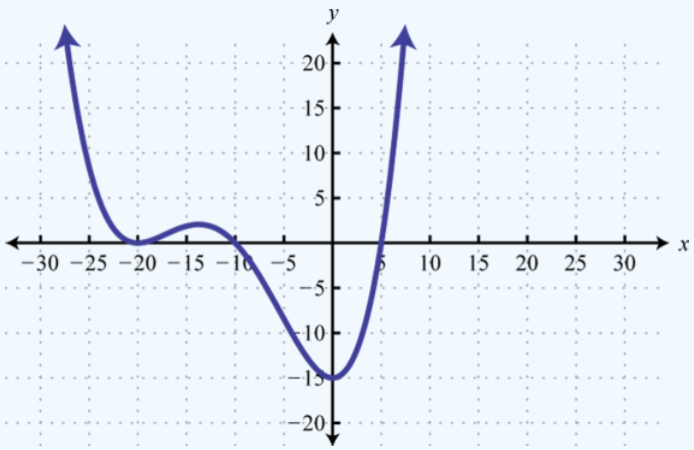

Figure 4.E.4

7. The height in feet of an object dropped from the top of a 16-foot ladder is given by $h(t) = -16t^2 + 16$, where t represents the time in seconds after the object has been dropped. How long will it take to hit the ground?

8. The length of a rectangle is 2 centimeters less than twice its width. If the area of the rectangle is 112 square centimeters, find its dimensions.

9. A triangle whose base is equal in measure to its height has an area of 72 square inches. Find the length of the base.

10. A box can be made by cutting out the corners and folding up the edges of a sheet of cardboard. A template for a rectangular cardboard box of height 2 inches is given.

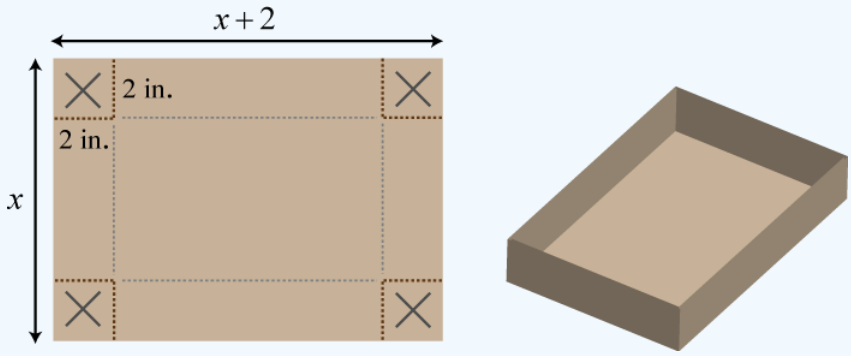

Figure 4.E.5

What are the dimensions of a cardboard sheet that will make a rectangular box with volume 240 cubic inches?

Answer

1. $0, \frac{2}{3}$
3. ± 2
5. $-9, 0, 6$
7. 1 second
9. 12 inches

Exercise 13.E.11

Solve or factor.

1. $x^2 - 25$
2. $x^2 - 121 = 0$
3. $16x^2 - 22x - 3 = 0$

4. $3x^2 - 14x - 5$
5. $x^3 - x^2 - 2x - 2$
6. $3x^2 = -15x$

Answer

1. Factor; $(x+5)(x-5)$
3. Solve; $-\frac{1}{8}, \frac{3}{2}$
5. Factor; $(x-1)\left(x^2-2\right)$

Exercise 13.E.12

Find a polynomial equation with integer coefficients, given the solutions.

1. $5, -2$
2. $\frac{2}{3}, -\frac{1}{2}$
3. $\pm\frac{4}{5}$
4. ± 10
5. $-4, 0, 3$
6. -8 double root

Answer

1. $x^2 - 3x - 10 = 0$
3. $25x^2 - 16 = 0$
5. $x^3 + x^2 - 12x = 0$

Exercise 13.E.13

State the restrictions and simplify.

1. $\frac{108x^3}{12x^2}$
2. $\frac{56x^2(x-2)^2}{8x(x-2)^3}$
3. $\frac{64-x^2}{2x^2-15x-8}$
4. $\frac{3x^2+28x+9}{81-x^2}$
5. $\frac{x^2-25}{5x^2} \cdot \frac{10x^2-15x}{2x^2+7x-15}$
6. $\frac{7x^2-41x-6}{(x-7)^2} \cdot \frac{49-x^2}{x^2+x-42}$
7. $\frac{28x^2(2x-3)}{4x^2-9} \div \frac{7x}{4x^2-12x+9}$
8. $\frac{x^2-10x+24}{x^2-8x+16} \div \frac{2x^2-13x+6}{x^2+2x-24}$

Answer

1. $9x; x \neq 0$
3. $-\frac{x+8}{2x+1}; x \neq -\frac{1}{2}, 8$
5. $\frac{x-5}{x}; x \neq -5, 0, \frac{3}{2}$
7. $\frac{4x(2x-3)^2}{2x+3}; x \neq \pm\frac{3}{2}, 0$

https://math.libretexts.org/@go/page/46396

Exercise 13.E.14

Perform the operations and simplify. Assume all variable expressions in the denominator are nonzero.

1. $\frac{a^2-b^2}{4a^2b^2+4ab^3} \cdot \frac{2ab}{a^2-2ab+b^2}$
2. $\frac{a^2-5ab+6b^2}{a^2-4ab+4b^2} \div \frac{9b^2-a^2}{3a^3b-6a^2b^2}$
3. $\frac{x^2+xy+y^2}{4x^2+3xy-y^2} \cdot \frac{x^2-y^2}{x^3-y^3} \div \frac{x+y}{12x^2y-3xy^2}$
4. $\frac{x^4-y^4}{x^2-2xy+y^2} \div \frac{x^2-4xy-5y^2}{10x^3} \cdot \frac{2x^2-11xy+5y^2}{2x^3y+2xy^3}$

Answer

1. $\frac{1}{2b(a-b)}$
3. $\frac{3xy}{x+y}$

Exercise 13.E.15

Perform the operations and state the restrictions.

1. Given $f(x)=\frac{4x^2+39x-10}{x^2+3x-10}$ and $g(x)=\frac{2x^2+7x-15}{x^2+13x+30}$, find $(f \cdot g)(x)$.
2. Given $f(x)=\frac{25-x^2}{3+x}$ and $g(x)=\frac{9-x^2}{5-x}$, find $(f \cdot g)(x)$.
3. Given $f(x)=\frac{42x^2}{2x^2+3x-2}$ and $g(x)=\frac{14x}{4x^2-4x+1}$, find $(f/g)(x)$.
4. Given $f(x)=\frac{x^2-20x+100}{x^2-1}$ and $g(x)=\frac{x^2-100}{x^2+2x+1}$, find $(f/g)(x)$.
5. The daily cost in dollars of running a small business is given by $C(x)=150+45x$ where x represents the number of hours the business is in operation. Determine the average cost per hour if the business is in operation for 8 hours in a day.
6. An electric bicycle manufacturer has determined that the cost of producing its product in dollars is given by the function $C(n)=2n^2+100n+2,500$ where n represents the number of electric bicycles produced in a day. Determine the average cost per bicycle if 10 and 20 are produced in a day.
7. Given $f(x)=3x-5$, simplify $\frac{f(x+h)-f(x)}{h}$.
8. Given $g(x)=2x^2-x+1$, simplify $\frac{g(x+h)-g(x)}{h}$.

Answer

1. $(f \cdot g)(x)=\frac{(4x-1)(2x-3)}{(x-2)(x+3)}; x \neq -10, -5, -3, 2$
3. $(f/g)(x)=\frac{3x(2x-1)}{x+2}; x \neq -2, 0, \frac{1}{2}$
5. $\$63.75$per hour
7. 3

Exercise 13.E.16

State the restrictions and simplify.

1. $\frac{5x-6}{x^2-36}-\frac{4x}{x^2-36}$
2. $\frac{2}{x}+5x$
3. $\frac{5}{x-5}+\frac{1}{2x}$
4. $\frac{x}{x-2}+\frac{3}{x+3}$
5. $\frac{7(x-1)}{4x^2-17x+15}-\frac{2}{x-3}$
6. $\frac{5}{x}-\frac{19x+25}{2x^2+5x}$
7. $\frac{x}{x-5}-\frac{2}{x-3}-\frac{5(x-3)}{x^2-8x+15}$

8. $\frac{3x}{2x-1}-\frac{x-4}{x+4}+\frac{12(2-x)}{2x^2+7x-4}$
9. $\frac{1}{t-1}+\frac{1}{(t-1)^2}-\frac{1}{t^2-1}$
10. $\frac{1}{t-1}-\frac{2t-5}{t^2-2t+1}-\frac{5t^2-3t-2}{(t-1)^3}$
11. $2x^{-1}+x^{-2}$
12. $(x-4)^{-1}-2x^{-2}$

Answer

1. $\frac{1}{x+6}; x \neq \pm 6$
3. $\frac{11x-5}{2x(x-5)}; x \neq 0, 5$
5. $-\frac{1}{4x-5}; x \neq \frac{5}{4}, 3$
7. $\frac{x-5}{x-3}; x \neq 3, 5$
9. $\frac{t^2+1}{(t+1)(t-1)^2}; t \neq \pm 1$
11. $\frac{2x+1}{x^2}; x \neq 0$

Exercise 13.E.17

Simplify. Assume that all variable expressions used as denominators are nonzero.

1. $\frac{\frac{1}{7}+\frac{1}{x}}{\frac{1}{49}-\frac{1}{x^2}}$
2. $\frac{\frac{1}{100}-\frac{1}{x^2}}{\frac{1}{x}-\frac{1}{10}}$
3. $\frac{\frac{3}{x}-\frac{1}{x-5}}{\frac{5}{x+2}-\frac{2}{x}}$
4. $\frac{1-\frac{12}{x}+\frac{35}{x^2}}{1-\frac{25}{x^2}}$
5. $\frac{x-4x^{-1}}{2-5x^{-1}+2x^{-2}}$
6. $\frac{8x^{-1}+y^{-1}}{y^{-2}-64x^{-2}}$

Answer

1. $\frac{7x}{x-7}$
3. $\frac{(x+2)(2x-15)}{(x-5)(3x-4)}$
5. $\frac{x(x+2)}{2x-1}$

Exercise 13.E.18

Perform the operations and state the restrictions.

1. Given $f(x)=\frac{3}{x-3}$ and $g(x)=\frac{x-2}{x+2}$, find $(f+g)(x)$.
2. Given $f(x)=\frac{1}{x^2+x}$ and $g(x)=\frac{2x}{x^2-1}$, find $(f+g)(x)$.
3. Given $f(x)=\frac{x-3}{x-5}$ and $g(x)=\frac{x^2-x}{x^2-25}$, find $(f-g)(x)$.
4. Given $f(x)=\frac{11x+4}{x^2-2x-8}$ and $g(x)=\frac{2x}{x-4}$, find $(f-g)(x)$.

Answer

1. $(f+g)(x)=\frac{x^2-2x+12}{(x-3)(x+2)}; x\neq -2,3$

3. $(f-g)(x)=\frac{3}{x+5}; x\neq \pm 5$

Exercise 13.E.19

Solve.

1. $\frac{3}{x}=\frac{1}{2x+15}$
2. $\frac{x}{x-4}=\frac{x+8}{x-8}$
3. $\frac{x+5}{2(x+2)}+\frac{x-2}{x+4}=1$
4. $\frac{2x}{x-5}+\frac{1}{x+1}=0$
5. $\frac{x+1}{x-4}+\frac{4}{x+6}=-\frac{10}{x^2+2x-24}$
6. $\frac{2}{x}-\frac{12}{2x+3}=\frac{2-3x^2}{2x^2+3x}$
7. $\frac{x+7}{x-2}-\frac{9}{x+7}=\frac{81}{x^2+5x-14}$
8. $\frac{x}{x+5}+\frac{1}{x-4}=\frac{4x-7}{x^2+x-20}$
9. $\frac{2}{3x-1}+\frac{x}{2x+1}=\frac{2(3-4x)}{6x^2+x-1}$
10. $\frac{x}{x-1}+\frac{1}{x+1}=\frac{2x}{x^2-1}$
11. $\frac{2x}{x+5}-\frac{1}{2x-3}=\frac{4-7x}{2x^2+7x-15}$
12. $\frac{x}{x+4}+\frac{1}{2x+7}=\frac{x+8}{2x^2+15x+28}$
13. $\frac{1}{t-1}-\frac{2}{2t+1}=\frac{1}{t-2}-\frac{2}{2t-1}$
14. $\frac{t-1}{t-2}-\frac{t-2}{t-3}=\frac{t-3}{t-4}-\frac{t-4}{t-5}$
15. Solve for a : $\frac{1}{a}=\frac{1}{b}-\frac{1}{c}$
16. Solve for y : $x=\frac{3y-1}{y-5}$
17. A positive integer is 4 less than another. If the reciprocal of the larger integer is subtracted from twice the reciprocal of the smaller, the result is $\frac{1}{6}$. Find the two integers.
18. If 3 times the reciprocal of the larger of two consecutive odd integers is added to 7 times the reciprocal of the smaller, the result is $\frac{4}{3}$. Find the integers.
19. If the reciprocal of the smaller of two consecutive integers is subtracted from three times the reciprocal of the larger, the result is $\frac{3}{10}$. Find the integers.
20. A positive integer is twice that of another. The sum of the reciprocals of the two positive integers is $\frac{1}{4}$. Find the two integers.

Answer

1. -9

3. $-1, 4$

5. $-11, 0$

7. Ø

9. -4

11. $-\frac{3}{2}$

13. $\frac{3}{4}$

15. $a=\frac{bc}{c-b}$

17. $8, 12$

19. $5, 6$

Exercise 13.E.20

Use algebra to solve the following applications.

1. Manuel traveled 8 miles on the bus and another 84 miles on a train. If the train was 16 miles per hour faster than the bus, and the total trip took 2 hours, what was the average speed of the train?
2. A boat can average 10 miles per hour in still water. On a trip downriver, the boat was able to travel 7.5 miles with the current. On the return trip, the boat was only able to travel 4.5 miles in the same amount of time against the current. What was the speed of the current?
3. Susan can jog, on average, $1\frac{1}{2}$ miles per hour faster than her husband Bill. Bill can jog 10 miles in the same amount of time it takes Susan to jog 13 miles. How fast, on average, can Susan jog?
4. In the morning, Raul drove 8 miles to visit his grandmother and then returned later that evening. Because of traffic, his average speed on the return trip was $\frac{1}{2}$ that of his average speed that morning. If the total driving time was $\frac{3}{4}$ of an hour, what was his average speed on the return trip?
5. One pipe can completely fill a water tank in 6 hours while another smaller pipe takes 8 hours to fill the same tank. How long will it take to fill the tank to $\frac{3}{4}$ capacity if both pipes are turned on?
6. It takes Bill 3 minutes longer than Jerry to fill an order. Working together they can fill 15 orders in 30 minutes. How long does it take Bill to fill an order by himself?
7. Manny takes twice as long as John to assemble a skateboard. If they work together, they can assemble a skateboard in 6 minutes. How long would it take Manny to assemble the skateboard without John's help?
8. Working alone, Joe can complete the yard work in 30 minutes. It takes Mike 45 minutes to complete work on the same yard. How long would it take them working together?

Answer

1. 48 miles per hour

3. 6.5 miles per hour

5. Approximately 2.6 hours

7. 18 minutes

Exercise 13.E.21

Construct a mathematical model given the following:

1. y varies directly as x, where $y = 30$ when $x = 5$.
2. y varies inversely as x, where $y = 3$ when $x = -2$.
3. y is jointly proportional to x and z, where $y = -50$ when $x = -2$ and $z = 5$.
4. y is directly proportional to the square of x and inversely proportional to z, where $y = -6$ when $x = 2$ and $z = -8$.
5. The distance an object in free fall varies directly with the square of the time that it has been falling. It is observed that an object falls 36 feet in $1\frac{1}{2}$ seconds. Find an equation that models the distance an object will fall, and use it to determine how far it will fall in $2\frac{1}{2}$ seconds.
6. After the brakes are applied, the stopping distance d of an automobile varies directly with the square of the speed s of the car. If a car traveling 55 miles per hour takes 181.5 feet to stop, how many feet will it take to stop if it is moving 65 miles per hour?
7. The weight of an object varies inversely as the square of its distance from the center of the Earth. If an object weighs 180 lbs on the surface of the Earth (approximately 4,000 miles from the center), then how much will it weigh at 2,000 miles above the Earth's surface?
8. The cost per person of renting a limousine varies inversely with the number of people renting it. If 5 people go in on the rental, the limousine will cost $112 per person. How much will the rental cost per person if 8 people go in on the rental?
9. To balance a seesaw, the distance from the fulcrum that a person must sit is inversely proportional to his weight. If a 52-pound boy is sitting 3 feet away from the fulcrum, then how far from the fulcrum must a 44-pound boy sit? Round to the nearest tenth of a foot.

Answer

1. $y = 6x$
3. $y = 5xz$
5. $d = 16t^2$; 100 feet
7. 80 lbs
9. Approximately 3.5 feet

Sample Exam

Exercise 13.E.22

Given $f(x) = x^2 - x + 4, g(x) = 5x - 1$, and $h(x) = 2x^2 + x - 3$, find the following:

1. $(g \cdot h)(x)$
2. $(h - f)(x)$
3. $(f + g)(-1)$

Answer

1. $(g \cdot h)(x) = 10x^3 + 3x^2 - 16x + 3$
3. $(f + g)(-1) = 0$

Exercise 13.E.23

Factor.

1. $x^3 + 16x - 2x^2 - 32$
2. $x^3 - 8y^3$
3. $x^4 - 81$
4. $25x^2y^2 - 40xy + 16$
5. $16x^3y + 12x^2y^2 - 18xy^3$

Answer

2. $(x - 2y)\left(x^2 + 2xy + 4y^2\right)$
4. $(5xy - 4)^2$

Exercise 13.E.24

Solve

1. $6x^2 + 24x = 0$
2. $(2x + 1)(3x + 2) = 12$
3. $(2x + 1)^2 = 23x + 6$
4. Find a quadratic equation with integer coefficients given the solutions $\left\{\frac{1}{2}, -3\right\}$.
5. Given $f(x) = 5x^2 - x + 4$, simplify $\frac{f(x+h) - f(x)}{h}$, where $h \neq 0$.

Answer

1. $-4, 0$
3. $-\frac{1}{4}, 5$
5. $10x + 5h - 1$

Exercise 13.E.25

Simplify and state the restrictions.

1. $\frac{4x^2-33x+8}{x^2-10x+16} \div \frac{16x^2-1}{x^2-4x+4}$
2. $\frac{x-1}{x-7} + \frac{1}{1-x} - \frac{2(x+11)}{x^2-8x+7}$

Answer

2. $\frac{x+2}{x-1}; x \neq 1, 7$

Exercise 13.E.26

Assume all variable expressions in the denominator are nonzero and simplify.

1. $\frac{\frac{3}{x}+\frac{1}{y}}{\frac{1}{y^2}-\frac{9}{x^2}}$

Exercise 13.E.27

Solve.

1. $\frac{6x-5}{3x+2} = \frac{2x}{x+1}$
2. $\frac{2x}{x+5} - \frac{1}{5-x} = \frac{2x}{x^2-25}$
3. Find the root of the function defined by $f(x) = \frac{1}{x+3} - 4$.
4. Solve for y: $x = \frac{4y}{3y-1}$

Answer

1. $-\frac{5}{3}$
3. $-\frac{11}{4}$

Exercise 13.E.28

Use algebra to solve.

1. The height of an object dropped from a 64-foot building is given by the function $h(t) = -16t^2 + 64$, where t represents time in seconds after it was dropped.
   1. Determine the height of the object at $\frac{3}{4}$ of a second.
   2. How long will it take the object to hit the ground?
2. One positive integer is 3 units more than another. When the reciprocal of the larger is subtracted from twice the reciprocal of the smaller, the result is $\frac{2}{9}$. Find the two positive integers.
3. A light airplane can average 126 miles per hour in still air. On a trip, the airplane traveled 222 miles with a tailwind. On the return trip, against a headwind of the same speed, the plane was only able to travel 156 miles in the same amount of time. What was the speed of the wind?
4. On the production line, it takes John 2 minutes less time than Mark to assemble a watch. Working together they can assemble 5 watches in 12 minutes. How long does it take John to assemble a watch working alone?
5. Write an equation that relates x and y, given that y varies inversely with the square of x, where $y = -\frac{1}{3}$ when $x = 3$. Use it to find y when $x = \frac{1}{2}$.

Answer

1. (1) 55 feet; (2) 2 seconds
3. 22 miles per hour

5. $y = -\frac{3}{x^2}; y = -12$

14.1: Prelude to Factoring

Figure 14.1.1: Scientists use factoring to calculate growth rates of infectious diseases such as viruses. (credit: “FotoshopTofs” / Pixabay)

An epidemic of a disease has broken out. Where did it start? How is it spreading? What can be done to control it? Answers to these and other questions can be found by scientists known as epidemiologists. They collect data and analyze it to study disease and consider possible control measures. Because diseases can spread at alarming rates, these scientists must use their knowledge of mathematics involving factoring. In this chapter, you will learn how to factor and apply factoring to real-life situations.

14.2: Greatest Common Factor and Factor by Grouping

Learning Objectives

By the end of this section, you will be able to:

- Find the greatest common factor of two or more expressions
- Factor the greatest common factor from a polynomial
- Factor by grouping

Be Prepared

Before you get started, take this readiness quiz.

1. Factor 56 into primes.
   If you missed this problem, review [link].
2. Find the least common multiple (LCM) of 18 and 24.
   If you missed this problem, review [link].
3. Multiply: $-3a(7a+8b)$.
   If you missed this problem, review [link].

Find the Greatest Common Factor of Two or More Expressions

Earlier we multiplied factors together to get a **product**. Now, we will reverse this process; we will start with a product and then break it down into its factors. Splitting a product into factors is called **factoring**.

We have learned how to factor numbers to find the least common multiple (LCM) of two or more numbers. Now we will factor expressions and find the **greatest common factor** of two or more expressions. The method we use is similar to what we used to find the LCM.

GREATEST COMMON FACTOR

The **greatest common factor** (GCF) of two or more expressions is the largest expression that is a factor of all the expressions.

We summarize the steps we use to find the greatest common factor.

FIND THE GREATEST COMMON FACTOR (GCF) OF TWO EXPRESSIONS.

1. Factor each coefficient into primes. Write all variables with exponents in expanded form.
2. List all factors—matching common factors in a column. In each column, circle the common factors.
3. Bring down the common factors that all expressions share.
4. Multiply the factors.

The next example will show us the steps to find the greatest common factor of three expressions.

Example 14.2.1

Find the greatest common factor of $21x^3,\ 9x^2,\ 15x$.

Answer

Factor each coefficient into primes and write the variables with exponents in expanded form. Circle the common factors in each column. Bring down the common factors.	$21x^3 = 3 \cdot 7 \cdot x \cdot x \cdot x$ $9x^2 = 3 \cdot 3 \cdot x \cdot x$ $15x = 3 \cdot 5 \cdot x$ $\text{GCF} = 3 \cdot x$
Multiply the factors.	$\text{GCF} = 3x$
	The GCF of $21x^3$, $9x^2$ and $15x$ is $3x$.

Example 14.2.2

Find the greatest common factor: $25m^4,\ 35m^3,\ 20m^2$.

Answer

$5m^2$

Example 14.2.3

Find the greatest common factor: $14x^3,\ 70x^2,\ 105x$.

Answer

$7x$

Factor the Greatest Common Factor from a Polynomial

It is sometimes useful to represent a number as a product of factors, for example, 12 as $2 \cdot 6$ or $3 \cdot 4$. In algebra, it can also be useful to represent a polynomial in factored form. We will start with a product, such as $3x^2 + 15x$, and end with its factors, $3x(x + 5)$. To do this we apply the Distributive Property "in reverse."

We state the Distributive Property here just as you saw it in earlier chapters and "in reverse."

DISTRIBUTIVE PROPERTY

If *a*, *b*, and *c* are real numbers, then

$$a(b+c) = ab + ac \quad \text{and} \quad ab + ac = a(b+c)$$

The form on the left is used to multiply. The form on the right is used to factor.

So how do you use the Distributive Property to factor a **polynomial**? You just find the GCF of all the terms and write the polynomial as a product!

Example 14.2.4: How to Use the Distributive Property to factor a polynomial

Factor: $8m^3 - 12m^2n + 20mn^2$.

Answer

Step 1. Find the GCF of all the terms of the polynomial.	Find the GCF of $8m^3$, $12m^2n$, $20mn^2$	$8m^3 = 2 \cdot 2 \cdot 2 \cdot m \cdot m \cdot m$ $12m^2n = 2 \cdot 2 \cdot 3 \cdot m \cdot m \cdot n$ $20mn^2 = 2 \cdot 2 \cdot 5 \cdot m \cdot n \cdot n$ $GCF = 2 \cdot 2 \cdot m$ $GCF = 4m$
Step 2. Rewrite each term as a product using the GCF.	Rewrite $8m^3$, $12m^2n$, $20mn^2$ as products of their GCF, $4m$. $8m^3 = 4m \cdot 2m^2$ $12m^2n = -4m \cdot 3m\,n$ $20mn^2 = 4m \cdot 5n^2$	$8m^3 - 12m^2n + 20mn^2$ $4m \cdot 2m^2 - 4m \cdot 3m\,n + 4m \cdot 5n^2$
Step 3. Use the "reverse" Distributive Property to factor the expression.		$4m(2m^2 - 3m\,n + 5n^2)$
Step 4. Check by multiplying the factors.		$4m(2m^2 - 3m\,n + 5n^2)$ $4m \cdot 2m^2 - 4m \cdot 3m\,n + 4m \cdot 5n^2$ $8m^3 - 12m^2n + 20mn^2$ ✓

Example 14.2.5

Factor: $9xy^2 + 6x^2y^2 + 21y^3$.

Answer

$3y^2(3x + 2x^2 + 7y)$

Example 14.2.6

Factor: $3p^3 - 6p^2q + 9pq^3$.

Answer

$3p(p^2 - 2pq + 3q^3)$

FACTOR THE GREATEST COMMON FACTOR FROM A POLYNOMIAL.

1. Find the GCF of all the terms of the polynomial.
2. Rewrite each term as a product using the GCF.
3. Use the "reverse" Distributive Property to factor the expression.
4. Check by multiplying the factors.

FACTOR AS A NOUN AND A VERB

We use "factor" as both a noun and a verb:

Noun:	7 is a factor of 14
Verb:	factor 3 from $3a + 3$

Example 14.2.7

Factor: $5x^3 - 25x^2$.

Answer

Find the GCF of $5x^3$ and $25x^2$.		$5x^3 = \textcircled{5} \cdot \textcircled{x} \cdot \textcircled{x} \cdot x$ $25x^2 = \textcircled{5} \cdot 5 \cdot \textcircled{x} \cdot \textcircled{x}$ $\text{GCF} = 5 \cdot x \cdot x$
		$\text{GCF} = 5x^2$
		$5x^3 - 25x^2$
Rewrite each term.		$5x^2 \cdot x - 5x^2 \cdot 5$
Factor the GCF.		$5x^2(x - 5)$
Check: $5x^2(x-5)$ $5x^2 \cdot x - 5x^2 \cdot 5$ $5x^3 - 25x^2$ ✓		

Example 14.2.8

Factor: $2x^3 + 12x^2$.

Answer

$2x^2(x+6)$

Example 14.2.9

Factor: $6y^3 - 15y^2$.

Answer

$3y^2(2y-5)$

Example 14.2.10

Factor: $8x^3y - 10x^2y^2 + 12xy^3$.

Answer

The GCF of $8x^3y$, $-10x^2y^2$, and $12xy^3$ is $2xy$.	$8x^3y = 2 \cdot 2 \cdot 2 \cdot x \cdot x \cdot x \cdot y$ $10x^2y^2 = 2 \cdot 5 \cdot x \cdot x \cdot y \cdot y$ $12xy^3 = 2 \cdot 2 \cdot 3 \cdot x \cdot y \cdot y \cdot y$ $\text{GCF} = 2 \cdot x \cdot y$
	$\text{GCF} = 2xy$
	$8x^3y - 10x^2y^2 + 12xy^3$
Rewrite each term using the GCF, $2xy$.	$2xy \cdot 4x^2 - 2xy \cdot 5xy + 2xy \cdot 6y^2$
Factor the GCF.	$2xy(4x^2 - 5xy + 6y^2)$

Check: $$2xy(4x^2-5xy+6y^2)$$ $$2xy\cdot 4x^2-2xy\cdot 5xy+2xy\cdot 6y^2$$ $$8x^3y-10x^2y^2+12xy^3\checkmark$$	

? Example 14.2.11

Factor: $15x^3y-3x^2y^2+6xy^3$.

Answer

$3xy(5x^2-xy+2y^2)$

? Example 14.2.12

Factor: $8a^3b+2a^2b^2-6ab^3$.

Answer

$2ab(4a^2+ab-3b^2)$

When the leading coefficient is negative, we factor the negative out as part of the GCF.

? Example 14.2.13

Factor: $-4a^3+36a^2-8a$.

Answer

The leading coefficient is negative, so the GCF will be negative.

	$-4a^3+36a^2-8a$
Rewrite each term using the GCF, $-4a$.	$-4a\cdot a^2-(-4a)\cdot 9a+(-4a)\cdot 2$
Factor the GCF.	$-4a(a^2-9a+2)$
Check: $$-4a(a^2-9a+2)$$ $$-4a\cdot a^2-(-4a)\cdot 9a+(-4a)\cdot 2$$ $$-4a^3+36a^2-8a\checkmark$$	

? Example 14.2.14

Factor: $-4b^3+16b^2-8b$.

Answer

$-4b(b^2-4b+2)$

Example 14.2.15

Factor: $-7a^3+21a^2-14a$.

Answer

$-7a(a^2-3a+2)$

So far our greatest common factors have been monomials. In the next example, the greatest common factor is a binomial.

Example 14.2.16

Factor: $3y(y+7)-4(y+7)$.

Answer

The GCF is the binomial $y+7$.

		$3y(y+7)-4(y+7)$
Factor the GCF, $(y+7)$.		$(y+7)(3y-4)$
Check on your own by multiplying.		

Example 14.2.17

Factor: $4m(m+3)-7(m+3)$.

Answer

$(m+3)(4m-7)$

Example 14.2.18

Factor: $8n(n-4)+5(n-4)$.

Answer

$(n-4)(8n+5)$

Factor by Grouping

Sometimes there is no common factor of all the terms of a polynomial. When there are four terms we separate the polynomial into two parts with two terms in each part. Then look for the **GCF** in each part. If the polynomial can be factored, you will find a common factor emerges from both parts. Not all polynomials can be factored. Just like some numbers are **prime**, some polynomials are prime.

Example 14.2.19: How to Factor a Polynomial by Grouping

Factor by grouping: $xy+3y+2x+6$.

Answer

Step 1. Group terms with common factors.	Is there a greatest common factor of all four terms?	$xy + 3y + 2x + 6$
	No, so let's separate the first two terms from the second two.	$xy + 3y + 2x + 6$
Step 2. Factor out the common factor in each group.	Factor the GCF from the first two terms.	$y(x + 3) + 2x + 6$
	Factor the GCF from the second two terms.	$y(x + 3) + 2(x + 3)$
Step 3. Factor the common factor from the expression.	Notice that each term has a common factor of $(x + 3)$.	$y(x + 3) + 2(x + 3)$
	Factor out the common factor.	$(x + 3)(y + 2)$
Step 4. Check.	Multiply $(x + 3)(y + 2)$. Is the product the original expression?	$(x + 3)(y + 2)$ $xy + 2x + 3y + 6$ $xy + 3y + 2x + 6$ ✓

Example 14.2.20

Factor by grouping: $xy+8y+3x+24$.

Answer

$(x+8)(y+3)$

Example 14.2.21

Factor by grouping: $ab+7b+8a+56$.

Answer

$(a+7)(b+8)$

FACTOR BY GROUPING.

1. Group terms with common factors.
2. Factor out the common factor in each group.
3. Factor the common factor from the expression.
4. Check by multiplying the factors.

Example 14.2.22

Factor by grouping: ⓐ $x^2+3x-2x-6$ ⓑ $6x^2-3x-4x+2$.

Answer

ⓐ

There is no GCF in all four terms.	$x^2+3x-2x-6$
Separate into two parts.	$x^2+3x \quad -2x-6$
Factor the GCF from both parts. Be careful with the signs when factoring the GCF from the last two terms.	$x(x+3)-2(x+3)$
Factor out the common factor.	$(x+3)(x-2)$
Check on your own by multiplying.	

ⓑ

There is no GCF in all four terms.	$6x^2-3x-4x+2$
Separate into two parts.	$6x^2-3x \quad -4x+2$
Factor the GCF from both parts.	$3x(2x-1)-2(2x-1)$
Factor out the common factor.	$(2x-1)(3x-2)$
Check on your own by multiplying.	

? Example 14.2.23

Factor by grouping: ⓐ $x^2+2x-5x-10$ ⓑ $20x^2-16x-15x+12$.

Answer

ⓐ $(x-5)(x+2)$
ⓑ $(5x-4)(4x-3)$

? Example 14.2.24

Factor by grouping: ⓐ $y^2+4y-7y-28$ ⓑ $42m^2-18m-35m+15$.

Answer

ⓐ $(y+4)(y-7)$
ⓑ $(7m-3)(6m-5)$

Key Concepts

- **How to find the greatest common factor (GCF) of two expressions.**
  1. Factor each coefficient into primes. Write all variables with exponents in expanded form.
  2. List all factors—matching common factors in a column. In each column, circle the common factors.
  3. Bring down the common factors that all expressions share.
  4. Multiply the factors.
- **Distributive Property:** If a, b and c are real numbers, then

$$a(b+c)=ab+ac \quad \text{and} \quad ab+ac=a(b+c)$$

  The form on the left is used to multiply. The form on the right is used to factor.
- **How to factor the greatest common factor from a polynomial.**
  1. Find the GCF of all the terms of the polynomial.
  2. Rewrite each term as a product using the GCF.
  3. Use the "reverse" Distributive Property to factor the expression.
  4. Check by multiplying the factors.
- **Factor as a Noun and a Verb:** We use "factor" as both a noun and a verb.

Noun:	7 is a factor of 14
Verb:	factor 3 from $3a+3$

- **How to factor by grouping.**
  1. Group terms with common factors.
  2. Factor out the common factor in each group.
  3. Factor the common factor from the expression.
  4. Check by multiplying the factors.

Glossary

factoring

Splitting a product into factors is called factoring.

greatest common factor

The greatest common factor (GCF) of two or more expressions is the largest expression that is a factor of all the expressions.

14.2E: Exercises

Practice Makes Perfect

Find the Greatest Common Factor of Two or More Expressions

In the following exercises, find the greatest common factor.

1. $10p^3q, 12pq^2$

Answer

$2pq$

2. $8a^2b^3, 10ab^2$

3. $12m^2n^3, 30m^5n^3$

Answer

$6m^2n^3$

4. $28x^2y^4, 42x^4y^4$

5. $10a^3, 12a^2, 14a$

Answer

$2a$

6. $20y^3, 28y^2, 40y$

7. $35x^3y^2, 10x^4y, 5x^5y^3$

Answer

$5x^3y$

8. $27p^2q^3, 45p^3q^4, 9p^4q^3$

Factor the Greatest Common Factor from a Polynomial

In the following exercises, factor the greatest common factor from each polynomial.

9. $6m+9$

Answer

$3(2m+3)$

10. $14p+35$

11. $9n-63$

Answer

$9(n-7)$

12. $45b-18$

13. $3x^2+6x-9$

Answer

$3(x^2+2x-3)$

14. $4y^2+8y-4$

15. $8p^2+4p+2$

Answer

$2(4p^2+2p+1)$

16. $10q^2+14q+20$

17. $8y^3+16y^2$

Answer

$8y^2(y+2)$

18. $12x^3-10x$

19. $5x^3-15x^2+20x$

Answer

$5x(x^2-3x+4)$

20. $8m^2-40m+16$

21. $24x^3-12x^2+15x$

Answer

$3x(8x^2-4x+5)$

22. $24y^3-18y^2-30y$

23. $12xy^2+18x^2y^2-30y^3$

Answer

$6y^2(2x+3x^2-5y)$

24. $21pq^2+35p^2q^2-28q^3$

25. $20x^3y-4x^2y^2+12xy^3$

Answer

$4xy(5x^2-xy+3y^2)$

26. $24a^3b+6a^2b^2-18ab^3$

27. $-2x-4$

Answer

$-2(x+4)$

28. $-3b+12$

29. $-2x^3+18x^2-8x$

Answer

$-2x(x^2-9x+4)$

30. $-5y^3+35y^2-15y$

31. $-4p^3q-12p^2q^2+16pq^2$

Answer

$-4pq(p^2+3pq-4q)$

32. $-6a^3b-12a^2b^2+18ab^2$

33. $5x(x+1)+3(x+1)$

Answer

$(x+1)(5x+3)$

34. $2x(x-1)+9(x-1)$

35. $3b(b-2)-13(b-2)$

Answer

$(b-2)(3b-13)$

36. $6m(m-5)-7(m-5)$

Factor by Grouping

In the following exercises, factor by grouping.

37. $ab+5a+3b+15$

Answer

$(b+5)(a+3)$

38. $cd+6c+4d+24$

39. $8y^2+y+40y+5$

Answer

$(y+5)(8y+1)$

40. $6y^2+7y+24y+28$

41. $uv-9u+2v-18$

Answer

$(u+2)(v-9)$

42. $pq-10p+8q-80$

43. $u^2-u+6u-6$

Answer

$(u-1)(u+6)$

44. $x^2-x+4x-4$

45. $9p^2-15p+12p-20$

Answer

$(3p-5)(3p+4)$

46. $16q^2+20q-28q-35$

47. $mn-6m-4n+24$

Answer

$(n-6)(m-4)$

48. $r^2-3r-r+3$

49. $2x^2-14x-5x+35$

Answer

$(x-7)(2x-5)$

50. $4x^2-36x-3x+27$

Mixed Practice

In the following exercises, factor.

51. $-18xy^2-27x^2y$

Answer

$-9xy(3x+2y)$

52. $-4x^3y^5-x^2y^3+12xy^4$

53. $3x^3 - 7x^2 + 6x - 14$

Answer

$(x^2 + 2)(3x - 7)$

54. $x^3 + x^2 - x - 1$

55. $x^2 + xy + 5x + 5y$

Answer

$(x + y)(x + 5)$

56. $5x^3 - 3x^2 + 5x - 3$

Writing Exercises

57. What does it mean to say a polynomial is in factored form?

Answer

Answers will vary.

58. How do you check result after factoring a polynomial?

59. The greatest common factor of 36 and 60 is 12. Explain what this means.

Answer

Answers will vary.

60. What is the GCF of y^4, y^5, and y^{10}? Write a general rule that tells you how to find the GCF of y^a, y^b, and y^c.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find the greatest common factor of two or more expressions.			
factor the greatest common factor from a polynomial.			
factor by grouping.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved your goals in this section! Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific!

…with some help. This must be addressed quickly as topics you do not master become potholes in your road to success. Math is sequential - every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is critical and you must not ignore it. You need to get help immediately or you will quickly be overwhelmed. See your instructor as soon as possible to discuss your situation. Together you can come up with a plan to get you

the help you need.

14.3: Factor Trinomials

Learning Objectives

By the end of this section, you will be able to:

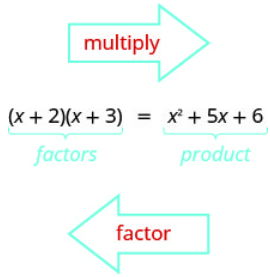
- Factor trinomials of the form x^2+bx+c
- Factor trinomials of the form ax^2+bx+c using trial and error
- Factor trinomials of the form ax^2+bx+c using the 'ac' method
- Factor using substitution

Before you get started, take this readiness quiz.

1. Find all the factors of 72.
   If you missed this problem, review [link].
2. Find the product: $(3y+4)(2y+5)$.
   If you missed this problem, review [link].
3. Simplify: $-9(6);\ -9(-6)$.
   If you missed this problem, review [link].

Factor Trinomials of the Form x^2+bx+c

You have already learned how to multiply binomials using **FOIL**. Now you'll need to "undo" this multiplication. To factor the trinomial means to start with the product, and end with the factors.



To figure out how we would factor a **trinomial** of the form x^2+bx+c, such as x^2+5x+6 and factor it to $(x+2)(x+3)$, let's start with two general binomials of the form $(x+m)$ and $(x+n)$.

	$(x+m)(x+n)$
Foil to find the product.	$x^2+mx+nx+mn$
Factor the GCF from the middle terms.	$x^2+(m+n)x+mn$
Our trinomial is of the form x^2+bx+c.	$\overbrace{x^2+(m+n)x+mn}^{x^2+bx+c}$

This tells us that to factor a trinomial of the form x^2+bx+c, we need two factors $(x+m)$ and $(x+n)$ where the two numbers m and n multiply to c and add to b.

Example 14.3.1: How to Factor a Trinomial of the form x^2+bx+c

Factor: $x^2+11x+24$.

Answer

Step 1. Write the factors as two binomials with first terms x.	Write two sets of parentheses and put x as the first term.	$x^2 + 11x + 24$ $(x \quad)(x \quad)$
Step 2. Find two numbers m and n that multiply to c, $m \cdot n = c$ add to b, $m + n = b$	Find two numbers that multiply to 24 and add to 11. **Factors of 24** / **Sum of factors** 1, 24 — $1 + 24 = 25$ 2, 12 — $2 + 12 = 14$ 3, 8 — $3 + 8 = 11$* 4, 6 — $4 + 6 = 10$	
Step 3. Use m and n as the last terms of the factors.	Use 3 and 8 as the last terms of the binomials.	$(x + 3)(x + 8)$
Step 4. Check by multiplying the factors.		$(x + 3)(x + 8)$ $x^2 + 8x + 3x + 24$ $x^2 + 11x + 24$ ✓

? Example 14.3.2

Factor: $q^2 + 10q + 24$.

Answer

$(q+4)(q+6)$

? Example 14.3.3

Factor: $t^2 + 14t + 24$.

Answer

$(t+2)(t+12)$

Let's summarize the steps we used to find the factors.

1. Write the factors as two binomials with first terms x. $x^2 + bx + c$ $(x \quad)(x \quad)$
2. Find two numbers m and n that
   - multiply to c, $m \cdot n = c$
   - add to b, $m + n = b$
3. Use m and n as the last terms of the factors. $(x+m)(x+n)$
4. Check by multiplying the factors.

In the first example, all terms in the trinomial were positive. What happens when there are negative terms? Well, it depends which term is negative. Let's look first at trinomials with only the middle term negative.

How do you get a *positive product* and a *negative sum*? We use two negative numbers.

? Example 14.3.4

Factor: $y^2 - 11y + 28$.

Answer

Again, with the positive last term, 28, and the negative middle term, $-11y$, we need two negative factors. Find two numbers that multiply 28 and add to -11.

	$y^2-11y+28$
Write the factors as two binomials with first terms y.	$(y\quad)(y\quad)$
Find two numbers that: multiply to 28 and add to -11.	

Factors of 28	Sum of factors
$-1,\ -28$	$-1+(-28)=-29$
$-2,\ -14$	$-2+(-14)=-16$
$-4,\ -7$	$-4+(-7)=-11^*$

Use $-4,\ -7$ as the last terms of the binomials.	$(y-4)(y-7)$
Check:	
	$(y-4)(y-7)$
	$y^2-7y-4y+28$
	$y^2-11y+28\checkmark$

? Example 14.3.5

Factor: $u^2-9u+18$.

Answer

$(u-3)(u-6)$

? Example 14.3.6

Factor: $y^2-16y+63$.

Answer

$(y-7)(y-9)$

Now, what if the last term in the trinomial is negative? Think about **FOIL**. The last term is the product of the last terms in the two binomials. A negative product results from multiplying two numbers with opposite signs. You have to be very careful to choose factors to make sure you get the correct sign for the middle term, too.

How do you get a *negative product* and a *positive sum*? We use one positive and one negative number.

When we factor trinomials, we must have the terms written in descending order—in order from highest degree to lowest degree.

? Example 14.3.7

Factor: $2x+x^2-48$.

Answer

	$2x+x^2-48$
First we put the terms in decreasing degree order.	$x^2+2x-48$
Factors will be two binomials with first terms x.	$(x\quad)(x\quad)$

Factors of −48−48	Sum of factors

Factors of -48	Sum of factors
$-1,\ 48$	$-1+48=47$
$-2,\ 24$	$-2+24=22$
$-3,\ 16$	$-3+16=13$
$-4,\ 12$	$-4+12=8$
$-6,\ 8$	$-6+8=2^*$

Use $-6,\ 8$ as the last terms of the binomials. $(x-6)(x+8)$

Check:

$$(x-6)(x+8)$$
$$x^2-6q+8q-48$$
$$x^2+2x-48\checkmark$$

Example 14.3.8

Factor: $9m+m^2+18$.

Answer

$(m+3)(m+6)$

Example 14.3.9

Factor: $-7n+12+n^2$.

Answer

$(n-3)(n-4)$

Sometimes you'll need to factor trinomials of the form $x^2+bxy+cy^2$ with two variables, such as $x^2+12xy+36y^2$. The first term, x^2, is the product of the first terms of the binomial factors, $x\cdot x$. The y^2 in the last term means that the second terms of the binomial factors must each contain y. To get the coefficients b and c, you use the same process summarized in How To Factor trinomials.

Example 14.3.10

Factor: $r^2-8rs-9s^2$.

Answer

We need r in the first term of each binomial and s in the second term. The last term of the trinomial is negative, so the factors must have opposite signs.

$$r^2-8rs-9s^2$$
$$(r\quad s)(r\quad s)$$

Note that the first terms are r, last terms contain s.

Find the numbers that multiply to -9 and add to -8.

Factors of -9	Sum of factors
$1,\ -9$	$-1+9=8$
$-1,\ 9$	$1+(-9)=-8^*$
$3,\ -3$	$3+(-3)=0$

Use $1, -9$ as coefficients of the last terms. $(r+s)(r-9s)$

Check:

$$(r-9s)(r+s)$$
$$r^2+rs-9rs-9s^2$$
$$r^2-8rs-9s^2 \checkmark$$

Example 14.3.11

Factor: $a^2-11ab+10b^2$.

Answer

$(a-b)(a-10b)$

Example 14.3.12

Factor: $m^2-13mn+12n^2$.

Answer

$(m-n)(m-12n)$

Some trinomials are prime. The only way to be certain a trinomial is **prime** is to list all the possibilities and show that none of them work.

Example 14.3.13

Factor: $u^2-9uv-12v^2$.

Answer

We need u in the first term of each binomial and v in the second term. The last term of the trinomial is negative, so the factors must have opposite signs.

$$u^2-9uv-12v^2$$

Note that the first terms are u, last terms contain v. $(u \quad v)(u \quad v)$

Find the numbers that multiply to -12 and add to -9.

Factors of -12	Sum of factors
$1, -12$	$1+(-12)=-11$
$-1, 12$	$-1+12=11$
$2, -6$	$2+(-6)=-4$
$-2, 6$	$-2+6=4$
$3, -4$	$3+(-4)=-1$
$-3, 4$	$-3+4=1$

Note there are no factor pairs that give us -9 as a sum. The trinomial is prime.

Example 14.3.14

Factor: $x^2-7xy-10y^2$.

Answer

prime

Example 14.3.15

Factor: $p^2+15pq+20q^2$.

Answer

prime

Let's summarize the method we just developed to factor trinomials of the form x^2+bx+c .

STRATEGY FOR FACTORING TRINOMIALS OF THE FORM x^2+bx+c

When we factor a trinomial, we look at the signs of its terms first to determine the signs of the binomial factors.

	x^2+bx+c	
	$(x+m)(x+n)$	
When c is positive, m and n have the same sign.		
b positive		b negative
m, n positive		m, n negative
x^2+5x+6		x^2-6x+8
$(x+2)(x+3)$		$(x-4)(x-2)$
same signs		same signs
When c is negative, m and n have the opposite sign.		
x^2+x-12		$x^2-2x-15$
$(x+4)(x-3)$		$(x-5)(x+3)$
opposite signs		opposite signs

Notice that, in the case when m and n have opposite signs, the sign of the one with the larger absolute value matches the sign of b.

Factor Trinomials of the form $ax^2 + bx + c$ using Trial and Error

Our next step is to factor trinomials whose leading coefficient is not 1, trinomials of the form ax^2+bx+c .

Remember to always check for a **GCF** first! Sometimes, after you factor the GCF, the leading coefficient of the trinomial becomes 1 and you can factor it by the methods we've used so far. Let's do an example to see how this works.

ExAMPLE 14.3.16

Factor completely: $4x^3+16x^2-20x$.

Answer

Is there a greatest common factor? Yes, $GCF = 4x$. Factor it.	$4x^3 + 16x^2 - 20x$ $4x(x^2 + 4x - 5)$
Binomial, trinomial, or more than three terms? It is a trinomial. So "undo FOIL."	$4x(x \quad)(x \quad)$
Use a table like the one shown to find two numbers that multiply to -5 and add to 4.	$4x(x-1)(x+5)$

Factors of -5	Sum of factors
$-1, 5$ $1, -5$	$-1+5=4^*$ $1+(-5)=-4$

Check:

$$4x(x-1)(x+5)$$
$$4x(x^2+5x-x-5)$$
$$4x(x^2+4x-5)$$
$$4x^3+16x2-20x\checkmark$$

? ExAMPLE 14.3.17

Factor completely: $5x^3 + 15x^2 - 20x$.

Answer

$5x(x-1)(x+4)$

? ExAMPLE 14.3.18

Factor completely: $6y^3 + 18y^2 - 60y$.

Answer

$6y(y-2)(y+5)$

What happens when the leading coefficient is not 1 and there is no GCF? There are several methods that can be used to factor these trinomials. First we will use the Trial and Error method.

Let's factor the trinomial $3x^2 + 5x + 2$.

From our earlier work, we expect this will factor into two binomials.

$$3x^2 + 5x + 2$$
$$(\quad)(\quad)$$

We know the first terms of the binomial factors will multiply to give us $3x^2$. The only factors of $3x^2$ are $1x$, $3x$. We can place them in the binomials.

$$3x^2 + 5x + 2$$
$$1x,\ 3x$$
$$(x\quad)(3x\quad)$$

Check: Does $1x \cdot 3x = 3x^2$?

We know the last terms of the binomials will multiply to 2. Since this trinomial has all positive terms, we only need to consider positive factors. The only factors of 2 are 1 and 2. But we now have two cases to consider as it will make a difference if we write 1, 2 or 2, 1.

$$3x^2 + 5x + 2 \quad (1x,\ 3x;\ 1,\ 2) \quad (x + 1)(3x + 2) \quad \text{or} \quad 3x^2 + 5x + 2 \quad (1x,\ 3x;\ 1,\ 2) \quad (x + 2)(3x + 1)$$

Which factors are correct? To decide that, we multiply the inner and outer terms.

$$(x + 1)(3x + 2): \quad 3x,\ 2x \rightarrow 5x \qquad \text{or} \qquad (x + 2)(3x + 1): \quad 6x,\ 1x \rightarrow 7x$$

Since the middle term of the trinomial is $5x$, the factors in the first case will work. Let's use FOIL to check.

$$(x+1)(3x+2)$$
$$3x^2+2x+3x+2$$
$$3x^2+5x+2\checkmark$$

Our result of the factoring is:

$$3x^2+5x+2$$
$$(x+1)(3x+2)$$

? ExAMPLE 14.3.19: How to Factor a Trinomial Using Trial and Error

Factor completely using trial and error: $3y^2+22y+7$.

Answer

Step 1. Write the trinomial in descending order.	The trinomial is already in descending order.	$3y^2 + 22y + 7$
Step 2. Factor any GCF.	There is no GCF.	
Step 3. Find all the factor pairs of the first term.	The only of $3y^2$ are $1y$, $3y$. Since there is only one pair, we can put them in the parentheses.	$3y^2 + 22y + 7$ ($1y,\ 3y$) $3y^2 + 22y + 7$ ($1y,\ 3y$) $(y\quad)(3y\quad)$
Step 4. Find all the factor pairs of the third term.	The only factors of 7 are 1, 7.	$3y^2 + 22y + 7$ ($1y,\ 3y$; $1,\ 7$) $(y\quad)(3y\quad)$

Step 5. Test all the possible combinations of the factors until the correct product is found.	$3y^2 + 22y + 7$ 1y, 3y 1, 7 $(y + 1)(3y + 7)$ 3y 7y 10y No! We need 22y $3y^2 + 22y + 7$ 1y, 3y 1, 7 $(y + 7)(3y + 1)$ 21y +y 22y	$3y^2 + 22y + 7$ **Possible factors** / **Product** $(y + 1)(3y + 7)$ / $3y^2 + 10y + 7$ $(y + 7)(3y + 1)$ / $3y^2 + 22y + 7$
Step 6. Check by multiplying.		$(y + 7)(3y + 1)$ $3y^2 + 22y + 7$ ✓

? ExAMPLE 14.3.20

Factor completely using trial and error: $2a^2+5a+3$.

Answer

$(a+1)(2a+3)$

? ExAMPLE 14.3.21

Factor completely using trial and error: $4b^2+5b+1$.

Answer

$(b+1)(4b+1)$

FACTOR TRINOMIALS OF THE FORM $ax^2 + bx + c$ USING TRIAL AND ERROR.

1. Write the trinomial in descending order of degrees as needed.
2. Factor any GCF.
3. Find all the factor pairs of the first term.
4. Find all the factor pairs of the third term.
5. Test all the possible combinations of the factors until the correct product is found.
6. Check by multiplying.

Remember, when the middle term is negative and the last term is positive, the signs in the binomials must both be negative.

? ExAMPLE 14.3.22

Factor completely using trial and error: $6b^2-13b+5$.

Answer

The trinomial is already in descending order.	$6b^2 - 13b + 5$
Find the factors of the first term.	$6b^2 - 13b + 5$ $1b \cdot 6b$ $2b \cdot 3b$

Find the factors of the last term. Consider the signs. Since the last term, 5, is positive its factors must both be positive or both be negative. The coefficient of the middle term is negative, so we use the negative factors.	$6b^2 - 13b + 5$ $1b \cdot 6b$ $2b \cdot 3b$ $-1, -5$

Consider all the combinations of factors.

$6b^2 - 13b + 5$

Possible factors	Product
$(b-1)(6b-5)$	$6b^2 - 11b + 5$
$(b-5)(6b-1)$	$6b^2 - 31b + 5$
$(2b-1)(3b-5)$	$6b^2 - 13b + 5^*$
$(2b-5)(3b-1)$	$6b^2 - 17b + 5$

The correct factors are those whose product is the original trinomial. $(2b-1)(3b-5)$

Check by multiplying:

$$(2b-1)(3b-5)$$
$$6b^2 - 10b - 3b + 5$$
$$6b^2 - 13b + 5 \checkmark$$

? ExAMPLE 14.3.23

Factor completely using trial and error: $8x^2 - 14x + 3$.

Answer

$(2x-3)(4x-1)$

? ExAMPLE 14.3.24

Factor completely using trial and error: $10y^2 - 37y + 7$.

Answer

$(2y-7)(5y-1)$

When we factor an expression, we always look for a greatest common factor first. If the expression does not have a greatest common factor, there cannot be one in its factors either. This may help us eliminate some of the possible factor combinations.

? ExAMPLE 14.3.25

Factor completely using trial and error: $18x^2 - 37xy + 15y^2$.

Answer

The trinomial is already in descending order.	$18x^2 - 37xy + 15y^2$
Find the factors of the first term.	$18x^2 - 37xy + 15y^2$ $1x \cdot 18x$ $2x \cdot 9x$ $3x \cdot 6x$

Find the factors of the last term. Consider the signs. Since 15 is positive and the coefficient of the middle term is negative, we use the negative factors.	$18x^2 - 37xy + 15y^2$ $1x \cdot 18x$ $\quad -1, -15$ $2x \cdot 9x$ $\quad -3, -5$ $3x \cdot 6x$

Consider all the combinations of factors.

$18x^2 - 37xy + 15y^2$	
Possible factors	**Product**
$(x - 1y)(18x - 15y)$	Not an option
$(x - 15y)(18x - 1y)$	$18x^2 - 271xy + 15y^2$
$(x - 3y)(18x - 5y)$	$18x^2 - 59xy + 15y^2$
$(x - 5y)(18x - 3y)$	Not an option
$(2x - 1y)(9x - 15y)$	Not an option
$(2x - 15y)(9x - 1y)$	$18x^2 - 137xy + 15y^2$
$(2x - 3y)(9x - 5y)$	$18x^2 - 37xy + 15y^2$*
$(2x - 5y)(9x - 3y)$	Not an option
$(3x - 1y)(6x - 15y)$	Not an option
$(3x - 15y)(6x - 1y)$	Not an option
$(3x - 3y)(6x - 5y)$	Not an option

If the trinomial has no common factors, then neither factor can contain a common factor. That means this combination is not an option.

The correct factors are those whose product is the original trinomial.
Check by multiplying:

$(2x - 3y)(9x - 5y)$

$$(2x - 3y)(9x - 5y)$$
$$18x^2 - 10xy - 27xy + 15y^2$$
$$18x^2 - 37xy + 15y^2 \checkmark$$

? ExAMPLE 14.3.26

Factor completely using trial and error $18x^2 - 3xy - 10y^2$.

Answer

$(3x + 2y)(6x - 5y)$

? ExAMPLE 14.3.27

Factor completely using trial and error: $30x^2 - 53xy - 21y^2$.

Answer

$(3x + y)(10x - 21y)$

Don't forget to look for a GCF first and remember if the leading coefficient is negative, so is the GCF.

? ExAMPLE 14.3.28

Factor completely using trial and error: $-10y^4 - 55y^3 - 60y^2$.

Answer

	$-10y^4 - 55y^3 - 60y^2$
Notice the greatest common factor, so factor it first.	$-5y^2(2y^2 + 11y + 12)$
Factor the trinomial.	$-5y^2\left(2y^2 + 11y + 12\right)$ $y \cdot 2y$ $1 \cdot 12$ $2 \cdot 6$ $3 \cdot 4$

Consider all the combinations.

$2y^2 + 11y + 12$	
Possible factors	**Product**
$(y + 1)(2y + 12)$	Not an option
$(y + 12)(2y + 1)$	$2y^2 + 25y + 12$
$(y + 2)(2y + 6)$	Not an option
$(y + 6)(2y + 2)$	Not an option
$(y + 3)(2y + 4)$	Not an option
$(y + 4)(2y + 3)$	$2y^2 + 11y + 12$*

If the trinomial has no common factors, then neither factor can contain a common factor. That means this combination is not an option.

The correct factors are those whose product is the original trinomial. Remember to include the factor -5^y2.

$$-5y^2(y+4)(2y+3)$$

Check by multiplying:

$$-5y^2(y+4)(2y+3)$$
$$-5y^2(2y^2+8y+3y+12)$$
$$-10y^4 - 55y^3 - 60y^2 \checkmark$$

Factor completely using trial and error: $56q^3 + 320q^2 - 96q$.

Answer

$8q(q+6)(7q-2)$

Factor Trinomials of the Form $ax^2 + bx + c$ using the "ac" Method

Another way to factor trinomials of the form $ax^2 + bx + c$ is the "ac" method. (The "ac" method is sometimes called the grouping method.) The "ac" method is actually an extension of the methods you used in the last section to factor trinomials with leading coefficient one. This method is very structured (that is step-by-step), and it always works!

Example 14.3.31: How to Factor Trinomials using the "ac" Method

Factor using the "ac" method: $6x^2+7x+2$.

Answer

Step 1. Factor any GCF.	Is there a greatest common factor? No!	$6x^2+7x+2$
Step 2. Find the product ac.	$a \cdot c$ $6 \cdot 2$ 12	ax^2+bx+c $6x^2+7x+2$
Step 3. Find two numbers m and n that: Multiply to ac. $m \cdot n = a \cdot c$ Add to b. $m+n=b$	Find two numbers that multiply to 12 and add to 7. Both factors must be positive. $3 \cdot 4 = 12 \quad 3+4=7$	
Step 4. Split the middle term using m and n. ax^2+bx+c $ax^2+\overbrace{mx+nx}^{bx}+c$	Rewrite $7x$ as $3x+4x$. It would also give the same result if we used $4x+3x$. Notice that $6x^2+3x+4x+2$ is equal to $6x^2+7x+2$. We just split the middle term to get a more useful form.	$6x^2+7x+2$ $6x^2+\underbrace{3x}+\underbrace{4x}+2$
Step 5. Factor by grouping.		$3x(2x+1)+2(2x+1)$ $(2x+1)(3x+2)$
Step 6. Check by multiplying the factors.		$(2x+1)(3x+2)$ $6x^2+4x+3x+2$ $6x^2+7x+2$ ✓

Example 14.3.32

Factor using the "ac" method: $6x^2+13x+2$.

Answer

$(x+2)(6x+1)$

Example 14.3.33

Factor using the "ac" method: $4y^2+8y+3$.

Answer

$(2y+1)(2y+3)$

The "ac" method is summarized here.

FACTOR TRINOMIALS OF THE FORM $ax^2 + bx + c$ USING THE "ac" METHOD.

1. Factor any GCF.
2. Find the product ac.
3. Find two numbers m and n that:
   Multiply to ac $m \cdot n = a \cdot c$
   Add to b $m + n = b$
   $ax^2 + bx + c$
4. Split the middle term using m and n. $ax^2 + mx + nx + c$
5. Factor by grouping.
6. Check by multiplying the factors.

Don't forget to look for a common factor!

Example 14.3.34

Factor using the "'ac" method: $10y^2 - 55y + 70$.

Answer

Is there a greatest common factor?		
Yes. The GCF is 5.		$10y^2 - 55y + 70$
Factor it.		$5(2y^2 - 11y + 14)$
The trinomial inside the parentheses has a leading coefficient that is not 1.		$ax^2 + bx + c$ $5(2y^2 - 11y + 14)$
Find the product ac.	$ac = 28$	
Find two numbers that multiply to ac	$(-4)(-7) = 28$	
and add to b.	$-4(-7) = -11$	
Split the middle term.		$5(2y^2 - 11y + 14)$
		$5(2y^2 - 7y - 4y + 14)$
Factor the trinomial by grouping.		
		$5(y - 2)(2y - 7)$
Check by multiplying all three factors. $5(y-2)(2y-7)$ $5(2y^2 - 7y - 4y + 14)$ $5(2y^2 - 11y + 14)$ $10y^2 - 55y + 70$✓		

Example 14.3.35

Factor using the "ac" method: $16x^2 - 32x + 12$.

Answer

$4(2x - 3)(2x - 1)$

Example 14.3.36

Factor using the "ac" method: $18w^2 - 39w + 18$.

Answer

$3(3w - 2)(2w - 3)$

Factor Using Substitution

Sometimes a trinomial does not appear to be in the $ax^2 + bx + c$ form. However, we can often make a thoughtful substitution that will allow us to make it fit the $ax^2 + bx + c$ form. This is called **factoring by substitution**. It is standard to use u for the substitution.

In the $ax^2 + bx + c$, the middle term has a variable, x, and its square, x^2, is the variable part of the first term. Look for this relationship as you try to find a substitution.

ExAMPLE 14.3.37

Factor by substitution: $x^4 - 4x^2 - 5$.

Answer

The variable part of the middle term is x^2 and its square, x^4, is the variable part of the first term. (We know $(x^2)^2 = x^4$). If we let $u = x^2$, we can put our trinomial in the $ax^2 + bx + c$ form we need to factor it.

	$x^4 - 4x^2 - 5$
Rewrite the trinomial to prepare for the substitution.	$(x^2)^2 - 4(x^2) - 5$
Let $u = x^2$ and substitute.	$(u)^2 - 4(u) - 5$
Factor the trinomial.	$(u + 1)(u - 5)$
Replace u with x^2.	$(x^2 + 1)(x^2 - 5)$
Check: $(x^2 + 1)(x^2 - 5)$ $x^4 - 5x^2 + x^2 - 5$ $x^4 - 4x^2 - 5$✓	

ExAMPLE 14.3.38

Factor by substitution: $h^4 + 4h^2 - 12$.

Answer

$(h^2 - 2)(h^2 + 6)$

ExAMPLE 14.3.39

Factor by substitution: $y^4 - y^2 - 20$.

Answer

$(y^2 + 4)(y^2 - 5)$

Sometimes the expression to be substituted is not a monomial.

ExAMPLE 14.3.40

Factor by substitution: $(x-2)^2+7(x-2)+12$

Answer

The binomial in the middle term, $(x-2)$ is squared in the first term. If we let $u=x-2$ and substitute, our trinomial will be in ax^2+bx+c form.

	$(x-2)^2+7(x-2)+12$
Rewrite the trinomial to prepare for the substitution.	$(x-2)^2+7(x-2)+12$
Let $u=x-2$ and substitute.	$u^2+7u+12$
Factor the trinomial.	$(u+3)(u+4)$
Replace u with $x-2$.	$((x-2)+3)((x-2)+4)$
Simplify inside the parentheses.	$(x+1)(x+2)$

This could also be factored by first multiplying out the $(x-2)^2$ and the $7(x-2)$ and then combining like terms and then factoring. Most students prefer the substitution method.

ExAMPLE 14.3.41

Factor by substitution: $(x-5)^2+6(x-5)+8$.

Answer

$(x-3)(x-1)$

ExAMPLE 14.3.42

Factor by substitution: $(y-4)^2+8(y-4)+15$.

Answer

$(y-1)(y+1)$

Watch this video for additional instruction and practice with factoring.

Key Concepts

- **How to factor trinomials of the form x^2+bx+c.**
  1. Write the factors as two binomials with first terms x. $l)x^2+bx+c$ $(x\quad)(x\quad)$
  2. Find two numbers m and n that
     multiply to $c,\ m\cdot n=c$
     add to $b,\ m+n=b$
  3. Use m and n as the last terms of the factors. $(x+m)(x+n)$
  4. Check by multiplying the factors.
- **Strategy for Factoring Trinomials of the Form x^2+bx+c** : When we factor a trinomial, we look at the signs of its terms first to determine the signs of the binomial factors.

  For trinomials of the form: $x^2+bx+c=(x+m)(x+n)$

  When c is positive, m and n must have the same sign (and this will be the sign of b).

  Examples: $x^2+5x+6=(x+2)(x+3)$, $x^2-6x+8=(x-4)(x-2)$

  When c is negative, m and n have opposite signs. The larger of m and n will have the sign of b.

  Examples: $x^2+x-12=(x+4)(x-3)$, $x^2-2x-15=(x-5)(x+3)$

  Notice that, in the case when m and n have opposite signs, the sign of the one with the larger absolute value matches the sign of b.
- **How to factor trinomials of the form ax^2+bx+c using trial and error.**
  1. Write the trinomial in descending order of degrees as needed.
  2. Factor any GCF.
  3. Find all the factor pairs of the first term.
  4. Find all the factor pairs of the third term.
  5. Test all the possible combinations of the factors until the correct product is found.
  6. Check by multiplying.
- **How to factor trinomials of the form ax^2+bx+c using the "ac" method.**

1. Factor any GCF.
2. Find the product ac.
3. Find two numbers m and n that:
   Multiply to ac. $m \cdot n = a \cdot c$
   Add to b. $m + n = b$
   $ax^2 + bx + c$
4. Split the middle term using m and n. $ax^2 + mx + nx + c$
5. Factor by grouping.
6. Check by multiplying the factors.

14.3E: Exercises

Practice Makes Perfect

Factor Trinomials of the Form x^2+bx+c

In the following exercises, factor each trinomial of the form x^2+bx+c .

1. $p^2+11p+30$

Answer

$(p+5)(p+6)$

2. $w^2+10w+21$

3. $n^2+19n+48$

Answer

$(n+3)(n+16)$

4. $b^2+14b+48$

5. $a^2+25a+100$

Answer

$(a+5)(a+20)$

6. $u^2+101u+100$

7. $x^2-8x+12$

Answer

$(x-2)(x-6)$

8. $q^2-13q+36$

9. $y^2-18y+45$

Answer

$(y-3)(y-15)$

10. $m^2-13m+30$

11. x^2-8x+7

Answer

$(x-1)(x-7)$

12. y^2-5y+6

13. $5p-6+p^2$

Answer

$(p-1)(p+6)$

14. $6n-7+n^2$

15. $8-6x+x^2$

Answer

$(x-4)(x-2)$

16. $7x+x^2+6$

17. $x^2-12-11x$

Answer

$(x-12)(x+1)$

18. $-11-10x+x^2$

In the following exercises, factor each trinomial of the form $x^2+bxy+cy^2$.

19. $x^2-2xy-80y^2$

Answer

$(x+8y)(x-10y)$

20. $p^2-8pq-65q^2$

21. $m^2-64mn-65n^2$

Answer

$(m+n)(m-65n)$

22. $p^2-2pq-35q^2$

23. $a^2+5ab-24b^2$

Answer

$(a+8b)(a-3b)$

24. $r^2+3rs-28s^2$

25. $x^2-3xy-14y^2$

Answer

Prime

26. $u^2-8uv-24v^2$

27. $m^2 - 5mn + 30n^2$

Answer

Prime

28. $c^2 - 7cd + 18d^2$

Factor Trinomials of the Form $ax^2 + bx + c$ Using Trial and Error

In the following exercises, factor completely using trial and error.

29. $p^3 - 8p^2 - 20p$

Answer

$p(p-10)(p+2)$

30. $q^3 - 5q^2 - 24q$

31. $3m^3 - 21m^2 + 30m$

Answer

$3m(m-5)(m-2)$

32. $11n^3 - 55n^2 + 44n$

33. $5x^4 + 10x^3 - 75x^2$

Answer

$5x^2(x-3)(x+5)$

34. $6y^4 + 12y^3 - 48y^2$

35. $2t^2 + 7t + 5$

Answer

$(2t+5)(t+1)$

36. $5y^2 + 16y + 11$

37. $11x^2 + 34x + 3$

Answer

$(11x+1)(x+3)$

38. $7b^2 + 50b + 7$

39. $4w^2 - 5w + 1$

Answer

$(4w-1)(w-1)$

40. $5x^2 - 17x + 6$

41. $4q^2 - 7q - 2$

Answer

$(4q+1)(q-2)$

42. $10y^2 - 53y - 111$

43. $6p^2 - 19pq + 10q^2$

Answer

$(2p-5q)(3p-2q)$

44. $21m^2 - 29mn + 10n^2$

45. $4a^2 + 17ab - 15b^2$

Answer

$(4a-3b)(a+5b)$

46. $6u^2 + 5uv - 14v^2$

47. $-16x^2 - 32x - 16$

Answer

$-16(x+1)(x+1)$

48. $-81a^2 + 153a + 18$

49. $-30q^3 - 140q^2 - 80q$

Answer

$-10q(3q+2)(q+4)$

50. $-5y^3 - 30y^2 + 35y$

Factor Trinomials of the Form $ax^2 + bx + c$ using the 'ac' Method

In the following exercises, factor using the 'ac' method.

51. $5n^2 + 21n + 4$

Answer

$(5n+1)(n+4)$

52. $8w^2 + 25w + 3$

53. $4k^2 - 16k + 15$

Answer

$(2k-3)(2k-5)$

54. $5s^2-9s+4$

55. $6y^2+y-15$

Answer

$(3y+5)(2y-3)$

Factor Using Substitution

In the following exercises, factor using substitution.

https://math.libretexts.org/@go/page/46374

67. $x^4 - x^2 - 12$

Answer

$(x^2 + 3)(x^2 - 4)$

68. $x^4 + 2x^2 - 8$

69. $x^4 - 3x^2 - 28$

Answer

$(x^2 - 7)(x^2 + 4)$

70. $x^4 - 13x^2 - 30$

71. $(x - 3)^2 - 5(x - 3) - 36$

Answer

$(x - 12)(x + 1)$

72. $(x - 2)^2 - 3(x - 2) - 54$

73. $(3y - 2)^2 - (3y - 2) - 2$

Answer

$(3y - 4)(3y - 1)$

74. $(5y - 1)^2 - 3(5y - 1) - 18$

Mixed Practice

In the following exercises, factor each expression using any method.

75. $u^2 - 12u + 36$

Answer

$(u - 6)(u - 6)$

76. $x^2 - 14x - 32$

77. $r^2 - 20rs + 64s^2$

Answer

$(r - 4s)(r - 16s)$

78. $q^2 - 29qr - 96r^2$

79. $12y^2 - 29y + 14$

Answer

$(4y - 7)(3y - 2)$

80. $12x^2+36y-24z$

81. $6n^2+5n-4$

Answer

$(2n-1)(3n+4)$

82. $3q^2+6q+2$

83. $13z^2+39z-26$

Answer

$13(z^2+3z-2)$

84. $5r^2+25r+30$

85. $3p^2+21p$

Answer

$3p(p+7)$

86. $7x^2-21x$

87. $6r^2+30r+36$

Answer

$6(r+2)(r+3)$

88. $18m^2+15m+3$

89. $24n^2+20n+4$

Answer

$4(2n+1)(3n+1)$

90. $4a^2+5a+2$

91. x^4-4x^2-12

Answer

$(x^2+2)(x^2-6)$

92. x^4-7x^2-8

93. $(x+3)^2-9(x+3)-36$

Answer

$(x-9)(x+6)$

94. $(x+2)^2-25(x+2)-54$

Writing Exercises

95. Many trinomials of the form x^2+bx+c factor into the product of two binomials $(x+m)(x+n)$. Explain how you find the values of m and n.

Answer

Answers will vary.

96. Tommy factored x^2-x-20 as $(x+5)(x-4)$. Sara factored it as $(x+4)(x-5)$. Ernesto factored it as $(x-5)(x-4)$. Who is correct? Explain why the other two are wrong.

97. List, in order, all the steps you take when using the "ac" method to factor a trinomial of the form ax^2+bx+c.

Answer

Answers will vary.

98. How is the "ac" method similar to the "undo FOIL" method? How is it different?

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
factor trinomials of the form x^2+bx+c			
factor trinomials of the form ax^2+bx+c using trial and error.			
factor trinomials of the form ax^2+bx+c with using the "ac" method.			
factor using substitution.			

b. After reviewing this checklist, what will you do to become confident for all objectives?

14.4: Factor Special Products

Learning Objectives

By the end of this section, you will be able to:

- Factor perfect square trinomials
- Factor differences of squares
- Factor sums and differences of cubes

Before you get started, take this readiness quiz.

1. Simplify: $(3x^2)^3$.
2. Multiply: $(m+4)^2$.
3. Multiply: $(x-3)(x+3)$.

We have seen that some binomials and trinomials result from special products—squaring binomials and multiplying conjugates. If you learn to recognize these kinds of polynomials, you can use the special products patterns to factor them much more quickly.

Factor Perfect Square Trinomials

Some trinomials are perfect squares. They result from multiplying a binomial times itself. We squared a binomial using the Binomial Squares pattern in a previous chapter.

$$\begin{matrix} (a & + & b)^2 \\ (3x & + & 4)^2 \end{matrix}$$

$$\begin{matrix} a^2 & + & 2 \cdot a & \cdot & b & + & b^2 \\ (3x)^2 & + & 2(3x & \cdot & 4) & + & 4^2 \end{matrix}$$

$$9x^2 + 24x + 16$$

The trinomial $9x^2+24x+16$ is called a *perfect square trinomial*. It is the square of the binomial $3x+4$.

In this chapter, you will start with a perfect square trinomial and factor it into its **prime** factors. You could factor this **trinomial** using the methods described in the last section, since it is of the form ax^2+bx+c. But if you recognize that the first and last terms are squares and the trinomial fits the perfect square trinomials pattern, you will save yourself a lot of work. Here is the pattern—the reverse of the binomial squares pattern.

PERFECT SQUARE TRINOMIALS PATTERN

If a and b are real numbers

$$a^2+2ab+b^2=(a+b)^2$$

$$a^2-2ab+b^2=(a-b)^2$$

To make use of this pattern, you have to recognize that a given trinomial fits it. Check first to see if the leading coefficient is a perfect square, a^2. Next check that the last term is a perfect square, b^2. Then check the middle term—is it the product, $2ab$? If everything checks, you can easily write the factors.

Example 14.4.1: How to Factor Perfect Square Trinomials

Factor: $9x^2+12x+4$.

Answer

Step 1. Does the trinomial fit the perfect square trinomials pattern, $a^2 + 2ab + b^2$? • Is the first term a perfect square? Write it as a square, a^2. • Is the last term a perfect square? Write it as a square, b^2. • Check the middle term. Is it $2ab$?	Is $9x^2$ a perfect square? Yes—write it as $(3x)^2$. Is 4 a perfect square? Yes—write it as $(2)^2$. Is $12x$ twice the product of $3x$ and 2? Does it match? Yes, so we have a perfect square trinomial!	$9x^2 + 12x + 4$ $(3x)^2$ $(3x)^2$ $(2)^2$ $2(3x)(2)$ $12x$
Step 2. Write the square of the binomial.		$9x^2 + 12x + 4$ $a^2 + 2 \cdot a \cdot b + b^2$ $(3x)^2 + 2 \cdot 3x \cdot 2 + 2^2$ $(a + b)^2$ $(3x + 2)^2$
Step 3. Check.		$(3x + 2)^2$ $(3x)^2 + 2 \cdot 3x \cdot 2 + 2^2$ $9x^2 + 12x + 4$ ✓

? Example 14.4.2

Factor: $4x^2 + 12x + 9$.

Answer

$(2x + 3)^2$

? Example 14.4.3

Factor: $9y^2 + 24y + 16$.

Answer

$(3y + 4)^2$

The sign of the middle term determines which pattern we will use. When the middle term is negative, we use the pattern $a^2 - 2ab + b^2$, which factors to $(a - b)^2$.

The steps are summarized here.

FACTOR PERFECT SQUARE TRINOMIALS

Step 1.	Does the trinomial fit the pattern?	$a^2 + 2ab + b^2$	$a^2 - 2ab + b^2$
	Are the first and last terms perfect squares?		
	Write them as squares.	$(a)^2$ $(b)^2$	$(a)^2$ $(b)^2$
	Check the middle term. Is it $2ab$?	$2 \cdot a \cdot b$	$2 \cdot a \cdot b$
Step 2.	Write the square of the binomial.	$(a + b)^2$	$(a - b)^2$
Step 3.	Check by multiplying.		

We'll work one now where the middle term is negative.

Example 14.4.4

Factor: $81y^2 - 72y + 16$.

Answer

The first and last terms are squares. See if the middle term fits the pattern of a **perfect square** trinomial. The middle term is negative, so the binomial square would be $(a-b)^2$.

	$81y^2 - 72y + 16$
Are the first and last terms perfect squares?	$(9y)^2 \qquad (4)^2$
Check the middle term.	$(9y)^2 \qquad (4)^2$ $2(9y)(4)$ $72y$
Does it match $(a-b)^2$? Yes.	$a^2 \quad -2 \quad a \quad b + b^2$ $(9y)^2 - 2 \cdot 9y \cdot 4 + 4^2$
Write as the square of a binomial.	$(9y-4)^2$
Check by multiplying:	$(9y-4)^2$ $(9y)^2 - 2 \cdot 9y \cdot 4 + 4^2$ $81y^2 - 72y + 16$✓

Example 14.4.5

Factor: $64y^2 - 80y + 25$.

Answer

$(8y-5)^2$

Example 14.4.6

Factor: $16z^2 - 72z + 81$.

Answer

$(4z-9)^2$

The next example will be a perfect square trinomial with two variables.

Example 14.4.7

Factor: $36x^2 + 84xy + 49y^2$.

Answer

	$36x^2 + 84xy + 49y^2$
Test each term to verify the pattern.	$a^2 \quad +2 \quad a \quad b + b^2$ $(6x)^2 + 2 \cdot 6x \cdot 7y + (7y)^2$
Factor.	$(6x+7y)^2$

Check by multiplying. $(6x+7y)^2$ $(6x)^2+2\cdot 6x\cdot 7y+(7y)^2$ $36x^2+84xy+49y^2$ ✓	

Example 14.4.8

Factor: $49x^2+84xy+36y^2$.

Answer

$(7x+6y)^2$

Example 14.4.9

Factor: $64m^2+112mn+49n^2$.

Answer

$(8m+7n)^2$

Remember the first step in factoring is to look for a greatest common factor. Perfect square trinomials may have a **GCF** in all three terms and it should be factored out first. And, sometimes, once the GCF has been factored, you will recognize a perfect square trinomial.

Example 14.4.10

Factor: $100x^2y-80xy+16y$.

Answer

	$100x^2y-80xy+16y$
Is there a GCF? Yes, $4y$, so factor it out.	$4y\left(25x^2-20x+4\right)$
Is this a perfect square trinomial?	
Verify the pattern.	$4y[(5x)^2-2\cdot 5x\cdot 2+2^2]$
Factor.	$4y(5x-2)^2$
Remember: Keep the factor $4y$ in the final product.	
Check: $4y(5x-2)^2$ $4y[(5x)2-2\cdot 5x\cdot 2+22]$ $4y(25x2-20x+4)$ 100x2y−80xy+16y\checkmark\]	

Example 14.4.11

Factor: $8x^2y-24xy+18y$.

Answer

$2y(2x-3)^2$

Example 14.4.12

Factor: $27p^2q+90pq+75q$.

Answer

$3q(3p+5)^2$

Factor Differences of Squares

The other special product you saw in the previous chapter was the Product of Conjugates pattern. You used this to multiply two binomials that were conjugates. Here's an example:

$$\begin{array}{c} (a-b)(a+b) \\ (3x-4)(3x+4) \\ (a)^2-(b)^2 \\ (3x)^2-(4)^2 \\ 9x^2-16 \end{array}$$

A difference of squares factors to a product of conjugates.

DIFFERENCE OF SQUARES PATTERN

If a and b are real numbers,

$$a^2-b^2=(a-b)(a+b)$$

difference: a^2 (squares) $-$ b^2 (squares); $(a-b)(a+b)$ (conjugates)

Remember, "difference" refers to subtraction. So, to use this pattern you must make sure you have a binomial in which two squares are being subtracted.

Example 14.4.13: How to Factor a Trinomial Using the Difference of Squares

Factor: $64y^2-1$.

Answer

Step 1. Does the binomial fit the pattern?		$64y^2-1$
• Is this a difference?	Yes	$64y^2-1$
• Are the first and last terms perfect squares?	Yes	
Step 2. Write them as squares.	Write them as x^2 and 2^2.	a^2-b^2 $(8y)^2-1^2$

Step 3. Write the product of conjugates.		$(a-b)(a+b)$ $(8y-1)(8y+1)$
Step 4. Check.		$(8y-1)(8y+1)$ $64y^2-1$ ✓

Example 14.4.14

Factor: $121m^2-1$.

Answer

$(11m-1)(11m+1)$

Example 14.4.15

Factor: $81y^2-1$.

Answer

$(9y-1)(9y+1)$

FACTOR DIFFERENCES OF SQUARES.

Step 1.	Does the binomial fit the pattern?	a^2-b^2
	Is this a difference?	____−____
	Are the first and last terms perfect squares?	
Step 2.	Write them as squares.	$(a)^2-(b)^2$
Step 3.	Write the product of conjugates.	$(a-b)(a+b)$
Step 4.	Check by multiplying.	

It is important to remember that *sums of squares do not factor into a product of binomials*. There are no binomial factors that multiply together to get a sum of squares. After removing any GCF, the expression a^2+b^2 is prime!

The next example shows variables in both terms.

Example 14.4.16

Factor: $144x^2-49y^2$.

Answer

	$144x^2-49y^2$
Is this a difference of squares? Yes.	$(12x)^2-(7y)^2$
Factor as the product of conjugates.	$(12x-7y)(12x+7y)$
Check by multiplying.	$(12x-7y)(12x+7y)$

Check by multiplying.

$(12x-7y)(12x+7y)$

$144x^2-49y^2$ ✓

Example 14.4.17

Factor: $196m^2 - 25n^2$.

Answer

$(14m - 5n)(14m + 5n)$

Example 14.4.18

Factor: $121p^2 - 9q^2$.

Answer

$(11p - 3q)(11p + 3q)$

As always, you should look for a common factor first whenever you have an expression to factor. Sometimes a common factor may "disguise" the difference of squares and you won't recognize the perfect squares until you factor the GCF.

Also, to completely factor the binomial in the next example, we'll factor a difference of squares twice!

Example 14.4.19

Factor: $48x^4y^2 - 243y^2$.

Answer

	$48x^4y^2 - 243y^2$
Is there a GCF? Yes, $3y^2$—factor it out!	$3y^2(16x^4 - 81)$
Is the binomial a difference of squares? Yes.	$3y^2\left((4x^2)^2 - (9)^2\right)$
Factor as a product of conjugates.	$3y^2(4x^2 - 9)(4x^2 + 9)$
Notice the first binomial is also a difference of squares!	$3y^2((2x)^2 - (3)^2)(4x^2 + 9)$
Factor it as the product of conjugates.	$3y^2(2x - 3)(2x + 3)(4x^2 + 9)$

The last factor, the sum of squares, cannot be factored.

Check by multiplying:

$3y^2(2x - 3)(2x + 3)(4x^2 + 9)$

$3y^2(4x^2 - 9)(4x^2 + 9)$

$3y^2(16x^4 - 81)$

$48x^4y^2 - 243y^2$ ✓

Example 14.4.20

Factor: $2x^4y^2 - 32y^2$.

Answer

$2y^2(x - 2)(x + 2)(x^2 + 4)$

Example 14.4.21

Factor: $7a^4c^2 - 7b^4c^2$.

Answer

$7c^2(a-b)(a+b)(a^2+b^2)$

The next example has a polynomial with 4 terms. So far, when this occurred we grouped the terms in twos and factored from there. Here we will notice that the first three terms form a perfect square trinomial.

Example 14.4.22

Factor: $x^2 - 6x + 9 - y^2$.

Answer

Notice that the first three terms form a perfect square trinomial.

	$x^2 - 6x + 9 - y^2$
Factor by grouping the first three terms.	$\underbrace{x^2 - 6x + 9}\ - y^2$
Use the perfect square trinomial pattern.	$(x-3)^2 - y^2$
Is this a difference of squares? Yes.	
Yes—write them as squares.	$\overset{a^2}{(x-3)^2} - \overset{b^2}{y^2}$
Factor as the product of conjugates.	$((\overset{a}{x-3}) - \overset{b}{y})((\overset{a}{x-3}) + \overset{b}{y})$
	$(x-3-y)(x-3+y)$

You may want to rewrite the solution as $(x-y-3)(x+y-3)$.

Example 14.4.23

Factor: $x^2 - 10x + 25 - y^2$.

Answer

$(x-5-y)(x-5+y)$

Example 14.4.24

Factor: $x^2 + 6x + 9 - 4y^2$.

Answer

$(x+3-2y)(x+3+2y)$

Factor Sums and Differences of Cubes

There is another special pattern for factoring, one that we did not use when we multiplied polynomials. This is the pattern for the sum and difference of cubes. We will write these formulas first and then check them by multiplication.

$$a^3 + b^3 = (a+b)(a^2 - ab + b^2$$

$$a^3 - b^3 = (a-b)(a^2 + ab + b^2)$$

We'll check the first pattern and leave the second to you.

	$(a+b)\left(a^2-ab+b^2\right)$
Distribute.	$a\left(a^2-ab+b^2\right)+b\left(a^2-ab+b^2\right)$
Multiply.	$a^3-a^2b+ab^2+a^2b-ab^2+b^3$
Combine like terms.	a^3+b^3

SUM AND DIFFERENCE OF CUBES PATTERN

$$a^3+b^3=(a+b)(a^2-ab+b^2$$
$$a^3-b^3=(a-b)(a^2+ab+b^2)$$

The two patterns look very similar, don't they? But notice the signs in the factors. The sign of the binomial factor matches the sign in the original binomial. And the sign of the middle term of the trinomial factor is the opposite of the sign in the original binomial. If you recognize the pattern of the signs, it may help you memorize the patterns.

$$a^3 \underbrace{+}_{\text{same sign}} b^3 = (a \underbrace{+}_{\text{opposite signs}} b)(a^2 - ab + b^2)$$

$$a^3 \underbrace{-}_{\text{same sign}} b^3 = (a \underbrace{-}_{\text{opposite signs}} b)(a^2 + ab + b^2)$$

The trinomial factor in the sum and difference of cubes pattern cannot be factored.

It be very helpful if you learn to recognize the cubes of the integers from 1 to 10, just like you have learned to recognize squares. We have listed the cubes of the integers from 1 to 10 in Table.

n	1	2	3	4	5	6	7	8	9	10
n^3	1	8	27	64	125	216	343	512	729	1000

Example 14.4.25: How to Factor the Sum or Difference of Cubes

Factor: x^3+64.

Answer

Step 1. Does the binomial fit the sum or difference of cubes pattern? • Is it a sum or difference? • Are the first and last terms perfect cubes?	This is a sum. Yes.	x^3+64 x^3+64
Step 2. Write the terms as cubes.	Write them as x^3 and 4^3.	a^3+b^3 x^3+4^3
Step 3. Use either the sum or difference of cubes pattern.	This is a sum of cubes.	$(a+b)\left(a^2-ab+b^2\right)$ $(x+4)\left(x^2-4x+4^2\right)$

Step 4. Simplify inside the parentheses.	It is already simplified.	$(x+4)(x^2-4x+16)$
Step 5. Check by multiplying the factors.		$\begin{array}{r} x^2-4x+16 \\ x+4 \\ \hline 4x^2-16x+64 \checkmark \\ x^3-4x^2+16x \\ \hline x^3 \qquad +64 \end{array}$

? Example 14.4.26

Factor: x^3+27.

Answer

$(x+3)(x^2-3x+9)$

? Example 14.4.27

Factor: y^3+8.

Answer

$(y+2)(y^2-2y+4)$

FACTOR THE SUM OR DIFFERENCE OF CUBES.

1. Does the binomial fit the sum or difference of cubes pattern?
   Is it a sum or difference?
   Are the first and last terms perfect cubes?
2. Write them as cubes.
3. Use either the sum or difference of cubes pattern.
4. Simplify inside the parentheses.
5. Check by multiplying the factors.

? Example 14.4.28

Factor: $27u^3-125v^3$.

Answer

	$27u^3-125v^3$
This binomial is a difference. The first and last terms are perfect cubes.	
Write the terms as cubes.	$\overset{a^3}{(3u)^3} - \overset{b^3}{(5v)^3}$
Use the difference of cubes pattern.	$\left(\overset{a}{3u} - \overset{b}{5v}\right)\left(\overset{a^2}{(3u)^2} + \overset{ab}{3u \cdot 5v} + \overset{b^2}{(5v)^2}\right)$
Simplify.	$\left(\overset{a}{3u} - \overset{b}{5v}\right)\left(\overset{a^2}{9u^2} + \overset{ab}{15uv} + \overset{b^2}{25v^2}\right)$
Check by multiplying.	We'll leave the check to you.

Example 14.4.29

Factor: $8x^3 - 27y^3$.

Answer

$(2x - 3y)(4x^2 + 6xy + 9y^2)$

Example 14.4.30

Factor: $1000m^3 - 125n^3$.

Answer

$(10m - 5n)(100m^2 + 50mn + 25n^2)$

In the next example, we first factor out the GCF. Then we can recognize the sum of cubes.

Example 14.4.31

Factor: $6x^3y + 48y^4$.

Answer

	$6x^3y + 48y^4$
Factor the common factor.	$6y\left(x^3 + 8y^3\right)$
This binomial is a sum The first and last terms are perfect cubes.	
Write the terms as cubes.	$6y\left(x^3 + (2y)^3\right)$
Use the sum of cubes pattern.	$6y\left(x + 2y\right)\left(x^2 - x \cdot 2y + (2y)^2\right)$
Simplify.	$6y(x + 2y)(x^2 - 2xy + 4y^2)$

Check:

To check, you may find it easier to multiply the sum of cubes factors first, then multiply that product by 6y.6y. We'll leave the multiplication for you.

Example 14.4.32

Factor: $500p^3 + 4q^3$.

Answer

$4(5p + q)(25p^2 - 5pq + q^2)$

Example 14.4.33

Factor: $432c^3 + 686d^3$.

Answer

$2(6c + 7d)(36c^2 - 42cd + 49d^2)$

The first term in the next example is a binomial cubed.

Example 14.4.34

Factor: $(x+5)^3-64x^3$.

Answer

	$(x+5)^3-64x^3$
This binomial is a difference. The first and last terms are perfect cubes.	
Write the terms as cubes.	$\overset{a^3}{(x+5)^3}-\overset{b^3}{(4x)^3}$
Use the difference of cubes pattern.	$\left(\overset{a}{(x+5)}-\overset{b}{4x}\right)\left(\overset{a^2}{(x+5)^2}+\overset{a}{(x+5)}\cdot\overset{b}{4x}+\overset{b^2}{(4x)^2}\right)$
Simplify.	$(x+5-4x)\left(x^2+10x+25+4x^2+20x+16x^2\right)$
	$(-3x+5)\left(21x^2+30x+25\right)$
Check by multiplying.	We'll leave the check to you.

Example 14.4.35

Factor: $(y+1)^3-27y^3$.

Answer

$(-2y+1)(13y^2+5y+1)$

Example 14.4.36

Factor: $(n+3)^3-125n^3$.

Answer

$(-4n+3)(31n^2+21n+9)$

Access this online resource for additional instruction and practice with factoring special products.

- Factoring Binomials-Cubes #2

Key Concepts

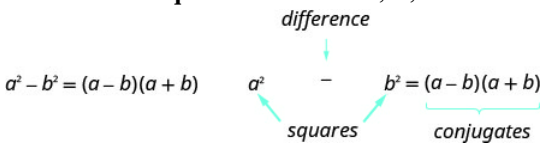
- **Perfect Square Trinomials Pattern:** If *a* and *b* are real numbers,

$$a^2+2ab+b^2=(a+b)^2$$
$$a^2-2ab+b^2=(a-b)^2$$

- **How to factor perfect square trinomials.**

Step 1.	Does the trinomial fit the pattern?	$a^2+2ab+b^2$	$a^2-2ab+b^2$
	Are the first and last terms perfect squares?		
	Write them as squares.	$(a)^2 \quad (b)^2$	$(a)^2 \quad (b)^2$
	Check the middle term. Is it $2ab$?	$\searrow 2\cdot a\cdot b \swarrow$	$\searrow 2\cdot a\cdot b \swarrow$
Step 2.	Write the square of the binomial.	$(a+b)^2$	$(a-b)^2$
Step 3.	Check by multiplying.		

- **Difference of Squares Pattern:** If a,ba,b are real numbers,



- **How to factor differences of squares.**

Step 1.	Does the binomial fit the pattern?	$a^2 - b^2$
	Is this a difference?	____−____
	Are the first and last terms perfect squares?	
Step 2.	Write them as squares.	$(a)^2 - (b)^2$
Step 3.	Write the product of conjugates.	$(a-b)(a+b)$
Step 4.	Check by multiplying.	

- **Sum and Difference of Cubes Pattern**
  $a^3 + b3 = (a+b)(a^2 - ab + b^2)$
  $a^3 - b^3 = (a-b)(a^2 + ab + b^2)$
- **How to factor the sum or difference of cubes.**
  1. Does the binomial fit the sum or difference of cubes pattern?
     Is it a sum or difference?
     Are the first and last terms perfect cubes?
  2. Write them as cubes.
  3. Use either the sum or difference of cubes pattern.
  4. Simplify inside the parentheses
  5. Check by multiplying the factors.

14.4E: Exercises

Practice Makes Perfect

Factor Perfect Square Trinomials

In the following exercises, factor completely using the perfect square trinomials pattern.

1. $16y^2+24y+9$

Answer

$(4y+3)^2$

2. $25v^2+20v+4$

3. $36s^2+84s+49$

Answer

$(6s+7)^2$

4. $49s^2+154s+121$

5. $100x^2-20x+1$

Answer

$(10x-1)^2$

6. $64z^2-16z+1$

7. $25n^2-120n+144$

Answer

$(5n-12)^2$

8. $4p^2-52p+169$

9. $49x^2+28xy+4y^2$

Answer

$(7x+2y)^2$

10. $25r^2+60rs+36s^2$

11. $100y^2-52y+1$

Answer

$(50y-1)(2y-1)$

12. $64m^2-34m+1$

13. $10jk^2+80jk+160j$

https://math.libretexts.org/@go/page/46376

Answer

$10j(k+4)^2$

14. $64x^2y-96xy+36y$

15. $75u^4-30u^3v+3u^2v^2$

Answer

$3u^2(5u-v)^2$

16. $90p^4+300p^4q+250p^2q^2$

Factor Differences of Squares

In the following exercises, factor completely using the difference of squares pattern, if possible.

17. $25v^2-1$

Answer

$(5v-1)(5v+1)$

18. $169q^2-1$

19. $4-49x^2$

Answer

$(7x-2)(7x+2)$

20. $121-25s^2$

21. $6p^2q^2-54p^2$

Answer

$6p^2(q-3)(q+3)$

22. $98r^3-72r$

23. $24p^2+54$

Answer

$6(4p^2+9)$

24. $20b^2+140$

25. $121x^2-144y^2$

Answer

$(11x-12y)(11x+12y)$

26. $49x^2-81y^2$

27. $169c^2 - 36d^2$

Answer

$(13c - 6d)(13c + 6d)$

28. $36p^2 - 49q^2$

29. $16z^4 - 1$

Answer

$(2z - 1)(2z + 1)(4z^2 + 1)$

30. $m^4 - n^4$

31. $162a^4b^2 - 32b^2$

Answer

$2b^2(3a - 2)(3a + 2)(9a^2 + 4)$

32. $48m^4n^2 - 243n^2$

33. $x^2 - 16x + 64 - y^2$

Answer

$(x - 8 - y)(x - 8 + y)$

34. $p^2 + 14p + 49 - q^2$

35. $a^2 + 6a + 9 - 9b^2$

Answer

$(a + 3 - 3b)(a + 3 + 3b)$

36. $m^2 - 6m + 9 - 16n^2$

Factor Sums and Differences of Cubes

In the following exercises, factor completely using the sums and differences of cubes pattern, if possible.

37. $x^3 + 125$

Answer

$(x + 5)(x^2 - 5x + 25)$

38. $n^6 + 512$

39. $z^6 - 27$

Answer

$(z^2 - 3)(z^4 + 3z^2 + 9)$

40. $v^3 - 216$

41. $8 - 343t^3$

Answer

$(2-7t)(4+14t+49t^2)$

42. $125 - 27w^3$

43. $8y^3 - 125z^3$

Answer

$(2y-5z)(4y^2+10yz+25z^2)$

44. $27x^3 - 64y^3$

45. $216a^3 + 125b^3$

Answer

$(6a+5b)(36a^2-30ab+25b^2)$

46. $27y^3 + 8z^3$

47. $7k^3 + 56$

Answer

$7(k+2)(k^2-2k+4)$

48. $6x^3 - 48y^3$

49. $2x^2 - 16x^2y^3$

Answer

$2x^2(1-2y)(1+2y+4y^2)$

50. $-2x^3y^2 - 16y^5$

51. $(x+3)^3 + 8x^3$

Answer

$9(x+1)(x^2+3)$

52. $(x+4)^3 - 27x^3$

53. $(y-5)^3 - 64y^3$

Answer

$-(3y+5)(21y^2-30y+25)$

54. $(y-5)^3+125y^3$

Mixed Practice

In the following exercises, factor completely.

55. $64a^2-25$

Answer

$(8a-5)(8a+5)$

56. $121x^2-144$

57. $27q^2-3$

Answer

$3(3q-1)(3q+1)$

58. $4p^2-100$

59. $16x^2-72x+81$

Answer

$(4x-9)^2$

60. $36y^2+12y+1$

61. $8p^2+2$

Answer

$2(4p^2+1)$

62. $81x^2+169$

63. $125-8y^3$

Answer

$(5-2y)(25+10y+4y^2)$

64. $27u^3+1000$

65. $45n^2+60n+20$

Answer

$5(3n+2)^2$

66. $48q^3-24q^2+3q$

67. $x^2-10x+25-y^2$

Answer

$(x+y-5)(x-y-5)$

68. $x^2+12x+36-y^2$

69. $(x+1)^3+8x^3$

Answer

$(3x+1)(3x^2+1)$

70. $(y-3)^3-64y^3$

Writing Exercises

71. Why was it important to practice using the binomial squares pattern in the chapter on multiplying polynomials?

Answer

Answers will vary.

72. How do you recognize the binomial squares pattern?

73. Explain why $n^2+25 \neq (n+5)^2$. Use algebra, words, or pictures.

Answer

Answers will vary.

74. Maribel factored $y^2-30y+81$ as $(y-9)^2$. Was she right or wrong? How do you know?

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
factor perfect square trinomials.			
factor differences of squares.			
factor sums and differences of cubes.			

b. What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 14.4E: Exercises is shared under a CC BY license and was authored, remixed, and/or curated by OpenStax.

14.5: General Strategy for Factoring Polynomials

Learning Objectives

By the end of this section, you will be able to:

- Recognize and use the appropriate method to factor a polynomial completely

Recognize and Use the Appropriate Method to Factor a Polynomial Completely

You have now become acquainted with all the methods of factoring that you will need in this course. The following chart summarizes all the factoring methods we have covered, and outlines a strategy you should use when factoring polynomials.

GENERAL STRATEGY FOR FACTORING POLYNOMIALS

GCF

Binomial	Trinomial	More than 3 terms
• **Difference of Squares** $a^2 - b^2 = (a - b)(a + b)$	• $x^2 + bx + c$ $(x \quad)(x \quad)$	• grouping
• **Sum of Squares** Sums of squares do not factor.	• $ax^2 + bx + c$ ◦ **'a' and 'c' squares** $(a + b)^2 = a^2 + 2ab + b^2$ $(a - b)^2 = a^2 - 2ab + b^2$	
• **Sum of Cubes** $a^3 + b^3 = (a + b)(a^2 - ab + b^2)$	◦ **'ac' method**	
• **Difference of Cubes** $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$		

USE A GENERAL STRATEGY FOR FACTORING POLYNOMIALS.

1. Is there a greatest common factor?
   Factor it out.
2. Is the polynomial a binomial, trinomial, or are there more than three terms?
   If it is a binomial:
   - Is it a sum?
     Of squares? Sums of squares do not factor.
     Of cubes? Use the sum of cubes pattern.
   - Is it a difference?
     Of squares? Factor as the product of conjugates.
     Of cubes? Use the difference of cubes pattern.

   If it is a trinomial:
   - Is it of the form $x^2 + bx + c$? Undo FOIL.
   - Is it of the form $ax^2 + bx + c$?
     If a and c are squares, check if it fits the trinomial square pattern.
     Use the trial and error or "ac" method.

   If it has more than three terms:
   - Use the grouping method.
3. Check.
   Is it factored completely?
   Do the factors multiply back to the original polynomial?

Remember, a polynomial is completely factored if, other than monomials, its factors are **prime**!

Example 14.5.1

Factor completely: $7x^3 - 21x^2 - 70x$.

Solution

$7x^3 - 21x^2 - 70x$

Is there a GCF? Yes, $7x$.

Factor out the GCF. $7x(x^2 - 3x - 10)$

In the parentheses, is it a binomial, trinomial, or are there more terms?

Trinomial with leading coefficient 1.

"Undo" FOIL. $7x(x \quad)(x \quad)$

$7x(x+2)(x-5)$

Is the expression factored completely? Yes.

Neither binomial can be factored.

Check your answer.

Multiply.

$$7x(x+2)(x-5)$$
$$7x(x^2 - 5x + 2x - 10)$$
$$7x(x^2 - 3x - 10)$$
$$7x^3 - 21x^2 - 70x \checkmark$$

Try It 14.5.1

Factor completely: $8y^3 + 16y^2 - 24y$.

Answer

$8y(y-1)(y+3)$

Try It 14.5.2

Factor completely: $5y^3 - 15y^2 - 270y$.

Answer

$5y(y-9)(y+6)$

Be careful when you are asked to factor a binomial as there are several options!

Example 14.5.2

Factor completely: $24y^2 - 150$

Solution

	$24y^2-150$
Is there a GCF? Yes, 6.	
Factor out the GCF.	$6(4y^2-25)$
In the parentheses, is it a binomial, trinomial or are there more than three terms? Binomial.	
Is it a sum? No.	
Is it a difference? Of squares or cubes? Yes, squares.	$6((2y)^2-(5)^2)$
Write as a product of conjugates.	$6(2y-5)(2y+5)$

Is the expression factored completely?
Neither binomial can be factored.

Check:

Multiply.

$6(2y-5)(2y+5)$

$6(4y^2-25)$
$24y^2-150$✓

? Try It 14.5.3

Factor completely: $16x^3-36x$.

Answer

$4x(2x-3)(2x+3)$

? Try It 14.5.4

Factor completely: $27y^2-48$.

Answer

$3(3y-4)(3y+4)$

The next example can be factored using several methods. Recognizing the trinomial squares pattern will make your work easier.

? Example 14.5.3

Factor completely: $4a^2-12ab+9b^2$.

Solution

$4a^2-12ab+9b^2$

Is there a GCF? No.

Is it a binomial, trinomial, or are there more terms?

Trinomial with $a \neq 1$. But the first term is a perfect square.

Is the last term a perfect square? Yes. $(2a)^2-12ab+(3b)^2$

Does it fit the pattern, $a^2-2ab+b^2$? Yes. $(2a)^2-12ab+(3b)^2$

$\searrow \quad -2(2a)(3b) \quad \swarrow$

Write it as a square. $(2a-3b)^2$

Is the expression factored completely? Yes.

The binomial cannot be factored.

Check your answer.

Multiply.

$$(2a-3b)^2$$
$$(2a)^2-2\cdot 2a\cdot 3b+(3b)^2$$
$$4a^2-12ab+9b^2 \checkmark$$

? Try It 14.5.5

Factor completely: $4x^2+20xy+25y^2$.

Answer

$(2x+5y)^2$

? Try It 14.5.6

Factor completely: $9x^2-24xy+16y^2$.

Answer

$(3x-4y)^2$

Remember, sums of squares do not factor, but sums of cubes do!

? Example 14.5.4

Factor completely $12x^3y^2+75xy^2$.

Solution

	$12x^3y^2+75xy^2$
Is there a GCF? Yes, $3xy^2$.	
Factor out the GCF.	$3xy^2(4x^2+25)$
In the parentheses, is it a binomial, trinomial, or are there more than three terms? Binomial.	
Is it a sum? Of squares? Yes.	Sums of squares are prime.
Is the expression factored completely? Yes.	

Check:

Multiply.

$3xy^2(4x^2+25)$

$12x^3y^2+75xy^2$ ✓

? Try It 14.5.7

Factor completely: $50x^3y+72xy$.

Answer

$2xy(25x^2+36)$

? Try It 14.5.8

Factor completely: $27xy^3+48xy$.

Answer

$3xy(9y^2+16)$

When using the sum or difference of cubes pattern, being careful with the signs.

? Example 14.5.5

Factor completely: $24x^3+81y^3$.

Solution

Is there a GCF? Yes, 3.	$24x^3+81y^3$
Factor it out.	$3(8x^3+27y^3)$
In the parentheses, is it a binomial, trinomial, of are there more than three terms? Binomial.	
Is it a sum or difference? Sum.	
Of squares or cubes? Sum of cubes.	$3\left(\overset{a^3}{(2x)^3}+\overset{b^3}{(3y)^3}\right)$
Write it using the sum of cubes pattern.	$3\left(\overset{a}{2x}+\overset{b}{3y}\right)\left(\overset{a^2}{(2x)^2}-\overset{ab}{2x\cdot 3y}+\overset{b^2}{(3y)^3}\right)$
Is the expression factored completely? Yes.	$3(2x+3y)(4x^2-6xy+9y^2)$

Check by multiplying.

Try It 14.5.9

Factor completely: $250m^3+432n^3$.

Answer

$2(5m+6n)(25m^2-30mn+36n^2)$

Try It 14.5.10

Factor completely: $2p^3+54q^3$.

Answer

$2(p+3q)(p^2-3pq+9q^2)$

Example 14.5.6

Factor completely: $3x^5y-48xy$.

Solution

	$3x^5y-48xy$
Is there a GCF? Factor out $3xy$	$3xy(x^4-16)$
Is the binomial a sum or difference? Of squares or cubes? Write it as a difference of squares.	$3xy\left((x^2)^2-(4)2\right)$
Factor it as a product of conjugates	$3xy(x^2-4)(x^2+4)$
The first binomial is again a difference of squares.	$3xy\left((x)^2-(2)^2\right)(x^2+4)$
Factor it as a product of conjugates.	$3xy(x-2)(x+2)(x^2+4)$
Is the expression factored completely? Yes.	
Check your answer.	
Multiply.	
$3xy(x-2)(x+2)(x^2+4)$	
$3xy(x^2-4)(x^2+4)$	
$3xy(x^4-16)$	
$3x^5y-48xy$✓	

Try It 14.5.11

Factor completely: $4a^5b-64ab$.

Answer

$4ab(a^2+4)(a-2)(a+2)$

Try It 14.5.12

Factor completely: $7xy^5-7xy$.

Answer

$7xy(y^2+1)(y-1)(y+1)$

? Example 14.5.7

Factor completely: $4x^2+8bx-4ax-8ab$.

Solution

	$4x^2+8bx-4ax-8ab$
Is there a GCF? Factor out the GCF, 4.	$4(x^2+2bx-ax-2ab)$
There are four terms. Use grouping.	$4[x(x+2b)-a(x+2b)]4(x+2b)(x-a)$

Is the expression factored completely? Yes.

Check your answer.

Multiply.

$$4(x+2b)(x-a)$$
$$4(x^2-ax+2bx-2ab)$$
$$4x^2+8bx-4ax-8ab\checkmark$$

? Try It 14.5.13

Factor completely: $6x^2-12xc+6bx-12bc$.

Answer

$6(x+b)(x-2c)$

? Try It 14.5.14

Factor completely: $16x^2+24xy-4x-6y$.

Answer

$2(4x-1)(2x+3y)$

Taking out the complete GCF in the first step will always make your work easier.

? Example 14.5.8

Factor completely: $40x^2y+44xy-24y$.

Solution

	$40x^2y+44xy-24y$
Is there a GCF? Factor out the GCF, $4y$.	$4y(10x^2+11x-6)$
Factor the trinomial with $a\neq 1$.	$4y(10x^2+11x-6)$
	$4y(5x-2)(2x+3)$

Is the expression factored completely? Yes.

Check your answer.

Multiply.

$$4y(5x-2)(2x+3)$$
$$4y(10x^2+11x-6)$$
$$40x^2y+44xy-24y\checkmark$$

Try It 14.5.15

Factor completely: $4p^2q-16pq+12q$.

Answer

$4q(p-3)(p-1)$

Try It 14.5.16

Factor completely: $6pq^2-9pq-6p$.

Answer

$3p(2q+1)(q-2)$

When we have factored a polynomial with four terms, most often we separated it into two groups of two terms. Remember that we can also separate it into a trinomial and then one term.

Example 14.5.9

Factor completely: $9x^2-12xy+4y^2-49$.

Solution

	$9x^2-12xy+4y^2-49$
Is there a GCF? No.	
With more than 3 terms, use grouping. Last 2 terms have no GCF. Try grouping first 3 terms.	$9x^2-12xy+4y^2-49$
Factor the trinomial with $a\neq 1$. But the first term is a perfect square.	
Is the last term of the trinomial a perfect square? Yes.	$(3x)^2-12xy+(2y)^2-49$
Does the trinomial fit the pattern, $a^2-2ab+b^2$? Yes.	$(3x)^2-12xy+(2y)^2-49$ $\searrow \quad -2(3x)(2y) \quad \swarrow$
Write the trinomial as a square.	$(3x-2y)^2-49$
Is this binomial a sum or difference? Of squares or cubes? Write it as a difference of squares.	$(3x-2y)^2-72$
Write it as a product of conjugates.	$((3x-2y)-7)((3x-2y)+7)$ $(3x-2y-7)(3x-2y+7)$
Is the expression factored completely? Yes.	
Check your answer.	
Multiply.	
	$(3x-2y-7)(3x-2y+7)$
	$9x^2-6xy-21x-6xy+4y^2+14y+21x-14y-49$
	$9x^2-12xy+4y^2-49$✓

Try It 14.5.17

Factor completely: $4x^2-12xy+9y^2-25$.

Answer

$(2x-3y-5)(2x-3y+5)$

? Try It 14.5.18

Factor completely: $16x^2 - 24xy + 9y^2 - 64$.

Answer

$(4x - 3y - 8)(4x - 3y + 8)$

Key Concepts

General Strategy for Factoring Polynomials

GCF

Binomial	Trinomial	More than 3 terms
• **Difference of Squares** $a^2 - b^2 = (a - b)(a + b)$	• $x^2 + bx + c$ $(x \quad)(x \quad)$	• grouping
• **Sum of Squares** Sums of squares do not factor.	• $ax^2 + bx + c$ ∘ **'a' and 'c' squares** $(a + b)^2 = a^2 + 2ab + b^2$ $(a - b)^2 = a^2 - 2ab + b^2$	
• **Sum of Cubes** $a^3 + b^3 = (a + b)(a^2 - ab + b^2)$	∘ **'ac' method**	
• **Difference of Cubes** $a^3 - b^3 = (a - b)(a^2 + ab + b^2)$		

- **How to use a general strategy for factoring polynomials.**
  1. Is there a greatest common factor?
     Factor it out.
  2. Is the polynomial a binomial, trinomial, or are there more than three terms?
     If it is a binomial:
     Is it a sum?
     Of squares? Sums of squares do not factor.
     Of cubes? Use the sum of cubes pattern.
     Is it a difference?
     Of squares? Factor as the product of conjugates.
     Of cubes? Use the difference of cubes pattern.
     If it is a trinomial:
     Is it of the form $x^2 + bx + c$? Undo FOIL.
     Is it of the form $ax^2 + bx + c$?
     If *a* and *c* are squares, check if it fits the trinomial square pattern.
     Use the trial and error or "ac" method.
     If it has more than three terms:
     Use the grouping method.
  3. Check.
     Is it factored completely?
     Do the factors multiply back to the original polynomial?

14.5E: Exercises

Practice Makes Perfect

Recognize and Use the Appropriate Method to Factor a Polynomial Completely

In the following exercises, factor completely.

1. $2n^2+13n-7$

Answer

$(2n-1)(n+7)$

2. $8x^2-9x-3$

3. a^5+9a^3

Answer

$a^3(a^2+9)$

4. $75m^3+12m$

5. $121r^2-s^2$

Answer

$(11r-s)(11r+s)$

6. $49b^2-36a^2$

7. $8m^2-32$

Answer

$8(m-2)(m+2)$

8. $36q^2-100$

9. $25w^2-60w+36$

Answer

$(5w-6)^2$

10. $49b^2-112b+64$

11. $m^2+14mn+49n^2$

Answer

$(m+7n)^2$

12. $64x^2+16xy+y^2$

13. $7b^2+7b-42$

Answer

$7(b+3)(b-2)$

14. $30n^2+30n+72$

15. $3x^4y-81xy$

Answer

$3xy(x-3)(x^2+3x+9)$

16. $4x^5y-32x^2y$

17. k^4-16

Answer

$(k-2)(k+2)(k^2+4)$

18. m^4-81

19. $5x5y^2-80xy^2$

Answer

$5xy^2(x^2+4)(x+2)(x-2)$

20. $48x^5y^2-243xy^2$

21. $15pq-15p+12q-12$

Answer

$3(5p+4)(q-1)$

22. $12ab-6a+10b-5$

23. $4x^2+40x+84$

Answer

$4(x+3)(x+7)$

24. $5q^2-15q-90$

25. $4u^5v+4u^2v^3$

Answer

$u^2(u+1)(u^2-u+1)$

26. $5m^4n+320mn^4$

27. $4c^2+20cd+81d^2$

Answer

prime

28. $25x^2+35xy+49y^2$

29. $10m^4-6250$

Answer

$10(m-5)(m+5)(m^2+25)$

30. $3v^4-768$

31. $36x^2y+15xy-6y$

Answer

$3y(3x+2)(4x-1)$

32. $60x^2y-75xy+30y$

33. $8x^3-27y^3$

Answer

$(2x-3y)(4x^2+6xy+9y^2)$

34. $64x^3+125y^3$

35. y^6-1

Answer

$(y+1)(y-1)(y^2-y+1)$

36. y^6+1

37. $9x^2-6xy+y^2-49$

Answer

$(3x-y+7)(3x-y-7)$

38. $16x^2-24xy+9y^2-64$

39. $(3x+1)^2-6(3x-1)+9$

Answer

$(3x-2)2$

40. $(4x-5)^2-7(4x-5)+12$

Writing Exercises

41. Explain what it mean to factor a polynomial completely.

Answer

Answers will vary.

42. The difference of squares $y^4 - 625$ can be factored as $(y^2 - 25)(y^2 + 25)$. But it is not completely factored. What more must be done to completely factor.

43. Of all the factoring methods covered in this chapter (GCF, grouping, undo FOIL, 'ac' method, special products) which is the easiest for you? Which is the hardest? Explain your answers.

Answer

Answers will vary.

44. Create three factoring problems that would be good test questions to measure your knowledge of factoring. Show the solutions.

Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
recognize and use the appropriate method to factor a polynomial completely.			

b. On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

14.6: Polynomial Equations

Learning Objectives

By the end of this section, you will be able to:

- Use the Zero Product Property
- Solve quadratic equations by factoring
- Solve equations with polynomial functions
- Solve applications modeled by polynomial equations

Before you get started, take this readiness quiz.

1. Solve: $5y-3=0$.
   If you missed this problem, review [link].
2. Factor completely: n^3-9n^2-22n.
   If you missed this problem, review [link].
3. If $f(x)=8x-16$, find $f(3)$ and solve $f(x)=0$.
   If you missed this problem, review [link].

We have spent considerable time learning how to factor polynomials. We will now look at polynomial equations and solve them using factoring, if possible.

A **polynomial equation** is an equation that contains a polynomial expression. The **degree of the polynomial equation** is the degree of the polynomial.

POLYNOMIAL EQUATION

A **polynomial equation** is an equation that contains a polynomial expression.

The **degree of the polynomial equation** is the degree of the polynomial.

We have already solved polynomial equations of **degree one**. Polynomial equations of degree one are linear equations are of the form $ax+b=c$.

We are now going to solve polynomial equations of **degree two**. A polynomial equation of degree two is called a **quadratic equation**. Listed below are some examples of quadratic equations:

$$x^2+5x+6=0 \qquad 3y^2+4y=10 \qquad 64u^2-81=0 \qquad n(n+1)=42$$

The last equation doesn't appear to have the variable squared, but when we simplify the expression on the left we will get n^2+n.

The general form of a quadratic equation is $ax^2+bx+c=0$, with $a\neq 0$. (If $a=0$, then $0\cdot x^2=0$ and we are left with no quadratic term.)

QUADRATIC EQUATION

An equation of the form $ax^2+bx+c=0$ is called a quadratic equation.

$$a, b, \text{ and } c \text{ are real numbers and } a\neq 0$$

To solve quadratic equations we need methods different from the ones we used in solving linear equations. We will look at one method here and then several others in a later chapter.

Use the Zero Product Property

We will first solve some quadratic equations by using the **Zero Product Property**. The Zero Product Property says that if the product of two quantities is zero, then at least one of the quantities is zero. The only way to get a product equal to zero is to multiply by zero itself.

ZERO PRODUCT PROPERTY

If $a \cdot b = 0$, then either $a = 0$ or $b = 0$ or both.

We will now use the Zero Product Property, to solve a **quadratic equation**.

Example 14.6.1: How to Solve a Quadratic Equation Using the Zero Product Property

Solve: $(5n-2)(6n-1)=0$.

Answer

Step 1. Set each factor equal to zero.	The product equals zero, so at least one factor must equal zero.	$(5n-2)(6n-1)=0$ $5n-2=0$ or $6n-1=0$
Step 2. Solve the linear equations.	Solve each equation.	$n=\frac{2}{5}$ $n=\frac{1}{6}$
Step 3. Check.	Substitute each solution separately into the original equation.	$n=\frac{2}{5}$ $(5n-2)(6n-1)=0$ $\left(5\cdot\frac{2}{5}-2\right)\left(6\cdot\frac{2}{5}-1\right)\stackrel{?}{=}0$ $(2-2)\left(\frac{12}{5}-1\right)\stackrel{?}{=}0$ $0\cdot\frac{7}{5}\stackrel{?}{=}0$ $0=0$ ✓ $n=\frac{1}{6}$ $(5n-2)(6n-1)=0$ $\left(5\cdot\frac{1}{6}-2\right)\left(6\cdot\frac{1}{6}-1\right)\stackrel{?}{=}0$ $\left(\frac{5}{6}-\frac{12}{6}\right)(1-1)\stackrel{?}{=}0$ $\left(-\frac{7}{6}\right)(0)\stackrel{?}{=}0$ $0=0$ ✓

Example 14.6.2

Solve: $(3m-2)(2m+1)=0$.

Answer

$m=\frac{2}{3}$, $m=-\frac{1}{2}$

Example 14.6.3

Solve: $(4p+3)(4p-3)=0$.

Answer

$p=-\frac{3}{4}$, $p=\frac{3}{4}$

USE THE ZERO PRODUCT PROPERTY.

1. Set each factor equal to zero.
2. Solve the linear equations.
3. Check.

Solve Quadratic Equations by Factoring

The Zero Product Property works very nicely to solve quadratic equations. The quadratic equation must be factored, with zero isolated on one side. So we be sure to start with the quadratic equation in **standard form**, $ax^2+bx+c=0$. Then we factor the expression on the left.

Solve: $2y^2=13y+45$.

Answer

Step 1. Write the quadratic equation in standard form, $ax^2+bx+c=0$.	Write the equation in standard form.	$2y^2=13y+45$ $2y^2-13y-45=0$
Step 2. Factor the quadratic expression.	Factor $2y^2-13y+45$ $(2y+5)(y-9)$	$(2y+5)(y-9)=0$
Step 3. Use the Zero Product Property.	Set each factor equal to zero. We have two linear equations.	$2y+5=0$ $y-9=0$
Step 4. Solve the linear equations.		$y=-\frac{5}{2}$ $y=9$
Step 5. Check. Substitute each solution separately into the original equation.	Substitute each solution separately into the original equation.	$y=-\frac{5}{2}$ $2y^2=13y+45$ $2\left(-\frac{5}{2}\right)^2 \stackrel{?}{=} 13\left(-\frac{5}{2}\right)+45$ $2\left(\frac{25}{4}\right) \stackrel{?}{=} \left(-\frac{65}{2}\right)+\frac{90}{2}$ $\frac{25}{2}=\frac{25}{2}$ ✓ $y=9$ $2y^2=13y+45$ $2(9)^2 \stackrel{?}{=} 13(9)+45$ $2(81) \stackrel{?}{=} 117+45$ $162=162$ ✓

Example 14.6.5

Solve: $3c^2=10c-8$.

Answer

$c=2,\ c=\frac{4}{3}$

Example 14.6.6

Solve: $2d^2 - 5d = 3$.

Answer

$d = 3,\ d = -12$

SOLVE A QUADRATIC EQUATION BY FACTORING.

1. Write the quadratic equation in standard form, $ax^2 + bx + c = 0$.
2. Factor the quadratic expression.
3. Use the Zero Product Property.
4. Solve the linear equations.
5. Check. Substitute each solution separately into the original equation.

Before we factor, we must make sure the **quadratic equation** is in **standard form**.

Solving quadratic equations by factoring will make use of all the factoring techniques you have learned in this chapter! Do you recognize the special product pattern in the next example?

Example 14.6.7

Solve: $169q^2 = 49$.

Answer

	$169x^2 = 49$
Write the quadratic equation in standard form.	$169x^2 - 49 = 0$
Factor. It is a difference of squares.	$(13x - 7)(13x + 7) = 0$
Use the Zero Product Property to set each factor to 0.	
	$13x - 7 = 0 \quad 13x + 7 = 0$
Solve each equation.	$13x = 7 \quad 13x = -7$
	$x = \frac{7}{13} \quad x = -\frac{7}{13}$

Check:

We leave the check up to you.

Example 14.6.8

Solve: $25p^2 = 49$.

Answer

$p = \frac{7}{5}, p = -\frac{7}{5}$

Example 14.6.9

Solve: $36x^2 = 121$.

Answer

$x = \frac{11}{6}, x = -\frac{11}{6}$

In the next example, the left side of the equation is factored, but the right side is not zero. In order to use the **Zero Product Property**, one side of the equation must be zero. We'll multiply the factors and then write the equation in standard form.

Example 14.6.10

Solve: $(3x-8)(x-1)=3x$.

Answer

	$(3x-8)(x-1)=3x$
Multiply the binomials.	$3x^2-11x+8=3x$
Write the quadratic equation in standard form.	$3x^2-14x+8=0$
Factor the trinomial.	$(3x-2)(x-4)=0$
Use the Zero Product Property to set each factor to 0.	$3x-2=0 \quad x-4=0$
Solve each equation.	$3x=2 \quad x=4$
	$x=\frac{2}{3}$
Check your answers.	The check is left to you.

Example 14.6.11

Solve: $(2m+1)(m+3)=12m$.

Answer

$m=1,\ m=\frac{3}{2}$

Example 14.6.12

Solve: $(k+1)(k-1)=8$.

Answer

$k=3,\ k=-3$

In the next example, when we factor the quadratic equation we will get three factors. However the first factor is a constant. We know that factor cannot equal 0.

Example 14.6.13

Solve: $3x^2=12x+63$.

Answer

	$3x^2=12x+63$
Write the quadratic equation in standard form.	$3x^2-12x-63=0$
Factor the greatest common factor first.	$3(x^2-4x-21)=0$
Factor the trinomial.	$3(x-7)(x+3)=0$
Use the Zero Product Property to set each factor to 0.	$3\neq 0 \quad x-7=0 \quad x+3=0$
Solve each equation.	$3\neq 0 \quad x=7 \quad x=-3$
Check your answers.	The check is left to you.

Example 14.6.14

Solve: $18a^2-30=-33a$.

Answer

$a=-\frac{5}{2}, a=\frac{2}{3}$

Example 14.6.15

Solve: $123b = -6 - 60b^2$

Answer

$b = -2,\ b = -\frac{1}{20}$

The **Zero Product Property** also applies to the product of three or more factors. If the product is zero, at least one of the factors must be zero. We can solve some equations of degree greater than two by using the Zero Product Property, just like we solved quadratic equations.

Example 14.6.16

Solve: $9m^3 + 100m = 60m^2$

Answer

	$9m^3 + 100m = 60m^2$
Bring all the terms to one side so that the other side is zero.	$9m^3 - 60m^2 + 100m = 0$
Factor the greatest common factor first.	$m(9m^2 - 60m + 100) = 0$
Factor the trinomial.	$m(3m - 10)^2 = 0$
Use the Zero Product Property to set each factor to 0.	
Solve each equation.	$m = 0 \quad 3m - 10 = 0$ $m = 0 \quad m = \frac{10}{3}$
Check your answers.	The check is left to you.

Example 14.6.17

Solve: $8x^3 = 24x^2 - 18x$.

Answer

$x = 0,\ x = \frac{3}{2}$

Example 14.6.18

Solve: $16y^2 = 32y^3 + 2y$.

Answer

$y = 0,\ y = 14$

Solve Equations with Polynomial Functions

As our study of polynomial functions continues, it will often be important to know when the function will have a certain value or what points lie on the graph of the function. Our work with the **Zero Product Property** will be help us find these answers.

Example 14.6.19

For the function $f(x) = x^2 + 2x - 2$,

ⓐ find x when $f(x) = 6$

ⓑ find two points that lie on the graph of the function.

Answer

ⓐ

	$f(x)=x^2+2x-2$
Substitute 6 for $f(x)$.	$6=x^2+2x-2$
Put the quadratic in standard form.	$x^2+2x-8=0$
Factor the trinomial.	$(x+4)(x-2)=0$
Use the zero product property.	$x+4=0 \quad \text{or} \quad x-2=0$
Solve.	$x=-4 \quad \text{or} \quad x=2$
Check:	

$f(x)=x^2+2x-2$	$f(x)=x^2+2x-2$
$f(-4)=(-4)^2+2(-4)-2$	$f(2)=2^2+2\cdot 2-2$
$f(-4)=16-8-2$	$f(2)=4+4-2$
$f(-4)=6$✓	$f(2)=6$✓

ⓑ Since $f(-4)=6$ and $f(2)=6$, the points $(-4,6)$ and $(2,6)$ lie on the graph of the function.

? Example 14.6.20

For the function $f(x)=x^2-2x-8$,

ⓐ find x when $f(x)=7$
ⓑ Find two points that lie on the graph of the function.

Answer

ⓐ $x=-3$ or $x=5$
ⓑ $(-3,7)$ $(5,7)$

? Example 14.6.21

For the function $f(x)=x^2-8x+3$,

ⓐ find x when $f(x)=-4$
ⓑ Find two points that lie on the graph of the function.

Answer

ⓐ $x=1$ or $x=7$
ⓑ $(1,-4)$ $(7,-4)$

The **Zero Product Property** also helps us determine where the function is zero. A value of x where the function is 0, is called a **zero of the function**.

ZERO OF A FUNCTION

For any function f, if $f(x)=0$, then x is a **zero of the function**.

When $f(x)=0$, the point $(x,0)$ is a point on the graph. This point is an x-**intercept** of the graph. It is often important to know where the graph of a function crosses the axes. We will see some examples later.

Example 14.6.22

For the function $f(x)=3x^2+10x-8$, find

ⓐ the zeros of the function,
ⓑ any x-intercepts of the graph of the function
ⓒ any y-intercepts of the graph of the function

Answer

ⓐ To find the zeros of the function, we need to find when the function value is 0.

	$f(x)=3x^2+10x-8$
Substitute 0 for $f(x)$.	$0=3x^2+10x-8$
Factor the trinomial.	$(x+4)(3x-2)=0$
Use the zero product property.	$x+4=0 \quad \text{or} \quad 3x-2=0$
Solve.	$x=-4 \quad \text{or} \quad x=\frac{2}{3}$

ⓑ An x-intercept occurs when $y=0$. Since $f(-4)=0$ and $f(\frac{2}{3})=0$, the points $(-4,0)$ and $(\frac{2}{3},0)$ lie on the graph. These points are x-intercepts of the function.

ⓒ A y-intercept occurs when $x=0$. To find the y-intercepts we need to find $f(0)$.

	$f(x)=3x^2+10x-8$
Find $f(0)$ by substituting 0 for x.	$f(0)=3\cdot 0^2+10\cdot 0-8$
Simplify.	$f(0)=-8$

Since $f(0)=-8$, the point $(0,-8)$ lies on the graph. This point is the y-intercept of the function.

Example 14.6.23

For the function $f(x)=2x^2-7x+5$, find

ⓐ the zeros of the function
ⓑ any x-intercepts of the graph of the function
ⓒ any y-intercepts of the graph of the function.

Answer

ⓐ $x=1$ or $x=\frac{5}{2}$
ⓑ $(1,0),\ (\frac{5}{2},0)$ ⓒ $(0,5)$

Example 14.6.24

For the function $f(x)=6x^2+13x-15$, find

ⓐ the zeros of the function
ⓑ any x-intercepts of the graph of the function
ⓒ any y-intercepts of the graph of the function.

Answer

ⓐ $x=-3$ or $x=\frac{5}{6}$
ⓑ $(-3,0),\ (\frac{5}{6},0)$ ⓒ $(0,-15)$

Solve Applications Modeled by Polynomial Equations

The problem-solving strategy we used earlier for applications that translate to linear equations will work just as well for applications that translate to polynomial equations. We will copy the problem-solving strategy here so we can use it for reference.

USE A PROBLEM SOLVING STRATEGY TO SOLVE WORD PROBLEMS.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. **Solve** the equation using appropriate algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

We will start with a number problem to get practice translating words into a polynomial equation.

Example 14.6.25

The product of two consecutive odd integers is 323. Find the integers.

Answer

Step 1. Read the problem.

Step 2. Identify what we are looking for. — We are looking for two consecutive integers.

Step 3. Name what we are looking for. — Let $n=$ the first integer.
$n+2=$ next consecutive odd integer

Step 4. Translate into an equation. Restate the problem in a sentence. — The product of the two consecutive odd integers is 323.
$n(n+2)=323$

Step 5. Solve the equation. $n^2+2n=323$

Bring all the terms to one side. $n^2+2n-323=0$

Factor the trinomial. $(n-17)(n+19)=0$

Use the Zero Product Property. $n-17=0$ $\quad$ $n+19=0$

Solve the equations. $n=17$ $\quad$ $n=-19$

There are two values for n that are solutions to this problem. So there are two sets of consecutive odd integers that will work.

If the first integer is $n=17$ then the next odd integer is

$$\begin{aligned} n+2 \\ 17+2 \\ 19 \\ 17,19 \end{aligned}$$

If the first integer is $n=-19$ then the next odd integer is

$$\begin{aligned} n+2 \\ -19+2 \\ -17 \\ -17,-19 \end{aligned}$$

Step 6. Check the answer.

The results are consecutive odd integers
$17,\ 19$ and $-19,\ -17$.

$17\cdot 19=323$✓ $\quad$ $-19(-17)=323$✓

Both pairs of consecutive integers are solutions.

Step 7. Answer the question — The consecutive integers are $17, 19$ and $-19, -17$.

? Example 14.6.26

The product of two consecutive odd integers is 255. Find the integers.

Answer

$-15, -17$ and $15, 17$

? Example 14.6.27

The product of two consecutive odd integers is 483 Find the integers.

Answer

$-23, -21$ and $21, 23$

Were you surprised by the pair of negative integers that is one of the solutions to the previous example? The product of the two positive integers and the product of the two negative integers both give positive results.

In some applications, negative solutions will result from the algebra, but will not be realistic for the situation.

? Example 14.6.28

A rectangular bedroom has an area 117 square feet. The length of the bedroom is four feet more than the width. Find the length and width of the bedroom.

Answer

Step 1. Read the problem. In problems involving geometric figures, a sketch can help you visualize the situation.	
Step 2. Identify what you are looking for.	We are looking for the length and width.
Step 3. Name what you are looking for.	Let $w =$ the width of the bedroom.
The length is four feet more than the width.	$w + 4 =$ the length of the garden
Step 4. Translate into an equation.	
Restate the important information in a sentence.	The area of the bedroom is 117 square feet.
Use the formula for the area of a rectangle.	$A = l \cdot w$
Substitute in the variables.	$117 = (w + 4)w$
Step 5. Solve the equation Distribute first.	$117 = w^2 + 4w$
Get zero on one side.	$117 = w^2 + 4w$
Factor the trinomial.	$0 = w^2 + 4w - 117$
Use the Zero Product Property.	$0 = (w^2 + 13)(w - 9)$
Solve each equation.	$0 = w + 13 \quad 0 = w - 9$
Since w is the width of the bedroom, it does not make sense for it to be negative. We eliminate that value for w.	$\cancel{w = -13} \quad w = 9$
	$w = 9$ The width is 9 feet.
Find the value of the length.	$w + 4$ $9 + 4$ 13 The length is 13 feet.

Step 6. Check the answer. Does the answer make sense?  $A = l \cdot w$ $A = 13 \cdot 9$ $A = 117$ Yes, this makes sense.	
Step 7. Answer the question.	The width of the bedroom is 9 feet and the length is 13 feet.

Example 14.6.29

A rectangular sign has area 30 square feet. The length of the sign is one foot more than the width. Find the length and width of the sign.

Answer

The width is 5 feet and length is 6 feet.

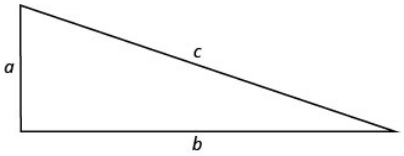
Example 14.6.30

A rectangular patio has area 180 square feet. The width of the patio is three feet less than the length. Find the length and width of the patio.

Answer

The length of the patio is 12 feet and the width 15 feet.

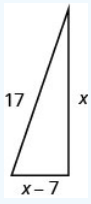
In the next example, we will use the Pythagorean Theorem $(a^2 + b^2 = c^2)$. This formula gives the relation between the legs and the hypotenuse of a right triangle.



We will use this formula to in the next example.

Example 14.6.31

A boat's sail is in the shape of a right triangle as shown. The hypotenuse will be 17 feet long. The length of one side will be 7 feet less than the length of the other side. Find the lengths of the sides of the sail.



Answer

Step 1. Read the problem

https://math.libretexts.org/@go/page/46379

Step 2. Identify what you are looking for.	We are looking for the lengths of the sides of the sail.
Step 3. Name what you are looking for. One side is 7 less than the other.	Let $x =$ length of a side of the sail. $x - 7 =$ length of other side
Step 4. Translate into an equation. Since this is a right triangle we can use the Pythagorean Theorem.	$a^2 + b^2 = c^2$
Substitute in the variables.	$x^2 + (x-7)^2 = 17^2$
Step 5. Solve the equation Simplify.	$x^2 + x^2 - 14x + 49 = 289$
	$2x^2 - 14x + 49 = 289$
It is a quadratic equation, so get zero on one side.	$2x^2 - 14x - 240 = 0$
Factor the greatest common factor.	$2(x^2 - 7x - 120) = 0$
Factor the trinomial.	$2(x-15)(x+8) = 0$
Use the Zero Product Property.	$2 \neq 0 \quad x - 15 = 0 \quad x + 8 = 0$
Solve.	$2 \neq 0 \quad x = 15 \quad x = -8$
Since x is a side of the triangle, $x = -8$ does not make sense.	$2 \neq 0 \quad x = 15 \quad \cancel{x = -8}$
Find the length of the other side.	
If the length of one side is then the length of the other side is	$x = 15$ $x - 7$ $15 - 7$ 8 is the length of the other side.
Step 6. Check the answer in the problem Do these numbers make sense? 	
Step 7. Answer the question	The sides of the sail are 8, 15 and 17 feet.

? Example 14.6.32

Justine wants to put a deck in the corner of her backyard in the shape of a right triangle. The length of one side of the deck is 7 feet more than the other side. The hypotenuse is 13. Find the lengths of the two sides of the deck.

Answer

5 feet and 12 feet

Example 14.6.33

A meditation garden is in the shape of a right triangle, with one leg 7 feet. The length of the hypotenuse is one more than the length of the other leg. Find the lengths of the hypotenuse and the other leg.

Answer

24 feet and 25 feet

The next example uses the function that gives the height of an object as a function of time when it is thrown from 80 feet above the ground.

Example 14.6.34

Dennis is going to throw his rubber band ball upward from the top of a campus building. When he throws the rubber band ball from 80 feet above the ground, the function $h(t) = -16t^2 + 64t + 80$ models the height, h, of the ball above the ground as a function of time, t. Find:

ⓐ the zeros of this function which tell us when the ball hits the ground
ⓑ when the ball will be 80 feet above the ground
ⓒ the height of the ball at $t = 2$ seconds.

Answer

ⓐ The zeros of this function are found by solving $h(t) = 0$. This will tell us when the ball will hit the ground.

	$h(t) = 0$
Substitute in the polynomial for $h(t)$.	$-16t^2 + 64t + 80 = 0$
Factor the GCF, -16.	$-16(t^2 - 4t - 5) = 0$
Factor the trinomial.	$-16(t-5)(t+1) = 0$
Use the Zero Product Property.	$t-5=0 \quad t+1=0$
Solve.	$t=5 \quad t=-1$

The result $t = 5$ tells us the ball will hit the ground 5 seconds after it is thrown. Since time cannot be negative, the result $t = -1$ is discarded.

ⓑ The ball will be 80 feet above the ground when $h(t) = 80$.

	$h(t) = 80$
Substitute in the polynomial for $h(t)$.	$-16t^2 + 64t + 80 = 80$
Subtract 80 from both sides.	$-16t^2 + 64t = 0$
Factor the GCF, $-16t$.	$-16t(t-4) = 0$
Use the Zero Product Property.	$-16t = 0 \quad t-4=0$
Solve.	$t=0 \quad t=4$
	The ball will be at 80 feet the moment Dennis tosses the ball and then 4 seconds later, when the ball is falling.

ⓒ To find the height ball at $t = 2$ seconds we find $h(2)$.

	$h(t) = -16t^2 + 64t + 80$
To find $h(2)$ substitute 2 for t.	$h(2) = -16(2)^2 + 64 \cdot 2 + 80$
Simplify.	$h(2) = 144$
	After 2 seconds, the ball will be at 144 feet.

? Example 14.6.35

Genevieve is going to throw a rock from the top a trail overlooking the ocean. When she throws the rock upward from 160 feet above the ocean, the function $h(t) = -16t^2 + 48t + 160$ models the height, h, of the rock above the ocean as a function of time, t. Find:

ⓐ the zeros of this function which tell us when the rock will hit the ocean
ⓑ when the rock will be 160 feet above the ocean.
ⓒ the height of the rock at $t = 1.5$ seconds.

Answer

ⓐ 5 ⓑ 0;3 ⓒ 196

? Example 14.6.36

Calib is going to throw his lucky penny from his balcony on a cruise ship. When he throws the penny upward from 128 feet above the ground, the function $h(t) = -16t^2 + 32t + 128$ models the height, h, of the penny above the ocean as a function of time, t. Find:

ⓐ the zeros of this function which is when the penny will hit the ocean
ⓑ when the penny will be 128 feet above the ocean.
ⓒ the height the penny will be at $t = 1$ seconds which is when the penny will be at its highest point.

Answer

ⓐ 4 ⓑ 0;2 ⓒ 144

Access this online resource for additional instruction and practice with quadratic equations.

- Beginning Algebra & Solving Quadratics with the Zero Property

Key Concepts

- **Polynomial Equation:** A polynomial equation is an equation that contains a polynomial expression. The degree of the polynomial equation is the degree of the polynomial.
- **Quadratic Equation:** An equation of the form $ax^2 + bx + c = 0$ is called a quadratic equation.

$$a, b, c \text{ are real numbers and } a \neq 0$$

- **Zero Product Property:** If $a \cdot b = 0$, then either $a = 0$ or $b = 0$ or both.
- **How to use the Zero Product Property**
  1. Set each factor equal to zero.
  2. Solve the linear equations.
  3. Check.
- **How to solve a quadratic equation by factoring.**
  1. Write the quadratic equation in standard form, $ax^2 + bx + c = 0$.
  2. Factor the quadratic expression.
  3. Use the Zero Product Property.
  4. Solve the linear equations.
  5. Check. Substitute each solution separately into the original equation.
- **Zero of a Function:** For any function f, if $f(x) = 0$, then x is a zero of the function.
- **How to use a problem solving strategy to solve word problems.**
  1. **Read** the problem. Make sure all the words and ideas are understood.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose a variable to represent that quantity.

4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. **Solve** the equation using appropriate algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

14.6E: Exercises

Practice Makes Perfect

Use the Zero Product Property

In the following exercises, solve.

1. $(3a-10)(2a-7)=0$

Answer

$a=\frac{10}{3},\ a=\frac{7}{2}$

2. $(5b+1)(6b+1)=0$

3. $6m(12m-5)=0$

Answer

$m=0,\ m=\frac{5}{12}$

4. $2x(6x-3)=0$

5. $(2x-1)^2=0$

Answer

$x=\frac{1}{2}$

6. $(3y+5)^2=0$

Solve Quadratic Equations by Factoring

In the following exercises, solve.

7. $5a^2-26a=24$

Answer

$a=-\frac{4}{5},\ a=6$

8. $4b^2+7b=-3$

9. $4m^2=17m-15$

Answer

$m=\frac{5}{4},\ m=3$

10. $n^2=5-6n$

11. $7a^2+14a=7a$

Answer

$a=-1,\ a=0$

12. $12b^2 - 15b = -9b$

13. $49m^2 = 144$

Answer

$m = \frac{12}{7},\ m = -\frac{12}{7}$

14. $625 = x^2$

15. $16y^2 = 81$

Answer

$y = -\frac{9}{4},\ y = \frac{9}{4}$

16. $64p^2 = 225$

17. $121n^2 = 36$

Answer

$n = -\frac{6}{11},\ n = \frac{6}{11}$

18. $100y^2 = 9$

19. $(x+6)(x-3) = -8$

Answer

$x = 2,\ x = -5$

20. $(p-5)(p+3) = -7$

21. $(2x+1)(x-3) = -4x$

Answer

$x = \frac{3}{2},\ x = -1$

22. $(y-3)(y+2) = 4y$

23. $(3x-2)(x+4) = 12x$

Answer

$x = \frac{3}{2},\ x = -1$

24. $(2y-3)(3y-1) = 8y$

25. $20x^2 - 60x = -45$

Answer

$x = -\frac{2}{3}$

26. $3y^2 - 18y = -27$

27. $15x^2 - 10x = 40$

Answer

$x = 2,\ x = -\frac{4}{3}$

28. $14y^2 - 77y = -35$

29. $18x^2 - 9 = -21x$

Answer

$x = -\frac{3}{2},\ x = \frac{1}{3}$

30. $16y^2 + 12 = -32y$

31. $16p^3 = 24p^2 - 9p$

Answer

$p = 0,\ p = \frac{3}{4}$

32. $m^3 - 2m^2 = -m$

33. $2x^3 + 72x = 24x^2$

Answer

$x = 0,\ x = 6$

34. $3y^3 + 48y = 24y^2$

35. $36x^3 + 24x^2 = -4x$

Answer

$x = 0,\ x = \frac{1}{3}$

36. $2y^3 + 2y^2 = 12y$

Solve Equations with Polynomial Functions

In the following exercises, solve.

37. For the function, $f(x) = x^2 - 8x + 8$, ⓐ find when $f(x) = -4$ ⓑ Use this information to find two points that lie on the graph of the function.

Answer

ⓐ $x = 2$ or $x = 6$ ⓑ $(2, -4)$ $(6, -4)$

38. For the function, $f(x) = x^2 + 11x + 20$, ⓐ find when $f(x) = -8$ ⓑ Use this information to find two points that lie on the graph of the function.

39. For the function, $f(x) = 8x^2 - 18x + 5$, ⓐ find when $f(x) = -4$ ⓑ Use this information to find two points that lie on the graph of the function.

Answer

ⓐ $x = \frac{3}{2}$ or $x = \frac{3}{4}$
ⓑ $(\frac{3}{2}, -4)$ $(\frac{3}{4}, -4)$

40. For the function, $f(x) = 18x^2 + 15x - 10$, ⓐ find when $f(x) = 15$ ⓑ Use this information to find two points that lie on the graph of the function.

In the following exercises, for each function, find: ⓐ the zeros of the function ⓑ the x-intercepts of the graph of the function ⓒ the y-intercept of the graph of the function.

41. $f(x) = 9x^2 - 4$

Answer

ⓐ $x = \frac{2}{3}$ or $x = -\frac{2}{3}$
ⓑ $(\frac{2}{3}, 0)$, $(-\frac{2}{3}, 0)$
ⓒ $(0, -4)$

42. $f(x) = 25x^2 - 49$

43. $f(x) = 6x^2 - 7x - 5$

Answer

ⓐ $x = \frac{5}{3}$ or $x = -\frac{1}{2}$
ⓑ $(\frac{5}{3}, 0)$, $(-\frac{1}{2}, 0)$
ⓒ $(0, -5)$

44. $f(x) = 12x^2 - 11x + 2$

Solve Applications Modeled by Quadratic Equations

In the following exercises, solve.

45. The product of two consecutive odd integers is 143. Find the integers.

Answer

$-13,\ -11$ and $11,\ 13$

46. The product of two consecutive odd integers is 195. Find the integers.

47. The product of two consecutive even integers is 168. Find the integers.

Answer

$-14,\ -12$ and $12,\ 14$

48. The product of two consecutive even integers is 288. Find the integers.

49. The area of a rectangular carpet is 28 square feet. The length is three feet more than the width. Find the length and the width of the carpet.

Answer

-4 and 7

50. A rectangular retaining wall has area 15 square feet. The height of the wall is two feet less than its length. Find the height and the length of the wall.

51. The area of a bulletin board is 55 square feet. The length is four feet less than three times the width. Find the length and the width of the a bulletin board.

Answer

$5,\ 11$

52. A rectangular carport has area 150 square feet. The height of the carport is five feet less than twice its length. Find the height and the length of the carport.

53. A pennant is shaped like a right triangle, with hypotenuse 10 feet. The length of one side of the pennant is two feet longer than the length of the other side. Find the length of the two sides of the pennant.

Answer

$6,\ 8$

54. A stained glass window is shaped like a right triangle. The hypotenuse is 15 feet. One leg is three more than the other. Find the lengths of the legs.

55. A reflecting pool is shaped like a right triangle, with one leg along the wall of a building. The hypotenuse is 9 feet longer than the side along the building. The third side is 7 feet longer than the side along the building. Find the lengths of all three sides of the reflecting pool.

Answer

$8,\ 15,\ 17$

56. A goat enclosure is in the shape of a right triangle. One leg of the enclosure is built against the side of the barn. The other leg is 4 feet more than the leg against the barn. The hypotenuse is 8 feet more than the leg along the barn. Find the three sides of the goat enclosure.

57. Juli is going to launch a model rocket in her back yard. When she launches the rocket, the function $h(t) = -16t^2 + 32t$ models the height, h, of the rocket above the ground as a function of time, t. Find:

ⓐ the zeros of this function which tells us when the rocket will hit the ground. ⓑ the time the rocket will be 16 feet above the ground.

Answer

ⓐ 0, 2 ⓑ 1

58. Gianna is going to throw a ball from the top floor of her middle school. When she throws the ball from 48 feet above the ground, the function $h(t) = -16t^2 + 32t + 48$ models the height, h, of the ball above the ground as a function of time, t. Find:

ⓐ the zeros of this function which tells us when the ball will hit the ground. ⓑ the time(s) the ball will be 48 feet above the ground. ⓒ the height the ball will be at $t = 1$ seconds which is when the ball will be at its highest point.

Writing Exercises

59. Explain how you solve a quadratic equation. How many answers do you expect to get for a quadratic equation?

Answer

Answers will vary.

60. Give an example of a quadratic equation that has a GCF and none of the solutions to the equation is zero.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve quadratic equations by using the Zero Product Property.			
solve quadratic equations by factoring.			
solve applications modeled by quadratic equations.			

ⓑ Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

14.E: Chapter 6 Review Exercises

Chapter Review Exercises

Greatest Common Factor and Factor by Grouping

Find the Greatest Common Factor of Two or More Expressions

In the following exercises, find the greatest common factor.

$12a^2b^3,\ 15ab^2$

Answer

$3ab^2$

$12m^2n^3, 42m^5n^3$

$15y^3,\ 21y^2,\ 30y$

Answer

$3y$

$45x^3y^2,\ 15x^4y,\ 10x^5y^3$

Factor the Greatest Common Factor from a Polynomial

In the following exercises, factor the greatest common factor from each polynomial.

$35y+84$

Answer

$7(5y+12)$

$6y^2+12y-6$

$18x^3-15x$

Answer

$3x(6x^2-5)$

$15m^4+6m^2n$

$4x^3-12x^2+16x$

Answer

$4x(x^2-3x+4)$

$-3x+24$

$-3x^3+27x^2-12x$

Answer

$-3x(x^2-9x+4)$

$3x(x-1)+5(x-1)$

Factor by Grouping

In the following exercises, factor by grouping.

$ax-ay+bx-by$

Answer

$(a+b)(x-y)$

$x^2y-xy^2+2x-2y$

$x^2+7x-3x-21$

Answer

$(x-3)(x+7)$

$4x^2-16x+3x-12$

m^3+m^2+m+1

Answer

$(m^2+1)(m+1)$

$5x-5y-y+x$

Factor Trinomials

Factor Trinomials of the Form x^2+bx+c

In the following exercises, factor each trinomial of the form x^2+bx+c .

$a^2+14a+33$

Answer

$(a+3)(a+11)$

$k^2-16k+60$

$m^2+3m-54$

Answer

$(m+9)(m-6)$

$x^2-3x-10$

In the following examples, factor each trinomial of the form $x^2+bxy+cy^2$.

$x^2+12xy+35y^2$

Answer

$(x+5y)(x+7y)$
