This text is disseminated via the Open Education Resource (OER) LibreTexts Project (https://LibreTexts.org) and like the thousands of other texts available within this powerful platform, it is freely available for reading, printing, and "consuming."

The LibreTexts mission is to bring together students, faculty, and scholars in a collaborative effort to provide and accessible, and comprehensive platform that empowers our community to develop, curate, adapt, and adopt openly licensed resources and technologies; through these efforts we can reduce the financial burden born from traditional educational resource costs, ensuring education is more accessible for students and communities worldwide.

Most, but not all, pages in the library have licenses that may allow individuals to make changes, save, and print this book. Carefully consult the applicable license(s) before pursuing such effects. Instructors can adopt existing LibreTexts texts or Remix them to quickly build course-specific resources to meet the needs of their students. Unlike traditional textbooks, LibreTexts' web based origins allow powerful integration of advanced features and new technologies to support learning.

LibreTexts is the adaptable, user-friendly non-profit open education resource platform that educators trust for creating, customizing, and sharing accessible, interactive textbooks, adaptive homework, and ancillary materials. We collaborate with individuals and organizations to champion open education initiatives, support institutional publishing programs, drive curriculum development projects, and more.

The LibreTexts libraries are Powered by NICE CXone Expert and was supported by the Department of Education Open Textbook Pilot Project, the California Education Learning Lab, the UC Davis Office of the Provost, the UC Davis Library, the California State University Affordable Learning Solutions Program, and Merlot. This material is based upon work supported by the National Science Foundation under Grant No. 1246120, 1525057, and 1413739.

TABLE OF CONTENTS

Licensing

1: The Whole Numbers

- 1.1: An Introduction to the Whole Numbers
- 1.2: Adding and Subtracting Whole Numbers
- 1.3: Multiplication and Division of Whole Numbers
- 1.4: Prime Factorization
- 1.5: Order of Operations
- 1.6: Solving Equations by Addition and Subtraction
- 1.7: Solving Equations by Multiplication and Division
- 1.8: Use the Language of Algebra (Part 1)
- 1.9: Use the Language of Algebra (Part 2)
- 1.10: Evaluate, Simplify, and Translate Expressions (Part 1)
- 1.11: Evaluate, Simplify, and Translate Expressions (Part 2)
- 1.12: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 1)
- 1.13: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 2)
- 1.E: Introduction to the Language of Algebra (Exercises)
- 1.E: Whole Numbers (Exercises)
- 1.S: Introduction to the Language of Algebra (Summary)
- 1.S: Whole Numbers (Summary)

2: Integers

- 2.1: Introduction to Integers (Part 1)
- 2.2: Introduction to Integers (Part 2)
- 2.3: Add Integers (Part 1)
- 2.4: Add Integers (Part 2)
- 2.5: Subtract Integers (Part 1)
- 2.6: Subtract Integers (Part 2)
- 2.7: Multiply and Divide Integers (Part 1)
- 2.8: Multiply and Divide Integers (Part 2)
- 2.9: Square Roots
- 2.10: What to Combine? Order of Operations with Integers
- 2.11: Mathematical Expressions (NOT Equations)
- 2.12: Evaluating (NOT Solving) Algebraic Expressions
- 2.13: Simplifying (Still Not Solving) Algebraic Expressions)
  - 2.13.1: Simplifying Algebraic Expressions
  - 2.13.2: Combining Like Terms
- 2.14: Mean
- 2.15: Solve Equations Using Integers; The Division Property of Equality (Part 1)
- 2.16: Solve Equations Using Integers; The Division Property of Equality (Part 2)
- 2.E: Integers (Exercises)
- 2.S: Integers (Summary)

3: Algebraic Expressions

- 3.1: Use the Language of Algebra (Part 1)
- 3.2: Use the Language of Algebra (Part 2)

- 3.3: Evaluate, Simplify, and Translate Expressions (Part 1)
- 3.4: Evaluate, Simplify, and Translate Expressions (Part 2)
- 3.5: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 1)
- 3.6: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 2)
- 3.E: Introduction to the Language of Algebra (Exercises)
- 3.S: Introduction to the Language of Algebra (Summary)

4: Fractions

- 4.1: Visualize Fractions (Part 1)
- 4.2: Visualize Fractions (Part 2)
- 4.3: Rational Expressions (INTRO)
- 4.4: Multiply and Divide Fractions (Part 1)
- 4.5: Multiply and Divide Fractions (Part 2)
- 4.6: Find Multiples and Factors (Part 1)
- 4.7: Find Multiples and Factors (Part 2)
- 4.8: Prime Factorization and the Least Common Multiple (Part 1)
- 4.9: Prime Factorization and the Least Common Multiple (Part 2)
- 4.10: Multiply and Divide Mixed Numbers and Complex Fractions (Part 1)
- 4.11: Multiply and Divide Mixed Numbers and Complex Fractions (Part 2)
- 4.12: Add and Subtract Fractions with Common Denominators
- 4.13: Add and Subtract Fractions with Different Denominators (Part 1)
- 4.14: Add and Subtract Fractions with Different Denominators (Part 2)
- 4.15: Add and Subtract Mixed Numbers (Part 1)
- 4.16: Add and Subtract Mixed Numbers (Part 2)
- 4.17: Complex Rational Expressions
- 4.18: Solve Equations with Fractions (Part 1)
- 4.19: Solve Equations with Fractions (Part 2)
- 4.E: Fractions (Exercises)
- 4.S: Fractions (Summary)

5: Decimals

- 5.1: Decimals (Part 1)
- 5.2: Decimals (Part 2)
- 5.3: Decimal Operations (Part 1)
- 5.4: Decimal Operations (Part 2)
- 5.5: Decimals and Fractions (Part 1)
- 5.6: Decimals and Fractions (Part 2)
- 5.7: Rational and Irrational Numbers
- 5.8: Averages and Probability (Part 1)
- 5.9: Averages and Probability (Part 2)
- 5.10: Ratios and Rate (Part 1)
- 5.11: Ratios and Rate (Part 2)
- 5.12: Simplify and Use Square Roots (Part 1)
- 5.13: Simplify and Use Square Roots (Part 2)
- 5.14: Commutative and Associative Properties (Part 1)
- 5.15: Commutative and Associative Properties (Part 2)
- 5.16: Distributive Property
- 5.17: Properties of Identity, Inverses, and Zero
- 5.18: Solve Equations with Decimals
- 5.E: Decimals (Exercises)
- 5.E: The Properties of Real Numbers (Exercises)

- 5.S: Decimals (Summary)
- 5.S: The Properties of Real Numbers (Summary)

6: Ratio, Proportion, and Measurement

- 6.1: Ratio and Proportion
- 6.2: Introduction to Ratios and Rates
- 6.3: Introduction to Proportion
- 6.4: Unit Conversion - American System
- 6.5: Unit Conversion- Metric System
- 6.6: American Units to Metric Units and Vice-Versa
- 6.7: Use a Problem Solving Strategy (Part 1)
- 6.8: Use a Problem Solving Strategy (Part 2)
- 6.9: Solve a Formula for a Specific Variable
- 6.E: Math Models and Geometry (Exercises)
- 6.S: Math Models and Geometry (Summary)

7: Percents

- 7.1: Understand Percent
- 7.2: Solve General Applications of Percent
- 7.3: Solve Sales Tax, Commission, and Discount Applications
- 7.4: Solve Simple Interest Applications
- 7.5: Percent Increase or Decrease
- 7.6: Pie Charts
- 7.7: Solve Proportions and their Applications (Part 1)
- 7.8: Solve Proportions and their Applications (Part 2)
- 7.E: Percents (Exercises)
- 7.S: Percents (Summary)

8: Geometry and Graphing

- 8.1: Solve Geometry Applications- Circles and Irregular Figures
- 8.2: Use the Rectangular Coordinate System (Part 1)
- 8.3: Solve Geometry Applications- Volume and Surface Area (Part 1)
- 8.4: Use the Rectangular Coordinate System (Part 2)
- 8.5: Graphing Linear Equations (Part 1)
- 8.6: Solve Geometry Applications- Volume and Surface Area (Part 2)
- 8.7: Graphing Linear Equations (Part 2)
- 8.8: Use the Rectangular Coordinate System
  - 8.8E: Exercises
- 8.9: Graphing with Intercepts (Part 1)
- 8.10: Graph Linear Equations in Two Variables
  - 8.10E: Exercises
- 8.11: Graphing with Intercepts (Part 2)
- 8.12: Graph with Intercepts
  - 8.12E: Exercises
- 8.13: Understand Slope of a Line (Part 1)
- 8.14: Understand Slope of a Line (Part 2)
- 8.E: Graphs (Exercises)
- 8.E: Review Exercises
- 8.S: Graphs (Summary)

9: Solving Linear Equations and Inequalities

- 9.1: Solve Equations Using the Subtraction and Addition Properties of Equality
  - 9.1E: Exercises
- 9.2: Solve Equations using the Division and Multiplication Properties of Equality
  - 9.2E: Exercises
- 9.3: Solve Equations with Variables and Constants on Both Sides
  - 9.3E: Exercises
- 9.4: Use a General Strategy to Solve Linear Equations
  - 9.4E: Exercises
- 9.5: Solve Equations with Fractions or Decimals
  - 9.5E: Exercises
- 9.6: Solve a Formula for a Specific Variable
  - 9.6E: Exercises
- 9.7: Solve Linear Inequalities
  - 9.7E: Exercises
- 9.8: Chapter 2 Review Exercises

10: Graphs

- 10.1: Understanding the Slope of a Line
  - 10.1E: Exercises
- 10.2: Use the Slope–Intercept Form of an Equation of a Line
  - 10.2E: Exercises
- 10.3: Find the Equation of a Line
  - 10.3E: Exercises

11: Systems of Linear Equations

- 11.1: Solve Systems of Linear Equations with Two Variables
  - 11.1E: Exercises
- 11.2: Solve Applications with Systems of Equations
  - 11.2E: Exercises
- 11.3: Solve Mixture Applications with Systems of Equations
  - 11.3E: Exercises
- 11.4: Graphs of Linear Inequalities
  - 11.4E: Exercises

12: Polynomials

- 12.1: Add and Subtract Polynomials
- 12.2: Use Multiplication Properties of Exponents (Part 1)
- 12.3: Use Multiplication Properties of Exponents (Part 2)
- 12.4: Multiply Polynomials (Part 1)
- 12.5: Multiply Polynomials (Part 2)
- 12.6: Divide Monomials (Part 1)
- 12.7: Divide Monomials (Part 2)
- 12.8: Integer Exponents and Scientific Notation (Part 1)
- 12.9: Integer Exponents and Scientific Notation (Part 2)

- 12.10: Introduction to Factoring Polynomials
- 12.E: Polynomials (Exercises)
- 12.S: Polynomials (Summary)

13: Additional Foundational Content

- 13.1: Cumulative Review
- 13.2: Powers and Roots
- 13.3: Geometric Formulas
- 13.4: Math Models and Geometry
  - 13.4.1: Solve Money Applications
  - 13.4.2: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 1)
  - 13.4.3: Use Properties of Angles, Triangles, and the Pythagorean Theorem (Part 2)
  - 13.4.4: Use Properties of Rectangles, Triangles, and Trapezoids (Part 1)
  - 13.4.5: Use Properties of Rectangles, Triangles, and Trapezoids (Part 2)
- 13.5: Foundations
  - 13.5.1: Prelude to Foundations of Algebra
  - 13.5.2: Introduction to Whole Numbers
    - 13.5.2E: Exercises
  - 13.5.3: Use the Language of Algebra
    - 13.5.3E: Exercises
  - 13.5.4: Add and Subtract Integers
    - 13.5.4E: Exercises
  - 13.5.5: Multiply and Divide Integers
    - 13.5.5E: Exercises
  - 13.5.6: Visualize Fractions
    - 13.5.6E: Exercises
  - 13.5.7: Add and Subtract Fractions
    - 13.5.7E: Exercises
  - 13.5.8: Decimals
    - 13.5.8E: Exercises
  - 13.5.9: The Real Numbers
    - 13.5.9E: Exercises
  - 13.5.10: Properties of Real Numbers
    - 13.5.10E: Exercises
  - 13.5.11: Systems of Measurement
    - 13.5.11E: Exercises
  - 13.5.12: Chapter 1 Review Exercises
- 13.6: Math Models
  - 13.6.1: Use a Problem-Solving Strategy
    - 13.6.1E: Exercises
  - 13.6.2: Solve Percent Applications
    - 13.6.2E: Exercises
  - 13.6.3: Solve Mixture Applications
    - 13.6.3E: Exercises
  - 13.6.4: Triangles, Rectangles, and the Pythagorean Theorem

CHAPTER OVERVIEW

1: The Whole Numbers

Welcome to the study of prealgebra. In this first chapter of study, we will introduce the set of natural numbers, then follow with the set of whole numbers. We will then follow with a quick review of addition, subtraction, multiplication, and division skills involving whole numbers that are prerequisite for success in the study of prealgebra. Along the way we will introduce a number of properties of the whole numbers and show how that can be used to evaluate expressions involving whole number operations. We will also define what is meant by *prime* and *composite* numbers, discuss a number of divisibility tests, then show how any composite number can be written uniquely as a product of prime numbers. This will lay the foundation for requisite skills with fractional numbers in later chapters. Finally, we will introduce the concept of a *variable*, then introduce equations and technique required for their solution. We will use equations to model and solve a number of real-world applications along the way.

Let's begin the journey.

1.1: An Introduction to the Whole Numbers
1.2: Adding and Subtracting Whole Numbers
1.3: Multiplication and Division of Whole Numbers
1.4: Prime Factorization
1.5: Order of Operations
1.6: Solving Equations by Addition and Subtraction
1.7: Solving Equations by Multiplication and Division
1.8: Use the Language of Algebra (Part 1)
1.9: Use the Language of Algebra (Part 2)
1.10: Evaluate, Simplify, and Translate Expressions (Part 1)
1.11: Evaluate, Simplify, and Translate Expressions (Part 2)
1.12: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 1)
1.13: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 2)
1.E: Introduction to the Language of Algebra (Exercises)
1.E: Whole Numbers (Exercises)
1.S: Introduction to the Language of Algebra (Summary)
1.S: Whole Numbers (Summary)

This page titled 1: The Whole Numbers is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

1.1: An Introduction to the Whole Numbers

A *set* is a collection of objects. If the set is finite, we can describe the set completely by simply listing all the objects in the set and enclosing the list in curly braces. For example, the set

$$S = \{dog,\ \text{cat, parakeet}\ \}$$

is the set whose members are “dog”, “cat”, and “parakeet.” If the set is infinite, then we need to be more clever with our description. For example, the set of *natural numbers* (or *counting numbers*) is the set

$$\mathbb{N} = \{1, 2, 3, 4, 5, \ldots\}.$$

Because this set is infinite (there are an infinite number of natural numbers), we can’t list all of them. Instead, we list the first few then follow with “three dots,” which essentially mean “etcetera.” The implication is that the reader sees the intended pattern and can then intuit the remaining numbers in the set. Can you see that the next few numbers are 6, 7, 8, 9, etc.?

If we add the number zero to the set of natural numbers, then we have a set of numbers that are called the *whole numbers*.

The Whole Numbers

The set

$$\mathbb{W} = \{0, 1, 2, 3, 4, 5, \ldots\}$$

is called the set of *whole numbers*.

The whole numbers will be our focus in the remainder of this chapter.

Graphing Numbers on the Number Line

It is a simple matter to set up a correspondence between the whole numbers and points on a **number line**. First, draw a number line, then set a tick mark at zero.

The next step is to declare a unit length.

The remainder of the whole numbers now fall easily in place on the number line.

When asked to graph a whole number on a number line, shade in a solid dot at the position on the number line that corresponds to the given whole number.

Example 1.

Graph the whole numbers 1, 3, and 5 on the number line.

Solution

Shade the numbers 1, 3, and 5 on the number line as solid dots.

Exercise

Graph the whole numbers 3, 4, and 6 on the number line.

Ordering the whole numbers

Now that we have a correspondence between the whole numbers and points on the number line, we can order the whole numbers in a natural way. Note that as you move to the left along the number line, the numbers get smaller; as you move to the right, the numbers get bigger. This inspires the following definition.

Ordering the Whole Numbers

Suppose that a and b are whole numbers located on the number line so that the point representing the whole number a lies to the left of the point representing the whole number b.

Then the whole number a is "less than" the whole number b and write

$$a < b.$$

Alternatively, we can also say that the whole number b is "greater than" the whole number a and write

$$b > a.$$

Comparison Property

When comparing two whole numbers a and b, only one of three possibilities is true:

$$a < b \text{ or } a = b \text{ or } a > b.$$

Example 2.

Compare the whole numbers 25 and 31.

Solution

On the number line, 25 is located to the left of 31.

Therefore, 25 is less than 31 and write $25 < 31$. Alternatively, we could also note that 31 is located to the right of 25. Therefore, 31 is greater than 25 and write $31 > 25$.

Exercise

Compare the whole numbers 18 and 12.

Answer

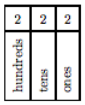
$18 > 12$.

Expanded Notation

The whole numbers

$$D = \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9\}$$

are called *digits* and are used to construct larger whole numbers. For example, consider the whole number 222 (pronounced "two hundred twenty two"). It is made up of three twos, but the position of each two describes a different meaning or value.



- The first two is in the "hundreds" position and represents two hundreds or 200.
- The second two is in the "tens" position and represents two tens or 20.
- The third two is in the "ones" position and represents two ones or 2.

Consider the larger number 123,456,789. The following table shows the place value of each digit.

1	2	3	4	5	6	7	8	9
hundred millions	ten millions	millions	hundred thousands	ten thousands	thousands	hundreds	tens	ones
millions			thousands			ones		

In “expanded notation,” we would write

1 hundred million + 2 ten millions + 3 millions + 4 hundred thousands + 5 ten thousands + 6 thousands + 7 hundreds + 8 tens + 9 ones.

We read the numeral 123,456,789 as “one hundred twenty three million, four hundred fifty six thousand, seven hundred eighty nine.”

Let’s look at another example.

Example 3.

Write the number 23,712 in expanded notation, then pronounce the result.

Solution

In expanded notation, 23,712 becomes

2 ten thousands + 3 thousands + 7 hundreds + 1 ten + 2 ones.

This is pronounced "twenty three thousand, seven hundred twelve."

Exercise

Write the number 54,615 in expanded notation. Pronounce the result.

Example 4.

Write the number 203,405 in expanded notation, then pronounce the result.

Solution

In expanded notation, 203,405 becomes

2 hundred thousands + 0 ten thousands + 3 thousands + 4 hundreds + 0 tens + 5 ones.

Since 0 ten thousands is zero and 0 tens is also zero, this can also be written

2 hundred thousands + 3 thousands + 4 hundreds + 5 ones.

This is pronounced “two hundred three thousand, four hundred five.”

Exercise

Write the number 430,705 in expanded notation. Pronounce the result.

Answer

9,440

Rounding whole numbers

When less precision is needed, we round numbers to a particular place. For example, suppose a store owner needs approximately 87 boxes of ten-penny nails, but they can only be ordered in cartons containing ten boxes.

Note that 87 is located closer to 9 tens (or 90) than it is to 8 tens (or 80). Thus, rounded to the nearest ten, 87 ≈ 90 (87 approximately equals 90). The store owner decides that 90 boxes is probably a better fit for his needs. On the other hand, the same store owner estimates that he will need 230 bags of peatmoss for his garden section.

Note that 230 is closer to 2 hundreds (or 200) than it is to 3 hundreds (or 300). The store owner worries that might have overestimated his need, so he rounds down to the nearest hundred, 230 ≈ 200 (230 approximately equals 200). There is a simple set of rules to follow when rounding.

Rules for Rounding

To round a number to a particular place, follow these steps:

1. Mark the place you wish to round to. This is called the rounding digit.

2. Check the next digit to the right of your digit marked in step 1. This is called the test digit.

    a) If the test digit is greater than or equal to 5, add 1 to the rounding digit and replace all digits to the right of the rounding digit with zeros.

    b) If the test digit is less than 5, keep the rounding digit the same and replace all digits to the right of rounding digit with zero

Let's try these rules with an example or two.

Example 5

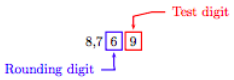
Round the number 8,769 to the nearest ten.

Solution

Mark the rounding and test digits.

Exercise

Round the number 9,443 to the nearest ten.



The test digit is greater than 5. The “Rules for Rounding” require that we add 1 to the rounding digit, then make all digits to the right of the rounding digit zeros. Thus, rounded to the nearest ten,

$$8,769 \approx 8,770.$$

That is, 8,769 is *approximately* equal to 8,770.

Mathematical Notation.

The symbol

$$\approx$$

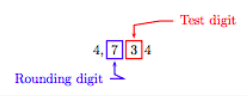
means *approximately equal*.

Example 6.

Round the number 4,734 to the nearest hundred.

Solution

Mark the rounding and test digits.



The test digit is less than 5. The “Rules for Rounding” require that we keep the rounding digit the same, then make all digits to the right of the rounding digit zeros. Thus, rounded to the nearest hundred,

$$4,734 \approx 4,700.$$

Exercise

Round the number 6,656 to the nearest hundred.

Answer

6,700

Table 1.1: Atmospheric CO_2 values (ppmv) derived from in situ air samples collected at Mauna Loa, Hawaii, USA.

Year	1965	1975	1985	1995	2005
Atmospheric CO_2	319	330	344	359	378

Tables and Graphs

Reading data in graphical form is an important skill. The data in Table 1.1 provides measures of the carbon dioxide content (CO_2) in the atmosphere, gathered in the month of January at the observatory atop Mauna Loa in Hawaii.

In Figure 1.1(a), a *bar graph* is used to display the carbon dioxide measurements. The year the measurement was taken is placed on the horizontal axis, and the height of each bar equals the amount of carbon dioxide in the atmosphere during that year.

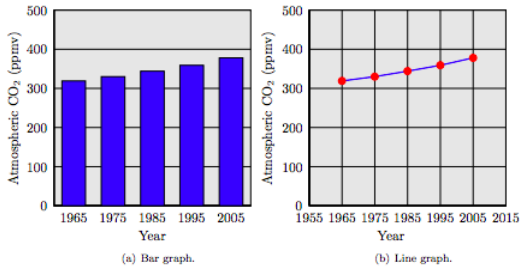


Figure 1.1: Using graphs to examine carbon dioxide data.

In Figure 1.1(b), a *line graph* is used to display the carbon dioxide measurements. Again, the dates of measurement are placed on the horizontal axis, and the amount of carbon dioxide in the atmosphere is placed on the vertical axis. Instead of using the height of a bar to represent the carbon dioxide measurement, we place a dot at a height that represents the carbon monoxide content. Once each data point is plotted, we connect consecutive data points with line segments.

Exercises

In Exercises 1-12, sketch the given whole numbers on a number line, then arrange them in order, from smallest to largest.

1. 2, 8, and 4
2. 2, 7, and 4
3. 1, 8, and 2
4. 0, 4, and 3
5. 0, 4, and 1
6. 3, 6, and 5
7. 4, 9, and 6

8. 2, 4, and 3
9. 0, 7, and 4
10. 2, 8, and 6
11. 1, 6, and 5
12. 0, 9, and 5

In Exercises 13-24, create a number line diagram to determine which of the two given statements is true.

13. $3 < 8$ or $3 > 8$
14. $44 < 80$ or $44 > 80$
15. $59 < 24$ or $59 > 24$
16. $15 < 11$ or $15 > 11$
17. $0 < 74$ or $0 > 74$
18. $11 < 18$ or $11 > 18$
19. $1 < 81$ or $1 > 81$
20. $65 < 83$ or $65 > 83$
21. $43 < 1$ or $43 > 1$
22. $62 < 2$ or $62 > 2$
23. $43 < 28$ or $43 > 28$
24. $73 < 21$ or $73 > 21$

25. Which digit is in the thousands column of the number 2,054,867,372?
26. Which digit is in the hundreds column of the number 2,318,999,087?
27. Which digit is in the hundred thousands column of the number 8,311,900,272?
28. Which digit is in the tens column of the number 1,143,676,212?
29. Which digit is in the hundred millions column of the number 9,482,616,000?
30. Which digit is in the hundreds column of the number 375,518,067?
31. Which digit is in the ten millions column of the number 5,840,596,473?
32. Which digit is in the hundred thousands column of the number 6,125,412,255?
33. Which digit is in the hundred millions column of the number 5,577,422,501?
34. Which digit is in the thousands column of the number 8,884,966,835?
35. Which digit is in the tens column of the number 2,461,717,362?
36. Which digit is in the ten millions column of the number 9,672,482,548?

---

37. Round the number 93, 857 to the nearest thousand.
38. Round the number 56, 872 to the nearest thousand.
39. Round the number 9, 725 to the nearest ten.
40. Round the number 6, 815 to the nearest ten.
41. Round the number 58, 739 to the nearest hundred.
42. Round the number 93, 146 to the nearest hundred.
43. Round the number 2, 358 to the nearest ten.

44. Round the number 8, 957 to the nearest ten.

45. Round the number 39, 756 to the nearest thousand.

46. Round the number 24, 965 to the nearest thousand.

47. Round the number 5, 894 to the nearest ten.

48. Round the number 3, 281 to the nearest ten.

49. Round the number 56, 123 to the nearest hundred.

50. Round the number 49, 635 to the nearest hundred.

51. Round the number 5, 483 to the nearest ten.

52. Round the number 9, 862 to the nearest ten.

---

53. According to the U.S. Census Bureau, the estimated population of the US is 304,059,724 as of July 2008. Round to the nearest hundred thousand.

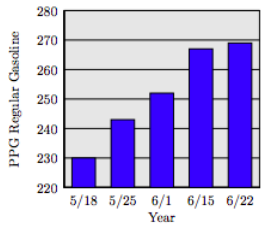
54. According to the U.S. Census Bureau, the estimated population of California is 36,756,666 as of July 2008. Round to the nearest hundred thousand.

55. According to the U.S. Census Bureau, the estimated population of Humboldt County is 129,000 as of July 2008. Round to the nearest ten thousand.

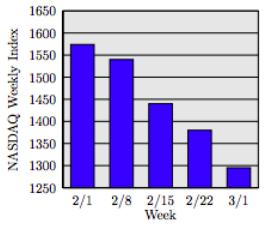
56. According to the U.S. Census Bureau, the estimated population of the state of Alaska was 686,293 as of July 2008. Round to the nearest ten thousand.

---

57. The following bar chart shows the average price (in cents) of one gallon of regular gasoline in the United States over five consecutive weeks in 2009, running from May 18 (5/18) through June 22 (6/22). What was the price (in cents) of one gallon of regular gasoline on June 1, 2009?



58. The following bar chart shows the average weekly NASDAQ index for five consecutive weeks in 2009, beginning with week starting February 1 (2/1) and ending with the week starting March 1 (3/1). What was the average NASDAQ index for the week starting February 8, 2009?



59. The population of Humboldt County is broken into age brackets in the following table. *Source: WolframAlpha*.

Age in years	Number
under 5	7,322
5 – 18	26,672
18 – 65	78,142
over 65	16,194

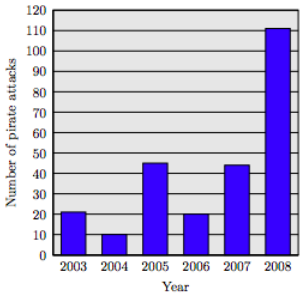
Create a bar chart for this data set with one bar for each age category.

60. The five cities with the largest number of reported violent crimes in the year 2007 are reported in the following table. *Source: Wikipedia.*

City	Violent Crimes
Setroit	2,289
St. Louis	2,196
Memphis	1,951
Oakland	1,918
Baltimore	1,631

Create a bar chart for this data set with one bar for each city.

61. The following bar chart tracks pirate attacks off the coast of Somalia.

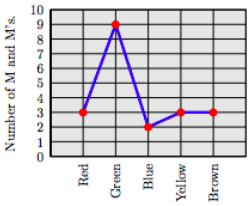


Source: ICC International Maritime Bureau, AP Times-Standard, 4/15/2009

a) How many pirate attacks were there in 2003?

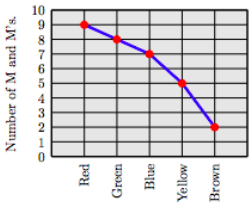
b) How many pirate attacks were there in 2008?

62. A team of students separated a small bowl of M and M's into five piles by color. The following line plot indicates the number of M and M's of each color.



How many red M and M's were in the bowl?

63. A team of students separated a small bowl of M and M's into five piles by color. The following line plot indicates the number of M and M's of each color.



How many red M and M's were in the bowl?

---

64. A team of students separated a small bowl of M and M's into five piles by color. The following table indicates the number of M and M's of each color.

Color	Number
Red	5
Green	9
Blue	7
Yellow	2
Brown	3

Create a lineplot for the M and M data. On the horizontal axis, arrange the colors in the same order as presented in the table above.

65. A team of students separated a small bowl of M and M's into five piles by color. The following table indicates the number of M and M's of every color.

Color	Number
Red	3
Green	7
Blue	2
Yellow	4
Brown	9

Create a lineplot for the M and M data. On the horizontal axis, arrange the colors in the same order as presented in the table above.

---

66. *Salmon count*. The table shows the number of adult coho salmon returning to the Shasta River over the past four years. Round the salmon count for each year to the nearest ten. *Times-Standard Shasta River coho rescue underway.*

Year	Salmon count
2007	300
2008	31
2009	9
2010	4

Answers

1. Smallest to largest: 2, 4, and 8.

3. Smallest to largest: 1, 2, and 8.

5. Smallest to largest: 0, 1, and 4.

7. Smallest to largest: 4, 6, and 9.

9. Smallest to largest: 0, 4, and 7.

11. Smallest to largest: 1, 5, and 6.

13.

Therefore, $3 < 8$.

15.

Therefore, $59 > 24$.

17.

Therefore, $0 < 74$.

This page titled 1.1: An Introduction to the Whole Numbers is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

1.2: Adding and Subtracting Whole Numbers

In the expression 3 + 4, which shows the sum of two whole numbers, the whole numbers 3 and 4 are called *addends* or *terms*. We can use a visual approach to find the sum of 3 and 4. First, construct a number line as shown in Figure 1.2.

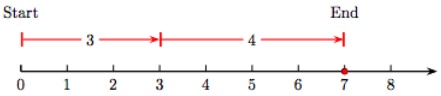

Figure 1.2: Adding whole numbers on the number line.

To add 3 and 4, proceed as follows.

1. Start at the number 0, then draw an arrow 3 units to the right, as shown in Figure 1.2. This arrow has magnitude (length) three and represents the whole number 3.
2. Draw a second arrow of length four, starting at the end of the first arrow representing the number 3. This arrow has magnitude (length) four and represents the whole number 4.
3. The sum of 3 and 4 could be represented by an arrow that starts at the number 0 and ends at the number 7. However, we prefer to mark this sum on the number line as a solid dot at the whole number 7. This number represents the sum of the whole numbers 3 and 4.

The Commutative Property of Addition

Let's change the order in which we add the whole numbers 3 and 4. That is, let's find the sum 4 + 3 instead.

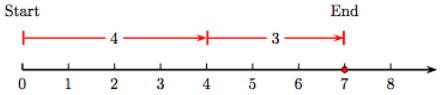

Figure 1.3: Addition is commutative; i.e., order doesn't matter.

As you can see in Figure 1.3, we start at zero then draw an arrow of length four, followed by an arrow of length three. However, the result is the same; i.e., 4 + 3 = 7.

Thus, the order in which we add three and four does not matter; that is,

$$3 + 4 = 4 + 3.$$

This property of addition of whole numbers is known as the *commutative property* of addition.

The Commutative Property of Addition

Let a and b represent two whole numbers. Then,

$$a + b = b + a.$$

Grouping Symbols

In mathematics, we use *grouping symbols* to affect the order in which an expression is evaluated. Whether we use parentheses, brackets, or curly braces, the expression inside any pair of grouping symbols must be evaluated first. For example, note how we first evaluate the sum in the parentheses in the following calculation.

$$(3 + 4) + 5 = 7 + 5$$

$$= 12$$

The rule is simple: Whatever is inside the parentheses is evaluated first.

Writing Mathematics

When writing mathematical statements, follow the mantra:

One equal sign per line.

We can use brackets instead of parentheses.

$$5 + [7 + 9] = 5 + 16$$
$$= 21$$

Again, note how the expression inside the brackets is evaluated first.

We can also use curly braces instead of parentheses or brackets.

$$\{2+3\} + 4 = 5 + 4$$
$$= 9$$

Again, note how the expression inside the curly braces is evaluated first.

If grouping symbols are nested, we evaluate the innermost parentheses first.

For example,

$$2 + [3 + (4 + 5)] = 2 + [3 + 9]$$
$$= 2 + 12$$
$$= 14.$$

Grouping Symbols

Use parentheses, brackets, or curly braces to delimit the part of an expression you want evaluated first. If grouping symbols are nested, evaluate the expression in the innermost pair of grouping symbols first.

The Associative Property of Addition

Consider the evaluation of the expression (2+3)+4. We evaluate the expression in parentheses first.

$$(2 + 3) + 4 = 5 + 4$$
$$= 9$$

Now, suppose we change the order of addition to 2 + (3 + 4). Then,

$$2 + (3 + 4) = 2 + 7$$
$$= 9.$$

Although the grouping has changed, the result is the same. That is,

$$(2 + 3) + 4 = 2 + (3 + 4).$$

This property of addition of whole numbers is called the *associate property* of addition.

Associate Property of Addition

Let a, b, and c represent whole numbers. Then,

$$(a + b) + c = a + (b + c).$$

Because of the associate property of addition, when presented with a sum of three numbers, whether you start by adding the first two numbers or the last two numbers, the resulting sum is the same.

The Additive Identity

Imagine a number line visualization of the sum of four and zero; i.e., 4 + 0.

In Figure 1.4, we start at zero, then draw an arrow of magnitude (length) four pointing to the right. Now, at the end of this arrow, attach a second arrow of length zero. Of course, that means that we remain right where we are, at 4. Hence the shaded dot at 4 is the sum. That is, 4 + 0 = 4.

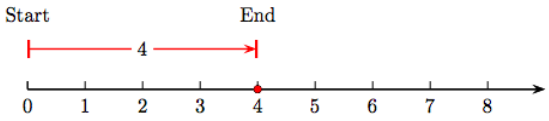

Figure 1.4: Adding zero to four.

The Additive Identity Property

The whole number zero is called the additive identity. If a is any whole number, the

$$a + 0 = a.$$

The number zero is called the additive identity because if you add zero to any number, you get the identical number back.

Adding Larger Whole Numbers

For completeness, we include two examples of adding larger whole numbers. Hopefully, the algorithm is familiar from previous coursework.

Example 1

Simplify: 1, 234 + 498.

Solution

Align the numbers vertically, then add, starting at the furthest column to the right. Add the digits in the ones column, 4 + 8 = 12. Write the 2, then carry a 1 to the tens column. Next, add the digits in the tens column, 3 + 9 = 12, add the carry to get 13, then write the 3 and carry a 1 to the hundreds column. Continue in this manner, working from right to left

$$\begin{array}{r} {\scriptstyle 11} \\ 1234 \\ +\ \ 498 \\ \hline 1732 \end{array}$$

Therefore, 1, 234 + 498 = 1, 732

Exercise

Simplify: 1,286 + 349.

Answer

1635

Add three or more numbers in the same manner.

Example 2

Simplify: 256 + 322 + 418.

Solution

Align the numbers vertically, then add, starting at the furthest column to the right. Add the digits in the ones column, 6 + 2 + 8 = 16. Write the 6, then carry a 1 to the tens column. Continue in this manner, working from right to left.

$$\begin{array}{r} 256 \\ 322 \\ +418 \\ \hline 996 \end{array}$$

Therefore, 256 + 322 + 418 = 996.

Exercise

Simplify: 256 + 342 + 283

Answer

881

Subtraction of Whole Numbers

The key idea is this: *Subtraction is the opposite of addition*. For example, consider the difference 7 - 4 depicted on the number line in Figure 1.5.

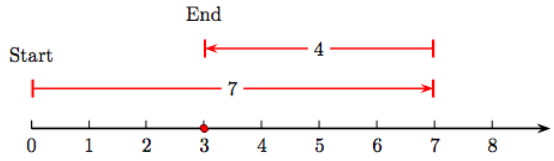

Figure 1.5: Subtraction means *add the opposite*.

If we were adding 7 and 4, we first draw an arrow starting at zero pointing to the right with magnitude (length) seven. Then, to add 4, we would draw a second arrow of magnitude (length) 4, attached to the end of the first arrow and pointing to the right.

However, because subtraction is the *opposite* of addition, in Figure 1.5 we attach an arrow of magnitude (length) four to the end of the first arrow, but *pointing in the opposite direction* (to the left). Note that this last arrow ends at the answer, which is a shaded dot on the number line at 3. That is, $7 - 4 = 3$.

Note that subtraction is **not commutative**; that is, it make no sense to say that $7 - 5$ is the same as $5 - 7$.

Subtraction is **not associative**. It is not the case that $(9 - 5) - 2$ is the same as $9 - (5 - 2)$. On the one hand,

$$(9 - 5) - 2 = 4 - 2$$
$$= 2,$$

but

$$9 - (5 - 2) = 9 - 3$$
$$= 6.$$

Subtracting Larger Whole Numbers

Much as we did with adding larger whole numbers, to subtract two large whole numbers, align them vertically then subtract, working from right to left. You may have to “borrow” to complete the subtraction at any step.

Example 3

Simplify: $1,755 - 328$.

Solution

Align the numbers vertically, then subtract, starting at the ones column, then working right to left. At the ones column, we cannot subtract 8 from 5, so we borrow from the previous column. Now, 8 from 15 is 7. Continue in this manner, working from right to left.

$$\begin{array}{r} {\scriptstyle}{\scriptstyle}{\scriptstyle}{\scriptstyle 4}{\scriptstyle} \\ 1\,7\,\not{5}^{\,1}5 \\ -\quad 3\,2\,8 \\ \hline 1\,4\,2\,7 \end{array}$$

Therefore, 1, 755 − 328 = 1, 427.

Exercise

Simplify: 5,635 - 288.

Answer

5,347

Order of Operations

In the absence of grouping symbols, it is important to understand that addition holds no precedence over subtraction, and vice-versa.

> Perform all additions and subtractions in the order presented, moving left to right.

Let's look at an example.

Example 4

Simplify the expression $15-8+4$.

Solution

This example can be trickier than it seems. However, if we follow the rule (perform all additions and subtractions in the order presented, moving left to right), we should have no trouble. First comes fifteen minus eight, which is seven. Then seven plus four is eleven.

$$\begin{aligned} 15-8+4 &= 7+4 \\ &= 11. \end{aligned}$$

Exercise

Simplify: $25-10+8$.

Answer

23

Caution! Incorrect answer ahead!

Note that it is possible to arrive at a different (but incorrect) answer if we favor addition over subtraction in Example 4. If we first add eight and four, then 15 − 8 + 4 becomes 15 − 12, which is 3. However, note that **this is incorrect**, because it violates the rule "perform all additions and subtractions in the order presented, moving left to right."

Applications — Geometry

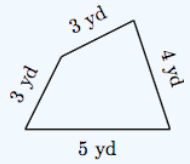
There are any number of applications that require a sum or difference of whole numbers. Let's examine a few from the world of geometry.

Perimeter of a Polygon

In geometry a polygon is a plane figure made up of a closed path of a finite sequence of segments. The segments are called the *edges* or *sides* of the polygon and the points where two edges meet are called the *vertices* of the polygon. The *perimeter* of any polygon is the sum of the lengths of its sides.

Example 5

A quadrilateral is a polygon with four sides. Find the perimeter of the quadrilateral shown below, where the sides are measured below.



Solution

To find the perimeter of the quadrilateral, find the sum of the lengths of the sides.

$$\text{Perimeter} = 3 + 3 + 4 + 5 = 15$$

Hence, the perimeter of the quadrilateral is 15 yards.

Exercise

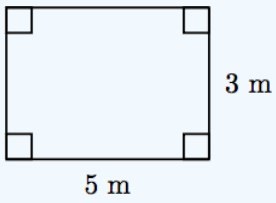
A quadrilateral has sides that measure in 4 in., 3 in., 5 in., and 5 in. Find the perimeter.

Answer

17 inches

Example 6

A quadrilateral (four sides) is a rectangle if all four of its angles are right angles. It can be shown that the opposite sides of a rectangle must be equal. Find the perimeter of the rectangle shown below, where the sides of the rectangle are measured in meters.



Solution

To find the perimeter of the rectangle, find the sum of the four sides. Because opposite sides have the same length, we have two sides of length 5 meters and two sides of length 3 meters. Hence,

$$\text{Perimeter} = 5 + 3 + 5 + 3 = 16.$$

Thus, the perimeter of the rectangle is 16 meters.

Exercise

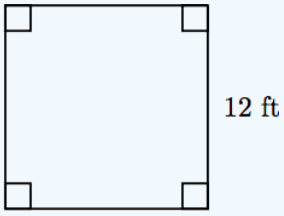
A rectangle has length 12 meters and width 8 meters. Find its perimeter.

Answer

40 meters

Example 7

A quadrilateral (four sides) is a *square* if all four of its sides measures 18 centimeters. Find its perimeter. are equal and all four of its angles are right angles. Pictured below is a square having a side of length 12 feet. Find the perimeter of the square.



Solution

Because the quadrilateral is a square, all four sides have the same length, namely 12 feet. To find the perimeter of the square, find the sum of the four sides. Perimeter = 12 + 12 + 12 + 12 = 48

Hence, the perimeter of the square is 48 feet.

Exercise

A square has a side that measures 18 centimeters. Find its perimeter.

Answer

72 centimeters

Application — Alternative Fuels

Automobiles that run on alternative fuels (other than gasoline) have increased in the United States over the years.

Example 8

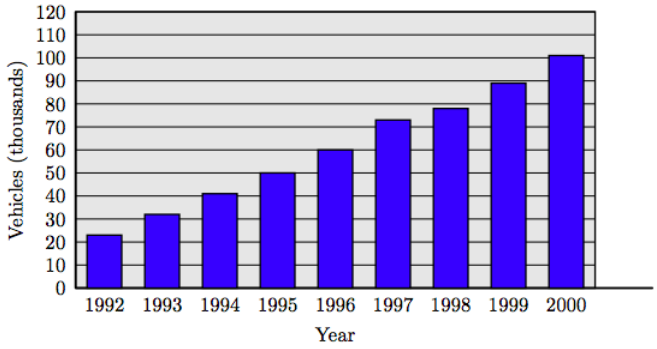
Table 1.2 show the number of cars (in thousands) running on compressed natural gas versus the year. Create a bar chart showing the number of cars running on compressed natural gas versus the year.

Year	1992	1993	1994	1995	1996	1997	1998	1999	2000
Number	23	32	4`	50	60	73	78	89	101

Table 1.2: Number of vehicles (in thousands) running on compressed natural gas.

Solution

Place the years on the horizontal axis. At each year, sketch a bar having height equal to the number of cars in that year that are running on compressed natural gas. Scale the vertical axis in thousands.



Exercise

The following table shows the number of hybrid cars (in thousands) by country.

Country	Number
U.S.	279
Japan	77
Canada	17
U.K.	14
Netherlands	11

Create a bar chart showing the number of cars versus the country of use.

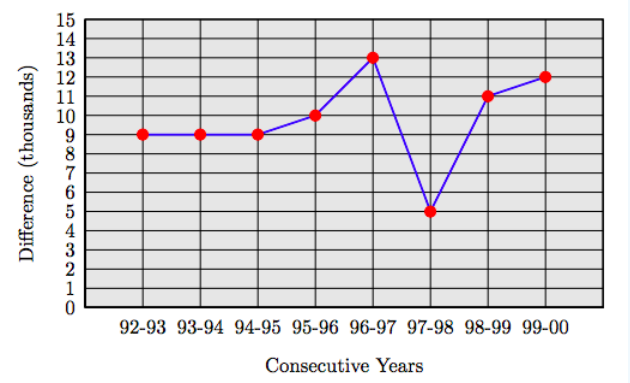
Example 9

Using the data in Table 1.2, crease a table that shows the differences in consecutive years, then create a line plot of the result. In what consecutive years did the United States see the greatest increase in cars powered by compressed natural gas?

Solution

Table 1.3 shows the differences in consecutive years.

Next, craft a line graph. Place consecutive years on the horizontal axis. At each consecutive year pair, plot a point at a height equal to the difference in alternative fuel vehicles. Connect the points with straight line segments.



Note how the line graph makes it completely clear that the greatest increase in vehicles powered by compressed natural gas occurred in the consecutive years 1996-1997, an increase of 13,000 vehicles.

Exercise

The following table show Alphonso's percentage scores on his examinations in mathematics.

Exam	Percentage
Exam #1	52
Exam #2	45
Exam #3	72
Exam #4	889
Exam #5	76

Construct a line graph of Alphonso's exam scores versus exam number.

Exercises

1. Sketch a number line diagram depicting the sum 3 + 2, as shown in Figure 1.2 in the narrative of this section.
2. Sketch a number line diagram depicting the sum 3 + 5, as shown in Figure 1.2 in the narrative of this section.
3. Sketch a number line diagram depicting the sum 3 + 4, as shown in Figure 1.2 in the narrative of this section.
4. Sketch a number line diagram depicting the sum 2 + 4, as shown in Figure 1.2 in the narrative of this section.
5. Sketch a number line diagram depicting the sum 4 + 2, as shown in Figure 1.2 in the narrative of this section.
6. Sketch a number line diagram depicting the sum 4 + 3, as shown in Figure 1.2 in the narrative of this section.
7. Sketch a number line diagram depicting the sum 2 + 5, as shown in Figure 1.2 in the narrative of this section.
8. Sketch a number line diagram depicting the sum 4 + 5, as shown in Figure 1.2 in the narrative of this section.
9. Sketch a number line diagram depicting the sum 4 + 4, as shown in Figure 1.2 in the narrative of this section.
10. Sketch a number line diagram depicting the sum 3 + 3, as shown in Figure 1.2 in the narrative of this section.

In Exercises 11-28, determine which property of addition is depicted by the given identity

11. 28 + 0 = 28
12. 53 + 0 = 53
13. 24 + 0 = 24
14. 93 + 0 = 93
15. (51 + 66) + 88 = 51 + (66 + 88)
16. (90 + 96) + 4 = 90 + (96 + 4)
17. 64 + 39 = 39 + 64
18. 68 + 73 = 73 + 68
19. (70 + 27) + 52 = 70 + (27 + 52)
20. (8 + 53) + 81 = 8 + (53 + 81)
21. 79 + 0 = 79
22. 42 + 0 = 42
23. 10 + 94 = 94 + 10
24. 55 + 86 = 86 + 55
25. 47 + 26 = 26 + 47

26. 62 + 26 = 26 + 62

27. (61 + 53) + 29 = 61 + (53 + 29)

28. (29 + 96) + 61 = 29 + (96 + 61)

---

29. Sketch a number line diagram depicting the difference 8−2, as shown in Figure 1.5 in the narrative of this section.

30. Sketch a number line diagram depicting the difference 8−4, as shown in Figure 1.5 in the narrative of this section.

31. Sketch a number line diagram depicting the difference 7−2, as shown in Figure 1.5 in the narrative of this section.

32. Sketch a number line diagram depicting the difference 9−5, as shown in Figure 1.5 in the narrative of this section.

33. Sketch a number line diagram depicting the difference 7−4, as shown in Figure 1.5 in the narrative of this section.

34. Sketch a number line diagram depicting the difference 6−4, as shown in Figure 1.5 in the narrative of this section.

35. Sketch a number line diagram depicting the difference 9−4, as shown in Figure 1.5 in the narrative of this section.

36. Sketch a number line diagram depicting the difference 6−5, as shown in Figure 1.5 in the narrative of this section.

37. Sketch a number line diagram depicting the difference 8−5, as shown in Figure 1.5 in the narrative of this section.

38. Sketch a number line diagram depicting the difference 9−3, as shown in Figure 1.5 in the narrative of this section.

In Exercises 39-50, simplify the given expression.

39. 16 − 8+2

40. 17 − 3+5

41. 20 − 5 + 14

42. 14 − 5+6

43. 15 − 2+5

44. 13 − 4+2

45. 12 − 5+4

46. 19 − 4 + 13

47. 12 − 6+4

48. 13 − 4 + 18

49. 15 − 5+8

50. 13 − 3 + 11

In Exercises 51-58, the width W and length L of a rectangle are given. Find the perimeter P of the rectangle.

51. W = 7 in, L = 9 in

52. W = 4 in, L = 6 in

53. W = 8 in, L = 9 in

54. W = 5 in, L = 9 in

55. W = 4 cm, L = 6 cm

56. W = 5 in, L = 8 in

57. W = 4 cm, L = 7 cm

58. W = 4 in, L = 9 in

In Exercises 59-66, the length s of a side of a square is given. Find the perimeter P of the square.

59. s = 25 cm

60. s = 21 in

61. s = 16 cm

62. s = 10 in

63. s = 18 in

64. s = 7 in

65. s = 3 in

66. s = 20 in

In Exercises 67-86, find the sum.

67. 3005 + 5217

68. 1870 + 5021

69. 575 + 354 + 759

70. 140 + 962 + 817

71. 472 + (520 + 575)

72. 318 + (397 + 437)

73. 274 + (764 + 690)

74. 638 + (310 + 447)

75. 8583 + 592

76. 5357 + 9936

77. 899 + 528 + 116

78. 841 + 368 + 919

79. (466 + 744) + 517

80. (899 + 996) + 295

81. 563 + 298 + 611 + 828

82. 789 + 328 + 887 + 729

83. 607 + 29 + 270 + 245

84. 738 + 471 + 876 + 469

85. (86 + 557) + 80

86. (435 + 124) + 132

In Exercises 87-104, find the difference.

87. 3493 − 2034 − 227

88. 3950 − 1530 − 2363

89. 8338 − 7366

90. 2157 − 1224

91. 2974 − 2374

92. 881 − 606

93. 3838 − (777 − 241)

94. 8695 − (6290 − 4233)

95. 5846 − 541 − 4577

96. 5738 − 280 − 4280

97. 3084 − (2882 − 614)

98. 1841 − (217 − 28)

99. 2103 − (1265 − 251)

100. 1471 − (640 − 50)

101. 9764 − 4837 − 150

102. 9626 − 8363 − 1052

103. 7095 − 226

104. 4826 − 1199

---

105. **Water Subsidies**. Since the drought began in 2007, California farms have received $79 million in water subsidies. California cotton and rice farmers received an additional $439 million. How much total water subsidies have farmers received? *Associated Press Times-Standard 4/15/09*

106. **War Budget**. The 2010 Federal budget allocates $534 billion for the Department of Defense base programs and an additional $130 billion for the nation's two wars. How much will the Department of Defense receive altogether? *Associated Press Times-Standard 5/8/09*

107. **Sun Frost**. Arcata, CA is home to Sun Frost, a manufacturer of highly efficient refrigerators and freezers. The AC model RF12 refrigerator/freezer costs $2,279 while an R16 model refrigerator/freezer costs $3,017. How much more does the R16 model cost? Source: www.sunfrost.com/retail pricelist.html

108. **Shuttle Orbit**. The space shuttle usually orbits at 250 miles above the surface of the earth. To service the Hubble Space Telescope, the shuttle had to go to 350 miles above the surface. How much higher did the shuttle have to orbit?

109. **Earth's Orbit**. Earth orbits the sun in an ellipse. When earth is at its closest to the sun, called *perihelion*, earth is about 147 million kilometers. When earth is at its furthest point from the sun, called *aphelion*, earth is about 152 million kilometers from the sun. What's the difference in millions of kilometers between aphelion and perihelion?

110. **Pluto's Orbit**. Pluto's orbit is highly eccentric. Find the difference between Pluto's closest approach to the sun and Pluto's furthest distance from the sun if Pluto's perihelion (closest point on its orbit about the sun) is about 7 billion kilometers and its aphelion (furthest point on its orbit about the sun) is about 30 billion kilometers.

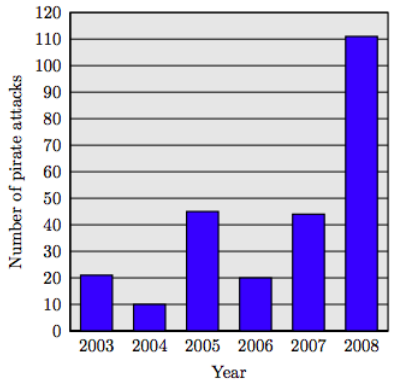
111. **Sunspot Temperature**. The surface of the sun is about 10,000 degrees Fahrenheit. Sunspots are darker regions on the surface of the sun that have a relatively cooler temperature of 6,300 degrees Fahrenheit. How many degrees cooler are sunspots?

112. **Jobs**. The Times-Standard reports that over the next year, the credit- and debitcard processing business Humboldt Merchant Services expects to cut 36 of its 80 jobs, but then turn around and hire another 21. How many people will be working for the company then? *Times-Standard 5/6/09*

113. **Wild tigers**. The chart shows the estimated wild tiger population, by region. According to this chart, what is the total wild tiger population worldwide? *Associated Press-Times-Standard 01/24/10 Pressure mounts to save the tiger*.

Region	Tiger population
India, Nepal and Bhutan	1650
China and Russia	450
Bangladesh	250
Sumatra (Indonesia)	400
Malaysia	500
other SE Asia	350

114. **Pirate Attacks**. The following bar chart tracks pirate attacks off the coast of Somalia.



Source: ICC International Maritime Bureau, AP Times-Standard, 4/15/2009

a) How many pirate attacks were there in 2003, 2004, and 2005 combined?

b) How many pirate attacks were there in 2006, 2007, and 2008 combined?

c) How many more pirate attacks were there in 2008 than in 2007?

115. Emily shows improvement on each successive examination throughout the term. Her exam scores are recorded in the following table.

Exam	**Score**
Exam #1	48
Exam #2	51
Exam #3	54
Exam #4	59
Exam #5	67
Exam #6	70

a) Create a bar plot for Emily's examination scores. Place the examination numbers on the horizontal axis in the same order shown in the table above.

b) Create a table that shows successive differences in examination scores. Make a line plot of these differences. Between which two exams did Emily show the greatest improvement?

116. Jason shows improvement on each successive examination throughout the term. His exam scores are recorded in the following table.

Exam	**Score**
Exam #1	34
Exam #2	42
Exam #3	45
Exam #4	50
Exam #5	57
Exam #6	62

a) Create a bar plot for Jason's examination scores. Place the examination numbers on the horizontal axis in the same order shown in the table above.

b) Create a table that shows successive differences in examination scores. Make a line plot of these differences. Between which two exams did Jason show the greatest improvement?

- **1.2: Adding and Subtracting Whole Numbers** by David Arnold is licensed CC BY-NC-SA 3.0.

1.3: Multiplication and Division of Whole Numbers

We begin this section by discussing multiplication of whole numbers. The first order of business is to introduce the various symbols used to indicate multiplication of two whole numbers.

Mathematical symbols that indicate multiplication

Symbol		Example
×	times symbol	3 × 4
·	dot	3 · 4
( )	parentheses	(3)(4) or 3(4) of (3)4

Products and Factors

In the expression $3 \cdot 4$, the whole numbers 3 and 4 are called the **factors** and $3 \cdot 4$ is called the **product**.

The key to understanding multiplication is held in the following statement.

> Multiplication is equivalent to repeated addition.

Suppose, for example, that we would like to evaluate the product $3 \cdot 4$. Because multiplication is equivalent to repeated addition, $3 \cdot 4$ is equivalent to adding three fours. That is,

$$3 \cdot 4 = \underbrace{4+4+4}_{\text{three fours}}$$

Thus, $3 \cdot 4 = 12$. You can visualize the product $3 \cdot 4$ as the sum of three fours on a number line, as shown in Figure 1.6.

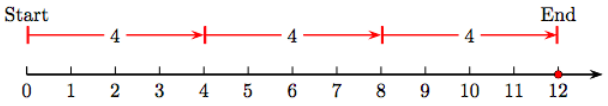

Figure 1.6: Note that 3 · 4 = 4 + 4 + 4. That is, 3 · 4 = 12.

Like addition, the order of the factors does not matter.

$$4 \cdot 3 = \underbrace{3+3+3+3}_{\text{four threes}}$$

Thus, $4 \cdot 3 = 12$. Consider the visualization of $4 \cdot 3$ in Figure 1.7.

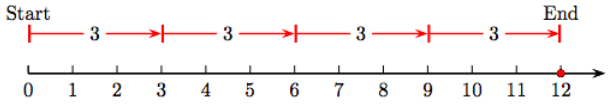

Figure 1.7: Note that 4 · 3 = 3 + 3 + 3 + 3. That is, 4 · 3 = 12.

The evidence in Figure 1.6 and Figure 1.7 show us that multiplication is commutative. That is,

$$3 \cdot 4 = 4 \cdot 3$$

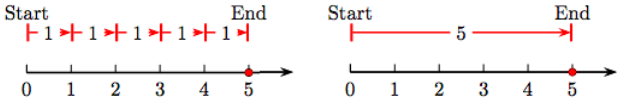
Commutative Property of Multiplication

If *a* and *b* are any whole numbers, then

$$a \cdot b = b \cdot a.$$

The Multiplicative Identity

In Figure 1.8(a), note that five ones equals 5; that is, $5 \cdot 1 = 5$. On the other hand, in Figure 1.8(b), we see that one five equals five; that is, $1 \cdot 5 = 5$.



(a) Note that $5 \cdot 1 = 1 + 1 + 1 + 1 + 1$. (b) Note that $1 \cdot 5 = 5$.

Figure 1.8: Note that 5 · 1 = 5 and 1 · 5 = 5.

Because multiplying a whole number by 1 equals that identical number, the whole number 1 is called the multiplicative identity.

The Multiplicative Identity Property

If a is any whole number, then

$$a \cdot 1 = a \text{ and } 1 \cdot a = a.$$

Multiplication by Zero

Because $3 \cdot 4 = 4 + 4 + 4$, we can say that the product $3 \cdot 4$ represents "3 sets of 4," as depicted in Figure 1.9, where three groups of four boxes are each enveloped in an oval.

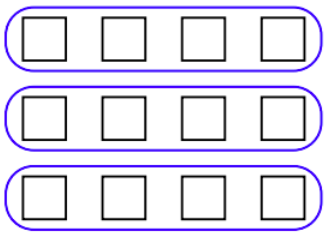


Figure 1.9: Three sets of four: 3 · 4 = 12.

Therefore, $0 \cdot 4$ would mean zero sets of four. Of course, zero sets of four is zero.

Multiplication by Zero.

If a represents any whole number, then

$$a \cdot 0 = 0 \text{ and } 0 \cdot a = 0.$$

The Associative Property of Multiplication

Like addition, multiplication of whole numbers is associative. Indeed,

$$\begin{aligned} 2 \cdot (3 \cdot 4) &= 2 \cdot 12 \\ &= 24 \end{aligned}$$

and

$$\begin{aligned} (2 \cdot 3) \cdot 4 &= 6 \cdot 4 \\ &= 24. \end{aligned}$$

The Associative Property of Multiplication.

If a, b, and c are any whole numbers, then

$$a \cdot (b \cdot c) = (a \cdot b) \cdot c.$$

Multiplying Larger Whole Numbers

Much like addition and subtraction of large whole numbers, we will also need to multiply large whole numbers. Again, we hope the algorithm is familiar from previous coursework.

Example 1

Simplify: $35 \cdot 127$.

Solution

Align the numbers vertically. The order of multiplication does not matter, but we'll put the larger of the two numbers on top of the smaller number. The first step is to multiply 5 times 127. Again, we proceed from right to left. So, 5 times 7 is 35. We write the 5, then carry the 3 to the tens column. Next, 5 times 2 is 10. Add the carry digit 3 to get 13. Write the 3 and carry the 1 to the hundreds column. Finally, 5 times 1 is 5. Add the carry digit to get 6.

$$\begin{array}{r} {\scriptstyle 1\ 3\ \ } \\ 1\,2\,7 \\ \times\ 3\,5 \\ \hline 6\,3\,5 \end{array}$$

The next step is to multiply 3 times 127. However, because 3 is in the tens place, its value is 30, so we actually multiply 30 times 127. This is the same as multiplying 127 by 3 and placing a 0 at the end of the result.

$$\begin{array}{r} {\scriptstyle 2\ \ } \\ 1\,2\,7 \\ \times\ 3\,5 \\ \hline 6\,3\,5 \\ 3\,8\,1\,0 \\ \hline \end{array}$$

After adding the 0, 3 times 7 is 21. We write the 1 and carry the 2 above the 2 in the tens column. Then, 3 times 2 is 6. Add the carry digit 2 to get 8. Finally, 3 times 1 is 1.

All that is left to do is to add the results.

$$\begin{array}{r} 1\,2\,7 \\ \times\ 3\,5 \\ \hline 6\,3\,5 \\ 3\,8\,1\,0 \\ \hline 4\,4\,4\,5 \end{array}$$

Thus, $35 \cdot 127 = 4,445$.

Alternate Format

It does not hurt to omit the trailing zero in the second step of the multiplication, where we multiply 3 times 127. The result would look like this:

$$\begin{array}{r} 1\,2\,7 \\ \times\ 3\,5 \\ \hline 6\,3\,5 \\ 3\,8\,1\,0 \\ \hline 4\,4\,4\,5 \end{array}$$

In this format, the zero is understood, so it is not necessary to have it physically present. The idea is that with each multiplication by a new digit, we indent the product one space from the right.

Exercise

Simplify: $56 \cdot 335$

Answer

18,760

Division of Whole Numbers

We now turn to the topic of division of whole numbers. We first introduce the various symbols used to indicate division of whole numbers.

Mathematical Symbols that Indicate Division

Symbol		Example
$\div$	division symbol	$12 \div 4$
-	fraction bar	$\frac{12}{4}$
$\longdiv{}$	division bar	$4\longdiv{12}$

Note that each of the following say the same thing; that is, "12 divided by 4 is 3."

$12 \div 4 = 3$ or $\frac{12}{4} = 3$ or $4\overline{)12}$

Quotients, Dividends, and Divisors

In the statement

$$\frac{3}{4)12}$$

the whole number 12 is called the *dividend*, the whole number 4 is called the *divisor*, and the whole number 3 is called the *quotient*. Note that this division bar notation is equivalent to

$$12 \div 4 = 3 \quad \text{and} \quad \frac{12}{4} = 3.$$

The expression a/b means "a divided by b," but this construct is also called a *fraction*.

Definition: Fraction

The expression

$$\frac{a}{b}$$

is called a **fraction**. The number a on top is called the **numerator** of the fraction; the number b on the bottom is called the **denominator** of the fraction.

The key to understanding division of whole numbers is contained in the following statement.

> Division is equivalent to repeated subtraction.

Suppose for example, that we would like to divide the whole number 12 by the whole number 4. This is equivalent to asking the question "how many fours can we subtract from 12?" This can be visualized in a number line diagram, such as the one in Figure 1.10.

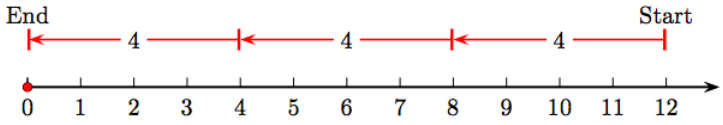

Figure 1.10: Division is repeated subtraction.

In Figure 1.10, note that we if we subtract three fours from twelve, the result is zero. In symbols,

$$12 - \underbrace{4 - 4 - 4}_{\text{three fours}} = 0.$$

Equivalently, we can also ask "How many groups of four are there in 12," and arrange our work as shown in Figure 1.11, where we can see that in an array of twelve objects, we can circle three groups of four ; i.e., 12 ÷ 4 = 3.

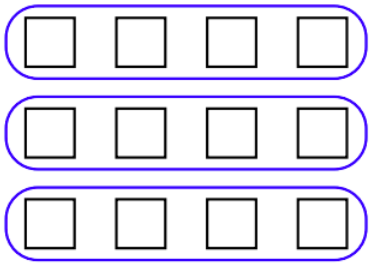

Figure 1.11: There are three groups of four in twelve.

In Figure 1.10 and Figure 1.11, note that the division (repeated subtraction) leaves no remainder. This is not always the case.

Example 2.

Divide 7 by 3.

Solution

In Figure 1.12, we can see that we can subtract two threes from seven, leaving a remainder of one.

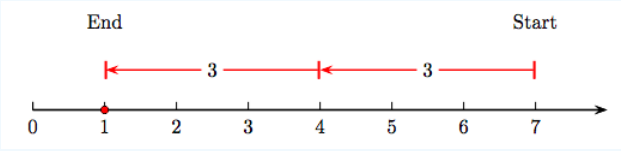

Figure 1.12: Division with a remainder.

Alternatively, in an array of seven objects, we can circle two groups of three, leaving a remainder of one.

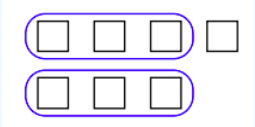

Figure 1.13: Dividing seven by three leaves a remainder of one.

Both Figure 1.12 and Figure1.13 show that there are two groups of three in seven, with one left over. We say "Seven divided by three is two, with a remainder of one.

Exercise

Use both the number line approach and the array of boxes approach to divide 12 by 5.

Division is not Commutative

When dividing whole numbers, the order matters. For example

$$12 \div 4 = 3,$$

but $4 \div 12$ is not even a whole number. Thus, if a and b are whole numbers, then $a \div b$ does **not** have to be the same as $b \div a$.

Division is not Associative

When you divide three numbers, the order in which they are grouped will usually affect the answer. For example,

$$(48 \div 8) \div 2 = 6 \div 2$$

$$= 3,$$

but

$$48 \div (8 \div 2) = 48 \div 4$$

$$= 12.$$

Thus, if a, b, and c are whole numbers, $(a \div b) \div c$ does not have to be the same as $a \div (b \div c)$.

Division by Zero is Undefined

Suppose that we are asked to divide six by zero; that is, we are asked to calculate $6 \div 0$. In Figure 1.14, we have an array of six objects.

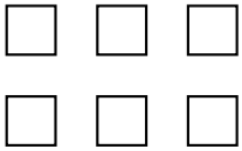

Figure 1.14: How many groups of zero do you see?

Now, to divide six by zero, we must answer the question "How many groups of zero can we circle in Figure 1.14?" Some thought will provide the answer: This is a meaningless request! It makes absolutely no sense to ask how many groups of zero can be circled in the array of six objects in Figure 1.14.

Division by Zero

Division by zero is **undefined**. Each of the expressions

$$6 \div 0 \quad \text{and} \quad \frac{6}{0} \quad \text{and} \quad 0\overline{)6}$$

is **undefined.**

On the other hand, it make sense to ask "What is zero divided by six?" If we create an array of zero objects, then ask how many groups of six we can circle, the answer is "zero groups of six." That is, zero divided by six is zero.

$$0 \div 6 = 0 \quad \text{and} \quad \frac{0}{6} = 0 \quad \text{and} \quad 6\overline{)0}$$

Dividing Larger Whole Numbers

We'll now provide a quick review of division of larger whole numbers, using an algorithm that is commonly called *long division*. This is not meant to be a thorough discussion, but a cursory one. We're counting on the fact that our readers have encountered this algorithm in previous courses and are familiar with the process.

Example 3

Simplify: 575/23.

Solution

We begin by estimating how many times 23 will divide into 57, guessing 1. We put the 1 in the quotient above the 7, multiply 1 times 23, place the answer underneath 57, then subtract.

$$23\overline{)575}^{\,1}$$

$$\underline{23}$$

$$34$$

Because the remainder is larger than the divisor, our estimate is too small. We try again with an estimate of 2.

$$\begin{array}{r} 2 \\ 23\overline{)575} \\ \underline{46} \\ 11 \end{array}$$

That's the algorithm. Divide, multiply, then subtract. You may continue only when the remainder is smaller than the divisor.

To continue, bring down the 5, estimate that 115 divided by 23 is 5, then multiply 5 times the divisor and subtract.

$$\begin{array}{r} 25 \\ 23\overline{)575} \\ \underline{46} \\ 115 \\ \underline{115} \\ 0 \end{array}$$

Because the remainder is zero, 575/23 = 25.

? Exercise

Divide 980/35

Answer

28

Application — Counting Rectangular Arrays

Consider the rectangular array of stars in Figure 1.15. To count the number of stars in the array, we could use brute force, counting each star in the array one at a time, for a total of 20 stars. However, as we have four rows of five stars each, it is much faster to multiply: $4 \cdot 5 = 20$ stars.

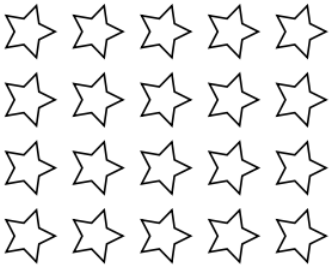

Figure 1.15: Four rows and five columns.

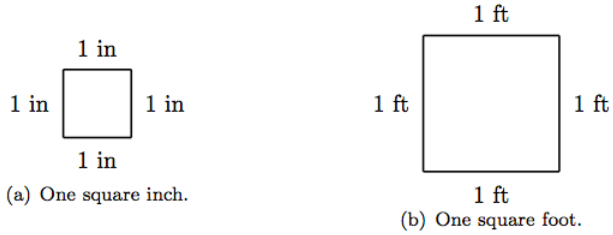

Figure 1.16: Measures of area are in square units.

Application — Area

In Figure 1.16(a), pictured is one square inch (1 in^2), a square with one inch on each side. In Figure 1.16(b), pictured is one square foot (1 ft^2), a square with one foot on each side. Both of these squares are measures of area. Now, consider the rectangle shown in Figure 1.17. The length of this rectangle is four inches (4 in) and the width is three inches (3 in).

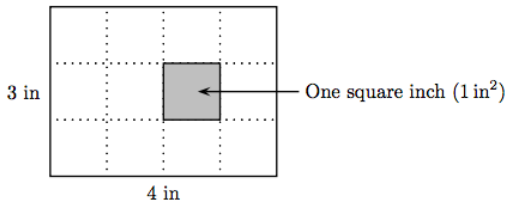

Figure 1.17: A rectangle with length 4 inches and width 3 inches.

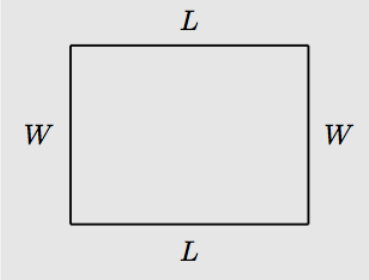
To find the area of the figure, we can count the individual units of area that make up the area of the rectangle, twelve square inches (12 in^2) in all. However, as we did in counting the stars in the array in Figure 1.15, it is much faster to note that we have three rows of four square inches. Hence, it is much faster to multiply the number of squares in each row by the number of squares in each column: 4·3 = 12 square inches.

The argument presented above leads to the following rule for finding the area of a rectangle.

Area of a Rectangle

Let L and W represent the length and width of a rectangle, respectively.



To find the area of the rectangle, calculate the product of the length and width. That is, if A represents the area of the rectangle, then the area of the rectangle is given by the formula

$$A = LW.$$

Example 4

A rectangle has width 5 feet and length 12 feet. Find the area of the rectangle.

Solution

Substitute L = 12 ft and W = 5 ft into the area formula.

$$A = LW$$
$$= (12 \text{ ft})(5 \text{ ft})$$
$$= 60 \text{ ft}^2$$

Hence, the area of the rectangle is 60 square feet.

Exercise

A rectangle has width 17 inches and length 33 inches. Find the area of the rectangle.

Answer

561 square inches

Exercises

In Exercises 1-4 use number line diagrams as shown in Figure 1.6 to depict the multiplication.

1. $2 \cdot 4$.
2. $3 \cdot 4$.
3. $4 \cdot 2$.
4. $4 \cdot 3$.

In Exercises 5-16, state the property of multiplication depicted by the given identity.

5. $9 \cdot 8 = 8 \cdot 9$
6. $5 \cdot 8 = 8 \cdot 5$
7. $8 \cdot (5 \cdot 6) = (8 \cdot 5) \cdot 6$
8. $4 \cdot (6 \cdot 5) = (4 \cdot 6) \cdot 5$
9. $6 \cdot 2 = 2 \cdot 6$
10. $8 \cdot 7 = 7 \cdot 8$
11. $3 \cdot (5 \cdot 9) = (3 \cdot 5) \cdot 9$
12. $8 \cdot (6 \cdot 4) = (8 \cdot 6) \cdot 4$
13. $21 \cdot 1 = 21$
14. $39 \cdot 1 = 39$
15. $13 \cdot 1 = 13$
16. $44 \cdot 1 = 44$

In Exercises 17-28, multiply the given numbers.

17. $78 \cdot 3$
18. $58 \cdot 7$
19. $907 \cdot 6$
20. $434 \cdot 80$
21. $128 \cdot 30$
22. $454 \cdot 90$
23. $799 \cdot 60$
24. $907 \cdot 20$
25. $14 \cdot 70$
26. $94 \cdot 90$
27. $34 \cdot 90$
28. $87 \cdot 20$

In Exercises 29-40, multiply the given numbers.

29. $237 \cdot 54$
30. $893 \cdot 94$
31. $691 \cdot 12$
32. $823 \cdot 77$

33. 955 · 89

34. 714 · 41

35. 266 · 61

36. 366 · 31

37. 365 · 73

38. 291 · 47

1.4: Prime Factorization

In the statement $3 \cdot 4 = 12$, the number 12 is called the *product*, while 3 and 4 are called *factors*.

Example 1

Find all whole number factors of 18.

Solution

We need to find all whole number pairs whose product equals 18. The following pairs come to mind.

$$1 \cdot 18 = 18 \text{ and } 2 \cdot 9 = 18 \text{ and } 3 \cdot 6 = 18.$$

Hence, the factors of 18 are (in order) 1, 2, 3, 6, 9, and 18.

Exercise

Find all whole number factors of 21.

Answer

1, 3, 7, and 21

Divisibility

In Example 1, we saw $3 \cdot 6 = 18$, making 3 and 6 factors of 18. Because division is the inverse of multiplication, that is, division by a number undoes the multiplication of that number, this immediately provides

$$18 \div 6 = 3 \text{ and } 18 \div 3 = 6.$$

That is, 18 is divisible by 3 and 18 is divisible by 6. When we say that 18 is divisible by 3, we mean that when 18 is divided by 3, there is a zero remainder.

Divisible

Let a and b be whole numbers. Then a is divisible by b if and only if the remainder is zero when a is divided by b. In this case, we say that "b is a divisor of a."

Example 2

Find all whole number divisors of 18.

Solution

In Example 1, we saw that $3 \cdot 6 = 18$. Therefore, 18 is divisible by both 3 and 6 ($18 \div 3 = 6$ and $18 \div 6 = 3$). Hence, when 18 is divided by 3 or 6, the remainder is zero. Therefore, 3 and 6 are divisors of 18. Noting the other products in Example 1, the complete list of divisors of 18 is 1, 2, 3, 6, 9, and 18.

Exercise

Find all whole number divisors of 21.

Answer

1, 3, 7, and 21.

Example 1 and Example 2 show that when working with whole numbers, the words *factor* and *divisor* are interchangeable.

Factors and Divisors

If $c = a \cdot b$, then a and b are called *factors* of c. Both a and b are also called *divisors* of c.

Divisibility Tests

There are a number of very useful divisibility tests.

Divisible by 2. If a whole number ends in 0, 2, 4, 6, or 8, then the number is called an even number and is divisible by 2. Examples of even numbers are 238 and 1,246 (238 ÷ 2 = 119 and 1, 246 ÷ 2 = 623). A number that is not even is called an odd number. Examples of odd numbers are 113 and 2,339.

Divisible by 3. If the sum of the digits of a whole number is divisible by 3, then the number itself is divisible by 3. An example is 141. The sum of the digits is 1 + 4 + 1 = 6, which is divisible by 3. Therefore, 141 is also divisible by 3 (141 ÷ 3 = 47).

Divisible by 4. If the number represented by the last two digits of a whole number is divisible by 4, then the number itself is divisible by 4. An example is 11,524. The last two digits represent 24, which is divisible by 4 (24 ÷ 4 = 6). Therefore, 11,524 is divisible by 4 (11, 524 ÷ 4=2, 881).

Divisible by 5. If a whole number ends in a zero or a 5, then the number is divisible by 5. Examples are 715 and 120 (715÷5 = 143 and 120÷5 = 24).

Divisible by 6. If a whole number is divisible by 2 and by 3, then it is divisible by 6. An example is 738. First, 738 is even and divisible by 2. Second, 7+3+8=18, which is divisible by 3. Hence, 738 is divisible by 3. Because 738 is divisible by both 2 and 3, it is divisible by 6 (738 ÷ 6 = 123).

Divisible by 8. If the number represented by the last three digits of a whole number is divisible by 8, then the number itself is divisible by 8. An example is 73,024. The last three digits represent the number 24, which is divisible by 8 (24÷8 = 3). Thus, 73,024 is also divisible by 8 (73, 024÷8 = 9, 128).

Divisible by 9. If the sum of the digits of a whole number is divisible by 9, then the number itself is divisible by 9. An example is 117. The sum of the digits is 1 + 1 + 7 = 9, which is divisible by 9. Hence, 117 is divisible by 9 (117 ÷ 9 = 13).

Prime Numbers

We begin with the definition of a prime number.

Prime Number

A whole number (other than 1) is a prime number if its only factors (divisors) are 1 and itself. Equivalently, a number is prime if and only if it has exactly two factors (divisors).

Example 3

Which of the whole numbers 12, 13, 21, and 37 are prime numbers?

Solution

- The factors (divisors) of 12 are 1, 2, 3, 4, 6, and 12. Hence, 12 is not a prime number.
- The factors (divisors) of 13 are 1 and 13. Because its only divisors are 1 and itself, 13 is a prime number.
- The factors (divisors) of 21 are 1, 3, 7, and 21. Hence, 21 is not a prime number.
- The factors (divisors) of 37 are 1 and 37. Because its only divisors are 1 and itself, 37 is a prime number.

Exercise

Which of the whole numbers 15, 23, 51, and 59 are prime numbers?

Answer

23 and 59

Example 4

List all the prime numbers less than 20.

Solution

The prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, and 19.

You try it!

List all the prime numbers less than 100.

Composite Numbers

If a whole number is not a prime number, then it is called a *composite number*.

Example 5

Is the whole number 1,179 prime or composite?

Solution

Note that 1 + 1 + 7 + 9 = 18, which is divisible by both 3 and 9. Hence, 3 and 9 are both divisors of 1,179. Therefore, 1,179 is a composite number.

Exercise

Is the whole number 2,571 prime or composite?

Answer

Composite

Factor Trees

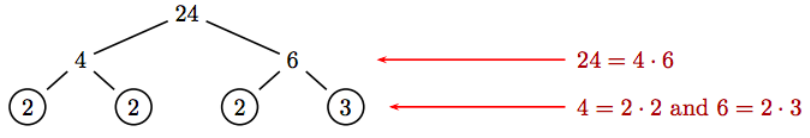
We will now learn how to express a composite number as a unique product of prime numbers. The most popular device for accomplishing this goal is the *factor tree*.

Example 6

Express 24 as a product of prime factors.

Solution

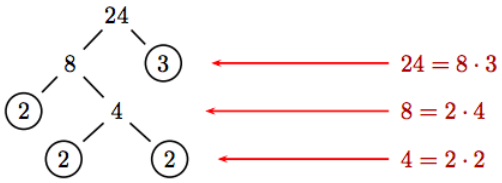
We use a factor tree to break 24 down into a product of primes.



At each level of the tree, break the current number into a product of two factors. The process is complete when all of the "circled leaves" at the bottom of the tree are prime numbers. Arranging the factors in the "circled leaves" in order,

$$24 = 2 \cdot 2 \cdot 2 \cdot 3.$$

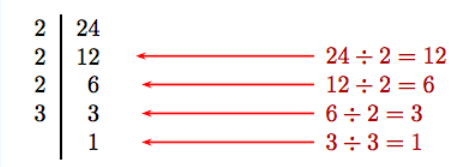
The final answer does not depend on product choices made at each level of the tree. Here is another approach.



The final answer is found by including all of the factors from the "circled leaves" at the end of each branch of the tree, which yields the same result, namely 24 = 2 · 2 · 2 · 3.

Alternate Approach

Some favor repeatedly dividing by 2 until the result is no longer divisible by 2. Then try repeatedly dividing by the next prime until the result is no longer divisible by that prime. The process terminates when the last resulting quotient is equal to the number 1.



The first column reveals the prime factorization; i.e., 24 = 2 · 2 · 2 · 3.

Exercise

Express 36 as a product of prime factors.

Answer

2 · 2 · 3 · 3.

The fact that the alternate approach in Example 6 yielded the same result is significant.

Unique Factorization Theorem

Every whole number can be **uniquely** factored as a product of primes.

This result guarantees that if the prime factors are ordered from smallest to largest, everyone will get the same result when breaking a number into a product of prime factors.

Exponents

We begin with the definition of an exponential expression.

Exponents

The expression a^m is defined to mean

$$a^m = \underbrace{a \cdot a \cdot \ldots \cdot a}_{m \text{ times}}$$

The number a is called the base of the exponential expression and the number m is called the exponent. The exponent m tells us to repeat the base a as a factor m times.

Example 7

Evaluate 2^5, 2^3, and 5^2.

Solution

- In the case of 2^5, we have

$$2^5 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$$
$$= 32.$$

- In the case of 3^3, we have

$$3^3 = 3 \cdot 3 \cdot 3$$
$$= 27.$$

- In the case of 5^2, we have

$$5^2 = 5 \cdot 5$$
$$= 25.$$

Exercise

Evaluate: 3^5.

Answer

243.

Example 8

Express the solution to Example 6 in compact form using exponents.

Solution

In Example 6, we determined the prime factorization of 24.

$$24 = 2 \cdot 2 \cdot 2 \cdot 3$$

Because $2 \cdot 2 \cdot 2 = 23$, we can write this more compactly.

$$24 = 2^3 \cdot 3$$

Exercise

Prime factor 54.

Answer

$2 \cdot 3 \cdot 3 \cdot 3$

Example 9

Evaluate the expression $2^3 \cdot 3^2 \cdot 5^2$.

Solution

First raise each factor to the given exponent, then perform the multiplication in order (left to right).

$$2^3 \cdot 3^2 \cdot 5^2 = 8 \cdot 9 \cdot 25$$
$$= 72 \cdot 25$$
$$= 1800$$

Exercise

Evaluate: $3^3 \cdot 5^2$.

Answer

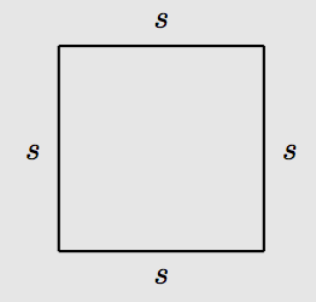
675

Application

A square is a rectangle with four equal sides.

Area of a Square

Let s represent the length of each side of a square.



Because a square is also a rectangle, we can find the area of the square by multiplying its length and width. However, in this case, the length and width both equal s, so $A = (s)(s) = s^2$. Hence, the formula for the area of a square is

$$A = s^2.$$

Example 10

The edge of a square is 13 centimeters. Find the area of a square.

Solution

Substitute $s = 13$ cm into the area formula.

$$A = s^2$$
$$= (13 \text{ cm})^2$$
$$= (13 \text{ cm})(13 \text{ cm})$$
$$= 169 \text{ cm}^2$$

Hence, the area of the square is 169 cm^2; i.e., 169 square centimeters.

Exercise

The edge of a square is 15 meters. Find the area of a square.

Answer

225 square meters

Exercises

In Exercises 1-12, find all divisors of the given number.

1. 30

2. 19

3. 83

4. 51

5. 91

6. 49

7. 75

8. 67

9. 64

10. 87

11. 14

123. **Sieve of Eratosthenes**. This exercise introduces the *Sieve of Eratosthenes*, an ancient algorithm for finding the primes less than a certain number n, first created by the Greek mathematician Eratosthenes. Consider the grid of integers from 2 through 100.

2	3	4	5	6	7	8	9	10	11
12	13	14	15	16	17	18	19	20	21
22	23	24	25	26	27	28	29	30	31
32	33	34	35	36	37	38	39	40	41
42	43	44	45	46	47	48	49	50	51
52	53	54	55	56	57	58	59	60	61
62	63	64	65	66	67	68	69	70	71
72	73	74	75	76	77	78	79	80	81
82	83	84	85	86	87	88	89	90	91
92	93	94	95	96	97	98	99	100	

To find the primes less than 100, proceed as follows.

i) Strike out all multiples of 2 (4, 6, 8, etc.)

ii) The list's next number that has not been struck out is a prime number.

iii) Strike out from the list all multiples of the number you identified in step (ii).

iv) Repeat steps (ii) and (iii) until you can no longer strike any more multiples.

v) All unstruck numbers in the list are primes.

1.5: Order of Operations

The order in which we evaluate expressions can be ambiguous. Take for example, the expression $4 + 3 \cdot 2$. If we do the addition first, then

$$4+3 \cdot 2=7 \cdot 2$$
$$= 14.$$

On the other hand, if we do the multiplication first, then

$$4+3 \cdot 2=4+6$$
$$= 10.$$

So, what are we to do? Of course, grouping symbols can remove the ambiguity

Grouping Symbols

Parentheses, brackets, or curly braces can be used to group parts of an expression. Each of the following are equivalent:

$$(4 + 3) \cdot 2 \text{ or } [4 + 3] \cdot 2 \text{ or } \{4+3\} \cdot 2$$

In each case, the rule is "evaluate the expression inside the grouping symbols first." If grouping symbols are nested, evaluate the expression in the innermost pair of grouping symbols first.

Thus, for example,

$$(4 + 3) \cdot 2=7 \cdot 2$$
$$= 14.$$

Note how the expression contained in the parentheses was evaluated first. Another way to avoid ambiguities in evaluating expressions is to establish an order in which operations should be performed. The following guidelines should always be strictly enforced when evaluating expressions.

Rules Guiding Order of Operations

When evaluating expressions, proceed in the following order.

1. Evaluate expressions contained in grouping symbols first. If grouping symbols are nested, evaluate the expression in the innermost pair of grouping symbols first.
2. Evaluate all exponents that appear in the expression.
3. Perform all multiplications and divisions in the order that they appear in the expression, moving left to right.
4. Perform all additions and subtractions in

Example 1

Evaluate $4 + 3 \cdot 2$.

Solution

Because of the established *Rules Guiding Order of Operations*, this expression is no longer ambiguous. There are no grouping symbols or exponents, so we immediately go to rule three, evaluate all multiplications and divisions in the order that they appear, moving left to right. After that we invoke rule four, performing all additions and subtractions in the order that they appear, moving left to right.

$$4+3\dot{2}=4+6$$
$$=10$$

Thus, $4 + 3 \cdot 2 = 10$.

Exercise

Simplify: 8 + 2 · 5.

Answer

18

Example 2

Evaluate 18 − 2 + 3.

Solution

Follow the *Rules Guiding Order of Operations*. Addition has no precedence over subtraction, nor does subtraction have precedence over addition. We are to perform additions and subtractions as they occur, moving left to right.

$$\begin{aligned} 18-2+3 &= 16+3 \quad \text{Subtract: } 18-2=16. \\ &= 19 \quad \text{Add: } 16+3=19. \end{aligned}$$

Thus, 18 − 2 + 3 = 19.

Exercise

Simplify: 17 − 8 + 2.

Answer

11

Example 3

Evaluate 54 ÷ 9 · 2.

Solution

Follow the *Rules Guiding Order of Operations*. Division has no precedence over multiplication, nor does multiplication have precedence over division. We are to perform divisions and multiplications as they occur, moving left to right.

$$\begin{aligned} 54 \div 9 \cdot 2 &= 6\dot{2} \quad \text{Divide: } 54 \div 9 = 6. \\ &= 12 \quad \text{Multiply: } 6 \cdot 2 = 12. \end{aligned}$$

Thus, 54 ÷ 9 · 2 = 12.

Exercise

Simplify: 72 ÷ 9 · 2.

Answer

16

Example 4

Evaluate $2 \cdot 3^2 - 12$.

Solution

Follow the *Rules Guiding Order of Operations*, exponents first, then multiplication, then subtraction.

$$\begin{aligned} 2 \cdot 3^2 - 12 &= 2\dot{9} - 12 && \text{Evaluate the exponent: } 3\hat{}2 = 9. \\ &= 18 - 12 && \text{Perform the multiplication: } 2 \cdot 9 = 18. \\ &= 6 && \text{Perform the subtraction: } 18 - 12 = 6. \end{aligned}$$

Thus, $2 \cdot 3^2 - 12 = 6$.

? Exercise

Simplify: $14 + 3 \cdot 4^2$

Answer

62

✓ Example 5

Evaluate $12 + 2(3 + 2 \cdot 5)^2$.

Solution

Follow the Rules Guiding Order of Operations, evaluate the expression inside the parentheses first, then exponents, then multiplication, then addition.

$$\begin{aligned} 12+2(3+5\cdot 5)^2 &= 12+2(3+10)^2 && \text{Multiply inside parentheses: } 2\ \cdot 5 = 10. \\ &= 12+2(13)^2 && \text{Add inside parentheses: } 3+10 = 13. \\ &= 12+2(169) && \text{Exponents are next: } (13)^2 = 169. \\ &= 12+338 && \text{Multiplication is next: } 2(169) = 338. \\ &= 350 && \text{Time to add: } 12+338 = 350. \end{aligned}$$

Thus, $12 + 2(3 + 2 \cdot 5)\ 2 = 350$.

? Exercise

Simplify: $3(2 + 3 \cdot 4)^2 - 11$.

Answer

577

✓ Example 6

Evaluate $2\{2 + 2[2 + 2]\}$.

Solution

When grouping symbols are nested, evaluate the expression between the pair of innermost grouping symbols first.

$$\begin{aligned} 2(2+2[2+2]) &= 2(2+2[4]) && \text{Innermost grouping first: } 2+2 = 4. \\ &= 2(2+8) && \text{Multiply next: } 2[4] = 8. \\ &= 2(10) && \text{Add inside braces: } 2+8 = 10. \\ &= 20 && \text{Multiply: } 2(10) = 20 \end{aligned}$$

Thus, $2(2 + 2[2 + 2]) = 20$.

? Exercise

Simplify: $2\{3 + 2[3 + 2]\}$.

Answer

26

Fraction Bars

Consider the expression

$$\frac{6^2+8^2}{(2+3)^2}$$

Because a fraction bar means division, the above expression is equivalent to

$$\left(6^2+8^2\right) \div (2+3)^2$$

The position of the grouping symbols signals how we should proceed. We should simplify the numerator, then the denominator, then divide.

Fractional Expressions

If a fractional expression is present, evaluate the numerator and denominator first, then divide.

Example 7

Evaluate the expression

$$\frac{6^2+8^2}{(2+3)^2}.$$

Solution

Simplify the numerator and denominator first, then divide.

$$\begin{aligned}
\frac{6^2+8^2}{(2+3)^2} &= \frac{6^2+8^2}{(5)^2} && \text{Parentheses in denominator first: } 2+3=5 \\
&= \frac{36+64}{25} && \text{Exponents are next: } 6^2=36,\ 8^2=64,\ 5^2=25. \\
&= \frac{100}{25} && \text{Add in numerator: } 36+64=100 \\
&= 4 && \text{Divide: } 100 \div 25 = 4.
\end{aligned}$$

Thus, $\frac{6^2+8^2}{(2+3)^2}=4$.

Exercise

Simplify: $\frac{12+3\cdot 2}{6}$ **Answer**

3

The Distributive Property

Consider the expression 2 · (3 + 4). If we follow the “Rules Guiding Order of Operations,” we would evaluate the expression inside the parentheses first. 2 · (3 + 4) = 2 · 7 Parentheses first: 3 + 4 = 7. = 14 Multiply: 2 · 7 = 14.

However, we could also choose to “distribute” the 2, first multiplying 2 times each addend in the parentheses.

$$\begin{aligned}
2\cdot(3+4) &= 2\cdot 3+2\cdot 4 && \text{Multiply 2 times both 3 and 4.} \\
&= 6+8 && \text{Multiply: } 2\cdot 3=6 \text{ and } 2\cdot 4=8. \\
&= 14 && \text{Add: } 6+8=14.
\end{aligned}$$

The fact that we get the same answer in the second approach is an illustration of an important property of whole numbers.[1]

The Distributive Property

Let a, b, and c be any whole numbers. Then,

$$a \cdot (b + c) = a \cdot b + a \cdot c.$$

We say that "multiplication is distributive with respect to addition."

Multiplication is distributive with respect to addition. If you are not computing the product of a number and a sum of numbers, the distributive property does not apply.

Caution! Wrong Answer Ahead!

If you are calculating the product of a number and the product of two numbers, the distributive property must not be used. For example, here is a common misapplication of the distributive property.

$$\begin{aligned} 2 \cdot (3 \cdot 4) &= (2 \cdot 3) \cdot (2 \cdot 4) \\ &= 6 \cdot 8 \\ &= 48 \end{aligned}$$

This result is quite distant from the correct answer, which is found by computing the product within the parentheses first.

$$\begin{aligned} 2 \cdot (3 \cdot 4) &= 2 \cdot 12 \\ &= 24. \end{aligned}$$

In order to apply the distributive property, you must be multiplying times a sum.

Example 8

Use the distributive property to calculate $4 \cdot (5 + 11)$.

Solution

This is the product of a number and a sum, so the distributive property may be applied.

$$\begin{aligned} 4 \cdot (5+11) &= 4 \cdot 5 + 4 \cdot 11 \quad \text{Distribute the 4 times addend in the sum.} \\ &= 20 + 44 \quad \text{Multiply: } 4 \cdot 5 = 20 \text{ and } 4 \cdot 11 = 44. \\ &= 64 \quad \text{Add: } 20 + 44 = 64. \end{aligned}$$

Readers should check that the same answer is found by computing the sum within the parentheses first.

Exercise

Distribute: $5 \cdot (11 + 8)$.

Answer

95

The distributive property is the underpinning of the multiplication algorithm learned in our childhood years.

Example 9

Multiply: $6 \cdot 43$.

Solution

We'll express 43 as sum, then use the distributive property.

$$\begin{aligned} 6 \cdot 43 &= 6 \cdot (40+3) && \text{Express 43 as a sum: } 43 = 40+3 \\ &= 6 \cdot 40 + 6 \cdot 3 && \text{Distribute the 6.} \\ &= 240 + 18 && \text{Multiply: } 6 \cdot 40 = 240 \text{ and } 6 \cdot 3 = 18. \\ &= 258 && \text{Add: } 240 + 18 = 258. \end{aligned}$$

Readers should be able to see this application of the distributive property in the more familiar algorithmic form:

$$\begin{array}{r} 43 \\ \times 6 \\ \hline 18 \\ 240 \\ \hline 258 \end{array}$$

Or in the even more condensed form with "carrying:"

$$\begin{array}{r} {}^{1}43 \\ \times 6 \\ \hline 258 \end{array}$$

Exercise

Use the distributive property to evaluate $8 \cdot 92$.

Answer

736

Multiplication is also distributive with respect to subtraction.

The Distributive Property (Subtraction)

Let a, b, and c be any whole numbers. Then,

$$a \cdot (b - c) = a \cdot b - a \cdot c.$$

We say the multiplication is "distributive with respect to subtraction."

Example 10

Use the distributive property to simplify: $3 \cdot (12 - 8)$.

Solution

This is the product of a number and a difference, so the distributive property may be applied.

$$\begin{aligned} 3 \cdot (12-8) &= 3 \cdot 12 - 3 \cdot 8 && \text{Distribute the 3 times each term in the difference.} \\ &= 36 - 24 && \text{Multiply: } 3 \cdot 12 = 36 \text{ and } 3 \cdot 8 = 24. \\ &= 12 && \text{Subtract: } 36 - 24 = 12. \end{aligned}$$

Alternate solution

Note what happens if we use the usual "order of operations" to evaluate the expression.

$$\begin{aligned} 3 \cdot (12-8) &= 3 \cdot 4 && \text{Parentheses first: } 12 - 8 = 4. \\ &= 12 && \text{Multiply: } 3 \cdot 4 = 12. \end{aligned}$$

Same answer.

Exercise

Distribute: $8 \cdot (9 - 2)$.

Answer

56

Exercises

In Exercises 1-12, simplify the given expression.

1. $5+2 \cdot 2$
2. $5+2 \cdot 8$
3. $23-7 \cdot 2$
4. $37-3 \cdot 7$
5. $4 \cdot 3+2 \cdot 5$
6. $2 \cdot 5+9 \cdot 7$
7. $6 \cdot 5+4 \cdot 3$
8. $5 \cdot 2+9 \cdot 8$
9. $9+2 \cdot 3$
10. $3+6 \cdot 6$
11. $32-8 \cdot 2$
12. $24-2 \cdot 5$

In Exercises 13-28, simplify the given expression.

13. $45 \div 3 \cdot 5$
14. $20 \div 1 \cdot 4$
15. $2 \cdot 9 \div 3 \cdot 18$
16. $19 \cdot 20 \div 4 \cdot 16$
17. $30 \div 2 \cdot 3$
18. $27 \div 3 \cdot 3$
19. $8-6+1$
20. $15-5+10$
21. $14 \cdot 16 \div 16 \cdot 19$
22. $20 \cdot 17 \div 17 \cdot 14$
23. $15 \cdot 17+10 \div 10-12 \cdot 4$
24. $14 \cdot 18+9 \div 3-7 \cdot 13$
25. $22-10+7$
26. $29-11+1$
27. $20 \cdot 10+15 \div 5-7 \cdot 6$
28. $18 \cdot 19+18 \div 18-6 \cdot 7$

In Exercises 29-40, simplify the given expression.

29. $9+8 \div \{4+4\}$
30. $10+20 \div \{2+2\}$
31. $7 \cdot [8-5]-10$
32. $11 \cdot [12-4]-10$

33. $(18 + 10) \div (2 + 2)$

34. $(14 + 7) \div (2 + 5)$

35. $9 \cdot (10 + 7) - 3 \cdot (4 + 10)$

36. $9 \cdot (7 + 7) - 8 \cdot (3 + 8)$

37. $2 \cdot \{8 + 12\} \div 4$

38. $4 \cdot \{8+7\} \div 3$

39. $9+6 \cdot (12 + 3)$

40. $3+5 \cdot (10 + 12)$

In Exercises 41-56, simplify the given expression.

41. $2+9 \cdot [7 + 3 \cdot (9 + 5)]$

42. $6+3 \cdot [4 + 4 \cdot (5 + 8)]$

43. $7+3 \cdot [8 + 8 \cdot (5 + 9)]$

44. $4+9 \cdot [7 + 6 \cdot (3 + 3)]$

45. $6 - 5[11 - (2 + 8)]$

46. $15 - 1[19 - (7 + 3)]$

47. $11 - 1[19 - (2 + 15)]$

48. $9 - 8[6 - (2 + 3)]$

49. $4\{7[9 + 3] - 2[3 + 2]\}$

50. $4\{8[3 + 9] - 4[6 + 2]\}$

51. $9 \cdot [3 + 4 \cdot (5 + 2)]$

52. $3 \cdot [4 + 9 \cdot (8 + 5)]$

53. $3\{8[6 + 5] - 8[7 + 3]\}$

54. $2\{4[6 + 9] - 2[3 + 4]\}$

55. $3 \cdot [2 + 4 \cdot (9 + 6)]$

56. $8 \cdot [3 + 9 \cdot (5 + 2)]$

In Exercises 57-68, simplfiy the given expression.

57. $(5 - 2)^2$

58. $(5 - 3)^4$

59. $(4 + 2)^2$

60. $(3 + 5)^2$

61. $2^3 + 3^3$

62. $5^4 + 2^4$

63. $2^3 - 1^3$

64. $3^2 - 1^2$

65. $12 \cdot 5^2 + 8 \cdot 9+4$

66. $6 \cdot 3^2 + 7 \cdot 5 + 12$

67. $9 - 3 \cdot 2 + 12 \cdot 10^2$

68. $11 - 2 \cdot 3 + 12 \cdot 4^2$

In Exercises 69-80, simplify the given expression.

69. $4^2 - (13 + 2)$

70. $3^3 - (7 + 6)$

71. $3^3 - (7 + 12)$

72. $4^3 - (6 + 5)$

73. $19 + 3[12 - (2^3 + 1)]$

74. $13 + 12[14 - (2^2 + 1)]$

75. $17 + 7[13 - (2^2 + 6)]$

76. $10 + 1[16 - (2^2 + 9)]$

77. $4^3 - (12 + 1)$

78. $5^3 - (17 + 15)$

79. $5 + 7[11 - (2^2 + 1)]$

80. $10 + 11[20 - (2^2 + 1)]$

In Exercises 81-92, simplify the given expression.

81. $\frac{13+35}{3(4)}$

82. $\frac{35+28}{7(3)}$

83. $\frac{64-(8\cdot 6-3)}{4\cdot 7-9}$

84. $\frac{19-(4\cdot 3-2)}{6\cdot 3-9}$

85. $\frac{2+13}{4-1}$

86. $\frac{7+1}{8-4}$

87. $\frac{17+14}{9-8}$

88. $\frac{16+2}{13-11}$

89. $\frac{37+27}{8(2)}$

90. $\frac{16+38}{6(3)}$

91. $\frac{40-(3\cdot 7-9)}{8\cdot 2-2}$

92. $\frac{60-(8\cdot 6-3)}{5\cdot 4-5}$

In Exercises 93-100, use the distributive property to evaluate the given expression.

93. $5 \cdot (8 + 4)$

94. $8 \cdot (4 + 2)$

95. $7 \cdot (8 - 3)$

96. $8 \cdot (9 - 7)$

97. $6 \cdot (7 - 2)$

98. $4 \cdot (8 - 6)$

99. $4 \cdot (3 + 2)$

100. $4 \cdot (9 + 6)$

In Exercises 101-104, use the distributive property to evaluate the given expression using the technique shown in Example 9.

101. $9 \cdot 62$

102. $3 \cdot 76$

103. $3 \cdot 58$

104. $7 \cdot 57$

1.6: Solving Equations by Addition and Subtraction

Let's start with the definition of a variable.

Variable

A *variable* is a symbol (usually a letter) that stands for a value that may vary

Next we follow with the definition of an equation.

Equation

An *equation* is a mathematical statement that equates two mathematical expressions.

The key difference between a mathematical expression and an equation is the presence of an an equals sign. So, for example,

$$2 + 3[5 - 4 \cdot 2],\ x2 + 2x - 3, \text{ and } x + 2y + 3$$

are mathematical expressions (two of which contain variables), while

$$3 + 2(7 - 3) = 11,\ x + 3 = 4, \text{ and } 3x = 9$$

are equations. Note that each of the equations contain an equals sign, but the expressions do not.

Next we have the definition of a solution of an equation.

What it Means to be a Solution

A *solution* of an equation is a numerical value that satisfies the equation. That is, when the variable in the equation is replaced by the solution, a true statement results.

Example 1

Show that 3 is a solution of the equation $x + 8 = 11$.

Solution

Substitute 3 for x in the given equation and simplify.

$$\begin{aligned} x+8 &= 11 && \text{The given equation.} \\ 3+8 &= 11 && \text{Substitute 3 for } x. \\ 11 &= 11 && \text{Simplify both sides.} \end{aligned}$$

Since the left- and right-hand sides of the last line are equal, this shows that when 3 is substituted for x in the equation a true statement results. Therefore, 3 is a solution of the equation.

Exercise

Show that 27 is a solution of the equation $x - 12 = 15$

Example 2

Is 23 a solution of the equation $4 = y - 11$?

Solution

Substitute 23 for y in the given equation and simplify.

$$\begin{aligned} 4 &= y - 11 && \text{The given equation.} \\ 4 &= 23 - 11 && \text{Substitute 23 for } y \\ 4 &= 12 && \text{Simplify both sides.} \end{aligned}$$

Since the left- and right-hand sides of the last line are **not** equal, this shows that when 23 is substituted for y in the equation a false statement results. Therefore, 23 is **not** a solution of the equation.

Exercise

Is 8 a solution of $5 = 12 - y$?

Answer

No.

Equivalent Equations

We start with the definition of equivalent equations.

Equivalent Equations

Two equations are equivalent if they have the same solution set.

Example 3

Are the equations $x + 2 = 9$ and $x = 7$ equivalent?

Solution

The number 7 is the only solution of the equation $x + 2 = 9$. Similarly, 7 is the only solution of the equation $x = 7$. Therefore $x + 2 = 9$ and Answer: No. $x = 7$ have the same solution sets and are equivalent.

Exercise

Are the equations $x = 4$ and $x + 8 = 3$ equivalent?

Answer

No.

Example 4

Are the equations $x^2 = x$ and $x = 1$ equivalent?

Solution

By inspection, the equation $x^2 = x$ has two solutions, 0 and 1. On the other hand, the equation $x = 1$ has a single solution, namely 1. Hence, the equations $x^2 = x$ and $x = 1$ do not have the same solution sets and are **not** equivalent.

Exercise

Are the equations $x = 2$ and $x^2 = 2x$ equivalent?

Answer

No.

Operations that Produce Equivalent Equations

There are many operations that will produce equivalent operations. In this section we look at two: addition and subtraction.

Adding the Same Quantity to Both Sides of an Equation

Adding the same quantity to both sides of an equation does not change the solution set. That is, if

$$a = b,$$

then adding c to both sides of the equation produces the equivalent equation

$$a + c = b + c.$$

Let's see if this works as advertised. Consider the equation x − 4=3. By inspection, 7 is the only solution of the equation. Now, let's add 4 to both sides of the equation to see if the resulting equation is equivalent to x − 4 = 3.

$$\begin{aligned} x - 4 &= 3 && \text{The given equation.} \\ x - 4 + 4 &= 3 + 4 && \text{Add 4 to both sides of the equation.} \\ x &= 7 && \text{Simplify both sides of the equation.} \end{aligned}$$

The number 7 is the only solution of the equation x = 7. Thus, the equation x = 7 is equivalent to the original equation x − 4 = 3 (they have the same solutions).

Important Point

Adding the same amount to both sides of an equation does not change its solutions.

It is also a fact that subtracting the same quantity from both sides of an equation produces an equivalent equation.

Subtracting the Same Quantity from Both Sides of an Equation

Subtracting the same quantity from both sides of an equation does not change the solution set. That is, if

$$a = b,$$

then subtracting c from both sides of the equation produces the equivalent equation

$$a - c = b - c.$$

Let's also see if this works as advertised. Consider the equation

$$x + 4 = 9.$$

By inspection, 5 is the only solution of the equation. Now, let's subtract 4 from both sides of the equation to see if the resulting equation is equivalent to x + 4 = 9.

$$\begin{aligned} x + 4 &= 9 && \text{The given equation.} \\ x + 4 - 4 &= 9 - 4 && \text{Subtract 4 from both sides of the equation.} \\ x &= 5 && \text{Simplify both sides of the equation.} \end{aligned}$$

The number 5 is the only solution of the equation $x = 5$. Thus, the equation $x = 5$ is equivalent to the original equation $x + 4 = 9$ (they have the same solutions).

Important Point

Subtracting the same amount from both sides of an equation does not change its solutions.

Writing Mathematics

When solving equations, observe the following rules to neatly arrange your work:

1. **One equation per line**. This means that you should not arrange your work like this:

$$x+3=7 \quad x+3-3=7-3 \quad x=4$$

That's three equations on a line. Rather, arrange your work one equation per line like this:

$$\begin{aligned} x+3 &= 7 \\ x+3-3 &= 7-3 \\ x &= 4 \end{aligned}$$

2. **Add and subtract inline.** Don't do this:

$$\begin{array}{rcl} x-7 & = & 12 \\ +7 & & +7 \\ \hline x & = & 19 \end{array}$$

Instead, add 7 to both sides of the equation "inline."

$$\begin{aligned} x-7 &= 12 \\ x-7+7 &= 12+7 \\ x &= 19 \end{aligned}$$

Wrap and Unwrap

Suppose that you are wrapping a gift for your cousin. You perform the following steps in order.

1. Put the gift paper on.
2. Put the tape on.
3. Put the decorative bow on.

When we give the wrapped gift to our cousin, he politely unwraps the present, "undoing" each of our three steps in inverse order.

1. Take off the decorative bow.
2. Take off the tape.
3. Take off the gift paper.

This seemingly frivolous wrapping and unwrapping of a gift contains some deeply powerful mathematical ideas. Consider the mathematical expression $x+4$. To evaluate this expression at a particular value of *x*, we would start with the given value of *x*, then

1. Add 4.

Suppose we started with the number 7. If we add 4, we arrive at the following result: 11.

Now, how would we "unwrap" this result to return to our original number? We would start with our result, then

1. Subtract 4.

That is, we would take our result from above, 11, then subtract 4, which returns us to our original number, namely 7.

Addition and Subtraction as Inverse Operations

Two extremely important observations:

The inverse of addition is subtraction. If we start with a number *x* and add a number *a*, then subtracting *a* from the result will return us to the original number *x*. In symbols,

$$x+a-a=x.$$

The inverse of subtraction is addition. If we start with a number *x* and subtract a number *a*, then adding *a* to the result will return us to the original number *x*. In symbols,

$$x-a+a=x.$$

Example 5

Solve $x - 8 = 10$ for x.

Solution

To undo the effects of subtracting 8, we add 8 to both sides of the equation.

$$\begin{aligned} x - 8 &= 10 && \text{Original equation.} \\ x - 8 + 8 &= 10 + 8 && \text{Add 8 to both sides of the equation.} \\ x &= 18 && \text{On the left, adding "undoes" the effect of subtracting 8 and returns } x\text{. On the right, } 10 + 8 = 18. \end{aligned}$$

Therefore, the solution of the equation is 18.

Check

To check, substitute the solution 18 into the original equation.

$$\begin{aligned} x - 8 &= 10 && \text{Original equation.} \\ 18 - 8 &= 10 && \text{Substitute 18 for } x\text{.} \\ 10 &= 10 && \text{Simplify both sides.} \end{aligned}$$

The fact that the last line of our check is a true statement guarantees that 18 is a solution of x − 8 = 10.

Exercise

Solve $x + 5 = 12$ for x.

Answer

7.

Example 6

Solve $11 = y + 5$ for y.

Solution

To undo the effects of adding 5, we subtract 5 from both sides of the equation.

$$\begin{aligned} 11 &= y + 5 && \text{Original equation.} \\ 1 - 5 &= y + 5 - 5 && \text{Subtract 5 from both sides of the equation.} \\ 6 &= y && \text{On the right, subtracting "undoes" the effect of adding 5 and returns } y\text{. On the left, } 11 - 5 = 6. \end{aligned}$$

Therefore, the solution of the equation is 6.

Check

$$\begin{aligned} 11 &= y + 5 && \text{Original equation.} \\ 11 &= 6 + 5 && \text{Substitute 6 for } y\text{.} \\ 11 &= 11 && \text{Simplify both sides.} \end{aligned}$$

The fact that the last line of our check is a true statement guarantees that 6 is a solution of 11 = y + 5.

? Exercise

Solve $y - 8 = 11$ for y.

Answer

$y = 19$.

Word Problems

The solution of a word problem must incorporate each of the following steps.

Requirements for Word Problem Solutions

1. **Set up a Variable Dictionary**. You must let your readers know what each variable in your problem represents. This can be accomplished in a number of ways:
   1. Statements such as "Let P represent the perimeter of the rectangle."
   2. Labeling unknown values with variables in a table.
   3. Labeling unknown quantities in a sketch or diagram.
2. **Set up an Equation**. Every solution to a word problem must include a carefully crafted equation that accurately describes the constraints in the problem statement.
3. **Solve the Equation**. You must always solve the equation set up in the previous step.
4. **Answer the Question**. This step is easily overlooked. For example, the problem might ask for Jane's age, but your equation's solution gives the age of Jane's sister Liz. Make sure you answer the original question asked in the problem. Your solution should be written in a sentence with appropriate units.
5. **Look Back**. It is important to note that this step does not imply that you should simply check your solution in your equation. After all, it's possible that your equation incorrectly models the problem's situation, so you could have a valid solution to an incorrect equation. The important question is: "Does your answer make sense based on the words in the original problem statement."

Let's give these requirements a test drive.

✓ Example 7

Four more than a certain number is 12. Find the number.

Solution

In our solution, we will carefully address each step of the Requirements for Word Problem Solutions.

1. *Set up a Variable Dictionary*. We can satisfy this requirement by simply stating "Let x represent a certain number."
2. *Set up an Equation*. "Four more than a certain number is 12" becomes

$$\begin{array}{lllll} 4 & \text{more than} & \text{a certain number} & \text{is} & 12 \\ 4+ & & x = & & 12 \end{array}$$

3. *Solve the Equation*. To "undo" the addition, subtract 4 from both sides of the equation.

$$\begin{aligned} 4 + x &= 12 && \text{Original equation.} \\ 4 + x - 4 &= 12 - 4 && \text{Subtract 4 from both sides of the equation.} \\ x &= 8 && \text{On the left, subtracting 4 "undoes" the effect of adding 4 and returns } x. \text{ On the right, } 12 - 4 = 8. \end{aligned}$$

4. *Answer the Question*. The number is 8.
5. *Look Back*. Does the solution 8 satisfy the words in the original problem? We were told that "four more than a certain number is 12." Well, four more than 8 is 12, so our solution is correct.

Exercise

12 more than a certain number is 19. Find the number.

Answer

7

Example 8

Amelie withdraws $125 from her savings account. Because of the withdrawal, the current balance in her account is now $1,200. What was the original balance in the account before the withdrawal?

Solution

In our solution, we will carefully address each step of the *Requirements for Word Problem Solutions*.

1. *Set up a Variable Dictionary.* We can satisfy this requirement by simply stating "Let B represent the original balance in Amelie's account."

2. *Set up an Equation.* We can describe the situation in words and symbols.

Original Balance	minus	& is	Current Balance
B	$-$	$125 =$	1200

3. *Solve the Equation.* To "undo" the subtraction, add 125 to both sides of the equation.

$$\begin{aligned} B-125 &= 1200 && \text{Original equation.} \\ B-125+125 &= 1200+125 && \text{Add 125 to both sides of the equation.} \\ B &= 1325 && \text{On the left, adding 125 "undoes" the effect} \\ & && \text{of subtracting 125 and returns } B. \text{ On the right,} \\ & && 1200+125=1325. \end{aligned}$$

4. *Answer the Question.* The original balance was $1,325.

5. *Look Back.* Does the solution $1,325 satisfy the words in the original problem? Note that if Amelie withdraws $125 from this balance, the new balance will be $1,200. Hence, the solution is correct.

Exercise

Fred withdraws $230 from his account, lowering his balance to $3,500. What was his original balance?

Answer

$3730

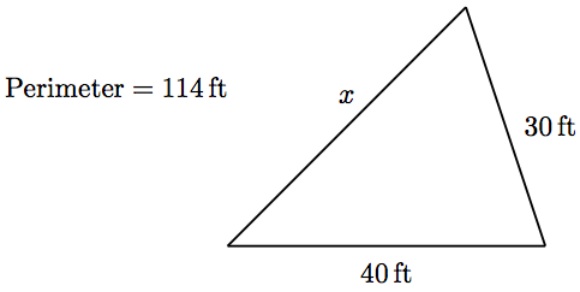
Example 9

The perimeter of a triangle is 114 feet. Two sides of the triangle measure 30 feet and 40 feet, respectively. Find the measure of the third side of the triangle.

Solution

In our solution, we will carefully address each step of the *Requirements for Word Problem Solutions*.

1. Set up a Variable Dictionary. When geometry is involved, we can create our variable dictionary by labeling a carefully constructed diagram. With this thought in mind, we draw a triangle, then label its known and unknown sides and its perimeter.



The figure makes it clear that x represents the length of the unknown side of the triangle. The figure also summarizes information needed for the solution. 2. Set up an equation. We know that the perimeter of a triangle is found by finding the sum of its three sides; in words and symbols,

Perimeter	is	First Side	plus	Second Side	plus	Third Side
114	=	x	+	30	+	40

Simplify the right-hand side by adding 30 and 40; i.e., $30+40=70$.

$$114 = x + 70$$

3. Solve the Equation. To "undo" adding 70, subtract 70 from both sides of the equation.

$$\begin{aligned} 114 &= x + 70 && \text{Our equation.} \\ 114 - 70 &= x + 70 - 70 && \text{Subtract 70 from both sides.} \\ 44 &= x && \text{On the right, subtracting 70 "undoes" the effect of adding 70 and returns to } x. \text{ On the left, } 114 - 70 = 44. \end{aligned}$$

4. *Answer the Question*. The unknown side of the triangle is 44 feet.

5. *Look Back*. Does the solution 44 feet satisfy the words of the original problem? We were told that the perimeter is 114 feet and two of the sides have length 30 feet and 40 feet respectively. We found that the third side has length 44 feet. Now, adding the three sides, 30+ 40+ 44 = 114, which equals the given perimeter of 114 feet. The answer works!

? Exercise

The perimeter of a quadrilateral is 200 meters. If three of the sides measure 20, 40, and 60 meters, what is the length of the fourth side.

Answer

80 meters

Exercises

In Exercises 1-12, which of the numbers following the given equation are solutions of the given equation? Support your response with work similar to that shown in Examples 1 and 2.

1. x − 4 = 6; 10, 17, 13, 11
2. x − 9 = 7; 17, 23, 19, 16
3. x + 2 = 6; 5, 11, 7, 4
4. x + 3 = 9; 6, 9, 7, 13
5. x + 2 = 3; 8, 1, 4, 2
6. x + 2 = 5; 10, 3, 6, 4

7. x − 4 = 7; 12, 11, 18, 14

8. x − 6 = 7; 13, 16, 20, 14

9. x + 3 = 4; 8, 4, 2, 1

10. x + 5 = 9; 5, 11, 7, 4

11. x − 6 = 8; 17, 21, 14, 15

12. x − 2 = 9; 11, 14, 12, 18

In Exercises 13-52, solve the given equation for *x*.

13. x +5=6

14. x + 6 = 19

15. 5=4+ x

16. 10 = 8 + x

17. 13 + x = 17

18. 7+ x = 15

19. 9+ x = 10

20. 14 + x = 17

21. 19 = x − 3

22. 2= x − 11

23. x − 18 = 1

24. x − 20 = 8

25. x − 3 = 11

26. x − 17 = 18

27. 2+ x = 4

28. 1+ x = 16

29. x − 14 = 12

30. x − 1 = 17

31. x +2=8

32. x + 11 = 14

33. 11 + x = 17

34. 11 + x = 18

35. x + 13 = 17

36. x + 1 = 16

37. 20 = 3 + x

38. 9=3+ x

39. 20 = 8 + x

40. 10 = 3 + x

41. 3= x − 20

42. 13 = x − 15

43. x + 16 = 17

44. $x + 6 = 12$

45. $5 = x - 6$

46. $10 = x - 7$

47. $18 = x - 6$

48. $14 = x - 4$

49. $18 = 13 + x$

50. $17 = 5 + x$

51. $x - 9 = 15$

52. $x - 11 = 17$

---

53. 12 less than a certain number is 19. Find the number.

54. 19 less than a certain number is 1. Find the number.

55. A triangle has a perimeter of 65 feet. It also has two sides measuring 19 feet and 17 feet, respectively. Find the length of the third side of the triangle.

56. A triangle has a perimeter of 55 feet. It also has two sides measuring 14 feet and 13 feet, respectively. Find the length of the third side of the triangle.

57. Burt makes a deposit to an account having a balance of $1900. After the deposit, the new balance in the account is $8050. Find the amount of the deposit.

58. Dave makes a deposit to an account having a balance of $3500. After the deposit, the new balance in the account is $4600. Find the amount of the deposit.

59. 8 more than a certain number is 18. Find the number.

60. 3 more than a certain number is 19. Find the number.

61. Michelle withdraws a $120 from her bank account. As a result, the new account balance is $1000. Find the account balance before the withdrawal.

62. Mercy withdraws a $430 from her bank account. As a result, the new account balance is $1200. Find the account balance before the withdrawal.

63. *Foreclosures*. Between January and March last year, 650,000 homes received a foreclosure notice. Between the first three months of this year, there were 804,000 foreclosure notices. What was the increase in home foreclosure notices? *Associated Press Times-Standard 4/22/09*

64. *Home Price*. According to the Humboldt State University Economics Department's Humboldt Economic Index, the median home price in the US fell $1500 over the last month to $265,000. What was the median home price before the price drop?

65. *Unmanned Areal Vehicle*. Northrup Grumman's Global Hawk unmanned drone can fly at 65,000 feet, 40,000 feet higher than NASA's Ikhana unmanned aircraft. How high can the Ikhana fly?

66. *Tribal Land*. The Yurok Tribe has the option to purchase 47,000 acres in order to increase its ancestral territory. The first phase would include 22,500 acres in the Cappel and Pecman watersheds. The second phase plans for acreage in the Blue Creek area. How many acres could be purchased in the second phase? *Times-Standard 4/15/09*

This page titled 1.6: Solving Equations by Addition and Subtraction is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

- **1.6: Solving Equations by Addition and Subtraction** by David Arnold is licensed CC BY-NC-SA 3.0.

1.7: Solving Equations by Multiplication and Division

In Section 1.6, we stated that two equations that have the same solutions are *equivalent*. Furthermore, we saw that adding the same number to both sides of an equation produced an equivalent equation. Similarly, subtracting the same the number from both sides of an equation also produces an equivalent equation. We can make similar statements for multiplication and division.

Multiplying both Sides of an Equation by the Same Quantity

Multiplying both sides of an equation by the same quantity does not change the solution set. That is, if

$$a = b$$

then multiplying both sides of the equation by c produces the equivalent equation

$$a \cdot c = b \cdot c$$

provided $c \neq 0$.

A similar statement can be made about division.

Dividing both Sides of an Equation by the Same Quantity

Dividing both sides of an equation by the same quantity does not change the solution set. That is, if

$$a = b$$

then dividing both sides of the equation by c produces the equivalent equation

$$\frac{a}{c} = \frac{b}{c},$$

provided $c \neq 0$.

In Section 1.6, we saw that addition and subtraction were inverse operations. If you start with a number, add 4 and subtract 4, you are back to the original number. This concept also works for multiplication and division.

Multiplication and Division as Inverse Operations

Two extremely important observations:

The inverse of multiplication is division. If we start with a number x and multiply by a number a, then dividing the result by the number a returns us to the original number x. In symbols,

$$\frac{a \cdot x}{a} = x.$$

The inverse of division is multiplication. If we start with a number x and divide by a number a, then multiplying the result by the number a returns us to the original number x. In symbols,

$$a \cdot \frac{x}{a} = x.$$

Let's put these ideas to work.

Example 1

Solve the equation $3x = 24$ for x.

Solution

To undo the effects of multiplying by 3, we divide both sides of the equation by 3.

$$
\begin{aligned}
3x &= 24 && \text{Original equation.} \\
\frac{3x}{3} &= \frac{24}{3} && \text{Divide both sides of the equation by 3.} \\
x &= 8 && \text{On the left, dividing by 3 "undoes" the effect of multiplying by 3 and returns to } x\text{. On the right, } 24/3 = 8.
\end{aligned}
$$

To check, substitute the solution 8 into the original equation.

$$
\begin{aligned}
3x &= 24 && \text{Original equation.} \\
3(8) &= 24 && \text{Substitute 8 for } x\text{.} \\
24 &= 24 && \text{Simplify both sides.}
\end{aligned}
$$

That fact that the last line of our check is a true statement guarantees that 8 is a solution of 3x = 24.

? Exercise

Solve for *x*: 5*x* = 120.

Answer

24

✔ Example 2

Solve the following equation for *x*.

$$\frac{x}{7} = 12$$

Solution

To undo the effects of dividing by 7, we multiply both sides of the equation by 7.

$$
\begin{aligned}
\frac{x}{7} &= 12 && \text{Original equation.} \\
\frac{84}{7} &= 12 && \text{Multiply both sides of the equation by 7.} \\
x &= 84 && \text{On the left, multiplying by 7 "undoes" the effect of dividing by 7 and returns to } x\text{. On the right, } 7 \cdot 12 = 84.
\end{aligned}
$$

To check, substitute the solution 84 into the original equation.

$$
\begin{aligned}
\frac{x}{7} &= 12 && \text{Original equation.} \\
\frac{84}{7} &= 12 && \text{Substitute 84 for } x\text{.} \\
12 &= 12 && \text{Simplify both sides.}
\end{aligned}
$$

That fact that the last line of our check is a true statement guarantees that 84 is a solution of *x*/7 = 12.

? Exercise

Solve for *x*: *x*/2 = 19

Answer

38

Word Problems

In Section 1.6 we introduced *Requirements for Word Problem Solutions*. Those requirements will be strictly adhered to in this section.

Example 3

Fifteen times a certain number is 45. Find the unknown number.

Solution

In our solution, we will carefully address each step of the Requirements for Word Problem Solutions.

1. *Set up a Variable Dictionary*. We can satisfy this requirement by simply stating "Let x represent a certain number."

2. *Set up an equation*. "Fifteen times a certain number is 45" becomes

$$\begin{array}{ccccccc} \boxed{15} & \text{times} & \boxed{\text{a certain number}} & \text{is} & \boxed{45} \\ 15 & \cdot & x & = & 45 \end{array}$$

3. *Solve the Equation*. To "undo" the multiplication by 15, divide both sides of the equation by 15.

$$\begin{aligned} 15x &= 45 && \text{Original equation. Write } 15 \cdot x \text{ as } 15x \\ \frac{15x}{15} &= \frac{45}{15} && \text{Divide both sides of the equation by } 15. \\ x &= 3 && \text{On the left, dividing by 15 "undoes" the effect of multiplying by 15 and returns to } x. \text{ On the right, } 45/15 = 3. \end{aligned}$$

4. *Answer the Question*. The unknown number is 3.

5. *Look Back*. Does the solution 3 satisfy the words of the original problem? We were told that "15 times a certain number is 45." Well, 15 times 3 is 45, so our solution is correct.

Exercise

Seven times a certain number is one hundred five. Find the unknown number.

Answer

15

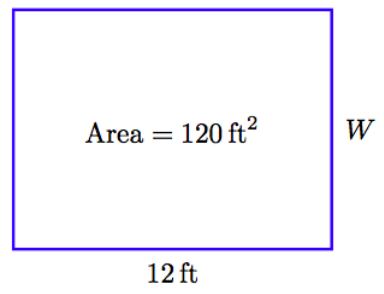
Example 4

The area of a rectangle is 120 square feet. If the length of the rectangle is 12 feet, find the width of the rectangle.

Solution

In our solution, we will carefully address each step of the *Requirements for Word Problem Solutions*.

1. *Set up a Variable Dictionary*. When geometry is involved, we can create our variable dictionary by labeling a carefully constructed diagram. With this thought in mind, we draw a rectangle, then label its length, width, and area.



The figure makes it clear that W represents the width of the rectangle. The figure also summarizes information needed for the solution.

2. *Set up an equation*. We know that the area of a rectangle is found by multiplying its length and width; in symbols,

$$A = LW.$$

We're given the area is A = 120 ft^2 and the length is L = 12 ft. Substitute these numbers into the area formula (1.1) to get

$$120 = 12W.$$

3. *Solve the Equation*. To "undo" the multiplication by 12, divide both sides of the equation by 12.

$$\begin{aligned} 120 &= 12W && \text{Our equation.} \\ \frac{120}{12} &= \frac{12W}{12} && \text{Divide both sides of the equation by 12.} \\ 10 &= W && \text{On the right, dividing by 12 "undoes" the effect} \\ & && \text{of multiplying by 12 and returns to } W. \text{ On the left,} \\ & && 120/12 = 10. \end{aligned}$$

4. *Answer the Question*. The width is 10 feet.

5. *Look Back*. Does the found width satisfy the words of the original problem? We were told that the area is 120 square feet and the length is 12 feet. The area is found by multiplying the length and width, which gives us 12 feet times 10 feet, or 120 square feet. The answer works!

Exercise

The area of a rectangle is 3,500 square meters. If the width is 50 meters, find the length.

Answer

70 meters

Example 5

A class of 23 students averaged 76 points on an exam. How many total points were accumulated by the class as a whole?

Solution

In our solution, we will carefully address each step of the Requirements for Word Problem Solutions. 1. Set up a Variable Dictionary. We can set up our variable dictionary by simply stating "Let T represent the total points accumulated by the class." 2. Set up an equation. To find the average score on the exam, take the total points accumulated by the class, then divide by the number of students in the class. In words and symbols,

Total Points	divided by	Number of Students	equals	Average Score
T	$\div$	23	$=$	76

An equivalent representation is

$$\frac{T}{23} = 76.$$

3. *Solve the Equation*. To "undo" the division by 23, multiply both sides of the equation by 23.

$$\begin{aligned} \frac{T}{23} &= 76 && \text{Our equation.} \\ 23 \cdot \frac{T}{23} &= 76 \cdot 23 && \text{Multiply both sides of the equation by 23.} \\ T &= 1748 && \text{On the left, multiplying by 23 "undoes" the effect} \\ & && \text{of dividing by 23 and returns to } T. \text{ On the right,} \\ & && 76 \cdot 23 = 1748. \end{aligned}$$

4. *Answer the Question*. The total points accumulated by the class on the exam is 1,748.

5. *Look Back*. Does the solution 1,748 satisfy the words of the original problem? To find the average on the exam, divide the total points 1,748 by 23, the number of students in the class. Note that this gives an average score of 1748 ÷ 23 = 76. The answer works!

? Try it out!

A class of 30 students averaged 75 points on an exam. How many total points were accumulated by the class as a whole?

Answer

2,250

Exercises

In Exercises 1-12, which of the numbers following the given equation are solutions of the given equation?

1. $\frac{x}{6} = 4$; 24, 25, 27, 31
2. $\frac{x}{7} = 6$; 49, 42, 43, 45
3. $\frac{x}{2} = 3$; 6, 9, 13, 7
4. $\frac{x}{9} = 5$; 45, 46, 48, 52
5. $5x = 10$; 9, 2, 3, 5
6. $4x = 36$; 12, 16, 9, 10
7. $5x = 25$; 5, 6, 8, 12
8. $3x = 3$; 1, 8, 4, 2
9. $2x = 2$; 4, 8, 1, 2
10. $3x = 6$; 2, 9, 5, 3
11. $\frac{x}{8} = 7$; 57, 59, 63, 56
12. $\frac{x}{3} = 7$; 24, 21, 28, 22

In Exercises 13-36, solve the given equation for x.

13. $\frac{x}{6} = 7$
14. $\frac{x}{8} = 6$
15. $2x = 16$
16. $2x = 10$
17. $2x = 18$
18. $2x = 0$
19. $4x = 24$
20. $2x = 4$
21. $\frac{x}{4} = 9$
22. $\frac{x}{5} = 6$
23. $5x = 5$
24. $3x = 15$
25. $5x = 30$

26. $4x = 28$

27. $\frac{x}{3} = 4$

28. $\frac{x}{9} = 4$

29. $\frac{x}{8} = 9$

30. $\frac{x}{8} = 2$

31. $\frac{x}{7} = 8$

32. $\frac{x}{4} = 6$

33. $2x = 8$

34. $3x = 9$

35. $\frac{x}{8} = 5$

36. $\frac{x}{5} = 4$

---

37. The price of one bookcase is $370. A charitable organization purchases an unknown number of bookcases and the total price of the purchase is $4,810. Find the number of bookcases purchased.

38. The price of one computer is $330. A charitable organization purchases an unknown number of computers and the total price of the purchase is $3,300. Find the number of computers purchased.

39. When an unknown number is divided by 3, the result is 2. Find the unknown number.

40. When an unknown number is divided by 8, the result is 3. Find the unknown number.

41. A class of 29 students averaged 80 points on an exam. How many total points were accumulated by the class as a whole?

42. A class of 44 students averaged 87 points on an exam. How many total points were accumulated by the class as a whole?

43. When an unknown number is divided by 9, the result is 5. Find the unknown number.

44. When an unknown number is divided by 9, the result is 2. Find the unknown number.

45. The area of a rectangle is 16 square cm. If the length of the rectangle is 2 cm, find the width of the rectangle.

46. The area of a rectangle is 77 square ft. If the length of the rectangle is 7 ft, find the width of the rectangle.

47. The area of a rectangle is 56 square cm. If the length of the rectangle is 8 cm, find the width of the rectangle.

48. The area of a rectangle is 55 square cm. If the length of the rectangle is 5 cm, find the width of the rectangle.

49. The price of one stereo is $430. A charitable organization purchases an unknown number of stereos and the total price of the purchase is $6,020. Find the number of stereos purchased.

50. The price of one computer is $490. A charitable organization purchases an unknown number of computers and the total price of the purchase is $5,880. Find the number of computers purchased.

51. A class of 35 students averaged 74 points on an exam. How many total points were accumulated by the class as a whole?

52. A class of 44 students averaged 88 points on an exam. How many total points were accumulated by the class as a whole?

53. 5 times an unknown number is 20. Find the unknown number.

54. 5 times an unknown number is 35. Find the unknown number.

55. 3 times an unknown number is 21. Find the unknown number.

1.8: Use the Language of Algebra (Part 1)

Learning Objectives

- Use variables and algebraic symbols
- Identify expressions and equations
- Simplify expressions with exponents
- Simplify expressions using the order of operations

Be Prepared!

Before you get started, take this readiness quiz.

a. Add: $43+69$. If you missed this problem, review Example 1.2.8.
b. Multiply: $(896)201$. If you missed this problem, review Example 1.4.11.
c. Divide: $7,263 \div 9$. If you missed this problem, review Example 1.5.8.

Use Variables and Algebraic Symbols

Greg and Alex have the same birthday, but they were born in different years. This year Greg is 20 years old and Alex is 23, so Alex is 3 years older than Greg. When Greg was 12, Alex was 15. When Greg is 35, Alex will be 38. No matter what Greg's age is, Alex's age will always be 3 years more, right?

In the language of algebra, we say that Greg's age and Alex's age are variable and the three is a constant. The ages change, or vary, so age is a variable. The 3 years between them always stays the same, so the age difference is the constant.

In algebra, letters of the alphabet are used to represent variables. Suppose we call Greg's age g. Then we could use $g+3$ to represent Alex's age. See Table 1.8.1.

Table 1.8.1

Greg's age	Alex's age
12	15
20	23
35	38
g	g + 3

Letters are used to represent variables. Letters often used for variables are $x, y, a, b,$ and c.

Definition: Variables and Constants

A variable is a letter that represents a number or quantity whose value may change.

A constant is a number whose value always stays the same.

To write algebraically, we need some symbols as well as numbers and variables. There are several types of symbols we will be using. In Whole Numbers, we introduced the symbols for the four basic arithmetic operations: addition, subtraction, multiplication, and division. We will summarize them here, along with words we use for the operations and the result.

Table 1.8.2

Operation	Notation	Say:	The result is...
Addition	a + b	a plus b	the sum of a and b
Subtraction	a − b	a minus b	the difference of a and b
Multiplication	a • b, (a)(b), (a)b, a(b)	a times b	the product of a and b

Operation	Notation	Say:	The result is...
Division	a ÷ b, a / b, $\frac{a}{b}$, $b\overline{)a}$	a divided by b	the quotient of a and b

In algebra, the cross symbol, $\times$, is not used to show multiplication because that symbol may cause confusion. Does $3xy$ mean $3 \times y$ (three times y) or $3 \bullet x \bullet y$ (three times x times y)? To make it clear, use $\bullet$ or parentheses for multiplication.

We perform these operations on two numbers. When translating from symbolic form to words, or from words to symbolic form, pay attention to the words *of* or *and* to help you find the numbers.

The *sum* ***of*** 5 ***and*** 3 means add 5 plus 3, which we write as $5+3$.

The *difference* ***of*** 9 ***and*** 2 means subtract 9 minus 2, which we write as $9-2$.

The *product* ***of*** 4 ***and*** 8 means multiply 4 times 8, which we can write as $4 \bullet 8$.

The *quotient* ***of*** 20 ***and*** 5 means divide 20 by 5, which we can write as $20 \div 5$.

Example 1.8.1: translate to words

Translate from algebra to words:

a. $12+14$
b. $(30)(5)$
c. $64 \div 8$
d. $x-y$

Solution

a.

12 + 14
12 plus 14
the sum of twelve and fourteen

b.

(30)(5)
30 times 5
the product of thirty and five

c.

64 ÷ 8
64 divided by 8
the quotient of sixty-four and eight

d.

x − y
x minus y
the difference of x and y

exercise 1.8.1

Translate from algebra to words.

a. $18+11$
b. $(27)(9)$
c. $84\div 7$
d. $p-q$

Answer a

18 plus 11; the sum of eighteen and eleven

Answer b

27 times 9; the product of twenty-seven and nine

Answer c

84 divided by 7; the quotient of eighty-four and seven

Answer d

p minus q; the difference of p and q

exercise 1.8.2

Translate from algebra to words.

a. $47-19$
b. $72\div 9$
c. $m+n$
d. $(13)(7)$

Answer a

47 minus 19; the difference of forty-seven and nineteen

Answer b

72 divided by 9; the quotient of seventy-two and nine

Answer c

m plus n; the sum of m and n

Answer d

13 times 7; the product of thirteen and seven

When two quantities have the same value, we say they are equal and connect them with an *equal sign*.

Definition: Equality Symbol

$a=b$ is read a is equal to b

The symbol $=$ is called the equal sign.

An inequality is used in algebra to compare two quantities that may have different values. The number line can help you understand inequalities. Remember that on the number line the numbers get larger as they go from left to right. So if we know that b is greater than a, it means that b is to the right of a on the number line. We use the symbols "$<$" and "$>$" for inequalities.

Definition: Inequality

$a < b$ is read a is less than b

a is to the left of b on the number line

$a > b$ is read a is greater than b

a is to the right of b on the number line

The expressions $a < b$ and $a > b$ can be read from left-to-right or right-to-left, though in English we usually read from left-to-right. In general, $a < b$ is equivalent to $b > a$. For example, $7 < 11$ is equivalent to $11 > 7$. $a > b$ is equivalent to $b < a$. For example, $17 > 4$ is equivalent to $4 < 17$.

When we write an inequality symbol with a line under it, such as $a \leq b$, it means $a < b$ or $a = b$. We read this a is less than or equal to b. Also, if we put a slash through an equal sign, $\neq$, it means not equal.

We summarize the symbols of equality and inequality in Table 1.8.3.

Table 1.8.3

Algebraic Notation	Say
a = b	a is equal to b
a ≠ b	a is not equal to b
a < b	a is less than b
a > b	a is greater than b
a ≤ b	a is less than or equal to b
a ≥ b	a is greater than or equal to b

Definition: Symbols $<$ and $>$

The symbols $<$ and $>$ each have a smaller side and a larger side.

$$\text{smaller side} < \text{larger side}$$

$$\text{larger side} > \text{smaller side}$$

The smaller side of the symbol faces the smaller number and the larger faces the larger number.

Example 1.8.2: translate to words

Translate from algebra to words:

a. $20 \leq 35$
b. $11 \neq 15 - 3$
c. $9 > 10 \div 2$
d. $x + 2 < 10$

Solution

a.

$20 \leq 35$
20 is less than or equal to 35

b.

$11 \neq 15 - 3$
11 is not equal to 15 minus 3

c.

$9 > 10 \div 2$
9 is greater than 10 divided by 2

d.

$x + 2 < 10$
x plus 2 is less than 10

exercise 1.8.3

Translate from algebra to words.

a. $14 \leq 27$
b. $19 - 2 \neq 8$
c. $12 > 4 \div 2$
d. $x - 7 < 1$

Answer a

fourteen is less than or equal to twenty-seven

Answer b

nineteen minus two is not equal to eight

Answer c

twelve is greater than four divided by two

Answer d

x minus seven is less than one

exercise 1.8.4

Translate from algebra to words.

a. $19 \geq 15$
b. $7 = 12 - 5$
c. $15 \div 3 < 8$
d. $y - 3 > 6$

Answer a

nineteen is greater than or equal to fifteen

Answer b

seven is equal to twelve minus five

Answer c

fifteen divided by three is less than eight

Answer d

y minus three is greater than six

Example 1.8.3: translate

The information in Figure 1.8.1 compares the fuel economy in miles-per-gallon (mpg) of several cars. Write the appropriate symbol =, in each expression to compare the fuel economy of the cars.

Car	Prius	Mini Cooper	Toyota Corolla	Versa	Honda Fit
Fuel economy (mpg)	48	27	28	26	27

Figure 1.8.1: (credit: modification of work by Bernard Goldbach, Wikimedia Commons)

a. MPG of Prius _____ MPG of Mini Cooper
b. MPG of Versa _____ MPG of Fit
c. MPG of Mini Cooper _____ MPG of Fit
d. MPG of Corolla _____ MPG of Versa
e. MPG of Corolla_____ MPG of Prius

Solution

a.

	MPG of Prius____MPG of Mini Cooper
Find the values in the chart.	48____27
Compare.	48 > 27
	MPG of Prius > MPG of Mini Cooper

b.

	MPG of Versa____MPG of Fit
Find the values in the chart.	26____27
Compare.	26 < 27
	MPG of Versa < MPG of Fit

c.

	MPG of Mini Cooper____MPG of Fit
Find the values in the chart.	27____27
Compare.	27 = 27
	MPG of Mini Cooper = MPG of Fit

d.

	MPG of Corolla____MPG of Versa
Find the values in the chart.	28____26
Compare.	28 > 26

	MPG of Corolla > MPG of Versa

e.

	MPG of Corolla____MPG of Prius
Find the values in the chart.	28____48
Compare.	28 < 48
	MPG of Corolla < MPG of Prius

? exercise 1.8.5

Use Figure 1.8.1 to fill in the appropriate symbol, $=$, $<$, or $>$.

a. MPG of Prius_____MPG of Versa
b. MPG of Mini Cooper_____ MPG of Corolla

Answer a

$>$

Answer b

$<$

? exercise 1.8.6

Use Figure 1.8.1 to fill in the appropriate symbol, $=$, $<$, or $>$.

a. MPG of Fit_____ MPG of Prius
b. MPG of Corolla _____ MPG of Fit

Answer a

$<$

Answer b

$<$

Grouping symbols in algebra are much like the commas, colons, and other punctuation marks in written language. They indicate which expressions are to be kept together and separate from other expressions. Table 1.8.4 lists three of the most commonly used grouping symbols in algebra.

Table 1.8.4

Common Grouping Symbols	
parentheses	( )
brackets	[ ]
braces	{ }

Here are some examples of expressions that include grouping symbols. We will simplify expressions like these later in this section.

$$8(14-8) \qquad 21-3[2+4(9-8)] \qquad 24\div 13-2[1(6-5)+4]$$

Identify Expressions and Equations

What is the difference in English between a phrase and a sentence? A phrase expresses a single thought that is incomplete by itself, but a sentence makes a complete statement. “Running very fast” is a phrase, but “The football player was running very fast” is a sentence. A sentence has a subject and a verb.

In algebra, we have *expressions* and *equations*. An expression is like a phrase. Here are some examples of expressions and how they relate to word phrases:

Table 1.8.5

Expression	Words	Phrase
3 + 5	3 plus 5	the sum of three and five
n - 1	n minus one	the difference of n and one
6 • 7	6 times 7	the product of six and seven
$\frac{x}{y}$	x divided by y	the quotient of x and y

Notice that the phrases do not form a complete sentence because the phrase does not have a verb. An equation is two expressions linked with an equal sign. When you read the words the symbols represent in an equation, you have a complete sentence in English. The equal sign gives the verb. Here are some examples of equations:

Table 1.8.6

Equation	Sentence
3 + 5 = 8	The sum of three and five is equal to eight.
n − 1 = 14	n minus one equals fourteen.
6 • 7 = 42	The product of six and seven is equal to forty-two.
x = 53	x is equal to fifty-three.
y + 9 = 2y − 3	y plus nine is equal to two y minus three.

Definition: Expressions and Equations

An expression is a number, a variable, or a combination of numbers and variables and operation symbols.

An equation is made up of two expressions connected by an equal sign.

Example 1.8.4: expression or equation

Determine if each is an expression or an equation:

a. $16 - 6 = 10$
b. $4 \bullet 2 + 1$
c. $x \div 25$
d. $y + 8 = 40$

Solution

(a) 16 − 6 = 10	This is an equation—two expressions are connected with an equal sign.
(b) 4 • 2 + 1	This is an expression—no equal sign.
(c) x ÷ 25	This is an expression—no equal sign.

(d) y + 8 = 40	This is an equation—two expressions are connected with an equal sign.

? exercise 1.8.7

Determine if each is an expression or an equation:

a. $23+6=29$
b. $7 \bullet 3-7$

Answer a

equation

Answer b

expression

? exercise 1.8.8

Determine if each is an expression or an equation:

a. $y \div 14$
b. $x-6=21$

Answer a

expression

Answer b

equation

Simplify Expressions with Exponents

To simplify a numerical expression means to do all the math possible. For example, to simplify $4 \bullet 2+1$ we'd first multiply $4 \bullet 2$ to get 8 and then add the 1 to get 9. A good habit to develop is to work down the page, writing each step of the process below the previous step. The example just described would look like this:

$$\begin{aligned} 4 \cdot 2+1 \\ 8+1 \\ 9 \end{aligned}$$

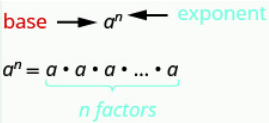
Suppose we have the expression $2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2$. We could write this more compactly using exponential notation. Exponential notation is used in algebra to represent a quantity multiplied by itself several times. We write $2 \bullet 2 \bullet 2$ as 2^3 and $2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2$ as 2^9. In expressions such as 2^3, the 2 is called the **base** and the 3 is called the **exponent**. The exponent tells us how many factors of the base we have to multiply.

means multiply three factors of 2

We say 2^3 is in exponential notation and $2 \bullet 2 \bullet 2$ is in expanded notation.

Definition: Exponential Notation

For any expression a^n, a is a factor multiplied by itself n times if n is a positive integer.



The expression a^n is read a to the n^{th} power.

For powers of $n = 2$ and $n = 3$, we have special names. a^2 is read as "a squared" a^3 is read as "a cubed" Table 1.8.7 lists some examples of expressions written in exponential notation.

Table 1.8.7

Exponential Notation	In Words
7^2	7 to the second power, or 7 squared
5^3	5 to the third power, or 5 cubed
9^4	9 to the fourth power
12^5	12 to the fifth power

Example 1.8.5: exponential form

Write each expression in exponential form:

a. $16 \bullet 16 \bullet 16 \bullet 16 \bullet 16 \bullet 16 \bullet 16$
b. $9 \bullet 9 \bullet 9 \bullet 9 \bullet 9$
c. $x \bullet x \bullet x \bullet x$
d. $a \bullet a \bullet a \bullet a \bullet a \bullet a \bullet a \bullet a$

Solution

(a) The base 16 is a factor 7 times.	16^7
(b) The base 9 is a factor 5 times.	9^5
(c) The base x is a factor 4 times.	x^4
(d) The base a is a factor 8 times.	a^8

exercise 1.8.9

Write each expression in exponential form: $41 \bullet 41 \bullet 41 \bullet 41 \bullet 41$

Answer

41^5

exercise 1.8.10

Write each expression in exponential form: $7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7$

Answer

7^9

Example 1.8.6: expanded form

Write each exponential expression in expanded form:

a. 8^6
b. x^5

Solution

a. The base is 8 and the exponent is 6, so 8^6 means $8 \bullet 8 \bullet 8 \bullet 8 \bullet 8 \bullet 8$
b. The base is x and the exponent is 5, so x^5 means $x \bullet x \bullet x \bullet x \bullet x$

exercise 1.8.11

Write each exponential expression in expanded form:

a. 4^8
b. a^7

Answer a

$4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4$

Answer b

$a \cdot a \cdot a \cdot a \cdot a \cdot a \cdot a$

exercise 1.8.12

Write each exponential expression in expanded form:

a. 8^8
b. b^6

Answer a

$8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8$

Answer b

$b \cdot b \cdot b \cdot b \cdot b \cdot b$

To simplify an exponential expression without using a calculator, we write it in expanded form and then multiply the factors.

Example 1.8.7: simplify

Simplify: 3^4.

Solution

Expand the expression.	$3^4 = 3 \cdot 3 \cdot 3 \cdot 3$
Multiply left to right.	$9 \cdot 3 \cdot 3 = 27 \cdot 3$
Multiply.	81

exercise 1.8.13

Simplify:

a. 5^3
b. 1^7

Answer a

125

Answer b

1

? exercise 1.8.14

Simplify:

a. 7^2
b. 0^5

Answer a

49

Answer b

0

1.9: Use the Language of Algebra (Part 2)

Simplify Expressions Using the Order of Operations

We've introduced most of the symbols and notation used in algebra, but now we need to clarify the order of operations. Otherwise, expressions may have different meanings, and they may result in different values. For example, consider the expression:

$$4+3\cdot 7$$

Some students say it simplifies to	49	Some students say it simplifies to	25
Since 4 + 3 gives 7.	4 + 3 • 7 = 7 • 7	Since 3 • 7 is 21.	4 + 3 • 7 = 4 + 21
And 7 • 7 is 49.	7 • 7 = 49	And 21 + 4 makes 25.	4 + 21 = 25

Imagine the confusion that could result if every problem had several different correct answers. The same expression should give the same result. So mathematicians established some guidelines called the order of operations, which outlines the order in which parts of an expression must be simplified.

Definition: Order of Operations

When simplifying mathematical expressions perform the operations in the following order:

1. **P**arentheses and other Grouping Symbols
- Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. **E**xponents
- Simplify all expressions with exponents.
3. **M**ultiplication and **D**ivision
- Perform all multiplication and division in order from left to right. These operations have equal priority.
4. **A**ddition and **S**ubtraction
- Perform all addition and subtraction in order from left to right. These operations have equal priority.

Students often ask, "How will I remember the order?" Here is a way to help you remember: Take the first letter of each key word and substitute the silly phrase. **P**lease **E**xcuse **M**y **D**ear **A**unt **S**ally.

Table 1.9.8

Order of Operations	
Please	**P**arentheses
Excuse	**E**xponents
My **D**ear	**M**ultiplication and **D**ivision
Aunt **S**ally	**A**ddition and **S**ubtraction

It's good that '**M**y **D**ear' goes together, as this reminds us that **m**ultiplication and **d**ivision have equal priority. We do not always do multiplication before division or always do division before multiplication. We do them in order from left to right.

Similarly, '**A**unt **S**ally' goes together and so reminds us that **a**ddition and **s**ubtraction also have equal priority and we do them in order from left to right.

Example 1.9.8: simplify

Simplify the expressions:

a. $4+3 \bullet 7$
b. $(4+3) \bullet 7$

Solution

a.

Are there any parentheses? No. Are there any exponents? No. Is there any multiplication or division? Yes.	$4+3 \cdot 7$
Multiply first.	$4+3 \cdot 7$
Add.	$4+21$
	25

b.

Are there any parentheses? Yes.	$(4+3) \cdot 7$
Simplify inside the parentheses.	$(4+3) \cdot 7$
Are there any exponents? No. Is there any multiplication or division? Yes.	$(7)7$
Multiply.	49

exercise 1.9.15

Simplify the expressions:

a. $12-5 \bullet 2$
b. $(12-5) \bullet 2$

Answer a

2

Answer b

14

exercise 1.9.16

Simplify the expressions:

a. $8+3 \bullet 9$
b. $(8+3) \bullet 9$

Answer a

35

Answer b

99

Example 1.9.9: simplify

Simplify:

a. $18 \div 9 \bullet 2$
b. $18 \bullet 9 \div 2$

Solution

a.

Are there any parentheses? No. Are there any exponents? No. Is there any multiplication or division? Yes.	$18 \div 9 \cdot 2$
Multiply and divide from left to right. Divide.	$2 \cdot 2$
Multiply.	4

b.

Are there any parentheses? No. Are there any exponents? No. Is there any multiplication or division? Yes.	$18 \cdot 9 \div 2$
Multiply and divide from left to right. Multiply.	$162 \div 2$
Divide.	81

exercise 1.9.17

Simplify: $42 \div 7 \bullet 3$

Answer

18

exercise 1.9.18

Simplify: $12 \bullet 3 \div 4$

Answer

9

Example 1.9.10: simplify

Simplify: $18 \div 6 + 4(5 - 2)$.

Solution

Parentheses? Yes, subtract first.	$18 \div 6 + 4(5 - 2)$
Exponents? No. Multiplication or division? Yes.	$18 \div 6 + 4(3)$
Divide first because we multiply and divide left to right.	$3 + 4(3)$
Any other multiplication or division? Yes. Multiply.	$3 + 12$
Any other multiplication or division? No. Any addition or subtraction? Yes	15

exercise 1.9.19

Simplify: $30 \div 5 + 10(3-2)$

Answer

16

exercise 1.9.20

Simplify: $70 \div 10 + 4(6-2)$

Answer

23

When there are multiple grouping symbols, we simplify the innermost parentheses first and work outward.

Example 1.9.11: simplify

Simplify: $5 + 2^3 + 3[6 - 3(4-2)]$.

Solution

Are there any parentheses (or other grouping symbol)? Yes.	$5 + 2^3 + 3[6 - 3(4-2)]$
Focus on the parentheses that are inside the brackets.	$5 + 2^3 + 3[6 - 3(4-2)]$
Subtract.	$5 + 2^3 + 3[6 - 3(2)]$
Continue inside the brackets and multiply.	$5 + 2^3 + 3[6 - 6]$
Continue inside the brackets and subtract.	$5 + 2^3 + 3[0]$
The expression inside the brackets requires no further simplification.	
Are there any exponents? Yes.	$5 + 2^3 + 3[0]$
Simplify exponents.	$5 + 8 + 3[0]$
Is there any multiplication or division? Yes.	$5 + 8 + 3[0]$
Multiply.	$5 + 8 + 0$
Is there any addition or subtraction? Yes.	$textcolorred5 + 8 + 0$
Add.	$13 + 0$
Add.	13

exercise 1.9.21

Simplify: $9 + 5^3 - [4(9+3)]$

Answer

86

exercise 1.9.22

Simplify: $7^2 - 2[4(5+1)]$

Answer

1

Example 1.9.12: simplify

Simplify: $2^3 + 34 \div 3 - 5^2$.

Solution

If an expression has several exponents, they may be simplified in the same step.	$2^3 + 3^4 \div 3 - 52$
Simplify exponents.	$2^3 + 3^4 \div 3 - 5^2$
Divide.	$8 + 81 \div 3 - 25$
Add.	$8 + 27 - 25$
Subtract.	$35 - 25$
	10

exercise 1.9.23

Simplify: $3^2 + 2^4 \div 2 + 4^3$

Answer

81

exercise 1.9.24

Simplify: $6^2 - 5^3 \div 5 + 8^2$

Answer

75

- Order of Operations
- Order of Operations – The Basics
- Ex: Evaluate an Expression Using the Order of Operations
- Example 3: Evaluate an Expression Using The Order of Operations

Key Concepts

Operation	Notation	Say:	The result is…
Addition	a+b	a plus b	the sum of a and b
Multiplication	a·b,(a)(b),(a)b,a(b)	a times b	The product of a and b
Subtraction	a−b	a minus b	the difference of a and b

Operation	Notation	Say:	The result is…
Division	$a \div b, a/b, \frac{a}{b}, a\overline{)b}$	a divided by b	The quotient of a and b

- **Equality Symbol**
  - $a = b$ is read as a is equal to b
  - The symbol $=$ is called the equal sign.
- **Inequality**
  - $a < b$ is read a is less than b
  - a is to the left of b on the number line

  - $a > b$ is read a is greater than b
  - a is to the right of b on the number line

Algebraic Notation	Say
a=b	a is equal to b
a≠b	a is not equal to b
a<b	a is less than b
a>b	a is greater than b
a≤b	a is less than or equal to b
a≥b	a is greater than or equal to b

- **Exponential Notation**
  - For any expression a^n is a factor multiplied by itself n times, if n is a positive integer.
  - a^n means multiply n factors of a

  - The expression of a^n is read a to the n^{th} power.

Order of Operations When simplifying mathematical expressions perform the operations in the following order:

- Parentheses and other Grouping Symbols: Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
- Exponents: Simplify all expressions with exponents.
- Multiplication and Division: Perform all multiplication and division in order from left to right. These operations have equal priority.
- Addition and Subtraction: Perform all addition and subtraction in order from left to right. These operations have equal priority.

Glossary

expressions

An expression is a number, a variable, or a combination of numbers and variables and operation symbols.

equation

An equation is made up of two expressions connected by an equal sign.

Practice Makes Perfect

Use Variables and Algebraic Symbols

In the following exercises, translate from algebraic notation to words.

1. $16 - 9$
2. $25 - 7$
3. $5 \cdot 6$
4. $3 \cdot 9$
5. $28 \div 4$
6. $45 \div 5$
7. $x + 8$
8. $x + 11$
9. $(2)(7)$
10. $(4)(8)$
11. $14 < 21$
12. $17 < 35$
13. $36 \geq 19$
14. $42 \geq 27$
15. $3n = 24$
16. $6n = 36$
17. $y - 1 > 6$
18. $y - 4 > 8$
19. $2 \leq 18 \div 6$
20. $3 \leq 20 \div 4$
21. $a \neq 7 \cdot 4$
22. $a \neq 1 \cdot 12$

Identify Expressions and Equations

In the following exercises, determine if each is an expression or an equation.

23. $9 \cdot 6 = 54$
24. $7 \cdot 9 = 63$
25. $5 \cdot 4 + 3$
26. $6 \cdot 3 + 5$
27. $x + 7$
28. $x + 9$
29. $y - 5 = 25$
30. $y - 8 = 32$

Simplify Expressions with Exponents

In the following exercises, write in exponential form.

31. $3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3$
32. $4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4$
33. $x \cdot x \cdot x \cdot x \cdot x$
34. $y \cdot y \cdot y \cdot y \cdot y \cdot y$

In the following exercises, write in expanded form.

35. 5^3
36. 8^3
37. 2^8
38. 10^5

Simplify Expressions Using the Order of Operations

In the following exercises, simplify.

39. (a) 3 + 8 • 5 (b) (3+8) • 5
40. (a) 2 + 6 • 3 (b) (2+6) • 3
41. $2^3 - 12 \div (9 - 5)$
42. $3^2 - 18 \div (11 - 5)$
43. 3 • 8 + 5 • 2
44. 4 • 7 + 3 • 5
45. 2 + 8(6 + 1)
46. 4 + 6(3 + 6)
47. 4 • 12 / 8
48. 2 • 36 / 6
49. 6 + 10 / 2 + 2
50. 9 + 12 / 3 + 4
51. (6 + 10) ÷ (2 + 2)
52. (9 + 12) ÷ (3 + 4)
53. 20 ÷ 4 + 6 • 5
54. 33 ÷ 3 + 8 • 2
55. 20 ÷ (4 + 6) • 5
56. 33 ÷ (3 + 8) • 2
57. $4^2 + 5^2$
58. $3^2 + 7^2$
59. $(4 + 5)^2$
60. $(3 + 7)^2$
61. $3(1 + 9 \cdot 6) - 4^2$
62. $5(2 + 8 \cdot 4) - 7^2$
63. 2[1 + 3(10 − 2)]
64. 5[2 + 4(3 − 2)]

Everyday Math

65. **Basketball** In the 2014 NBA playoffs, the San Antonio Spurs beat the Miami Heat. The table below shows the heights of the starters on each team. Use this table to fill in the appropriate symbol (=, <, >).

Spurs	Height	Heat	Height
Tim Duncan	83″	Rashard Lewis	82"
Boris Diaw	80"	LeBron James	80"
Kawhi Leonard	79"	Chris Bosh	83"
Tony Parker	74"	Dwyane Wade	76"
Danny Green	78"	Ray Allen	77"

a. Height of Tim Duncan____Height of Rashard Lewis
b. Height of Boris Diaw____Height of LeBron James
c. Height of Kawhi Leonard____Height of Chris Bosh
d. Height of Tony Parker____Height of Dwyane Wade
e. Height of Danny Green____Height of Ray Allen

66. **Elevation** In Colorado there are more than 50 mountains with an elevation of over 14,000 feet. The table shows the ten tallest. Use this table to fill in the appropriate inequality symbol.

Mountain	Elevation

Mountain	Elevation
Mt. Elbert	14,433′
Mt. Massive	14,421′
Mt. Harvard	14,420′
Blanca Peak	14,345′
La Plata Peak	14,336′
Uncompahgre Peak	14,309′
Crestone Peak	14,294′
Mt. Lincoln	14,286′
Grays Peak	14,270′
Mt. Antero	14,269′

a. Elevation of La Plata Peak____Elevation of Mt. Antero
b. Elevation of Blanca Peak____Elevation of Mt. Elbert
c. Elevation of Gray's Peak____Elevation of Mt. Lincoln
d. Elevation of Mt. Massive____Elevation of Crestone Peak
e. Elevation of Mt. Harvard____Elevation of Uncompahgre Peak

Writing Exercises

67. Explain the difference between an expression and an equation.
68. Why is it important to use the order of operations to simplify an expression?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use variables and algebraic symbols.			
identify expressions and equations.			
simplify expressions with exponents.			
simplify expressions using the order of operations.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

1.10: Evaluate, Simplify, and Translate Expressions (Part 1)

Learning Objectives

- Evaluate algebraic expressions
- Identify terms, coefficients, and like terms
- Simplify expressions by combining like terms
- Translate word phrases to algebraic expressions

Be prepared!

Before you get started, take this readiness quiz.

1. Is $n \div 5$ an expression or an equation? If you missed this problem, review Example 2.1.4.
2. Simplify 4^5. If you missed this problem, review Example 2.1.6.
3. Simplify $1 + 8 \bullet 9$. If you missed this problem, review Example 2.1.8.

Evaluate Algebraic Expressions

In the last section, we simplified expressions using the order of operations. In this section, we'll evaluate expressions—again following the order of operations.

To **evaluate** an algebraic expression means to find the value of the expression when the variable is replaced by a given number. To evaluate an expression, we substitute the given number for the variable in the expression and then simplify the expression using the order of operations.

Example 1.10.1: evaluate

Evaluate $x + 7$ when

a. $x = 3$
b. $x = 12$

Solution

a. To evaluate, substitute 3 for x in the expression, and then simplify.

	$x + 7$
Substitute.	$3 + 7$
Add.	10

When $x = 3$, the expression $x + 7$ has a value of 10.

b. To evaluate, substitute 12 for x in the expression, and then simplify.

	$x + 7$
Substitute.	$12 + 7$
Add.	19

When $x = 12$, the expression $x + 7$ has a value of 19. Notice that we got different results for parts (a) and (b) even though we started with the same expression. This is because the values used for x were different. When we evaluate an expression, the value varies depending on the value used for the variable.

exercise 1.10.1

Evaluate: $y+4$ when

a. $y=6$
b. $y=15$

Answer a

10

Answer b

19

exercise 1.10.2

Evaluate: $a-5$ when

a. $a=9$
b. $a=17$

Answer a

4

Answer b

12

Example 1.10.2

Evaluate $9x-2$, when

a. $x=5$
b. $x=1$

Solution

Remember ab means a times b, so $9x$ means 9 times x.

a. To evaluate the expression when $x=5$, we substitute 5 for x, and then simplify.

	$9x-2$
Substitute 5 for x.	$9\cdot 5-2$
Multiply.	$45-2$
Subtract.	43

b. To evaluate the expression when $x=1$, we substitute 1 for x, and then simplify.

	$9x-2$
Substitute 1 for x.	$9\cdot 1-2$
Multiply.	$9-2$
Subtract.	7

Notice that in part (a) that we wrote $9\bullet 5$ and in part (b) we wrote $9(1)$. Both the dot and the parentheses tell us to multiply.

exercise 1.10.3

Evaluate: $8x - 3$, when

a. $x = 2$
b. $x = 1$

Answer a

13

Answer b

5

exercise 1.10.4

Evaluate: $4y - 4$, when

a. $y = 3$
b. $y = 5$

Answer a

8

Answer b

16

Example 1.10.3: evaluate

Evaluate x^2 when $x = 10$.

Solution

We substitute 10 for x, and then simplify the expression.

	x^2
Substitute 10 for x.	10^2
Use the definition of exponent.	$10 \cdot 10$
Multiply	100

When $x = 10$, the expression x^2 has a value of 100.

exercise 1.10.5

Evaluate: x^2 when $x = 8$.

Answer

64

exercise 1.10.6

Evaluate: x^3 when $x = 6$.

Answer

216

Example 1.10.4: evaluate

Evaluate 2^x when $x = 5$.

Solution

In this expression, the variable is an exponent.

	2^x
Substitute 5 for x.	2^5
Use the definition of exponent.	$2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$
Multiply	32

When $x = 5$, the expression 2^x has a value of 32.

exercise 1.10.7

Evaluate: 2^x when $x = 6$.

Answer

64

exercise 1.10.8

Evaluate: 3^x when $x = 4$.

Answer

81

Example 1.10.5: evaluate

Evaluate $3x + 4y - 6$ when $x = 10$ and $y = 2$.

Solution

This expression contains two variables, so we must make two substitutions.

	$3x + 4y - 6$
Substitute 10 for x and 2 for y.	$3(10) + 4(2) - 6$
Multiply.	$30 + 8 - 6$
Add and subtract left to right.	32

When $x = 10$ and $y = 2$, the expression $3x + 4y - 6$ has a value of 32.

exercise 1.10.9

Evaluate: $2x + 5y - 4$ when $x = 11$ and $y = 3$

Answer

33

exercise 1.10.10

Evaluate: $5x - 2y - 9$ when $x = 7$ and $y = 8$

Answer

10

Example 1.10.6: evaluate

Evaluate $2x^2 + 3x + 8$ when $x = 4$.

Solution

We need to be careful when an expression has a variable with an exponent. In this expression, $2x^2$ means $2 \bullet x \bullet x$ and is different from the expression $(2x)^2$, which means $2x \bullet 2x$.

	$2x^2 + 3x + 8$
Substitute 4 for each x.	$2(4)^2 + 3(4) + 8$
Simplify 4^2.	$2(16) + 3(4) + 8$
Multiply.	$32 + 12 + 8$
Add.	52

exercise 1.10.11

Evaluate: $3x^2 + 4x + 1$ when $x = 3$.

Answer

40

exercise 1.10.12

Evaluate: $6x^2 - 4x - 7$ when $x = 2$.

Answer

9

Identify Terms, Coefficients, and Like Terms

Algebraic expressions are made up of *terms*. A **term** is a constant or the product of a constant and one or more variables. Some examples of terms are 7, y, $5x^2$, $9a$, and $13xy$.

The constant that multiplies the variable(s) in a term is called the **coefficient**. We can think of the coefficient as the number *in front of* the variable. The coefficient of the term $3x$ is 3. When we write x, the coefficient is 1, since $x = 1 \bullet x$. Table 1.10.1 gives the coefficients for each of the terms in the left column.

Table 1.10.1

Term	Coefficient
7	7
9a	9
y	1

Term	Coefficient
$5x^2$	5

An algebraic expression may consist of one or more terms added or subtracted. In this chapter, we will only work with terms that are added together. Table $1.10.2$ gives some examples of algebraic expressions with various numbers of terms. Notice that we include the operation before a term with it.

Table 1.10.2

Expression	Terms
7	7
y	y
x + 7	x, 7
2x + 7y + 4	2x, 7y, 4
$3x^2 + 4x^2 + 5y + 3$	$3x^2$, $4x^2$, 5y, 3

Example 1.10.7:

Identify each term in the expression $9b+15x^2+a+6$. Then identify the coefficient of each term.

Solution

The expression has four terms. They are $9b$, $15x^2$, a, and 6.

The coefficient of $9b$ is 9.

The coefficient of $15x^2$ is 15.

Remember that if no number is written before a variable, the coefficient is 1. So the coefficient of a is 1.

The coefficient of a constant is the constant, so the coefficient of 6 is 6.

exercise 1.10.13

Identify all terms in the given expression, and their coefficients: $4x+3b+2$

Answer

The terms are $4x, 3b,$ and 2. The coefficients are $4, 3,$ and 2.

exercise 1.10.14

Identify all terms in the given expression, and their coefficients: $9a+13a^2+a^3$

Answer

The terms are $9a, 13a^2,$ and a^3, The coefficients are $9, 13,$ and 1.

Some terms share common traits. Look at the following terms. Which ones seem to have traits in common?

$5x, 7, n^2, 4, 3x, 9n^2$

Which of these terms are like terms?

- The terms 7 and 4 are both constant terms.
- The terms $5x$ and $3x$ are both terms with x.
- The terms n^2 and $9n^2$ both have n^2.

Terms are called like terms if they have the same variables and exponents. All constant terms are also like terms. So among the terms $5x, 7, n^2, 4, 3x, 9n^2, 7$and 4 are like terms, $5x$ and $3x$ are like terms, and n^2 and $9n^2$ are like terms.

Definition: Like terms

Terms that are either constants or have the same variables with the same exponents are like terms.

Example 1.10.8: identify

Identify the like terms:

a. $y^3, 7x^2, 14, 23, 4y^3, 9x, 5x^2$
b. $4x^2 + 2x + 5x^2 + 6x + 40x + 8xy$

Solution

a. $y^3, 7x^2, 14, 23, 4y^3, 9x, 5x^2$

Look at the variables and exponents. The expression contains y^3, x^2, x, and constants. The terms y^3 and $4y^3$ are like terms because they both have y^3. The terms $7x^2$ and $5x^2$ are like terms because they both have x^2. The terms 14 and 23 are like terms because they are both constants. The term $9x$ does not have any like terms in this list since no other terms have the variable x raised to the power of 1.

b. $4x^2 + 2x + 5x^2 + 6x + 40x + 8xy$

Look at the variables and exponents. The expression contains the terms $4x^2, 2x, 5x^2, 6x, 40x$and $8xy$The terms $4x^2$ and $5x^2$ are like terms because they both have x^2. The terms $2x, 6x$, and $40x$ are like terms because they all have x. The term $8xy$ has no like terms in the given expression because no other terms contain the two variables xy.

exercise 1.10.15

Identify the like terms in the list or the expression: $9, 2x^3, y^2, 8x^3, 15, 9y, 11y^2$

Answer

$9, 15$; $2x^3$ and $8x^3$, y^2, and $11y^2$

exercise 1.10.16

Identify the like terms in the list or the expression: $4x^3 + 8x^2 + 19 + 3x^2 + 24 + 6x^3$

Answer

$4x^3$ and $6x^3$; $8x^2$ and $3x^2$; 19 and 24

Simplify Expressions by Combining Like Terms

We can simplify an expression by combining the like terms. What do you think $3x + 6x$ would simplify to? If you thought $9x$, you would be right!

We can see why this works by writing both terms as addition problems.

$$\overbrace{x+x+x}^{3x} + \overbrace{x+x+x+x+x+x}^{6x}$$
$$+$$
$$9x$$

Add the coefficients and keep the same variable. It doesn't matter what x is. If you have 3 of something and add 6 more of the same thing, the result is 9 of them. For example, 3 oranges plus 6 oranges is 9 oranges. We will discuss the mathematical properties behind this later.

The expression $3x + 6x$ has only two terms. When an expression contains more terms, it may be helpful to rearrange the terms so that like terms are together. The Commutative Property of Addition says that we can change the order of addends without changing the sum. So we could rearrange the following expression before combining like terms.

$$3x + 4y - 2x + 6y$$
$$3x - 2x + 4y + 6y$$

Now it is easier to see the like terms to be combined.

HOW TO: COMBINE LIKE TERMS

Step 1. Identify like terms.

Step 2. Rearrange the expression so like terms are together.

Step 3. Add the coefficients of the like terms.

Example 1.10.9: simplify

Simplify the expression: $3x + 7 + 4x + 5$.

Solution

	$3x + 7 + 4x + 5$
Identify the like terms	$3x + 7 + 4x + 5$
Rearrange the expression, so the like terms are together.	$3x + 4x + 7 + 5$
Add the coefficients of the like terms.	$7x + 12$
The original expression is simplified to...	$7x + 12$

exercise 1.10.17

Simplify: $7x + 9 + 9x + 8$

Answer

$16x + 17$

exercise 1.10.18

Simplify: $5y + 2 + 8y + 4y + 5$

Answer

$17y + 7$

Example 1.10.10: simplify

Simplify the expression: $7x^2 + 8x + x^2 + 4x$.

Solution

	$7x^2 + 8x + x^2 + 4x$
Identify the like terms.	$7x^2 + 8x + x^2 + 4x$
Rearrange the expression so like terms are together.	$7x^2 + x^2 + 8x + 4x$

Add the coefficients of the like terms.	$8x^2 + 12x$

These are not like terms and cannot be combined. So $8x^2 + 12x$ is in simplest form.

? exercise 1.10.19

Simplify: $3x^2 + 9x + x^2 + 5x$

Answer

$4x^2 + 14x$

? exercise 1.10.20

Simplify: $11y^2 + 8y + y^2 + 7y$

Answer

$12y^2 + 15y$

1.11: Evaluate, Simplify, and Translate Expressions (Part 2)

Translate Words to Algebraic Expressions

In the previous section, we listed many operation symbols that are used in algebra, and then we translated expressions and equations into word phrases and sentences. Now we'll reverse the process and translate word phrases into algebraic expressions. The symbols and variables we've talked about will help us do that. They are summarized in Table 1.11.3.

Table 1.11.3

Operation	Phrase	Expression
Addition	a plus b the sum of a and b a increased by b b more than a the total of a and b b added to a	a + b
Subtraction	a minus b the difference of a and b b subtracted from a a decreased by b b less than a	a - b
Multiplication	a times b the product of a and b	a • b, ab, a(b), (a)(b)
Division	a divided by b the quotient of a and b the ratio of a and b b divided into a	a ÷ b, a / b, $\frac{a}{b}$, $b\overline{)a}$

Look closely at these phrases using the four operations:

- the sum of a and b
- the difference of a and b
- the product of a and b
- the quotient of a and b

Each phrase tells you to operate on two numbers. Look for the words ***of*** and ***and*** to find the numbers.

Example 1.11.11: translate

Translate each word phrase into an algebraic expression:

a. the difference of 20 and 4
b. the quotient of $10x$ and 3

Solution

a. The key word is *difference*, which tells us the operation is subtraction. Look for the words *of* and *and* to find the numbers to subtract.

$$\text{the difference of } 20 \text{ and } 4$$

$$20 \text{ minus } 4$$

$$20 - 4$$

b. The key word is *quotient*, which tells us the operation is division.

the quotient of $10x$ and 3

divide $10x$ by 3

$$10x \div 3$$

This can also be written as $10x/3$ or $\frac{10x}{3}$

? exercise 1.11.21

Translate the given word phrase into an algebraic expression:

a. the difference of 47 and 41
b. the quotient of $5x$ and 2

Answer a

$47 - 41$

Answer b

$5x \div 2$

? exercise 1.11.22

Translate the given word phrase into an algebraic expression:

a. the sum of 17 and 19
b. the product of 7 and x

Answer a

$17 + 19$

Answer b

$7x$

How old will you be in eight years? What age is eight more years than your age now? Did you add 8 to your present age? Eight *more than* means eight added to your present age.

How old were you seven years ago? This is seven years less than your age now. You subtract 7 from your present age. Seven *less than* means seven subtracted from your present age.

✓ Example 1.11.12: translate

Translate each word phrase into an algebraic expression:

a. Eight more than y
b. Seven less than $9z$

Solution

a. The key words are more than. They tell us the operation is addition. More than means "added to".

Eight more than y

Eight added to y

$$y + 8$$

b. The key words are less than. They tell us the operation is subtraction. Less than means "subtracted from".

Seven less than $9z$

Seven subtracted from $9z$

$$9z-7$$

exercise 1.11.23

Translate each word phrase into an algebraic expression:

a. Eleven more than x
b. Fourteen less than $11a$

Answer a

$x+11$

Answer b

$11a-14$

exercise 1.11.24

Translate each word phrase into an algebraic expression:

a. 19 more than j
b. 21 less than $2x$

Answer a

$j+19$

Answer b

$2x-21$

Example 1.11.13: translate

Translate each word phrase into an algebraic expression:

a. five times the sum of m and n
b. the sum of five times m and n

Solution

a. There are two operation words: times tells us to multiply and sum tells us to add. Because we are multiplying 5 times the sum, we need parentheses around the sum of m and n.

$$\text{five times the sum of } m \text{ and } n$$
$$5(m+n)$$

b. To take a sum, we look for the words of and and to see what is being added. Here we are taking the sum of five times m and n.

$$\text{the sum of five times } m \text{ and } n$$
$$5m+n$$

Notice how the use of parentheses changes the result. In part (a), we add first and in part (b), we multiply first.

exercise 1.11.25

Translate the word phrase into an algebraic expression:

a. four times the sum of p and q
b. the sum of four times p and q

Answer a

$4(p+q)$

Answer b

$4p+q$

exercise 1.11.26

Translate the word phrase into an algebraic expression:

a. the difference of two times x and 8
b. two times the difference of x and 8

Answer a

$2x-8$

Answer b

$2(x-8)$

Later in this course, we'll apply our skills in algebra to solving equations. We'll usually start by translating a word phrase to an algebraic expression. We'll need to be clear about what the expression will represent. We'll see how to do this in the next two examples.

Example 1.11.14: write an expression

The height of a rectangular window is 6 inches less than the width. Let w represent the width of the window. Write an expression for the height of the window.

Solution

Write a phrase about the height.	6 less than the width
Substitute w for the width.	6 less than w
Rewrite 'less than' as 'subtracted from'.	6 subtracted from w
Translate the phrase into algebra.	w - 6

exercise 1.11.27

The length of a rectangle is 5 inches less than the width. Let w represent the width of the rectangle. Write an expression for the length of the rectangle.

Answer

$w-5$

exercise 1.11.28

The width of a rectangle is 2 meters greater than the length. Let l represent the length of the rectangle. Write an expression for the width of the rectangle.

Answer

$l+2$

Example 1.11.15: write an expression

Blanca has dimes and quarters in her purse. The number of dimes is 2 less than 5 times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Solution

Write a phrase about the number of dimes.	two less than five times the number of quarters
Substitute q for the number of quarters.	2 less than five times q
Translate 5 *times* q.	2 less than 5q
Translate the phrase into algebra.	5q - 2

exercise 1.11.29

Geoffrey has dimes and quarters in his pocket. The number of dimes is seven less than six times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Answer

$6q-7$

exercise 1.11.30

Lauren has dimes and nickels in her purse. The number of dimes is eight more than four times the number of nickels. Let n represent the number of nickels. Write an expression for the number of dimes.

Answer

$4n+8$

Access Additional Online Resources

- Algebraic Expression Vocabulary

Key Concepts

- Combine like terms.
  - Identify like terms.
  - Rearrange the expression so like terms are together.
  - Add the coefficients of the like terms

Glossary

term

A term is a constant or the product of a constant and one or more variables.

coefficient

The constant that multiplies the variable(s) in a term is called the coefficient.

like terms

Terms that are either constants or have the same variables with the same exponents are like terms.

evaluate

To evaluate an algebraic expression means to find the value of the expression when the variable is replaced by a given number.

Practice Makes Perfect

Evaluate Algebraic Expressions

In the following exercises, evaluate the expression for the given value.

69. $7x + 8$ when $x = 2$
70. $9x + 7$ when $x = 3$
71. $5x - 4$ when $x = 6$
72. $8x - 6$ when $x = 7$
73. x^2 when $x = 12$
74. x^3 when $x = 5$
75. x^5 when $x = 2$
76. x^4 when $x = 3$
77. 3^x when $x = 3$
78. 4^x when $x = 2$
79. $x^2 + 3x - 7$ when $x = 4$
80. $x^2 + 5x - 8$ when $x = 6$
81. $2x + 4y - 5$ when $x = 7, y = 8$
82. $6x + 3y - 9$ when $x = 6, y = 9$
83. $(x - y)^2$ when $x = 10, y = 7$
84. $(x + y)^2$ when $x = 6, y = 9$
85. $a^2 + b^2$ when $a = 3, b = 8$
86. $r^2 - s^2$ when $r = 12, s = 5$
87. $2l + 2w$ when $l = 15, w = 12$
88. $2l + 2w$ when $l = 18, w = 14$

Identify Terms, Coefficients, and Like Terms

In the following exercises, list the terms in the given expression.

89. $15x^2 + 6x + 2$
90. $11x^2 + 8x + 5$
91. $10y^3 + y + 2$
92. $9y^3 + y + 5$

In the following exercises, identify the coefficient of the given term.

93. $8a$
94. $13m$
95. $5r^2$
96. $6x^3$

In the following exercises, identify all sets of like terms.

97. x^3, $8x$, 14, $8y$, 5, $8x^3$
98. $6z$, $3w^2$, 1, $6z^2$, $4z$, w^2
99. $9a$, a^2, $16ab$, $16b^2$, $4ab$, $9b^2$
100. 3, $25r^2$, $10s$, $10r$, $4r^2$, $3s$

Simplify Expressions by Combining Like Terms

In the following exercises, simplify the given expression by combining like terms.

101. $10x + 3x$
102. $15x + 4x$
103. $17a + 9a$
104. $18z + 9z$
105. $4c + 2c + c$
106. $6y + 4y + y$

107. $9x + 3x + 8$
108. $8a + 5a + 9$
109. $7u + 2 + 3u + 1$
110. $8d + 6 + 2d + 5$
111. $7p + 6 + 5p + 4$
112. $8x + 7 + 4x - 5$
113. $10a + 7 + 5a - 2 + 7a - 4$
114. $7c + 4 + 6c - 3 + 9c - 1$
115. $3x^2 + 12x + 11 + 14x^2 + 8x + 5$
116. $5b^2 + 9b + 10 + 2b^2 + 3b - 4$

Translate English Phrases into Algebraic Expressions

In the following exercises, translate the given word phrase into an algebraic expression.

117. The sum of 8 and 12
118. The sum of 9 and 1
119. The difference of 14 and 9
120. 8 less than 19
121. The product of 9 and 7
122. The product of 8 and 7
123. The quotient of 36 and 9
124. The quotient of 42 and 7
125. The difference of x and 4
126. 3 less than x
127. The product of 6 and y
128. The product of 9 and y
129. The sum of 8x and 3x
130. The sum of 13x and 3x
131. The quotient of y and 3
132. The quotient of y and 8
133. Eight times the difference of y and nine
134. Seven times the difference of y and one
135. Five times the sum of x and y
136. Nine times five less than twice x

In the following exercises, write an algebraic expression.

137. Adele bought a skirt and a blouse. The skirt cost $15 more than the blouse. Let b represent the cost of the blouse. Write an expression for the cost of the skirt.
138. Eric has rock and classical CDs in his car. The number of rock CDs is 3 more than the number of classical CDs. Let c represent the number of classical CDs. Write an expression for the number of rock CDs.
139. The number of girls in a second-grade class is 4 less than the number of boys. Let b represent the number of boys. Write an expression for the number of girls.
140. Marcella has 6 fewer male cousins than female cousins. Let f represent the number of female cousins. Write an expression for the number of boy cousins.
141. Greg has nickels and pennies in his pocket. The number of pennies is seven less than twice the number of nickels. Let n represent the number of nickels. Write an expression for the number of pennies.
142. Jeannette has $5 and $10 bills in her wallet. The number of fives is three more than six times the number of tens. Let t represent the number of tens. Write an expression for the number of fives.

Everyday Math

In the following exercises, use algebraic expressions to solve the problem.

143. **Car insurance** Justin's car insurance has a $750 deductible per incident. This means that he pays $750 and his insurance company will pay all costs beyond $750. If Justin files a claim for $2,100, how much will he pay, and how much will his

insurance company pay?

144. **Home insurance** Pam and Armando's home insurance has a $2,500 deductible per incident. This means that they pay $2,500 and their insurance company will pay all costs beyond $2,500. If Pam and Armando file a claim for $19,400, how much will they pay, and how much will their insurance company pay?

Writing Exercises

145. Explain why "the sum of x and y" is the same as "the sum of y and x," but "the difference of x and y" is not the same as "the difference of y and x." Try substituting two random numbers for x and y to help you explain. 146. Explain the difference between "4 times the sum of x and y" and "the sum of 4 times x and y."

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
evaluate algebraic expressions.			
identify terms, coefficients, and like terms.			
simplify expressions by combining like terms.			
translate word phrases to algebraic expressions.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

1.12: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 1)

Learning Objectives

- Determine whether a number is a solution of an equation
- Model the Subtraction Property of Equality
- Solve equations using the Subtraction Property of Equality
- Solve equations using the Addition Property of Equality
- Translate word phrases to algebraic equations
- Translate to an equation and solve

Be Prepared!

Before you get started, take this readiness quiz.

1. Evaluate $x+8$ when $x=11$. If you missed this problem, review Example 2..2.1.
2. Evaluate $5x-3$ when $x=9$. If you missed this problem, review Example 2.2.2.
3. Translate into algebra: the difference of x and 8. If you missed this problem, review Example 2.2.11.

When some people hear the word *algebra*, they think of solving equations. The applications of solving equations are limitless and extend to all careers and fields. In this section, we will begin solving equations. We will start by solving basic equations, and then as we proceed through the course we will build up our skills to cover many different forms of equations.

Determine Whether a Number is a Solution of an Equation

Solving an equation is like discovering the answer to a puzzle. An algebraic equation states that two algebraic expressions are equal. To solve an equation is to determine the values of the variable that make the equation a true statement. Any number that makes the equation true is called a **solution** of the equation. It is the answer to the puzzle!

Definition: Solution of an Equation

A solution to an equation is a value of a variable that makes a true statement when substituted into the equation. The process of finding the solution to an equation is called solving the equation.

To find the solution to an equation means to find the value of the variable that makes the equation true. Can you recognize the solution of $x+2=7$? If you said 5, you're right! We say 5 is a solution to the equation $x+2=7$ because when we substitute 5 for x the resulting statement is true.

$$\begin{aligned} x+2 &= 7 \\ 5+2 &\stackrel{?}{=} 7 \\ 7 &= 7 \checkmark \end{aligned}$$

Since $5+2=7$ is a true statement, we know that 5 is indeed a solution to the equation. The symbol $\stackrel{?}{=}$ asks whether the left side of the equation is equal to the right side. Once we know, we can change to an equal sign ($=$) or not-equal sign ($\neq$).

HOW TO: DETERMINE WHETHER A NUMBER IS A Solution TO AN EQUATION

Step 1. Substitute the number for the variable in the equation.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Determine whether the resulting equation is true.

- If it is true, the number is a solution.
- If it is not true, the number is not a solution.

Example 1.12.1

Determine whether $x = 5$ is a solution of $6x - 17 = 16$.

Solution

	$6x - 17 = 16$
Substitute 5 for x.	$6 \cdot 5 - 17 \stackrel{?}{=} 16$
Multiply.	$30 - 17 \stackrel{?}{=} 16$
Subtract	$13 \neq 16$

So $x = 5$ is not a solution to the equation $6x - 17 = 16$.

exercise 1.12.1

Is $x = 3$ a solution of $4x - 7 = 16$?

Answer

no

exercise 1.12.2

Is $x = 2$ a solution of $6x - 2 = 10$?

Answer

yes

Example 1.12.2

Determine whether $y = 2$ is a solution of $6y - 4 = 5y - 2$.

Solution

Here, the variable appears on both sides of the equation. We must substitute 2 for each y.

	$6y - 4 = 5y - 2$
Substitute 2 for y.	$6(2) - 4 \stackrel{?}{=} 5(2) - 2$
Multiply.	$12 - 4 \stackrel{?}{=} 10 - 2$
Subtract	$8 = 8$ ✓

Since $y = 2$ results in a true equation, we know that 2 is a solution to the equation $6y - 4 = 5y - 2$.

exercise 1.12.3

Is $y = 3$ a solution of $9y - 2 = 8y + 1$?

Answer

yes

? exercise 1.12.4

Is $y = 4$ a solution of $5y - 3 = 3y + 5$?

Answer

yes

Model the Subtraction Property of Equality

We will use a model to help you understand how the process of solving an equation is like solving a puzzle. An envelope represents the variable – since its contents are unknown – and each counter represents one.

Suppose a desk has an imaginary line dividing it in half. We place three counters and an envelope on the left side of desk, and eight counters on the right side of the desk as in Figure 1.12.1. Both sides of the desk have the same number of counters, but some counters are hidden in the envelope. Can you tell how many counters are in the envelope?

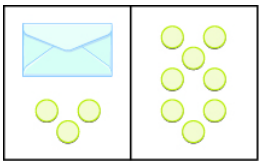

Figure 1.12.1

What steps are you taking in your mind to figure out how many counters are in the envelope? Perhaps you are thinking "I need to remove the 3 counters from the left side to get the envelope by itself. Those 3 counters on the left match with 3 on the right, so I can take them away from both sides. That leaves five counters on the right, so there must be 5 counters in the envelope." Figure 1.12.2 shows this process.

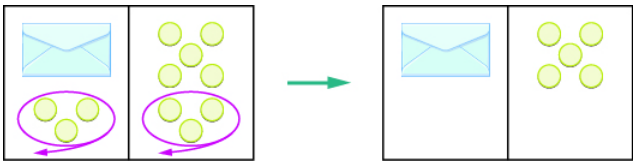

Figure 1.12.2

What algebraic equation is modeled by this situation? Each side of the desk represents an expression and the center line takes the place of the equal sign. We will call the contents of the envelope x, so the number of counters on the left side of the desk is $x + 3$. On the right side of the desk are 8 counters. We are told that $x + 3$ is equal to 8 so our equation is $x + 3 = 8$.

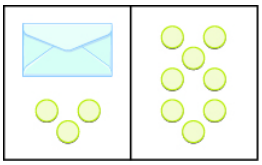

Figure 1.12.3

$$x + 3 = 8$$

Let's write algebraically the steps we took to discover how many counters were in the envelope.

	$x + 3 = 8$
First, we took away three from each side.	$x + 3 - 3 = 8 - 3$
Then we were left with five.	$x = 5$

Now let's check our solution. We substitute 5 for x in the original equation and see if we get a true statement.

$$x+3=8$$
$$5+3\stackrel{?}{=}8$$
$$8=8\ \checkmark$$

Our solution is correct. Five counters in the envelope plus three more equals eight

Example 1.12.3

Write an equation modeled by the envelopes and counters, and then solve the equation:

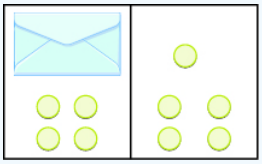

Figure 1.12.4

Solution

On the left, write x for the contents of the envelope, add the 4 counters, so we have x + 4.	x + 4
On the right, there are 5 counters.	5
The two sides are equal.	x + 4 = 5
Solve the equation by subtracting 4 counters from each side.	

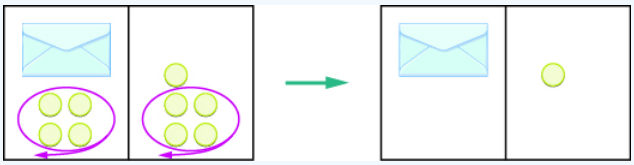

Figure 1.12.5

We can see that there is one counter in the envelope. This can be shown algebraically as:

$$x+4=5$$
$$x+4-4=5-4$$
$$x=1$$

Substitute 1 for x in the equation to check.

$$x+4=5$$
$$1+4\stackrel{?}{=}5$$
$$5=5\ \checkmark$$

Since $x=1$ makes the statement true, we know that 1 is indeed a solution.

Exercise 1.12.5

Write the equation modeled by the envelopes and counters, and then solve the equation:

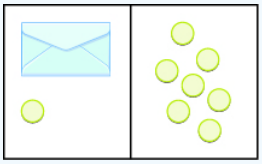

Figure 1.12.6

Answer

$x+1=7; x=6$

Exercise 1.12.6

Write the equation modeled by the envelopes and counters, and then solve the equation:

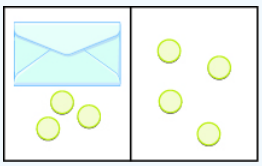

Figure 1.12.7

Answer

$x+3=4; x=1$

Solve Equations Using the Subtraction Property of Equality

Our puzzle has given us an idea of what we need to do to solve an equation. The goal is to isolate the variable by itself on one side of the equations. In the previous examples, we used the Subtraction Property of Equality, which states that when we subtract the same quantity from both sides of an equation, we still have equality.

Definition: Subtraction Property of Equality

For any numbers a, b, and c, if $a=b$ then $a-c=b-c$

Think about twin brothers Andy and Bobby. They are 17 years old. How old was Andy 3 years ago? He was 3 years less than 17, so his age was $17-3$, or 14. What about Bobby's age 3 years ago? Of course, he was 14 also. Their ages are equal now, and subtracting the same quantity from both of them resulted in equal ages 3 years ago.

$$\begin{aligned} a &= b \\ a-3 &= b-3 \end{aligned}$$

HOW TO: SOLVE AN EQUATION USING THE SUBTRACTION PROPERTY OF EQUALITY

Step 1. Use the Subtraction Property of Equality to isolate the variable.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Check the solution.

Example 1.12.4: solve

Solve: $x+8=17$.

Solution

We will use the Subtraction Property of Equality to isolate x.

	$x+8=17$
Subtract 8 from both sides.	$x+8-8=17-8$
Simplify.	$x=9$

Check the solution.	$9+8=17$
	$17=17$ ✓

Since $x=9$ makes $x+8=17$ a true statement, we know 9 is the solution to the equation.

Exercise 1.12.7

Solve: $x+6=19$

Answer

$x=13$

Exercise 1.12.8

Solve: $x+9=14$

Answer

$x=5$

Example 1.12.5: solve

Solve: $100=y+74$.

Solution

To solve an equation, we must always isolate the variable—it doesn't matter which side it is on. To isolate y, we will subtract 74 from both sides.

	$100=y+74$
Subtract 74 from both sides.	$100-74=y+74-74$
Simplify.	$26=y$
Substitute 26 for y to check	$100\stackrel{?}{=}26+74$
	$100=100$ ✓

Since $y=26$ makes $100=y+74$ a true statement, we have found the solution to this equation.

Exercise 1.12.9

Solve: $95=y+67$

Answer

$y=28$

Exercise 1.12.10

Solve: $91=y+45$

Answer

$y=46$

Solve Equations Using the Addition Property of Equality

In all the equations we have solved so far, a number was added to the variable on one side of the equation. We used subtraction to "undo" the addition in order to isolate the variable.

But suppose we have an equation with a number subtracted from the variable, such as $x-5=8$. We want to isolate the variable, so to "undo" the subtraction we will add the number to both sides.

We use the Addition Property of Equality, which says we can add the same number to both sides of the equation without changing the equality. Notice how it mirrors the Subtraction Property of Equality.

Definition: Addition Property of Equality

For any numbers a, b, and c, if $a=b$ then $a+c=b+c$

Remember the 17-year-old twins, Andy and Bobby? In ten years, Andy's age will still equal Bobby's age. They will both be 27.

$$\begin{aligned} a &= b \\ a+10 &= b+10 \end{aligned}$$

We can add the same number to both sides and still keep the equality.

HOW TO: SOLVE AN EQUATION USING THE ADDITION PROPERTY OF EQUALITY

Step 1. Use the Addition Property of Equality to isolate the variable.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Check the solution.

Example 1.12.6: solve

Solve: $x-5=8$.

Solution

We will use the Addition Property of Equality to isolate the variable.

	$x-5=8$
Add 5 to both sides.	$x-5+5=8+5$
Simplify	$x=13$
Now we can check. Let x = 13.	$13-5\stackrel{?}{=}8$
	$8=8$ ✓

Exercise 1.12.11

Solve: $x-9=13$

Answer

$x=22$

Exercise 1.12.12

Solve: $y-1=3$

Answer

$y = 4$

Example 1.12.7: solve

Solve: $27 = a - 16$.

Solution

We will add 16 to each side to isolate the variable.

	$27 = a - 16$
Add 16 to each side.	$27 + 16 = a - 16 + 16$
Simplify.	$43 = a$
Now we can check. Let a = 43.	$27 \stackrel{?}{=} 43 - 16$
	$27 = 27$ ✓

The solution to $27 = a - 16$ is $a = 43$.

Exercise 1.12.13

Solve: $19 = a - 18$

Answer

$a = 37$

Exercise 1.12.14

Solve: $27 = n - 14$

Answer

$n = 41$

1.13: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 2)

Translate Word Phrases to Algebraic Equations

Remember, an equation has an equal sign (=) between two algebraic expressions. So if we have a sentence that tells us that two phrases are equal, we can translate it into an equation. We look for clue words that mean equals. Some words that translate to the equal sign are:

- is equal to
- is the same as
- is
- gives
- was
- will be

It may be helpful to put a box around the equals word(s) in the sentence to help you focus separately on each phrase. Then translate each phrase into an expression, and write them on each side of the equal sign.

We will practice translating word sentences into algebraic equations. Some of the sentences will be basic number facts with no variables to solve for. Some sentences will translate into equations with variables. The focus right now is just to translate the words into algebra.

Example 1.13.8: translate

Translate the sentence into an algebraic equation: The sum of 6 and 9 is 15.

Solution

The word is tells us the equal sign goes between 9 and 15.

Locate the “equals” word(s).	The sum of 6 and 9 is 15
Write the = sign.	The sum of 6 and 9 = 15
Translate the words to the left of the *equals* word into an algebraic expression.	6 + 9 = _____
Translate the words to the right of the *equals* word into an algebraic expression.	6 + 9 = 15

Exercise 1.13.15

Translate the sentence into an algebraic equation: The sum of 7 and 6 gives 13.

Answer

$7+6=13$

Exercise 1.13.16

Translate the sentence into an algebraic equation: The sum of 8 and 6 is 14.

Answer

$8+6=14$

Example 1.13.9: translate

Translate the sentence into an algebraic equation: The product of 8 and 7 is 56.

Solution

The location of the word is tells us that the equal sign goes between 7 and 56.

Locate the “equals” word(s).	The product of 8 and 7 is 56
Write the = sign.	The product of 8 and 7 = 56
Translate the words to the left of the *equals* word into an algebraic expression.	8 • 7 = _____
Translate the words to the right of the *equals* word into an algebraic expression.	8 • 7 = 56

Exercise 1.13.17

Translate the sentence into an algebraic equation: The product of 6 and 9 is 54.

Answer

$6 \cdot 9 = 54$

Exercise 1.13.18

Translate the sentence into an algebraic equation: The product of 21 and 3 gives 63.

Answer

$21 \cdot 3 = 63$

Example 1.13.10: translate

Translate the sentence into an algebraic equation: Twice the difference of x and 3 gives 18.

Solution

Locate the “equals” word(s).	Twice the difference of x and 3 gives 18.
Recognize the key words: *twice*; *difference of … and …*	*Twice* means two times.
Translate.	Twice (2) the difference of x and 3 ($x - 3$) gives (=) 18.

Exercise 1.13.19

Translate the given sentence into an algebraic equation: Twice the difference of x and 5 gives 30.

Answer

$2(x - 5) = 30$

Exercise 1.13.20

Translate the given sentence into an algebraic equation: Twice the difference of y and 4 gives 16.

Answer

$2(y-4)=16$

Translate to an Equation and Solve

Now let's practice translating sentences into algebraic equations and then solving them. We will solve the equations by using the Subtraction and Addition Properties of Equality.

Example 1.13.11: translate and solve

Translate and solve: Three more than x is equal to 47.

Solution

	Three more than x is equal to 47.
Translate.	$x+3=47$
Subtract 3 from both sides of the equation.	$x+3-3=47-3$
Simplify	$x=44$
We can check. Let x = 44.	$44+3\stackrel{?}{=}47$
	$47=47$ ✓

So $x=44$ is the solution.

Exercise 1.13.21

Translate and solve: Seven more than x is equal to 37.

Answer

$x+7=37; x=30$

Exercise 1.13.22

Translate and solve: Eleven more than y is equal to 28.

Answer

$y+11=28; y=17$

Example 1.13.12: translate and solve

Translate and solve: The difference of y and 14 is 18.

Solution

	The difference of y and 14 is 18.
Translate.	$y-14=18$
Add 14 to both sides.	$y-14+14=18+14$

Simplify.	$y = 32$
We can check. Let y = 32.	$32 - 14 \stackrel{?}{=} 18$
	$18 = 18$ ✓

So $y = 32$ is the solution.

? Exercise 1.13.23

Translate and solve: The difference of z and 17 is equal to 37.

Answer

$z - 17 = 37; z = 54$

? Exercise 1.13.24

Translate and solve: The difference of x and 19 is equal to 45.

Answer

$x - 19 = 45; x = 64$

Glossary

solution of an equation

A solution to an equation is a value of a variable that makes a true statement when substituted into the equation. The process of finding the solution to an equation is called solving the equation.

Practice Makes Perfect

Determine Whether a Number is a Solution of an Equation

In the following exercises, determine whether each given value is a solution to the equation.

147. $x + 13 = 21$
   a. $x = 8$
   b. $x = 34$

148. $y + 18 = 25$
   a. $y = 7$
   b. $y = 43$

149. $m - 4 = 13$
   a. $m = 9$
   b. $m = 17$

150. $n - 9 = 6$
   a. $n = 3$
   b. $n = 15$

151. $3p + 6 = 15$
   a. $p = 3$
   b. $p = 7$

152. $8q + 4 = 20$
   a. $q = 2$
   b. $q = 3$

153. $18d - 9 = 27$
   a. $d = 1$
   b. $d = 2$

154. $24\,f - 12 = 60$
   a. $f = 2$
   b. $f = 3$

155. $8u - 4 = 4u + 40$
   a. $u = 3$
   b. $u = 11$

156. $7v - 3 = 4v + 36$
   a. $v = 3$
   b. $v = 11$

157. $20h - 5 = 15h + 35$
   a. $h = 6$
   b. $h = 8$

158. $18k - 3 = 12k + 33$
   a. $k = 1$
   b. $k = 6$

Model the Subtraction Property of Equality

In the following exercises, write the equation modeled by the envelopes and counters and then solve using the subtraction property of equality.

159. 
160. 
161. 
162. 
Solve Equations using the Subtraction Property of Equality

In the following exercises, solve each equation using the subtraction property of equality.

163. $a + 2 = 18$
164. $b + 5 = 13$
165. $p + 18 = 23$
166. $q + 14 = 31$
167. $r + 76 = 100$
168. $s + 62 = 95$
169. $16 = x + 9$
170. $17 = y + 6$
171. $93 = p + 24$
172. $116 = q + 79$
173. $465 = d + 398$
174. $932 = c + 641$

Solve Equations using the Addition Property of Equality

In the following exercises, solve each equation using the addition property of equality.

175. $y - 3 = 19$
176. $x - 4 = 12$
177. $u - 6 = 24$
178. $v - 7 = 35$
179. $f - 55 = 123$
180. $g - 39 = 117$
181. $19 = n - 13$
182. $18 = m - 15$

183. $10 = p - 38$
184. $18 = q - 72$
185. $268 = y - 199$
186. $204 = z - 149$

Translate Word Phrase to Algebraic Equations

In the following exercises, translate the given sentence into an algebraic equation.

187. The sum of 8 and 9 is equal to 17.
188. The sum of 7 and 9 is equal to 16.
189. The difference of 23 and 19 is equal to 4.
190. The difference of 29 and 12 is equal to 17.
191. The product of 3 and 9 is equal to 27.
192. The product of 6 and 8 is equal to 48.
193. The quotient of 54 and 6 is equal to 9.
194. The quotient of 42 and 7 is equal to 6.
195. Twice the difference of n and 10 gives 52.
196. Twice the difference of m and 14 gives 64.
197. The sum of three times y and 10 is 100.
198. The sum of eight times x and 4 is 68.

Translate to an Equation and Solve

In the following exercises, translate the given sentence into an algebraic equation and then solve it.

199. Five more than p is equal to 21.
200. Nine more than q is equal to 40.
201. The sum of r and 18 is 73.
202. The sum of s and 13 is 68.
203. The difference of d and 30 is equal to 52.
204. The difference of c and 25 is equal to 75.
205. 12 less than u is 89.
206. 19 less than w is 56.
207. 325 less than c gives 799.
208. 299 less than d gives 850.

Everyday Math

209. **Insurance** Vince's car insurance has a $500 deductible. Find the amount the insurance company will pay, p, for an $1800 claim by solving the equation $500 + p = 1800$.
210. **Insurance** Marta's homeowner's insurance policy has a $750 deductible. The insurance company paid $5800 to repair damages caused by a storm. Find the total cost of the storm damage, d, by solving the equation $d - 750 = 5800$.
211. **Sale purchase** Arthur bought a suit that was on sale for $120 off. He paid $340 for the suit. Find the original price, p, of the suit by solving the equation $p - 120 = 340$.
212. **Sale purchase** Rita bought a sofa that was on sale for $1299. She paid a total of $1409, including sales tax. Find the amount of the sales tax, t, by solving the equation $1299 + t = 1409$.

Writing Exercises

213. Is $x = 1$ a solution to the equation $8x - 2 = 16 - 6x$? How do you know?
214. Write the equation $y - 5 = 21$ in words. Then make up a word problem for this equation.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether a number is a solution of an equation.			
model the subtraction property of equality.			
solve equations using the subtraction property of equality.			
solve equations using the addition property of equality.			
translate word phrases to algebraic equations.			
translate to an equation and solve.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

1.E: Introduction to the Language of Algebra (Exercises)

2.1 - Use the Language of Algebra

Use Variables and Algebraic Symbols

In the following exercises, translate from algebra to English.

317. $3 \cdot 8$
318. $12 - x$
319. $24 \div 6$
320. $9 + 2a$
321. $50 \geq 47$
322. $3y < 15$
323. $n + 4 = 13$
324. $32 - k = 7$

Identify Expressions and Equations

In the following exercises, determine if each is an expression or equation.

325. $5 + u = 84$
326. $36 - 6s$
327. $4y - 11$
328. $10x = 120$

Simplify Expressions with Exponents

In the following exercises, write in exponential form.

329. $2 \cdot 2 \cdot 2$
330. $a \cdot a \cdot a \cdot a \cdot a$
331. $x \cdot x \cdot x \cdot x \cdot x \cdot x$
332. $10 \cdot 10 \cdot 10$

In the following exercises, write in expanded form.

333. 8^4
334. 3^6
335. y^5
336. n^4

In the following exercises, simplify each expression.

337. 3^4
338. 10^6
339. 2^7
340. 4^3

Simplify Expressions Using the Order of Operations

In the following exercises, simplify.

341. $10 + 2 \cdot 5$
342. $(10 + 2) \cdot 5$
343. $(30 + 6) \div 2$
344. $30 + 6 \div 2$
345. $7^2 + 5^2$
346. $(7 + 5)^2$
347. $4 + 3(10 - 1)$
348. $(4 + 3)(10 - 1)$

2.2 - Evaluate, Simplify, and Translate Expressions

Evaluate an Expression

In the following exercises, evaluate the following expressions.

349. $9x - 5$ when $x = 7$
350. y^3 when $y = 5$
351. $3a - 4b$ when $a = 10, b = 1$
352. bh when $b = 7, h = 8$

Identify Terms, Coefficients and Like Terms

In the following exercises, identify the terms in each expression.

353. $12n^2 + 3n + 1$
354. $4x^3 + 11x + 3$

In the following exercises, identify the coefficient of each term.

355. $6y$
356. $13x^2$

In the following exercises, identify the like terms.

357. $5x^2$, 3, $5y^2$, $3x$, x, 4
358. 8, $8r^2$, $8r$, $3r$, r^2, $3s$

Simplify Expressions by Combining Like Terms

In the following exercises, simplify the following expressions by combining like terms.

359. $15a + 9a$
360. $12y + 3y + y$
361. $4x + 7x + 3x$
362. $6 + 5c + 3$
363. $8n + 2 + 4n + 9$
364. $19p + 5 + 4p - 1 + 3p$
365. $7y^2 + 2y + 11 + 3y^2 - 8$
366. $13x^2 - x + 6 + 5x^2 + 9x$

Translate English Phrases to Algebraic Expressions

In the following exercises, translate the following phrases into algebraic expressions.

367. the difference of x and 6
368. the sum of 10 and twice a
369. the product of $3n$ and 9
370. the quotient of s and 4
371. 5 times the sum of y and 1
372. 10 less than the product of 5 and z
373. Jack bought a sandwich and a coffee. The cost of the sandwich was $3 more than the cost of the coffee. Call the cost of the coffee c. Write an expression for the cost of the sandwich.
374. The number of poetry books on Brianna's bookshelf is 5 less than twice the number of novels. Call the number of novels n. Write an expression for the number of poetry books.

2.3 - Solve Equations Using the Subtraction and Addition Properties of Equality

Determine Whether a Number is a Solution of an Equation

In the following exercises, determine whether each number is a solution to the equation.

375. $y + 16 = 40$

    a. 24

b. 56

376. $d - 6 = 21$

a. 15
b. 27

377. $4n + 12 = 36$

a. 6
b. 12

378. $20q - 10 = 70$

a. 3
b. 4

379. $15x - 5 = 10x + 45$

a. 2
b. 10

380. $22p - 6 = 18p + 86$

a. 4
b. 23

Model the Subtraction Property of Equality

In the following exercises, write the equation modeled by the envelopes and counters and then solve the equation using the subtraction property of equality

381. 
382. 
Solve Equations using the Subtraction Property of Equality

In the following exercises, solve each equation using the subtraction property of equality.

383. $c + 8 = 14$
384. $v + 8 = 150$
385. $23 = x + 12$
386. $376 = n + 265$

Solve Equations using the Addition Property of Equality

In the following exercises, solve each equation using the addition property of equality.

387. $y - 7 = 16$
388. $k - 42 = 113$
389. $19 = p - 15$
390. $501 = u - 399$

Translate English Sentences to Algebraic Equations

In the following exercises, translate each English sentence into an algebraic equation.

391. The sum of 7 and 33 is equal to 40.

392. The difference of 15 and 3 is equal to 12.
393. The product of 4 and 8 is equal to 32.
394. The quotient of 63 and 9 is equal to 7.
395. Twice the difference of n and 3 gives 76.
396. The sum of five times y and 4 is 89.

Translate to an Equation and Solve

In the following exercises, translate each English sentence into an algebraic equation and then solve it.

397. Eight more than x is equal to 35.
398. 21 less than a is 11.
399. The difference of q and 18 is 57.
400. The sum of m and 125 is 240.

Mixed Practice

In the following exercises, solve each equation.

401. $h - 15 = 27$
402. $k - 11 = 34$
403. $z + 52 = 85$
404. $x + 93 = 114$
405. $27 = q + 19$
406. $38 = p + 19$
407. $31 = v - 25$
408. $38 = u - 16$

2.4 - Find Multiples and Factors

Identify Multiples of Numbers

In the following exercises, list all the multiples less than 50 for each of the following.

409. 3
410. 2
411. 8
412. 10

Use Common Divisibility Tests

In the following exercises, using the divisibility tests, determine whether each number is divisible by 2, by 3, by 5, by 6, and by 10.

413. 96
414. 250
415. 420
416. 625

Find All the Factors of a Number

In the following exercises, find all the factors of each number.

417. 30
418. 70
419. 180
420. 378

Identify Prime and Composite Numbers

In the following exercises, identify each number as prime or composite.

421. 19
422. 51

423. 121

2.5 - Prime Factorization and the Least Common Multiple

Find the Prime Factorization of a Composite Number

In the following exercises, find the prime factorization of each number.

425. 84
426. 165
427. 350
428. 572

Find the Least Common Multiple of Two Numbers

In the following exercises, find the least common multiple of each pair of numbers.

429. 9, 15
430. 12, 20
431. 25, 35
432. 18, 40

Everyday Math

433. Describe how you have used two topics from The Language of Algebra chapter in your life outside of your math class during the past month.

PRACTICE TEST

In the following exercises, translate from an algebraic equation to English phrases.

434. $6 \cdot 4$
435. $15 - x$

In the following exercises, identify each as an expression or equation.

436. $5 \cdot 8 + 10$
437. $x + 6 = 9$
438. $3 \cdot 11 = 33$
439. (a) Write $n \cdot n \cdot n \cdot n \cdot n \cdot n$ in exponential form. (b) Write 3^5 in expanded form and then simplify.

In the following exercises, simplify, using the order of operations.

440. $4 + 3 \cdot 5$
441. $(8 + 1) \cdot 4$
442. $1 + 6(3 - 1)$
443. $(8 + 4) \div 3 + 1$
444. $(1 + 4)^2$
445. $5[2 + 7(9 - 8)]$

In the following exercises, evaluate each expression.

446. $8x - 3$ when $x = 4$
447. y^3 when $y = 5$
448. $6a - 2b$ when $a = 5, b = 7$
449. hw when $h = 12, w = 3$
450. Simplify by combining like terms.
    a. $6x + 8x$
    b. $9m + 10 + m + 3$

In the following exercises, translate each phrase into an algebraic expression.

451. 5 more than x

452. the quotient of 12 and y
453. three times the difference of a and b
454. Caroline has 3 fewer earrings on her left ear than on her right ear. Call the number of earrings on her right ear, r. Write an expression for the number of earrings on her left ear.

In the following exercises, solve each equation.

455. n − 6 = 25
456. x + 58 = 71

In the following exercises, translate each English sentence into an algebraic equation and then solve it.

457. 15 less than y is 32.
458. the sum of a and 129 is 164.
459. List all the multiples of 4, that are less than 50.
460. Find all the factors of 90.
461. Find the prime factorization of 1080.
462. Find the LCM (Least Common Multiple) of 24 and 40.

1.E: Whole Numbers (Exercises)

1.1 - Introduction to Whole Numbers

Identify Counting Numbers and Whole Numbers

In the following exercises, determine which of the following numbers are (a) counting numbers (b) whole numbers.

453. 0, 2, 99
454. 0, 3, 25
455. 0, 4, 90
456. 0, 1, 75

Model Whole Numbers

In the following exercises, model each number using base-10 blocks and then show its value using place value notation.

457. 258
458. 104

Identify the Place Value of a Digit

In the following exercises, find the place value of the given digits.

459. 472,981

(a) 8 (b) 4 (c) 1 (d) 7 (e) 2

459. 12,403,295

(a) 4 (b) 0 (c) 1 (d) 9 (e) 3

Use Place Value to Name Whole Numbers

In the following exercises, name each number in words.

461. 5,280
462. 204,614
463. 5,012,582
464. 31,640,976

Use Place Value to Write Whole Numbers

In the following exercises, write each number as a whole number using digits.

465. six hundred two
466. fifteen thousand, two hundred fifty-three
467. three hundred forty million, nine hundred twelve thousand, sixty-one
468. two billion, four hundred ninety-two million, seven hundred eleven thousand, two

Round Whole Numbers

In the following exercises, round to the nearest ten.

469. 412
470. 648
471. 3,556
472. 2,734

In the following exercises, round to the nearest hundred.

473. 38,975
474. 26,849
475. 81,486
476. 75,992

1.2 - Add Whole Numbers

Use Addition Notation

In the following exercises, translate the following from math notation to words.

477. 4 + 3
478. 25 + 18
479. 571 + 629
480. 10,085 + 3,492

Model Addition of Whole Numbers

In the following exercises, model the addition.

481. 6 + 7
482. 38 + 14

Add Whole Numbers

In the following exercises, fill in the missing values in each chart.

483.

+	0	1	2	3	4	5	6	7	8	9
0	0	1		3	4		6	7		9
1	1	2	3	4			7	8	9	
2		3	4	5	6	7	8		10	11
3	3		5		7	8		10		12
4	4	5			8	9			12	
5	5		7	8			11		13	
6	6	7	8		10			13		15
7			9			12	13		15	16
8	8	9		11			14		16	
9	9	10	11		13	14			17	

484.

+	3	4	5	6	7	8	9
6							
7							
8							
9							

In the following exercises, add.

485. (a) 0 + 19 (b) 19 + 0
486. (a) 0 + 480 (b) 480 + 0
487. (a) 7 + 6 (b) 6 + 7
488. (a) 23 + 18 (b) 18 + 23
489. 44 + 35
490. 63 + 29
491. 96 + 58
492. 375 + 591
493. 7,281 + 12,546
494. 5,280 + 16,324 + 9,731

Translate Word Phrases to Math Notation

In the following exercises, translate each phrase into math notation and then simplify.

495. the sum of 30 and 12
496. 11 increased by 8
497. 25 more than 39
498. total of 15 and 50

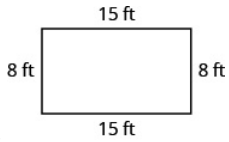
Add Whole Numbers in Applications

In the following exercises, solve.

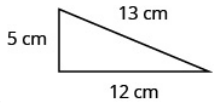
499. **Shopping for an interview** Nathan bought a new shirt, tie, and slacks to wear to a job interview. The shirt cost $24, the tie cost $14, and the slacks cost $38. What was Nathan's total cost?
500. **Running** Jackson ran 4 miles on Monday, 12 miles on Tuesday, 1 mile on Wednesday, 8 miles on Thursday, and 5 miles on Friday. What was the total number of miles Jackson ran?

In the following exercises, find the perimeter of each figure.

501.



502.



1.3 - Subtract Whole Numbers

Use Subtraction Notation

In the following exercises, translate the following from math notation to words.

503. $14 - 5$
504. $40 - 15$
505. $351 - 249$
506. $5{,}724 - 2{,}918$

Model Subtraction of Whole Numbers

In the following exercises, model the subtraction.

507. $18 - 4$
508. $41 - 29$

Subtract Whole Numbers

In the following exercises, subtract and then check by adding.

509. $8 - 5$
510. $12 - 7$
511. $23 - 9$
512. . $46 - 21$
513. $82 - 59$
514. $110 - 87$
515. $539 - 217$
516. $415 - 296$
517. $1{,}020 - 640$
518. $8{,}355 - 3{,}947$
519. $10{,}000 - 15$
520. $54{,}925 - 35{,}647$

Translate Word Phrases to Math Notation

In the following exercises, translate and simplify.

521. the difference of nineteen and thirteen
522. subtract sixty-five from one hundred
523. seventy-four decreased by eight
524. twenty-three less than forty-one

Subtract Whole Numbers in Applications

In the following exercises, solve.

525. **Temperature** The high temperature in Peoria one day was 86 degrees Fahrenheit and the low temperature was 28 degrees Fahrenheit. What was the difference between the high and low temperatures?
526. **Savings** Lynn wants to go on a cruise that costs $2,485. She has $948 in her vacation savings account. How much more does she need to save in order to pay for the cruise?

1.4 - Multiply Whole Numbers

Use Multiplication Notation

In the following exercises, translate from math notation to words.

527. 8 × 5
528. 6 • 14
529. (10)(95)
530. 54(72)

Model Multiplication of Whole Numbers

In the following exercises, model the multiplication.

531. 2 × 4
532. 3 × 8

Multiply Whole Numbers

In the following exercises, fill in the missing values in each chart.

533.

×	0	1	2	3	4	5	6	7	8	9
0	0	0	0	0	0		0		0	0
1	0	1	2		4	5	6	7		9
2	0		4		8	10		14	16	
3		3		9			18		24	
4	0	4		12			24			36
5	0	5	10		20		30	35	40	45
6			12	18			36	42		54
7	0	7		21		35			56	63
8	0	8	16		32		48		64	
9			18	27	36			63	72	

534.

×	3	4	5	6	7	8	9
6							
7							
8							
9							

In the following exercises, multiply.

535. 0 • 14
536. (256)0
537. 1 • 99
538. (4,789)1
539. (a) 7 • 4 (b) 4 • 7
540. (25)(6)
541. 9,261 × 3
542. 48 • 76
543. 64 • 10
544. 1,000(22)
545. 162 × 493
546. (601)(943)

547. 3,624 × 517
548. 10,538 • 22

Translate Word Phrases to Math Notation

In the following exercises, translate and simplify.

549. the product of 15 and 28
550. ninety-four times thirty-three
551. twice 575
552. ten times two hundred sixty-four

Multiply Whole Numbers in Applications

In the following exercises, solve.

553. **Gardening** Geniece bought 8 packs of marigolds to plant in her yard. Each pack has 6 flowers. How many marigolds did Geniece buy?
554. **Cooking** Ratika is making rice for a dinner party. The number of cups of water is twice the number of cups of rice. If Ratika plans to use 4 cups of rice, how many cups of water does she need?
555. **Multiplex** There are twelve theaters at the multiplex and each theater has 150 seats. What is the total number of seats at the multiplex?
556. **Roofing** Lewis needs to put new shingles on his roof. The roof is a rectangle, 30 feet by 24 feet. What is the area of the roof?

1.5 - Divide Whole Numbers

Use Division Notation

Translate from math notation to words.

557. $54 \div 9$
558. $42 / 7$
559. $\frac{72}{8}$
560. $6\overline{)48}$

Model Division of Whole Numbers

In the following exercises, model.

561. $8 \div 2$
562. $3\overline{)12}$

Divide Whole Numbers

In the following exercises, divide. Then check by multiplying.

563. $14 \div 2$
564. $\frac{32}{8}$
565. $52 \div 4$
566. $26\overline{)26}$
567. $\frac{97}{1}$
568. $0 \div 52$
569. $100 \div 0$
570. $\frac{355}{5}$
571. $3828 \div 6$
572. $31\overline{)1,519}$
573. $\frac{7505}{25}$

574. 5,166 ÷ 42

Translate Word Phrases to Math Notation

In the following exercises, translate and simplify.

575. the quotient of 64 and 16
576. the quotient of 572 and 52

Divide Whole Numbers in Applications

In the following exercises, solve.

577. **Ribbon** One spool of ribbon is 27 feet. Lizbeth uses 3 feet of ribbon for each gift basket that she wraps. How many gift baskets can Lizbeth wrap from one spool of ribbon?
578. **Juice** One carton of fruit juice is 128 ounces. How many 4 ounce cups can Shayla fill from one carton of juice?

PRACTICE TEST

579. Determine which of the following numbers are (a) counting numbers (b) whole numbers.

$$0, 4, 87 \qquad (1.E.1)$$

580. Find the place value of the given digits in the number 549,362.

(a) 9 (b) 6 (c) 2 (d) 5

581. Write each number as a whole number using digits.

(a) six hundred thirteen (b) fifty-five thousand two hundred eight

582. Round 25,849 to the nearest hundred.

Simplify.

583. 45 + 23
584. 65 − 42
585. 85 ÷ 5
586. 1,000 × 8
587. 90 − 58
588. 73 + 89
589. (0)(12,675)
590. 634 + 255
591. $\frac{0}{9}$
592. $8\overline{)128}$
593. 145 − 79
594. 299 + 836
595. 7 • 475
596. 8,528 + 704
597. 35(14)
598. $\frac{26}{0}$
599. 733 − 291
600. 4,916 − 1,538
601. 495 ÷ 45
602. 52 × 983

Translate each phrase to math notation and then simplify.

603. The sum of 16 and 58
604. The product of 9 and 15
605. The difference of 32 and 18

606. The quotient of 63 and 21
607. Twice 524
608. 29 more than 32
609. 50 less than 300

In the following exercises, solve.

610. LaVelle buys a jumbo bag of 84 candies to make favor bags for her son's party. If she wants to make 12 bags, how many candies should she put in each bag?
611. Last month, Stan's take-home pay was $3,816 and his expenses were $3,472. How much of his take-home pay did Stan have left after he paid his expenses?
612. Each class at Greenville School has 22 children enrolled. The school has 24 classes. How many children are enrolled at Greenville School?
613. Clayton walked 12 blocks to his mother's house, 6 blocks to the gym, and 9 blocks to the grocery store before walking the last 3 blocks home. What was the total number of blocks that Clayton walked?

Contributors and Attributions

1.S: Introduction to the Language of Algebra (Summary)

Key Terms

coefficient	The constant that multiplies the variable(s) in a term.
composite number	A composite number is a counting number that is not prime.
divisibility	If a number m is a multiple of n, then we say that m is divisible by n.
equation	An equation is made up of two expressions connected by an equal sign.
evaluate	To evaluate an algebraic expression means to find the value of the expression when the variable is replaced by a given number.
expression	An expression is a number, a variable, or a combination of numbers and variables and operation symbols.
least common multiple (LCM)	The smallest number that is a multiple of two numbers.
like terms	Terms that are either constants or have the same variables with the same exponents.
multiple of a number	A number is a multiple of n if it is the product of a counting number and n.
prime factorization	The product of prime numbers that equals the number.
prime number	A counting number greater than 1 whose only factors are 1 and itself.
solution of an equation	A value of a variable that makes a true statement when substituted into the equation. The process of finding the solution to an equation is called solving the equation.
term	A constant or the product of a constant and one or more variables.

Key Concepts

2.1 - Use the Language of Algebra

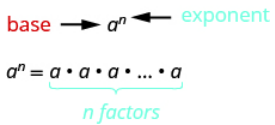
Operation	Notation	Say:	The result is…
Addition	a + b	a plus b	The sum of a and b
Multiplication	a • b, (a)(b), (a)b, a(b)	a times b	The product of a and b
Subtraction	a - b	a minus b	The difference of a and b
Division	a ÷ b, a / b, $\frac{a}{b}$, $b\overline{)a}$	a divided by b	The quotient of a and b

- **Equality Symbol**
  - a = b is read as a is equal to b
  - The symbol = is called the equal sign.
- **Inequality**
  - a < b is read a is less than b
  - a is to the left of b on the number line: 
  - a > b is read a is greater than b

- a is to the right of b on the number line: 
Table 2.77

Algebraic Notation	Say
a = b	a is equal to b
a ≠ b	a is not equal to b
a < b	a is less than b
a > b	a is greater than b
a ≤ b	a is less than or equal to b
a ≥ b	a is greater than or equal to b

- **Exponential Notation**
  - For any expression a n is a factor multiplied by itself n times, if n is a positive integer.
  - a^n means multiply n factors of a
  - The expression of a^n is read a to the n^{th} power



- **Order of Operations**: When simplifying mathematical expressions perform the operations in the following order:

1. Parentheses and other Grouping Symbols: Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. Exponents: Simplify all expressions with exponents.
3. Multiplication and Division: Perform all multiplication and division in order from left to right. These operations have equal priority.
4. Addition and Subtraction: Perform all addition and subtraction in order from left to right. These operations have equal priority.

2.2 - Evaluate, Simplify, and Translate Expressions

- **Combine like terms**.

1. Identify like terms.
2. Rearrange the expression so like terms are together.
3. Add the coefficients of the like terms

2.3 - Solving Equations Using the Subtraction and Addition Properties of Equality

- **Determine whether a number is a solution to an equation.**

1. Substitute the number for the variable in the equation.
2. Simplify the expressions on both sides of the equation.
3. Determine whether the resulting equation is true. If it is true, the number is a solution. If it is not true, the number is not a solution.

- **Subtraction Property of Equality**
  - For any numbers a, b, and c, if a = b, then a - c = b - c.
- Solve an equation using the Subtraction Property of Equality.

1. Use the Subtraction Property of Equality to isolate the variable.
2. Simplify the expressions on both sides of the equation.
3. Check the solution.

- **Addition Property of Equality**

- For any numbers a, b, and c, if a = b, then a + c = b + c.

- Solve an equation using the Addition Property of Equality.

1. Use the Addition Property of Equality to isolate the variable.
2. Simplify the expressions on both sides of the equation.
3. Check the solution.

2.4 - Find Multiples and Factors

Divisibility Tests	
A number is divisible by	
2	if the last digit is 0, 2, 4, 6, or 8
3	if the sum of the digits is divisible by 3
5	if the last digit is 5 or 0
6	if divisible by both 2 and 3
10	if the last digit is 0

- **Factors:** If a • b = m, then a and b are factors of m, and m is the product of a and b.
- **Find all the factors of a counting number.**

1. Divide the number by each of the counting numbers, in order, until the quotient is smaller than the divisor.
   a. If the quotient is a counting number, the divisor and quotient are a pair of factors.
   b. If the quotient is not a counting number, the divisor is not a factor.
2. List all the factor pairs.
3. Write all the factors in order from smallest to largest.

- **Determine if a number is prime**.

1. Test each of the primes, in order, to see if it is a factor of the number.
2. Start with 2 and stop when the quotient is smaller than the divisor or when a prime factor is found.
3. If the number has a prime factor, then it is a composite number. If it has no prime factors, then the number is prime.

2.5 - Prime Factorization and the Least Common Multiple

- **Find the prime factorization of a composite number using the tree method**.

1. Find any factor pair of the given number, and use these numbers to create two branches.
2. If a factor is prime, that branch is complete. Circle the prime.
3. If a factor is not prime, write it as the product of a factor pair and continue the process.
4. Write the composite number as the product of all the circled primes.

- **Find the prime factorization of a composite number using the ladder method**.

1. Divide the number by the smallest prime.
2. Continue dividing by that prime until it no longer divides evenly.
3. Divide by the next prime until it no longer divides evenly.
4. Continue until the quotient is a prime.
5. Write the composite number as the product of all the primes on the sides and top of the ladder.

- **Find the LCM by listing multiples**

1. List the first several multiples of each number.
2. Look for multiples common to both lists. If there are no common multiples in the lists, write out additional multiples for each number.
3. Look for the smallest number that is common to both lists.
4. This number is the LCM.

- **Find the LCM using the prime factors method**.

1. Find the prime factorization of each number.
2. Write each number as a product of primes, matching primes vertically when possible.
3. Bring down the primes in each column.
4. Multiply the factors to get the LCM.

1.S: Whole Numbers (Summary)

Key Terms

coordinate	A number paired with a point on a number line.
counting numbers	The counting numbers are the numbers 1, 2, 3, ….
difference	The result of subtracting two or more numbers.
dividend	The number being divided when dividing two numbers.
divisor	The number dividing the dividend when dividing two numbers.
number line	A number line is used to visualize numbers. The numbers on the number line get larger as they go from left to right, and smaller as they go from right to left.
origin	The point labeled 0 on a number line.
place value system	Our number system is called a place value system because the value of a digit depends on its position, or place, in a number.
product	The result of multiplying two or more numbers.
quotient	The result of dividing two numbers.
rounding	The process of approximating a number.
sum	The result of adding two or more numbers.
whole numbers	The whole numbers are the numbers 0, 1, 2, 3, ….

Key Concepts

1.1 - Introduction to Whole Numbers

Place Value														
Trillions			Billions			Millions			Thousands			Ones		
Hundred trillions	Ten trillions	Trillions	Hundred billions	Ten billions	Billions	Hundred millions	Ten millions	Millions	Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones
								5	2	7	8	1	9	4

- **Name a whole number in words.**
  1. Starting at the digit on the left, name the number in each period, followed by the period name. Do not include the period name for the ones.
  2. Use commas in the number to separate the periods.
- **Use place value to write a whole number.**
  1. Identify the words that indicate periods. (Remember the ones period is never named.)
  2. Draw three blanks to indicate the number of places needed in each period.
  3. Name the number in each period and place the digits in the correct place value position.
- **Round a whole number to a specific place value.**
  1. Locate the given place value. All digits to the left of that place value do not change.

2. Underline the digit to the right of the given place value.
3. Determine if this digit is greater than or equal to 5. If yes—add 1 to the digit in the given place value. If no—do not change the digit in the given place value.
4. Replace all digits to the right of the given place value with zeros.

1.2 - Add Whole Numbers

• **Addition Notation:** To describe addition, we can use symbols and words.

Operation	Notation	Expression	Read as	Result
Addition	+	3 + 4	three plus four	the sum of 3 and 4

- **Identity Property of Addition:** The sum of any number a and 0 is the number.

$$a+0=a$$
$$0+a=a$$

- **Commutative Property of Addition:** Changing the order of the addends a and b does not change their sum.

$$a+b=b+a. \tag{1.S.1}$$

- **Add whole numbers**.

1. Write the numbers so each place value lines up vertically.
2. Add the digits in each place value. Work from right to left starting with the ones place. If a sum in a place value is more than 9, carry to the next place value.
3. Continue adding each place value from right to left, adding each place value and carrying if needed.

1.3 - Subtract Whole Numbers

Operation	Notation	Expression	Read as	Result
Subtraction	-	7 - 3	seven minus three	the difference of 7 and 3

- **Subtract whole numbers**.

1. Write the numbers so each place value lines up vertically.
2. Subtract the digits in each place value. Work from right to left starting with the ones place. If the digit on top is less than the digit below, borrow as needed.
3. Continue subtracting each place value from right to left, borrowing if needed.
4. Check by adding.

1.4 - Multiply Whole Numbers

Operation	Notation	Expression	Read as	Result
Multiplication	×	3 × 8	three times eight	the product of 3 and 8
	•	3 • 8		
	()	3(8)		

- **Multiplication Property of Zero:** The product of any number and 0 is 0.

$$a\cdot 0=0$$
$$0\cdot a=0$$

- **Identity Property of Multiplication:** The product of any number and 1 is the number.

$$1\cdot a=a$$
$$a\cdot 1=a$$

- **Commutative Property of Multiplication:** Changing the order of the factors does not change their product.

$$a \cdot b = b \cdot a. \tag{1.S.2}$$

- **Multiply two whole numbers to find the product**.

1. Write the numbers so each place value lines up vertically.
2. Multiply the digits in each place value.
3. Work from right to left, starting with the ones place in the bottom number.
4. Multiply the bottom number by the ones digit in the top number, then by the tens digit, and so on.
5. If a product in a place value is more than 9, carry to the next place value.
6. Write the partial products, lining up the digits in the place values with the numbers above. Repeat for the tens place in the bottom number, the hundreds place, and so on.
7. Insert a zero as a placeholder with each additional partial product.
8. Add the partial products.

1.5 - Divide Whole Numbers

Operation	Notation	Expression	Read as	Result
Division	$\div$	$12 \div 4$	Twelve divided by four	the quotient of 12 and 4
	$\frac{a}{b}$	$\frac{12}{4}$		
	$b\overline{)a}$	$4\overline{)12}$		
	a / b	12 / 4		

- **Division Properties of One:**
  - Any number (except 0) divided by itself is one.

$$a \div a = 1 \tag{1.S.3}$$

  - Any number divided by one is the same number.

$$a \div 1 = a \tag{1.S.4}$$

- **Division Properties of Zero:**
  - Zero divided by any number is 0.

$$0 \div a = 0 \tag{1.S.5}$$

  - Dividing a number by zero is undefined.

$$a \div 0 = undefined \tag{1.S.6}$$

- **Divide whole numbers**.

1. Divide the first digit of the dividend by the divisor. If the divisor is larger than the first digit of the dividend, divide the first two digits of the dividend by the divisor, and so on.
2. Write the quotient above the dividend.
3. Multiply the quotient by the divisor and write the product under the dividend.
4. Subtract that product from the dividend.
5. Bring down the next digit of the dividend.
6. Repeat from Step 1 until there are no more digits in the dividend to bring down.
7. Check by multiplying the quotient times the divisor.

CHAPTER OVERVIEW

2: Integers

At over 29,000 feet, Mount Everest stands as the tallest peak on land. Located along the border of Nepal and China, Mount Everest is also known for its extreme climate. Near the summit, temperatures never rise above freezing. Every year, climbers from around the world brave the extreme conditions in an effort to scale the tremendous height. Only some are successful. Describing the drastic change in elevation the climbers experience and the change in temperatures requires using numbers that extend both above and below zero. In this chapter, we will describe these kinds of numbers and operations using them.

2.1: Introduction to Integers (Part 1)

Learning Objectives

- Locate positive and negative numbers on the number line
- Order positive and negative numbers
- Find opposites
- Simplify expressions with absolute value
- Translate word phrases to expressions with integers

be prepared!

Before you get started, take this readiness quiz.

1. Plot 0, 1, and 3 on a number line. If you missed this problem, review Example 1.1.1.
2. Fill in the appropriate symbol: ($=$, $<$, or $>$): $2___4$ If you missed this problem, review Example 2.1.2.

Locate Positive and Negative Numbers on the Number Line

Do you live in a place that has very cold winters? Have you ever experienced a temperature below zero? If so, you are already familiar with negative numbers. A **negative number** is a number that is less than 0. Very cold temperatures are measured in degrees below zero and can be described by negative numbers. For example, -1° F (read as "negative one degree Fahrenheit") is 1 degree below 0. A minus sign is shown before a number to indicate that it is negative. Figure $2.1.1$ shows -20° F, which is 20 degrees below 0.

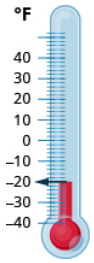

Figure $2.1.1$: Temperatures below zero are described by negative numbers.

Temperatures are not the only negative numbers. A bank overdraft is another example of a negative number. If a person writes a check for more than he has in his account, his balance will be negative.

Elevations can also be represented by negative numbers. The elevation at sea level is 0 feet. Elevations above sea level are positive and elevations below sea level are negative. The elevation of the Dead Sea, which borders Israel and Jordan, is about $1,302$ feet below sea level, so the elevation of the Dead Sea can be represented as $-1,302$ feet. See Figure $2.1.2$.

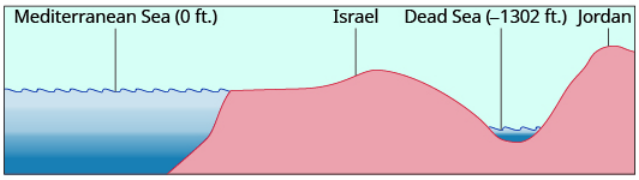

Figure $2.1.2$: The surface of the Mediterranean Sea has an elevation of 0 ft. The diagram shows that nearby mountains have higher (positive) elevations whereas the Dead Sea has a lower (negative) elevation.

Depths below the ocean surface are also described by negative numbers. A submarine, for example, might descend to a depth of 500 feet. Its position would then be -500 feet as labeled in Figure $2.1.3$.

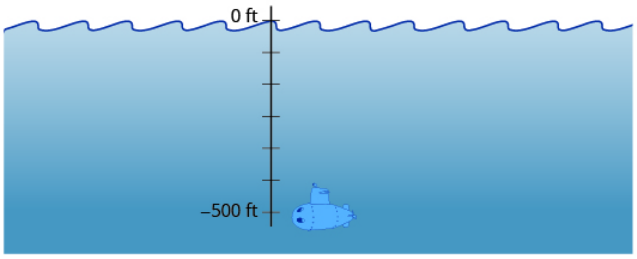

Figure 2.1.3: Depths below sea level are described by negative numbers. A submarine 500 ft below sea level is at −500 ft.

Both positive and negative numbers can be represented on a number line. Recall that the number line created in Add Whole Numbers started at 0 and showed the counting numbers increasing to the right as shown in Figure 2.1.4. The counting numbers ($1, 2, 3, \ldots$) on the number line are all positive. We could write a plus sign, $+$, before a positive number such as $+2$ or $+3$, but it is customary to omit the plus sign and write only the number. If there is no sign, the number is assumed to be positive.

Figure 2.1.4

Now we need to extend the number line to include negative numbers. We mark several units to the left of zero, keeping the intervals the same width as those on the positive side. We label the marks with negative numbers, starting with -1 at the first mark to the left of 0, -2 at the next mark, and so on. See Figure 2.1.5.

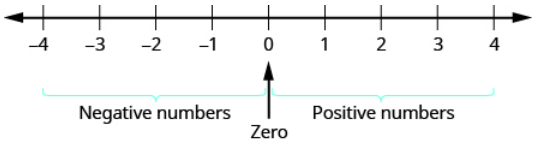

Figure 2.1.5: On a number line, positive numbers are to the right of zero. Negative numbers are to the left of zero. What about zero? Zero is neither positive nor negative.

The arrows at either end of the line indicate that the number line extends forever in each direction. There is no greatest positive number and there is no smallest negative number.

Example 2.1.1: plot on the number line

Plot the numbers on a number line:

a. 3
b. -3
c. -2

Solution

Draw a number line. Mark 0 in the center and label several units to the left and right.

a. To plot 3, start at 0 and count three units to the right. Place a point as shown in Figure 2.1.6.

Figure 2.1.6

b. To plot -3, start at 0 and count three units to the left. Place a point as shown in Figure 2.1.7.

Figure 2.1.7

c. To plot -2, start at 0 and count two units to the left. Place a point as shown in Figure 2.1.8.

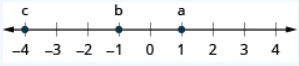
Figure 2.1.8

? Exercise 2.1.1

Plot the numbers on a number line.

$1, -1, -4$

Answer



? Exercise 2.1.2

Plot the numbers on a number line.

$-4, 4, -1$

Answer

Order Positive and Negative Numbers

We can use the number line to compare and order positive and negative numbers. Going from left to right, numbers increase in value. Going from right to left, numbers decrease in value. See Figure 2.1.9.

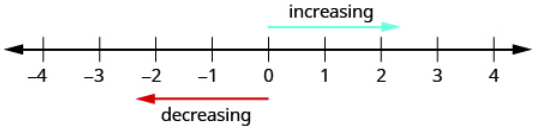


Figure 2.1.9

Just as we did with positive numbers, we can use inequality symbols to show the ordering of positive and negative numbers. Remember that we use the notation $a < b$ (read a is less than b) when a is to the left of b on the number line. We write $a > b$ (read a is greater than b) when a is to the right of b on the number line. This is shown for the numbers 3 and 5 in Figure 2.1.10.

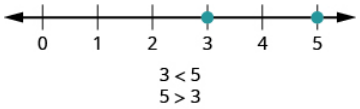

Figure 2.1.10: The number 3 is to the left of 5 on the number line. So 3 is less than 5, and 5 is greater than 3.

The numbers lines to follow show a few more examples.

a.

4 is to the right of 1 on the number line, so $4 > 1$. 1 is to the left of 4 on the number line, so $1 < 4$.

b.

-2 is to the left of 1 on the number line, so $-2 < 1$. 1 is to the right of -2 on the number line, so $1 > -2$.

c.

-1 is to the right of -3 on the number line, so $-1 > -3$. -3 is to the left of -1 on the number line, so $-3 < -1$.

Example 2.1.2: order the pairs

Order each of the following pairs of numbers using $<$ or $>$:

a. $14 ___ 6$
b. $-1 ___ 9$
c. $-1 ___ -4$
d. $2 ___ -20$

Solution

Begin by plotting the numbers on a number line as shown in Figure 2.1.11.

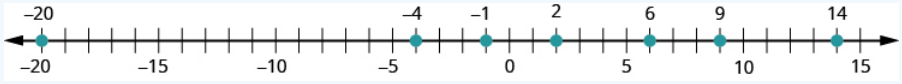

Figure 2.1.11

a.

Compare 14 and 6.	$14 ___ 6$
14 is to the right of 6 on the number line.	$14 > 6$

b.

Compare -1 and 9.	$-1 ___ 9$
-1 is to the left of 9 on the number line.	$-1 < 9$

c.

Compare -1 and -4.	$-1 ___ -4$
-1 is to the right of -4 on the number line.	$-1 > -4$

d.

Compare 2 and -20.	$2 ___ -20$
2 is to the right of -20 on the number line.	$2 > -20$

Exercise 2.1.3

Order each of the following pairs of numbers using $<$ or $>$.

a. $15 ___ 7$
b. $-2 ___ 5$
c. $-3 ___ -7$
d. $5 ___ -17$

Answer a

$>$

Answer b

$<$

Answer c

$>$

Answer d

$>$

Exercise 2.1.4

Order each of the following pairs of numbers using $<$ or $>$.

a. $8 ___ 13$
b. $3 ___ -4$
c. $-5 ___ -2$
d. $9 ___ -21$

Answer a

$<$

Answer b

$>$

Answer c

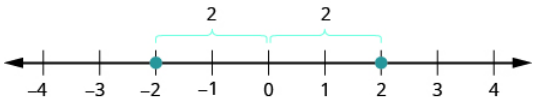
$<$

Answer d

$>$

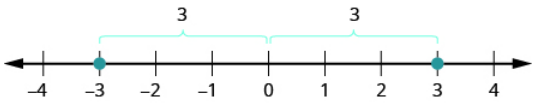
Find Opposites

On the number line, the negative numbers are a mirror image of the positive numbers with zero in the middle. Because the numbers 2 and -2 are the same distance from zero, they are called **opposites**. The opposite of 2 is -2, and the opposite of -2 is 2 as shown in Figure $2.1.12a$. Similarly, 3 and -3 are opposites as shown in Figure $2.1.12b$



The numbers –2 and 2 are opposites.

(a)



The numbers –3 and 3 are opposites.

(b)

Figure 2.1.12

Definition: opposite

The opposite of a number is the number that is the same distance from zero on the number line, but on the opposite side of zero.

Example 2.1.3:

Find the opposite of each number:

a. 7

b. -10

Solution

a. The number -7 is the same distance from 0 as 7, but on the opposite side of 0. So -7 is the opposite of 7 as shown in Figure 2.1.13.

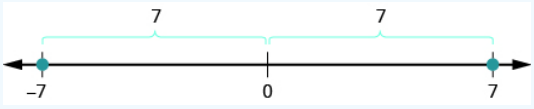


Figure 2.1.13

b. The number 10 is the same distance from 0 as -10, but on the opposite side of 0. So 10 is the opposite of -10 as shown in Figure 2.1.14.

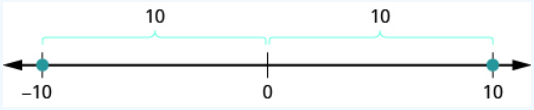

Figure 2.1.14

? Exercise 2.1.5

Find the opposite of each number:

a. 4
b. -3

Answer a

-4

Answer b

3

? Exercise 2.1.6

Find the opposite of each number:

a. 8
b. -5

Answer a

-8

Answer b

5

Opposite Notation

Just as the same word in English can have different meanings, the same symbol in algebra can have different meanings.

The specific meaning becomes clear by looking at how it is used. You have seen the symbol "$-$", in three different ways.

10 - 4	Between two numbers, the symbol indicates the operation of subtraction. We read $10 - 4$ as 10 minus 4.
-8	In front of a number, the symbol indicates a negative number. We read -8 as negative eight.

-x	In front of a variable or a number, it indicates the opposite. We read −x as the opposite of x .
− (−2)	Here we have two signs. The sign in the parentheses indicates that the number is negative 2. The sign outside the parentheses indicates the opposite. We read − (−2) as the opposite of −2.

Definition: Opposite Notation

$-a$ means the opposite of the number a.

The notation $-a$ is read the opposite of a.

Example 2.1.4: simplify

Simplify: $-(-6)$.

Solution

	$-(-6)$
The opposite of −6 is 6.	6

Exercise 2.1.7

Simplify: $-(-1)$

Answer

1

Exercise 2.1.8

Simplify: $-(-5)$

Answer

5

Integers

The set of counting numbers, their opposites, and 0 is the set of integers.

Definition: integers

Integers are counting numbers, their opposites, and zero.

$$\ldots -3, -2, -1, 0, 1, 2, 3 \ldots$$

We must be very careful with the signs when evaluating the opposite of a variable.

Example 2.1.5: evaluate

Evaluate $-x$:

a. when $x = 8$
b. when $x = -8$

Solution

a.

To evaluate −x when x = 8, substitute 8 for x.	$-x$
Substitute 8 for x.	$-(8)$
Simplify.	-8

b.

To evaluate −x when x = −8, substitute 8 for x.	$-x$
Substitute -8 for x.	$-(-8)$
Simplify.	-8

Exercise 2.1.9

Evaluate $-n$:

a. when $n = 4$
b. when $n = -4$

Answer a

-4

Answer b

4

Exercise 2.1.10

Evaluate $-m$:

a. when $m = 11$
b. when $m = -11$

Answer a

-11

Answer b

11

Simplify Expressions with Absolute Value

We saw that numbers such as 5 and -5 are opposites because they are the same distance from 0 on the number line. They are both five units from 0. The distance between 0 and any number on the number line is called the absolute value of that number. Because distance is never negative, the absolute value of any number is never negative. The symbol for absolute value is two vertical lines on either side of a number. So the absolute value of 5 is written as $|5|$, and the absolute value of -5 is written as $|-5|$ as shown in Figure 2.1.15.

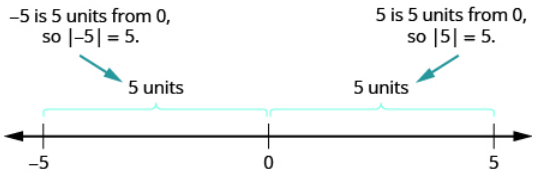

Figure 2.1.15

Definition: Absolute Value

The absolute value of a number is its distance from 0 on the number line.

The absolute value of a number n is written as $|n|$.

$$|n| \geq 0 \ for\ all\ numbers$$

Example 3.6:

Simplify:

a. $|3|$
b. $|-44|$
c. $|0|$

Solution

a.

		3
3 is 3 units from zero.	3

b.

	|-44
-44 is 44 units from zero.	44

c.

		0
0 is already at zero.	0

Exercise 2.1.11

Simplify:

a. $|12|$
b. $-|-28|$

Answer a

12

Answer b

-28

Exercise 3.12:

Simplify:

a. $|9|$
b. $-|37|$

Answer a

9

Answer b

-37

Contributors and Attributions

This page titled 2.1: Introduction to Integers (Part 1) is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

2.2: Introduction to Integers (Part 2)

We treat absolute value bars just like we treat parentheses in the order of operations. We simplify the expression inside first.

Example 2.2.7: evaluate

Evaluate:

a. $|x|$ when $x = -35$
b. $|-y|$ when $y = -20$
c. $-|u|$ when $u = 12$
d. $-|p|$ when $p = -14$

Solution

a.

To find |x| when x = −35:	$\|x\|$
Substitute -35 for x.	$\|-35\|$
Take the absolute value.	35

b.

To find |− y| when y = −20:	$\|-y\|$
Substitute -20 for y.	$\|-(-20)\|$
Simplify.	$\|20\|$
Take the absolute value.	20

c.

To find -|u| when u = 12:	$-\|u\|$
Substitute 12 for u.	$-\|12\|$
Take the absolute value.	-12

d.

To find −|p| when p = −14:	$-\|p\|$
Substitute -14 for p.	$-\|-14\|$
Take the absolute value.	-14

Notice that the result is negative only when there is a negative sign outside the absolute value symbol

Exercise 2.2.13

Evaluate:

a. $|x|$ when $x = -17$
b. $|-y|$ when $y = -39$
c. $-|m|$ when $m = 22$
d. $-|p|$ when $p = -11$

Answer a

17

Answer b

39

Answer c

-22

Answer d

11

Exercise 2.2.14

Evaluate:

a. $|y|$ when $y = -23$
b. $|-y|$ when $y = -21$
c. $-|n|$ when $n = 37$
d. $-|q|$ when $q = -49$

Answer a

23

Answer b

21

Answer c

-37

Answer d

-49

Example 2.2.8: compare expressions

Fill in $<$, $>$ or $=$ for each of the following:

a. $|-5|___-|-5|$
b. $8___-|-8|$
c. $-9___-|-9|$
d. $-|-7|___-7$

Solution

To compare two expressions, simplify each one first. Then compare.

a.

	|−5|___− |−5|
Simplify.	5___−5
Order.	5 > −5

b.

	8___− |−8|
Simplify.	8___−8

Order.	$8 > -8$

c.

	$-9 ___ -\lvert -9 \rvert$
Simplify.	$-9 ___ -9$
Order.	$-9 = -9$

d.

	$-\lvert -7 \rvert ___ -7$
Simplify.	$-7 ___ -7$
Order.	$-7 = -7$

Exercise 2.2.15

Fill in $<$, $>$, or $=$ for each of the following:

a. $|-9| ___ -|-9|$
b. $2 ___ -|-2|$
c. $-8 ___ |-8|$
d. $-|-5| ___ -5$

Answer a

$>$

Answer b

$>$

Answer c

$<$

Answer d

$=$

Exercise 2.2.16

Fill in $<$, $>$, or $=$ for each of the following:

a. $7 ___ -|-7|$
b. $-|-11| ___ -11$
c. $|-4| ___ -|-4|$
d. $-1 ___ |-1|$

Answer a

$>$

Answer b

$=$

Answer c

$>$

Answer d

$<$

Absolute value bars act like grouping symbols. First simplify inside the absolute value bars as much as possible. Then take the absolute value of the resulting number, and continue with any operations outside the absolute value symbols.

Example 2.2.9: simplify

Simplify:

a. $|9-3|$
b. $4|-2|$

Solution

For each expression, follow the order of operations. Begin inside the absolute value symbols just as with parentheses.

a.

Simplify inside the absolute value sign.	$\|9-3\| = \|6\|$
Take the absolute value.	6

b.

Take the absolute value.	$4\|-2\| = 4 \cdot 2$
Multiply.	8

Exercise 2.2.17

Simplify:

a. $|12-9|$
b. $3|-6|$

Answer a

3

Answer b

18

Exercise 2.2.18

Simplify:

a. $|27-16|$
b. $9|-7|$

Answer a

11

Answer b

63

Example 2.2.10: simplify

Simplify: $|8+7|-|5+6|$.

Solution

For each expression, follow the order of operations. Begin inside the absolute value symbols just as with parentheses.

Simplify inside each absolute value sign.	|8+7|−|5+6| = |15|−|11|
Subtract.	4

Exercise 2.2.19

Simplify: $|1+8|-|2+5|$

Answer

2

Exercise 2.2.20

Simplify: $|9-5|-|7-6|$

Answer

3

Example 2.2.11: simplify

Simplify: $24-|19-3(6-2)|$.

Solution

We use the order of operations. Remember to simplify grouping symbols first, so parentheses inside absolute value symbols would be first.

Simplify in the parentheses first.	24 − |19 − 3(6 − 2)| = 24 − |19 − 3(4)|
Multiply 3(4).	24 − |19 − 12|
Subtract inside the absolute value sign.	24 − |7|
Take the absolute value.	24 - 7
Subtract.	17

Exercise 2.2.21

Simplify: $19-|11-4(3-1)|$

Answer

16

Exercise 2.2.22

Simplify: $9-|8-4(7-5)|$

Answer

9

Translate Word Phrases into Expressions with Integers

Now we can translate word phrases into expressions with integers. Look for words that indicate a negative sign. For example, the word *negative* in "negative twenty" indicates -20. So does the word *opposite* in "the opposite of 20."

Example 2.2.12: translate

Translate each phrase into an expression with integers:

a. the opposite of positive fourteen
b. the opposite of -11
c. negative sixteen
d. two minus negative seven

Solution

a. the opposite of fourteen -14
b. the opposite of $-11-(-11)$
c. negative sixteen -16
d. two minus negative seven $2-(-7)$

Exercise 2.2.23

Translate each phrase into an expression with integers:

a. the opposite of positive nine
b. the opposite of -15
c. negative twenty
d. eleven minus negative four

Answer a

-9

Answer b

15

Answer c

-20

Answer d

$11-(-4)$

Exercise 2.2.24

Translate each phrase into an expression with integers:

a. the opposite of negative nineteen
b. the opposite of twenty-two
c. negative nine
d. negative eight minus negative five

Answer a

19

Answer b

-22

Answer c

-9

Answer d

$-8-(-5)$

As we saw at the start of this section, negative numbers are needed to describe many real-world situations. We'll look at some more applications of negative numbers in the next example.

Translate into an expression with integers:

a. The temperature is 12 degrees Fahrenheit below zero.
b. The football team had a gain of 3 yards.
c. The elevation of the Dead Sea is $1,302$ feet below sea level.
d. A checking account is overdrawn by $\$40$.

Solution

Look for key phrases in each sentence. Then look for words that indicate negative signs. Don't forget to include units of measurement described in the sentence.

a.

	The temperature is 12 degrees Fahrenheit below zero.
Below zero tells us that 12 is a negative number.	−12 ºF

b.

	The football team had a gain of 3 yards.
A *gain* tells us that 3 is a positive number.	3 yards

c.

	The elevation of the Dead Sea is 1,302 feet below sea level.
Below sea level tells us that 1,302 is a negative number.	−1,302 feet

d.

	A checking account is overdrawn by $40.
Overdrawn tells us that 40 is a negative number.	−$40

? Exercise 2.2.25

Translate into an expression with integers: The football team had a gain of 5 yards.

Answer

5 yards

Exercise 2.2.26

Translate into an expression with integers: The scuba diver was 30 feet below the surface of the water.

Answer

-30 feet

Access Additional Online Resources

- Introduction to Integers
- Simplifying the Opposites of Negative Integers
- Comparing Absolute Value of Integers
- Comparing Integers Using Inequalities

Key Concepts

- Opposite Notation
  - $-a$ means the opposite of the number a
  - The notation $-a$ is read the opposite of a.
- Absolute Value Notation
  - The absolute value of a number n is written as $|n|$.
  - $|n| \geq 0$ for all numbers.

Glossary

absolute value

The absolute value of a number is its distance from 0 on the number line.

integers

Integers are counting numbers, their opposites, and zero ... $-3, -2, -1, 0, 1, 2, 3 \ldots$

negative number

A negative number is less than zero.

opposites

The opposite of a number is the number that is the same distance from zero on the number line, but on the opposite side of zero.

Practice Makes Perfect

Locate Positive and Negative Numbers on the Number Line

In the following exercises, locate and label the given points on a number line.

1. (a) 2 (b) −2 (c) −5
2. (a) 5 (b) −5 (c) −2
3. (a) −8 (b) 8 (c) −6
4. (a) −7 (b) 7 (c) −1

Order Positive and Negative Numbers on the Number Line

In the following exercises, order each of the following pairs of numbers, using < or >.

5. (a) 9__4 (b) −3__6 (c) −8__−2 (d) 1__−10
6. (a) 6__2; (b) −7__4; (c) −9__−1; (d) 9__−3
7. (a) −5__1; (b) −4__−9; (c) 6__10; (d) 3__−8
8. (a) −7__3; (b) −10__−5; (c) 2__−6; (d) 8__9

Find Opposites

In the following exercises, find the opposite of each number.

9. (a) 2 (b) −6
10. (a) 9 (b) −4
11. (a) −8 (b) 1
12. (a) −2 (b) 6

In the following exercises, simplify.

13. −(−4)
14. −(−8)
15. −(−15)
16. −(−11)

In the following exercises, evaluate.

17. −m when (a) m = 3 (b) m = −3
18. −p when (a) p = 6 (b) p = −6
19. −c when (a) c = 12 (b) c = −12
20. −d when (a) d = 21 (b) d = −21

Simplify Expressions with Absolute Value

In the following exercises, simplify each absolute value expression.

21. (a) |7| (b) |−25| (c) |0|
22. (a) |5| (b) |20| (c) |−19|
23. (a) |−32| (b) |−18| (c) |16|
24. (a) |−41| (b) |−40| (c) |22|

In the following exercises, evaluate each absolute value expression.

25. (a) |x| when x = −28 (b) | − u| when u = −15
26. (a) |y| when y = −37 (b) | − z| when z = −24
27. (a) − |p| when p = 19 (b) − |q| when q = −33
28. (a) − |a| when a = 60 (b) − |b| when b = −12

In the following exercises, fill in , or = to compare each expression.

29. (a) −6__|−6| (b) − |−3|__−3
30. (a) −8__|−8| (b) − |−2|__−2
31. (a) |−3|__− |−3| (b) 4__− |−4|
32. (a) |−5|__− |−5| (b) 9__− |−9|

In the following exercises, simplify each expression.

33. |8 − 4|
34. |9 − 6|
35. 8|−7|
36. 5|−5|
37. |15 − 7| − |14 − 6|
38. |17 − 8| − |13 − 4|
39. 18 − |2(8 − 3)|
40. 15 − |3(8 − 5)|
41. 8(14 − 2|−2|)
42. 6(13 − 4|−2|)

Translate Word Phrases into Expressions with Integers

Translate each phrase into an expression with integers. Do not simplify.

43. (a) the opposite of 8 (b) the opposite of −6 (c) negative three (d) 4 minus negative 3
44. (a) the opposite of 11 (b) the opposite of −4 (c) negative nine (d) 8 minus negative 2
45. (a) the opposite of 20 (b) the opposite of −5 (c) negative twelve (d) 18 minus negative 7
46. (a) the opposite of 15 (b) the opposite of −9 (c) negative sixty (d) 12 minus 5
47. a temperature of 6 degrees below zero
48. a temperature of 14 degrees below zero
49. an elevation of 40 feet below sea level
50. an elevation of 65 feet below sea level
51. a football play loss of 12 yards
52. a football play gain of 4 yards
53. a stock gain of $3
54. a stock loss of $5
55. a golf score one above par
56. a golf score of 3 below par

Everyday Math

57. **Elevation** The highest elevation in the United States is Mount McKinley, Alaska, at 20,320 feet above sea level. The lowest elevation is Death Valley, California, at 282 feet below sea level. Use integers to write the elevation of: (a) Mount McKinley (b) Death Valley
58. **Extreme temperatures** The highest recorded temperature on Earth is 58° Celsius, recorded in the Sahara Desert in 1922. The lowest recorded temperature is 90° below 0° Celsius, recorded in Antarctica in 1983. Use integers to write the: (a) highest recorded temperature (b) lowest recorded temperature
59. **State budgets** In June, 2011, the state of Pennsylvania estimated it would have a budget surplus of $540 million. That same month, Texas estimated it would have a budget deficit of $27 billion. Use integers to write the budget: (a) surplus (b) deficit
60. **College enrollments** Across the United States, community college enrollment grew by 1,400,000 students from 2007 to 2010. In California, community college enrollment declined by 110,171 students from 2009 to 2010. Use integers to write the change in enrollment: (a) growth (b) decline

Writing Exercises

61. Give an example of a negative number from your life experience.
62. What are the three uses of the "−" sign in algebra? Explain how they differ.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
locate positive and negative numbers on the number line.			
order positive and negative numbers.			
find opposites.			
simplify expressions with absolute value.			
translate word phrases to expressions with integers.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don’t get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

2.3: Add Integers (Part 1)

Learning Objectives

- Model addition of integers
- Simplify expressions with integers
- Evaluate variable expressions with integers
- Translate word phrases to algebraic expressions
- Add integers in applications

be prepared!

Before you get started, take this readiness quiz.

1. Evaluate $x+8$ when $x=6$. If you missed this problem, review Example 2.2.1.
2. Simplify: $8+2(5+1)$. If you missed this problem, review Example 2.1.8.
3. Translate the sum of 3 and negative 7 into an algebraic expression. If you missed this problem, review Table 2.2.3.

Model Addition of Integers

Now that we have located positive and negative numbers on the number line, it is time to discuss arithmetic operations with integers.

Most students are comfortable with the addition and subtraction facts for positive numbers. But doing addition or subtraction with both positive and negative numbers may be more difficult. This difficulty relates to the way the brain learns.

The brain learns best by working with objects in the real world and then generalizing to abstract concepts. Toddlers learn quickly that if they have two cookies and their older brother steals one, they have only one left. This is a concrete example of $2-1$. Children learn their basic addition and subtraction facts from experiences in their everyday lives. Eventually, they know the number facts without relying on cookies.

Addition and subtraction of negative numbers have fewer real world examples that are meaningful to us. Math teachers have several different approaches, such as number lines, banking, temperatures, and so on, to make these concepts real.

We will model addition and subtraction of negatives with two color counters. We let a blue counter represent a positive and a red counter will represent a negative.

If we have one positive and one negative counter, the value of the pair is zero. They form a neutral pair. The value of this neutral pair is zero as summarized in Figure 2.3.1.

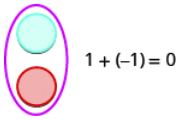

Figure 2.3.1: A blue counter represents +1. A red counter represents −1. Together they add to zero.

We will model four addition facts using the numbers 5, -5 and 3, -3.

$$5+3 \qquad -5+(-3) \qquad -5+3 \qquad 5+(-3)$$

Example 2.3.1: model the expression

Model: $5+3$.

Solution

Interpret the expression.	5 + 3 means the sum of 5 and 3.

Model the first number. Start with 5 positives.	5
Model the second number. Add 3 positives.	5 3
Count the total number of counters.	8 positives
The sum of 5 and 3 is 8.	5 + 3 = 8

Exercise 2.3.1

Model the expression. $2+4$

Answer

6

Exercise 2.3.2

Model the expression. $2+5$

Answer

7

Example 2.3.2: model the expression

Model: $-5+(-3)$.

Solution

Interpret the expression.	−5 + (−3) means the sum of −5 and −3.
Model the first number. Start with 5 negatives.	 −5
Model the second number. Add 3 negatives.	−5 −3
Count the total number of counters.	8 negatives
The sum of −5 and −3 is −8.	−5 + −3 = −8

Exercise 2.3.3

Model the expression. $-2+(-4)$

Answer

-6

Exercise 2.3.4

Model the expression. $-2+(-5)$

Answer

-7

Example 2.3.1 and Example 2.3.2 are very similar. The first example adds 5 positives and 3 positives—both positives. The second example adds 5 negatives and 3 negatives—both negatives. In each case, we got a result of 8 -- either 8 positives or 8 negatives. When the signs are the same, the counters are all the same color. Now let's see what happens when the signs are different.

Example 2.3.3: model the expression

Model: $-5+3$.

Solution

Interpret the expression.	−5 + 3 means the sum of −5 and 3.
Model the first number. Start with 5 negatives.	
Model the second number. Add 3 positives.	Remove any neutral pairs.	Count the result.	2 negatives
The sum of −5 and 3 is −2.	−5 + 3 = −2

Notice that there were more negatives than positives, so the result is negative.

Exercise 2.3.5

Model the expression, and then simplify: $2+(-4)$

Answer

-2

Exercise 2.3.6

Model the expression, and then simplify: $2+(-5)$

Answer

-3

Example 2.3.4: model the expression

Model: $5+(-3)$.

Solution

Interpret the expression.	5 + (−3) means the sum of 5 and −3.
Model the first number. Start with 5 positives.	
Model the second number. Add 3 negatives.	Remove any neutral pairs.	Count the result.	2 positives
The sum of 5 and −3 is 2.	5 + (−3) = 2

Exercise 2.3.7

Model the expression, and then simplify: $(-2)+4$

Answer

2

Exercise 2.3.8

Model the expression: $(-2)+5$

Answer

3

Example 2.3.5: model the addition

Model each addition.

a. $4+2$
b. $-3+6$
c. $4+(-5)$

d. $-2+(-3)$

Solution

a. $4+2$

Start with 4 positives.	
Add two positives.	
How many do you have? 6.	4 + 2 = 6

b. $-3+6$

Start with 3 negatives.	
Add 6 positives.	Remove neutral pairs.	How many are left?	
3.	−3 + 6 = 3

c. $4+(-5)$

Start with 4 positives.	
Add 5 negatives.	Remove neutral pairs.	How many are left?	
−1.	4 + (−5) = −1

d. $-2+(-3)$

Start with 2 negatives.	
Add 3 negatives.	
How many do you have? −5.	−2 + (−3) = −5

Exercise 2.3.9

Model each addition.

a. $3+4$
b. $-1+4$
c. $4+(-6)$
d. $-2+(-2)$

Answer a

Answer b

Answer c

Answer d

Exercise2.3.10

Model each addition.

a. $5+1$
b. $-3+7$
c. $2+(-8)$
d. $-3+(-4)$

Answer a

Answer b

Answer c

Answer d

Simplify Expressions with Integers

Now that you have modeled adding small positive and negative integers, you can visualize the model in your mind to simplify expressions with any integers.

For example, if you want to add $37+(-53)$, you don't have to count out 37 blue counters and 53 red counters.

Picture 37 blue counters with 53 red counters lined up underneath. Since there would be more negative counters than positive counters, the sum would be negative. Because $53-37=16$, there are 16 more negative counters.

$$37+(-53)=-16$$

Let's try another one. We'll add $-74+(-27)$. Imagine 74 red counters and 27 more red counters, so we have 101 red counters all together. This means the sum is -101.

$$-74+(-27)=-101$$

Look again at the results of Example 2.3.1 - Example 2.3.2.

Table 2.3.1: Addition of Positive and Negative Integers

5 + 3	−5 + (−3)
both positive, sum positive	both negative, sum negative
When the signs are the same, the counters would be all the same color, so add them.	
−5 + 3	5 + (−3)
different signs, more negatives	different signs, more positives
sum negative	sum positive
When the signs are different, some counters would make neutral pairs; subtract to see how many are left.	

Example 2.3.6: simplify

Simplify:

a. $19+(-47)$
b. $-32+40$

Solution

a. Since the signs are different, we subtract 19 from 47. The answer will be negative because there are more negatives than positives. $19+(-47)=-28$
b. The signs are different so we subtract 32 from 40. The answer will be positive because there are more positives than negatives $-32+40=8$

Exercise 2.3.11

Simplify each expression:

a. $15+(-32)$
b. $-19+76$

Answer a

-17

Answer b

57

Exercise 2.3.12

Simplify each expression:

a. $-55+9$
b. $43+(-17)$

Answer a

-46

Answer b

26

Example 2.3.7: simplify

Simplify: $-14+(-36)$.

Solution

Since the signs are the same, we add. The answer will be negative because there are only negatives.

$$-14+(-36)=-50$$

Exercise 2.3.13

Simplify the expression: $-31+(-19)$

Answer

-50

Exercise 2.3.14

Simplify the expression: $-42+(-28)$

Answer

-70

The techniques we have used up to now extend to more complicated expressions. Remember to follow the order of operations.

Example 2.3.8: simplify

Simplify: $-5+3(-2+7)$.

Solution

Simplify inside the parentheses.	−5 + 3(5)
Multiply.	−5 + 15
Add left to right.	10

Exercise 2.3.15

Simplify the expression: $-2+5(-4+7)$

Answer

13

Exercise 2.3.16

Simplify the expression: $-4+2(-3+5)$

Answer

0

2.4: Add Integers (Part 2)

Evaluate Variable Expressions with Integers

Remember that to evaluate an expression means to substitute a number for the variable in the expression. Now we can use negative numbers as well as positive numbers when evaluating expressions.

Example 2.4.9: evaluate

Evaluate $x+7$ when

a. $x=-2$
b. $x=-11$

Solution

a. Evaluate $x+7$ when $x=-2$

Substitute -2 for x.	$-2+7$	$(2.4.1)$
Simplify.	5	$(2.4.2)$

b. Evaluate $x+7$ when $x=-11$

Substitute -11 for x.	$-11+7$	$(2.4.3)$
Simplify.	-4	$(2.4.4)$

Exercise 2.4.17

Evaluate each expression for the given values: $x+5$ when

a. $x=-3$
b. $x=-17$

Answer a

2

Answer b

-12

Exercise 2.4.18

Evaluate each expression for the given values: $y+7$ when

a. $y=-5$
b. $y=-8$

Answer a

2

Answer b

-1

Example 2.4.10: evaluate

When $n = -5$, evaluate

a. $n + 1$
b. $-n + 1$

Solution

a.

Evaluate n + 1 when n = −5	$n + 1$	(2.4.5)
Substitute -5 for n.	$-5 + 1$	(2.4.6)
Simplify.	-4	(2.4.7)

b.

Evaluate −n + 1 when n = −5	$-n + 1$	(2.4.8)
Substitute -5 for n.	$-(-5) + 1$	(2.4.9)
Simplify.	$5 + 1$	(2.4.10)
Add.	6	(2.4.11)

Exercise 2.4.19

When $n = -8$, evaluate

a. $n + 2$
b. $-n + 2$

Answer a

-6

Answer b

10

Exercise 2.4.20

When $y = -9$, evaluate

a. $y + 8$
b. $-y + 8$

Answer a

-1

Answer b

17

Next we'll evaluate an expression with two variables.

Example 2.4.11: evaluate

Evaluate $3a+b$ when $a=12$ and $b=-30$.

Solution

Substitute 12 for a and -30 for b.	$3(12)+(-30)$
Multiply.	$36+(-30)$
Add.	6

Exercise 2.4.21

Evaluate the expression: $a+2b$ when $a=-19$ and $b=14$.

Answer

9

Exercise 2.4.22

Evaluate the expression: $5p+q$ when $p=4$ and $q=-7$.

Answer

13

Example 2.4.12: evaluate

Evaluate \((x + y)^2\) when $x=-18$ and $y=24$.

Solution

This expression has two variables.

Substitute -18 for x and 24 for y.	$(-18+24)^2$	(2.4.12)
Add inside the parentheses.	$(6)^2$	(2.4.13)
Simplify.	36	(2.4.14)

Exercise 2.4.23

Evaluate: $(x+y)^2$ when $x=-15$ and $y=29$.

Answer

196

Exercise 2.4.24

Evaluate: $(x+y)^3$ when $x=-8$ and $y=10$.

Answer

8

Translate Word Phrases to Algebraic Expressions

All our earlier work translating word phrases to algebra also applies to expressions that include both positive and negative numbers. Remember that the phrase *the sum* indicates addition.

Example 2.4.13: translate

Translate and simplify: the sum of -9 and 5.

Solution

The sum of −9 and 5 indicates addition.	the sum of −9 and 5
Translate.	−9 + 5
Simplify.	−4

Exercise 2.4.25

Translate and simplify the expression: the sum of -7 and 4

Answer

$-7+4=-3$

Exercise 2.4.26

Translate and simplify the expression: the sum of -8 and -6

Answer

$-8+(-6)=-14$

Example 2.4.14: translate

Translate and simplify: the sum of 8 and -12, increased by 3.

Solution

The phrase *increased by* indicates addition.

Translate.	[8 + (−12)] + 3
Simplify.	−4 + 3
Add.	−1

Exercise 2.4.27

Translate and simplify: the sum of 9 and -16, increased by 4.

Answer

$[9+(-16)]+4=-3$

Exercise 2.4.28

Translate and simplify: the sum of -8 and -12, increased by 7.

Answer

$[-8+(-12)]+7=-13$

Add Integers in Applications

Recall that we were introduced to some situations in everyday life that use positive and negative numbers, such as temperatures, banking, and sports. For example, a debt of $\$5$ could be represented as $-\$5$. Let's practice translating and solving a few applications.

Solving applications is easy if we have a plan. First, we determine what we are looking for. Then we write a phrase that gives the information to find it. We translate the phrase into math notation and then simplify to get the answer. Finally, we write a sentence to answer the question.

Example 2.4.15: evaluate

The temperature in Buffalo, NY, one morning started at 7 degrees below zero Fahrenheit. By noon, it had warmed up 12 degrees. What was the temperature at noon?

Solution

We are asked to find the temperature at noon.

Write a phrase for the temperature.	The temperature warmed up 12 degrees from 7 degrees below zero.
Translate to math notation.	−7 + 12
Simplify.	5
Write a sentence to answer the question.	The temperature at noon was 5 degrees Fahrenheit.

Exercise 2.4.29

The temperature in Chicago at 5 A.M. was 10 degrees below zero Celsius. Six hours later, it had warmed up 14 degrees Celsius. What is the temperature at 11 A.M.?

Answer

4 degrees Celsius

Exercise 2.4.30

A scuba diver was swimming 16 feet below the surface and then dove down another 17 feet. What is her new depth?

Answer

-33 feet

Example 2.4.16: evaluate

A football team took possession of the football on their 42-yard line. In the next three plays, they lost 6 yards, gained 4 yards, and then lost 8 yards. On what yard line was the ball at the end of those three plays?

Solution

We are asked to find the yard line the ball was on at the end of three plays.

Write a word phrase for the position of the ball.	Start at 42, then lose 6, gain 4, lose 8.
Translate to math notation	$42 - 6 + 4 - 8$
Simplify.	32
Write a sentence to answer the question.	At the end of the three plays, the ball is on the 32-yard line.

Exercise 2.4.31

The Bears took possession of the football on their 20-yard line. In the next three plays, they lost 9 yards, gained 7 yards, then lost 4 yards. On what yard line was the ball at the end of those three plays?

Answer

14 yard line

Exercise 2.4.32

The Chargers began with the football on their 25-yard line. They gained 5 yards, lost 8 yards and then gained 15 yards on the next three plays. Where was the ball at the end of these plays?

Answer

37 yard line

Access Additional Online Resources

- Adding Integers with Same Sign Using Color Counters
- Adding Integers with Different Signs Using Counters
- Ex1: Adding Integers
- Ex2: Adding Integers

Key Concepts

Addition of Positive and Negative Integers

$5+3$	$-5+(-3)$
both positive, sum positive	both negative, sum negative
When the signs are the same, the counters would be all the same color, so add them.	
$-5+3$	$5+(-3)$
different signs, more negatives	different signs, more positives
Sum negative	sum positive
When the signs are different, some counters would make neutral pairs; subtract to see how many are left.	

Practice Makes Perfect

Model Addition of Integers

In the following exercises, model the expression to simplify.

63. 7 + 4
64. 8 + 5
65. −6 + (−3)
66. −5 + (−5)
67. −7 + 5
68. −9 + 6
69. 8 + (−7)
70. 9 + (−4)

Simplify Expressions with Integers

In the following exercises, simplify each expression.

71. −21 + (−59)
72. −35 + (−47)
73. 48 + (−16)
74. 34 + (−19)
75. −200 + 65
76. −150 + 45
77. 2 + (−8) + 6
78. 4 + (−9) + 7
79. −14 + (−12) + 4
80. −17 + (−18) + 6
81. 135 + (−110) + 83
82. 140 + (−75) + 67
83. −32 + 24 + (−6) + 10
84. −38 + 27 + (−8) + 12
85. 19 + 2(−3 + 8)
86. 24 + 3(−5 + 9)

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

87. 87. x + 8 when
    a. x = −26
    b. x = −95
88. y + 9 when
    a. y = −29
    b. y = −84
89. y + (−14) when
    a. y = −33
    b. y = 30
90. x + (−21) when
    a. x = −27
    b. x = 44
91. When a = −7, evaluate:
    a. a + 3
    b. −a + 3
92. When b = −11, evaluate:

a. $b + 6$
b. $-b + 6$

93. When $c = -9$, evaluate:
    a. $c + (-4)$
    b. $-c + (-4)$
94. When $d = -8$, evaluate:
    a. $d + (-9)$
    b. $-d + (-9)$
95. $m + n$ when, $m = -15$, $n = 7$
96. $p + q$ when, $p = -9$, $q = 17$
97. $r-3s$ when, $r = 16$, $s = 2$
98. $2t + u$ when, $t = -6$, $u = -5$
99. $(a + b)^2$ when, $a = -7$, $b = 15$
100. $(c + d)^2$ when, $c = -5$, $d = 14$
101. $(x + y)^2$ when, $x = -3$, $y = 14$
102. $(y + z)^2$ when, $y = -3$, $z = 15$

Translate Word Phrases to Algebraic Expressions

In the following exercises, translate each phrase into an algebraic expression and then simplify.

103. The sum of -14 and 5
104. The sum of -22 and 9
105. 8 more than -2
106. 5 more than -1
107. -10 added to -15
108. -6 added to -20
109. 6 more than the sum of -1 and -12
110. 3 more than the sum of -2 and -8
111. the sum of 10 and -19, increased by 4
112. the sum of 12 and -15, increased by 1

Add Integers in Applications

In the following exercises, solve.

113. **Temperature** The temperature in St. Paul, Minnesota was -19 °F at sunrise. By noon the temperature had risen 26 °F. What was the temperature at noon?
114. **Temperature** The temperature in Chicago was -15 °F at 6 am. By afternoon the temperature had risen 28 °F. What was the afternoon temperature?
115. **Credit Cards** Lupe owes $73 on her credit card. Then she charges $45 more. What is the new balance?
116. **Credit Cards** Frank owes $212 on his credit card. Then he charges $105 more. What is the new balance?
117. **Weight Loss** Angie lost 3 pounds the first week of her diet. Over the next three weeks, she lost 2 pounds, gained 1 pound, and then lost 4 pounds. What was the change in her weight over the four weeks?
118. **Weight Loss** April lost 5 pounds the first week of her diet. Over the next three weeks, she lost 3 pounds, gained 2 pounds, and then lost 1 pound. What was the change in her weight over the four weeks?
119. **Football** The Rams took possession of the football on their own 35-yard line. In the next three plays, they lost 12 yards, gained 8 yards, then lost 6 yards. On what yard line was the ball at the end of those three plays?
120. **Football** The Cowboys began with the ball on their own 20-yard line. They gained 15 yards, lost 3 yards and then gained 6 yards on the next three plays. Where was the ball at the end of these plays?
121. **Calories** Lisbeth walked from her house to get a frozen yogurt, and then she walked home. By walking for a total of 20 minutes, she burned 90 calories. The frozen yogurt she ate was 110 calories. What was her total calorie gain or loss?
122. **Calories** Ozzie rode his bike for 30 minutes, burning 168 calories. Then he had a 140-calorie iced blended mocha. Represent the change in calories as an integer.

Everyday Math

123. **Stock Market** The week of September 15, 2008, was one of the most volatile weeks ever for the U.S. stock market. The change in the Dow Jones Industrial Average each day was: Monday −504, Tuesday +142, Wednesday −449, Thursday +410, Friday +369. What was the overall change for the week?
124. **Stock Market** During the week of June 22, 2009, the change in the Dow Jones Industrial Average each day was: Monday −201, Tuesday −16, Wednesday −23, Thursday +172, Friday −34. What was the overall change for the week?

Writing Exercises

125. Explain why the sum of −8 and 2 is negative, but the sum of 8 and −2 and is positive.
126. Give an example from your life experience of adding two negative numbers.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
model addition of integers.			
simplify expressions with integers.			
evaluate variable expressions with integers.			
translate word phrases to algebraic expressions.			
add integers in applications.			

(b) After reviewing this checklist, what will you do to become confident or all objectives?

2.5: Subtract Integers (Part 1)

Learning Objectives

- Model subtraction of integers
- Simplify expressions with integers
- Evaluate variable expressions with integers
- Translate words phrases to algebraic expressions
- Subtract integers in applications

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $12-(8-1)$. If you missed this problem, review Example 2.1.8.
2. Translate the *difference of* \(20\) *and* -15 into an algebraic expression. If you missed this problem, review Example 1.3.11.
3. Add: $-18+7$. If you missed this problem, review Example 3.2.6.

Model Subtraction of Integers

Remember the story in the last section about the toddler and the cookies? Children learn how to subtract numbers through their everyday experiences. Real-life experiences serve as models for subtracting positive numbers, and in some cases, such as temperature, for adding negative as well as positive numbers. But it is difficult to relate subtracting negative numbers to common life experiences. Most people do not have an intuitive understanding of subtraction when negative numbers are involved. Math teachers use several different models to explain subtracting negative numbers.

We will continue to use counters to model subtraction. Remember, the blue counters represent positive numbers and the red counters represent negative numbers.

Perhaps when you were younger, you read $5-3$ as *five take away three*. When we use counters, we can think of subtraction the same way.

We will model four subtraction facts using the numbers 5 and 3.

$$5-3 \qquad -5-(-3) \qquad -5-3 \qquad 5-(-3)$$

Example 2.5.1: model

Model: $5-3$.

Solution

Interpret the expression.	5 − 3 means 5 take away 3.
Model the first number. Start with 5 positives.	5
Take away the second number. So take away 3 positives.	2 positives
Find the counters that are left.	
The difference between 5 and 3 is 2.

Exercise 2.5.1

Model the expression: $6 - 4$

Answer

2

Exercise 2.5.2

Model the expression: $7 - 4$

Answer

3

Example 2.5.2: model

Model: $-5 - (-3)$.

Solution

Interpret the expression.	−5 − (−3) means −5 take away −3.
Model the first number. Start with 5 negatives.	
Take away the second number. So take away 3 negatives.	
Find the number of counters that are left.	

The difference between -5 and -3 is -2.

Exercise 2.5.3

Model the expression: $-6 - (-4)$

Answer

-2

Exercise 2.5.4

Model the expression: $-7 - (-4)$

Answer

-3

Notice that Example 2.5.1 and Example 2.5.2 are very much alike.

- First, we subtracted 3 positives from 5 positives to get 2 positives.
- Then we subtracted 3 negatives from 5 negatives to get 2 negatives.

Each example used counters of only one color, and the "take away" model of subtraction was easy to apply.

Figure 2.5.1

Now let's see what happens when we subtract one positive and one negative number. We will need to use both positive and negative counters and sometimes some neutral pairs, too. Adding a neutral pair does not change the value.

Example 2.5.3: model

Model: $-5-3$.

Solution

Interpret the expression.	−5 − 3 means −5 take away 3.
Model the first number. Start with 5 negatives.	
Take away the second number. So we need to take away 3 positives.	
But there are no positives to take away. Add neutral pairs until you have 3 positives.	
Now take away 3 positives.	Count the number of counters that are left.	

The difference of -5 and 3 is -8.

Exercise 2.5.5

Model the expression: $-6-4$

Answer

-10

Exercise 2.5.6

Model the expression: $-7-4$

Answer

-11

Example 2.5.4: model

Model: $5-(-3)$.

Solution

Interpret the expression.	5 − (−3) means 5 take away −3.
Model the first number. Start with 5 positives.	
Take away the second number, so take away 3 negatives.	
But there are no negatives to take away. Add neutral pairs until you have 3 negatives.	Then take away 3 negatives.	Count the number of counters that are left.	8 positives

The difference of 5 and -3 is 8.

Exercise 2.5.7

Model the expression: $6-(-4)$

Answer

10

Exercise 2.5.8

Model the expression: $7-(-4)$

Answer

11

Example 2.5.5: model

Model each subtraction.

a. $8 - 2$
b. $-5 - 4$
c. $6 - (-6)$
d. $-8 - (-3)$

Solution

a. $8 - 2$: This means 8 take away 2.

Start with 8 positives.	
Take away 2 positives.	
How many are left?	8 − 2 = 6

b. $-5 - 4$: This means -5 take away 4.

Start with 5 negatives.	
You need to take away 4 positives. Add 4 neutral pairs to get 4 positives.	
Take away 4 positives.	How many are left?	−5 − 4 = −9

c. $6 - (-6)$: This means 6 take away -6.

Start with 6 positives.	
Add 6 neutrals to get 6 negatives to take away.	Remove 6 negatives.	How many are left?	6 − (−6) = 12

d. $-8 - (-3)$: This means -8 take away -3.

Start with 8 negatives.	

Take away 3 negatives.	
How many are left?	$-8-(-3)=-5$

Exercise 2.5.9

Model each subtraction.

a. $7-(-8)$
b. $-7-(-2)$
c. $4-1$
d. $-6-8$

Answer a

Answer b

Answer c

Answer d

Exercise 2.5.10

Model each subtraction.

a. $4-(-6)$
b. $-8-(-1)$
c. $7-3$
d. $-4-2$

Answer a

Answer b

Answer c

Answer d

Example 2.5.6: model

Model each subtraction expression:

a. $2-8$
b. $-3-(-8)$

Solution

a.

We start with 2 positives.	2
We need to take away 8 positives, but we have only 2.	
Add neutral pairs until there are 8 positives to take away.	Then take away eight positives.	Find the number of counters that are left. There are 6 negatives.	6 negatives

$2-8=-6$

b.

We start with 3 negatives.	3
We need to take away 8 negatives, but we have only 3.	
Add neutral pairs until there are 8 negatives to take away	Then take away the 8 negatives.	Find the number of counters that are left. There are 5 positives.	5 positives

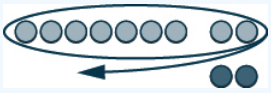
$-3-(-8)=5$

Exercise 2.5.11

Model each subtraction expression.

a. $7 - 9$
b. $-5 - (-9)$

Answer a



-2

Answer b

4

Exercise 2.5.12

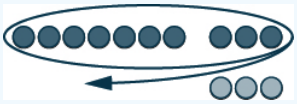
Model each subtraction expression.

a. $4 - 7$
b. $-7 - (-10)$

Answer a

-3

Answer b



3

Simplify Expressions with Integers

Do you see a pattern? Are you ready to subtract integers without counters? Let's do two more subtractions. We'll think about how we would model these with counters, but we won't actually use the counters.

- Subtract $-23 - 7$. Think: We start with 23 negative counters. We have to subtract 7 positives, but there are no positives to take away. So we add 7 neutral pairs to get the 7 positives. Now we take away the 7 positives. So what's left? We have the original 23 negatives plus 7 more negatives from the neutral pair. The result is 30 negatives. $-23 - 7 = -30$ Notice, that to subtract 7, we added 7 negatives.
- Subtract $30 - (-12)$. Think: We start with 30 positives. We have to subtract 12 negatives, but there are no negatives to take away. So we add 12 neutral pairs to the 30 positives. Now we take away the 12 negatives. What's left? We have the original 30 positives plus 12 more positives from the neutral pairs. The result is 42 positives. $30 - (-12) = 42$ Notice that to subtract -12, we added 12.

While we may not always use the counters, especially when we work with large numbers, practicing with them first gave us a concrete way to apply the concept, so that we can visualize and remember how to do the subtraction without the counters.

Have you noticed that subtraction of signed numbers can be done by adding the opposite? You will often see the idea, the Subtraction Property, written as follows:

Definition: Subtraction Property

$$a-b=a+(-b) \tag{2.5.1}$$

Look at these two examples.

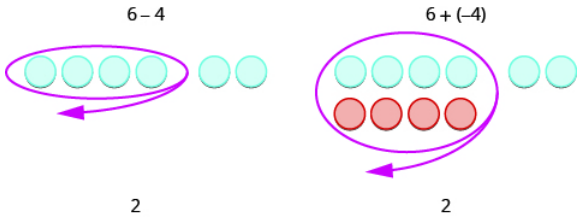


Figure 2.5.2

We see that $6-4$ gives the same answer as $6+(-4)$.

Of course, when we have a subtraction problem that has only positive numbers, like the first example, we just do the subtraction. We already knew how to subtract $6-4$ long ago. But knowing that $6-4$ gives the same answer as $6+(-4)$ helps when we are subtracting negative numbers.

Example 2.5.7: simplify

Simplify:

a. $13-8$ and $13+(-8)$
b. $-17-9$ and $-17+(-9)$

Solution

a.

Subtract to simplify.	13 − 8 = 5
Add to simplify.	13 + (−8) = 5
Subtracting 8 from 13 is the same as adding −8 to 13.	

b.

Subtract to simplify.	−17 − 9 = −26
Add to simplify.	−17 + (−9) = −26
Subtracting 9 from −17 is the same as adding −9 to −17.	

Exercise 2.5.13

Simplify each expression:

a. $21-13$ and $21+(-13)$
b. $-11-7$ and $-11+(-7)$

Answer a

8, 8

Answer b

$-18, -18$

Exercise 2.5.14

Simplify each expression:

a. $15-7$ and $15+(-7)$
b. $-14-8$ and $-14+(-8)$

Answer a

$8, 8$

Answer b

$-22, -22$

Now look what happens when we subtract a negative.

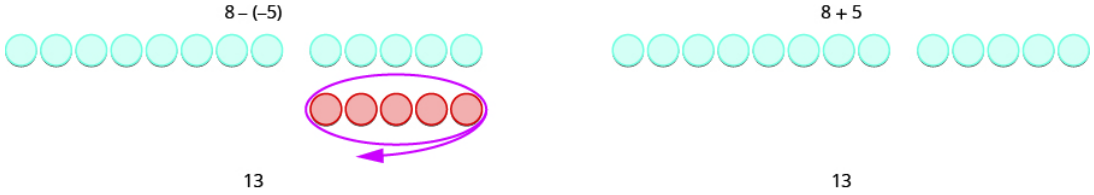

Figure 2.5.3

We see that $8-(-5)$ gives the same result as $8+5$. Subtracting a negative number is like adding a positive.

Example 2.5.8: simplify

Simplify:

a. $9-(-15)$ and $9+15$
b. $-7-(-4)$ and $-7+4$

Solution

a. $9-(-15)$ and $9+15$

Subtract to simplify.	9 − (−15) = 24
Add to simplify.	9 + 15 = 24

Subtracting -15 from 9 is the same as adding 15 to 9.

b. $-7-(-4)$ and $-7+4$

Subtract to simplify.	−7 − (−4) = −3
Add to simplify.	−7 + 4 = −3

Subtracting -4 from -7 is the same as adding 4 to -7.

Exercise 2.5.15

Simplify each expression:

a. $6-(-13)$ and $6+13$
b. $-5-(-1)$ and $-5+1$

Answer a

$19, 19$

Answer b

$-4, -4$

? Exercise 2.5.16

Simplify each expression:

a. $4-(-19)$ and $4+19$
b. $-4-(-7)$ and $-4+7$

Answer a

$23, 23$

Answer b

$3, 3$

Look again at the results of Example 2.5.1 - Example 2.5.4.

Table 2.5.1: Subtraction of Integers

5 – 3	–5 – (–3)
2	–2
2 positives	2 negatives
When there would be enough counters of the color to take away, subtract.	
–5 – 3	5 – (–3)
–8	8
5 negatives, want to subtract 3 positives	5 positives, want to subtract 3 negatives
need neutral pairs	need neutral pairs
When there would not be enough of the counters to take away, add neutral pairs.

2.6: Subtract Integers (Part 2)

Example 2.6.9: simplify

Simplify: $-74-(-58)$.

Solution

We are taking 58 negatives away from 74 negatives.	−74 − (−58)
Subtract.	−16

Exercise 2.6.17

Simplify the expression: $-67-(-38)$

Answer

-29

Exercise 2.6.18

Simplify the expression: $-83-(-57)$

Answer

-26

Example 2.6.10

Simplify: $7-(-4-3)-9$.

Solution

We use the order of operations to simplify this expression, performing operations inside the parentheses first. Then we subtract from left to right.

Simplify inside the parentheses first.	7 − (−7) − 9
Subtract from left to right.	14 − 9
Subtract.	5

Exercise 2.6.19

Simplify the expression: $8-(-3-1)-9$

Answer

3

Exercise 2.6.20

Simplify the expression: $12-(-9-6)-14$

Answer

13

Example 2.6.11: simplify

Simplify: $3 \bullet 7 - 4 \bullet 7 - 5 \bullet 8$.

Solution

We use the order of operations to simplify this expression. First we multiply, and then subtract from left to right.

Multiply first.	21 - 28 - 40
Subtract from left to right.	-7 - 40
Subtract.	-47

Exercise 2.6.21

Simplify the expression: $6 \bullet 2 - 9 \bullet 1 - 8 \bullet 9$

Answer

-69

Exercise 2.6.22

Simplify the expression: $2 \bullet 5 - 3 \bullet 7 - 4 \bullet 9$

Answer

-47

Evaluate Variable Expressions with Integers

Now we'll practice evaluating expressions that involve subtracting negative numbers as well as positive numbers.

Example 2.6.12: evaluate

Evaluate $x - 4$ when

a. $x = 3$
b. $x = -6$

Solution

a. To evaluate $x - 4$ when $x = 3$, substitute 3 for x in the expression.

Substitute 3 for x.	$3 - 4$
Subtract.	-1

b. To evaluate $x - 4$ when $x = -6$, substitute -6 for x in the expression.

Substitute -6 for x.	$-6 - 4$
Subtract.	-10

Exercise 2.6.23

Evaluate each expression: $y-7$ when

a. $y=5$
b. $y=-8$

Answer a

-2

Answer b

-15

Exercise 2.6.24

Evaluate each expression: $m-3$ when

a. $m=1$
b. $m=-4$

Answer a

-2

Answer b

-7

Example 2.6.13: evaluate

Evaluate $20-z$ when

a. $z=12$
b. $z=-12$

Solution

a. To evaluate $20-z$ when $z=12$, substitute 12 for z in the expression.

Substitute 12 for z.	$20-12$
Subtract.	8

b. To evaluate $20-z$ when $z=-12$, substitute -12 for z in the expression.

Substitute -12 for z.	$20-(-12)$
Subtract.	32

Exercise 2.6.25

Evaluate each expression: $17-k$ when

a. $k=19$
b. $k=-19$

Answer a

-2

Answer b

36

Exercise 2.6.26

Evaluate each expression: $-5-b$ when

a. $b=14$
b. $b=-14$

Answer a

-19

Answer b

9

Translate Word Phrases to Algebraic Expressions

When we first introduced the operation symbols, we saw that the expression $a-b$ may be read in several ways as shown below.

$a-b$
a minus b
the difference of a and b
subtract b from a
b subtracted from a
b less than a

Figure 2.6.4

Be careful to get a and b in the right order!

Example 2.6.14: translate and simplify

Translate and then simplify:

a. the difference of 13 and -21
b. subtract 24 from -19

Solution

a. A *difference* means subtraction. Subtract the numbers in the order they are given.

Translate.	13 - (-21)
Simplify	34

b. *Subtract* means to take 24 away from -19.

Translate.	-19 - 24
Simplify	-43

Exercise 2.6.27

Translate and simplify:

a. the difference of 14 and -23
b. subtract 21 from -17

Answer a

$-14-(-23)=37$

Answer b

$-17-21=-38$

Exercise 2.6.28

Translate and simplify:

a. the difference of 11 and -19
b. subtract 18 from -11

Answer a

$11-(-19)=30$

Answer b

$-11-18=-29$

Subtract Integers in Applications

It's hard to find something if we don't know what we're looking for or what to call it. So when we solve an application problem, we first need to determine what we are asked to find. Then we can write a phrase that gives the information to find it. We'll translate the phrase into an expression and then simplify the expression to get the answer. Finally, we summarize the answer in a sentence to make sure it makes sense.

HOW TO: SOLVE APPLICATION PROBLEMS.

Step 1. Identify what you are asked to find.

Step 2. Write a phrase that gives the information to find it.

Step 3. Translate the phrase to an expression.

Step 4. Simplify the expression.

Step 5. Answer the question with a complete sentence.

Example 2.6.15: simplify

The temperature in Urbana, Illinois one morning was 11 degrees Fahrenheit. By mid-afternoon, the temperature had dropped to -9 degrees Fahrenheit. What was the difference between the morning and afternoon temperatures?

Solution

Step 1. Identify what we are asked to find.	the difference between the morning and afternoon temperatures
Step 2. Write a phrase that gives the information to find it.	the difference of 11 and −9
Step 3. Translate the phrase to an expression. The word *difference* indicates subtraction.	11 − (−9)
Step 4. Simplify the expression.	20
Step 5. Write a complete sentence that answers the question.	The difference in temperature was 20 degrees Fahrenheit.

Exercise 2.6.29

The temperature in Anchorage, Alaska one morning was 15 degrees Fahrenheit. By mid-afternoon the temperature had dropped to 30 degrees below zero. What was the difference between the morning and afternoon temperatures?

Answer

45 degrees Fahrenheit

Exercise 2.6.30

The temperature in Denver was -6 degrees Fahrenheit at lunchtime. By sunset the temperature had dropped to -15 degree Fahrenheit. What was the difference between the lunchtime and sunset temperatures?

Answer

9 degrees Fahrenheit

Geography provides another application of negative numbers with the elevations of places below sea level.

Example 2.6.16: simplify

Dinesh hiked from Mt. Whitney, the highest point in California, to Death Valley, the lowest point. The elevation of Mt. Whitney is $14,497$ feet above sea level and the elevation of Death Valley is 282 feet below sea level. What is the difference in elevation between Mt. Whitney and Death Valley?

Solution

Step 1. What are we asked to find?	The difference in elevation between Mt. Whitney and Death Valley
Step 2. Write a phrase.	elevation of Mt. Whitney−elevation of Death Valley
Step 3. Translate.	14,497 − (−282)
Step 4. Simplify.	14,779
Step 5. Write a complete sentence that answers the question.	The difference in elevation is 14,779 feet.

Exercise 2.6.31

One day, John hiked to the $10,023$ foot summit of Haleakala volcano in Hawaii. The next day, while scuba diving, he dove to a cave 80 feet below sea level. What is the difference between the elevation of the summit of Haleakala and the depth of the cave?

Answer

$10,103$ feet

Exercise 2.6.32

The submarine Nautilus is at 340 feet below the surface of the water and the submarine Explorer is 573 feet below the surface of the water. What is the difference in the position of the Nautilus and the Explorer?

Answer

233 feet

Managing your money can involve both positive and negative numbers. You might have overdraft protection on your checking account. This means the bank lets you write checks for more money than you have in your account (as long as they know they can get it back from you!)

Example 2.6.17: simplify

Leslie has $25 in her checking account and she writes a check for $8.

a. What is the balance after she writes the check?
b. She writes a second check for $20. What is the new balance after this check?
c. Leslie's friend told her that she had lost a check for $10 that Leslie had given her with her birthday card. What is the balance in Leslie's checking account now?

Solution

a.

What are we asked to find?	The balance of the account
Write a phrase.	$25 minus $8
Translate.	$25 - $8
Simplify.	$17
Write a sentence answer.	The balance is $17.

b.

What are we asked to find?	The new balance
Write a phrase.	$17 minus $20
Translate.	$17 - $20
Simplify.	-$3
Write a sentence answer.	She is overdrawn by $3.

c.

What are we asked to find?	The new balance
Write a phrase.	$10 more than −$3
Translate.	-$3 + $10
Simplify.	$7
Write a sentence answer.	The balance is now $7.

Exercise 2.6.33

Araceli has $75 in her checking account and writes a check for $27.

a. What is the balance after she writes the check?
b. She writes a second check for $50. What is the new balance?
c. The check for $20 that she sent a charity was never cashed. What is the balance in Araceli's checking account now?

Answer a

$48

Answer b

$-\$2$

Answer c

$\$18$

? Exercise 2.6.34

Genevieve's bank account was overdrawn and the balance is $-\$78$.

a. She deposits a check for $\$24$ that she earned babysitting. What is the new balance?
b. She deposits another check for $\$49$. Is she out of debt yet? What is her new balance?

Answer a

$-\$54$

Answer b

No, $-\$5$

- Subtraction of Integers

5–3	–5–(–3)
2	–2
2 positives	2 negatives
When there would be enough counters of the color to take away, subtract.	
–5–3	5–(–3)
–8	8
5 negatives, want to subtract 3 positives	5 positives, want to subtract 3 negatives
need neutral pairs	need neutral pairs
When there would not be enough of the counters to take away, add neutral pairs.	

- Subtraction Property
  - $a-b=a+(-b)$
  - $a-(-b)=a+b$
- Solve Application Problems
  - Step 1. Identify what you are asked to find.
  - Step 2. Write a phrase that gives the information to find it.
  - Step 3. Translate the phrase to an expression.
  - Step 4. Simplify the expression.

- Step 5. Answer the question with a complete sentence.

Practice Makes Perfect

Model Subtraction of Integers

In the following exercises, model each expression and simplify.

127. 8 − 2
128. 9 − 3
129. −5 − (−1)
130. −6 − (−4)
131. −5 − 4
132. −7 − 2
133. 8 − (−4)
134. 7 − (−3)

Simplify Expressions with Integers

In the following exercises, simplify each expression.

135. (a) 15 − 6 (b) 15 + (−6)
136. (a) 12 − 9 (b) 12 + (−9)
137. (a) 44 − 28 (b) 44 + (−28)
138. (a) 35 − 16 (b) 35 + (−16)
139. (a) 8 − (−9) (b) 8 + 9
140. (a) 4 − (−4) (b) 4 + 4
141. (a) 27 − (−18) (b) 27 + 18
142. (a) 46 − (−37) (b) 46 + 37

In the following exercises, simplify each expression.

143. 15 − (−12)
144. 14 − (−11)
145. 10 − (−19)
146. 11 − (−18)
147. 48 − 87
148. 45 − 69
149. 31 − 79
150. 39 − 81
151. −31 − 11
152. −32 − 18
153. −17 − 42
154. −19 − 46
155. −103 − (−52)
156. −105 − (−68)
157. −45 − (−54)
158. −58 − (−67)
159. 8 − 3 − 7
160. 9 − 6 − 5
161. −5 − 4 + 7
162. −3 − 8 + 4
163. −14 − (−27) + 9
164. −15 − (−28) + 5
165. 71 + (−10) − 8
166. 64 + (−17) − 9
167. −16 − (−4 + 1) − 7
168. −15 − (−6 + 4) − 3

169. $(2 - 7) - (3 - 8)$
170. $(1 - 8) - (2 - 9)$
171. $-(6 - 8) - (2 - 4)$
172. $-(4 - 5) - (7 - 8)$
173. $25 - [10 - (3 - 12)]$
174. $32 - [5 - (15 - 20)]$
175. $6.3 - 4.3 - 7.2$
176. $5.7 - 8.2 - 4.9$
177. $5^2 - 6^2$
178. $6^2 - 7^2$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression for the given values.

179. $x - 6$ when (a) $x = 3$ (b) $x = -3$
180. $x - 4$ when (a) $x = 5$ (b) $x = -5$
181. $5 - y$ when (a) $y = 2$ (b) $y = -2$
182. $8 - y$ when (a) $y = 3$ (b) $y = -3$
183. $4x^2 - 15x + 1$ when $x = 3$
184. $5x^2 - 14x + 7$ when $x = 2$
185. $-12 - 5x^2$ when $x = 6$
186. $-19 - 4x^2$ when $x = 5$

Translate Word Phrases to Algebraic Expressions

In the following exercises, translate each phrase into an algebraic expression and then simplify.

187. (a) The difference of 3 and −10 (b) Subtract −20 from 45
188. (a) The difference of 8 and −12 (b) Subtract −13 from 50
189. (a) The difference of −6 and 9 (b) Subtract −12 from −16
190. (a) The difference of −8 and 9 (b) Subtract −15 from −19
191. (a) 8 less than −17 (b) −24 minus 37
192. (a) 5 less than −14 (b) −13 minus 42
193. (a) 21 less than 6 (b) 31 subtracted from −19
194. (a) 34 less than 7 (b) 29 subtracted from −50

Subtract Integers in Applications

In the following exercises, solve the following applications.

195. **Temperature** One morning, the temperature in Urbana, Illinois, was 28° Fahrenheit. By evening, the temperature had dropped 38° Fahrenheit. What was the temperature that evening?
196. **Temperature** On Thursday, the temperature in Spincich Lake, Michigan, was 22° Fahrenheit. By Friday, the temperature had dropped 35° Fahrenheit. What was the temperature on Friday?
197. **Temperature** On January 15, the high temperature in Anaheim, California, was 84° Fahrenheit. That same day, the high temperature in Embarrass, Minnesota was −12° Fahrenheit. What was the difference between the temperature in Anaheim and the temperature in Embarrass?
198. **Temperature** On January 21, the high temperature in Palm Springs, California, was 89°, and the high temperature in Whitefield, New Hampshire was −31°. What was the difference between the temperature in Palm Springs and the temperature in Whitefield?
199. **Football** At the first down, the Warriors football team had the ball on their 30-yard line. On the next three downs, they gained 2 yards, lost 7 yards, and lost 4 yards. What was the yard line at the end of the third down?
200. **Football** At the first down, the Barons football team had the ball on their 20-yard line. On the next three downs, they lost 8 yards, gained 5 yards, and lost 6 yards. What was the yard line at the end of the third down?
201. **Checking Account** John has $148 in his checking account. He writes a check for $83. What is the new balance in his checking account?

202. **Checking Account** Ellie has $426 in her checking account. She writes a check for $152. What is the new balance in her checking account?
203. **Checking Account** Gina has $210 in her checking account. She writes a check for $250. What is the new balance in her checking account?
204. **Checking Account** Frank has $94 in his checking account. He writes a check for $110. What is the new balance in his checking account?
205. **Checking Account** Bill has a balance of −$14 in his checking account. He deposits $40 to the account. What is the new balance?
206. **Checking Account** Patty has a balance of −$23 in her checking account. She deposits $80 to the account. What is the new balance?

Everyday Math

207. **Camping** Rene is on an Alpine hike. The temperature is −7°. Rene's sleeping bag is rated "comfortable to −20°". How much can the temperature change before it is too cold for Rene's sleeping bag?
208. **Scuba Diving** Shelly's scuba watch is guaranteed to be watertight to −100 feet. She is diving at −45 feet on the face of an underwater canyon. By how many feet can she change her depth before her watch is no longer guaranteed?

Writing Exercises

209. Explain why the difference of 9 and −6 is 15.
210. Why is the result of subtracting 3 − (−4) the same as the result of adding 3 + 4?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section

I can...	Confidently	With some help	No-I don't get it!
model subtraction of integers.			
simplify expressions with integers.			
evaluate variable expressions with integers.			
translate word phrases to algebraic expressions.			
subtract integers in applications.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

2.7: Multiply and Divide Integers (Part 1)

Learning Objectives

- Multiply integers
- Divide integers
- Simplify expressions with integers
- Evaluate variable expressions with integers
- Translate word phrases to algebraic expressions

be prepared!

Before you get started, take this readiness quiz.

1. Translate the quotient of 20 and 13 into an algebraic expression. If you missed this problem, review Example 1.5.12.
2. Add: $-5+(-5)+(-5)$. If you missed this problem, review Example 3.2.8.
3. Evaluate $n+4$ when $n=-7$. If you missed this problem, review Example 3.2.10.

Multiply Integers

Since multiplication is mathematical shorthand for repeated addition, our counter model can easily be applied to show multiplication of integers. Let's look at this concrete model to see what patterns we notice. We will use the same examples that we used for addition and subtraction.

We remember that $a \bullet b$ means add a, b times. Here, we are using the model shown in Figure $2.7.1$ just to help us discover the pattern.

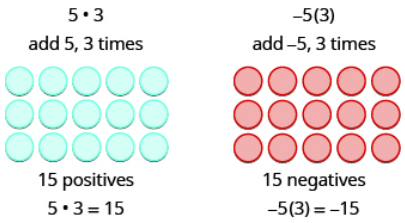

Figure 2.7.1

Now consider what it means to multiply 5 by -3. It means subtract 5, 3 times. Looking at subtraction as taking away, it means to take away 5, 3 times. But there is nothing to take away, so we start by adding neutral pairs as shown in Figure $2.7.2$.

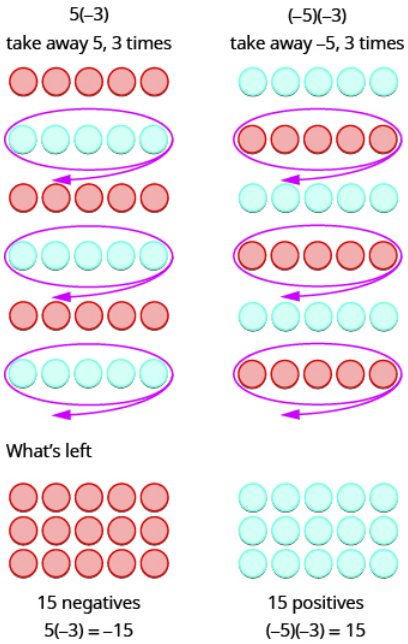

Figure 2.7.2

In both cases, we started with 15 neutral pairs. In the case on the left, we took away 5, 3 times and the result was -15. To multiply $(-5)(-3)$, we took away -5, 3 times and the result was 15. So we found that

5(3) = 15	-5(3) = -15
5(-3) = -15	(-5)(-3) = 15

Notice that for multiplication of two signed numbers, when the signs are the same, the product is positive, and when the signs are different, the product is negative.

Definition: Multiplication of Signed Numbers

The sign of the product of two numbers depends on their signs.

Same signs	Product
Two positives	Positive
Two negatives	Positive

Different signs	Product
Positive • negative	Negative
Negative • positive	Negative

Example 2.7.1:multiply

Multiply each of the following:

a. $-9 \bullet 3$
b. $-2(-5)$
c. $4(-8)$
d. $7 \bullet 6$

Solution

a.

Multiply, noting that the signs are different and so the product is negative.	–9 • 3 = –27

b.

Multiply, noting that the signs are the same and so the product is positive.	–2(–5) = 10

c.

Multiply, noting that the signs are different and so the product is negative.	4(–8) = –32

d.

The signs are the same, so the product is positive.	7 • 6 = 42

Exercise 2.7.1

Multiply:

a. $-6 \bullet 8$
b. $-4(-7)$
c. $9(-7)$
d. $5 \bullet 12$

Answer a

-48

Answer b

28

Answer c

-63

Answer d

60

Exercise 2.7.2

Multiply:

a. $-8 \bullet 7$
b. $-6(-9)$
c. $7(-4)$
d. $3 \bullet 13$

Answer a

-56

Answer b

54

Answer c

-28

Answer d

39

When we multiply a number by 1, the result is the same number. What happens when we multiply a number by -1? Let's multiply a positive number and then a negative number by -1 to see what we get.

$-1 \cdot 4$	$-1(-3)$
-4	3
-4 is the opposite of 4	3 is the opposite of -3

Each time we multiply a number by -1, we get its opposite.

Definition: Multiplication by -1

Multiplying a number by -1 gives its opposite.

$$-1 \cdot a = -a \tag{2.7.1}$$

Example 2.7.2: multiply

Multiply each of the following:

a. $-1 \bullet 7$
b. $-1(-11)$

Solution

a.

The signs are different, so the product will be negative.	$-1 \cdot 7$
Notice that -7 is the opposite of 7.	-7

b.

The signs are the same, so the product will be positive.	$-1(-11)$
Notice that 11 is the opposite of -11.	11

Exercise 2.7.3

Multiply.

a. $-1 \bullet 9$
b. $-1 \bullet (-17)$

Answer a

-9

Answer b

17

Exercise 2.7.4

Multiply.

a. $-1 \bullet 8$
b. $-1 \bullet (-16)$

Answer a

-8

Answer b

16

Divide Integers

Division is the inverse operation of multiplication. So, $15 \div 3 = 5$ because $5 \bullet 3 = 15$ In words, this expression says that 15 can be divided into 3 groups of 5 each because adding five three times gives 15. If we look at some examples of multiplying integers, we might figure out the rules for dividing integers.

5 • 3 = 15 so 15 ÷ 3 = 5	−5(3) = −15 so −15 ÷ 3 = −5
(−5)(−3) = 15 so 15 ÷ (−3) = −5	5(−3) = −15 so −15 ÷ −3 = 5

Division of signed numbers follows the same rules as multiplication. When the signs are the same, the quotient is positive, and when the signs are different, the quotient is negative.

Definition: Division of Signed Numbers

The sign of the quotient of two numbers depends on their signs.

Same signs	Quotient
Two positives	Positive
Two negatives	Positive

Different signs	Quotient
Positive & negative	Negative
Negative & positive	Negative

Remember, you can always check the answer to a division problem by multiplying.

Example 2.7.3: divide

Divide each of the following:

a. $-27 \div 3$
b. $-100 \div (-4)$

Solution

a.

Divide, noting that the signs are different and so the quotient is negative.	–27 ÷ 3 = –9

b.

Divide, noting that the signs are the same and so the quotient is positive.	–100 ÷ (–4) = 25

Exercise 2.7.5

Divide:

a. $-42 \div 6$
b. $-117 \div (-3)$

Answer a

-7

Answer b

39

Exercise 2.7.6

Divide:

a. $-63 \div 7$
b. $-115 \div (-5)$

Answer a

-9

Answer b

23

Just as we saw with multiplication, when we divide a number by 1, the result is the same number. What happens when we divide a number by -1? Let's divide a positive number and then a negative number by -1 to see what we get.

$8 \div (-1)$	$-9 \div (-1)$
-8	9
-8 is the opposite of 8	9 is the opposite of -9

When we divide a number by, -1 we get its opposite.

Definition: Division by -1

Dividing a number by -1 gives its opposite.

$$a \div (-1) = -a \tag{2.7.2}$$

Example 2.7.4: divide

Divide each of the following:

a. $16 \div (-1)$
b. $-20 \div (-1)$

Solution

a.

The dividend, 16, is being divided by –1.	$16 \div (-1)$
Dividing a number by –1 gives its opposite.	–16

Notice that the signs were different, so the result was negative.

b.

The dividend, –20, is being divided by –1.	$-20 \div (-1)$
Dividing a number by –1 gives its opposite.	20

Notice that the signs were the same, so the quotient was positive.

Exercise 2.7.7

Divide:

a. $6 \div (-1)$
b. $-36 \div (-1)$

Answer a

-6

Answer b

36

Exercise 2.7.8

Divide:

a. $28 \div (-1)$
b. $-52 \div (-1)$

Answer a

-28

Answer b

52

Simplify Expressions with Integers

Now we'll simplify expressions that use all four operations–addition, subtraction, multiplication, and division–with integers. Remember to follow the order of operations.

Example 2.7.5: simplify

Simplify: $7(-2)+4(-7)-6$.

Solution

We use the order of operations. Multiply first and then add and subtract from left to right.

Multiply first.	$-14 + (-28) - 6$
Add.	$-42 - 6$

Subtract.	−48

Exercise 2.7.9

Simplify: $8(-3)+5(-7)-4$

Answer

-63

Exercise 2.7.10

Simplify: $9(-3)+7(-8)-1$

Answer

-84

Example 2.7.6: simplify

Simplify:

a. $(-2)^4$
b. -2^4

Solution

The exponent tells how many times to multiply the base.

a. The exponent is 4 and the base is -2. We raise -2 to the fourth power.

Write in expanded form.	(−2)(−2)(−2)(−2)
Multiply.	4(−2)(−2)
Multiply.	−8(−2)
Multiply.	16

b. The exponent is 4 and the base is 2. We raise 2 to the fourth power and then take the opposite.

Write in expanded form.	−(2 • 2 • 2 • 2)
Multiply.	−(4 • 2 • 2)
Multiply.	−(8 • 2)
Multiply.	−16

Exercise 2.7.11

Simplify:

a. $(-3)^4$
b. -3^4

Answer a

81

Answer b

-81

Exercise 2.7.12

Simplify:

a. $(-7)^2$
b. -7^2

Answer a

49

Answer b

-49

Example 2.7.7: simplify

Simplify: $12-3(9-12)$.

Solution

According to the order of operations, we simplify inside parentheses first. Then we will multiply and finally we will subtract.

Subtract the parentheses first.	12 − 3(−3)
Multiply.	12 − (−9)
Subtract.	21

Exercise 2.7.13

Simplify: $17-4(8-11)$

Answer

29

Exercise 2.7.14

Simplify: $16-6(7-13)$

Answer

52

Example 2.7.8: simplify

Simplify: $8(-9)\div(-2)^3$.

Solution

We simplify the exponent first, then multiply and divide.

Simplify the exponent.	8(−9) ÷ (−8)
Multiply.	−72 ÷ (−8)

Divide.	9

Exercise 2.7.15

Simplify: $12(-9) \div (-3)^3$

Answer

4

Exercise 2.7.16

Simplify: $18(-4) \div (-2)^3$

Answer

9

Example 2.7.9: simplify

Simplify: $-30 \div 2 + (-3)(-7)$.

Solution

First we will multiply and divide from left to right. Then we will add.

Divide.	$-15 + (-3)(-7)$
Multiply.	$-15 + 21$
Add.	6

Exercise 2.7.17

Simplify: $-27 \div 3 + (-5)(-6)$

Answer

21

Exercise 2.7.18

Simplify: $-32 \div 4 + (-2)(-7)$

Answer

6

Contributors and Attributions

2.8: Multiply and Divide Integers (Part 2)

Evaluate Variable Expressions with Integers

Now we can evaluate expressions that include multiplication and division with integers. Remember that to evaluate an expression, substitute the numbers in place of the variables, and then simplify.

Example 2.8.10: evaluate

Evaluate $2x^2 - 3x + 8$ when $x = -4$.

Solution

Substitute -4 for x.	$2(-4)^2 - 3(-4) + 8$
Simplify exponents.	$2(16) - 3(-4) + 8$
Multiply.	$32 - (-12) + 8$
Subtract.	$44 + 8$
Add.	52

Keep in mind that when we substitute -4 for x, we use parentheses to show the multiplication. Without parentheses, it would look like $2 \bullet -4^2 - 3 \bullet -4 + 8$.

Exercise 2.8.19

Evaluate: $3x^2 - 2x + 6$ when $x = -3$

Answer

39

Exercise 2.8.20

Evaluate: $4x^2 - x - 5$ when $x = -2$

Answer

13

Example 2.8.11: evaluate

Evaluate $3x + 4y - 6$ when $x = -1$ and $y = 2$.

Solution

Substitute x = -1 and y = 2.	$3(-1) + 4(2) - 6$
Multiply.	$-3 + 8 - 6$
Simplify.	-1

Exercise 2.8.21

Evaluate: $7x + 6y - 12$ when $x = -2$ and $y = 3$

Answer

-8

Exercise 2.8.22

Evaluate: $8x-6y+13$ when $x=-3$ and $y=-5$

Answer

19

Translate Word Phrases to Algebraic Expressions

Once again, all our prior work translating words to algebra transfers to phrases that include both multiplying and dividing integers. Remember that the key word for multiplication is *product* and for division is *quotient*.

Example 2.8.12: translate

Translate to an algebraic expression and simplify if possible: the product of -2 and 14.

Solution

The word *product* tells us to multiply.

Translate.	$(-2)(14)$
Simplify.	-28

Exercise 2.8.23

Translate to an algebraic expression and simplify if possible: the product of -5 and 12

Answer

$-5(12)=-60$

Exercise 2.8.24

Translate to an algebraic expression and simplify if possible: the product of 8 and -13

Answer

$8(-13)=-104$

Example 2.8.13

Translate to an algebraic expression and simplify if possible: the quotient of -56 and -7.

Solution

The word *quotient* tells us to divide.

Translate.	$-56 \div (-7)$
Simplify.	8

Exercise 2.8.25

Translate to an algebraic expression and simplify if possible: the quotient of -63 and -9

Answer

$-63 \div -9 = 7$

Exercise 2.8.26

Translate to an algebraic expression and simplify if possible: the quotient of -72 and -9

Answer

$-72 \div -9 = 8$

  - Dividing a number by -1 gives its opposite: $a \div (-1) = -a$

Practice Makes Perfect

Multiply Integers

In the following exercises, multiply each pair of integers.

211. $-4 \cdot 8$
212. $-3 \cdot 9$
213. $-5(7)$
214. $-8(6)$
215. $-18(-2)$
216. $-10(-6)$
217. $9(-7)$
218. $13(-5)$
219. $-1 \cdot 6$
220. $-1 \cdot 3$
221. $-1(-14)$
222. $-1(-19)$

Divide Integers

In the following exercises, divide.

223. $-24 \div 6$
224. $-28 \div 7$
225. $56 \div (-7)$
226. $35 \div (-7)$
227. $-52 \div (-4)$
228. $-84 \div (-6)$
229. $-180 \div 15$
230. $-192 \div 12$
231. $49 \div (-1)$
232. $62 \div (-1)$

Simplify Expressions with Integers

In the following exercises, simplify each expression.

233. $5(-6) + 7(-2) - 3$
234. $8(-4) + 5(-4) - 6$
235. $-8(-2) - 3(-9)$
236. $-7(-4) - 5(-3)$
237. $(-5)^3$
238. $(-4)^3$
239. $(-2)^6$
240. $(-3)^5$
241. -4^2
242. -6^2
243. $-3(-5)(6)$
244. $-4(-6)(3)$
245. $-4 \cdot 2 \cdot 11$
246. $-5 \cdot 3 \cdot 10$
247. $(8 - 11)(9 - 12)$
248. $(6 - 11)(8 - 13)$
249. $26 - 3(2 - 7)$

250. $23 - 2(4 - 6)$
251. $-10(-4) \div (-8)$
252. $-8(-6) \div (-4)$
253. $65 \div (-5) + (-28) \div (-7)$
254. $52 \div (-4) + (-32) \div (-8)$
255. $9 - 2[3 - 8(-2)]$
256. $11 - 3[7 - 4(-2)]$
257. $(-3)^2 - 24 \div (8 - 2)$
258. $(-4)^2 - 32 \div (12 - 4)$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

259. $-2x + 17$ when (a) $x = 8$ (b) $x = -8$
260. $-5y + 14$ when (a) $y = 9$ (b) $y = -9$
261. $10 - 3m$ when (a) $m = 5$ (b) $m = -5$
262. $18 - 4n$ when (a) $n = 3$ (b) $n = -3$
263. $p^2 - 5p + 5$ when $p = -1$
264. $q^2 - 2q + 9$ when $q = -2$
265. $2w^2 - 3w + 7$ when $w = -2$
266. $3u^2 - 4u + 5$ when $u = -3$
267. $6x - 5y + 15$ when $x = 3$ and $y = -1$
268. $3p - 2q + 9$ when $p = 8$ and $q = -2$
269. $9a - 2b - 8$ when $a = -6$ and $b = -3$
270. $7m - 4n - 2$ when $m = -4$ and $n = -9$

Translate Word Phrases to Algebraic Expressions

In the following exercises, translate to an algebraic expression and simplify if possible.

271. The product of -3 and 15
272. The product of -4 and 16
273. The quotient of -60 and -20
274. The quotient of -40 and -20
275. The quotient of -6 and the sum of a and b
276. The quotient of -7 and the sum of m and n
277. The product of -10 and the difference of p and q
278. The product of -13 and the difference of c and d

Everyday Math

279. **Stock market** Javier owns 300 shares of stock in one company. On Tuesday, the stock price dropped $12 per share. What was the total effect on Javier's portfolio?
280. **Weight loss** In the first week of a diet program, eight women lost an average of 3 pounds each. What was the total weight change for the eight women?

Writing Exercises

281. In your own words, state the rules for multiplying two integers.
282. In your own words, state the rules for dividing two integers.
283. Why is $-2^4 \neq (-2)^4$?
284. Why is $-4^2 \neq (-4)^2$?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
multiply integers.			
divide integers.			
simplify expressions with integers.			
evaluate variable expressions with integers.			
translate word phrases to algebraic expressions.			

(b) On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

2.9: Square Roots

Recall that

$$x^2 = x \cdot x.$$

The Square of a Number

The number x^2 is called the square of the number x.

Thus, for example:

- $9^2 = 9 \cdot 9 = 81$. Therefore, the number 81 is the square of the number 9.
- $(-4)^2 = (-4)(-4) = 16$. Therefore, the number 16 is the square of the number −4.

In the margin, we've placed a "List of Squares" of the whole numbers ranging from 0 through 25, inclusive.

x	x^2
0	0
1	1
2	4
3	9
4	16
5	25
6	36
7	49
8	64

19	361
20	400
21	441
22	484
23	529
24	576
25	625

Square Roots

Once you've mastered the process of squaring a whole number, then you are ready for the inverse of the squaring process, taking the *square root* of a whole number.

- Above, we saw that $9^2 = 81$. We called the number 81 the square of the number 9. Conversely, we call the number 9 a *square root* of the number 81.
- Above, we saw that $(-4)^2 = 16$. We called the number 16 the *square* of the number −4. Conversely, we call the number −4 a *square root* of the number 16.

x	$\sqrt{x}$

Square Root

If $a^2 = b$, then a is called a square root of the number b.

Example 1

Find the square roots of the number 49.

Solution

To find a square root of 49, we must think of a number a such that $a^2 = 49$. Two numbers come to mind.

- $(-7)^2 = 49$. Therefore, -7 is a square root of 49.
- $7^2 = 49$. Therefore, 7 is a square root of 49.

Note that 49 has two square roots, one of which is positive and the other one is negative.

Exercise

Find the square roots of 256.

Answer

$-16, 16$

Example 2

Find the square roots of the number 196. Solution. To find a square root of 196, we must think of a number a such that a^2 = 196. With help from the "List of Squares," two numbers come to mind.

- $(-14)^2$ = 196. Therefore, −14 is a square root of 196.
- 14^2 = 196. Therefore, 14 is a square root of 196.

Note that 196 has two square roots, one of which is positive and the other one is negative.

Exercise

Find the square roots of 625.

Answer

−25, 25

Example 3

Find the square roots of the number 0.

Solution

To find a square root of 0, we must think of a number *a* such that a^2 = 0. There is only one such number, namely zero. Hence, 0 is the square root of 0.

Exercise

Find the square roots of 9.

Answer

−3, 3

Example 4

Find the square roots of the number −25.

Solution

To find a square root of −25, we must think of a number a such that a^2 = −25. This is impossible because no square of a real number (whole number, integer, fraction, or decimal) can be negative. Positive times positive is positive and negative times negative is also positive. You cannot square and get a negative answer. Therefore, −25 has no square roots[2].

Exercise

Find the square roots of −81.

Answer

There are none.

[2]At least not in Prealgebra. In later courses, you will be introduced to the set of complex numbers, where −25 will have two square roots.

Radical Notation

Because $(-3)^2$ = 9 and 3^2 = 9, both −3 and 3 are square roots of 9. Special notation, called *radical notation*, is used to request these square roots.

- The radical notation $\sqrt{9}$, pronounced "the nonnegative square root of 9," calls for the nonnegative[3] square root of 9. Hence,

$$\sqrt{9} = 3.$$

- The radical notation $-\sqrt{9}$, pronounced "the negative square root of 9," calls for the negative square root of 9. Hence,

$$-\sqrt{9} = -3.$$

Radical Notation

In the expression $\sqrt{9}$, the symbol $\sqrt{\ }$ is called a *radical* and the number within the radical, in this case the number 9, is called the *radicand*.

For example,

- In the expression $\sqrt{529}$, the number 529 is the radicand.
- In the expression $\sqrt{a^2 + b^2}$, the expression $a2^+b^2$ is the radicand.

Radical Notation and Square Root

If *b* is a positive number, then

1. $\sqrt{b}$ calls for the nonnegative square root of *b*.
2. $-\sqrt{b}$ calls for the negative square root of *b*.

Note: Nonnegative is equivalent to saying "not negative;" i.e., positive or zero.

Example 5

Simplify: (a) $\sqrt{121}$, (b) $-\sqrt{625}$, and (c) $\sqrt{0}$.

Solution

(a) Referring to the list of squares, we note that 11^2 = 121 and $(-11)^2$ = 121. Therefore, both 11 and −11 are square roots of 121. However, $\sqrt{121}$ calls for the nonnegative square root of 121. Thus,

$$\sqrt{121} = 11.$$

(b) Referring to the list of squares, we note that 25^2 = 625 and $(-25)^2$ = 625. Therefore, both 25 and −25 are square roots of 625. However, $-\sqrt{625}$ calls for the negative square root of 625. Thus,

$$-\sqrt{625} = -25.$$

(c) There is only one square root of zero. Therefore,

$$\sqrt{0} = 0.$$

Exercise

Simplify: a) $\sqrt{144}$ b) $-\sqrt{324}$

Answer

(a) 12 (b) −18

Example 6

Simplify: (a) $-\sqrt{25}$, and (b) $-\sqrt{25}$

Solution

(a) Because 5^2 = 25 and $(-5)^2$ = 25, both 5 and −5 are square roots of 25. However, the notation $-\sqrt{25}$ calls for the negative square root of 25. Thus, $-\sqrt{25} = -5$.

(b) It is not possible to square a real number (whole number, integer, fraction, or decimal) and get −25. Therefore, there is no real square root of −25. That is, $\sqrt{-25}$ is not a real number. It is undefined.[4]

Exercise

Simplify: a) $-\sqrt{36}$ b) $\sqrt{-36}$

Answer

(a) −6 (b) undefined

[3]Nonnegative is equivalent to saying "not negative;" i.e., positive or zero.

[4]At least in Prealgebra. In later courses you will be introduced to the set of complex numbers, where $\sqrt{-25}$ will take on a new meaning.

Order of Operations

With the addition of radical notation, the *Rules Guiding Order of Operations* change slightly.

Rules Guiding Order of Operations

When evaluating expressions, proceed in the following order.

1. Evaluate expressions contained in grouping symbols first. If grouping symbols are nested, evaluate the expression in the innermost pair of grouping symbols first.
2. Evaluate all exponents and radicals that appear in the expression.
3. Perform all multiplications and divisions in the order that they appear in the expression, moving left to right.
4. Perform all additions and subtractions in the order that they appear in the expression, moving left to right.

The only change in the rules is in item #2, which says: "Evaluate all exponents and radicals that appear in the expression," putting radicals on the same level as exponents.

Example 7

Simplify: $-3\sqrt{9}+12\sqrt{4}$.

Solution

According to the *Rules Guiding Order of Operations*, we must evaluate the radicals in this expression first.

$$\begin{aligned} -3\sqrt{9}+12\sqrt{4} &= -3(3)+12(2) && \text{Evaluate radicals first: } \sqrt{9}=3 \\ & && \text{and } \sqrt{4}=2. \\ &= -9+24 && \text{Multiply: } -3(3)=-9 \text{ and } 12(2)=24. \\ &= 15 && \text{Add: } -9+24=15. \end{aligned}$$

Exercise

Simplify: $2\sqrt{4}-3\sqrt{9}$

Answer

−5

Example 8

Simplify: $-2-3\sqrt{36}$.

Solution

According to the *Rules Guiding Order of Operations*, we must evaluate the radicals in this expression first, moving left to right.

$$\begin{aligned} -2-3\sqrt{36} &= -2-36 && \text{Evaluate radicals first: } \sqrt{36}=6 \\ &= -2-18 && \text{Multiply: } 3(6)=18. \\ &= -20 && \text{Subtract: } -2-18=-2+(-18)=-20. \end{aligned}$$

? Exercise

Simplify: $5-8\sqrt{169}$

Answer

−99

✔ Example 9

Simplify: (a) $\sqrt{9+16}$ and (b) $\sqrt{9}+\sqrt{16}$.

Solution

Apply the *Rules Guiding Order of Operations*.

a) In this case, the radical acts like grouping symbols, so we must evaluate what is inside the radical first.

$$\begin{aligned} \sqrt{9+16} &= \sqrt{25} && \text{Add: } 9+16=25. \\ &= 5 && \text{Take nonnegative square root: } \sqrt{25}=5. \end{aligned}$$

b) In this example, we must evaluate the square roots first.

$$\begin{aligned} \sqrt{9}+\sqrt{16} &= 3+4 && \text{Square root: } \sqrt{9}=3 \text{ and } \sqrt{16}=4. \\ &= 7 && \text{Add: } 3+4=7. \end{aligned}$$

? Exercise

Simplify: a) $\sqrt{25+144}$ b) $\sqrt{25}+\sqrt{144}$

Answer

(a) 13 (b) 17

Fractions and Decimals

We can also find square roots of fractions and decimals.

✔ Example 10

Simplify: (a) $\sqrt{49}$, and (b) $-\sqrt{0.49}$.

Solution

(a) Because $\left(\frac{2}{3}\right)^2=\left(\frac{2}{3}\right)\left(\frac{2}{3}\right)=\frac{4}{9}$, then

$$\sqrt{\frac{4}{9}}=\frac{2}{3}.$$

(b) Because $(0.7)^2 = (0.7)(0.7) = 0.49$ and $(-0.7)^2 = (-0.7)(-0.7) = 0.49$, both 0.7 and −0.7 are square roots of 0.49. However, $-\sqrt{0.49}$ calls for the negative square root of 0.49. Hence,

$$-\sqrt{0.49}=-0.7$$

Exercise

Simplify: a) $\sqrt{\frac{25}{49}}$ b) $\sqrt{0.36}$

Answer

(a) 5/7 (b) 0.6

Estimating Square Roots

The squares in the "List of Squares" are called *perfect squares*. Each is the square of a whole number. Not all numbers are perfect squares. For example, in the case of $\sqrt{24}$, there is no whole number whose square is equal to 24. However, this does not prevent $\sqrt{24}$ from being a perfectly good number.

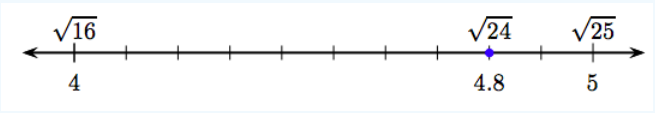
We can use the "List of Squares" to find decimal approximations when the radicand is not a perfect square.

Example 11

Estimate $\sqrt{24}$ by guessing. Use a calculator to find a more accurate result and compare this result with your guess.

Solution

From the "List of Squares," note that 24 lies betwen 16 and 25, so 24 will lie between 4 and 5, with √24 much closer to 5 than it is to 4.



Let's guess

$$\sqrt{24} \approx 4.8.$$

As a check, let's square 4.8.

$$(4.8)^2 = (4.8)(4.8) = 23.04$$

Not quite 24! Clearly, $\sqrt{24}$ must be a little bit bigger than 4.8.

Let's use a scientific calculator to get a better approximation. From our calculator, using the square root button, we find

$$\sqrt{24} \approx 4.89897948557.$$

Even though this is better than our estimate of 4.8, it is still only an approximation. Our calculator was only capable of providing 11 decimal places. However, the exact decimal representation of $\sqrt{24}$ is an infinite decimal that never terminates and never establishes a pattern of repetition.

Just for fun, here is a decimal approximation of $\sqrt{24}$ that is accurate to 1000 places, courtesy of http://www.wolframalpha.com/.

4.89897948556635619639456814941178278393189496131334025686538513450192075491463005307971886620928046963718920245322837824971773091967551468325156790247455710565782549505535314249526021054182354044696262135797338170726488670509120806761761787874917113569314944872260828854054043234840367660016317961567602617940145738798726167431618880160088747737509832902930787829002408945289626663258702188948362702657099008893234345326285099529663624900802313209072918018687172335863967331332533818263813071727532210516312358732472358220589344176709151025767105979664820111738041001283093224823470679882086211598579693467906510557472083659310343660782073560076724633259464660565809954782094852720141025275395093777354012819859118514346569290057761830288514926052059059264741510500684551198309085256259600612934415988485060457568524106813589572009319387995987119508123342717309306912496416512553772738561882612744867017729603144969267446489475909097628876958672740183948202955704655118212631969215662073401907064945 3

If you were to multiply this number by itself (square the number), you would get a number that is extremely close to 24, but it would not be exactly 24. There would still be a little discrepancy.

? Exercise

Estimate: $\sqrt{83}$.

Answer

9.1

Important Observation

A calculator can only produce a finite number of decimal places. If the decimal representation of your number does not terminate within this limited number of places, then the number in your calculator window is only an approximation.

- The decimal representation of 1/8 will terminate within three places, so most calculators will report the exact answer, 0.125.
- For contrast, 2/3 does not terminate. A calculator capable of reporting 11 places of accuracy produces the number 0.666666666667. However, the exact decimal representation of 2/3 is 0.6. Note that the calculator has rounded in the last place and only provides an approximation of 2/3. If your instructor asks for an exact answer on an exam or quiz then 0.666666666667, being an approximation, is not acceptable. You must give the exact answer 2/3.

Exercises

In Exercises 1-16, list all square roots of the given number. If the number has no square roots, write “none”.

1. 256
2. 361
3. −289
4. −400
5. 441
6. 36
7. 324
8. 0
9. 144

11. −144
12. −100
13. 121
14. −196
15. 529
16. 400

In Exercises 17-32, compute the exact square root. If the square root is undefined, write “undefined”.

17. $\sqrt{-9}$
18. $-\sqrt{-196}$
19. $\sqrt{576}$
20. $\sqrt{289}$

21. $\sqrt{-529}$
22. $\sqrt{-256}$
23. $-\sqrt{25}$
24. $\sqrt{225}$
25. $-\sqrt{484}$
26. $-\sqrt{36}$
27. $-\sqrt{196}$
28. $-\sqrt{289}$
29. $\sqrt{441}$
30. $\sqrt{324}$
31. $-\sqrt{4}$
32. $\sqrt{100}$

In Exercises 33-52, compute the exact square root.

33. $\sqrt{0.81}$
34. $\sqrt{5.29}$
35. $\sqrt{3.61}$
36. $\sqrt{0.09}$
37. $\sqrt{\frac{225}{16}}$
38. $\sqrt{\frac{100}{81}}$
39. $\sqrt{3.24}$
40. $\sqrt{5.76}$
41. $\sqrt{\frac{121}{49}}$
42. $\sqrt{\frac{625}{324}}$
43. $\sqrt{\frac{529}{121}}$
44. $\sqrt{\frac{4}{121}}$
45. $\sqrt{2.89}$
46. $\sqrt{4.41}$
47. $\sqrt{\frac{144}{25}}$
48. $\sqrt{\frac{49}{36}}$
49. $\sqrt{\frac{256}{361}}$
50. $\sqrt{\frac{529}{16}}$
51. $\sqrt{0.49}$
52. $\sqrt{4.84}$

In Exercises 53-70, compute the exact value of the given expression.

53. $6-\sqrt{576}$
54. $-2-7\sqrt{576}$
55. $\sqrt{8^2+15^2}$
56. $\sqrt{7^2+24^2}$
57. $6\sqrt{16}-9\sqrt{49}$
58. $3\sqrt{441}+6\sqrt{484}$
59. $\sqrt{5^2+12^2}$
60. $\sqrt{15^2+20^2}$
61. $\sqrt{3^2+4^2}$
62. $\sqrt{6^2+8^2}$
63. $-2\sqrt{324}-6\sqrt{361}$
64. $-6\sqrt{576}-8\sqrt{121}$
65. $-4-3\sqrt{529}$
66. $-1+\sqrt{625}$
67. $-9\sqrt{484}+7\sqrt{81}$
68. $-\sqrt{625}-5\sqrt{576}$
69. $2-\sqrt{16}$
70. $8-6\sqrt{400}$

In Exercises 71-76, complete the following tasks to estimate the given square root.

a) Determine the two integers that the square root lies between.

b) Draw a number line, and locate the approximate location of the square root between the two integers found in part (a).

c) Without using a calculator, estimate the square root to the nearest tenth.

71. $\sqrt{58}$
72. $\sqrt{27}$
73. $\sqrt{79}$
74. $\sqrt{12}$
75. $\sqrt{44}$
76. $\sqrt{88}$

In Exercises 77-82, use a calculator to approximate the square root to the nearest tenth.

77. $\sqrt{469}$
78. $\sqrt{73}$
79. $\sqrt{615}$
80. $\sqrt{162}$
81. $\sqrt{444}$
82. $\sqrt{223}$

Answers

1. 16, −16

3. none

2.10: What to Combine? Order of Operations with Integers

For convenience, we repeat the "Rules Guiding Order of Operations" first introduced in Section 1.5.

Rules Guiding Order of Operations

When evaluating expressions, proceed in the following order.

1. Evaluate expressions contained in grouping symbols first. If grouping symbols are nested, evaluate the expression in the innermost pair of grouping symbols first.
2. Evaluate all exponents that appear in the expression.
3. Perform all multiplications and divisions in the order that they appear in the expression, moving left to right.
4. Perform all additions and subtractions in the order that they appear in the expression, moving left to right.

Let's look at a number of examples that require the use of these rules.

Example 1

Simplify: (a) $(-3)^2$ and (b) -3^2

Solution

Recall that for any integer a, we have $(-1)a = -a$. Because negating is equivalent to multiplying by -1, the "Rules Guiding Order of Operations" require that we address grouping symbols and exponents before negation.

a) Because of the grouping symbols, we negate first, then square. That is,

$$\begin{aligned}(-3)^2 &= (-3)(-3)\\ &= 9.\end{aligned}$$

b) There are no grouping symbols in this example. Thus, we must square first, then negate. That is,

$$\begin{aligned}-3^2 &= -(3 \cdot 3)\\ &= -9.\end{aligned}$$

Exercise

Simplify: -2^2.

Answer

-4

Example 2

Simplify: $-2 - 3(5 - 7)$.

Solution

Grouping symbols first, then multiplication, then subtraction.

$$\begin{aligned}-2-3(5-7) &= -2-3(-2) && \text{Perform subtraction within parentheses.}\\ &= 2-2-(-6) && \text{Multiply: } 3(-2) = -6.\\ &= -2+6 && \text{Add the opposite.}\\ &= 4\end{aligned}$$

Exercise

Simplify: $-3-2(6-8)$.

Answer

1

Example 3

Simplify: $-2(2-4)^2-3(3-5)^3$.

Solution

Grouping symbols first, then multiplication, and subtraction, in that order.

\[\begin{aligned} -2(2-4)^2 -3(3-5)^3 = -2(-2)^2 -3(-2)^3 ~ & \textcolor{red}{ \text{ Perform subtraction within parentheses first.} } \\ =2 (4) -3(-8) ~ & \textcolor{red}{ \text{ Exponents are next.} } \\ =-8-(-24) ~ & \textcolor{red}{ \text{ Multiplications are next.} } \\ =-8+24 ~ & \textcolor{red}{ \text{ Add the opposite.} } \\ =16 \end{aligned}\nonumber \]

Exercise

Simplify: $-2(5-6)^3-3(5-7)^2$

Answer

-10

Example 4

Simplify: $-24 \div 8(-3)$.

Solution

Division has no preference over multiplication, or vice versa. Divisions and multiplications must be performed in the order that they occur, moving left to right.

$$\begin{aligned} -24 \div 8(-3) &= -3(-3) \quad \text{Division first: } -24 \div 8 = -3. \\ &= 9 \end{aligned}$$

Note that if you multiply first, which would be incorrect, you would get a completely different answer.

Exercise

Simplify: $-48 \div 6(-2)$.

Answer

16

Example 5

Simplify: $(-2)(-3)(-2)^3$.

Solution

Exponents first, then multiplication in the order that it occurs, moving left to right.

$$\begin{aligned} (-2)(-3)(-2)^3 &= (-2)(-3)(-8) \quad \text{Exponent first: } (-2)^3 = -8. \\ &= 6(-8) \quad \text{Multiply from left to right: } (-2)(-3) = 6. \\ &= -48 \end{aligned}$$

? You try it!

Simplify: $(-4)(-2)^2(-1)^3$.

Answer

16

Evaluating Fractions

If a fraction bar is present, evaluate the numerator and denominator separately according to the "Rules Guiding Order of Operations," then perform the division in the final step.

✔ Example 6

Simplify:

$$\frac{-5-5(2-4)^3}{-22-3(-5)}$$

Solution

Evaluate numerator and denominator separately, then divide.

$$\begin{aligned}
\frac{-5-5(2-4)^3}{-22-3(-5)} &= \frac{-5-5(-2)^3}{-22-(-15)} && \text{Numerator: parentheses first.}\\
&= \frac{-5-5(-8)}{-22+15} && \text{Denominator: multiply } 3(-5)=-15.\\
&= \frac{-5-(-40)}{-7} && \text{Numerator: exponent } (-2)^3=-8.\\
&= \frac{-5+40}{-7} && \text{Denominator: add the opposite.}\\
&= \frac{35}{-7} && \text{Numerator: multiply } 5(-8)=-40.\\
&= -5 && \text{Denominator: add } -22+15=-7.\\
& && \text{Numerator: add the opposite.}\\
& && \text{Numerator: } -5+40=35.\\
& && \text{Divide: } 35/-7=-5.
\end{aligned}$$

? Exercise

Simplify:

$$\frac{6-2(-6)}{-2-(-2)^2}$$

Answer

-3

Absolute Value

Absolute value calculates the magnitude of the vector associated with an integer, which is equal to the distance between the number and the origin (zero) on the number line. Thus, for example, |4| = 4 and | − 5| = 5.

But absolute value bars also act as grouping symbols, and according to the "Rules Guiding Order of Operations," you should evaluate the expression inside a pair of grouping symbols first.

Example 7

Simplify: (a) $-(-3)$ and (b) $-|-3|$.

Solution

There is a huge difference between simple grouping symbols and absolute value.

a) This is a case of $-(-a) = a$. Thus, $-(-3) = 3$.

b) This case is much different. The absolute value of -3 is 3, and then the negative of that is -3. In symbols,

$$-|-3| = -3$$

Exercise

Simplify: $-|-8|$.

Answer

-8

Example 8

Simplify: $-3 - 2|5 - 7|$.

Solution

Evaluate the expression inside the absolute value bars first. Then multiply, then subtract.

$$-3 - 2|5 - 7| = -3 - 2|-2|$$

Exercise

Simplify: $-2 - 4|6 - 8|$.

Answer

-10

Exercises

In Exercises 1-40, compute the exact value of the given expression.

1. $7 - \frac{-14}{2}$
2. $-2 - \frac{-16}{4}$
3. $-7 - \frac{-18}{9}$
4. $-6 - \frac{-7}{7}$
5. -54
6. -33
7. $9 - 1(-7)$
8. $85 - 8(9)$
9. -63
10. -35
11. $3 + 9(4)$

12. $6 + 7(-1)$
13. $10 - 72 \div 6 \cdot 3+8$
14. $8 - 120 \div 5 \cdot 6+7$
15. $6 + \frac{14}{2}$
16. $16 + \frac{8}{2}$
17. -34
18. -22
19. $3 - 24 \div 4 \cdot 3+4$
20. $4 - 40 \div 5 \cdot 4+9$
21. $64 \div 4 \cdot 4$
22. $18 \div 6 \cdot 1$
23. $-2 - 3(-5)$
24. $64 - 7(7)$
25. $15 \div 1 \cdot 3$
26. $30 \div 3 \cdot 5$
27. $8 + 12 \div 6 \cdot 1 - 5$
28. $9 + 16 \div 2 \cdot 4 - 9$
29. $32 \div 4 \cdot 4$
30. $72 \div 4 \cdot 6$
31. $-11 + \frac{16}{16}$
32. $4 + \frac{-20}{4}$
33. -52
34. -43
35. $10 + 12(-5)$
36. $4 + 12(4)$
37. $2+6 \div 1 \cdot 6 - 1$
38. $1 + 12 \div 2 \cdot 2 - 6$
39. $40 \div 5 \cdot 4$
40. $30 \div 6 \cdot 5$

In Exercises 41-80, simplify the given expression.

41. $-11 + |-1 - (-6)^2|$
42. $13 + |-21 - (-4)^2|$
43. $|0(-4)| - 4(-4)$
44. $|10(-3)| - 3(-1)$
45. $(2 + 3 \cdot 4) - 8$
46. $(11 + 5 \cdot 2) - 10$
47. $(8 - 1 \cdot 12) + 4$
48. $(9 - 6 \cdot 1) + 3$

49. $(6 + 10 \cdot 4) - 6$

50. $(8 + 7 \cdot 6) - 12$

51. $10 + (6 - 4)^3 - 3$

52. $5 + (12 - 7)^2 - 6$

53. $(6 - 8)^2 - (4 - 7)^3$

54. $(3 - 8)^2 - (4 - 9)^3$

55. $|0(-10)| + 4(-4)$

56. $|12(-5)| + 7(-5)$

57. $|8(-1)| - 8(-7)$

58. $|6(-11)| - 7(-1)$

59. $3 + (3 - 8)^2 - 7$

60. $9 + (8 - 3)^3 - 6$

61. $(4 - 2)^2 - (7 - 2)^3$

62. $(1 - 4)^2 - (3 - 6)^3$

63. $8 - |- 25 - (-4)^2|$

64. $20 - |- 22 - 4^2|$

65. $-4 - |30 - (-5)^2|$

66. $-8 - |- 11 - (-6)^2|$

67. $(8 - 7)^2 - (2 - 6)^3$

68. $(2 - 7)^2 - (4 - 7)^3$

69. $4 - (3 - 6)^3 + 4$

70. $6 - (7 - 8)^3 + 2$

71. $-3 + | - 22 - 5^2|$

72. $12 + |23 - (-6)^2|$

73. $(3 - 4 \cdot 1) + 6$

74. $(12 - 1 \cdot 6) + 4$

75. $1 - (1 - 5)^2 + 11$

76. $9 - (3 - 1)^3 + 10$

77. $(2 - 6)^2 - (8 - 6)^3$

78. $(2 - 7)^2 - (2 - 4)^3$

79. $|9(-3)| + 12(-2)$

80. $|0(-3)| + 9(-7)$

In Exercises 81-104, simplify the given expression.

81. $\frac{4(-10)-5}{-9}$

82. $\frac{-4 \cdot 6-(-8)}{-4}$

83. $\frac{10^2-4^2}{2 \cdot 6-10}$

84. $\frac{3^2-9^2}{2 \cdot 7-5}$

85. $\frac{3^2+6^2}{5-1\cdot 8}$

86. $\frac{10^2+4^2}{1-6\cdot 5}$

87. $\frac{-8-4}{7-13}$

88. $\frac{13-1}{8-4}$

89. $\frac{2^2+6^2}{11-4\cdot 4}$

90. $\frac{7^2+3^2}{10-8\cdot 1}$

91. $\frac{1^2-5^2}{9\cdot 1-5}$

92. $\frac{5^2-7^2}{2\cdot 2-12}$

93. $\frac{4^2-8^2}{6\cdot 3-2}$

94. $\frac{7^2-6^2}{6\cdot 3-5}$

95. $\frac{10^2+2^2}{10-2\cdot 7}$

96. $\frac{2^2+10^2}{10-2\cdot 7}$

97. $\frac{16-(-2)}{19-1}$

98. $\frac{-8-20}{-15-(-17}$

99. $\frac{15-(-15)}{13-(-17)}$

100. $\frac{7-(-9)}{-1-1}$

101. $\frac{4\cdot 5-(-19)}{3}$

102. $\frac{10\cdot 7-(-11)}{-3}$

103. $\frac{-6\cdot 9-(-4)}{2}$

104. $\frac{-6\cdot 2-10}{-11}$

2.11: Mathematical Expressions (NOT Equations)

Recall the definition of a *variable* presented in Section 1.6.

Definition: Variable

A variable is a symbol (usually a letter) that stands for a value that may vary.

Let's add the definition of a *mathematical expression*.

Definition: Mathematical Expression

When we combine numbers and variables in a valid way, using operations such as addition, subtraction, multiplication, division, exponentiation, and other operations and functions as yet unlearned, the resulting combination of mathematical symbols is called a *mathematical expression*.

Thus,

$$2a,\ x + 5, \text{ and } y^2,$$

being formed by a combination of numbers, variables, and mathematical operators, are valid mathematical expressions. A mathematical expression must be *well-formed*. For example,

$$2 + \div 5x$$

is *not a valid expression* because there is no term following the plus sign (it is not valid to write +÷ with nothing between these operators). Similarly,

$$2 + 3(2$$

is not well-formed because parentheses are not balanced.

Translating Words into Mathematical Expressions

In this section we turn our attention to translating word phrases into mathematical expressions. We begin with phrases that translate into *sums*. There is a wide variety of word phrases that translate into sums. Some common examples are given in Table 2.11.1*a*, though the list is far from complete. In like manner, a number of phrases that translate into differences are shown in Table 2.11.1*b*

Table 2.11.1: Translating words into symbols.

Phrase	Translates to:	Phrase	Translates to:
sum of x and 12	$x + 12$	difference of x and 12	$x - 12$
4 greater than b	$b + 4$	4 less than b	$b - 4$
6 more than y	$y + 6$	7 subtracted from y	$y - 7$
44 plus r	$44 + r$	44 minus r	$44 - r$
3 larger than z	$z + 3$	3 smaller than z	$z - 3$
a) Phrases that are sums		b) Phrases that are differences	

Let's look at some examples, some of which translate into expressions involving sums, and some of which translate into expressions involving differences.

Example 1

Translate the following phrases into mathematical expressions:

a. "12 larger than x,"
b. "11 less than y," and

c. "r decreased by 9."

Solution

Here are the translations.

a. “12 larger than x” becomes $x + 12$.
b. “11 less than y” becomes $y - 11$.
c. “r decreased by 9” becomes $r - 9$.

Exercise

Translate the following phrases into mathematical expressions:

a. "13 more than x" and
b. "12 fewer than y".

Answer

(a) $x + 13$ and

(b) $y - 12$

Example 2

Let W represent the width of the rectangle. The length of a rectangle is 4 feet longer than its width. Express the length of the rectangle in terms of its width W.

Solution

We know that the width of the rectangle is W. Because the length of the rectangle is 4 feet longer that the width, we must add 4 to the width to find the length.

Length	is	4	more than	the width
Length	$=$	4	$+$	W

Thus, the length of the rectangle, in terms of its width W, is $4 + W$.

Exercise

The width of a rectangle is 5 inches shorter than its length L. Express the width of the rectangle in terms of its length L.

Answer

$L - 5$

Example 3

A string measures 15 inches is cut into two pieces. Let x represent the length of one of the resulting pieces. Express the length of the second piece in terms of the length x of the first piece.

Solution

The string has original length 15 inches. It is cut into two pieces and the first piece has length x. To find the length of the second piece, we must subtract the length of the first piece from the total length.

Length of the second piece	is	Total length	minus	the length of the first piece
Length of the second piece	$=$	15	$-$	x

Thus, the length of the second piece, in terms of the length x of the first piece, Answer: $12 + x$ is $15 - x$.

Exercise

A string is cut into two pieces, the first of which measures 12 inches. Express the total length of the string as a function of x, where x represents the length of the second piece of string.

Answer

$12 + x$

There is also a wide variety of phrases that translate into products. Some examples are shown in Table 3.2(a), though again the list is far from complete. In like manner, a number of phrases translate into quotients, as shown in Table 3.2(b).

Table 2.11.2: Translating words into symbols.

Phrase	Translates to:	Phrase	Translates to:
product of x and 12	$12x$	quotient of x and 12	$x/12$
4 times b	$4b$	4 divided by b	$4/b$
twice r	$2r$	the ratio of 44 to r	$44/r$
a) Phrases that are products.		b) Phrases that are differences.	

Let's look at some examples, some of which translate into expressions involving products, and some of which translate into expressions involving quotients.

Example 4

Translate the following phrases into mathematical expressions: (a) "11 times x," (b) "quotient of y and 4," and (c) "twice a."

Solution

Here are the translations. a) "11 times x" becomes $11x$. b) "quotient of y and 4" becomes $y/4$, or equivalently, $\frac{y}{4}$. c) "twice a" becomes $2a$.

Exercise

Translate into mathematical symbols: (a) "the product of 5 and x" and (b) "12 divided by y."

Answer

(a) $5x$ and (b) $12/y$.

Example 5

A plumber has a pipe of unknown length x. He cuts it into 4 equal pieces. Find the length of each piece in terms of the unknown length x.

Solution

The total length is unknown and equal to x. The plumber divides it into 4 equal pieces. To find the length of each pieces, we must divide the total length by 4.

$$\begin{array}{cccccc} \text{Length of each piece} & \text{is} & \text{Total length} & \text{divided by} & 4 \\ \text{Length of each piece} & = & x & \div & 4 \end{array}$$

Thus, the length of each piece, in terms of the unknown length x, is $x/4$, or equivalently, $\frac{x}{4}$.

Exercise

A carpenter cuts a board of unknown length L into three equal pieces. Express the length of each piece in terms of L.

Answer

L/3

Example 6

Mary invests A dollars in a savings account paying 2% interest per year. She invests five times this amount in a certificate of deposit paying 5% per year. How much does she invest in the certificate of deposit, in terms of the amount A in the savings account?

Solution

The amount in the savings account is A dollars. She invests five times this amount in a certificate of deposit.

$$\begin{array}{cccccc} \text{Amount in CD} & \text{is} & 5 & \text{times} & \text{Amount in savings} \\ \text{Amount in CD} & = & 5 & \cdot & A \end{array}$$

Thus, the amount invested in the certificate of deposit, in terms of the amount A in the savings account, is $5A$.

Exercise

David invests K dollars in a savings account paying 3% per year. He invests half this amount in a mutual fund paying 4% per year. Express the amount invested in the mutual fund in terms of K, the amount invested in the savings account.

Answer

$\frac{1}{2}K$

Combinations

Some phrases require combinations of the mathematical operations employed in previous examples.

Example 7

Let the first number equal x. The second number is 3 more than twice the first number. Express the second number in terms of the first number x.

Solution

The first number is x. The second number is 3 more than twice the first number.

$$\begin{array}{cccc} \text{Second number} & \text{is} & 3 \text{ more than} & \text{twice the first number} \\ \text{Second number} = & & 3+ & 2x \end{array}$$

Therefore, the second number, in terms of the first number x, is $3 + 2x$.

Exercise

A second number is 4 less than 3 times a first number. Express the second number in terms of the first number y.

Answer

$3y - 4$

Example 8

The length of a rectangle is L. The width is 15 feet less than 3 times the length. What is the width of the rectangle in terms of the length L?

Solution

The length of the rectangle is L. The width is 15 feet less than 3 times the length.

Width	is	3 times the length	less	15
Width $=$		$3L-$		15

Therefore, the width, in terms of the length L, is $3L - 15$.

Exercise

The width of a rectangle is W. The length is 7 inches longer than twice the width. Express the length of the rectangle in terms of its length L.

Answer

$2W + 7$

Exercises

In Exercises 1-20, translate the phrase into a mathematical expression involving the given variable.

1. “8 times the width n ”
2. “2 times the length z ”
3. “6 times the sum of the number n and 3”
4. “10 times the sum of the number n and 8”
5. “the demand b quadrupled”
6. “the supply y quadrupled”
7. “the speed y decreased by 33”
8. “the speed u decreased by 30”
9. “10 times the width n ”
10. “10 times the length z ”
11. “9 times the sum of the number z and 2”
12. “14 times the sum of the number n and 10”
13. “the supply y doubled”
14. “the demand n quadrupled”
15. “13 more than 15 times the number p ”
16. “14 less than 5 times the number y ”
17. “4 less than 11 times the number x ”
18. “13 less than 5 times the number p ”
19. “the speed u decreased by 10”
20. “the speed w increased by 32”

---

21. Representing Numbers. Suppose n represents a whole number.

i) What does n + 1 represent?

ii) What does n + 2 represent?

iii) What does n − 1 represent?

22. Suppose 2n represents an even whole number. How could we represent the next even number after 2n?

23. Suppose 2n + 1 represents an odd whole number. How could we represent the next odd number after 2n + 1?

24. There are b bags of mulch produced each month. How many bags of mulch are produced each year?

25. Steve sells twice as many products as Mike. Choose a variable and write an expression for each man's sales.

26. Find a mathematical expression to represent the values.

i) How many quarters are in d dollars?

ii) How many minutes are in h hours?

iii) How many hours are in d days?

iv) How many days are in y years?

v) How many months are in y years?

vi) How many inches are in f feet?

vii) How many feet are in y yards?

Answers

1. 8n

3. 6(n + 3)

5. 4b

7. y − 33

9. 10n

11. 9(z + 2)

13. 2y

15. 15p + 13 17.

11x − 4

19. u − 10

21.

i) n+1 represents the next whole number after n.

ii) n+2 represents the next whole number after n + 1, or, two whole numbers after n.

iii) n − 1 represents the whole number before n.

23. 2n + 3

25. Let Mike sell p products. Then Steve sells 2p products.

- **3.1: Mathematical Expressions** by David Arnold is licensed CC BY-NC-SA 3.0.

2.12: Evaluating (NOT Solving) Algebraic Expressions

In this section we will evaluate *algebraic expressions* for given values of the variables contained in the expressions. Here are some simple tips to help you be successful.

Tips for Evaluating Algebraic Expressions

1. Replace all occurrences of variables in the expression with open parentheses. Leave room between the parentheses to substitute the given value of the variable.
2. Substitute the given values of variables in the open parentheses prepared in the first step.
3. Evaluate the resulting expression according to the Rules Guiding Order of Operations.

Let's begin with an example.

Example 1

Evaluate the expression $x^2-2xy+y^2$ at $x=-3$ and $y=2$.

Solution

Following "Tips for Evaluating Algebraic Expressions," first replace all occurrences of variables in the expression $x^2 - 2xy + y^2$ with open parentheses.

$$x^2-2xy+y^2=(\,)^2-2(\,)(\,)+(\,)^2$$

Secondly, replace each variable with its given value, and thirdly, follow the "Rules Guiding Order of Operations" to evaluate the resulting expression.

$$\begin{aligned} x^2-2xy+y^2 &\quad \text{Original expression.}\\ =(-3)^2-2(-3)(2)+(2)^2 &\quad \text{Substitute } -3 \text{ for } x \text{and } 2 \text{ for } y.\\ =9-2(-3)(2)+4 &\quad \text{Evaluate exponents first.}\\ =9-(-6)(2)+4 &\quad \text{Left to right, multiply } 2(-3)=-6.\\ =9-(-12)+4 &\quad \text{Left to right, multiply: } (-6)(2)=-12.\\ =9+12+4 &\quad \text{Add the opposite.}\\ =25 &\quad \text{Add.} \end{aligned}$$

Exercise

If $x = -2$ and $y = -1$, evaluate $x^3 - y^3$.

Answer

-7

Example 2

Evaluate the expression $(a - b)^2$ If $a = 3$ and $b = -5$, at $a = 3$ and $b = -5$.

Solution

Following "Tips for Evaluating Algebraic Expressions," first replace all occurrences of variables in the expression $(a - b)^2$ with open parentheses.

$$(a-b)^2=((\,)-(\,))^2$$

Secondly, replace each variable with its given value, and thirdly, follow the "Rules Guiding Order of Operations" to evaluate the resulting expression.

$$
\begin{aligned}
(a-b)^2 &= ((3)-(-5))^2 && \text{Substitute 3 for } a \text{ and } -5 \text{ for } b.\\
&= (3+5)^2 && \text{Add the opposite: } (3)-(-5)=3+5\\
&= 8^2 && \text{Simplify inside parentheses: } 3+5=8\\
&= 64 && \text{Evaluate exponent: } 8^2=64
\end{aligned}
$$

? Exercise

If $a = 3$ and $b = -5$, evaluate $a^2 - b^2$.

Answer

−16

✓ Example 3

Evaluate the expression |a|−|b| at a = 5 and b = −7.

Solution

Following "Tips for Evaluating Algebraic Expressions," first replace all occurrences of variables in the expression |a|−|b| with open parentheses.

$$|a|-|b| = |(\,)|-|(\,)|$$

Secondly, replace each variable with its given value, and thirdly, follow the "Rules Guiding Order of Operations" to evaluate the resulting expression.

$$
\begin{aligned}
|a|-|b| = |(5)| &= |(-7)| && \text{Substitute } 5 \text{ for } a \text{ and } -7 \text{ for } b.\\
&= 5-7 && \text{Absolute values first: } |(5)|=5 \text{ and } |(-7)|=7|\\
&= 5+(-7) && \text{Add the opposites: } 5-7=5+(-7).\\
&= -2 && \text{Add: } 5+(-7)=-2.
\end{aligned}
$$

? Exercise

If $a = 5$ and $b = -7$, evaluate $2|a| - 3|b|$.

Answer

−11

✓ Example 4

Evaluate the expression $|a - b|$ at $a = 5$ and $b = -7$.

Solution

Following "Tips for Evaluating Algebraic Expressions," first replace all occurrences of variables in the expression $|a - b|$ with open parentheses.

$$|a-b| = |(\,)-(\,)|$$

Secondly, replace each variable with its given value, and thirdly, follow the "Rules Guiding Order of Operations" to evaluate the resulting expression.

$$
\begin{aligned}
|a-b| &= |(5)-(-7)| && \text{Substitute } 5 \text{ for } a \text{ and } -7 \text{ for } b.\\
&= |5+7| && \text{Add the opposite: } 5-(-7)=5+7.\\
&= |12| && \text{Add: } 5+7=12.\\
&= 12 && \text{Take the absolute value: } |12|=12.
\end{aligned}
$$

Exercise

If $a = 5$ and $b = -7$, evaluate $|2a - 3b|$.

Answer

31

Example 5

Evaluate the expression

$$\frac{ad-bc}{a+b}$$

at $a = 5$, $b = -3$, $c = 2$, and $d = -4$.

Solution

Following "Tips for Evaluating Algebraic Expressions," first replace all occurrences of variables in the expression with open parentheses.

$$\frac{ad-bc}{a+b} = \frac{(\,)(\,)-(\,)(\,)}{(\,)+(\,)}$$

Secondly, replace each variable with its given value, and thirdly, follow the "Rules Guiding Order of Operations" to evaluate the resulting expression.

$$\begin{aligned}
\frac{ad-bc}{a+b} &= \frac{(5)-(-3)(2)}{(5)+(-3)} && \text{Substitute: } 5 \text{ for } a,\ -3 \text{ for } b,\ 2 \text{ for } c,\ -4 \text{ for } d.\\
&= \frac{-20-(-6)}{2} && \text{Numerator: } (5)(=4) = -20,\ (-3)(2) = -6.\\
&&& \text{Denominator: } 5+(-3) = 2.\\
&= \frac{-20+6}{2} && \text{Numerator: Add the opposite.}\\
&= \frac{-14}{2} && \text{Numerator: } -20+6 = -14.\\
&= -7 && \text{Divide.}
\end{aligned}$$

Exercise

If a = −7, b = −3, c = −15, 15, and $d = -14$, evaluate:

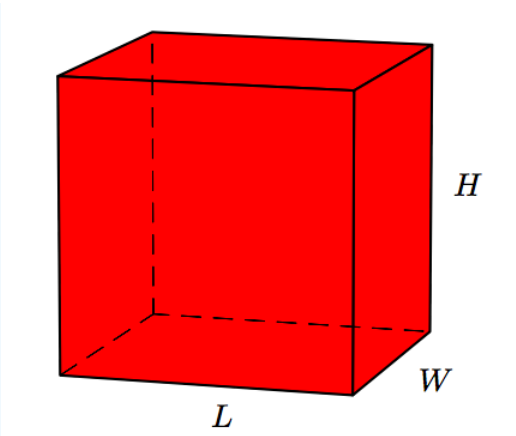
$$\frac{a^2+b^2}{c+d}$$

Answer

−2

Example 6

Pictured below is a rectangular prism.



The volume of the rectangular prism is given by the formula

$$V = LWH,$$

where L is the length, W is the width, and H is the height of the rectangular prism. Find the volume of a rectangular prism having length 12 feet, width 4 feet, and height 6 feet.

Solution

Following "Tips for Evaluating Algebraic Expressions," first replace all occurrences of of L, W, and H in the formula

$$V = LWH$$

with open parentheses.

$$V = (\,)(\,)(\,)$$

Next, substitute 12 ft for L, 4 ft for W, and 6 ft for H and simplify.

$$\begin{aligned} V &= (12\text{ft})(4\text{ft})(6\text{ft}) \\ &= 288\text{ft}^3 \end{aligned}$$

Hence, the volume of the rectangular prism is 288 cubic feet.

? Exercise

The surface area of the prism pictured in this example is given by the following formula:

$$S = 2(WH + LH + LW)$$

If L = 12, W = 4, and H = 6 feet, respectively, calculate the surface area.

Answer

288 square feet

Exercises

In Exercises 1-12, evaluate the expression at the given value of x.

1. $-3x^2 - 6x + 3$ at $x = 7$
2. $7x^2 - 7x + 1$ at $x = -8$
3. $-6x - 6$ at $x = 3$
4. $6x - 1$ at $x = -10$
5. $5x^2 + 2x + 4$ at $x = -1$

6. $4x^2 - 9x + 4$ at $x = -3$

7. $-9x - 5$ at $x = -2$

8. $-9x + 12$ at $x = 5$

9. $4x^2 + 2x + 6$ at $x = -6$

10. $-3x^2 + 7x + 4$ at $x = -7$

11. $12x + 10$ at $x = -12$

12. $-6x + 7$ at $x = 11$

In Exercises 13-28, evaluate the expression at the given values of x and y.

13. $|x|-|y|$ at $x = -5$ and $y = 4$

14. $|x|-|y|$ at $x = -1$ and $y = -2$

15. $-5x^2 + 2y^2$ at $x = 4$ and $y = 2$

16. $-5x^2 - 4y^2$ at $x = -2$ and $y = -5$

17. $|x|-|y|$ at $x = 0$ and $y = 2$

18. $|x|-|y|$ at $x = -2$ and $y = 0$

19. $|x - y|$ at $x = 4$ and $y = 5$

20. $|x - y|$ at $x = -1$ and $y = -4$

21. $5x^2 - 4xy + 3y^2$ at $x = 1$ and $y = -4$

22. $3x^2 + 5xy + 3y^2$ at $x = 2$ and $y = -1$

23. $|x - y|$ at $x = 4$ and $y = 4$

24. $|x - y|$ at $x = 3$ and $y = -5$

25. $-5x^2 - 3xy + 5y^2$ at $x = -1$ and $y = -2$

26. $3x^2 - 2xy - 5y^2$ at $x = 2$ and $y = 5$

27. $5x^2 + 4y^2$ at $x = -2$ and $y = -2$

28. $-4x^2 + 2y^2$ at $x = 4$ and $y = -5$

In Exercises 29-40, evaluate the expression at the given value of x.

29. $\frac{9+9x}{-x}$ at $x = -3$

30. $\frac{9-2x}{-x}$ at $x = -1$

31. $\frac{-8x+9}{-9+x}$ at $x = 10$

32. $\frac{2x+4}{1+x}$ at $x = 0$

33. $\frac{-4+9x}{7x}$ at $x = 2$

34. $\frac{-1-9x}{x}$ at $x = -1$

35. $\frac{-12-7x}{x}$ at $x = -1$

36. $\frac{12+11x}{3x}$ at $x = -6$

37. $\frac{6x-10}{5}$ + x at $x = -6$

38. $\frac{11x+11}{-4}$ + x at $x = 5$

39. $\frac{10x+11}{5}$ + x at $x = -4$

40. $\frac{6x+12}{-3}$ + x at x = 2

41. The formula

$$d = 16t^2$$

gives the distance (in feet) that an object falls from rest in terms of the time t that has elapsed since its release. Find the distance d (in feet) that an object falls in t = 4 seconds.

42. The formula

$$d = 16t^2$$

gives the distance (in feet) that an object falls from rest in terms of the time t that has elapsed since its release. Find the distance d (in feet) that an object falls in t = 24 seconds.

43. The formula

$$C = \frac{5(F-32)}{9}$$

gives the Celcius temperature C in terms of the Fahrenheit temperature F. Use the formula to find the Celsius temperature (◦ C) if the Fahrenheit temperature is F = 230◦ F.

44. The formula

$$C = \frac{5(F-32)}{9}$$

gives the Celcius temperature C in terms of the Fahrenheit temperature F. Use the formula to find the Celsius temperature (°C) if the Fahrenheit temperature is F = 95 °F.

45. The Kelvin scale of temperature is used in chemistry and physics. Absolute zero occurs at 0° K, the temperature at which molecules have zero kinetic energy. Water freezes at 273° K and boils at K = 373° K. To change Kelvin temperature to Fahrenheit temperature, we use the formula

$$F = \frac{9(K-273)}{5} + 32.$$

Use the formula to change 28° K to Fahrenheit.

46. The Kelvin scale of temperature is used in chemistry and physics. Absolute zero occurs at 0° K, the temperature at which molecules have zero kinetic energy. Water freezes at 273° K and boils at K = 373° K. To change Kelvin temperature to Fahrenheit temperature, we use the formula

$$F = \frac{9(K-273)}{5} + 32.$$

Use the formula to change 248° K to Fahrenheit.

47. A ball is thrown vertically upward. Its velocity t seconds after its release is given by the formula

$$v = v0 - gt,$$

where v_0 is its initial velocity, g is the acceleration due to gravity, and v is the velocity of the ball at time t. The acceleration due to gravity is g = 32 feet per second per second. If the initial velocity of the ball is v_0 = 272 feet per second, find the speed of the ball after t = 6 seconds.

48. A ball is thrown vertically upward. Its velocity t seconds after its release is given by the formula

$$v = v_0 - gt,$$

where v_0 is its initial velocity, g is the acceleration due to gravity, and v is the velocity of the ball at time t. The acceleration due to gravity is g = 32 feet per second per second. If the initial velocity of the ball is v_0 = 470 feet per second, find the speed of the ball after t = 4 seconds.

49. **Even numbers**. Evaluate the expression 2n for the following values:

i) n = 1

ii) n = 2

iii) n = 3

iv) n = −4

v) n = −5

vi) Is the result always an even number? Explain.

50. **Odd numbers**. Evaluate the expression 2n + 1 for the following values:

i) n = 1

ii) n = 2

iii) n = 3

iv) n = −4

v) n = −5

vi) Is the result always an odd number? Explain.

Answers

1. −186
3. −24
5. 7
7. 13
9. 138
11. −134
13. 1
15. −72
17. −2
19. 1
21. 69

2.13: Simplifying (Still Not Solving) Algebraic Expressions) is shared under a not declared license and was authored, remixed, and/or curated by LibreTexts.

2.13.1: Simplifying Algebraic Expressions

Recall the commutative and associative properties of multiplication.

The Commutative Property of Multiplication. If a and b are any integers, then

$$a \cdot b = b \cdot a, \text{ or equivalently, } ab = ba.$$

The Associative Property of Multiplication. If a, b, and c are any integers, then

$$(a \cdot b) \cdot c = a \cdot (b \cdot c), \text{ or equivalently, } (ab)c = a(bc).$$

The commutative property allows us to change the order of multiplication without affecting the product or answer. The associative property allows us to regroup without affecting the product or answer.

Example 1

Simplify: $2(3x)$.

Solution

Use the associative property to regroup, then simplify.

$$\begin{aligned} 2(3x) &= (2 \cdot 3)x \quad \text{Regrouping with the associative property.} \\ &= 6x \quad \text{Simplify: } 2 \cdot 3 = 6. \end{aligned}$$

Exercise

Simplify: $-5(7y)$

Answer

$-35y$

The statement $2(3x)=6x$ is an *identity*. That is, the left-hand side and right-hand side of $2(3x)=6x$ are the same for all values of x. Although the derivation in Example 1 should be the proof of this statement, it helps the intuition to check the validity of the statement for one or two values of x.

If $x = 4$, then

$$\begin{aligned} 2(3x) &= 2(3(4)) \\ &= 2(12) \\ &= 24 \end{aligned} \quad \text{and} \quad \begin{aligned} 6x &= 6(4) \\ &= 24 \end{aligned}$$

If $x = -5$, then

$$\begin{aligned} 2(3x) &= 2(3(-5)) \\ &= 2(-15) \\ &= -30 \end{aligned} \quad \text{and} \quad \begin{aligned} 6x &= 6(-5) \\ &= -30 \end{aligned}$$

The above calculations show that $2(3x)=6x$ for both $x = 4$ and $x = -5$. Indeed, the statement $2(3x)=6x$ is true, regardless of what is substituted for x.

Example 2

Simplify: $(-3t)(-5)$.

Solution

In essence, we are multiplying three numbers, −3, *t*, and −5, but the grouping symbols ask us to multiply the −3 and the t first. The associative and commutative properties allow us to change the order and regroup.

$$\begin{aligned}(-3t)(-5) &= ((-3)(-5))t \quad \text{Change the order and regroup.}\\ &= 15t \quad \text{Multiply: } (-3)(-5) = 15.\end{aligned}$$

? Exercise

Simplify: (−8*a*)(5)

Answer

−40*a*

✓ Example 3

Simplify: (−3*x*)(−2*y*)

Solution

In essence, we are multiplying four numbers, −3, x, −2, and y, but the grouping symbols specify a particular order. The associative and commutative properties allow us to change the order and regroup.

$$\begin{aligned}(-3x)(-2y) &= ((-3)(-2))(xy) \quad \text{Change the order and regroup.}\\ &= 6xy \quad \text{Multiply: } (-3)(-2) = 6.\end{aligned}$$

? Exercise

Simplify: (−4*a*)(5*b*)

Answer

−20*ab*

Speeding Things Up

The meaning of the expression $2 \cdot 3 \cdot 4$ is clear. Parentheses and order of operations are really not needed, as the commutative and associative properties explain that it doesn't matter which of the three numbers you multiply together first.

- You can multiply 2 and 3 first:

$$\begin{aligned}2 \cdot 3 \cdot 4 &= (2 \cdot 3) \cdot 4\\ &= 6 \cdot 4\\ &= 24.\end{aligned}$$

- Or you can multiply 3 and 4 first:

$$\begin{aligned}2 \cdot 3 \cdot 4 &= 2 \cdot (3 \cdot 4)\\ &= 2 \cdot 12\\ &= 24.\end{aligned}$$

- Or you can multiply 2 and 4 first:

$$\begin{aligned}2 \cdot 3 \cdot 4 &= (2 \cdot 4) \cdot 3\\ &= 8 \cdot 3\\ &= 24.\end{aligned}$$

So, it does not matter which two factors you multiply first.

Of course, this would not be the case if there were a mixture of multiplication and other operators (division, addition, subtraction). Then we would have to strictly follow the "Rules Guiding Order of Operations." But if the only operator is multiplication, the order

of multiplication is irrelevant.

Thus, when we see 2(3x), as in Example 1, we should think "It's all multiplication and it doesn't matter which two numbers I multiply together first, so I'll multiply the 2 and the 3 and get 2(3x)=6x."

Our comments apply equally well to a product of four or more factors. It simply doesn't matter how you group the multiplication. So, in the case of (−3x)(−2y), as in Example 3, find the product of −2 and −3 and multiply the result by the product of x and y. That is, (−3x)(−2y)=6xy.

Example 4

Simplify: (2a)(3b)(4c).

Solution

The only operator is multiplication, so we can order and group as we please. So, we'll take the product of 2, 3, and 4, and multiply the result by the product of a, b, and c. That is,

$$(2a)(3b)(4c) = 24abc$$

Exercise

Simplify: (−3x)(−2y)(−4z)

Answer

−24xyz.

The Distributive Property

Multiplication is distributive with respect to addition.

The Distributive Property

If a, b, and c are any integers, then

$a \cdot (b + c) = a \cdot b + a \cdot c$, or equivalently, $a(b + c) = ab + ac$.

For example, if we follow the "Rules Guiding Order of Operations" and first evaluate the expression inside the parentheses, then

$$\begin{aligned} 3(4+5) &= 3(9) && \text{Parentheses first: } 4+5=9. \\ &= 27. && \text{Multiply: } 3(9)=27. \end{aligned}$$

But if we "distribute" the 3, we get the same answer.

$$\begin{aligned} 3(4+5) &= 3(4+5) && \text{Each number in parentheses is multiplied by the number 3 outside the parentheses.} \\ &= 3(4)+3(5) \\ &= 12+15 && \text{Multiply first: } 3(4)=12,\ 3(5)=15. \\ &= 27 && \text{Add.} \end{aligned}$$

Example 5

Use the distributive property to simplify: 3(4x + 5).

Solution

Distribute the 3.

$$\begin{aligned} 3(4x+5) &= 3(4x)+3(5) && \text{Each number in parentheses is multiplied by the number 3 outside the parentheses.} \\ &= 12x+15 && \text{Multiply first: } 3(4x)=12x,\ 3(5)=15. \end{aligned}$$

Exercise

Use the distributive property to simplify: 2(5z+7).

Answer

10z + 14

Multiplication is also distributive with respect to subtraction.

The Distributive Property

If a, b, and c are any integers, then

$$a \cdot (b - c) = a \cdot b - a \cdot c, \text{ or equivalently, } a(b - c) = ab - ac.$$

The application of this form of the distributive property is identical to the first, the only difference being the subtraction symbol.

Example 6

Use the distributive property to simplify: 5(3x − 2).

Solution

Distribute the 5.

$$\begin{aligned} 5(3x-2) &= 5(3x)-5(2) && \text{Each number in parentheses is multiplied by the number 5 outside the parentheses.} \\ &= 15x-10 && \text{Multiply first: } 5(3x)=15x, 5(2)=10. \end{aligned}$$

Exercise

Use the distributive property to simplify: 7(4a − 5).

Answer

28a − 35

Example 7

Remove parentheses: (a) −9(2t + 7), and (b) −5(4 − 3y).

Solution

a) Use the distributive property.

$$\begin{aligned} -9(2t+7) &= -9(2t)+(-9)(7) && \text{Distribute multiplication by } -9. \\ &= -18t+(-63) && \text{Multiply: } -9(2t)=-18t \text{ and } -9(7)=-63. \\ &= -18t-63 && \text{Write the answer in simpler form.} \\ & && \text{Adding } -63 \text{ is the same as subtracting } 63. \end{aligned}$$

b) Use the distributive property.

$$\begin{aligned} -5(4-3y) &= -5(4)-(-5)(3y) && \text{Distribute multiplication by } -5. \\ &= -20-(-15y) && \text{Multiply: } -5(4)=-20 \text{ and } -5(3y)=-15y. \\ &= -18t-63 && \text{Write the answer in simpler form.} \\ & && \text{Subtracting } -15y \text{ is the same as adding } 15y. \end{aligned}$$

Exercise

Remove parentheses: $-3(4t - 11)$.

Answer

$-12t + 33$

Writing Mathematics

Example 7 stresses the importance of using as few symbols as possible to write your final answer. Hence, $-18t - 63$ is favored over $-18t + (-63)$ and $-20 + 15y$ is favored over $-20 - (-15y)$. You should always make these final simplifications.

Moving a Bit Quicker

Once you've applied the distributive property to a number of problems, showing all the work as in Example 7, you should try to eliminate some of the steps. For example, consider again Example 7(a). It's not difficult to apply the distributive property without writing down a single step, getting:

$$-9(2t+7) = -18t - 63.$$

Here's the thinking behind this technique:

1. First, multiply -9 times $2t$, getting $-18t$.
2. Second, multiply -9 times $+7$, getting -63.

Note that this provides exactly the same solution found in Example 7(a).

Let try this same technique on Example 7(b).

$$-5(4 - 3y) = -20 + 15y$$

Here's the thinking behind this technique.

1. First, multiply -5 times 4, getting -20.
2. Second, multiply -5 times $-3y$, getting $+15y$.

Note that this provides exactly the same solution found in Example 7(b).

Extending the Distributive Property

Suppose that we add an extra term inside the parentheses.

Distributive Property

If a, b, c, and d are any integers, then

$$a(b + c + d) = ab + ac + ad.$$

Note that we "distributed" the a times each term inside the parentheses. Indeed, if we added still another term inside the parentheses, we would "distribute" a times that term as well.

Example 8

Remove parentheses: $-5(2x - 3y + 8)$.

Solution

We will use the "quicker" technique, "distributing" -5 times each term in the parentheses mentally.

$$-5(2x - 3y + 8) = -10x + 15y - 40$$

Here is our thought process:

1. First, multiply −5 times 2x, getting −10x.
2. Second, multiply −5 times −3y, getting +15y.
3. Third, multiply −5 times +8, getting −40.

Exercise

Remove parentheses: −3(4a − 5b + 7)

Answer

−12a + 15b − 21

Example 9

Remove parentheses: −4(−3a + 4b − 5c + 12).

Solution

We will use the "quicker" technique, "distributing" −4 times each term in the parentheses mentally.

$$-4(-3a+4b-5c+12)=12a-16b+20c-48$$

Here is our thought process:

1. First, multiply −4 times −3a, getting 12a.
2. Second, multiply −4 times +4b, getting −16b.
3. Third, multiply −4 times −5c, getting +20c.
4. Fourth, multiply −4 times +12, getting −48.

Exercise

Remove parentheses: −2(−2x + 4y − 5z − 11).

Answer

4x − 8y + 10z + 22

Distributing a Negative

It is helpful to recall that negating is equivalent to multiplying by −1.

Multiplying by −1

Let a be any integer, then

$$(-1)a = -a \text{ and } -a = (-1)a.$$

We can use this fact, combined with the distributive property, to negate a sum.

Example 10

Remove parentheses: −(a + b).

Solution

Change the negative symbol into multiplying by −1, then distribute the −1.

$$\begin{aligned} -(a+b) &= (-1)(a+b) && \text{Negating is equivalent to multiplying by } -1. \\ &= -a-b && \text{Distribute the } -1. \end{aligned}$$

We chose to use the "quicker" technique of "distributing" the −1. Here is our thinking:

1. Multiply -1 times a, getting $-a$.
2. Multiply -1 times $+b$, getting $-b$.

Exercise

Remove parentheses: $-(4a - 3c)$

Answer

$-4a + 3c$

The results in Example 10 and Example 11 show us how to negate a sum: Simply negate each term of the sum. Positive terms change to negative, negative terms turn to positive.

Negating a Sum

To negate a sum, simply negate each term of the sum. For example, if a and b are integers, then

$$-(a + b) = -a - b \text{ and } -(a - b) = -a + b.$$

Example 12

Remove parentheses: $-(5 - 7u + 3t)$.

Solution

Simply negate each term in the parentheses.

$$-(5 - 7u + 3t) = -5+7u - 3t$$

Exercise

Remove parentheses: $-(5 - 2x + 4y - 5z)$

Answer

$-5+2x - 4y + 5z$

Exercises

In Exercises 1-20, use the associative and commutative properties of multiplication to simplify the expression.

1. $10(-4x)$
2. $7(-8x)$
3. $(-10x)(-3)$
4. $(-5x)(-8)$
5. $-5(3x)$
6. $9(6x)$
7. $(-4x)10$
8. $(-10x)(-6)$
9. $(5x)3$
10. $(3x)3$
11. $(5x)10$
12. $(-2x)(-10)$

13. −9(−7x)
14. −10(5x)
15. 6(2x)
16. 3(−10x)
17. −8(−9x)
18. 3(−3x)
19. (6x)7
20. (−8x)(−5)

In Exercises 21-44, simplify the expression.

21. 8(7x + 8)
22. −2(5x + 5)
23. 9(−2 + 10x)
24. −9(4 + 9x)
25. −(−2x + 10y − 6)
26. −(−6y + 9x − 7)
27. 2(10 + x)
28. 2(10 − 6x)
29. 3(3 + 4x)
30. 3(4 + 6x)
31. −(−5 − 7x + 2y)
32. −(4x − 8 − 7y)
33. 4(−6x + 7)
34. 6(4x + 9)
35. 4(8x − 9)
36. 10(−10x + 1)
37. −(4 − 2x − 10y)
38. −(−4x + 6 − 8y)
39. −(−5x +1+9y)
40. −(−10 − 5x − 4y)
41. −(6x + 2 − 10y)
42. −(6x + 4 − 10y)
43. −(−3y − 4+4x)
44. −(−7 − 10x + 7y)

Answers

1. −40x
3. 30x
5. −15x

7. −40x

9. 15x

11. 50x

13. 63x

15. 12x

17. 72x

19. 42x

21. 56x + 64

23. −18 + 90x

25. 2x − 10y + 6

27. 20 + 2x

29. 9 + 12x

31. 5+7x − 2y

33. −24x + 28

35. 32x − 36

37. −4+2x + 10y

39. 5x − 1 − 9y

41. −6x − 2 + 10y

43. 3y + 4 − 4x

2.13.2: Combining Like Terms

We begin our discussion with the definition of a *term*.

Definition: Term

A **term** is a single number or variable, or it can be the product of a number (called its coefficient) and one or more variables (called its variable part). The terms in an algebraic expression are separated by addition symbols.

Example 1

Identify the terms in the algebraic expression

$$3x^2 + 5xy + 9y^2 + 12$$

For each term, identify its coefficient and variable part.

Solution

In tabular form, we list each term of the expression 3x^2 + 5xy + 9y^2 + 12, its coefficient, and its variable part.

Term	Coefficient	Variable Part
$3x^2$	3	x^2
$5xy$	5	xy
$9y^2$	9	y^2
12	12	None

Exercise

How many terms are in the algebraic expression $3x^2 + 2xy - 3y^2$?

Answer

3

Example 2

Identify the terms in the algebraic expression

$$a^3 - 3a^2b + 3ab^2 - b^3$$

For each term, identify its coefficient and variable part.

Solution

The first step is to write each difference as a sum, because the terms of an expression are defined above to be those items separated by addition symbols.

$$a^3 + (-3a^2b) + 3ab^2 + (-b^3)$$

In tabular form, we list each term of the expression $a^3 + (-3a^2b) + 3ab^2 + (-b^3)$, its coefficient, and its variable part.

Term	Coefficient	Variable Part
a^3	1	a^3
$-3a^2b$	-3	a^2b

Term	Coefficient	Variable Part
$3ab^2$	3	ab^2
$-b^3$	-1	b^3

Exercise

How many terms are in the algebraic expression $11 - a^2 - 2ab + 3b^2a$?

Answer

4

Like Terms

We define what is meant by "like terms" and "unlike terms."

Definition

Like and Unlike Terms. The variable parts of two terms determine whether the terms are like terms or unlike terms.

Like Terms. Two terms are called like terms if they have identical variable parts, which means that the terms must contain the same variables raised to the same exponential powers.

Unlike Terms. Two terms are called unlike terms if their variable parts are different.

Example 3

Classify each of the following pairs as either *like terms* or *unlike terms*: (a) $3x$ and $-7x$, (b) $2y$ and $3y^2$, (c) $-3t$ and $5u$, and (d) $-4a^3$ and $3a^3$.

Solution

Like terms must have *identical* variable parts.

a. $3x$ and $-7x$ have identical variable parts. They are "like terms."
b. $2y$ and $3y^2$ do not have identical variable parts (the exponents differ). They are "unlike terms."
c. $-3t$ and $5u$ do not have identical variable parts (different variables). They are "unlike terms."
d. $-4a^3$ and $3a^3$ have identical variable parts. They are "like terms."

Exercise

Are $-3xy$ and $11xy$ *like* or *unlike* terms?

Answer

Like terms

Combining Like Terms

When using the distributive property, it makes no difference whether the multiplication is on the left or the right, one still distributes the multiplication times each term in the parentheses.

Distributive Property

If a, b, and c are integers, then

$$a(b + c) = ab + ac \text{ and } (b + c)a = ba + ca.$$

In either case, you distribute a times each term of the sum.

"Like terms" can be combined and simplified. The tool used for combining like terms is the distributive property. For example, consider the expression $3y + 7y$, composed of two "like terms" with a common variable part. We can use the distributive property and write

$$3y + 7y = (3 + 7)y$$

Note that we are using the distributive property in reverse, "factoring out" the common variable part of each term. Checking our work, note that if we redistribute the variable part y times each term in the parentheses, we are returned to the original expression $3y + 7y$.

Example 4

Use the distributive property to combine like terms (if possible) in each of the following expressions: (a) $-5x^2 - 9x^2$, (b) $-5ab + 7ab$, (c) $4y^3 - 7y^2$, and (d) $3xy^2 - 7xy^2$.

Solution

If the terms are "like terms," you can use the distributive property to "factor out" the common variable part.

a) Factor out the common variable part x^2.

$$\begin{aligned} -5x^2 - 9x^2 &= (-5 - 9)x^2 \quad \text{Use the distributive property.} \\ &= -14x^2 \quad \text{Simplify: } -5 - 9 = -5 + (-9) = -14. \end{aligned}$$

b) Factor out the common variable part ab.

$$\begin{aligned} -5ab + 7ab &= (-5 + 7)ab \quad \text{Use the distributive property.} \\ &= 2ab \quad \text{Simplify: } -5 + 7 = 2. \end{aligned}$$

c) The terms in the expression $4y^3 - 7y^2$ have different variable parts (the exponents are different). These are "unlike terms" and cannot be combined.

d) Factor out the common variable part xy^2.

$$\begin{aligned} 3xy^2 - 7xy^2 &= (3 - 7)xy^2 \quad \text{Use the distributive property.} \\ &= -4xy^2 \quad \text{Simplify: } 3 - 7 = 3 + (-7) = -4. \end{aligned}$$

Exercise

Simplify: $-8z - 11z$

Answer

$-19z$

Speeding Things Up a Bit

Once you've written out all the steps for combining like terms, like those shown in Example 4, you can speed things up a bit by following this rule:

Combining Like Terms

To combine like terms, simply add their coefficients and keep the common variable part.

Thus for example, when presented with the sum of two like terms, such as in $5x + 8x$, simply add the coefficients and repeat the common variable part; that is, $5x + 8x = 13x$.

Example 5

Combine like terms:

a. $-9y - 8y$,
b. $-3y^5 + 4y^5$ and
c. $-3u^2 + 2u^2$.

Solution

a) Add the coefficients and repeat the common variable part. Therefore,

$$-9y - 8y = -17y.$$

b) Add the coefficients and repeat the common variable part. Therefore,

$$-3y^5 + 4y^5 = 1y^5.$$

However, note that $1y^5 = y^5$. Following the rule that the final answer should use as few symbols as possible, a better answer is $-3y^5 + 4y^5 = y^5$.

c) Add the coefficients and repeat the common variable part. Therefore,

$$-3u^2 + 2u^2 = (-1)u^2.$$

However, note that $(-1)u^2 = -u^2$. Following the rule that the final answer should use as few symbols as possible, a better answer is $-3u^2 + 2u^2 = -u^2$.

Exercise

Combine: $-3x$, and $-4x^2$

Answer

$-7x^2$

Simplify

A frequently occurring instruction asks the reader to *simplify* an expression.

Simplify

The instruction simplify is a generic term that means "try to write the expression in its most compact form, using the fewest symbols possible."

One way you can accomplish this goal is by combining like terms when they are present.

Example 6

Simplify: $2x + 3y - 5x + 8y$.

Solution

Use the commutative property to reorder terms and the associative and distributive properties to regroup and combine like terms.

$$\begin{aligned} 2x + 3y - 5x + 8y &= (2x - 5x) + (3y + 8y) && \text{Reorder and regroup.} \\ &= -3x + 11y && \text{Combine like terms:} \\ & && 2x - 5x = -3x \text{ and } 3y + 8y = 11y. \end{aligned}$$

Alternate solution

Of course, you do not need to show the regrouping step. If you are more comfortable combining like terms in your head, you are free to present your work as follows:

$$2x+3y-5x+8y=-3x+11y.$$

Exercise

Simplify: $-3a + 4b - 7a - 9b$

Answer

$-10a - 5b$

Example 7

Simplify: $-2x - 3 - (3x + 4)$.

Solution

First, distribute the negative sign.

$$-2x-3-(3x+4)=-2x-3-3x-4 \quad -(3x+4)=-3x-4.$$

Next, use the commutative property to reorder, then the associative property to regroup. Then combine like terms.

$$\begin{aligned} &=(-2x-3x)+(-3-4) && \text{Reorder and regroup.}\\ &=-5x+(-7) && \text{Combine like terms:}\\ & && -2x-3x=-5x.\\ &=-5x-7 && \text{Simplify:}\\ & && -5x+(-7)=-5x-7. \end{aligned}$$

Alternate solution

You may skip the second step if you wish, simply combining like terms mentally. That is, it is entirely possible to order your work as follows:

$$\begin{aligned} -2x-3-(3x+4)&=-2x-3-3x-4 && \text{Distribute negative sign.}\\ &=-5x-7 && \text{Combine like terms.} \end{aligned}$$

Exercise

Simplify: $-9a - 4 - (4a - 8)$

Answer

$-13a + 4$

Example 8

Simplify: $2(5 - 3x) - 4(x + 3)$.

Solution

Use the distributive property to expand, then use the commutative and associative properties to group the like terms and combine them.

\[\begin{aligned} 2(5-3x)-4(x+3) = 10-6x-4x-12 ~ & \textcolor{red}{ \text{ Use the distributive property.}} \\ =(-6x-4x)+(10-12) ~ & \textcolor{red}{ \text{ Group like terms.}} \\ =-10x-2 ~ & \textcolor{red}{ \text{ Combine like terms: }} \\ ~ & \textcolor{red}{-6x-4x=-10x \text{ and}} \\ ~ & \textcolor{red}{10-12=-2.} \end{aligned}\nonumber \]

Alternate solution

You may skip the second step if you wish, simply combining like terms mentally. That is, it is entirely possible to order your work as follows:

$$\begin{aligned} 2(5-3x)-4(x+3) &= 10-6x-4x-12 \quad \text{Distribute.} \\ &= -10x-2 \quad \text{Combine like terms.} \end{aligned}$$

Exercise

Simplify: $-2(3a-4)-2(5-a)$

Answer

$-4a-2$

Example 9

Simplify: $-8(3x^2y-9xy)-8(-7x^2-8xy)$

Solution

We will proceed a bit quicker with this solution, using the distributive property to expand, then combining like terms mentally.

$$\begin{aligned} -8(3x^2y-9xy)-8(-7x^2y-8xy) &= -24x^2y+72xy+56x^2y+64xy \\ &= 32x^2y+136xy \end{aligned}$$

Exercise

Simplify: $(a^2-2ab)-2(3ab+a^2)$

Answer

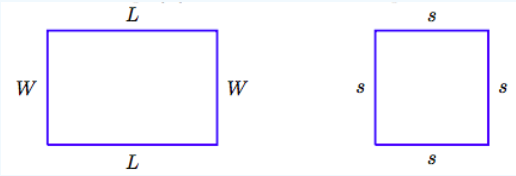
$-a^2-8ab$

Applications

We can simplify a number of useful formulas by combining like terms.

Example 10

Find the perimeter P of the (a) rectangle and (b) square pictured below. Simplify your answer as much as possible.



Solution

The perimeter of any polygonal figure is the sum of the lengths of its sides.

a) To find the perimeter P of the rectangle, sum its four sides.

$$P = L+W+L+W.$$

Combine like terms.

$$P = 2L+2W.$$

b) To find the perimeter P of the square, sum its four sides.

$$P = s + s + s + s.$$

Combine like terms.

$$P = 4s.$$

Exercise

A regular hexagon has six equal sides, each with length *x*. Find its perimeter in terms of *x*.

Answer

P = 6*x*

Sometimes it is useful to replace a variable with an expression containing another variable.

Example 11

The length of a rectangle is three feet longer than twice its width. Find the perimeter *P* of the rectangle in terms of its width alone.

Solution

From the previous problem, the perimeter of the rectangle is given by

$$P = 2L + 2W,$$

where *L* and *W* are the length and width of the rectangle, respectively. This equation gives the perimeter in terms of its length and width, but we're asked to get the perimeter in terms of the width alone. However, we're also given the fact that the length is three feet longer than twice the width.

$$\begin{array}{rcrcr} cyanLength & \text{is} & \text{Three Feet} & \text{longer than} & \text{Twice the Width} \\ L & = & 3 & + & 2W \end{array}$$

Because *L* = 3+2*W*, we can replace *L* with 3+2*W* in the perimeter equation 3.1.

$$P = 2L + 2W$$

$$P = 2(3 + 2W) + 2W$$

Use the distributive property, then combine like terms.

$$P = 6 + 4W + 2W$$

$$P = 6 + 6W.$$

This last equation gives the perimeter *P* in terms of the width *W* alone.

Exercise

The length *L* of a rectangle is 5 meters longer than twice its width *W*. Find the perimeter *P* of the rectangle in terms of its width *W*.

Answer

Answer: *P* = 6*W* + 10

Example 12

The width of a rectangle is two feet less than its length. Find the perimeter P of the rectangle in terms of its length alone.

Solution

Again, the perimeter of a rectangle is given by the equation

$$P = 2L + 2W,$$

where L and W are the length and width of the rectangle, respectively. This equation gives the perimeter in terms of its length and width, but we're asked to get the perimeter in terms of the length alone.

However, we're also given the fact that the width is two feet less than the length.

Width	is	Length	minus	Two feet
W	$=$	L	$-$	2

Because $W = L-2$, we can replace W with $L-2$ in the perimeter equation 3.2.

$$P = 2L + 2W$$

$$P = 2L + 2(L - 2)$$

Use the distributive property, then combine like terms.

$$P = 2L + 2L - 4$$

$$P = 4L - 4.$$

This last equation gives the perimeter P in terms of the length L alone.

Exercise

The width W of a rectangle is 5 feet less than twice its width L. Find the perimeter P of the rectangle in terms of its length L.

Answer

$P = 6L - 10$

Exercises

In Exercises 1-16, combine like terms by first using the distributive property to factor out the common variable part, and then simplifying.

1. $17xy^2 + 18xy^2 + 20xy^2$
2. $13xy - 3xy + xy$
3. $-8xy^2 - 3xy^2 - 10xy^2$
4. $-12xy - 2xy + 10xy$
5. $4xy - 20xy$
6. $-7y^3 + 15y^3$
7. $12r - 12r$
8. $16s - 5s$
9. $-11x - 13x + 8x$
10. $-9r - 10r + 3r$
11. $-5q + 7q$
12. $17n + 15n$

13. $r - 13r - 7r$

14. $19m + m + 15m$

15. $3x^3 - 18x^3$

16. $13x^2y + 2x^2y$

In Exercises 17-32, combine like terms by first rearranging the terms, then using the distributive property to factor out the common variable part, and then simplifying.

17. $-8 + 17n + 10 + 8n$

18. $11 + 16s - 14 - 6s$

19. $-2x^3 - 19x^2y - 15x^2y + 11x^3$

20. $-9x^2y - 10y^3 - 10y^3 + 17x^2y$

21. $-14xy - 2x^3 - 2x^3 - 4xy$

22. $-4x^3 + 12xy + 4xy - 12x^3$

23. $-13 + 16m + m + 16$

24. $9 - 11x - 8x + 15$

25. $-14x^2y - 2xy^2 + 8x^2y + 18xy^2$

26. $-19y^2 + 18y^3 - 5y^2 - 17y^3$

27. $-14x^3 + 16xy + 5x^3 + 8xy$

28. $-16xy + 16y^2 + 7xy + 17y^2$

29. $9n + 10 + 7 + 15n$

30. $-12r + 5 + 17 + 17r$

31. $3y + 1 + 6y + 3$

32. $19p + 6 + 8p + 13$

In Exercises 33-56, simplify the expression by first using the distributive property to expand the expression, and then rearranging and combining like terms mentally.

33. $-4(9x^2y + 8) + 6(10x^2y - 6)$

34. $-4(-4xy + 5y^3) + 6(-5xy - 9y^3)$

35. $3(-4x^2 + 10y^2) + 10(4y^2 - x^2)$

36. $-7(-7x^3 + 6x^2) - 7(-10x^2 - 7x^3)$

37. $-s + 7 - (-1 - 3s)$

38. $10y - 6 - (-10 - 10y)$

39. $-10q - 10 - (-3q + 5)$

40. $-2n + 10 - (7n - 1)$

41. $7(8y + 7) - 6(8 - 7y)$

42. $-6(-5n - 4) - 9(3 + 4n)$

43. $7(10x^2 - 8xy^2) - 7(9xy^2 + 9x^2)$

44. $10(8x^2y - 10xy^2) + 3(8xy^2 + 2x^2y)$

45. $-2(6 + 4n) + 4(-n - 7)$

46. $-6(-2 - 6m) + 5(-9m + 7)$

47. $8 - (4 + 8y)$

48. $-1 - (8 + s)$

49. $-8(-n + 4) - 10(-4n + 3)$

50. $3(8r - 7) - 3(2r - 2)$

51. $-5 - (10p + 5)$

52. $-1 - (2p - 8)$

53. $7(1 + 7r) + 2(4 - 5r)$

54. $(5 - s) + 10(9 + 5s)$

55. $-2(-5 - 8x^2) - 6(6)$

56. $8(10y^2 + 3x^3) - 5(-7y^2 - 7x^3)$

---

57. The length L of a rectangle is 2 feet longer than 6 times its width W. Find the perimeter of the rectangle in terms of its width alone.

58. The length L of a rectangle is 7 feet longer than 6 times its width W. Find the perimeter of the rectangle in terms of its width alone.

59. The width W of a rectangle is 8 feet shorter than its length L. Find the perimeter of the rectangle in terms of its length alone.

60. The width W of a rectangle is 9 feet shorter than its length L. Find the perimeter of the rectangle in terms of its length alone.

61. The length L of a rectangle is 9 feet shorter than 4 times its width W. Find the perimeter of the rectangle in terms of its width alone.

62. The length L of a rectangle is 2 feet shorter than 6 times its width W. Find the perimeter of the rectangle in terms of its width alone.

2.14: Mean

Lesson

Let's explore the mean of a data set and what it tells us.

Exercise 2.14.1: Close to Four

Use the digits 0–9 to write an expression with a value as close as possible to 4. Each digit can be used only one time in the expression.

$(\square + \square + \square + \square) \div 4$

Figure 2.14.1

Exercise 2.14.2: Spread Out and Share

1. The kittens in a room at an animal shelter are arranged in five crates, as shown.

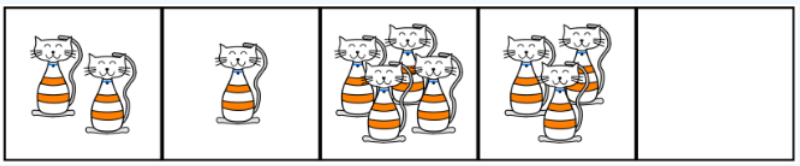

Figure 2.14.2: By Clker-Free-Vector-Images. Public Domain. Pixabay. Source.

   a. The manager of the shelter wants the kittens distributed equally among the crates. How might that be done? How many kittens will end up in each crate?
   b. The number of kittens in each crate after they are equally distributed is called the **mean** number of kittens per crate, or the **average** number of kittens per crate.
   Explain how the expression $10 \div 5$ is related to the average.
   c. Another room in the shelter has 6 crates. No two crates contain the same number of kittens, and there is an average of 3 kittens per crate.
   Draw or describe at least two different arrangements of kittens that match this description. You may choose to use the applet to help.

2. Five servers were scheduled to work the number of hours shown. They decided to share the workload, so each one would work equal hours.
   Server A: 3
   Server B: 6
   Server C: 11
   Server D: 7
   Server E: 4

   a. On the grid on the left, draw 5 bars whose heights represent the hours worked by servers A, B, C, D, and E.

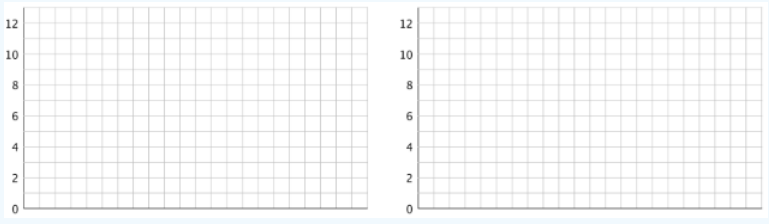

Figure 2.14.3

   b. Think about how you would rearrange the hours so that each server gets a fair share. Then, on the grid on the right, draw a new graph to represent the rearranged hours. Be prepared to explain your reasoning.
   c. Based on your second drawing, what is the average or mean number of hours that the servers will work?
   d. Explain why we can also find the mean by finding the value of $31 \div 5$.
   e. Which server will see the biggest change to work hours? Which server will see the least change?

Are you ready for more?

Server F, working 7 hours, offers to join the group of five servers, sharing their workload. If server F joins, will the mean number of hours worked increase or decrease? Explain how you know.

Exercise 2.14.3: Getting to School

For the past 12 school days, Mai has recorded how long her bus rides to school take in minutes. The times she recorded are shown in the table.

9	8	6	9	10	7	6	12	9	8	10	8

1. Find the mean for Mai's data. Show your reasoning.
2. In this situation, what does the mean tell us about Mai's trip to school?
3. For 5 days, Tyler has recorded how long his walks to school take in minutes. The mean for his data is 11 minutes. Without calculating, predict if each of the data sets shown could be Tyler's. Explain your reasoning.
   - data set A: 11, 8, 7, 9, 8
   - data set B: 12, 7, 13, 9, 14
   - data set C: 11, 20, 6, 9, 10
   - data set D: 8, 10, 9, 11, 11
4. Determine which data set is Tyler's. Explain how you know.

Summary

Sometimes a general description of a distribution does not give enough information, and a more precise way to talk about center or spread would be more useful. The **mean**, or **average**, is a number we can use to summarize a distribution.

We can think about the mean in terms of "fair share" or "leveling out." That is, a mean can be thought of as a number that each member of a group would have if all the data values were combined and distributed equally among the members.

For example, suppose there are 5 bottles which have the following amounts of water: 1 liter, 4 liters, 2 liters, 3 liters, and 0 liters.

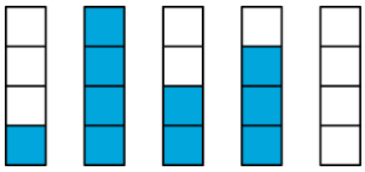

Figure 2.14.4: There are 5 identical tape diagrams that are each partitioned into 4 equal parts. The first diagram has 1 part shaded. The second diagram has 4 parts shaded. The third diagram has 2 parts shaded. The fourth diagram has 3 parts shaded. The fifth diagram has no parts shaded.

To find the mean, first we add up all of the values. We can think of as putting all of the water together: $1+4+2+3+0=10$.

Figure 2.14.5

To find the "fair share," we divide the 10 liters equally into the 5 containers: $10 \div 5 = 2$.

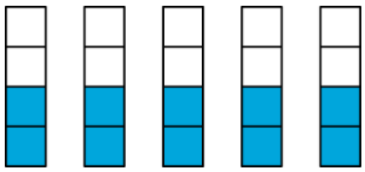

Figure 2.14.6

Suppose the quiz scores of a student are 70, 90, 86, and 94. We can find the mean (or average) score by finding the sum of the scores $(70+90+86+94=340)$ and dividing the sum by four $(340 \div 4 = 85)$. We can then say that the student scored, on average, 85 points on the quizzes.

In general, to find the mean of a data set with n values, we add all of the values and divide the sum by n.

Glossary Entries

Definition: Average

The average is another name for the mean of a data set.

For the data set 3, 5, 6, 8, 11, 12, the average is 7.5.

$3+5+6+8+11+12=45$

$45\div 6=7.5$

Definition: Mean

The mean is one way to measure the center of a data set. We can think of it as a balance point. For example, for the data set 7, 9, 12, 13, 14, the mean is 11.

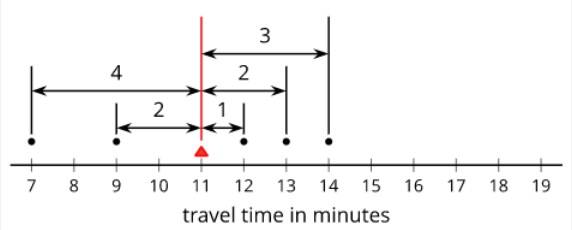

Figure 2.14.7

To find the mean, add up all the numbers in the data set. Then, divide by how many numbers there are. $7+9+12+13+14=55$ and $55\div 5=11$.

Practice

Exercise 2.14.4

A preschool teacher is rearranging four boxes of playing blocks so that each box contains an equal number of blocks. Currently Box 1 has 32 blocks, Box 2 has 18, Box 3 has 41, and Box 4 has 9.

Select **all** the ways he could make each box have the same number of blocks.

A. Remove all the blocks and make four equal piles of 25, then put each pile in one of the boxes.
B. Remove 7 blocks from Box 1 and place them in Box 2.
C. Remove 21 blocks from Box 3 and place them in Box 4.
D. Remove 7 blocks from Box 1 and place them in Box 2, and remove 21 blocks from Box 3 and place them in Box 4.
E. Remove 7 blocks from Box 1 and place them in Box 2, and remove 16 blocks from Box 3 and place them in Box 4.

Exercise 2.14.5

In a round of mini-golf, Clare records the number of strokes it takes to hit the ball into the hole of each green.

2 3 1 4 5 2 3 4 3

She said that, if she redistributed the strokes on different greens, she could tell that her average number of strokes per hole is 3. Explain how Clare is correct.

Exercise 2.14.6

Three sixth-grade classes raised $25.50, $49.75, and $37.25 for their classroom libraries. They agreed to share the money raised equally. What is each class's equal share? Explain or show your reasoning.

Exercise 2.14.7

In her English class, Mai's teacher gives 4 quizzes each worth 5 points. After 3 quizzes, she has the scores 4, 3, and 4. What does she need to get on the last quiz to have a mean score of 4? Explain or show your reasoning.

Exercise 2.14.8

An earthworm farmer examined two containers of a certain species of earthworms so that he could learn about their lengths. He measured 25 earthworms in each container and recorded their lengths in millimeters.

Here are histograms of the lengths for each container.

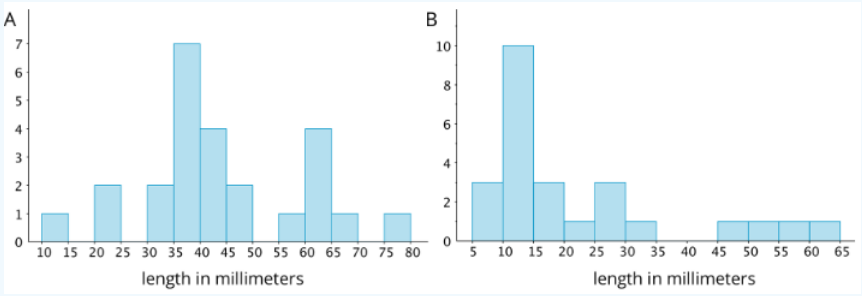

Figure 2.14.8: Two histograms, length in millimeters. Histogram A from 10 to 80 by fives, Beginning at 10 up to but not including 15, height of bar at each interval is 1, 0, 2, 0, 2, 7, 4, 2, 0, 1, 4, 1, 0, 1. Histogram B from 5 to 65 by fives. Beginning at 5 up to but not including 10, height of bar at each interval is 3, 10, 3, 1, 3, 1, 0, 0, 1, 1, 1, 1.

1. Which container tends to have longer worms than the other container?
2. For which container would 15 millimeters be a reasonable description of a typical length of the worms in the container?
3. If length is related to age, which container had the most young worms?

(From Unit 8.2.5)

Exercise 2.14.9

Diego thinks that $x = 3$ is a solution to the equation $x^2 = 16$. Do you agree? Explain or show your reasoning.

(From Unit 6.3.4)

2.14: Mean is shared under a not declared license and was authored, remixed, and/or curated by LibreTexts.

- **43.1: Mean** is licensed CC BY 4.0.

2.15: Solve Equations Using Integers; The Division Property of Equality (Part 1)

Learning Objectives

- Determine whether an integer is a solution of an equation
- Solve equations with integers using the Addition and Subtraction Properties of Equality
- Model the Division Property of Equality
- Solve equations using the Division Property of Equality
- Translate to an equation and solve

be prepared!

Before you get started, take this readiness quiz.

1. Evaluate $x+4$ when $x=-4$. If you missed this problem, review Example 3.2.9.
2. Solve: $y-6=10$. If you missed this problem, review Example 2.3.6.
3. Translate into an algebraic expression 5 less than x. If you missed this problem, review Table 1.3.1.

Determine Whether a Number is a Solution of an Equation

In Solve Equations with the Subtraction and Addition Properties of Equality, we saw that a solution of an equation is a value of a variable that makes a true statement when substituted into that equation. In that section, we found solutions that were whole numbers. Now that we've worked with integers, we'll find integer solutions to equations.

The steps we take to determine whether a number is a solution to an equation are the same whether the solution is a whole number or an integer.

HOW TO: DETERMINE WHETHER A NUMBER IS A Solution TO AN EQUATION.

Step 1. Substitute the number for the variable in the equation.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Determine whether the resulting equation is true.

- If it is true, the number is a solution.
- If it is not true, the number is not a solution.

Example 2.15.1: determine the solution

Determine whether each of the following is a solution of $2x-5=-13$:

a. $x=4$
b. $x=-4$
c. $x=-9$

Solution

(a) Substitute 4 for x in the equation to determine if it is true.	2x − 5 = −13
Substitute 4 for x.	$2(4)-5 \stackrel{?}{=} -13$
Multiply.	$8-5 \stackrel{?}{=} -13$
Subtract.	$3 \neq -13$

Since $x=4$ does not result in a true equation, 4 is not a solution to the equation.

(b) Substitute -4 for x in the equation to determine if it is true.	2x − 5 = −13

Substitute -4 for x.	$2(-4)-5 \stackrel{?}{=} -13$
Multiply.	$-8-5 \stackrel{?}{=} -13$
Subtract.	$-13=-13$ ✓

Since $x=-4$ results in a true equation, -4 is a solution to the equation.

(b) Substitute -9 for x in the equation to determine if it is true.	2x − 5 = −13
Substitute -9 for x.	$2(-9)-5 \stackrel{?}{=} -13$
Multiply.	$-18-5 \stackrel{?}{=} -13$
Subtract.	$-23 \neq -13$

Since $x=-9$ does not result in a true equation, -9 is not a solution to the equation.

? Exercise 2.15.1

Determine whether each of the following is a solution of $2x-8=-14$:

a. $x=-11$
b. $x=11$
c. $x=-3$

Answer a

no

Answer b

no

Answer c

yes

? Exercise 2.15.2

Determine whether each of the following is a solution of $2y+3=-11$:

a. $y=4$
b. $y=-4$
c. $y=-7$

Answer a

no

Answer b

no

Answer c

yes

Solve Equations with Integers Using the Addition and Subtraction Properties of Equality

In Solve Equations with the Subtraction and Addition Properties of Equality, we solved equations similar to the two shown here using the Subtraction and Addition Properties of Equality. Now we can use them again with integers.

$$\begin{aligned} x+4 &= 12 \\ x+4-4 &= 12-4 \\ x &= 8 \end{aligned} \qquad \begin{aligned} y-5 &= 9 \\ y-5+5 &= 9+5 \\ y &= 14 \end{aligned}$$

When you add or subtract the same quantity from both sides of an equation, you still have equality.

Definition: Properties of Equalities

Subtraction Property of Equality	Addition Property of Equality
For any numbers a, b, c, if a = b then a − c = b − c.	For any numbers a, b, c, if a = b then a + c = b + c.

Example 2.15.2:

Solve: $y+9=5$.

Solution

Subtract 9 from each side to undo the addition.	$y+9-9=5-9$
Simplify.	$y=-4$

Check the result by substituting -4 into the original equation.

Substitute −4 for y	$-4+9 \stackrel{?}{=} 5$
	$5=5$ ✓

Since $y=-4$ makes $y+9=5$ a true statement, we found the solution to this equation

Exercise 2.15.3

Solve: $y+11=7$

Answer

-4

Exercise 2.15.4

Solve: $y+15=-4$

Answer

-19

Example 2.15.3: solve

Solve: $a-6=-8$

Solution

Add 6 to each side to undo the subtraction.	$a-6+6=-8+6$
Simplify.	$a=-2$
Check the result by substituting −2 into the original equation.	$a-6=-8$
Substitute −2 for a.	$-2-6 \stackrel{?}{=} -8$

	$-8 = -8$ ✓

The solution to $a - 6 = -8$ is -2. Since $a = -2$ makes $a - 6 = -8$ a true statement, we found the solution to this equation.

Exercise 2.15.5

Solve: $a - 2 = -8$

Answer

-6

Exercise 2.15.6

Solve: $n - 4 = -8$

Answer

-4

Model the Division Property of Equality

All of the equations we have solved so far have been of the form $x + a = b$ or $x - a = b$. We were able to isolate the variable by adding or subtracting the constant term. Now we'll see how to solve equations that involve division. We will model an equation with envelopes and counters in Figure 2.15.1.

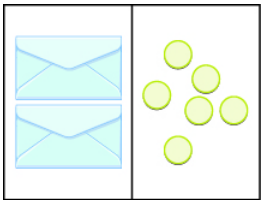

Figure 2.15.1

Here, there are two identical envelopes that contain the same number of counters. Remember, the left side of the workspace must equal the right side, but the counters on the left side are "hidden" in the envelopes. So how many counters are in each envelope?

To determine the number, separate the counters on the right side into 2 groups of the same size. So 6 counters divided into 2 groups means there must be 3 counters in each group (since $6 \div 2 = 3$).

What equation models the situation shown in Figure 2.15.2? There are two envelopes, and each contains x counters. Together, the two envelopes must contain a total of 6 counters. So the equation that models the situation is $2x = 6$.

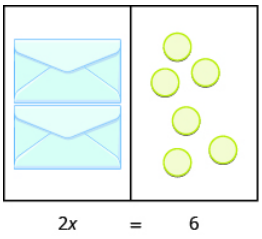

Figure 2.15.2

We can divide both sides of the equation by 2 as we did with the envelopes and counters.

$$\frac{2x}{2} = \frac{6}{2}$$
$$x = 3$$

We found that each envelope contains 3 counters. Does this check? We know $2 \bullet 3 = 6$, so it works. Three counters in each of two envelopes does equal six. Figure 2.15.3 shows another example.

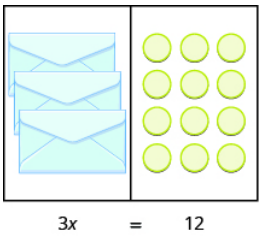

Figure 2.15.3

Now we have 3 identical envelopes and 12 counters. How many counters are in each envelope? We have to separate the 12 counters into 3 groups. Since $12 \div 3 = 4$, there must be 4 counters in each envelope. See Figure 2.15.4

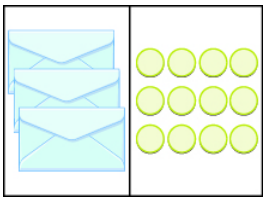

Figure 2.15.4

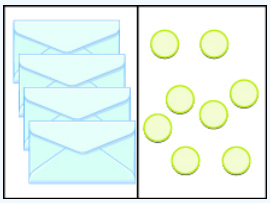
The equation that models the situation is $3x = 12$. We can divide both sides of the equation by 3.

$$\frac{3x}{3} = \frac{12}{3}$$
$$x = 4$$

Does this check? It does because $3 \bullet 4 = 12$.

Example 2.15.4: write an equation

Write an equation modeled by the envelopes and counters, and then solve it.



Solution

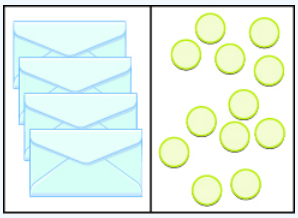
There are 4 envelopes, or 4 unknown values, on the left that match the 8 counters on the right. Let's call the unknown quantity in the envelopes x.

Write the equation.	$4x = 8$
Divide both sides by 4.	$\frac{4x}{4} = \frac{8}{4}$
Simplify.	$x = 2$

There are 2 counters in each envelope.

Exercise 2.15.7

Write the equation modeled by the envelopes and counters. Then solve it.

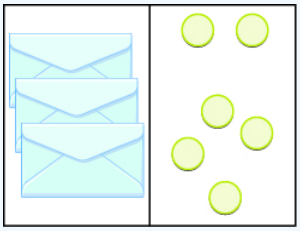


Answer

$4x = 12; x = 3$

Exercise 2.15.8

Write the equation modeled by the envelopes and counters. Then solve it.



Answer

$3x = 6; x = 2$

Solve Equations Using the Division Property of Equality

The previous examples lead to the Division Property of Equality. When you divide both sides of an equation by any nonzero number, you still have equality.

Definition: Division Property of Equality

For any numbers a, b, c, and $c \neq 0$,

$$\text{If } a = b \text{ then } \frac{a}{c} = \frac{b}{c}. \tag{2.15.1}$$

Example 2.15.5: solve

Solve: $7x = -49$.

Solution

To isolate x, we need to undo multiplication.

Divide each side by 7.	$\frac{7x}{7} = \frac{-49}{7}$
Simplify	$x = -7$

Check the solution.

Substitute −7 for x.	$7(-7) \stackrel{?}{=} -49$

	$-49 = -49$ ✓

Therefore, -7 is the solution to the equation.

? Exercise 2.15.9

Solve: $8a = 56$

Answer

7

? Exercise 2.15.10

Solve: $11n = 121$

Answer

11

✓ Example 2.15.6: solve

Solve: $-3y = 63$.

Solution

To isolate y, we need to undo the multiplication.

Divide each side by −3.	$\frac{-3y}{-3} = \frac{63}{-3}$
Simplify.	$y = -21$

Check the solution.

Substitute −21 for y.	$-3(-21) \stackrel{?}{=} 63$
	$63 = 63$ ✓

Since this is a true statement, $y = -21$ is the solution to the equation.

? Exercise 2.15.11

Solve: $-8p = 96$

Answer

-12

? Exercise 2.15.12

Solve: $-12m = 108$

Answer

-9

2.16: Solve Equations Using Integers; The Division Property of Equality (Part 2)

Translate to an Equation and Solve

In the past several examples, we were given an equation containing a variable. In the next few examples, we'll have to first translate word sentences into equations with variables and then we will solve the equations.

Example 2.16.7: translate

Translate and solve: five more than x is equal to -3.

Solution

Translate.	x + 5 = −3
Subtract 5 from both sides.	x + 5 − 5 = −3 − 5
Simplify.	x = −8

Check the answer by substituting it into the original equation.

$$\begin{aligned} x+5 &= -3 \\ -8+5 &\stackrel{?}{=} -3 \\ -3 &= -3 \checkmark \end{aligned}$$

Exercise 2.16.13

Translate and solve: Seven more than x is equal to -2.

Answer

$x+7=-2$; $x=-9$

Exercise 2.16.14

Translate and solve: Eleven more than y is equal to 2.

Answer

$y+11=2$; $y=-9$

Example 2.16.8: translate

Translate and solve: the difference of n and 6 is -10.

Solution

Translate.	n − 6 = −10
Add 6 to each side.	n − 6 + 6 = −10 + 6
Simplify.	n = −4

Check the answer by substituting it into the original equation.

$$\begin{aligned} n-6 &= -10 \\ -4-6 &\stackrel{?}{=} -10 \\ -10 &= -10 \checkmark \end{aligned}$$

Exercise 2.16.15

Translate and solve: The difference of p and 2 is -4.

Answer

$p-2=-4$; $p=-2$

Exercise 2.16.16

Translate and solve: The difference of q and 7 is -3.

Answer

$q-7=-3$; $q=4$

Example 2.16.9: translate

Translate and solve: the number 108 is the product of -9 and y.

Solution

Translate.	108 = −9y	
Divide by −9.	$\frac{108}{-9}=\frac{-9y}{-9}$	(2.16.1)
Simplify.	−12 = y	

Check the answer by substituting it into the original equation.

$$108=-9y$$
$$108\stackrel{?}{=}-9(-12)$$
$$108=108\ \checkmark$$

Exercise 2.16.17

Translate and solve: The number 132 is the product of -12 and y.

Answer

$132=-12y$; $y=-11$

Exercise 2.16.18

Translate and solve: The number 117 is the product of -13 and z.

Answer

$117=-13z$; $z=-9$

Key Concepts

- How to determine whether a number is a solution to an equation.
  - Step 1. Substitute the number for the variable in the equation.
  - Step 2. Simplify the expressions on both sides of the equation.
  - Step 3. Determine whether the resulting equation is true.
    - If it is true, the number is a solution.
    - If it is not true, the number is not a solution.
- Properties of Equalities

Subtraction Property of Equality	Addition Property of Equality
For any numbers a,b,c, if a=b then a−c=b−c	For any numbers a,b,c, if a=b then a+c=b+c

- Division Property of Equality
  - For any numbers a, b, c and $c \neq 0$, if $a = b$, then $\frac{a}{c} = \frac{b}{c}$

Practice Makes Perfect

Determine Whether a Number is a Solution of an Equation

In the following exercises, determine whether each number is a solution of the given equation.

285. $4x - 2 = 6$
   a. $x = -2$
   b. $x = -1$
   c. $x = 2$

286. $4y - 10 = -14$
   a. $y = -6$
   b. $y = -1$
   c. $y = 1$

287. $9a + 27 = -63$
   a. $a = 6$
   b. $a = -6$
   c. $a = -10$

288. $7c + 42 = -56$
   a. $c = 2$
   b. $c = -2$
   c. $c = -14$

Solve Equations Using the Addition and Subtraction Properties of Equality

In the following exercises, solve for the unknown.

289. $n + 12 = 5$
290. $m + 16 = 2$
291. $p + 9 = -8$
292. $q + 5 = -6$
293. $u - 3 = -7$
294. $v - 7 = -8$
295. $h - 10 = -4$
296. $k - 9 = -5$
297. $x + (-2) = -18$
298. $y + (-3) = -10$
299. $r - (-5) = -9$

300. $s - (-2) = -11$

Model the Division Property of Equality

In the following exercises, write the equation modeled by the envelopes and counters and then solve it.

301. 
302. 
303. 
304. 
Solve Equations Using the Division Property of Equality

In the following exercises, solve each equation using the division property of equality and check the solution.

305. $5x = 45$
306. $4p = 64$
307. $-7c = 56$
308. $-9x = 54$
309. $-14p = -42$
310. $-8m = -40$
311. $-120 = 10q$
312. $-75 = 15y$
313. $24x = 480$
314. $18n = 540$
315. $-3z = 0$
316. $4u = 0$

Translate to an Equation and Solve

In the following exercises, translate and solve.

317. Four more than n is equal to 1.
318. Nine more than m is equal to 5.

319. The sum of eight and p is −3.
320. The sum of two and q is −7.
321. The difference of a and three is −14.
322. The difference of b and 5 is −2.
323. The number −42 is the product of −7 and x.
324. The number −54 is the product of −9 and y.
325. The product of f and −15 is 75.
326. The product of g and −18 is 36.
327. −6 plus c is equal to 4.
328. −2 plus d is equal to 1.
329. Nine less than n is −4.
330. Thirteen less than n is −10 .

Mixed Practice

In the following exercises, solve.

331. (a) $x + 2 = 10$ (b) $2x = 10$
332. (a) $y + 6 = 12$ (b) $6y = 12$
333. (a) $-3p = 27$ (b) $p - 3 = 27$
334. (a) $-2q = 34$ (b) $q - 2 = 34$
335. $a - 4 = 16$
336. $b - 1 = 11$
337. $-8m = -56$
338. $-6n = -48$
339. $-39 = u + 13$
340. $-100 = v + 25$
341. $11r = -99$
342. $15s = -300$
343. $100 = 20d$
344. $250 = 25n$
345. $-49 = x - 7$
346. $64 = y - 4$

Everyday Math

347. **Cookie packaging** A package of 51 cookies has 3 equal rows of cookies. Find the number of cookies in each row, c, by solving the equation $3c = 51$.
348. **Kindergarten class** Connie's kindergarten class has 24 children. She wants them to get into 4 equal groups. Find the number of children in each group, g, by solving the equation $4g = 24$.

Writing Exercises

349. Is modeling the Division Property of Equality with envelopes and counters helpful to understanding how to solve the equation $3x = 15$? Explain why or why not.
350. Suppose you are using envelopes and counters to model solving the equations $x + 4 = 12$ and $4x = 12$. Explain how you would solve each equation.
351. Frida started to solve the equation $-3x = 36$ by adding 3 to both sides. Explain why Frida's method will not solve the equation.
352. Raoul started to solve the equation $4y = 40$ by subtracting 4 from both sides. Explain why Raoul's method will not solve the equation.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether an integer is a solution of an equation.			
solve equations with integers using the addition and subtraction properties of equality.			
model division property of equality.			
solve equations using the division property of equality.			
translate to an equation and solve.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

2.E: Integers (Exercises)

3.1 - Introduction to Integers

Locate Positive and Negative Numbers on the Number Line

In the following exercises, locate and label the integer on the number line.

353. 5
354. −5
355. −3
356. 3
357. −8
358. −7

Order Positive and Negative Numbers

In the following exercises, order each of the following pairs of numbers, using < or >.

359. 4__8
360. −6__3
361. −5__−10
362. −9__−4
363. 2__−7
364. −3__1

Find Opposites

In the following exercises, find the opposite of each number.

365. 6
366. −2
367. −4
368. 3

In the following exercises, simplify.

369. (a) −(8) (b) −(−8)
370. (a) −(9) (b) −(−9)

In the following exercises, evaluate.

371. −x, when (a) x = 32 (b) x = −32
372. −n, when (a) n = 20 (b) n = −20

Simplify Absolute Values

In the following exercises, simplify.

373. |−21|
374. |−42|
375. |36|
376. −|15|
377. |0|
378. −|−75|

In the following exercises, evaluate.

379. |x| when x = −14
380. −|r| when r = 27
381. −|−y| when y = 33
382. |−n| when n = −4

In the following exercises, fill in <, >, or = for each of the following pairs of numbers.

383. $-|-4|__4$
384. $-2__|-2|$
385. $-|-6|__-6$
386. $-|-9|__|-9|$

In the following exercises, simplify.

387. $-(-55)$ and $-|-55|$
388. $-(-48)$ and $-|-48|$
389. $|12-5|$
390. $|9+7|$
391. $6|-9|$
392. $|14-8|-|-2|$
393. $|9-3|-|5-12|$
394. $5+4|15-3|$

Translate Phrases to Expressions with Integers

In the following exercises, translate each of the following phrases into expressions with positive or negative numbers.

395. the opposite of 16
396. the opposite of −8
397. negative 3
398. 19 minus negative 12
399. a temperature of 10 below zero
400. an elevation of 85 feet below sea level

3.2 - Add Integers

Model Addition of Integers

In the following exercises, model the following to find the sum.

401. $3+7$
402. $-2+6$
403. $5+(-4)$
404. $-3+(-6)$

Simplify Expressions with Integers

In the following exercises, simplify each expression.

405. $14+82$
406. $-33+(-67)$
407. $-75+25$
408. $54+(-28)$
409. $11+(-15)+3$
410. $-19+(-42)+12$
411. $-3+6(-1+5)$
412. $10+4(-3+7)$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

413. $n+4$ when (a) $n=-1$ (b) $n=-20$
414. $x+(-9)$ when (a) $x=3$ (b) $x=-3$
415. $(x+y)^3$ when $x=-4$, $y=1$
416. $(u+v)^2$ when $u=-4$, $v=11$

Translate Word Phrases to Algebraic Expressions

In the following exercises, translate each phrase into an algebraic expression and then simplify.

417. the sum of −8 and 2
418. 4 more than −12
419. 10 more than the sum of −5 and −6
420. the sum of 3 and −5, increased by 18

Add Integers in Applications

In the following exercises, solve.

421. **Temperature** On Monday, the high temperature in Denver was −4 degrees. Tuesday's high temperature was 20 degrees more. What was the high temperature on Tuesday?
422. **Credit** Frida owed $75 on her credit card. Then she charged $21 more. What was her new balance?

3.3 - Subtract Integers

Model Subtraction of Integers

In the following exercises, model the following.

423. 6 − 1
424. −4 − (−3)
425. 2 − (−5)
426. −1 − 4

Simplify Expressions with Integers

In the following exercises, simplify each expression.

427. 24 − 16
428. 19 − (−9)
429. −31 − 7
430. −40 − (−11)
431. −52 − (−17) − 23
432. 25 − (−3 − 9)
433. (1 − 7) − (3 − 8)
434. $3^2 - 7^2$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

435. x − 7 when (a) x = 5 (b) x = −4
436. 10 − y when (a) y = 15 (b) y = −16
437. $2n^2 - n + 5$ when n = −4
438. $-15 - 3u^2$ when u = −5

Translate Phrases to Algebraic Expressions

In the following exercises, translate each phrase into an algebraic expression and then simplify.

439. the difference of −12 and 5
440. subtract 23 from −50

Subtract Integers in Applications

In the following exercises, solve the given applications.

441. **Temperature** One morning the temperature in Bangor, Maine was 18 degrees. By afternoon, it had dropped 20 degrees. What was the afternoon temperature?

442. **Temperature** On January 4, the high temperature in Laredo, Texas was 78 degrees, and the high in Houlton, Maine was −28 degrees. What was the difference in temperature of Laredo and Houlton?

3.4 - Multiply and Divide Integers

Multiply Integers

In the following exercises, multiply.

443. $-9 \cdot 4$
444. $5(-7)$
445. $(-11)(-11)$
446. $-1 \cdot 6$

Divide Integers

In the following exercises, divide.

447. $56 \div (-8)$
448. $-120 \div (-6)$
449. $-96 \div 12$
450. $96 \div (-16)$
451. $45 \div (-1)$
452. $-162 \div (-1)$

Simplify Expressions with Integers

In the following exercises, simplify each expression.

453. $5(-9) - 3(-12)$
454. $(-2)^5$
455. -3^4
456. $(-3)(4)(-5)(-6)$
457. $42 - 4(6 - 9)$
458. $(8 - 15)(9 - 3)$
459. $-2(-18) \div 9$
460. $45 \div (-3) - 12$

Evaluate Variable Expressions with Integers

In the following exercises, evaluate each expression.

461. $7x - 3$ when $x = -9$
462. $16 - 2n$ when $n = -8$
463. $5a + 8b$ when $a = -2$, $b = -6$
464. $x^2 + 5x + 4$ when $x = -3$

Translate Word Phrases to Algebraic Expressions

In the following exercises, translate to an algebraic expression and simplify if possible.

465. the product of −12 and 6
466. the quotient of 3 and the sum of −7 and s

3.5 - Solve Equations using Integers; The Division Property of Equality

Determine Whether a Number is a Solution of an Equation

In the following exercises, determine whether each number is a solution of the given equation.

467. $5x - 10 = -35$
    a. $x = -9$
    b. $x = -5$

c. x = 5

468. 8u + 24 = −32

a. u = −7
b. u = −1
c. u = 7

Using the Addition and Subtraction Properties of Equality

In the following exercises, solve.

469. a + 14 = 2
470. b − 9 = −15
471. c + (−10) = −17
472. d − (−6) = −26

Model the Division Property of Equality

In the following exercises, write the equation modeled by the envelopes and counters. Then solve it.

473. 
474. 
Solve Equations Using the Division Property of Equality

In the following exercises, solve each equation using the division property of equality and check the solution.

475. 8p = 72
476. −12q = 48
477. −16r = −64
478. −5s = −100

Translate to an Equation and Solve.

In the following exercises, translate and solve.

479. The product of −6 and y is −42
480. The difference of z and −13 is −18.
481. Four more than m is −48.
482. The product of −21 and n is 63.

Everyday Math

483. Describe how you have used two topics from this chapter in your life outside of your math class during the past month.

PRACTICE TEST

484. Locate and label 0, 2, −4, and −1 on a number line.

In the following exercises, compare the numbers, using < or > or =.

485. (a) −6__3 (b) −1__−4

486. (a) $-5 __ |-5|$ (b) $-|-2| __ -2$

In the following exercises, find the opposite of each number.

487. (a) -7 (b) 8

In the following exercises, simplify.

488. $-(-22)$
489. $|4 - 9|$
490. $-8 + 6$
491. $-15 + (-12)$
492. $-7 - (-3)$
493. $10 - (5 - 6)$
494. $-3 \cdot 8$
495. $-6(-9)$
496. $70 \div (-7)$
497. $(-2)^3$
498. -4^2
499. $16-3(5-7)$
500. $|21 - 6| - |-8|$

In the following exercises, evaluate.

501. $35 - a$ when $a = -4$
502. $(-2r)^2$ when $r = 3$
503. $3m - 2n$ when $m = 6, n = -8$
504. $-|-y|$ when $y = 17$

In the following exercises, translate each phrase into an algebraic expression and then simplify, if possible.

505. the difference of -7 and -4
506. the quotient of 25 and the sum of m and n.

In the following exercises, solve.

507. Early one morning, the temperature in Syracuse was $-8°$F. By noon, it had risen $12°$. What was the temperature at noon?
508. Collette owed $128 on her credit card. Then she charged $65. What was her new balance?

In the following exercises, solve.

509. $n + 6 = 5$
510. $p - 11 = -4$
511. $-9r = -54$

In the following exercises, translate and solve.

512. The product of 15 and x is 75.
513. Eight less than y is -32.

2.S: Integers (Summary)

Key Terms

absolute value	A number's distance from 0 on the number line.
integers	Counting numbers, their opposites, and zero $\ldots -3, -2, -1, 0, 1, 2, 3 \ldots$ (2.S.1)
negative number	A number less than zero.
opposites	The number that is the same distance from zero on the number line, but on the opposite side of zero.

Key Concepts

3.1 - Introduction to Integers

- **Opposite Notation**
  - −a means the opposite of the number a
  - The notation −a is read the opposite of a.
- **Absolute Value Notation**
  - The absolute value of a number n is written as |n|.
  - |n| ≥ 0 for all numbers.

3.2 - Add Integers

- **Addition of Positive and Negative Integers**

5 + 3	−5 + (−3)
both positive, sum positive	both negative, sum negative
When the signs are the same, the counters would be all the same color, so add them.	
−5 + 3	5 + (−3)
different signs, more negatives	different signs, more positives
sum negative	sum positive
When the signs are different, some counters would make neutral pairs; subtract to see how many are left.	

3.3 - Subtract Integers

- **Subtraction of Integers**

Table 3.110

5 – 3 = 2	–5 – (–3) = –2
2 positives	2 negatives
When there would be enough counters of the color to take away, subtract.	
–5 – 3 =	5 – (–3) = 8
5 negatives, want to subtract 3 positives	5 positives, want to subtract 3 negatives
When there would not be enough of the counters to take away, add neutral pairs.	

- **Subtraction Property**
  - a − b = a + (−b)

- $a - (-b) = a + b$

- **Solve Application Problems**
  1. Identify what you are asked to find.
  2. Write a phrase that gives the information to find it.
  3. Translate the phrase to an expression.
  4. Simplify the expression.
  5. Answer the question with a complete sentence.

3.4 - Multiply and Divide Integers

- **Multiplication of Signed Numbers**
  - To determine the sign of the product of two signed numbers:

Same Signs	Product
Two positives	Positive
Two negatives	Positive

Different Signs	Product
Positive • negative	Negative
Negative • positive	Negative

- **Division of Signed Numbers**
  - To determine the sign of the quotient of two signed numbers:

Same Signs	Quotient
Two positives	Positive
Two negatives	Positive

Different Signs	Quotient
Positive & negative	Negative
Negative & positive	Negative

- **Multiplication by −1**
  - Multiplying a number by −1 gives its opposite: $-1a = -a$
- **Division by −1**
  - Dividing a number by −1 gives its opposite: $a \div (-1) = -a$

3.5 - Solve Equations Using Integers; The Division Property of Equality

- **How to determine whether a number is a solution to an equation.**
  1. Substitute the number for the variable in the equation.
  2. Simplify the expressions on both sides of the equation.
  3. Determine whether the resulting equation is true.
  - If it is true, the number is a solution.
  - If it is not true, the number is not a solution.
- **Properties of Equalities**

Subtraction Property of Equality	Addition Property of Equality	Division Property of Equality

Subtraction Property of Equality	Addition Property of Equality	Division Property of Equality
For any numbers a, b, c, if a = b then a − c = b − c.	For any numbers a, b, c, if a = b then a + c = b + c.	For any numbers a, b, c, and c ≠ 0 If a = b, then $\frac{a}{c} = \frac{b}{c}$.

CHAPTER OVERVIEW

3: Algebraic Expressions

You may not realize it, but you already use algebra every day. Perhaps you figure out how much to tip a server in a restaurant. Maybe you calculate the amount of change you should get when you pay for something. It could even be when you compare batting averages of your favorite players. You can describe the algebra you use in specific words, and follow an orderly process. In this chapter, you will explore the words used to describe algebra and start on your path to solving algebraic problems easily, both in class and in your everyday life.

3.1: Use the Language of Algebra (Part 1)
3.2: Use the Language of Algebra (Part 2)
3.3: Evaluate, Simplify, and Translate Expressions (Part 1)
3.4: Evaluate, Simplify, and Translate Expressions (Part 2)
3.5: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 1)
3.6: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 2)
3.E: Introduction to the Language of Algebra (Exercises)
3.S: Introduction to the Language of Algebra (Summary)

Figure 2.1 - Algebra has a language of its own. The picture shows just some of the words you may see and use in your study of Prealgebra.

3.1: Use the Language of Algebra (Part 1)

Learning Objectives

- Use variables and algebraic symbols
- Identify expressions and equations
- Simplify expressions with exponents
- Simplify expressions using the order of operations

Be Prepared!

Before you get started, take this readiness quiz.

a. Add: $43+69$. If you missed this problem, review Example 1.2.8.
b. Multiply: $(896)201$. If you missed this problem, review Example 1.4.11.
c. Divide: $7,263 \div 9$. If you missed this problem, review Example 1.5.8.

Use Variables and Algebraic Symbols

Greg and Alex have the same birthday, but they were born in different years. This year Greg is 20 years old and Alex is 23, so Alex is 3 years older than Greg. When Greg was 12, Alex was 15. When Greg is 35, Alex will be 38. No matter what Greg's age is, Alex's age will always be 3 years more, right?

In the language of algebra, we say that Greg's age and Alex's age are variable and the three is a constant. The ages change, or vary, so age is a variable. The 3 years between them always stays the same, so the age difference is the constant.

In algebra, letters of the alphabet are used to represent variables. Suppose we call Greg's age g. Then we could use $g+3$ to represent Alex's age. See Table 3.1.1.

Table 3.1.1

Greg's age	Alex's age
12	15
20	23
35	38
g	g + 3

Letters are used to represent variables. Letters often used for variables are $x, y, a, b,$ and c.

Definition: Variables and Constants

A variable is a letter that represents a number or quantity whose value may change.

A constant is a number whose value always stays the same.

To write algebraically, we need some symbols as well as numbers and variables. There are several types of symbols we will be using. In Whole Numbers, we introduced the symbols for the four basic arithmetic operations: addition, subtraction, multiplication, and division. We will summarize them here, along with words we use for the operations and the result.

Table 3.1.2

Operation	Notation	Say:	The result is...
Addition	a + b	a plus b	the sum of a and b
Subtraction	a − b	a minus b	the difference of a and b
Multiplication	a • b, (a)(b), (a)b, a(b)	a times b	the product of a and b

Operation	Notation	Say:	The result is...
Division	a ÷ b, a / b, $\frac{a}{b}$, $b\overline{)a}$	a divided by b	the quotient of a and b

In algebra, the cross symbol, $\times$, is not used to show multiplication because that symbol may cause confusion. Does $3xy$ mean $3 \times y$ (three times y) or $3 \bullet x \bullet y$ (three times x times y)? To make it clear, use $\bullet$ or parentheses for multiplication.

We perform these operations on two numbers. When translating from symbolic form to words, or from words to symbolic form, pay attention to the words *of* or *and* to help you find the numbers.

The *sum* ***of*** 5 ***and*** 3 means add 5 plus 3, which we write as $5+3$.

The *difference* ***of*** 9 ***and*** 2 means subtract 9 minus 2, which we write as $9-2$.

The *product* ***of*** 4 ***and*** 8 means multiply 4 times 8, which we can write as $4 \bullet 8$.

The *quotient* ***of*** 20 ***and*** 5 means divide 20 by 5, which we can write as $20 \div 5$.

Example 3.1.1: translate to words

Translate from algebra to words:

a. $12+14$
b. $(30)(5)$
c. $64 \div 8$
d. $x-y$

Solution

a.

12 + 14
12 plus 14
the sum of twelve and fourteen

b.

(30)(5)
30 times 5
the product of thirty and five

c.

64 ÷ 8
64 divided by 8
the quotient of sixty-four and eight

d.

x − y
x minus y
the difference of x and y

exercise 3.1.1

Translate from algebra to words.

a. $18+11$
b. $(27)(9)$
c. $84\div 7$
d. $p-q$

Answer a

18 plus 11; the sum of eighteen and eleven

Answer b

27 times 9; the product of twenty-seven and nine

Answer c

84 divided by 7; the quotient of eighty-four and seven

Answer d

p minus q; the difference of p and q

exercise 3.1.2

Translate from algebra to words.

a. $47-19$
b. $72\div 9$
c. $m+n$
d. $(13)(7)$

Answer a

47 minus 19; the difference of forty-seven and nineteen

Answer b

72 divided by 9; the quotient of seventy-two and nine

Answer c

m plus n; the sum of m and n

Answer d

13 times 7; the product of thirteen and seven

When two quantities have the same value, we say they are equal and connect them with an *equal sign*.

Definition: Equality Symbol

$a=b$ is read a is equal to b

The symbol $=$ is called the equal sign.

An inequality is used in algebra to compare two quantities that may have different values. The number line can help you understand inequalities. Remember that on the number line the numbers get larger as they go from left to right. So if we know that b is greater than a, it means that b is to the right of a on the number line. We use the symbols "$<$" and "$>$" for inequalities.

Definition: Inequality

$a < b$ is read a is less than b

a is to the left of b on the number line

$a > b$ is read a is greater than b

a is to the right of b on the number line

The expressions $a < b$ and $a > b$ can be read from left-to-right or right-to-left, though in English we usually read from left-to-right. In general, $a < b$ is equivalent to $b > a$. For example, $7 < 11$ is equivalent to $11 > 7$. $a > b$ is equivalent to $b < a$. For example, $17 > 4$ is equivalent to $4 < 17$.

When we write an inequality symbol with a line under it, such as $a \leq b$, it means $a < b$ or $a = b$. We read this a is less than or equal to b. Also, if we put a slash through an equal sign, $\neq$, it means not equal.

We summarize the symbols of equality and inequality in Table 3.1.3.

Table 3.1.3

Algebraic Notation	Say
a = b	a is equal to b
a ≠ b	a is not equal to b
a < b	a is less than b
a > b	a is greater than b
a ≤ b	a is less than or equal to b
a ≥ b	a is greater than or equal to b

Definition: Symbols $<$ and $>$

The symbols $<$ and $>$ each have a smaller side and a larger side.

$$\text{smaller side} < \text{larger side}$$

$$\text{larger side} > \text{smaller side}$$

The smaller side of the symbol faces the smaller number and the larger faces the larger number.

Example 3.1.2: translate to words

Translate from algebra to words:

a. $20 \leq 35$
b. $11 \neq 15 - 3$
c. $9 > 10 \div 2$
d. $x + 2 < 10$

Solution

a.

$20 \leq 35$
20 is less than or equal to 35

b.

$11 \neq 15 - 3$
11 is not equal to 15 minus 3

c.

$9 > 10 \div 2$
9 is greater than 10 divided by 2

d.

$x + 2 < 10$
x plus 2 is less than 10

exercise 3.1.3

Translate from algebra to words.

a. $14 \leq 27$
b. $19 - 2 \neq 8$
c. $12 > 4 \div 2$
d. $x - 7 < 1$

Answer a

fourteen is less than or equal to twenty-seven

Answer b

nineteen minus two is not equal to eight

Answer c

twelve is greater than four divided by two

Answer d

x minus seven is less than one

exercise 3.1.4

Translate from algebra to words.

a. $19 \geq 15$
b. $7 = 12 - 5$
c. $15 \div 3 < 8$
d. $y - 3 > 6$

Answer a

nineteen is greater than or equal to fifteen

Answer b

seven is equal to twelve minus five

Answer c

fifteen divided by three is less than eight

Answer d

y minus three is greater than six

Example 3.1.3: translate

The information in Figure 3.1.1 compares the fuel economy in miles-per-gallon (mpg) of several cars. Write the appropriate symbol =, in each expression to compare the fuel economy of the cars.

Car	Prius	Mini Cooper	Toyota Corolla	Versa	Honda Fit
Fuel economy (mpg)	48	27	28	26	27

Figure 3.1.1: (credit: modification of work by Bernard Goldbach, Wikimedia Commons)

a. MPG of Prius _____ MPG of Mini Cooper
b. MPG of Versa _____ MPG of Fit
c. MPG of Mini Cooper _____ MPG of Fit
d. MPG of Corolla _____ MPG of Versa
e. MPG of Corolla_____ MPG of Prius

Solution

a.

	MPG of Prius____MPG of Mini Cooper
Find the values in the chart.	48____27
Compare.	48 > 27
	MPG of Prius > MPG of Mini Cooper

b.

	MPG of Versa____MPG of Fit
Find the values in the chart.	26____27
Compare.	26 < 27
	MPG of Versa < MPG of Fit

c.

	MPG of Mini Cooper____MPG of Fit
Find the values in the chart.	27____27
Compare.	27 = 27
	MPG of Mini Cooper = MPG of Fit

d.

	MPG of Corolla____MPG of Versa
Find the values in the chart.	28____26
Compare.	28 > 26

	MPG of Corolla > MPG of Versa

e.

	MPG of Corolla____MPG of Prius
Find the values in the chart.	28____48
Compare.	28 < 48
	MPG of Corolla < MPG of Prius

? exercise 3.1.5

Use Figure 3.1.1 to fill in the appropriate symbol, $=$, $<$, or $>$.

a. MPG of Prius_____MPG of Versa
b. MPG of Mini Cooper_____ MPG of Corolla

Answer a

$>$

Answer b

$<$

? exercise 3.1.6

Use Figure 3.1.1 to fill in the appropriate symbol, $=$, $<$, or $>$.

a. MPG of Fit_____ MPG of Prius
b. MPG of Corolla _____ MPG of Fit

Answer a

$<$

Answer b

$<$

Grouping symbols in algebra are much like the commas, colons, and other punctuation marks in written language. They indicate which expressions are to be kept together and separate from other expressions. Table 3.1.4 lists three of the most commonly used grouping symbols in algebra.

Table 3.1.4

Common Grouping Symbols	
parentheses	( )
brackets	[ ]
braces	{ }

Here are some examples of expressions that include grouping symbols. We will simplify expressions like these later in this section.

$$8(14-8) \qquad 21-3[2+4(9-8)] \qquad 24\div 13-2[1(6-5)+4]$$

Identify Expressions and Equations

What is the difference in English between a phrase and a sentence? A phrase expresses a single thought that is incomplete by itself, but a sentence makes a complete statement. “Running very fast” is a phrase, but “The football player was running very fast” is a sentence. A sentence has a subject and a verb.

In algebra, we have *expressions* and *equations*. An expression is like a phrase. Here are some examples of expressions and how they relate to word phrases:

Table 3.1.5

Expression	Words	Phrase
3 + 5	3 plus 5	the sum of three and five
n - 1	n minus one	the difference of n and one
6 • 7	6 times 7	the product of six and seven
$\frac{x}{y}$	x divided by y	the quotient of x and y

Notice that the phrases do not form a complete sentence because the phrase does not have a verb. An equation is two expressions linked with an equal sign. When you read the words the symbols represent in an equation, you have a complete sentence in English. The equal sign gives the verb. Here are some examples of equations:

Table 3.1.6

Equation	Sentence
3 + 5 = 8	The sum of three and five is equal to eight.
n − 1 = 14	n minus one equals fourteen.
6 • 7 = 42	The product of six and seven is equal to forty-two.
x = 53	x is equal to fifty-three.
y + 9 = 2y − 3	y plus nine is equal to two y minus three.

Definition: Expressions and Equations

An expression is a number, a variable, or a combination of numbers and variables and operation symbols.

An equation is made up of two expressions connected by an equal sign.

Example 3.1.4: expression or equation

Determine if each is an expression or an equation:

a. $16 - 6 = 10$
b. $4 \bullet 2 + 1$
c. $x \div 25$
d. $y + 8 = 40$

Solution

(a) 16 − 6 = 10	This is an equation—two expressions are connected with an equal sign.
(b) 4 • 2 + 1	This is an expression—no equal sign.
(c) x ÷ 25	This is an expression—no equal sign.

(d) y + 8 = 40	This is an equation—two expressions are connected with an equal sign.

? exercise 3.1.7

Determine if each is an expression or an equation:

a. $23+6=29$
b. $7 \bullet 3-7$

Answer a

equation

Answer b

expression

? exercise 3.1.8

Determine if each is an expression or an equation:

a. $y \div 14$
b. $x-6=21$

Answer a

expression

Answer b

equation

Simplify Expressions with Exponents

To simplify a numerical expression means to do all the math possible. For example, to simplify $4 \bullet 2+1$ we'd first multiply $4 \bullet 2$ to get 8 and then add the 1 to get 9. A good habit to develop is to work down the page, writing each step of the process below the previous step. The example just described would look like this:

$$\begin{aligned} 4 \cdot 2+1 \\ 8+1 \\ 9 \end{aligned}$$

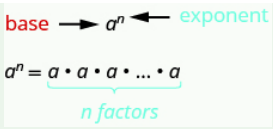
Suppose we have the expression $2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2$. We could write this more compactly using exponential notation. Exponential notation is used in algebra to represent a quantity multiplied by itself several times. We write $2 \bullet 2 \bullet 2$ as 2^3 and $2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2 \bullet 2$ as 2^9. In expressions such as 2^3, the 2 is called the **base** and the 3 is called the **exponent**. The exponent tells us how many factors of the base we have to multiply.

means multiply three factors of 2

We say 2^3 is in exponential notation and $2 \bullet 2 \bullet 2$ is in expanded notation.

Definition: Exponential Notation

For any expression a^n, a is a factor multiplied by itself n times if n is a positive integer.



The expression a^n is read a to the n^{th} power.

For powers of $n = 2$ and $n = 3$, we have special names. a^2 is read as "a squared" a^3 is read as "a cubed" Table 3.1.7 lists some examples of expressions written in exponential notation.

Table 3.1.7

Exponential Notation	In Words
7^2	7 to the second power, or 7 squared
5^3	5 to the third power, or 5 cubed
9^4	9 to the fourth power
12^5	12 to the fifth power

Example 3.1.5: exponential form

Write each expression in exponential form:

a. $16 \bullet 16 \bullet 16 \bullet 16 \bullet 16 \bullet 16 \bullet 16$
b. $9 \bullet 9 \bullet 9 \bullet 9 \bullet 9$
c. $x \bullet x \bullet x \bullet x$
d. $a \bullet a \bullet a \bullet a \bullet a \bullet a \bullet a \bullet a$

Solution

(a) The base 16 is a factor 7 times.	16^7
(b) The base 9 is a factor 5 times.	9^5
(c) The base x is a factor 4 times.	x^4
(d) The base a is a factor 8 times.	a^8

exercise 3.1.9

Write each expression in exponential form: $41 \bullet 41 \bullet 41 \bullet 41 \bullet 41$

Answer

41^5

exercise 3.1.10

Write each expression in exponential form: $7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7 \bullet 7$

Answer

7^9

Example 3.1.6: expanded form

Write each exponential expression in expanded form:

a. 8^6
b. x^5

Solution

a. The base is 8 and the exponent is 6, so 8^6 means $8 \bullet 8 \bullet 8 \bullet 8 \bullet 8 \bullet 8$
b. The base is x and the exponent is 5, so x^5 means $x \bullet x \bullet x \bullet x \bullet x$

exercise 3.1.11

Write each exponential expression in expanded form:

a. 4^8
b. a^7

Answer a

$4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4$

Answer b

$a \cdot a \cdot a \cdot a \cdot a \cdot a \cdot a$

exercise 3.1.12

Write each exponential expression in expanded form:

a. 8^8
b. b^6

Answer a

$8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8$

Answer b

$b \cdot b \cdot b \cdot b \cdot b \cdot b$

To simplify an exponential expression without using a calculator, we write it in expanded form and then multiply the factors.

Example 3.1.7: simplify

Simplify: 3^4.

Solution

Expand the expression.	$3^4 = 3 \cdot 3 \cdot 3 \cdot 3$
Multiply left to right.	$9 \cdot 3 \cdot 3 = 27 \cdot 3$
Multiply.	81

exercise 3.1.13

Simplify:

a. 5^3
b. 1^7

Answer a

125

Answer b

1

? exercise 3.1.14

Simplify:

a. 7^2
b. 0^5

Answer a

49

Answer b

0

3.2: Use the Language of Algebra (Part 2)

Simplify Expressions Using the Order of Operations

We've introduced most of the symbols and notation used in algebra, but now we need to clarify the order of operations. Otherwise, expressions may have different meanings, and they may result in different values. For example, consider the expression:

$$4+3\cdot 7$$

Some students say it simplifies to	49	Some students say it simplifies to	25
Since 4 + 3 gives 7.	4 + 3 • 7 = 7 • 7	Since 3 • 7 is 21.	4 + 3 • 7 = 4 + 21
And 7 • 7 is 49.	7 • 7 = 49	And 21 + 4 makes 25.	4 + 21 = 25

Imagine the confusion that could result if every problem had several different correct answers. The same expression should give the same result. So mathematicians established some guidelines called the order of operations, which outlines the order in which parts of an expression must be simplified.

Definition: Order of Operations

When simplifying mathematical expressions perform the operations in the following order:

1. **P**arentheses and other Grouping Symbols
- Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. **E**xponents
- Simplify all expressions with exponents.
3. **M**ultiplication and **D**ivision
- Perform all multiplication and division in order from left to right. These operations have equal priority.
4. **A**ddition and **S**ubtraction
- Perform all addition and subtraction in order from left to right. These operations have equal priority.

Students often ask, "How will I remember the order?" Here is a way to help you remember: Take the first letter of each key word and substitute the silly phrase. **P**lease **E**xcuse **M**y **D**ear **A**unt **S**ally.

Table 3.2.8

Order of Operations	
Please	**P**arentheses
Excuse	**E**xponents
My **D**ear	**M**ultiplication and **D**ivision
Aunt **S**ally	**A**ddition and **S**ubtraction

It's good that '**M**y **D**ear' goes together, as this reminds us that **m**ultiplication and **d**ivision have equal priority. We do not always do multiplication before division or always do division before multiplication. We do them in order from left to right.

Similarly, '**A**unt **S**ally' goes together and so reminds us that **a**ddition and **s**ubtraction also have equal priority and we do them in order from left to right.

Example 3.2.8: simplify

Simplify the expressions:

a. $4+3 \bullet 7$
b. $(4+3) \bullet 7$

Solution

a.

Are there any parentheses? No. Are there any exponents? No. Is there any multiplication or division? Yes.	$4+3 \cdot 7$
Multiply first.	$4+3 \cdot 7$
Add.	$4+21$
	25

b.

Are there any parentheses? Yes.	$(4+3) \cdot 7$
Simplify inside the parentheses.	$(4+3) \cdot 7$
Are there any exponents? No. Is there any multiplication or division? Yes.	$(7)7$
Multiply.	49

exercise 3.2.15

Simplify the expressions:

a. $12-5 \bullet 2$
b. $(12-5) \bullet 2$

Answer a

2

Answer b

14

exercise 3.2.16

Simplify the expressions:

a. $8+3 \bullet 9$
b. $(8+3) \bullet 9$

Answer a

35

Answer b

99

Example 3.2.9: simplify

Simplify:

a. $18 \div 9 \bullet 2$
b. $18 \bullet 9 \div 2$

Solution

a.

Are there any parentheses? No. Are there any exponents? No. Is there any multiplication or division? Yes.	$18 \div 9 \cdot 2$
Multiply and divide from left to right. Divide.	$2 \cdot 2$
Multiply.	4

b.

Are there any parentheses? No. Are there any exponents? No. Is there any multiplication or division? Yes.	$18 \cdot 9 \div 2$
Multiply and divide from left to right. Multiply.	$162 \div 2$
Divide.	81

exercise 3.2.17

Simplify: $42 \div 7 \bullet 3$

Answer

18

exercise 3.2.18

Simplify: $12 \bullet 3 \div 4$

Answer

9

Example 3.2.10: simplify

Simplify: $18 \div 6 + 4(5 - 2)$.

Solution

Parentheses? Yes, subtract first.	$18 \div 6 + 4(5 - 2)$
Exponents? No. Multiplication or division? Yes.	$18 \div 6 + 4(3)$
Divide first because we multiply and divide left to right.	$3 + 4(3)$
Any other multiplication or division? Yes. Multiply.	$3 + 12$
Any other multiplication or division? No. Any addition or subtraction? Yes	15

exercise 3.2.19

Simplify: $30 \div 5 + 10(3-2)$

Answer

16

exercise 3.2.20

Simplify: $70 \div 10 + 4(6-2)$

Answer

23

When there are multiple grouping symbols, we simplify the innermost parentheses first and work outward.

Example 3.2.11: simplify

Simplify: $5 + 2^3 + 3[6 - 3(4-2)]$.

Solution

Are there any parentheses (or other grouping symbol)? Yes.	$5 + 2^3 + 3[6 - 3(4-2)]$
Focus on the parentheses that are inside the brackets.	$5 + 2^3 + 3[6 - 3(4-2)]$
Subtract.	$5 + 2^3 + 3[6 - 3(2)]$
Continue inside the brackets and multiply.	$5 + 2^3 + 3[6 - 6]$
Continue inside the brackets and subtract.	$5 + 2^3 + 3[0]$
The expression inside the brackets requires no further simplification.	
Are there any exponents? Yes.	$5 + 2^3 + 3[0]$
Simplify exponents.	$5 + 8 + 3[0]$
Is there any multiplication or division? Yes.	$5 + 8 + 3[0]$
Multiply.	$5 + 8 + 0$
Is there any addition or subtraction? Yes.	$textcolorred5 + 8 + 0$
Add.	$13 + 0$
Add.	13

exercise 3.2.21

Simplify: $9 + 5^3 - [4(9+3)]$

Answer

86

exercise 3.2.22

Simplify: $7^2 - 2[4(5+1)]$

Answer

1

Example 3.2.12: simplify

Simplify: $2^3 + 34 \div 3 - 5^2$.

Solution

If an expression has several exponents, they may be simplified in the same step.	$2^3 + 3^4 \div 3 - 52$
Simplify exponents.	$2^3 + 3^4 \div 3 - 5^2$
Divide.	$8 + 81 \div 3 - 25$
Add.	$8 + 27 - 25$
Subtract.	$35 - 25$
	10

exercise 3.2.23

Simplify: $3^2 + 2^4 \div 2 + 4^3$

Answer

81

exercise 3.2.24

Simplify: $6^2 - 5^3 \div 5 + 8^2$

Answer

75

- Order of Operations
- Order of Operations – The Basics
- Ex: Evaluate an Expression Using the Order of Operations
- Example 3: Evaluate an Expression Using The Order of Operations

Key Concepts

Operation	Notation	Say:	The result is…
Addition	a+b	a plus b	the sum of a and b
Multiplication	a·b,(a)(b),(a)b,a(b)	a times b	The product of a and b
Subtraction	a−b	a minus b	the difference of a and b

Operation	Notation	Say:	The result is…
Division	$a \div b, a/b, \frac{a}{b}, a\overline{)b}$	a divided by b	The quotient of a and b

- **Equality Symbol**
  - $a = b$ is read as a is equal to b
  - The symbol $=$ is called the equal sign.
- **Inequality**
  - $a < b$ is read a is less than b
  - a is to the left of b on the number line

  - $a > b$ is read a is greater than b
  - a is to the right of b on the number line

Algebraic Notation	Say
a=b	a is equal to b
a≠b	a is not equal to b
a<b	a is less than b
a>b	a is greater than b
a≤b	a is less than or equal to b
a≥b	a is greater than or equal to b

- **Exponential Notation**
  - For any expression a^n is a factor multiplied by itself n times, if n is a positive integer.
  - a^n means multiply n factors of a

  - The expression of a^n is read a to the n^{th} power.

Order of Operations When simplifying mathematical expressions perform the operations in the following order:

- Parentheses and other Grouping Symbols: Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
- Exponents: Simplify all expressions with exponents.
- Multiplication and Division: Perform all multiplication and division in order from left to right. These operations have equal priority.
- Addition and Subtraction: Perform all addition and subtraction in order from left to right. These operations have equal priority.

Glossary

expressions

An expression is a number, a variable, or a combination of numbers and variables and operation symbols.

equation

An equation is made up of two expressions connected by an equal sign.

Practice Makes Perfect

Use Variables and Algebraic Symbols

In the following exercises, translate from algebraic notation to words.

1. $16 - 9$
2. $25 - 7$
3. $5 \cdot 6$
4. $3 \cdot 9$
5. $28 \div 4$
6. $45 \div 5$
7. $x + 8$
8. $x + 11$
9. $(2)(7)$
10. $(4)(8)$
11. $14 < 21$
12. $17 < 35$
13. $36 \geq 19$
14. $42 \geq 27$
15. $3n = 24$
16. $6n = 36$
17. $y - 1 > 6$
18. $y - 4 > 8$
19. $2 \leq 18 \div 6$
20. $3 \leq 20 \div 4$
21. $a \neq 7 \cdot 4$
22. $a \neq 1 \cdot 12$

Identify Expressions and Equations

In the following exercises, determine if each is an expression or an equation.

23. $9 \cdot 6 = 54$
24. $7 \cdot 9 = 63$
25. $5 \cdot 4 + 3$
26. $6 \cdot 3 + 5$
27. $x + 7$
28. $x + 9$
29. $y - 5 = 25$
30. $y - 8 = 32$

Simplify Expressions with Exponents

In the following exercises, write in exponential form.

31. $3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3$
32. $4 \cdot 4 \cdot 4 \cdot 4 \cdot 4 \cdot 4$
33. $x \cdot x \cdot x \cdot x \cdot x$
34. $y \cdot y \cdot y \cdot y \cdot y \cdot y$

In the following exercises, write in expanded form.

35. 5^3
36. 8^3
37. 2^8
38. 10^5

Simplify Expressions Using the Order of Operations

In the following exercises, simplify.

39. (a) 3 + 8 • 5 (b) (3+8) • 5
40. (a) 2 + 6 • 3 (b) (2+6) • 3
41. $2^3 - 12 \div (9 - 5)$
42. $3^2 - 18 \div (11 - 5)$
43. 3 • 8 + 5 • 2
44. 4 • 7 + 3 • 5
45. 2 + 8(6 + 1)
46. 4 + 6(3 + 6)
47. 4 • 12 / 8
48. 2 • 36 / 6
49. 6 + 10 / 2 + 2
50. 9 + 12 / 3 + 4
51. (6 + 10) ÷ (2 + 2)
52. (9 + 12) ÷ (3 + 4)
53. 20 ÷ 4 + 6 • 5
54. 33 ÷ 3 + 8 • 2
55. 20 ÷ (4 + 6) • 5
56. 33 ÷ (3 + 8) • 2
57. $4^2 + 5^2$
58. $3^2 + 7^2$
59. $(4 + 5)^2$
60. $(3 + 7)^2$
61. $3(1 + 9 \cdot 6) - 4^2$
62. $5(2 + 8 \cdot 4) - 7^2$
63. 2[1 + 3(10 − 2)]
64. 5[2 + 4(3 − 2)]

Everyday Math

65. **Basketball** In the 2014 NBA playoffs, the San Antonio Spurs beat the Miami Heat. The table below shows the heights of the starters on each team. Use this table to fill in the appropriate symbol (=, <, >).

Spurs	Height	Heat	Height
Tim Duncan	83″	Rashard Lewis	82"
Boris Diaw	80"	LeBron James	80"
Kawhi Leonard	79"	Chris Bosh	83"
Tony Parker	74"	Dwyane Wade	76"
Danny Green	78"	Ray Allen	77"

a. Height of Tim Duncan____Height of Rashard Lewis
b. Height of Boris Diaw____Height of LeBron James
c. Height of Kawhi Leonard____Height of Chris Bosh
d. Height of Tony Parker____Height of Dwyane Wade
e. Height of Danny Green____Height of Ray Allen

66. **Elevation** In Colorado there are more than 50 mountains with an elevation of over 14,000 feet. The table shows the ten tallest. Use this table to fill in the appropriate inequality symbol.

Mountain	Elevation

Mountain	Elevation
Mt. Elbert	14,433′
Mt. Massive	14,421′
Mt. Harvard	14,420′
Blanca Peak	14,345′
La Plata Peak	14,336′
Uncompahgre Peak	14,309′
Crestone Peak	14,294′
Mt. Lincoln	14,286′
Grays Peak	14,270′
Mt. Antero	14,269′

a. Elevation of La Plata Peak____Elevation of Mt. Antero
b. Elevation of Blanca Peak____Elevation of Mt. Elbert
c. Elevation of Gray's Peak____Elevation of Mt. Lincoln
d. Elevation of Mt. Massive____Elevation of Crestone Peak
e. Elevation of Mt. Harvard____Elevation of Uncompahgre Peak

Writing Exercises

67. Explain the difference between an expression and an equation.
68. Why is it important to use the order of operations to simplify an expression?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use variables and algebraic symbols.			
identify expressions and equations.			
simplify expressions with exponents.			
simplify expressions using the order of operations.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

3.3: Evaluate, Simplify, and Translate Expressions (Part 1)

Learning Objectives

- Evaluate algebraic expressions
- Identify terms, coefficients, and like terms
- Simplify expressions by combining like terms
- Translate word phrases to algebraic expressions

Be prepared!

Before you get started, take this readiness quiz.

1. Is $n \div 5$ an expression or an equation? If you missed this problem, review Example 2.1.4.
2. Simplify 4^5. If you missed this problem, review Example 2.1.6.
3. Simplify $1 + 8 \bullet 9$. If you missed this problem, review Example 2.1.8.

Evaluate Algebraic Expressions

In the last section, we simplified expressions using the order of operations. In this section, we'll evaluate expressions—again following the order of operations.

To **evaluate** an algebraic expression means to find the value of the expression when the variable is replaced by a given number. To evaluate an expression, we substitute the given number for the variable in the expression and then simplify the expression using the order of operations.

Example 3.3.1: evaluate

Evaluate $x + 7$ when

a. $x = 3$
b. $x = 12$

Solution

a. To evaluate, substitute 3 for x in the expression, and then simplify.

	$x + 7$
Substitute.	$3 + 7$
Add.	10

When $x = 3$, the expression $x + 7$ has a value of 10.

b. To evaluate, substitute 12 for x in the expression, and then simplify.

	$x + 7$
Substitute.	$12 + 7$
Add.	19

When $x = 12$, the expression $x + 7$ has a value of 19. Notice that we got different results for parts (a) and (b) even though we started with the same expression. This is because the values used for x were different. When we evaluate an expression, the value varies depending on the value used for the variable.

exercise 3.3.1

Evaluate: $y+4$ when

a. $y=6$
b. $y=15$

Answer a

10

Answer b

19

exercise 3.3.2

Evaluate: $a-5$ when

a. $a=9$
b. $a=17$

Answer a

4

Answer b

12

Example 3.3.2

Evaluate $9x-2$, when

a. $x=5$
b. $x=1$

Solution

Remember ab means a times b, so $9x$ means 9 times x.

a. To evaluate the expression when $x=5$, we substitute 5 for x, and then simplify.

	$9x-2$
Substitute 5 for x.	$9\cdot 5-2$
Multiply.	$45-2$
Subtract.	43

b. To evaluate the expression when $x=1$, we substitute 1 for x, and then simplify.

	$9x-2$
Substitute 1 for x.	$9\cdot 1-2$
Multiply.	$9-2$
Subtract.	7

Notice that in part (a) that we wrote $9 \bullet 5$ and in part (b) we wrote $9(1)$. Both the dot and the parentheses tell us to multiply.

exercise 3.3.3

Evaluate: $8x - 3$, when

a. $x = 2$
b. $x = 1$

Answer a

13

Answer b

5

exercise 3.3.4

Evaluate: $4y - 4$, when

a. $y = 3$
b. $y = 5$

Answer a

8

Answer b

16

Example 3.3.3: evaluate

Evaluate x^2 when $x = 10$.

Solution

We substitute 10 for x, and then simplify the expression.

	x^2
Substitute 10 for x.	10^2
Use the definition of exponent.	$10 \cdot 10$
Multiply	100

When $x = 10$, the expression x^2 has a value of 100.

exercise 3.3.5

Evaluate: x^2 when $x = 8$.

Answer

64

exercise 3.3.6

Evaluate: x^3 when $x = 6$.

Answer

216

Example 3.3.4: evaluate

Evaluate 2^x when $x = 5$.

Solution

In this expression, the variable is an exponent.

	2^x
Substitute 5 for x.	2^5
Use the definition of exponent.	$2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$
Multiply	32

When $x = 5$, the expression 2^x has a value of 32.

exercise 3.3.7

Evaluate: 2^x when $x = 6$.

Answer

64

exercise 3.3.8

Evaluate: 3^x when $x = 4$.

Answer

81

Example 3.3.5: evaluate

Evaluate $3x + 4y - 6$ when $x = 10$ and $y = 2$.

Solution

This expression contains two variables, so we must make two substitutions.

	$3x + 4y - 6$
Substitute 10 for x and 2 for y.	$3(10) + 4(2) - 6$
Multiply.	$30 + 8 - 6$
Add and subtract left to right.	32

When $x = 10$ and $y = 2$, the expression $3x + 4y - 6$ has a value of 32.

exercise 3.3.9

Evaluate: $2x + 5y - 4$ when $x = 11$ and $y = 3$

Answer

33

exercise 3.3.10

Evaluate: $5x - 2y - 9$ when $x = 7$ and $y = 8$

Answer

10

Example 3.3.6: evaluate

Evaluate $2x^2 + 3x + 8$ when $x = 4$.

Solution

We need to be careful when an expression has a variable with an exponent. In this expression, $2x^2$ means $2 \bullet x \bullet x$ and is different from the expression $(2x)^2$, which means $2x \bullet 2x$.

	$2x^2 + 3x + 8$
Substitute 4 for each x.	$2(4)^2 + 3(4) + 8$
Simplify 4^2.	$2(16) + 3(4) + 8$
Multiply.	$32 + 12 + 8$
Add.	52

exercise 3.3.11

Evaluate: $3x^2 + 4x + 1$ when $x = 3$.

Answer

40

exercise 3.3.12

Evaluate: $6x^2 - 4x - 7$ when $x = 2$.

Answer

9

Identify Terms, Coefficients, and Like Terms

Algebraic expressions are made up of *terms*. A **term** is a constant or the product of a constant and one or more variables. Some examples of terms are 7, y, $5x^2$, $9a$, and $13xy$.

The constant that multiplies the variable(s) in a term is called the **coefficient**. We can think of the coefficient as the number *in front of* the variable. The coefficient of the term $3x$ is 3. When we write x, the coefficient is 1, since $x = 1 \bullet x$. Table 3.3.1 gives the coefficients for each of the terms in the left column.

Table 3.3.1

Term	Coefficient
7	7
9a	9
y	1

Term	Coefficient
$5x^2$	5

An algebraic expression may consist of one or more terms added or subtracted. In this chapter, we will only work with terms that are added together. Table 3.3.2 gives some examples of algebraic expressions with various numbers of terms. Notice that we include the operation before a term with it.

Table 3.3.2

Expression	Terms
7	7
y	y
x + 7	x, 7
2x + 7y + 4	2x, 7y, 4
$3x^2 + 4x^2 + 5y + 3$	$3x^2$, $4x^2$, 5y, 3

Example 3.3.7:

Identify each term in the expression $9b+15x^2+a+6$. Then identify the coefficient of each term.

Solution

The expression has four terms. They are $9b$, $15x^2$, a, and 6.

The coefficient of $9b$ is 9.

The coefficient of $15x^2$ is 15.

Remember that if no number is written before a variable, the coefficient is 1. So the coefficient of a is 1.

The coefficient of a constant is the constant, so the coefficient of 6 is 6.

exercise 3.3.13

Identify all terms in the given expression, and their coefficients: $4x+3b+2$

Answer

The terms are $4x, 3b,$ and 2. The coefficients are $4, 3,$ and 2.

exercise 3.3.14

Identify all terms in the given expression, and their coefficients: $9a+13a^2+a^3$

Answer

The terms are $9a, 13a^2,$ and a^3, The coefficients are $9, 13,$ and 1.

Some terms share common traits. Look at the following terms. Which ones seem to have traits in common?

$5x, 7, n^2, 4, 3x, 9n^2$

Which of these terms are like terms?

- The terms 7 and 4 are both constant terms.
- The terms $5x$ and $3x$ are both terms with x.
- The terms n^2 and $9n^2$ both have n^2.

Terms are called like terms if they have the same variables and exponents. All constant terms are also like terms. So among the terms $5x, 7, n^2, 4, 3x, 9n^2, 7$and 4 are like terms, $5x$ and $3x$ are like terms, and n^2 and $9n^2$ are like terms.

Definition: Like terms

Terms that are either constants or have the same variables with the same exponents are like terms.

Example 3.3.8: identify

Identify the like terms:

a. $y^3, 7x^2, 14, 23, 4y^3, 9x, 5x^2$
b. $4x^2 + 2x + 5x^2 + 6x + 40x + 8xy$

Solution

a. $y^3, 7x^2, 14, 23, 4y^3, 9x, 5x^2$

Look at the variables and exponents. The expression contains y^3, x^2, x, and constants. The terms y^3 and $4y^3$ are like terms because they both have y^3. The terms $7x^2$ and $5x^2$ are like terms because they both have x^2. The terms 14 and 23 are like terms because they are both constants. The term $9x$ does not have any like terms in this list since no other terms have the variable x raised to the power of 1.

b. $4x^2 + 2x + 5x^2 + 6x + 40x + 8xy$

Look at the variables and exponents. The expression contains the terms $4x^2, 2x, 5x^2, 6x, 40x$and $8xy$The terms $4x^2$ and $5x^2$ are like terms because they both have x^2. The terms $2x, 6x$, and $40x$ are like terms because they all have x. The term $8xy$ has no like terms in the given expression because no other terms contain the two variables xy.

exercise 3.3.15

Identify the like terms in the list or the expression: $9, 2x^3, y^2, 8x^3, 15, 9y, 11y^2$

Answer

$9, 15$; $2x^3$ and $8x^3$, y^2, and $11y^2$

exercise 3.3.16

Identify the like terms in the list or the expression: $4x^3 + 8x^2 + 19 + 3x^2 + 24 + 6x^3$

Answer

$4x^3$ and $6x^3$; $8x^2$ and $3x^2$; 19 and 24

Simplify Expressions by Combining Like Terms

We can simplify an expression by combining the like terms. What do you think $3x + 6x$ would simplify to? If you thought $9x$, you would be right!

We can see why this works by writing both terms as addition problems.

$$\overbrace{x+x+x}^{3x} + \overbrace{x+x+x+x+x+x}^{6x}$$
$$+$$
$$9x$$

Add the coefficients and keep the same variable. It doesn't matter what x is. If you have 3 of something and add 6 more of the same thing, the result is 9 of them. For example, 3 oranges plus 6 oranges is 9 oranges. We will discuss the mathematical properties behind this later.

The expression $3x + 6x$ has only two terms. When an expression contains more terms, it may be helpful to rearrange the terms so that like terms are together. The Commutative Property of Addition says that we can change the order of addends without changing the sum. So we could rearrange the following expression before combining like terms.

$$3x + 4y - 2x + 6y$$
$$3x - 2x + 4y + 6y$$

Now it is easier to see the like terms to be combined.

HOW TO: COMBINE LIKE TERMS

Step 1. Identify like terms.

Step 2. Rearrange the expression so like terms are together.

Step 3. Add the coefficients of the like terms.

Example 3.3.9: simplify

Simplify the expression: $3x + 7 + 4x + 5$.

Solution

	$3x + 7 + 4x + 5$
Identify the like terms	$3x + 7 + 4x + 5$
Rearrange the expression, so the like terms are together.	$3x + 4x + 7 + 5$
Add the coefficients of the like terms.	$7x + 12$
The original expression is simplified to...	$7x + 12$

exercise 3.3.17

Simplify: $7x + 9 + 9x + 8$

Answer

$16x + 17$

exercise 3.3.18

Simplify: $5y + 2 + 8y + 4y + 5$

Answer

$17y + 7$

Example 3.3.10: simplify

Simplify the expression: $7x^2 + 8x + x^2 + 4x$.

Solution

	$7x^2 + 8x + x^2 + 4x$
Identify the like terms.	$7x^2 + 8x + x^2 + 4x$
Rearrange the expression so like terms are together.	$7x^2 + x^2 + 8x + 4x$

Add the coefficients of the like terms.	$8x^2+12x$

These are not like terms and cannot be combined. So $8x^2+12x$ is in simplest form.

exercise 3.3.19

Simplify: $3x^2+9x+x^2+5x$

Answer

$4x^2+14x$

exercise 3.3.20

Simplify: $11y^2+8y+y^2+7y$

Answer

$12y^2+15y$

3.4: Evaluate, Simplify, and Translate Expressions (Part 2)

Translate Words to Algebraic Expressions

In the previous section, we listed many operation symbols that are used in algebra, and then we translated expressions and equations into word phrases and sentences. Now we'll reverse the process and translate word phrases into algebraic expressions. The symbols and variables we've talked about will help us do that. They are summarized in Table 3.4.3.

Table 3.4.3

Operation	Phrase	Expression
Addition	a plus b the sum of a and b a increased by b b more than a the total of a and b b added to a	a + b
Subtraction	a minus b the difference of a and b b subtracted from a a decreased by b b less than a	a - b
Multiplication	a times b the product of a and b	a • b, ab, a(b), (a)(b)
Division	a divided by b the quotient of a and b the ratio of a and b b divided into a	a ÷ b, a / b, $\frac{a}{b}$, $b\overline{)a}$

Look closely at these phrases using the four operations:

- the sum of a and b
- the difference of a and b
- the product of a and b
- the quotient of a and b

Each phrase tells you to operate on two numbers. Look for the words ***of*** and ***and*** to find the numbers.

Example 3.4.11: translate

Translate each word phrase into an algebraic expression:

a. the difference of 20 and 4
b. the quotient of $10x$ and 3

Solution

a. The key word is *difference*, which tells us the operation is subtraction. Look for the words *of* and *and* to find the numbers to subtract.

$$\text{the difference of } 20 \text{ and } 4$$

$$20 \text{ minus } 4$$

$$20 - 4$$

b. The key word is *quotient*, which tells us the operation is division.

the quotient of $10x$ and 3

divide $10x$ by 3

$$10x \div 3$$

This can also be written as $10x/3$ or $\frac{10x}{3}$

? exercise 3.4.21

Translate the given word phrase into an algebraic expression:

a. the difference of 47 and 41
b. the quotient of $5x$ and 2

Answer a

$47 - 41$

Answer b

$5x \div 2$

? exercise 3.4.22

Translate the given word phrase into an algebraic expression:

a. the sum of 17 and 19
b. the product of 7 and x

Answer a

$17 + 19$

Answer b

$7x$

How old will you be in eight years? What age is eight more years than your age now? Did you add 8 to your present age? Eight *more than* means eight added to your present age.

How old were you seven years ago? This is seven years less than your age now. You subtract 7 from your present age. Seven *less than* means seven subtracted from your present age.

✓ Example 3.4.12: translate

Translate each word phrase into an algebraic expression:

a. Eight more than y
b. Seven less than $9z$

Solution

a. The key words are more than. They tell us the operation is addition. More than means "added to".

Eight more than y

Eight added to y

$$y + 8$$

b. The key words are less than. They tell us the operation is subtraction. Less than means "subtracted from".

Seven less than $9z$

Seven subtracted from $9z$

$$9z-7$$

exercise 3.4.23

Translate each word phrase into an algebraic expression:

a. Eleven more than x
b. Fourteen less than $11a$

Answer a

$x+11$

Answer b

$11a-14$

exercise 3.4.24

Translate each word phrase into an algebraic expression:

a. 19 more than j
b. 21 less than $2x$

Answer a

$j+19$

Answer b

$2x-21$

Example 3.4.13: translate

Translate each word phrase into an algebraic expression:

a. five times the sum of m and n
b. the sum of five times m and n

Solution

a. There are two operation words: times tells us to multiply and sum tells us to add. Because we are multiplying 5 times the sum, we need parentheses around the sum of m and n.

$$\text{five times the sum of } m \text{ and } n$$
$$5(m+n)$$

b. To take a sum, we look for the words of and and to see what is being added. Here we are taking the sum of five times m and n.

$$\text{the sum of five times } m \text{ and } n$$
$$5m+n$$

Notice how the use of parentheses changes the result. In part (a), we add first and in part (b), we multiply first.

exercise 3.4.25

Translate the word phrase into an algebraic expression:

a. four times the sum of p and q
b. the sum of four times p and q

Answer a

$4(p+q)$

Answer b

$4p+q$

exercise 3.4.26

Translate the word phrase into an algebraic expression:

a. the difference of two times x and 8
b. two times the difference of x and 8

Answer a

$2x-8$

Answer b

$2(x-8)$

Later in this course, we'll apply our skills in algebra to solving equations. We'll usually start by translating a word phrase to an algebraic expression. We'll need to be clear about what the expression will represent. We'll see how to do this in the next two examples.

Example 3.4.14: write an expression

The height of a rectangular window is 6 inches less than the width. Let w represent the width of the window. Write an expression for the height of the window.

Solution

Write a phrase about the height.	6 less than the width
Substitute w for the width.	6 less than w
Rewrite 'less than' as 'subtracted from'.	6 subtracted from w
Translate the phrase into algebra.	w - 6

exercise 3.4.27

The length of a rectangle is 5 inches less than the width. Let w represent the width of the rectangle. Write an expression for the length of the rectangle.

Answer

$w-5$

exercise 3.4.28

The width of a rectangle is 2 meters greater than the length. Let l represent the length of the rectangle. Write an expression for the width of the rectangle.

Answer

$l+2$

Example 3.4.15: write an expression

Blanca has dimes and quarters in her purse. The number of dimes is 2 less than 5 times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Solution

Write a phrase about the number of dimes.	two less than five times the number of quarters
Substitute q for the number of quarters.	2 less than five times q
Translate 5 *times* q.	2 less than 5q
Translate the phrase into algebra.	5q - 2

exercise 3.4.29

Geoffrey has dimes and quarters in his pocket. The number of dimes is seven less than six times the number of quarters. Let q represent the number of quarters. Write an expression for the number of dimes.

Answer

$6q-7$

exercise 3.4.30

Lauren has dimes and nickels in her purse. The number of dimes is eight more than four times the number of nickels. Let n represent the number of nickels. Write an expression for the number of dimes.

Answer

$4n+8$

Access Additional Online Resources

- Algebraic Expression Vocabulary

Key Concepts

- Combine like terms.
  - Identify like terms.
  - Rearrange the expression so like terms are together.
  - Add the coefficients of the like terms

Glossary

term

A term is a constant or the product of a constant and one or more variables.

coefficient

The constant that multiplies the variable(s) in a term is called the coefficient.

like terms

Terms that are either constants or have the same variables with the same exponents are like terms.

evaluate

To evaluate an algebraic expression means to find the value of the expression when the variable is replaced by a given number.

Practice Makes Perfect

Evaluate Algebraic Expressions

In the following exercises, evaluate the expression for the given value.

69. $7x + 8$ when $x = 2$
70. $9x + 7$ when $x = 3$
71. $5x - 4$ when $x = 6$
72. $8x - 6$ when $x = 7$
73. x^2 when $x = 12$
74. x^3 when $x = 5$
75. x^5 when $x = 2$
76. x^4 when $x = 3$
77. 3^x when $x = 3$
78. 4^x when $x = 2$
79. $x^2 + 3x - 7$ when $x = 4$
80. $x^2 + 5x - 8$ when $x = 6$
81. $2x + 4y - 5$ when $x = 7, y = 8$
82. $6x + 3y - 9$ when $x = 6, y = 9$
83. $(x - y)^2$ when $x = 10, y = 7$
84. $(x + y)^2$ when $x = 6, y = 9$
85. $a^2 + b^2$ when $a = 3, b = 8$
86. $r^2 - s^2$ when $r = 12, s = 5$
87. $2l + 2w$ when $l = 15, w = 12$
88. $2l + 2w$ when $l = 18, w = 14$

Identify Terms, Coefficients, and Like Terms

In the following exercises, list the terms in the given expression.

89. $15x^2 + 6x + 2$
90. $11x^2 + 8x + 5$
91. $10y^3 + y + 2$
92. $9y^3 + y + 5$

In the following exercises, identify the coefficient of the given term.

93. $8a$
94. $13m$
95. $5r^2$
96. $6x^3$

In the following exercises, identify all sets of like terms.

97. x^3, $8x$, 14, $8y$, 5, $8x^3$
98. $6z$, $3w^2$, 1, $6z^2$, $4z$, w^2
99. $9a$, a^2, $16ab$, $16b^2$, $4ab$, $9b^2$
100. 3, $25r^2$, $10s$, $10r$, $4r^2$, $3s$

Simplify Expressions by Combining Like Terms

In the following exercises, simplify the given expression by combining like terms.

101. $10x + 3x$
102. $15x + 4x$
103. $17a + 9a$
104. $18z + 9z$
105. $4c + 2c + c$
106. $6y + 4y + y$

107. $9x + 3x + 8$
108. $8a + 5a + 9$
109. $7u + 2 + 3u + 1$
110. $8d + 6 + 2d + 5$
111. $7p + 6 + 5p + 4$
112. $8x + 7 + 4x - 5$
113. $10a + 7 + 5a - 2 + 7a - 4$
114. $7c + 4 + 6c - 3 + 9c - 1$
115. $3x^2 + 12x + 11 + 14x^2 + 8x + 5$
116. $5b^2 + 9b + 10 + 2b^2 + 3b - 4$

Translate English Phrases into Algebraic Expressions

In the following exercises, translate the given word phrase into an algebraic expression.

117. The sum of 8 and 12
118. The sum of 9 and 1
119. The difference of 14 and 9
120. 8 less than 19
121. The product of 9 and 7
122. The product of 8 and 7
123. The quotient of 36 and 9
124. The quotient of 42 and 7
125. The difference of x and 4
126. 3 less than x
127. The product of 6 and y
128. The product of 9 and y
129. The sum of 8x and 3x
130. The sum of 13x and 3x
131. The quotient of y and 3
132. The quotient of y and 8
133. Eight times the difference of y and nine
134. Seven times the difference of y and one
135. Five times the sum of x and y
136. Nine times five less than twice x

In the following exercises, write an algebraic expression.

137. Adele bought a skirt and a blouse. The skirt cost $15 more than the blouse. Let b represent the cost of the blouse. Write an expression for the cost of the skirt.
138. Eric has rock and classical CDs in his car. The number of rock CDs is 3 more than the number of classical CDs. Let c represent the number of classical CDs. Write an expression for the number of rock CDs.
139. The number of girls in a second-grade class is 4 less than the number of boys. Let b represent the number of boys. Write an expression for the number of girls.
140. Marcella has 6 fewer male cousins than female cousins. Let f represent the number of female cousins. Write an expression for the number of boy cousins.
141. Greg has nickels and pennies in his pocket. The number of pennies is seven less than twice the number of nickels. Let n represent the number of nickels. Write an expression for the number of pennies.
142. Jeannette has $5 and $10 bills in her wallet. The number of fives is three more than six times the number of tens. Let t represent the number of tens. Write an expression for the number of fives.

Everyday Math

In the following exercises, use algebraic expressions to solve the problem.

143. **Car insurance** Justin's car insurance has a $750 deductible per incident. This means that he pays $750 and his insurance company will pay all costs beyond $750. If Justin files a claim for $2,100, how much will he pay, and how much will his

insurance company pay?

144. **Home insurance** Pam and Armando's home insurance has a $2,500 deductible per incident. This means that they pay $2,500 and their insurance company will pay all costs beyond $2,500. If Pam and Armando file a claim for $19,400, how much will they pay, and how much will their insurance company pay?

Writing Exercises

145. Explain why "the sum of x and y" is the same as "the sum of y and x," but "the difference of x and y" is not the same as "the difference of y and x." Try substituting two random numbers for x and y to help you explain. 146. Explain the difference between "4 times the sum of x and y" and "the sum of 4 times x and y."

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
evaluate algebraic expressions.			
identify terms, coefficients, and like terms.			
simplify expressions by combining like terms.			
translate word phrases to algebraic expressions.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

3.5: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 1)

Learning Objectives

- Determine whether a number is a solution of an equation
- Model the Subtraction Property of Equality
- Solve equations using the Subtraction Property of Equality
- Solve equations using the Addition Property of Equality
- Translate word phrases to algebraic equations
- Translate to an equation and solve

Be Prepared!

Before you get started, take this readiness quiz.

1. Evaluate $x+8$ when $x=11$. If you missed this problem, review Example 2..2.1.
2. Evaluate $5x-3$ when $x=9$. If you missed this problem, review Example 2.2.2.
3. Translate into algebra: the difference of x and 8. If you missed this problem, review Example 2.2.11.

When some people hear the word *algebra*, they think of solving equations. The applications of solving equations are limitless and extend to all careers and fields. In this section, we will begin solving equations. We will start by solving basic equations, and then as we proceed through the course we will build up our skills to cover many different forms of equations.

Determine Whether a Number is a Solution of an Equation

Solving an equation is like discovering the answer to a puzzle. An algebraic equation states that two algebraic expressions are equal. To solve an equation is to determine the values of the variable that make the equation a true statement. Any number that makes the equation true is called a **solution** of the equation. It is the answer to the puzzle!

Definition: Solution of an Equation

A solution to an equation is a value of a variable that makes a true statement when substituted into the equation. The process of finding the solution to an equation is called solving the equation.

To find the solution to an equation means to find the value of the variable that makes the equation true. Can you recognize the solution of $x+2=7$? If you said 5, you're right! We say 5 is a solution to the equation $x+2=7$ because when we substitute 5 for x the resulting statement is true.

$$\begin{aligned} x+2 &= 7 \\ 5+2 &\stackrel{?}{=} 7 \\ 7 &= 7 \checkmark \end{aligned}$$

Since $5+2=7$ is a true statement, we know that 5 is indeed a solution to the equation. The symbol $\stackrel{?}{=}$ asks whether the left side of the equation is equal to the right side. Once we know, we can change to an equal sign ($=$) or not-equal sign ($\neq$).

HOW TO: DETERMINE WHETHER A NUMBER IS A Solution TO AN EQUATION

Step 1. Substitute the number for the variable in the equation.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Determine whether the resulting equation is true.

- If it is true, the number is a solution.
- If it is not true, the number is not a solution.

Example 3.5.1

Determine whether $x = 5$ is a solution of $6x - 17 = 16$.

Solution

	$6x - 17 = 16$
Substitute 5 for x.	$6 \cdot 5 - 17 \stackrel{?}{=} 16$
Multiply.	$30 - 17 \stackrel{?}{=} 16$
Subtract	$13 \neq 16$

So $x = 5$ is not a solution to the equation $6x - 17 = 16$.

exercise 3.5.1

Is $x = 3$ a solution of $4x - 7 = 16$?

Answer

no

exercise 3.5.2

Is $x = 2$ a solution of $6x - 2 = 10$?

Answer

yes

Example 3.5.2

Determine whether $y = 2$ is a solution of $6y - 4 = 5y - 2$.

Solution

Here, the variable appears on both sides of the equation. We must substitute 2 for each y.

	$6y - 4 = 5y - 2$
Substitute 2 for y.	$6(2) - 4 \stackrel{?}{=} 5(2) - 2$
Multiply.	$12 - 4 \stackrel{?}{=} 10 - 2$
Subtract	$8 = 8$ ✓

Since $y = 2$ results in a true equation, we know that 2 is a solution to the equation $6y - 4 = 5y - 2$.

exercise 3.5.3

Is $y = 3$ a solution of $9y - 2 = 8y + 1$?

Answer

yes

? exercise 3.5.4

Is $y = 4$ a solution of $5y - 3 = 3y + 5$?

Answer

yes

Model the Subtraction Property of Equality

We will use a model to help you understand how the process of solving an equation is like solving a puzzle. An envelope represents the variable – since its contents are unknown – and each counter represents one.

Suppose a desk has an imaginary line dividing it in half. We place three counters and an envelope on the left side of desk, and eight counters on the right side of the desk as in Figure 3.5.1. Both sides of the desk have the same number of counters, but some counters are hidden in the envelope. Can you tell how many counters are in the envelope?

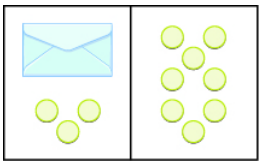

Figure 3.5.1

What steps are you taking in your mind to figure out how many counters are in the envelope? Perhaps you are thinking "I need to remove the 3 counters from the left side to get the envelope by itself. Those 3 counters on the left match with 3 on the right, so I can take them away from both sides. That leaves five counters on the right, so there must be 5 counters in the envelope." Figure 3.5.2 shows this process.

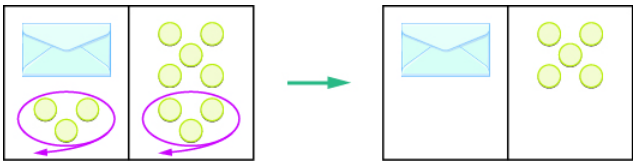

Figure 3.5.2

What algebraic equation is modeled by this situation? Each side of the desk represents an expression and the center line takes the place of the equal sign. We will call the contents of the envelope x, so the number of counters on the left side of the desk is $x + 3$. On the right side of the desk are 8 counters. We are told that $x + 3$ is equal to 8 so our equation is $x + 3 = 8$.

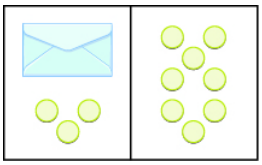

Figure 3.5.3

$x + 3 = 8$

Let's write algebraically the steps we took to discover how many counters were in the envelope.

	$x + 3 = 8$
First, we took away three from each side.	$x + 3 - 3 = 8 - 3$
Then we were left with five.	$x = 5$

Now let's check our solution. We substitute 5 for x in the original equation and see if we get a true statement.

$$x+3=8$$
$$5+3\stackrel{?}{=}8$$
$$8=8\ \checkmark$$

Our solution is correct. Five counters in the envelope plus three more equals eight

Example 3.5.3

Write an equation modeled by the envelopes and counters, and then solve the equation:

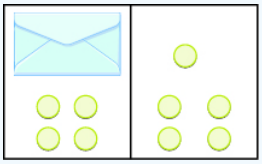

Figure 3.5.4

Solution

On the left, write x for the contents of the envelope, add the 4 counters, so we have x + 4.	x + 4
On the right, there are 5 counters.	5
The two sides are equal.	x + 4 = 5
Solve the equation by subtracting 4 counters from each side.	

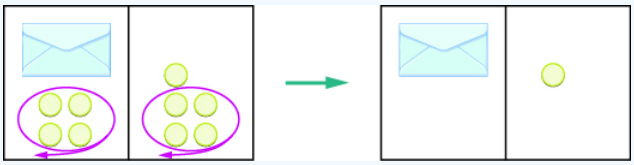

Figure 3.5.5

We can see that there is one counter in the envelope. This can be shown algebraically as:

$$x+4=5$$
$$x+4-4=5-4$$
$$x=1$$

Substitute 1 for x in the equation to check.

$$x+4=5$$
$$1+4\stackrel{?}{=}5$$
$$5=5\ \checkmark$$

Since $x=1$ makes the statement true, we know that 1 is indeed a solution.

Exercise 3.5.5

Write the equation modeled by the envelopes and counters, and then solve the equation:

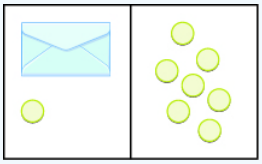

Figure 3.5.6

Answer

$x+1=7; x=6$

Exercise 3.5.6

Write the equation modeled by the envelopes and counters, and then solve the equation:

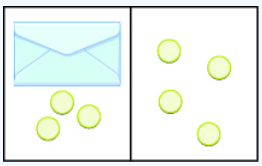

Figure 3.5.7

Answer

$x+3=4; x=1$

Solve Equations Using the Subtraction Property of Equality

Our puzzle has given us an idea of what we need to do to solve an equation. The goal is to isolate the variable by itself on one side of the equations. In the previous examples, we used the Subtraction Property of Equality, which states that when we subtract the same quantity from both sides of an equation, we still have equality.

Definition: Subtraction Property of Equality

For any numbers a, b, and c, if $a=b$ then $a-c=b-c$

Think about twin brothers Andy and Bobby. They are 17 years old. How old was Andy 3 years ago? He was 3 years less than 17, so his age was $17-3$, or 14. What about Bobby's age 3 years ago? Of course, he was 14 also. Their ages are equal now, and subtracting the same quantity from both of them resulted in equal ages 3 years ago.

$$\begin{aligned} a &= b \\ a-3 &= b-3 \end{aligned}$$

HOW TO: SOLVE AN EQUATION USING THE SUBTRACTION PROPERTY OF EQUALITY

Step 1. Use the Subtraction Property of Equality to isolate the variable.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Check the solution.

Example 3.5.4: solve

Solve: $x+8=17$.

Solution

We will use the Subtraction Property of Equality to isolate x.

	$x+8=17$
Subtract 8 from both sides.	$x+8-8=17-8$
Simplify.	$x=9$

Check the solution.	$9+8=17$
	$17=17$ ✓

Since $x=9$ makes $x+8=17$ a true statement, we know 9 is the solution to the equation.

Exercise 3.5.7

Solve: $x+6=19$

Answer

$x=13$

Exercise 3.5.8

Solve: $x+9=14$

Answer

$x=5$

Example 3.5.5: solve

Solve: $100=y+74$.

Solution

To solve an equation, we must always isolate the variable—it doesn't matter which side it is on. To isolate y, we will subtract 74 from both sides.

	$100=y+74$
Subtract 74 from both sides.	$100-74=y+74-74$
Simplify.	$26=y$
Substitute 26 for y to check	$100\stackrel{?}{=}26+74$
	$100=100$ ✓

Since $y=26$ makes $100=y+74$ a true statement, we have found the solution to this equation.

Exercise 3.5.9

Solve: $95=y+67$

Answer

$y=28$

Exercise 3.5.10

Solve: $91=y+45$

Answer

$y=46$

Solve Equations Using the Addition Property of Equality

In all the equations we have solved so far, a number was added to the variable on one side of the equation. We used subtraction to "undo" the addition in order to isolate the variable.

But suppose we have an equation with a number subtracted from the variable, such as $x-5=8$. We want to isolate the variable, so to "undo" the subtraction we will add the number to both sides.

We use the Addition Property of Equality, which says we can add the same number to both sides of the equation without changing the equality. Notice how it mirrors the Subtraction Property of Equality.

Definition: Addition Property of Equality

For any numbers a, b, and c, if $a=b$ then $a+c=b+c$

Remember the 17-year-old twins, Andy and Bobby? In ten years, Andy's age will still equal Bobby's age. They will both be 27.

$$\begin{aligned} a &= b \\ a+10 &= b+10 \end{aligned}$$

We can add the same number to both sides and still keep the equality.

HOW TO: SOLVE AN EQUATION USING THE ADDITION PROPERTY OF EQUALITY

Step 1. Use the Addition Property of Equality to isolate the variable.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Check the solution.

Example 3.5.6: solve

Solve: $x-5=8$.

Solution

We will use the Addition Property of Equality to isolate the variable.

	$x-5=8$
Add 5 to both sides.	$x-5+5=8+5$
Simplify	$x=13$
Now we can check. Let x = 13.	$13-5\stackrel{?}{=}8$
	$8=8$ ✓

Exercise 3.5.11

Solve: $x-9=13$

Answer

$x=22$

Exercise 3.5.12

Solve: $y-1=3$

Answer

$y = 4$

Example 3.5.7: solve

Solve: $27 = a - 16$.

Solution

We will add 16 to each side to isolate the variable.

	$27 = a - 16$
Add 16 to each side.	$27 + 16 = a - 16 + 16$
Simplify.	$43 = a$
Now we can check. Let a = 43.	$27 \stackrel{?}{=} 43 - 16$
	$27 = 27$ ✓

The solution to $27 = a - 16$ is $a = 43$.

Exercise 3.5.13

Solve: $19 = a - 18$

Answer

$a = 37$

Exercise 3.5.14

Solve: $27 = n - 14$

Answer

$n = 41$

3.6: Solving Equations Using the Subtraction and Addition Properties of Equality (Part 2)

Translate Word Phrases to Algebraic Equations

Remember, an equation has an equal sign (=) between two algebraic expressions. So if we have a sentence that tells us that two phrases are equal, we can translate it into an equation. We look for clue words that mean equals. Some words that translate to the equal sign are:

- is equal to
- is the same as
- is
- gives
- was
- will be

It may be helpful to put a box around the equals word(s) in the sentence to help you focus separately on each phrase. Then translate each phrase into an expression, and write them on each side of the equal sign.

We will practice translating word sentences into algebraic equations. Some of the sentences will be basic number facts with no variables to solve for. Some sentences will translate into equations with variables. The focus right now is just to translate the words into algebra.

Example 3.6.8: translate

Translate the sentence into an algebraic equation: The sum of 6 and 9 is 15.

Solution

The word is tells us the equal sign goes between 9 and 15.

Locate the “equals” word(s).	The sum of 6 and 9 is 15
Write the = sign.	The sum of 6 and 9 = 15
Translate the words to the left of the *equals* word into an algebraic expression.	6 + 9 = _____
Translate the words to the right of the *equals* word into an algebraic expression.	6 + 9 = 15

Exercise 3.6.15

Translate the sentence into an algebraic equation: The sum of 7 and 6 gives 13.

Answer

$7+6=13$

Exercise 3.6.16

Translate the sentence into an algebraic equation: The sum of 8 and 6 is 14.

Answer

$8+6=14$

Example 3.6.9: translate

Translate the sentence into an algebraic equation: The product of 8 and 7 is 56.

Solution

The location of the word is tells us that the equal sign goes between 7 and 56.

Locate the "equals" word(s).	The product of 8 and 7 is 56
Write the = sign.	The product of 8 and 7 = 56
Translate the words to the left of the *equals* word into an algebraic expression.	8 • 7 = _____
Translate the words to the right of the *equals* word into an algebraic expression.	8 • 7 = 56

Exercise 3.6.17

Translate the sentence into an algebraic equation: The product of 6 and 9 is 54.

Answer

$6 \cdot 9 = 54$

Exercise 3.6.18

Translate the sentence into an algebraic equation: The product of 21 and 3 gives 63.

Answer

$21 \cdot 3 = 63$

Example 3.6.10: translate

Translate the sentence into an algebraic equation: Twice the difference of x and 3 gives 18.

Solution

Locate the "equals" word(s).	Twice the difference of x and 3 gives 18.
Recognize the key words: *twice*; *difference of … and …*	*Twice* means two times.
Translate.	Twice the difference of x and 3 gives 18. 2 $(x-3)$ = 18

Exercise 3.6.19

Translate the given sentence into an algebraic equation: Twice the difference of x and 5 gives 30.

Answer

$2(x-5) = 30$

Exercise 3.6.20

Translate the given sentence into an algebraic equation: Twice the difference of y and 4 gives 16.

Answer

$2(y-4)=16$

Translate to an Equation and Solve

Now let's practice translating sentences into algebraic equations and then solving them. We will solve the equations by using the Subtraction and Addition Properties of Equality.

Example 3.6.11: translate and solve

Translate and solve: Three more than x is equal to 47.

Solution

	Three more than x is equal to 47.
Translate.	$x+3=47$
Subtract 3 from both sides of the equation.	$x+3-3=47-3$
Simplify	$x=44$
We can check. Let x = 44.	$44+3\stackrel{?}{=}47$
	$47=47$ ✓

So $x=44$ is the solution.

Exercise 3.6.21

Translate and solve: Seven more than x is equal to 37.

Answer

$x+7=37; x=30$

Exercise 3.6.22

Translate and solve: Eleven more than y is equal to 28.

Answer

$y+11=28; y=17$

Example 3.6.12: translate and solve

Translate and solve: The difference of y and 14 is 18.

Solution

	The difference of y and 14 is 18.
Translate.	$y-14=18$
Add 14 to both sides.	$y-14+14=18+14$

Simplify.	$y = 32$
We can check. Let y = 32.	$32 - 14 \stackrel{?}{=} 18$
	$18 = 18$ ✓

So $y = 32$ is the solution.

? Exercise 3.6.23

Translate and solve: The difference of z and 17 is equal to 37.

Answer

$z - 17 = 37; z = 54$

? Exercise 3.6.24

Translate and solve: The difference of x and 19 is equal to 45.

Answer

$x - 19 = 45; x = 64$

  2. Simplify the expressions on both sides of the equation.

3. Check the solution.

Glossary

solution of an equation

A solution to an equation is a value of a variable that makes a true statement when substituted into the equation. The process of finding the solution to an equation is called solving the equation.

Practice Makes Perfect

Determine Whether a Number is a Solution of an Equation

In the following exercises, determine whether each given value is a solution to the equation.

147. $x + 13 = 21$
   a. $x = 8$
   b. $x = 34$

148. $y + 18 = 25$
   a. $y = 7$
   b. $y = 43$

149. $m - 4 = 13$
   a. $m = 9$
   b. $m = 17$

150. $n - 9 = 6$
   a. $n = 3$
   b. $n = 15$

151. $3p + 6 = 15$
   a. $p = 3$
   b. $p = 7$

152. $8q + 4 = 20$
   a. $q = 2$
   b. $q = 3$

153. $18d - 9 = 27$
   a. $d = 1$
   b. $d = 2$

154. $24\,f - 12 = 60$
   a. $f = 2$
   b. $f = 3$

155. $8u - 4 = 4u + 40$
   a. $u = 3$
   b. $u = 11$

156. $7v - 3 = 4v + 36$
   a. $v = 3$
   b. $v = 11$

157. $20h - 5 = 15h + 35$
   a. $h = 6$
   b. $h = 8$

158. $18k - 3 = 12k + 33$
   a. $k = 1$
   b. $k = 6$

Model the Subtraction Property of Equality

In the following exercises, write the equation modeled by the envelopes and counters and then solve using the subtraction property of equality.

159. 
160. 
161. 
162. 
Solve Equations using the Subtraction Property of Equality

In the following exercises, solve each equation using the subtraction property of equality.

163. $a + 2 = 18$
164. $b + 5 = 13$
165. $p + 18 = 23$
166. $q + 14 = 31$
167. $r + 76 = 100$
168. $s + 62 = 95$
169. $16 = x + 9$
170. $17 = y + 6$
171. $93 = p + 24$
172. $116 = q + 79$
173. $465 = d + 398$
174. $932 = c + 641$

Solve Equations using the Addition Property of Equality

In the following exercises, solve each equation using the addition property of equality.

175. $y - 3 = 19$
176. $x - 4 = 12$
177. $u - 6 = 24$
178. $v - 7 = 35$
179. $f - 55 = 123$
180. $g - 39 = 117$
181. $19 = n - 13$
182. $18 = m - 15$

183. $10 = p - 38$
184. $18 = q - 72$
185. $268 = y - 199$
186. $204 = z - 149$

Translate Word Phrase to Algebraic Equations

In the following exercises, translate the given sentence into an algebraic equation.

187. The sum of 8 and 9 is equal to 17.
188. The sum of 7 and 9 is equal to 16.
189. The difference of 23 and 19 is equal to 4.
190. The difference of 29 and 12 is equal to 17.
191. The product of 3 and 9 is equal to 27.
192. The product of 6 and 8 is equal to 48.
193. The quotient of 54 and 6 is equal to 9.
194. The quotient of 42 and 7 is equal to 6.
195. Twice the difference of n and 10 gives 52.
196. Twice the difference of m and 14 gives 64.
197. The sum of three times y and 10 is 100.
198. The sum of eight times x and 4 is 68.

Translate to an Equation and Solve

In the following exercises, translate the given sentence into an algebraic equation and then solve it.

199. Five more than p is equal to 21.
200. Nine more than q is equal to 40.
201. The sum of r and 18 is 73.
202. The sum of s and 13 is 68.
203. The difference of d and 30 is equal to 52.
204. The difference of c and 25 is equal to 75.
205. 12 less than u is 89.
206. 19 less than w is 56.
207. 325 less than c gives 799.
208. 299 less than d gives 850.

Everyday Math

209. **Insurance** Vince's car insurance has a $500 deductible. Find the amount the insurance company will pay, p, for an $1800 claim by solving the equation $500 + p = 1800$.
210. **Insurance** Marta's homeowner's insurance policy has a $750 deductible. The insurance company paid $5800 to repair damages caused by a storm. Find the total cost of the storm damage, d, by solving the equation $d - 750 = 5800$.
211. **Sale purchase** Arthur bought a suit that was on sale for $120 off. He paid $340 for the suit. Find the original price, p, of the suit by solving the equation $p - 120 = 340$.
212. **Sale purchase** Rita bought a sofa that was on sale for $1299. She paid a total of $1409, including sales tax. Find the amount of the sales tax, t, by solving the equation $1299 + t = 1409$.

Writing Exercises

213. Is $x = 1$ a solution to the equation $8x - 2 = 16 - 6x$? How do you know?
214. Write the equation $y - 5 = 21$ in words. Then make up a word problem for this equation.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether a number is a solution of an equation.			
model the subtraction property of equality.			
solve equations using the subtraction property of equality.			
solve equations using the addition property of equality.			
translate word phrases to algebraic equations.			
translate to an equation and solve.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

3.E: Introduction to the Language of Algebra (Exercises)

2.1 - Use the Language of Algebra

Use Variables and Algebraic Symbols

In the following exercises, translate from algebra to English.

317. $3 \cdot 8$
318. $12 - x$
319. $24 \div 6$
320. $9 + 2a$
321. $50 \geq 47$
322. $3y < 15$
323. $n + 4 = 13$
324. $32 - k = 7$

Identify Expressions and Equations

In the following exercises, determine if each is an expression or equation.

325. $5 + u = 84$
326. $36 - 6s$
327. $4y - 11$
328. $10x = 120$

Simplify Expressions with Exponents

In the following exercises, write in exponential form.

329. $2 \cdot 2 \cdot 2$
330. $a \cdot a \cdot a \cdot a \cdot a$
331. $x \cdot x \cdot x \cdot x \cdot x \cdot x$
332. $10 \cdot 10 \cdot 10$

In the following exercises, write in expanded form.

333. 8^4
334. 3^6
335. y^5
336. n^4

In the following exercises, simplify each expression.

337. 3^4
338. 10^6
339. 2^7
340. 4^3

Simplify Expressions Using the Order of Operations

In the following exercises, simplify.

341. $10 + 2 \cdot 5$
342. $(10 + 2) \cdot 5$
343. $(30 + 6) \div 2$
344. $30 + 6 \div 2$
345. $7^2 + 5^2$
346. $(7 + 5)^2$
347. $4 + 3(10 - 1)$
348. $(4 + 3)(10 - 1)$

2.2 - Evaluate, Simplify, and Translate Expressions

Evaluate an Expression

In the following exercises, evaluate the following expressions.

349. $9x - 5$ when $x = 7$
350. y^3 when $y = 5$
351. $3a - 4b$ when $a = 10, b = 1$
352. bh when $b = 7, h = 8$

Identify Terms, Coefficients and Like Terms

In the following exercises, identify the terms in each expression.

353. $12n^2 + 3n + 1$
354. $4x^3 + 11x + 3$

In the following exercises, identify the coefficient of each term.

355. $6y$
356. $13x^2$

In the following exercises, identify the like terms.

357. $5x^2$, 3, $5y^2$, $3x$, x, 4
358. 8, $8r^2$, $8r$, $3r$, r^2, $3s$

Simplify Expressions by Combining Like Terms

In the following exercises, simplify the following expressions by combining like terms.

359. $15a + 9a$
360. $12y + 3y + y$
361. $4x + 7x + 3x$
362. $6 + 5c + 3$
363. $8n + 2 + 4n + 9$
364. $19p + 5 + 4p - 1 + 3p$
365. $7y^2 + 2y + 11 + 3y^2 - 8$
366. $13x^2 - x + 6 + 5x^2 + 9x$

Translate English Phrases to Algebraic Expressions

In the following exercises, translate the following phrases into algebraic expressions.

367. the difference of x and 6
368. the sum of 10 and twice a
369. the product of $3n$ and 9
370. the quotient of s and 4
371. 5 times the sum of y and 1
372. 10 less than the product of 5 and z
373. Jack bought a sandwich and a coffee. The cost of the sandwich was $3 more than the cost of the coffee. Call the cost of the coffee c. Write an expression for the cost of the sandwich.
374. The number of poetry books on Brianna's bookshelf is 5 less than twice the number of novels. Call the number of novels n. Write an expression for the number of poetry books.

2.3 - Solve Equations Using the Subtraction and Addition Properties of Equality

Determine Whether a Number is a Solution of an Equation

In the following exercises, determine whether each number is a solution to the equation.

375. $y + 16 = 40$
    a. 24

b. 56

376. d − 6 = 21

a. 15
b. 27

377. 4n + 12 = 36

a. 6
b. 12

378. 20q − 10 = 70

a. 3
b. 4

379. 15x − 5 = 10x + 45

a. 2
b. 10

380. 22p − 6 = 18p + 86

a. 4
b. 23

Model the Subtraction Property of Equality

In the following exercises, write the equation modeled by the envelopes and counters and then solve the equation using the subtraction property of equality

381. 
382. 
Solve Equations using the Subtraction Property of Equality

In the following exercises, solve each equation using the subtraction property of equality.

383. c + 8 = 14
384. v + 8 = 150
385. 23 = x + 12
386. 376 = n + 265

Solve Equations using the Addition Property of Equality

In the following exercises, solve each equation using the addition property of equality.

387. y − 7 = 16
388. k − 42 = 113
389. 19 = p − 15
390. 501 = u − 399

Translate English Sentences to Algebraic Equations

In the following exercises, translate each English sentence into an algebraic equation.

391. The sum of 7 and 33 is equal to 40.

392. The difference of 15 and 3 is equal to 12.
393. The product of 4 and 8 is equal to 32.
394. The quotient of 63 and 9 is equal to 7.
395. Twice the difference of n and 3 gives 76.
396. The sum of five times y and 4 is 89.

Translate to an Equation and Solve

In the following exercises, translate each English sentence into an algebraic equation and then solve it.

397. Eight more than x is equal to 35.
398. 21 less than a is 11.
399. The difference of q and 18 is 57.
400. The sum of m and 125 is 240.

Mixed Practice

In the following exercises, solve each equation.

401. $h - 15 = 27$
402. $k - 11 = 34$
403. $z + 52 = 85$
404. $x + 93 = 114$
405. $27 = q + 19$
406. $38 = p + 19$
407. $31 = v - 25$
408. $38 = u - 16$

2.4 - Find Multiples and Factors

Identify Multiples of Numbers

In the following exercises, list all the multiples less than 50 for each of the following.

409. 3
410. 2
411. 8
412. 10

Use Common Divisibility Tests

In the following exercises, using the divisibility tests, determine whether each number is divisible by 2, by 3, by 5, by 6, and by 10.

413. 96
414. 250
415. 420
416. 625

Find All the Factors of a Number

In the following exercises, find all the factors of each number.

417. 30
418. 70
419. 180
420. 378

Identify Prime and Composite Numbers

In the following exercises, identify each number as prime or composite.

421. 19
422. 51

423. 121

2.5 - Prime Factorization and the Least Common Multiple

Find the Prime Factorization of a Composite Number

In the following exercises, find the prime factorization of each number.

425. 84
426. 165
427. 350
428. 572

Find the Least Common Multiple of Two Numbers

In the following exercises, find the least common multiple of each pair of numbers.

429. 9, 15
430. 12, 20
431. 25, 35
432. 18, 40

Everyday Math

433. Describe how you have used two topics from The Language of Algebra chapter in your life outside of your math class during the past month.

PRACTICE TEST

In the following exercises, translate from an algebraic equation to English phrases.

434. $6 \cdot 4$
435. $15 - x$

In the following exercises, identify each as an expression or equation.

436. $5 \cdot 8 + 10$
437. $x + 6 = 9$
438. $3 \cdot 11 = 33$
439. (a) Write $n \cdot n \cdot n \cdot n \cdot n \cdot n$ in exponential form. (b) Write 3^5 in expanded form and then simplify.

In the following exercises, simplify, using the order of operations.

440. $4 + 3 \cdot 5$
441. $(8 + 1) \cdot 4$
442. $1 + 6(3 - 1)$
443. $(8 + 4) \div 3 + 1$
444. $(1 + 4)^2$
445. $5[2 + 7(9 - 8)]$

In the following exercises, evaluate each expression.

446. $8x - 3$ when $x = 4$
447. y^3 when $y = 5$
448. $6a - 2b$ when $a = 5, b = 7$
449. hw when $h = 12, w = 3$
450. Simplify by combining like terms.
    a. $6x + 8x$
    b. $9m + 10 + m + 3$

In the following exercises, translate each phrase into an algebraic expression.

451. 5 more than x

452. the quotient of 12 and y
453. three times the difference of a and b
454. Caroline has 3 fewer earrings on her left ear than on her right ear. Call the number of earrings on her right ear, r. Write an expression for the number of earrings on her left ear.

In the following exercises, solve each equation.

455. n − 6 = 25
456. x + 58 = 71

In the following exercises, translate each English sentence into an algebraic equation and then solve it.

457. 15 less than y is 32.
458. the sum of a and 129 is 164.
459. List all the multiples of 4, that are less than 50.
460. Find all the factors of 90.
461. Find the prime factorization of 1080.
462. Find the LCM (Least Common Multiple) of 24 and 40.

3.S: Introduction to the Language of Algebra (Summary)

Key Terms

coefficient	The constant that multiplies the variable(s) in a term.
composite number	A composite number is a counting number that is not prime.
divisibility	If a number m is a multiple of n, then we say that m is divisible by n.
equation	An equation is made up of two expressions connected by an equal sign.
evaluate	To evaluate an algebraic expression means to find the value of the expression when the variable is replaced by a given number.
expression	An expression is a number, a variable, or a combination of numbers and variables and operation symbols.
least common multiple (LCM)	The smallest number that is a multiple of two numbers.
like terms	Terms that are either constants or have the same variables with the same exponents.
multiple of a number	A number is a multiple of n if it is the product of a counting number and n.
prime factorization	The product of prime numbers that equals the number.
prime number	A counting number greater than 1 whose only factors are 1 and itself.
solution of an equation	A value of a variable that makes a true statement when substituted into the equation. The process of finding the solution to an equation is called solving the equation.
term	A constant or the product of a constant and one or more variables.

Key Concepts

2.1 - Use the Language of Algebra

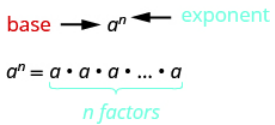
Operation	Notation	Say:	The result is…
Addition	a + b	a plus b	The sum of a and b
Multiplication	a • b, (a)(b), (a)b, a(b)	a times b	The product of a and b
Subtraction	a - b	a minus b	The difference of a and b
Division	a ÷ b, a / b, $\frac{a}{b}$, $b\overline{)a}$	a divided by b	The quotient of a and b

- **Equality Symbol**
  - a = b is read as a is equal to b
  - The symbol = is called the equal sign.
- **Inequality**
  - a < b is read a is less than b
  - a is to the left of b on the number line: 
  - a > b is read a is greater than b

- a is to the right of b on the number line: 
Table 2.77

Algebraic Notation	Say
a = b	a is equal to b
a ≠ b	a is not equal to b
a < b	a is less than b
a > b	a is greater than b
a ≤ b	a is less than or equal to b
a ≥ b	a is greater than or equal to b

- **Exponential Notation**
  - For any expression a n is a factor multiplied by itself n times, if n is a positive integer.
  - a^n means multiply n factors of a
  - The expression of a^n is read a to the n^{th} power



- **Order of Operations**: When simplifying mathematical expressions perform the operations in the following order:

1. Parentheses and other Grouping Symbols: Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. Exponents: Simplify all expressions with exponents.
3. Multiplication and Division: Perform all multiplication and division in order from left to right. These operations have equal priority.
4. Addition and Subtraction: Perform all addition and subtraction in order from left to right. These operations have equal priority.

2.2 - Evaluate, Simplify, and Translate Expressions

- **Combine like terms**.

1. Identify like terms.
2. Rearrange the expression so like terms are together.
3. Add the coefficients of the like terms

2.3 - Solving Equations Using the Subtraction and Addition Properties of Equality

- **Determine whether a number is a solution to an equation.**

1. Substitute the number for the variable in the equation.
2. Simplify the expressions on both sides of the equation.
3. Determine whether the resulting equation is true. If it is true, the number is a solution. If it is not true, the number is not a solution.

- **Subtraction Property of Equality**
  - For any numbers a, b, and c, if a = b, then a - c = b - c.
- Solve an equation using the Subtraction Property of Equality.

1. Use the Subtraction Property of Equality to isolate the variable.
2. Simplify the expressions on both sides of the equation.
3. Check the solution.

- **Addition Property of Equality**

- For any numbers a, b, and c, if a = b, then a + c = b + c.

- Solve an equation using the Addition Property of Equality.

1. Use the Addition Property of Equality to isolate the variable.
2. Simplify the expressions on both sides of the equation.
3. Check the solution.

2.4 - Find Multiples and Factors

Divisibility Tests	
A number is divisible by	
2	if the last digit is 0, 2, 4, 6, or 8
3	if the sum of the digits is divisible by 3
5	if the last digit is 5 or 0
6	if divisible by both 2 and 3
10	if the last digit is 0

- **Factors:** If a • b = m, then a and b are factors of m, and m is the product of a and b.
- **Find all the factors of a counting number.**

1. Divide the number by each of the counting numbers, in order, until the quotient is smaller than the divisor.
   a. If the quotient is a counting number, the divisor and quotient are a pair of factors.
   b. If the quotient is not a counting number, the divisor is not a factor.
2. List all the factor pairs.
3. Write all the factors in order from smallest to largest.

- **Determine if a number is prime**.

1. Test each of the primes, in order, to see if it is a factor of the number.
2. Start with 2 and stop when the quotient is smaller than the divisor or when a prime factor is found.
3. If the number has a prime factor, then it is a composite number. If it has no prime factors, then the number is prime.

2.5 - Prime Factorization and the Least Common Multiple

- **Find the prime factorization of a composite number using the tree method**.

1. Find any factor pair of the given number, and use these numbers to create two branches.
2. If a factor is prime, that branch is complete. Circle the prime.
3. If a factor is not prime, write it as the product of a factor pair and continue the process.
4. Write the composite number as the product of all the circled primes.

- **Find the prime factorization of a composite number using the ladder method**.

1. Divide the number by the smallest prime.
2. Continue dividing by that prime until it no longer divides evenly.
3. Divide by the next prime until it no longer divides evenly.
4. Continue until the quotient is a prime.
5. Write the composite number as the product of all the primes on the sides and top of the ladder.

- **Find the LCM by listing multiples**

1. List the first several multiples of each number.
2. Look for multiples common to both lists. If there are no common multiples in the lists, write out additional multiples for each number.
3. Look for the smallest number that is common to both lists.
4. This number is the LCM.

- **Find the LCM using the prime factors method**.

1. Find the prime factorization of each number.
2. Write each number as a product of primes, matching primes vertically when possible.
3. Bring down the primes in each column.
4. Multiply the factors to get the LCM.

CHAPTER OVERVIEW

4: Fractions

Often in life, whole amounts are not exactly what we need. A baker must use a little more than a cup of milk or part of a teaspoon of sugar. Similarly a carpenter might need less than a foot of wood and a painter might use part of a gallon of paint. In this chapter, we will learn about numbers that describe parts of a whole. These numbers, called fractions, are very useful both in algebra and in everyday life. You will discover that you are already familiar with many examples of fractions!

4.1: Visualize Fractions (Part 1)

Learning Objectives

- Understand the meaning of fractions
- Model improper fractions and mixed numbers
- Convert between improper fractions and mixed numbers
- Model equivalent fractions
- Find equivalent fractions
- Locate fractions and mixed numbers on the number line
- Order fractions and mixed numbers

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $5 \bullet 2+1$. If you missed this problem, review Example 2.1.8.
2. Fill in the blank with $<$ or $>$: $-2__-5$. If you missed this problem, review Example 3.1.2.

Understand the Meaning of Fractions

Andy and Bobby love pizza. On Monday night, they share a pizza equally. How much of the pizza does each one get? Are you thinking that each boy gets half of the pizza? That's right. There is one whole pizza, evenly divided into two parts, so each boy gets one of the two equal parts. In math, we write $\frac{1}{2}$ to mean one out of two parts.

Figure 4.1.1

On Tuesday, Andy and Bobby share a pizza with their parents, Fred and Christy, with each person getting an equal amount of the whole pizza. How much of the pizza does each person get? There is one whole pizza, divided evenly into four equal parts. Each person has one of the four equal parts, so each has $\frac{1}{4}$ of the pizza.

Figure 4.1.2

On Wednesday, the family invites some friends over for a pizza dinner. There are a total of 12 people. If they share the pizza equally, each person would get $\frac{1}{12}$ of the pizza.

Figure 4.1.3

Definition: Fractions

A fraction is written $\frac{a}{b}$, where a and b are integers and $b \neq 0$. In a fraction, a is called the numerator and b is called the denominator.

A fraction is a way to represent parts of a whole. The denominator b represents the number of equal parts the whole has been divided into, and the numerator a represents how many parts are included. The denominator, b, cannot equal zero because division by zero is undefined.

In Figure 4.1.4, the circle has been divided into three parts of equal size. Each part represents $\frac{1}{3}$ of the circle. This type of model is called a fraction circle. Other shapes, such as rectangles, can also be used to model fractions.

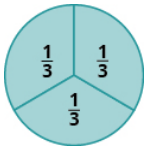

Figure 4.1.4

What does the fraction $\frac{2}{3}$ represent? The fraction $\frac{2}{3}$ means two of three equal parts.

Figure 4.1.5

Example 4.1.1: name the fraction

Name the fraction of the shape that is shaded in each of the figures.

a.

b. 
Solution

We need to ask two questions. First, how many equal parts are there? This will be the denominator. Second, of these equal parts, how many are shaded? This will be the numerator.

a.

How many equal parts are there?	There are eight equal parts.
How many are shaded?	Five parts are shaded.

Five out of eight parts are shaded. Therefore, the fraction of the circle that is shaded is $\frac{5}{8}$.

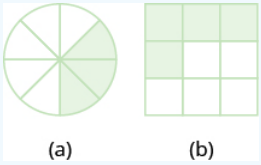
b.

How many equal parts are there?	There are nineequal parts.
How many are shaded?	Two parts are shaded.

Two out of nine parts are shaded. Therefore, the fraction of the square that is shaded is $\frac{2}{9}$.

Exercise 4.1.1

Name the fraction of the shape that is shaded in each figure:



Answer a

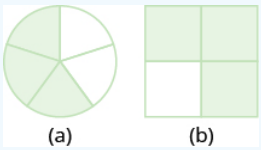
$\frac{3}{8}$

Answer b

$\frac{4}{9}$

Exercise 4.1.2

Name the fraction of the shape that is shaded in each figure:



Answer a

$\frac{3}{5}$

Answer b

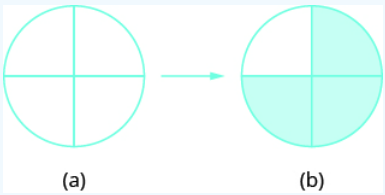
$\frac{3}{4}$

Example 4.1.2:

Shade $\frac{3}{4}$ of the circle.

Solution

The denominator is 4, so we divide the circle into four equal parts (a). The numerator is 3, so we shade three of the four parts (b).



$\frac{3}{4}$ of the circle is shaded.

Exercise 4.1.3

Shade $\frac{6}{8}$ of the circle.

Answer

Exercise 4.1.4

Shade $\frac{2}{5}$ of the rectangle.

Answer

In Example 4.1.1 and Example 4.1.2, we used circles and rectangles to model fractions. Fractions can also be modeled as manipulatives called fraction tiles, as shown in Figure 4.1.6. Here, the whole is modeled as one long, undivided rectangular tile. Beneath it are tiles of equal length divided into different numbers of equally sized parts.

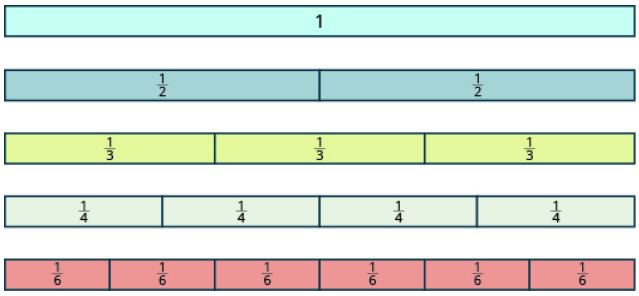


Figure 4.1.6

We'll be using fraction tiles to discover some basic facts about fractions. Refer to Figure 4.1.6 to answer the following questions:

How many $\frac{1}{2}$ tiles does it take to make one whole tile?	It takes two halves to make a whole, so two out of two is $\frac{2}{2} = 1$.
How many $\frac{1}{3}$ tiles does it take to make one whole tile?	It takes three thirds, so three out of three is $\frac{3}{3} = 1$.
How many $\frac{1}{4}$ tiles does it take to make one whole tile?	It takes four fourths, so four out of four is $\frac{4}{4} = 1$.
How many $\frac{1}{5}$ tiles does it take to make one whole tile?	It takes six sixths, so six out of six is $\frac{6}{6} = 1$.
What if the whole were divided into 24 equal parts? (We have not shown fraction tiles to represent this, but try to visualize it in your mind.) How many $\frac{1}{24}$ tiles does it take to make one whole tile?	It takes 24 twenty-fourths, so $\frac{24}{24} = 1$.

It takes 24 twenty-fourths, so $\frac{24}{24} = 1$. This leads us to the Property of One.

Definition: Property of One

Any number, except zero, divided by itself is one.

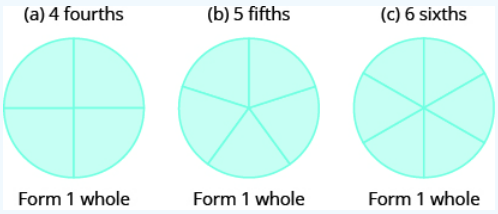
$$\frac{a}{a} = 1 \qquad (a \neq 0) \tag{4.1.1}$$

Example 4.1.3: fraction circles to form wholes

Use fraction circles to make wholes using the following pieces:

a. 4 fourths
b. 5 fifths
c. 6 sixths

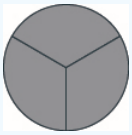
Solution



Exercise 4.1.5

Use fraction circles to make wholes with the following pieces: 3 thirds.

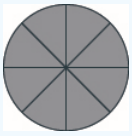
Answer



Exercise 4.1.6

Use fraction circles to make wholes with the following pieces: 8 eighths.

Answer



What if we have more fraction pieces than we need for 1 whole? We'll look at this in the next example.

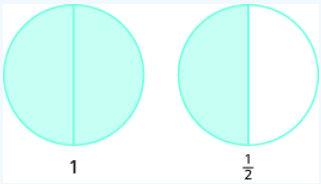
Example 4.1.4: fraction circles to form whole

Use fraction circles to make wholes using the following pieces:

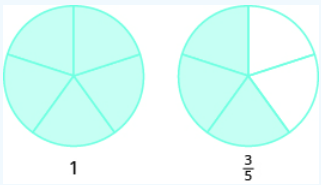
a. 3 halves
b. 8 fifths
c. 7 thirds

Solution

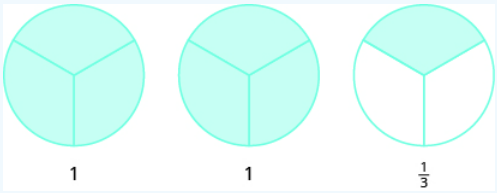
a. 3 halves make 1 whole with 1 half left over.



b. 8 fifths make 1 whole with 3 fifths left over.



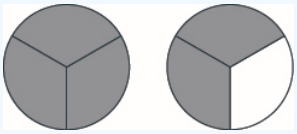
c. 7 thirds make 2 wholes with 1 third left over.



Exercise 4.1.7

Use fraction circles to make wholes with the following pieces: 5 thirds.

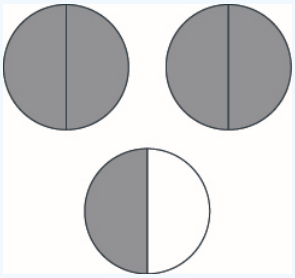
Answer



Exercise 4.1.8

Use fraction circles to make wholes with the following pieces: 5 halves.

Answer



Model Improper Fractions and Mixed Numbers

In Example 4.1.4b, you had eight equal fifth pieces. You used five of them to make one whole, and you had three fifths left over. Let us use fraction notation to show what happened. You had eight pieces, each of them one fifth, $\frac{1}{5}$, so altogether you had eight fifths, which we can write as $\frac{8}{5}$. The fraction $\frac{8}{5}$ is one whole, 1, plus three fifths, $\frac{3}{5}$, or $1\frac{3}{5}$, which is read as *one and three-fifths*. The number $1\frac{3}{5}$ is called a mixed number. A mixed number consists of a whole number and a fraction.

Definition: Mixed Numbers

A mixed number consists of a whole number a and a fraction $\frac{b}{c}$ where $c \neq 0$. It is written as follows.

$$a\frac{b}{c} \qquad c \neq 0 \tag{4.1.2}$$

Fractions such as $\frac{5}{4}$, $\frac{3}{2}$, $\frac{5}{5}$, and $\frac{7}{3}$ are called improper fractions. In an improper fraction, the numerator is greater than or equal to the denominator, so its value is greater than or equal to one. When a fraction has a numerator that is smaller than the denominator, it is called a proper fraction, and its value is less than one. Fractions such as $\frac{1}{2}$, $\frac{3}{7}$, and $\frac{11}{18}$ are proper fractions.

Definition: Proper and Improper Fractions

The fraction $\frac{a}{b}$ is a proper fraction if $a < b$ and an improper fraction if $a \geq b$.

Example 4.1.5: improper fraction

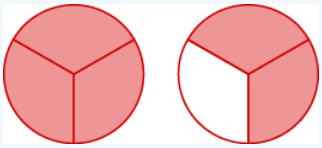
Name the improper fraction modeled. Then write the improper fraction as a mixed number.

Solution

Each circle is divided into three pieces, so each piece is $\frac{1}{3}$ of the circle. There are four pieces shaded, so there are four thirds or $\frac{4}{3}$. The figure shows that we also have one whole circle and one third, which is $1\frac{1}{3}$. So, $\frac{4}{3}=1\frac{1}{3}$.

Exercise 4.1.9

Name the improper fraction. Then write it as a mixed number.

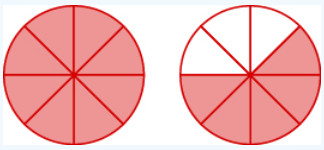


Answer

$\frac{5}{3}=1\frac{2}{3}$

Exercise 4.1.10

Name the improper fraction. Then write it as a mixed number.



Answer

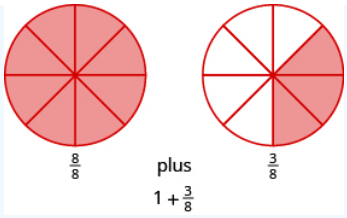
$\frac{13}{8}=1\frac{5}{8}$

Example 4.1.6: model a fraction

Draw a figure to model $\frac{11}{8}$.

Solution

The denominator of the improper fraction is 8. Draw a circle divided into eight pieces and shade all of them. This takes care of eight eighths, but we have 11 eighths. We must shade three of the eight parts of another circle.

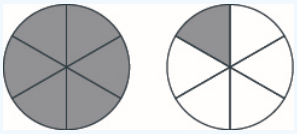


So, $\frac{11}{8}=1\frac{3}{8}$.

? Exercise4.1.11

Draw a figure to model $\frac{7}{6}$.

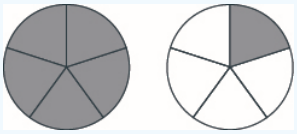
Answer



? Exercise 4.1.12

Draw a figure to model $\frac{6}{5}$.

Answer



✓ Example 4.1.7: model a fraction

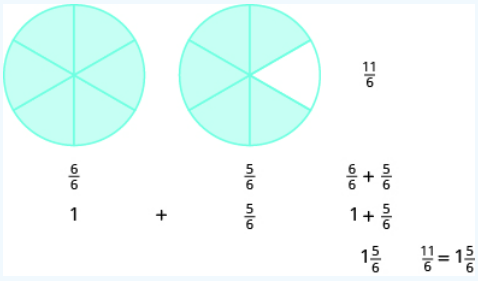
Use a model to rewrite the improper fraction $\frac{11}{6}$ as a mixed number.

Solution

We start with 11 sixths $\left(\frac{11}{6}\right)$. We know that six sixths makes one whole.

$$\frac{6}{6}=1$$

That leaves us with five more sixths, which is $\frac{5}{6}$ (11 sixths minus 6 sixths is 5 sixths). So, $\frac{11}{6}=1\frac{5}{6}$.



Exercise 4.1.13

Use a model to rewrite the improper fraction as a mixed number: $\frac{9}{7}$.

Answer

$1\frac{2}{7}$

Exercise 4.1.14

Use a model to rewrite the improper fraction as a mixed number: $\frac{7}{4}$.

Answer

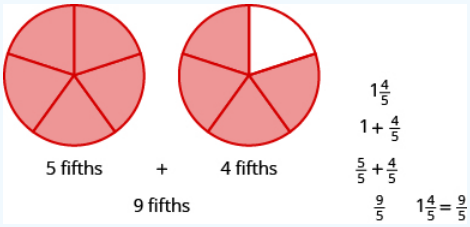
$1\frac{3}{4}$

Example 4.1.8: model a fraction

Use a model to rewrite the mixed number $1\frac{4}{5}$ as an improper fraction.

Solution

The mixed number $1\frac{4}{5}$ means one whole plus four fifths. The denominator is 5, so the whole is $\frac{5}{5}$. Together five fifths and four fifths equals nine fifths. So, $1\frac{4}{5}=\frac{9}{5}$.



Exercise 4.1.15

Use a model to rewrite the mixed number as an improper fraction: $1\frac{3}{8}$.

Answer

$\frac{11}{8}$

Exercise 4.1.16

Use a model to rewrite the mixed number as an improper fraction: $1\frac{5}{6}$.

Answer

$\frac{11}{6}$

Convert between Improper Fractions and Mixed Numbers

In Example 4.1.7, we converted the improper fraction $\frac{11}{6}$ to the mixed number $1\frac{5}{6}$ using fraction circles. We did this by grouping six sixths together to make a whole; then we looked to see how many of the 11 pieces were left. We saw that $\frac{11}{6}$ made one whole group of six sixths plus five more sixths, showing that $\frac{11}{6} = \frac{15}{6}$.

The division expression $\frac{11}{6}$ (which can also be written as $6\overline{)11}$) tells us to find how many groups of 6 are in 11. To convert an improper fraction to a mixed number without fraction circles, we divide.

Example 4.1.9:

Convert $\frac{11}{6}$ to a mixed number.

Solution

Divide the denominator into the numerator.	Remember $\frac{11}{6}$ means $11 \div 6$.
Identify the quotient, remainder and divisor.	$6\overline{)11}$ 1 ← quotient; divisor → 6; $\frac{6}{5}$ ← remainder
Write the mixed number as $quotient\ \frac{remainder}{divisor}$.	$1\frac{5}{6}$

So, $\frac{11}{6} = 1\frac{5}{6}$.

Exercise 4.1.17

Convert the improper fraction to a mixed number: $\frac{13}{7}$.

Answer

$1\frac{6}{7}$

Exercise 4.1.18

Convert the improper fraction to a mixed number: $\frac{14}{9}$.

Answer

$1\frac{5}{9}$

HOW TO: CONVERT AN IMPROPER FRACTION TO A MIXED NUMBER

Step 1. Divide the denominator into the numerator.

Step 2. Identify the quotient, remainder, and divisor.

Step 3. Write the mixed number as $quotient\ \frac{remainder}{divisor}$.

Example 4.1.10:

Convert the improper fraction $\frac{33}{8}$ to a mixed number.

Solution

Divide the denominator into the numerator.	Remember, $\frac{33}{8}$ means $8\overline{)33}$.
Identify the quotient, remainder, and divisor.	$\begin{array}{r} 4 \leftarrow \text{quotient} \\ 8\overline{)33} \leftarrow \text{divisor} \\ \underline{32} \\ 1 \leftarrow \text{remainder} \end{array}$
Write the mixed number as $quotient\,\frac{remainder}{divisor}$.	$4\frac{1}{8}$

So, $\frac{33}{8} = 4\frac{1}{8}$.

Exercise 4.1.19

Convert the improper fraction to a mixed number: $\frac{23}{7}$.

Answer

$3\frac{2}{7}$

Exercise 4.1.20

Convert the improper fraction to a mixed number: $\frac{48}{11}$.

Answer

$4\frac{4}{11}$

In Example 4.1.8, we changed $1\frac{4}{5}$ to an improper fraction by first seeing that the whole is a set of five fifths. So we had five fifths and four more fifths.

$$\frac{5}{5} + \frac{4}{5} = \frac{9}{5}$$

Where did the nine come from? There are nine fifths—one whole (five fifths) plus four fifths. Let us use this idea to see how to convert a mixed number to an improper fraction.

Example 4.1.11: convert

Convert the mixed number $4\frac{2}{3}$ to an improper fraction.

Multiply the whole number by the denominator.	$4\frac{2}{3}$
The whole number is 4 and the denominator is 3.	$\frac{4 \cdot 3 + \square}{\square}$

Simplify.	$\frac{12+\square}{\square}$
Add the numerator to the product.	
The numerator of the mixed number is 2.	$\frac{12+2}{\square}$
Simplify.	$\frac{14}{\square}$
Write the final sum over the original denominator.	
The denominator is 3.	$\frac{14}{3}$

Exercise 4.1.21

Convert the mixed number to an improper fraction: $3\frac{5}{7}$.

Answer

$\frac{26}{7}$

Exercise 4.1.22

Convert the mixed number to an improper fraction: $2\frac{7}{8}$.

Answer

$\frac{23}{8}$

HOW TO: CONVERT A MIXED NUMBER TO AN IMPROPER FRACTION

Step 1. Multiply the whole number by the denominator.

Step 2. Add the numerator to the product found in Step 1.

Step 3. Write the final sum over the original denominator.

Example 4.1.12:

Convert the mixed number $10\frac{2}{7}$ to an improper fraction.

Multiply the whole number by the denominator.	$10\frac{2}{7}$
The whole number is 10 and the denominator is 7.	$\frac{10\cdot 7+\square}{\square}$
Simplify.	$\frac{70+\square}{\square}$
Add the numerator to the product.	
The numerator of the mixed number is 2.	$\frac{70+2}{\square}$

Simplify.	$\frac{72}{\square}$
Write the final sum over the original denominator.	
The denominator is 7.	$\frac{72}{7}$

Exercise 4.1.23

Convert the mixed number to an improper fraction: $4\frac{6}{11}$.

Answer

$\frac{50}{11}$

Exercise 4.1.24

Convert the mixed number to an improper fraction: $11\frac{1}{3}$.

Answer

$\frac{34}{3}$

4.2: Visualize Fractions (Part 2)

Model Equivalent Fractions

Let's think about Andy and Bobby and their favorite food again. If Andy eats $\frac{1}{2}$ of a pizza and Bobby eats $\frac{2}{4}$ of the pizza, have they eaten the same amount of pizza? In other words, does $\frac{1}{2} = \frac{2}{4}$? We can use fraction tiles to find out whether Andy and Bobby have eaten *equivalent* parts of the pizza.

Definition: Equivalent Fractions

Equivalent fractions are fractions that have the same value.

Fraction tiles serve as a useful model of equivalent fractions. You may want to use fraction tiles to do the following activity. Or you might make a copy of Figure 4.3 and extend it to include eighths, tenths, and twelfths.

Start with a $\frac{1}{2}$ tile. How many fourths equal one-half? How many of the $\frac{1}{4}$ tiles exactly cover the $\frac{1}{2}$ tile?

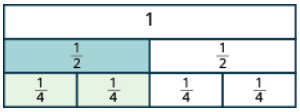

Figure 4.2.7

Since two $\frac{1}{4}$ tiles cover the $\frac{1}{2}$ tile, we see that $\frac{2}{4}$ is the same as $\frac{1}{2}$, or $\frac{2}{4} = \frac{1}{2}$.

How many of the $\frac{1}{6}$ tiles cover the $\frac{1}{2}$ tile?

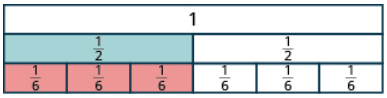

Figure 4.2.8

Since three $\frac{1}{6}$ tiles cover the $\frac{1}{2}$ tile, we see that $\frac{3}{6}$ is the same as $\frac{1}{2}$. So, $\frac{3}{6} = \frac{1}{2}$. The fractions are equivalent fractions.

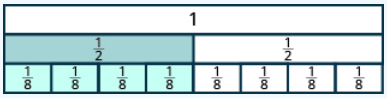
Example 4.2.13: equivalent fractions

Use fraction tiles to find equivalent fractions. Show your result with a figure.

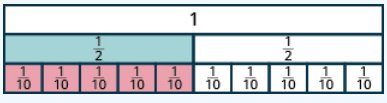
a. How many eighths equal one-half?
b. How many tenths equal one-half?
c. How many twelfths equal one-half?

Solution

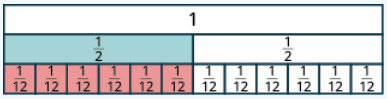
a. It takes four $\frac{1}{8}$ tiles to exactly cover the $\frac{1}{2}$ tile, so $\frac{4}{8} = \frac{1}{2}$.



b. It takes five $\frac{1}{10}$ tiles to exactly cover the $\frac{1}{2}$ tile, so $\frac{5}{10} = \frac{1}{2}$.



c. It takes six $\frac{1}{12}$ tiles to exactly cover the $\frac{1}{2}$ tile, so $\frac{6}{12} = \frac{1}{2}$.



Suppose you had tiles marked $\frac{1}{20}$. How many of them would it take to equal $\frac{1}{2}$? Are you thinking ten tiles? If you are, you're right, because $\frac{10}{20} = \frac{1}{2}$.

We have shown that $\frac{1}{2}, \frac{2}{4}, \frac{3}{6}, \frac{4}{8}, \frac{5}{10}, \frac{6}{12}$, and $\frac{10}{20}$ are all equivalent fractions.

Exercise 4.2.25

Use fraction tiles to find equivalent fractions: How many eighths equal one-fourth?

Answer

2

Exercise 4.2.26

Use fraction tiles to find equivalent fractions: How many twelfths equal one-fourth?

Answer

3

Find Equivalent Fractions

We used fraction tiles to show that there are many fractions equivalent to $\frac{1}{2}$. For example, $\frac{2}{4}, \frac{3}{6}$, and $\frac{4}{8}$ are all equivalent to $\frac{1}{2}$. When we lined up the fraction tiles, it took four of the $\frac{1}{8}$ tiles to make the same length as a $\frac{1}{2}$ tile. This showed that $\frac{4}{8} = \frac{1}{2}$. See Example 4.2.13.

We can show this with pizzas, too. Figure $4.2.9a$ shows a single pizza, cut into two equal pieces with $\frac{1}{2}$ shaded. Figure $4.2.9b$ shows a second pizza of the same size, cut into eight pieces with $\frac{4}{8}$ shaded.

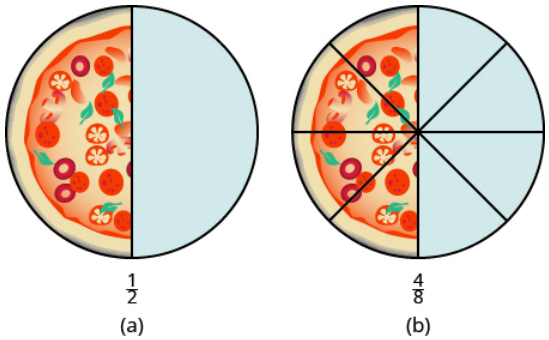


Figure 4.2.9

This is another way to show that $\frac{1}{2}$ is equivalent to $\frac{4}{8}$. How can we use mathematics to change $\frac{1}{2}$ into $frac48$? How could you take a pizza that is cut into two pieces and cut it into eight pieces? You could cut each of the two larger pieces into four smaller

pieces! The whole pizza would then be cut into eight pieces instead of just two. Mathematically, what we've described could be written as:

$$\frac{1 \cdot 4}{2 \cdot 4} = \frac{4}{8}$$

These models lead to the Equivalent Fractions Property, which states that if we multiply the numerator and denominator of a fraction by the same number, the value of the fraction does not change.

Definition: Equivalent Fractions Property

If a, b, and c are numbers where $b \neq 0$ and $c \neq 0$, then

$$\frac{a}{b} = \frac{a \cdot c}{b \cdot c} \tag{4.2.1}$$

When working with fractions, it is often necessary to express the same fraction in different forms. To find equivalent forms of a fraction, we can use the Equivalent Fractions Property. For example, consider the fraction one-half.

$$\frac{1 \cdot 3}{2 \cdot 3} = \frac{3}{6} \text{ so } \frac{1}{2} = \frac{3}{6}$$
$$\frac{1 \cdot 2}{2 \cdot 2} = \frac{2}{4} \text{ so } \frac{1}{2} = \frac{2}{4}$$
$$\frac{1 \cdot 10}{2 \cdot 10} = \frac{10}{20} \text{ so } \frac{1}{2} = \frac{10}{20}$$

So, we say that $\frac{1}{2}$, $\frac{2}{4}$, $\frac{3}{6}$, and $\frac{10}{20}$ are equivalent fractions.

Example 4.2.14: equivalent fractions

Find three fractions equivalent to $\frac{2}{5}$.

Solution

To find a fraction equivalent to $\frac{2}{5}$, we multiply the numerator and denominator by the same number (but not zero). Let us multiply them by 2, 3, and 5.

$$\frac{2 \cdot 2}{5 \cdot 2} = \frac{4}{10} \qquad \frac{2 \cdot 3}{5 \cdot 3} = \frac{6}{15} \qquad \frac{2 \cdot 5}{5 \cdot 5} = \frac{10}{25}$$

So, $\frac{4}{10}$, $\frac{6}{15}$, and $\frac{10}{25}$ are equivalent to $\frac{2}{5}$.

Exercise 4.2.27

Find three fractions equivalent to $\frac{3}{5}$.

Answer

Correct answers include $\frac{6}{10}$, $\frac{9}{15}$ and $\frac{12}{20}$

Exercise 4.2.28

Find three fractions equivalent to $\frac{4}{5}$.

Answer

Correct answers include $\frac{8}{10}$, $\frac{12}{15}$ and $\frac{16}{20}$

Example 4.2.15: equivalent fractions

Find a fraction with a denominator of 21 that is equivalent to $\frac{2}{7}$.

Solution

To find equivalent fractions, we multiply the numerator and denominator by the same number. In this case, we need to multiply the denominator by a number that will result in 21.

Since we can multiply 7 by 3 to get 21, we can find the equivalent fraction by multiplying both the numerator and denominator by 3.

$$\frac{2}{7} = \frac{2 \cdot 3}{7 \cdot 3} = \frac{6}{21}$$

Exercise 4.2.29

Find a fraction with a denominator of 21 that is equivalent to $\frac{6}{7}$.

Answer

$\frac{18}{21}$

Exercise 4.2.30

Find a fraction with a denominator of 100 that is equivalent to $\frac{3}{10}$.

Answer

$\frac{30}{100}$

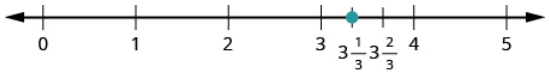
Locate Fractions and Mixed Numbers on the Number Line

Now we are ready to plot fractions on a number line. This will help us visualize fractions and understand their values.

Let us locate $\frac{1}{5}, \frac{4}{5}, 3, 3\frac{1}{3}, \frac{7}{4}, \frac{9}{2}, 5$, and $\frac{8}{3}$ on the number line. We will start with the whole numbers 3 and 5 because they are the easiest to plot.

The proper fractions listed are $\frac{1}{5}$ and $\frac{4}{5}$. We know proper fractions have values less than one, so $\frac{1}{5}$ and $\frac{1}{5}$ are located between the whole numbers 0 and 1. The denominators are both 5, so we need to divide the segment of the number line between 0 and 1 into five equal parts. We can do this by drawing four equally spaced marks on the number line, which we can then label as $\frac{1}{5}, \frac{2}{5}, \frac{3}{5}$, and $\frac{4}{5}$. Now plot points at $\frac{1}{5}$ and $\frac{4}{5}$.

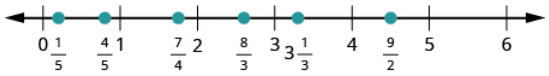
The only mixed number to plot is $3\frac{1}{3}$. Between what two whole numbers is $3\frac{1}{3}$? Remember that a mixed number is a whole number plus a proper fraction, so $3\frac{1}{3} > 3$. Since it is greater than 3, but not a whole unit greater, $3\frac{1}{3}$ is between 3 and 4. We need to divide the portion of the number line between 3 and 4 into three equal pieces (thirds) and plot $3\frac{1}{3}$ at the first mark.



Finally, look at the improper fractions $\frac{7}{4}$, $\frac{9}{2}$, and $\frac{8}{3}$. Locating these points will be easier if you change each of them to a mixed number.

$$\frac{7}{4} = 1\frac{3}{4}, \qquad \frac{9}{2} = 4\frac{1}{2}, \qquad \frac{8}{3} = 2\frac{2}{3}$$

Here is the number line with all the points plotted.

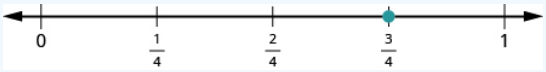


Example 4.2.16: locate and label

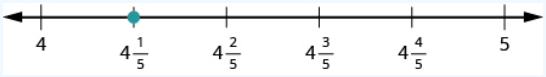
Locate and label the following on a number line: $\frac{3}{4}$, $\frac{4}{3}$, $\frac{5}{3}$, $4\frac{1}{5}$, and $\frac{7}{2}$.

Solution

Start by locating the proper fraction $\frac{3}{4}$. It is between 0 and 1. To do this, divide the distance between 0 and 1 into four equal parts. Then plot $\frac{3}{4}$.



Next, locate the mixed number $4\frac{1}{5}$. It is between 4 and 5 on the number line. Divide the number line between 4 and 5 into five equal parts, and then plot $4\frac{1}{5}$ one-fifth of the way between 4 and 5.

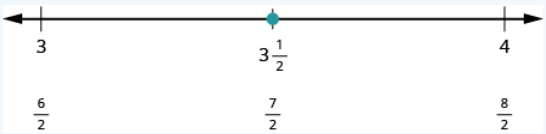


Now locate the improper fractions $\frac{4}{3}$ and $\frac{5}{3}$. It is easier to plot them if we convert them to mixed numbers first.

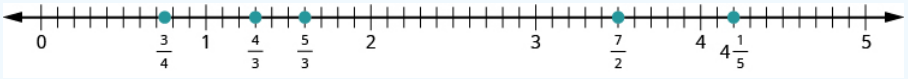
$$\frac{4}{3} = 1\frac{1}{3}, \qquad \frac{5}{3} = 1\frac{2}{3}$$

Divide the distance between 1 and 2 into thirds.

Next let us plot $\frac{7}{2}$. We write it as a mixed number, $\frac{7}{2} = 3\frac{1}{2}$. Plot it between 3 and 4.



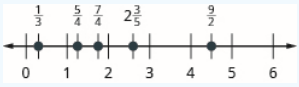
The number line shows all the numbers located on the number line.



Exercise 4.2.31

Locate and label the following on a number line: $\frac{1}{3}, \frac{5}{4}, \frac{7}{4}, 2\frac{3}{5}, \frac{9}{2}$.

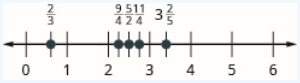
Answer



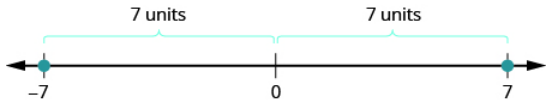
Exercise 4.2.32

Locate and label the following on a number line: $\frac{2}{3}, \frac{5}{2}, \frac{9}{4}, \frac{11}{4}, 3\frac{2}{5}$.

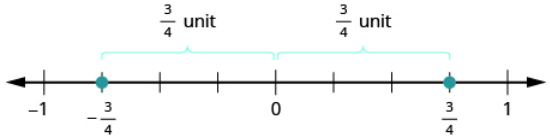
Answer



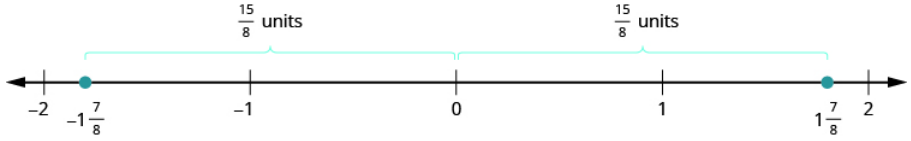
In Introduction to Integers, we defined the opposite of a number. It is the number that is the same distance from zero on the number line but on the opposite side of zero. We saw, for example, that the opposite of 7 is -7 and the opposite of -7 is 7.



Fractions have opposites, too. The opposite of $\frac{3}{4}$ is $-\frac{3}{4}$. It is the same distance from 0 on the number line, but on the opposite side of 0.



Thinking of negative fractions as the opposite of positive fractions will help us locate them on the number line. To locate $-\frac{15}{8}$ on the number line, first think of where $\frac{15}{8}$ is located. It is an improper fraction, so we first convert it to the mixed number $1\frac{7}{8}$ and see that it will be between 1 and 2 on the number line. So its opposite, $-\frac{15}{8}$, will be between -1 and -2 on the number line.



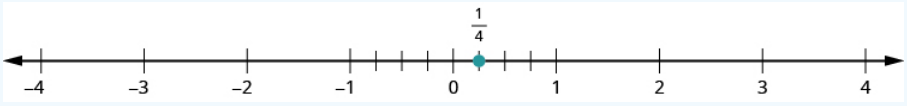
Example 4.2.17: locate and label

Locate and label the following on the number line: $\frac{1}{4}, -\frac{1}{4}, 1\frac{1}{3}, -1\frac{1}{3}, \frac{5}{2}$, and $-\frac{5}{2}$.

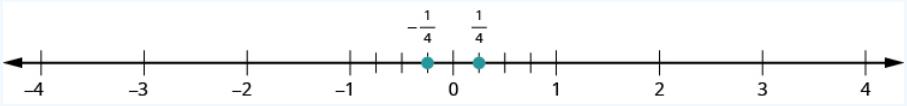
Solution

Draw a number line. Mark 0 in the middle and then mark several units to the left and right.

To locate $\frac{1}{4}$, divide the interval between 0 and 1 into four equal parts. Each part represents one-quarter of the distance. So plot $\frac{1}{4}$ at the first mark.

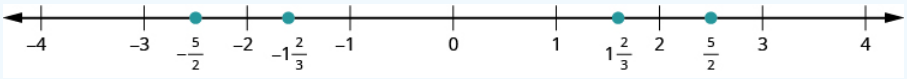


To locate $-\frac{1}{4}$, divide the interval between 0 and -1 into four equal parts. Plot $-\frac{1}{4}$ at the first mark to the left of 0.



Since $1\frac{1}{3}$ is between 1 and 2, divide the interval between 1 and 2 into three equal parts. Plot $1\frac{1}{3}$ at the first mark to the right of 1. Then since $-1\frac{1}{3}$ is the opposite of $1\frac{1}{3}$ it is between -1 and -2. Divide the interval between -1 and -2 into three equal parts. Plot $-1\frac{1}{3}$ at the first mark to the left of -1.

To locate $\frac{5}{2}$ and $-\frac{5}{2}$, it may be helpful to rewrite them as the mixed numbers $2\frac{1}{2}$ and $-2\frac{1}{2}$. Since $2\frac{1}{2}$ is between 2 and 3, divide the interval between 2 and 3 into two equal parts. Plot $\frac{5}{2}$ at the mark. Then since $-2\frac{1}{2}$ is between -2 and -3, divide the interval between -2 and -3 into two equal parts. Plot $-\frac{5}{2}$ at the mark.



Exercise 4.2.33

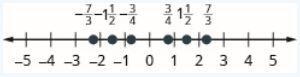
Locate and label each of the given fractions on a number line: $\frac{2}{3}, -\frac{2}{3}, 2\frac{1}{4}, -2\frac{1}{4}, \frac{3}{2}, -\frac{3}{2}$

Answer

Exercise 4.2.34

Locate and label each of the given fractions on a number line: $\frac{3}{4}, -\frac{3}{4}, 1\frac{1}{2}, -1\frac{1}{2}, \frac{7}{3}, -\frac{7}{3}$

Answer



Order Fractions and Mixed Numbers

We can use the inequality symbols to order fractions. Remember that $a > b$ means that a is to the right of b on the number line. As we move from left to right on a number line, the values increase.

Example 4.2.18: order

Order each of the following pairs of numbers, using $<$ or $>$:

a. $-\frac{2}{3}____-1$

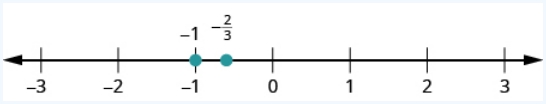
b. $-3\frac{1}{2}____-3$

c. $-\frac{3}{7}____-\frac{3}{8}$

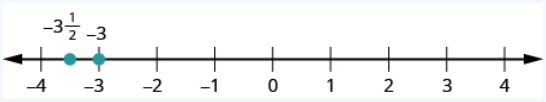
d. $-2____-\frac{16}{9}$

Solution

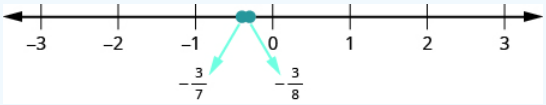
a. $-\frac{2}{3} > -1$



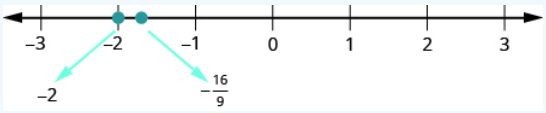
b. $-3\frac{1}{2} < -3$



c. $-\frac{3}{7} < -\frac{3}{8}$



d. $-2 < -\frac{16}{9}$



Exercise 4.2.35

Order each of the following pairs of numbers, using $<$ or $>$:

a. $-\frac{1}{3}__-1$

b. $-1\frac{1}{2}__-2$

c. $-\frac{2}{3}__-\frac{1}{3}$

d. $-3__-\frac{7}{3}$

Answer a

$>$

Answer b

$>$

Answer c

$<$

Answer d

$<$

Exercise 4.2.36

Order each of the following pairs of numbers, using $<$ or $>$:

a. $-3 __ -\frac{17}{5}$

b. $-2\frac{1}{4} __ -2$

c. $-\frac{3}{5} __ -\frac{4}{5}$

d. $-4 __ -\frac{10}{3}$

Answer a

$>$

Answer b

$<$

Answer c

$>$

Answer d

$<$

Glossary

equivalent fractions

Equivalent fractions are two or more fractions that have the same value.

fraction

A fraction is written $\frac{a}{b}$. in a fraction, a is the numerator and b is the denominator. A fraction represents parts of a whole. The denominator b is the number of equal parts the whole has been divided into, and the numerator a indicates how many parts are included.

mixed number

A mixed number consists of a whole number a and a fraction $\frac{b}{c}$ where $c \neq 0$. It is written as $a\frac{b}{c}$, where $c \neq 0$.

proper and improper fractions

The fraction $\frac{a}{b}$ is proper if $a < b$ and improper if $a > b$.

62. $\frac{3}{4}, -\frac{3}{4}, 1\frac{2}{3}, -1\frac{2}{3}, \frac{5}{2}, -\frac{5}{2}$
63. $\frac{2}{5}, -\frac{2}{5}, 1\frac{3}{4}, -1\frac{3}{4}, \frac{8}{3}, -\frac{8}{3}$

In the following exercises, order each of the following pairs of numbers, using < or >.

64. $-1 __ -\frac{1}{4}$
65. $-1 __ -\frac{1}{3}$
66. $-2\frac{1}{2} __ -3$
67. $-1\frac{3}{4} __ -2$
68. $-\frac{5}{12} __ -\frac{7}{12}$
69. $-\frac{9}{10} __ -\frac{3}{10}$
70. $-3 __ -\frac{13}{5}$
71. $-4 __ -\frac{23}{6}$

Everyday Math

72. **Music Measures** A choreographed dance is broken into counts. A $\frac{1}{1}$ count has one step in a count, a $\frac{1}{2}$ count has two steps in a count and a 1 3 count has three steps in a count. How many steps would be in a $\frac{1}{5}$ count? What type of count has four steps in it?
73. **Music Measures** Fractions are used often in music. In 4 4 time, there are four quarter notes in one measure.
    a. How many measures would eight quarter notes make?
    b. The song “Happy Birthday to You” has 25 quarter notes. How many measures are there in “Happy Birthday to You?”
74. **Baking** Nina is making five pans of fudge to serve after a music recital. For each pan, she needs 1 2 cup of walnuts.
    a. How many cups of walnuts does she need for five pans of fudge?
    b. Do you think it is easier to measure this amount when you use an improper fraction or a mixed number? Why?

Writing Exercises

75. Give an example from your life experience (outside of school) where it was important to understand fractions.
76. Explain how you locate the improper fraction $\frac{21}{4}$ on a number line on which only the whole numbers from 0 through 10 are marked.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
understand the meaning of fractions.			
model improper fractions and mixed numbers.			
convert between improper fractions and mixed numbers.			
model equivalent fractions.			
find equivalent fractions.			
locate fractions and mixed numbers on the number line.			
order fractions and mixed numbers.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

4.3: Rational Expressions (INTRO)

Learning Objectives

- Determine the restrictions to the domain of a rational expression.
- Simplify rational expressions.
- Simplify expressions with opposite binomial factors.
- Simplify and evaluate rational functions.

Rational Expressions, Evaluation, and Restrictions

A rational number, or fraction $\frac{a}{b}$, is a real number defined as a quotient of two integers ***a*** and ***b***, where $b \neq 0$. Similarly, we define a rational expression, or algebraic fraction $\frac{P}{Q}$, as the quotient of two polynomials ***P*** and ***Q***, where $Q \neq 0$. Some examples of rational expressions follow:

The example $\frac{x+3}{x-5}$ consists of linear expressions in both the numerator and denominator. Because the denominator contains a variable, this expression is not defined for all values of ***x***.

Evaluate $\frac{x+3}{x-5}$ for the set of ***x***-values $\{-3, 4, 5\}$.

Solution:

Substitute the values in for ***x***.

$x=-3$	$x=4$	$x=5$
$\frac{x+3}{x-5}=\frac{(-3)+3}{(-3)-5}$	$\frac{x+3}{x-5}=\frac{(4)+3}{(4)-5}$	$\frac{x+3}{x-5}=\frac{(5)+3}{(5)-5}$
$=\frac{0}{-8}$	$=\frac{7}{-1}$	$=\frac{8}{0}$ *Undefined*
$=0$	$=-7$	

Answer:

When $x=-3$, the value of the rational expression is 0; when $x=4$, the value of the rational expression is -7; and when $x=5$, the value of the rational expression is undefined.

This example illustrates that variables are restricted to values that do not make the denominator equal to 0. The domain of a rational expression is the set of real numbers for which it is defined, and restrictions are the real numbers for which the expression is not defined. We often express the domain of a rational expression in terms of its restrictions.

Example 4.3.2

Find the domain of the following:

$$\frac{x+7}{2x^2+x-6}$$

Solution:

In this example, the numerator $x+7$ is a linear expression and the denominator $2x^2+x-6$ is a quadratic expression. If we factor the denominator, then we will obtain an equivalent expression.

$$\frac{x+7}{2x^2+x-6}=\frac{x+7}{(2x-3)(x+2)}$$

Because rational expressions are undefined when the denominator is 0, we wish to find the values for ***x*** that make it 0. To do this, apply the zero product property. Set each factor in the denominator equal to 0 and solve.

$$(2x-3)(x+2)=0$$

$$\begin{aligned} 2x-3=0 \quad &\text{or} \quad x+2=0 \\ 2x=3 \quad &\quad\quad x=-2 \\ x=\tfrac{3}{2} \quad &\end{aligned}$$

We conclude that the original expression is defined for any real number except $\frac{3}{2}$ and -2. These two values are the restrictions to the domain. It is important to note that -7 is ***not*** a restriction to the domain because the expression is defined as 0 when the numerator is 0.

$$\begin{aligned} \frac{x+7}{2x^2+x-6} &= \frac{(-7)+7}{2(-7)^2+(-7)-6} \\ &= \frac{0}{98-7-6} \\ &= \frac{0}{85} \\ &= 0 \end{aligned}$$

Answer:

The domain consists of any real number ***x***, where $x \neq \frac{3}{2}$ and $x \neq -2$.

We can express the domain of the previous example using notation as follows:

Set − builder notation	*Interval notation*
$\left\{x \middle\| x \neq -2, \frac{3}{2}\right\}$	$(-\infty,-2)\cup\left(-2,\frac{3}{2}\right)\cup\left(\frac{3}{2},\infty\right)$

The restrictions to the domain of a rational expression are determined by the denominator. Ignore the numerator when finding those restrictions.

Example 4.3.3

Determine the domain:

$$\frac{x^4+x^3-2x^2-x}{x^2-1}$$

Solution:

To find the restrictions to the domain, set the denominator equal to 0 and solve:

$$\begin{aligned} x^2-1 &= 0 \\ (x+1)(x-1) &= 0 \\ x+1 = 0 \quad &\text{or} \quad x-1=0 \\ x=-1 \quad &\quad\quad x=1 \end{aligned}$$

These two values cause the denominator to be 0. Hence they are restricted from the domain.

Answer:

The domain consists of any real number ***x***, where $x \neq \pm 1$.

Example 4.3.4

Determine the domain:

$$\frac{x^2-25}{4}$$

Solution:

There is no variable in the denominator and thus no restriction to the domain.

Answer:

The domain consists of all real numbers, **R**.

Simplifying Rational Expressions

When simplifying fractions, look for common factors that cancel. For example,

$$\frac{12}{60}=\frac{1\cdot \cancel{12}}{5\cdot \cancel{12}}=\frac{1}{5}$$

We say that the fraction $\frac{12}{60}$ is equivalent to $\frac{1}{5}$. Fractions are in simplest form if the numerator and denominator share no common factor other than 1. Similarly, when working with rational expressions, look for factors to cancel. For example,

$$\frac{x+4}{(x-3)(x+4)}=\frac{1\cdot \cancel{(x+4)}}{(x-3)\ \cancel{(x+4)}}=\frac{1}{x-3}$$

The resulting rational expression is equivalent if it shares the same domain. Therefore, we must make note of the restrictions and write

$$\frac{x+4}{(x-3)(x+4)}=\frac{1}{x-3},\ \text{where } x\neq 3 \text{ and } x\neq -4$$

In words, $\frac{x+4}{(x-3)(x+4)}$ is equivalent to $\frac{1}{x-3}$, if $x\neq 3$ and $x\neq -4$. We can verify this by choosing a few values with which to evaluate both expressions to see if the results are the same. Here we choose $x=7$ and evaluate as follows:

$$\begin{aligned}\frac{x+4}{(x-3)(x+4)}&=\frac{1}{x-3}\\ \frac{(7)+4}{(7-3)(7+4)}&=\frac{1}{(7)-3}\\ \frac{11}{(4)(11)}&=\frac{1}{4}\\ \frac{1}{4}&=\frac{1}{4}\ \checkmark\end{aligned}$$

It is important to state the restrictions before simplifying rational expressions because the simplified expression may be defined for restrictions of the original. In this case, the expressions are not equivalent. Here −4 is defined for the simplified equivalent but not for the original, as illustrated below:

$$\begin{aligned}\frac{x+4}{(x-3)(x+4)}&=\frac{1}{x-3}\\ \frac{(-4)+4}{(-4-3)(-4+4)}&=\frac{1}{(-4)-3}\\ \frac{0}{(-7)(0)}&=\frac{1}{-7}\\ \frac{0}{0}&=-\frac{1}{7}\ \ x\end{aligned}$$

Example 4.3.5

Simplify and state the restriction:

$$\frac{25x^2}{15x^3}$$

Solution:

In this example, the expression is undefined when ***x*** is 0.

$$\frac{25x^2}{15x^3}=\frac{25(0)^2}{15(0)^3}=\frac{0}{0}\ \ Undefined$$

Therefore, the domain consists of all real numbers ***x***, where $x\neq 0$. With this understanding, we can cancel common factors.

$$\begin{aligned}\frac{25x^2}{15x^3}&=\frac{5\cdot \cancel{5x^2}}{3x\cdot \cancel{5x^2}}\\ &=\frac{5}{3x}\end{aligned}$$

Answer:

$\frac{5}{3x}$, where $x \neq 0$

Example 4.3.6

State the restrictions and simplify:

$$\frac{3x(x-5)}{(2x-1)(x-5)}$$

Solution:

To determine the restrictions, set the denominator equal to 0 and solve.

$$(2x+1)(x-5)=0$$

$$\begin{aligned} 2x+1 &= 0 \quad \text{or} \quad x-5=0 \\ 2x &= -1 \qquad\quad x=5 \\ x &= -\tfrac{1}{2} \end{aligned}$$

The domain consists of all real numbers except for $-\frac{1}{2}$ and 5. Next, we find an equivalent expression by canceling common factors.

$$\begin{aligned} \frac{3x(x-5)}{(2x+1)(x-5)} &= \frac{3x\ \cancel{(x-5)}}{(2x+1)\ \cancel{(x-5)}} \\ &= \frac{3x}{2x+1} \end{aligned}$$

Answer:

$\frac{3x}{2x+1}$, where $x \neq -\frac{1}{2}$ and $x \neq 5$

Typically, rational expressions are not given in factored form. If this is the case, factor first and then cancel. The steps are outlined in the following example.

Example 4.3.7

State the restrictions and simplify:

$$\frac{3x+6}{x^2+x-2}$$

Solution:

Step 1: Completely factor the numerator and denominator.

$$\frac{3x+6}{x^2+x-2} = \frac{3(x+2)}{(x-1)(x+2)}$$

Step 2: Determine the restrictions to the domain. To do this, set the denominator equal to 0 and solve.

$$(x-1)(x+2)=0$$

$$\begin{aligned} x-1 &= 0 \quad \text{or} \quad x+2=0 \\ x &= 1 \qquad\quad x=-2 \end{aligned}$$

The domain consists of all real numbers except -2 and 1.

Step 3: Cancel common factors, if any.

$$\begin{aligned} \frac{3x+6}{x^2+x-2} &= \frac{3\ \cancel{(x+2)}}{(x-1)\ \cancel{(x+2)}} \\ &= \frac{3}{x-1} \end{aligned}$$

Answer:

$\frac{3}{x-1}$, where $x \neq 1$ and $x \neq -2$

Example 4.3.8

State the restrictions and simplify:

Solution:

First, factor the numerator and denominator.

Any value of x that results in a value of 0 in the denominator is a restriction. By inspection, we determine that the domain consists of all real numbers except 4 and 3. Next, cancel common factors.

$$= \frac{\cancel{(x-3)}(x+10)}{(x-4)\ \cancel{(x-3)}}$$
$$= \frac{x+10}{x-4}$$

Answer:

$\frac{x+10}{x-4}$, where $x \neq 3$ and $x \neq 4$

It is important to remember that we can only cancel factors of a product. A common mistake is to cancel terms. For example,

State the restrictions and simplify:

$$\frac{x^2-16}{5x^2-20x}$$

Answer

$\frac{x+4}{5x}$, where $x \neq 0$ and $x \neq 4$

In some examples, we will make a broad assumption that the denominator is nonzero. When we make that assumption, we do not need to determine the restrictions.

Example 4.3.9

Simplify:

(Assume all denominators are nonzero.)

Solution:

Factor the numerator by grouping. Factor the denominator using the formula for a difference of squares.

Next, cancel common factors.

$$= \frac{\cancel{(x+y)}(y-3)}{\cancel{(x+y)}(x-y)}$$
$$= \frac{y-3}{x-y}$$

Answer:

$$\frac{y-3}{x-y}$$

Opposite Binomial Factors

Recall that the opposite of the real number a is $-a$. Similarly, we can define the opposite of a polynomial P to be $-P$. We first consider the opposite of the binomial $a-b$:

$$-(a-b)=-a+b=b-a \tag{4.3.1}$$

This leads us to the opposite binomial property:

$$-(a-b)=(b-a) \tag{4.3.2}$$

This is equivalent to factoring out a -1.

$$(b-a)=-1(a-b) \tag{4.3.3}$$

If $a \neq b$, then we can divide both sides by $(a-b)$ and obtain the following:

$$\frac{b-a}{a-b}=-1$$

Example 4.3.10

State the restrictions and simplify:

$$\frac{3-x}{x-3}$$

Solution:

By inspection, we can see that the denominator is 0 if $x=3$. Therefore, 3 is the restriction to the domain. Apply the opposite binomial property to the numerator and then cancel.

Answer:

$\frac{3-x}{x-3}$, where $x \neq 3$

Since addition is commutative, we have

$$(a+b)=(b+a) \tag{4.3.4}$$

or

$$\frac{b+a}{a+b}=1$$

Take care not to confuse this with the opposite binomial property. Also, it is important to recall that

$$\frac{-a}{b}=-\frac{a}{b}=\frac{a}{-b}$$

In other words, show a negative fraction by placing the negative sign in the numerator, in front of the fraction bar, or in the denominator. Generally, negative denominators are avoided.

Example 4.3.11

Simplify and state the restrictions:

$$\frac{4-x^2}{x^2+3x-10}$$

Solution:

Begin by factoring the numerator and denominator.

$$\begin{aligned}\frac{4-x^2}{x^2+3x-10} &= \frac{(2+x)(2-x)}{(x-2)(x+5)} && \textit{The restrictions are } x \neq 2 \textit{ and } x \neq -5.\\ &= \frac{(2+x)\cdot(-1)\,(x-2)}{(x-2)(x+5)} && \textit{Apply the opposite binomial property, then cancel.}\\ &= \frac{(2+x)\cdot(-1)}{(x+5)}\\ &= -\frac{2+x}{x+5} \quad \text{or} \quad = -\frac{x+2}{x+5}\end{aligned}$$

Answer:

$-\frac{x+2}{x+5}$, where $x \neq 2$ and $x \neq -5$

Exercise 4.3.2

Simplify and state the restrictions:

Answer

$\frac{-2x+3}{x+5}$, **where** $x \neq \pm 5$

Rational Functions

Rational functions have the form

$$r(x) = \frac{p(x)}{q(x)} \tag{4.3.5}$$

,

where *p(x)* and *q(x)* are polynomials and *q(x)≠0*. The domain of a rational function consists of all real numbers ***x*** such that the denominator *q(x)≠0*.

Example 4.3.12

a. Simplify: $r(x) = \frac{2x^2+5x-3}{6x^2+18x}$.
b. State the domain.
c. Calculate $r(-2)$.

Solution:

a. To simplify the rational function, first factor and then cancel.

$$\begin{aligned} r(x) &= \frac{2x^2+5x-3}{6x^2+18x} \\ &= \frac{(2x-1)\,(x+3)}{6x\,(x+3)} \\ &= \frac{2x-1}{6x} \end{aligned}$$

b. To determine the restrictions, set the denominator of the original function equal to 0 and solve.

$$\begin{aligned} 6x^2+18x &= 0 \\ 6x(x+3) &= 0 \\ 6x = 0 \quad &\text{or} \quad x+3 = 0 \\ x = 0 \quad &\quad\;\; x = -3 \end{aligned}$$

The domain consists of all real numbers ***x***, where $x \neq 0$ and $x \neq -3$.

c. Since -2 is not a restriction, substitute it for the variable ***x*** using the simplified form.

$$r(x) = \frac{2x-1}{6x}$$
$$r(-2) = \frac{2(-2)-1}{6(-2)}$$
$$= \frac{-4-1}{-12}$$
$$= \frac{-5}{-12}$$
$$= \frac{5}{12}$$

Answer:

a. $\frac{2x-1}{6x}$ b. The domain is all real numbers except 0 and -3. c. $r(-2) = \frac{5}{12}$

If a cost function $C(x)$ represents the cost of producing ***x*** units, then the average cost $c(x)$ is the cost divided by the number of units produced.

$$\textit{Average cost}: c(x) = \frac{C(x)}{x} \tag{4.3.6}$$

Example 4.3.13

The cost in dollars of producing t-shirts with a company logo is given by $C(x) = 7x + 200$, where ***x*** represents the number of shirts produced. Determine the average cost of producing

a. 40 t-shirts
b. 250 t-shirts
c. 1,000 t-shirts

Solution:

Set up a function representing the average cost.

$$c(x) = \frac{C(x)}{x} = \frac{7x+200}{x}$$

Next, calculate c(40), c(250), and c(1000).

$$c(40) = \frac{7(40)+200}{40} = \frac{280+200}{40} = \frac{480}{40} = 12.00$$
$$c(250) = \frac{7(250)+200}{250} = \frac{1750+200}{250} = \frac{1950}{250} = 7.80$$
$$c(1000) = \frac{7(1000)+200}{1000} = \frac{7000+200}{1000} = \frac{7200}{1000} = 7.20$$

Answer:

a. If 40 t-shirts are produced, then the average cost per t-shirt is $12.00.
b. If 250 t-shirts are produced, then the average cost per t-shirt is $7.80.
c. If 1,000 t-shirts are produced, then the average cost per t-shirt is $7.20.

Key Takeaways

- Rational expressions usually are not defined for all real numbers. The real numbers that give a value of 0 in the denominator are not part of the domain. These values are called restrictions.
- Simplifying rational expressions is similar to simplifying fractions. First, factor the numerator and denominator and then cancel the common factors. Rational expressions are simplified if there are no common factors other than 1 in the numerator and the denominator.
- Simplified rational expressions are equivalent for values in the domain of the original expression. Be sure to state the restrictions if the denominators are not assumed to be nonzero.

- Use the opposite binomial property to cancel binomial factors that involve subtraction. Use $-(a-b)=b-a$ to replace factors that will then cancel. Do not confuse this with factors that involve addition, such as $(a+b)=(b+a)$.

Exercise 4.3.3 Rational Expressions

Evaluate for the given set of *x*-values.

1. $5x; -1, 0, 1$
2. $\frac{4x^3}{x^2}; -1, 0, 1$
3. $\frac{1}{x+9}; -10, -9, 0$
4. $\frac{x+6}{x-5}; -6, 0, 5$
5. $\frac{3x(x-2)}{2x-1}; 0, \frac{1}{2}, 2$
6. $\frac{9x^2-1}{x-7}; 0, \frac{1}{3}, 7$
7. $5x^2-9; -3, 0, 3$
8. $\frac{x^2-2}{5x^2-3x-10}; -5, -4, 5$

? Exercise 4.3.4 Rational Expressions

An object's weight depends on its height above the surface of earth. If an object weighs 120 pounds on the surface of earth, then its weight in pounds, W, x miles above the surface is approximated by the formula

$$W = \frac{120 \cdot 4000^2}{(4000+x)^2}$$

For each problem below, approximate the weight of a 120-pound object at the given height above the surface of earth. (1 mile = 5,280 feet)

1. 100 miles
2. 1,000 miles
3. 44,350 feet
4. 90,000 feet

Answer

1. 114 pounds

3. 119.5 pounds

Exercise 4.3.5 Rational Expressions

The price to earnings ratio (P/E) is a metric used to compare the valuations of similar publicly traded companies. The P/E ratio is calculated using the stock price and the earnings per share (EPS) over the previous 12-month period as follows:

$$\text{P/E}=\frac{\text{price per share}}{\text{earnings per share}}$$

If each share of a company stock is priced at $22.40, then calculate the P/E ratio given the following values for the earnings per share.

1. $1.40
2. $1.21
3. What happens to the P/E ratio when earnings decrease?
4. What happens to the P/E ratio when earnings increase?

Answer

1. 16

3. The P/E ratio increases.

Exercise 4.3.6 Rational Expressions

State the restrictions to the domain.

1. $\frac{1}{3x}$
2. $\frac{3x^2}{7x^5}$
3. $\frac{3x(x+1)}{x+4}$
4. $\frac{2x^2(x-3)}{x-1}$
5. $\frac{1}{5x-1}$
6. $\frac{x-2}{3x-2}$
7. $\frac{x-9}{5x(x-2)}$
8. $\frac{1}{(x-3)(x+6)}$
9. $\frac{x}{1-x^2}$
10. $\frac{x^2-9}{x^2-36}$
11. $\frac{1}{2x(x+3)(2x-1)}$
12. $\frac{x-3}{(3x-1)(2x+3)}$
13. $\frac{4x(2x+1)}{12x^2+x-1}$
14. $\frac{x-5}{3x^2-15x}$

Answer

1. $x \neq 0$

3. $x \neq -4$

5. $x \neq \frac{1}{5}$

7. $x \neq 0$ and $x \neq 2$

9. $x \neq \pm 1$

11. $x \neq 0$, $x \neq -3$, and $x \neq \frac{1}{2}$

13. $x \neq -\frac{1}{3}$ and $x \neq \frac{1}{4}$

Exercise 4.3.7 Simplifying Rational Expressions

State the restrictions and then simplify.

1. $\frac{5x^2}{20x^3}$
2. $\frac{12x^6}{60x}$
3. $\frac{3x^2(x-2)}{9x(x-2)}$
4. $\frac{20(x-3)(x-5)}{6(x-3)(x+1)}$
5. $\frac{6x^2(x-8)}{36x(x+9)(x-8)}$
6. $\frac{16x^2-1}{(4x+1)^2}$
7. $\frac{9x^2-6x+1}{(3x-1)^2}$
8. $\frac{x-7}{x^2-49}$
9. $\frac{x^2-64}{x^2+8x}$
10. $\frac{x+10}{x^2-100}$
11. $\frac{2x^3-12x^2}{5x^2-30x}$
12. $\frac{30x^5+60x^4}{2x^3-8x}$
13. $\frac{2x-12}{x^2+x-6}$
14. $\frac{x^2-x-6}{3x^2-8x-3}$
15. $\frac{6x^2-25x+25}{3x^2+16x-35}$
16. $\frac{3x^2+4x-1}{5x^2-9}$
17. $\frac{x^2-10x+21}{x^2-4x-21}$
18. $\frac{x^3-1}{x^2-1}$
19. $\frac{x^3+8}{x^2-4}$
20. $\frac{x^4-1}{6x^2-4}$

Answer

1. $\frac{1}{4x}; x \neq 0$
3. $\frac{x}{3}; x \neq 0, 2$
5. $\frac{x}{6(x+9)}; x \neq 0, -9, 8$
7. $1; x \neq \frac{1}{3}$
9. $\frac{x-8}{x}; x \neq 0, -8$
11. $\frac{2x}{5}; x \neq 0, 6$
13. $\frac{2x-12}{x^2+x-6}$ $x \neq -2, \frac{3}{2}$
15. $\frac{2x-5}{x+7}; x \neq -7, \frac{5}{3}$
17. $\frac{x-3}{x+3}; x \neq -3, 7$
19. $\frac{x^2-2x+4}{x-2}; x \neq \pm 2$

Exercise 4.3.8 Simplifying Rational Expressions with Opposite Binomial Factors

State the restrictions and then simplify.

1. $\frac{x-9}{9-x}$
2. $\frac{3x-2}{2-3x}$
3. $\frac{x+6}{6+x}$
4. $\frac{3x+1}{1+3x}$
5. $\frac{(2x-5)(x-7)}{(7-x)(2x-1)}$
6. $\frac{(3x+2)(x+5)}{(x-5)(2+3x)}$
7. $\frac{x^2-4}{(2-x)^2}$
8. $\frac{16-9x^2}{(3x+4)^2}$
9. $\frac{4x^2(10-x)}{3x^3-300x}$
10. $-\frac{2x+1}{4x^3-49x}$
11. $\frac{2x^2-7x-4}{1-4x^2}$
12. $\frac{9x^2-4}{4x-6x^2}$
13. $\frac{x^2-5x-14}{7-15x+2x^2}$
14. $\frac{2x^3+x^2-2x-1}{1+x-2x^2}$
15. $\frac{x^3+2x-3x^2-6}{2+x^2}$
16. $\frac{27+x^3}{x^2+6x+9}$
17. $\frac{64-x^3}{x^2-8x+16}$
18. $\frac{x^2+4}{4-x^2}$

Answer

1. $-1; x \neq 9$
3. $1; x \neq -6$
5. $\frac{-2x-5}{2x-1}; x \neq \frac{1}{2}, 7$
7. $\frac{x+2}{x-2}; x \neq 2$
9. $-\frac{4x}{3(x+10)}; x \neq \pm 10, 0$
11. $\frac{x-4}{1-2x}; x \neq \pm\frac{1}{2}$
13. $\frac{x+2}{2x-1}; x \neq \frac{1}{2}, 7$
15. $x-3$; none
17. $\frac{-16+4x+x^2}{x-4}; x \neq 4$

Exercise 4.3.9 Simplifying Rational Expressions with Opposite Binomial Factors

Simplify. (Assume all denominators are nonzero.)

1. $-\frac{15x^3y^2}{5xy^2(x+y)}$
2. $\frac{14x^7y^2(x-2y)^4}{7x^8y(x-2y)^2}$
3. $\frac{y+x}{x^2-y^2}$

4. $\frac{y-x}{x^2-y^2}$
5. $\frac{x^2-y^2}{(x-y)^2}$
6. $\frac{a^2-ab-6b^2}{a^2-6ab+9b^2}$
7. $\frac{2a^2-11a+12}{-32+2a^2}$
8. $\frac{a^2b-3a^2}{3a^2-3ab}$
9. $\frac{xy^2-x+y^3-y}{x-xy^2}$
10. $\frac{x^3-xy^2-x^2y+y}{3x^2-2xy+y^2}$
11. $\frac{x^3-27}{x^2+3x+9}$
12. $\frac{x^2-x+1}{x^3+1}$

Answer

1. $-\frac{3x^2}{x+y}$
3. $\frac{1}{x-y}$
5. $\frac{x+y}{x-y}$
7. $\frac{2a-3}{2(a+4)}$
9. $-\frac{x+y}{x}$
11. $x-3$

Exercise 4.3.10 Rational Functions

Calculate the following.

1. $f(x)=\frac{5x}{x-3}; f(0), f(2), f(4)$
2. $f(x)=\frac{x+7}{x^2+1}; f(-1), f(0), f(1)$
3. $g(x)=\frac{x^3}{(x-2)^2}; g(0), g(2), g(-2)$
4. $g(x)=\frac{x^2-9}{9-x^2}; g(-2), g(0), g(2)$
5. $g(x)=\frac{x^3}{x^2+1}; g(-1), g(0), g(1)$
6. $g(x)=\frac{5x+1}{x^2-25}; g(-\frac{1}{5}), g(-1), g(-5)$

Answer

1. f(0)=0, f(2)=−10, f(4)=20
3. g(0)=0, g(2) undefined, g(−2)=$-\frac{1}{2}$
5. g(−1)=$-\frac{1}{2}$, g(0)=0, g(1)=$\frac{1}{2}$

Exercise 4.3.11 Rational Functions

State the restrictions to the domain and then simplify.

1. $f(x)=-\frac{3x^2-6x}{x^2+4x+4}$
2. $f(x)=\frac{x^2+6x+9}{2x^2+5x-3}$
3. $g(x)=\frac{9-x}{x^2-81}$
4. $g(x)=\frac{x^3-27}{3-x}$

5. $g(x) = \frac{3x-15}{10-2x}$
6. $g(x) = \frac{25-5x}{4x-20}$
7. The cost in dollars of producing coffee mugs with a company logo is given by $C(x) = x + 40$, where x represents the number of mugs produced. Calculate the average cost of producing 100 mugs and the average cost of producing 500 mugs.
8. The cost in dollars of renting a moving truck for the day is given by $C(x) = 0.45x + 90$, where x represents the number of miles driven. Calculate the average cost per mile if the truck is driven 250 miles in one day.
9. The cost in dollars of producing sweat shirts with a custom design on the back is given by $C(x) = 1200 + (12 - 0.05x)x$, where x represents the number of sweat shirts produced. Calculate the average cost of producing 150 custom sweat shirts.
10. The cost in dollars of producing a custom injected molded part is given by $C(x) = 500 + (3 - 0.001x)x$, where x represents the number of parts produced. Calculate the average cost of producing 1,000 custom parts.

Answer

1. $f(x) = -\frac{3x}{x+2}; x \neq -2$
3. $g(x) = -\frac{1}{x+9}; x \neq \pm 9$
5. $g(x) = -\frac{3}{2}; x \neq 5$
7. The average cost of producing 100 mugs is $1.40 per mug. The average cost of producing 500 mugs is $1.08 per mug.
9. $12.50

? Exercise 4.3.12 Discussion Board

1. Explain why $\frac{b-a}{a-b} = -1$ and illustrate this fact by substituting some numbers for the variables.
2. Explain why $\frac{b+a}{a+b} = 1$ and illustrate this fact by substituting some numbers for the variables.
3. Explain why we cannot cancel x in the expression $\frac{x}{x+1}$.

Answer

1. Answers may vary
3. Answers may vary

4.4: Multiply and Divide Fractions (Part 1)

Learning Objectives

- Simplify fractions
- Multiply fractions
- Find reciprocals
- Divide fractions

be prepared!

Before you get started, take this readiness quiz.

1. Find the prime factorization of 48. If you missed this problem, review Example 2.5.1.
2. Draw a model of the fraction $\frac{3}{4}$. If you missed this problem, review Example 4.1.2.
3. Find two fractions equivalent to $\frac{5}{6}$. Answers may vary. Acceptable answers include $\frac{10}{12}$, $\frac{15}{18}$, $\frac{50}{60}$, etc. If you missed this problem, review Example 4.1.14.

Simplify Fractions

In working with equivalent fractions, you saw that there are many ways to write fractions that have the same value, or represent the same part of the whole. How do you know which one to use? Often, we'll use the fraction that is in *simplified* form.

A fraction is considered simplified if there are no common factors, other than 1, in the numerator and denominator. If a fraction does have common factors in the numerator and denominator, we can reduce the fraction to its simplified form by removing the common factors.

Definition: Simplified Fraction

A fraction is considered simplified if there are no common factors in the numerator and denominator.

For example,

- $\frac{2}{3}$ is simplified because there are no common factors of 2 and 3.
- $\frac{10}{15}$ is not simplified because 5 is a common factor of 10 and 15.

The process of simplifying a fraction is often called *reducing the fraction*. In the previous section, we used the Equivalent Fractions Property to find equivalent fractions. We can also use the Equivalent Fractions Property in reverse to simplify fractions. We rewrite the property to show both forms together.

Definition: Equivalent Fractions Property

If a, b, c are numbers where $b \neq 0, c \neq 0$, then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$ and $\frac{a \cdot c}{b \cdot c} = \frac{a}{b}$.

Notice that c is a common factor in the numerator and denominator. Anytime we have a common factor in the numerator and denominator, it can be removed.

HOW TO: SIMPLIFY A FRACTION

Step 1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers.

Step 2. Simplify, using the equivalent fractions property, by removing common factors.

Step 3. Multiply any remaining factors.

Example 4.4.1: simplify

Simplify: $\frac{10}{15}$.

Solution

To simplify the fraction, we look for any common factors in the numerator and the denominator.

Notice that 5 is a factor of both 10 and 15.	$\frac{10}{15}$
Factor the numerator and denominator.	$\frac{2 \cdot 5}{3 \cdot 5}$
Remove the common factors.	$\frac{2 \cdot \cancel{5}}{3 \cdot \cancel{5}}$
Simplify.	$\frac{2}{3}$

Exercise 4.4.1

Simplify: $\frac{8}{12}$.

Answer

$\frac{2}{3}$

Exercise 4.4.2

Simplify: $\frac{12}{16}$.

Answer

$\frac{3}{4}$

To simplify a negative fraction, we use the same process as in Example 4.4.1. Remember to keep the negative sign.

Example 4.4.2: simplify

Simplify: $-\frac{18}{24}$.

Solution

We notice that 18 and 24 both have factors of 6.	$-\frac{18}{24}$
Rewrite the numerator and denominator showing the common factor.	$-\frac{3 \cdot 6}{4 \cdot 6}$
Remove common factors.	$-\frac{3 \cdot \cancel{6}}{4 \cdot \cancel{6}}$
Simplify.	$-\frac{3}{4}$

Exercise 4.4.3

Simplify: $-\frac{21}{28}$.

Answer

$-\frac{3}{4}$

Exercise 4.4.4

Simplify: $-\frac{16}{24}$.

Answer

$-\frac{2}{3}$

After simplifying a fraction, it is always important to check the result to make sure that the numerator and denominator do not have any more factors in common. Remember, the definition of a simplified fraction: *a fraction is considered simplified if there are no common factors in the numerator and denominator*.

When we simplify an improper fraction, there is no need to change it to a mixed number.

Example 4.4.3:

Simplify: $-\frac{56}{32}$.

Solution

	$-\frac{56}{32}$
Rewrite the numerator and denominator, showing the common factors, 8.	$-\frac{7\cdot 8}{4\cdot 8}$
Remove common factors.	$-\frac{7\cdot \cancel{8}}{4\cdot \cancel{8}}$
Simplify.	$-\frac{7}{4}$

Exercise 4.4.5

Simplify: $-\frac{54}{42}$.

Answer

$-\frac{9}{7}$

Exercise 4.4.6

Simplify: $-\frac{81}{45}$.

Answer

$-\frac{9}{5}$

HOW TO: SIMPLIFY A FRACTION

Step 1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers.

Step 2. Simplify, using the equivalent fractions property, by removing common factors.

Step 3. Multiply any remaining factors.

Sometimes it may not be easy to find common factors of the numerator and denominator. A good idea, then, is to factor the numerator and the denominator into prime numbers. (You may want to use the factor tree method to identify the prime factors.) Then divide out the common factors using the Equivalent Fractions Property.

Example 4.4.4: simplify

Simplify: $\frac{210}{385}$.

Solution

	$\frac{210}{385}$
Use factor trees to factor the numerator and denominator.	Rewrite the numerator and denominator as the product of the primes.	$\frac{210}{385} = \frac{2 \cdot 3 \cdot 5 \cdot 7}{5 \cdot 7 \cdot 11}$
Remove the common factors.	$\frac{2 \cdot 3 \cdot \cancel{5} \cdot \cancel{7}}{\cancel{5} \cdot \cancel{7} \cdot 11}$
Simplify.	$\frac{2 \cdot 3}{11}$
Multiply any remaining factors.	$\frac{6}{11}$

Exercise 4.4.7

Simplify: $\frac{69}{120}$.

Answer

$\frac{23}{40}$

Exercise 4.4.8

Simplify: $\frac{120}{192}$.

Answer

$\frac{5}{8}$

We can also simplify fractions containing variables. If a variable is a common factor in the numerator and denominator, we remove it just as we do with an integer factor.

Example 4.4.5: simplify

Simplify: $\frac{5xy}{15x}$.

Solution

	$\frac{5xy}{15x}$
Rewrite numerator and denominator showing common factors.	$\frac{5 \cdot x \cdot y}{3 \cdot 5 \cdot x}$
Remove common factors.	$\frac{\cancel{5} \cdot \cancel{x} \cdot y}{3 \cdot \cancel{5} \cdot \cancel{x}}$
Simplify.	$\frac{y}{3}$

Exercise 4.4.9

Simplify: $\frac{7x}{7y}$.

Answer

$\frac{x}{y}$

Exercise 4.4.10

Simplify: $\frac{9a}{9b}$.

Answer

$\frac{a}{b}$

Multiply Fractions

A model may help you understand multiplication of fractions. We will use fraction tiles to model $\frac{1}{2} \cdot \frac{3}{4}$. To multiply $\frac{1}{2}$ and $\frac{3}{4}$, think $\frac{1}{2}$ of $\frac{3}{4}$.

Start with fraction tiles for three-fourths. To find one-half of three-fourths, we need to divide them into two equal groups. Since we cannot divide the three $\frac{1}{4}$ tiles evenly into two parts, we exchange them for smaller tiles.

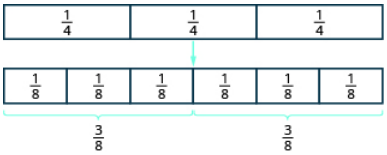

Figure 4.4.1

We see $\frac{6}{8}$ is equivalent to $\frac{3}{4}$. Taking half of the six $\frac{1}{8}$ tiles gives us three $\frac{1}{8}$ tiles, which is $\frac{3}{8}$. Therefore,

$$\frac{1}{2} \cdot \frac{3}{4} = \frac{3}{8}$$

Example 4.4.6: model a fraction

Use a diagram to model $\frac{1}{2} \cdot \frac{3}{4}$.

Solution

First shade in $\frac{3}{4}$ of the rectangle.

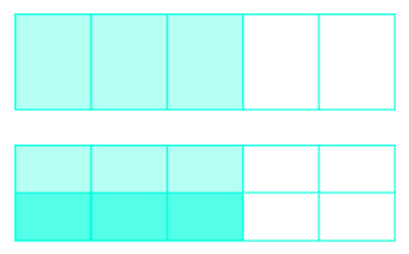
We will take $\frac{1}{2}$ of this $\frac{3}{4}$, so we heavily shade $\frac{1}{2}$ of the shaded region.

Notice that 3 out of the 8 pieces are heavily shaded. This means that $\frac{3}{8}$ of the rectangle is heavily shaded. Therefore, $\frac{1}{2}$ of $\frac{3}{4}$ is $\frac{3}{4}$, or $\frac{1}{2} \cdot \frac{3}{4} = \frac{3}{8}$.

Exercise 4.4.11

Use a diagram to model: $\frac{1}{2} \cdot \frac{3}{5}$.

Answer

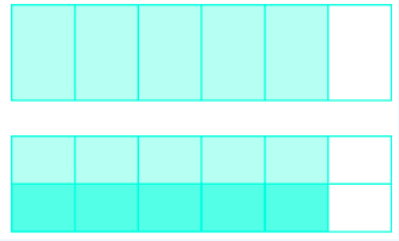


$\frac{3}{10}$

Exercise 4.4.12

Use a diagram to model: $\frac{1}{2} \cdot \frac{5}{6}$.

Answer



$\frac{5}{12}$

Look at the result we got from the model in Example 4.4.6. We found that $\frac{1}{2} \cdot \frac{3}{4} = \frac{3}{8}$. Do you notice that we could have gotten the same answer by multiplying the numerators and multiplying the denominators?

	$\frac{1}{2} \cdot \frac{3}{4}$
Multiply the numerators, and multiply the denominators.	$\frac{1}{2} \cdot \frac{3}{4}$
Simplify.	$\frac{3}{8}$

This leads to the definition of fraction multiplication. To multiply fractions, we multiply the numerators and multiply the denominators. Then we write the fraction in simplified form.

Definition: Fraction Multiplication

If a, b, c, and d are numbers where $b \neq 0$ and $d \neq 0$, then

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd} \tag{4.4.1}$$

Example 4.4.7: multiply

Multiply, and write the answer in simplified form: $\frac{3}{4} \cdot \frac{1}{5}$.

Solution

	$\frac{3}{4} \cdot \frac{1}{5}$
Multiply the numerators, and multiply the denominators.	$\frac{3 \cdot 1}{4 \cdot 5}$
Simplify.	$\frac{3}{20}$

There are no common factors, so the fraction is simplified.

Exercise 4.4.13

Multiply, and write the answer in simplified form: $\frac{1}{3} \cdot \frac{2}{5}$.

Answer

$\frac{2}{15}$

Exercise 4.4.14

Multiply, and write the answer in simplified form: $\frac{3}{5} \cdot \frac{7}{8}$.

Answer

$\frac{21}{40}$

When multiplying fractions, the properties of positive and negative numbers still apply. It is a good idea to determine the sign of the product as the first step. In Example 4.4.8 we will multiply two negatives, so the product will be positive.

Example 4.4.8: multiply

Multiply, and write the answer in simplified form: $-\frac{5}{8}\left(-\frac{2}{3}\right)$.

Solution

	$-\frac{5}{8}\left(-\frac{2}{3}\right)$
The signs are the same, so the product is positive. Multiply the numerators, multiply the denominators.	$\frac{5 \cdot 2}{8 \cdot 3}$
Simplify.	$\frac{10}{24}$
Look for common factors in the numerator and denominator. Rewrite showing common factors.	$\frac{5 \cdot \cancel{2}}{12 \cdot \cancel{2}}$
Remove common factors.	$\frac{5}{12}$

Another way to find this product involves removing common factors earlier.

	$-\frac{5}{8}\left(-\frac{2}{3}\right)$
Determine the sign of the product. Multiply.	$\frac{5 \cdot 2}{8 \cdot 3}$
Show common factors and then remove them.	$\frac{5 \cdot \cancel{2}}{12 \cdot \cancel{2}}$
Multiply remaining factors.	$\frac{5}{12}$

We get the same result.

Exercise 4.4.15

Multiply, and write the answer in simplified form: $-\frac{4}{7}\left(-\frac{5}{8}\right)$.

Answer

$\frac{5}{14}$

Exercise 4.4.16

Multiply, and write the answer in simplified form: $-\frac{7}{12}\left(-\frac{8}{9}\right)$.

Answer

$\frac{14}{27}$

Example 4.4.9: multiply

Multiply, and write the answer in simplified form: $-\frac{14}{15}\cdot\frac{20}{21}$.

Solution

	$-\frac{14}{15}\cdot\frac{20}{21}$
Determine the sign of the product; multiply.	$-\frac{14}{15}\cdot\frac{20}{21}$
Are there any common factors in the numerator and the denominator? We know that 7 is a factor of 14 and 21, and 5 is a factor of 20 and 15.	
Rewrite showing common factors.	$-\frac{2\cdot\cancel{7}\cdot 4\cdot\cancel{5}}{3\cdot\cancel{5}\cdot 3\cdot\cancel{7}}$
Remove the common factors.	$-\frac{2\cdot 4}{3\cdot 3}$
Multiply the remaining factors.	$-\frac{8}{9}$

Exercise 4.4.17

Multiply, and write the answer in simplified form: $-\frac{10}{28}\cdot\frac{8}{15}$.

Answer

$-\frac{4}{21}$

Exercise 4.4.18

Multiply, and write the answer in simplified form: $-\frac{9}{20}\cdot\frac{5}{12}$.

Answer

$-\frac{3}{16}$

When multiplying a fraction by an integer, it may be helpful to write the integer as a fraction. Any integer, a, can be written as $\frac{a}{1}$. So, $3=\frac{3}{1}$, for example.

Example 4.4.10:

Multiply, and write the answer in simplified form:

a. $\frac{1}{7} \cdot 56$

b. $\frac{12}{5}(-20x)$

Solution

a.

	$\frac{1}{7} \cdot 56$
Write 56 as a fraction.	$\frac{1}{7} \cdot \frac{56}{1}$
Determine the sign of the product; multiply.	$\frac{56}{7}$
Simplify.	8

b.

	$\frac{12}{5}(-20x)$
Write −20x as a fraction.	$\frac{12}{5}\left(\frac{-20x}{1}\right)$
Determine the sign of the product; multiply.	$-\frac{12 \cdot 20 \cdot x}{5 \cdot 1}$
Show common factors and then remove them.	$-\frac{12 \cdot 4 \cdot \cancel{5}x}{\cancel{5} \cdot 1}$
Multiply remaining factors; simplify.	$-48x$

Exercise 4.4.19

Multiply, and write the answer in simplified form:

a. $\frac{1}{8} \bullet 72$

b. $\frac{11}{3}(-9a)$

Answer a

9

Answer b

$-33a$

Exercise 4.4.20

Multiply, and write the answer in simplified form:

a. $\frac{3}{8} \bullet 64$

b. $16x \bullet \frac{11}{12}$

Answer a

24

Answer b

$\frac{44x}{3}$

4.5: Multiply and Divide Fractions (Part 2)

Find Reciprocals

The fractions $\frac{2}{3}$ and $\frac{3}{2}$ are related to each other in a special way. So are $-\frac{10}{7}$ and $-\frac{7}{10}$. Do you see how? Besides looking like upside-down versions of one another, if we were to multiply these pairs of fractions, the product would be 1.

$$\frac{2}{3} \cdot \frac{3}{2} = 1 \quad and \quad -\frac{10}{7}\left(-\frac{7}{10}\right) = 1$$

Such pairs of numbers are called reciprocals.

Definition: Reciprocal

The reciprocal of the fraction $\frac{a}{b}$ is $\frac{b}{a}$, where $a \neq 0$ and $b \neq 0$.

A number and its reciprocal have a product of 1.

$$\frac{a}{b} \cdot \frac{b}{a} = 1 \tag{4.2.54}$$

To find the reciprocal of a fraction, we invert the fraction. This means that we place the numerator in the denominator and the denominator in the numerator.

To get a positive result when multiplying two numbers, the numbers must have the same sign. So reciprocals must have the same sign.

$$\frac{a}{b} \cdot \frac{b}{a} = 1 \text{ positive}$$

$$3 \cdot \frac{1}{3} = 1 \quad \text{and} \quad -3 \cdot \left(-\frac{1}{3}\right) = 1$$

both positive both negative

To find the reciprocal, keep the same sign and invert the fraction. The number zero does not have a reciprocal. Why? A number and its reciprocal multiply to 1. Is there any number r so that $0 \cdot r = 1$? No. So, the number 0 does not have a reciprocal.

Example 4.5.11: reciprocal

Find the reciprocal of each number. Then check that the product of each number and its reciprocal is 1.

a. $\frac{4}{9}$
b. $-\frac{1}{6}$
c. $-\frac{14}{5}$
d. 7

Solution

To find the reciprocals, we keep the sign and invert the fractions.

a.

Find the reciprocal of $\frac{4}{9}$.	The reciprocal of $\frac{4}{9}$ is $\frac{9}{4}$.

Check:

Multiply the number and its reciprocal.	$\frac{4}{9} \cdot \frac{9}{4}$

Multiply numerators and denominators.	$\frac{36}{36}$
Simplify.	1 ✓

b.

Find the reciprocal of $-\frac{1}{6}$.	The reciprocal of $-\frac{1}{6}$ is $\frac{6}{1}$.
Simplify.	-6
Check.	$-\frac{1}{6} \cdot (-6) = 1$ ✓

c.

Find the reciprocal of $-\frac{14}{5}$.	$-\frac{5}{14}$
Check.	$-\frac{14}{5} \cdot \left(-\frac{5}{14}\right) = \frac{70}{70} = 1$ ✓

d.

Find the reciprocal of 7.	
Write 7 as a fraction.	$\frac{7}{1}$
Write the reciprocal of $\frac{7}{1}$.	$\frac{1}{7}$
Check.	$7 \cdot \left(\frac{1}{7}\right) = 1$ ✓

Exercise 4.5.21

Find the reciprocal:

a. $\frac{5}{7}$
b. $-\frac{1}{8}$
c. $-\frac{11}{4}$
d. 14

Answer a

$\frac{7}{5}$

Answer b

-8

Answer c

$-\frac{4}{11}$

Answer d

$\frac{1}{14}$

Exercise 4.5.22

Find the reciprocal:

a. $\frac{3}{7}$

b. $-\frac{1}{12}$

c. $-\frac{14}{9}$

d. 21

Answer a

$\frac{7}{3}$

Answer b

-12

Answer c

$-\frac{9}{14}$

Answer d

$\frac{1}{21}$

In a previous chapter, we worked with opposites and absolute values. Table 4.5.1 compares opposites, absolute values, and reciprocals.

Table 4.5.1

Opposite	Absolute Value	Reciprocal
has opposite sign	is never negative	has same sign, fraction inverts

Example 4.5.12: fractions

Fill in the chart for each fraction in the left column:

Number	Opposite	Absolute Value	Reciprocal
$-\frac{3}{8}$			
$\frac{1}{2}$			
$\frac{9}{5}$			
-5			

Solution

To find the opposite, change the sign. To find the absolute value, leave the positive numbers the same, but take the opposite of the negative numbers. To find the reciprocal, keep the sign the same and invert the fraction.

Number	Opposite	Absolute Value	Reciprocal

Number	Opposite	Absolute Value	Reciprocal
$-\frac{3}{8}$	$\frac{3}{8}$	$\frac{3}{8}$	$-\frac{8}{3}$
$\frac{1}{2}$	$-\frac{1}{2}$	$\frac{1}{2}$	2
$\frac{9}{5}$	$-\frac{9}{5}$	$\frac{9}{5}$	$\frac{5}{9}$
-5	5	5	$-\frac{1}{5}$

Exercise 4.5.23

Fill in the chart for each number given:

Number	Opposite	Absolute Value	Reciprocal
$-\frac{5}{8}$			
$\frac{1}{4}$			
$\frac{8}{3}$			
-8			

Answer

Number	Opposite	Absolute Value	Reciprocal
$-\frac{5}{8}$	$\frac{5}{8}$	$\frac{5}{8}$	$-\frac{8}{5}$
$\frac{1}{4}$	$-\frac{1}{4}$	$\frac{1}{4}$	4
$\frac{8}{3}$	$-\frac{8}{3}$	$\frac{8}{3}$	$\frac{3}{8}$
-8	8	8	$-\frac{1}{8}$

Exercise 4.5.24

Fill in the chart for each number given:

Number	Opposite	Absolute Value	Reciprocal
$-\frac{4}{7}$			
$\frac{1}{8}$			
$\frac{9}{4}$			
-1			

Answer

Number	Opposite	Absolute Value	Reciprocal
$-\frac{4}{7}$	$\frac{4}{7}$	$\frac{4}{7}$	$-\frac{7}{4}$
$\frac{1}{8}$	$-\frac{1}{8}$	$\frac{1}{8}$	8
$\frac{9}{4}$	$-\frac{9}{4}$	$\frac{9}{4}$	$\frac{4}{9}$
-1	1	1	$-\frac{1}{1}$

Divide Fractions

Why is $12 \div 3 = 4$? We previously modeled this with counters. How many groups of 3 counters can be made from a group of 12 counters?

Figure 4.5.2

There are 4 groups of 3 counters. In other words, there are four 3s in 12. So, $12 \div 3 = 4$.

What about dividing fractions? Suppose we want to find the quotient: $\frac{1}{2} \div \frac{1}{6}$. We need to figure out how many $\frac{1}{6}$s there are in $\frac{1}{2}$. We can use fraction tiles to model this division. We start by lining up the half and sixth fraction tiles as shown in Figure 4.5.3. Notice, there are three $\frac{1}{6}$ tiles in $\frac{1}{2}$, so $\frac{1}{2} \div \frac{1}{6} = 3$.

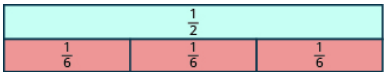

Figure 4.5.3

Example 4.5.13: model

Model: $\frac{1}{4} \div \frac{1}{8}$.

Solution

We want to determine how many $\frac{1}{8}$s are in $\frac{1}{4}$. Start with one $\frac{1}{4}$ tile. Line up $\frac{1}{8}$ tiles underneath the $\frac{1}{4}$ tile.

Exercise 4.5.25

Model: $\frac{1}{3} \div \frac{1}{6}$.

Answer

Exercise 4.5.26

Model: $\frac{1}{2} \div \frac{1}{4}$.

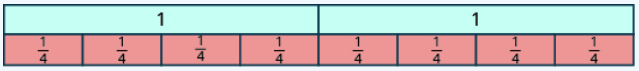
Answer

Example 4.5.14: model

Model: $2 \div \frac{1}{4}$.

Solution

We are trying to determine how many $\frac{1}{4}$s there are in 2. We can model this as shown.



Because there are eight $\frac{1}{4}$s in 2, $2 \div \frac{1}{4} = 8$.

Exercise 4.5.27

Model: $2 \div \frac{1}{3}$

Answer

Exercise 4.5.28

Model: $3 \div \frac{1}{2}$

Answer

Let's use money to model $2 \div \frac{1}{4}$ in another way. We often read $\frac{1}{4}$ as a 'quarter', and we know that a quarter is one-fourth of a dollar as shown in Figure 4.5.4. So we can think of $2 \div \frac{1}{4}$ as, "How many quarters are there in two dollars?" One dollar is 4 quarters, so 2 dollars would be 8 quarters. So again, $2 \div \frac{1}{4} = 8$.

Figure 4.5.4: The U.S. coin called a quarter is worth one-fourth of a dollar.

Using fraction tiles, we showed that $\frac{1}{2} \div \frac{1}{6} = 3$. Notice that $\frac{1}{2} \cdot \frac{6}{1} = 3$ also. How are $\frac{1}{6}$ and $\frac{6}{1}$ related? They are reciprocals. This leads us to the procedure for fraction division.

Definition: Fraction Division

If a, b, c, and d are numbers where $b \neq 0$, $c \neq 0$, and $d \neq 0$, then

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} \tag{4.5.1}$$

To divide fractions, multiply the first fraction by the reciprocal of the second.

We need to say $b \neq 0$, $c \neq 0$ and $d \neq 0$ to be sure we don't divide by zero.

Example 4.5.15: divide

Divide, and write the answer in simplified form: \(\dfrac{2}{5} \div \left(- \dfrac{3}{7}\right).

Solution

Multiply the first fraction by the reciprocal of the second.	$\frac{2}{5}\left(-\frac{7}{3}\right)$
Multiply. The product is negative.	$-\frac{14}{15}$

Exercise 4.5.29

Divide, and write the answer in simplified form: $\frac{3}{7} \div \left(-\frac{2}{3}\right)$.

Answer

$-\frac{9}{14}$

Exercise 4.5.30

Divide, and write the answer in simplified form: $\frac{2}{3} \div \left(-\frac{7}{5}\right)$.

Answer

$-\frac{10}{21}$

Example 4.5.16: divide

Divide, and write the answer in simplified form: $\frac{2}{3} \div \frac{n}{5}$.

Solution

Multiply the first fraction by the reciprocal of the second.	$\frac{2}{3} \div \frac{5}{n}$
Multiply.	$\frac{10}{3n}$

Exercise 4.5.31

Divide, and write the answer in simplified form: $\frac{3}{5} \div \frac{p}{7}$.

Answer

$\frac{21}{5p}$

Exercise 4.5.32

Divide, and write the answer in simplified form: $\frac{5}{8} \div \frac{q}{3}$.

Answer

$\frac{15}{8q}$

Example 4.5.17: divide

Divide, and write the answer in simplified form: $-\frac{3}{4} \div \left(-\frac{7}{8}\right)$.

Solution

Multiply the first fraction by the reciprocal of the second.	$-\frac{3}{4} \cdot \left(-\frac{8}{7}\right)$
Multiply. Remember to determine the sign first.	$\frac{3 \cdot 8}{4 \cdot 7}$
Rewrite to show common factors.	$\frac{3 \cdot \cancel{4} \cdot 2}{\cancel{4} \cdot 7}$
Remove common factors and simplify.	$\frac{6}{7}$

Exercise 4.5.33

Divide, and write the answer in simplified form: $-\frac{2}{3} \div \left(-\frac{5}{6}\right)$.

Answer

$\frac{4}{5}$

Exercise 4.5.34

Divide, and write the answer in simplified form: $-\frac{5}{6} \div \left(-\frac{2}{3}\right)$.

Answer

$\frac{5}{4}$

Example 4.5.18: divide

Divide, and write the answer in simplified form: $\frac{7}{18} \div \frac{14}{27}$.

Solution

Multiply the first fraction by the reciprocal of the second.	$\frac{7}{18} \cdot \frac{27}{14}$
Multiply.	$\frac{7 \cdot 27}{18 \cdot 14}$

Rewrite showing common factors.	$\frac{\cancel{7}\cdot\cancel{9}\cdot 3}{\cancel{9}\cdot\cancel{7}\cdot 2}$
Remove common factors.	$\frac{3}{2\cdot 2}$
Simplify.	$\frac{3}{4}$

Exercise 4.5.35

Divide, and write the answer in simplified form: $\frac{7}{27} \div \frac{35}{36}$.

Answer

$\frac{4}{15}$

Exercise 4.5.36

Divide, and write the answer in simplified form: $\frac{5}{14} \div \frac{15}{28}$.

Answer

$\frac{2}{3}$

Key Concepts

- **Equivalent Fractions Property**
- If a, b, c are numbers where $b \neq 0, c \neq 0$, then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$ and $\frac{a \cdot c}{b \cdot c} = \frac{a}{b}$
- **Simplify a fraction.**
  1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers.
  2. Simplify, using the equivalent fractions property, by removing common factors.
  3. Multiply any remaining factors.
- **Fraction Multiplication**
  - If a, b, c, and dd are numbers where $b \neq 0$ and $d \neq 0$, then $\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$
- **Reciprocal**
  - A number and its reciprocal have a product of 1. $\frac{a}{b} \cdot \frac{b}{a} = 1$
  -

Opposite	Absolute Value	Reciprocal
has opposite sign	is never negative	has same sign, fraction inverts

- **Fraction Division**
  - If a, b, c, and d are numbers where $b \neq 0$, $c \neq 0$, and $d \neq 0$, then $\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c}$
  - To divide fractions, multiply the first fraction by the reciprocal of the second.

Glossary

reciprocal

The reciprocal of the fraction $\frac{a}{b}$ is $\frac{b}{a}$ where $a \neq 0$ and $b \neq 0$.

simplified fraction

A fraction is considered simplified if there are no common factors in the numerator and denominator.

Practice Makes Perfect

Simplify Fractions

In the following exercises, simplify each fraction. Do not convert any improper fractions to mixed numbers.

77. $\frac{7}{21}$
78. $\frac{8}{24}$
79. $\frac{15}{20}$
80. $\frac{12}{18}$
81. $-\frac{40}{88}$
82. $-\frac{63}{99}$
83. $-\frac{108}{63}$
84. $-\frac{104}{48}$
85. $\frac{120}{252}$
86. $\frac{182}{294}$
87. $-\frac{168}{192}$
88. $-\frac{140}{224}$
89. $\frac{11x}{11y}$
90. $\frac{15a}{15b}$
91. $-\frac{3x}{12y}$
92. $-\frac{4x}{32y}$
93. $\frac{14x^2}{21y}$
94. $\frac{24a}{32b^2}$

Multiply Fractions

In the following exercises, use a diagram to model.

95. $\frac{1}{2} \cdot \frac{2}{3}$
96. $\frac{1}{2} \cdot \frac{5}{8}$
97. $\frac{1}{3} \cdot \frac{5}{6}$
98. $\frac{1}{3} \cdot \frac{2}{5}$

In the following exercises, multiply, and write the answer in simplified form.

99. $\frac{2}{5} \cdot \frac{1}{3}$
100. $\frac{1}{2} \cdot \frac{3}{8}$
101. $\frac{3}{4} \cdot \frac{9}{10}$
102. $\frac{4}{5} \cdot \frac{2}{7}$
103. $-\frac{2}{3}\left(-\frac{3}{8}\right)$
104. $-\frac{3}{4}\left(-\frac{4}{9}\right)$
105. $-\frac{5}{9} \cdot \frac{3}{10}$
106. $-\frac{3}{8} \cdot \frac{4}{15}$
107. $-\frac{7}{12}\left(-\frac{8}{21}\right)$
108. $\frac{5}{12}\left(-\frac{8}{15}\right)$
109. $\left(-\frac{14}{15}\right)\left(\frac{9}{20}\right)$
110. $\left(-\frac{9}{10}\right)\left(\frac{25}{33}\right)$
111. $\left(-\frac{63}{84}\right)\left(-\frac{44}{90}\right)$
112. $\left(-\frac{33}{60}\right)\left(-\frac{40}{88}\right)$
113. $4 \cdot \frac{5}{11}$
114. $5 \cdot \frac{8}{3}$
115. $\frac{3}{7} \cdot 21n$
116. $\frac{5}{6} \cdot 30m$
117. $-28p\left(-\frac{1}{4}\right)$
118. $-51q\left(-\frac{1}{3}\right)$
119. $-8\left(\frac{17}{4}\right)$
120. $\frac{14}{5}(-15)$
121. $-1\left(-\frac{3}{8}\right)$
122. $(-1)\left(-\frac{6}{7}\right)$

123. $\left(\frac{2}{3}\right)^3$
124. $\left(\frac{4}{5}\right)^2$
125. $\left(\frac{6}{5}\right)^4$
126. $\left(\frac{4}{7}\right)^4$

Find Reciprocals In the following exercises, find the reciprocal.

127. $\frac{3}{4}$
128. $\frac{2}{3}$
129. $-\frac{5}{17}$
130. $-\frac{6}{19}$
131. $\frac{11}{8}$
132. -13
133. -19
134. -1
135. 1
136. Fill in the chart.

	Opposite	Absolute Value	Reciprocal
$-\frac{7}{11}$			
$\frac{4}{5}$			
$\frac{10}{7}$			
-8			

137. Fill in the chart.

	Opposite	Absolute Value	Reciprocal
$-\frac{3}{13}$			
$\frac{9}{14}$			
$\frac{15}{7}$			
-9			

Divide Fractions

In the following exercises, model each fraction division.

138. $\frac{1}{2} \div \frac{1}{4}$
139. $\frac{1}{2} \div \frac{1}{8}$
140. $2 \div \frac{1}{5}$

141. $3 \div \frac{1}{4}$

In the following exercises, divide, and write the answer in simplified form.

142. $\frac{1}{2} \div \frac{1}{4}$
143. $\frac{1}{2} \div \frac{1}{8}$
144. $\frac{3}{4} \div \frac{2}{3}$
145. $\frac{4}{5} \div \frac{3}{4}$
146. $-\frac{4}{5} \div \frac{4}{7}$
147. $-\frac{3}{4} \div \frac{3}{5}$
148. $-\frac{7}{9} \div \left(-\frac{7}{9}\right)$
149. $-\frac{5}{6} \div \left(-\frac{5}{6}\right)$
150. $\frac{3}{4} \div \frac{x}{11}$
151. $\frac{2}{5} \div \frac{y}{9}$
152. $\frac{5}{8} \div \frac{a}{10}$
153. $\frac{5}{6} \div \frac{c}{15}$
154. $\frac{5}{18} \div \left(-\frac{15}{24}\right)$
155. $\frac{7}{18} \div \left(-\frac{14}{27}\right)$
156. $\frac{7p}{12} \div \frac{21p}{8}$
157. $\frac{5q}{12} \div \frac{15q}{8}$
158. $\frac{8u}{15} \div \frac{12v}{25}$
159. $\frac{12r}{25} \div \frac{18s}{35}$
160. $-5 \div \frac{1}{2}$
161. $-3 \div \frac{1}{4}$
162. $\frac{3}{4} \div (-12)$
163. $\frac{2}{5} \div (-10)$
164. $-18 \div \left(-\frac{9}{2}\right)$
165. $-15 \div \left(-\frac{5}{3}\right)$
166. $\frac{1}{2} \div \left(-\frac{3}{4}\right) \div \frac{7}{8}$
167. $\frac{11}{2} \div \frac{7}{8} \cdot \frac{2}{11}$

Everyday Math

168. **Baking** A recipe for chocolate chip cookies calls for 3 4 cup brown sugar. Imelda wants to double the recipe.
    a. How much brown sugar will Imelda need? Show your calculation. Write your result as an improper fraction and as a mixed number.
    b. Measuring cups usually come in sets of $\frac{1}{8}, \frac{1}{4}, \frac{1}{3}, \frac{1}{2}$, and 1 cup. Draw a diagram to show two different ways that Imelda could measure the brown sugar needed to double the recipe.
169. **Baking** Nina is making 4 pans of fudge to serve after a music recital. For each pan, she needs 2 3 cup of condensed milk.
    a. How much condensed milk will Nina need? Show your calculation. Write your result as an improper fraction and as a mixed number.
    b. Measuring cups usually come in sets of $\frac{1}{8}, \frac{1}{4}, \frac{1}{3}, \frac{1}{2}$, and 1 cup. Draw a diagram to show two different ways that Nina could measure the condensed milk she needs.
170. **Portions** Don purchased a bulk package of candy that weighs 5 pounds. He wants to sell the candy in little bags that hold $\frac{1}{4}$ pound. How many little bags of candy can he fill from the bulk package?
171. **Portions** Kristen has $\frac{3}{4}$ yards of ribbon. She wants to cut it into equal parts to make hair ribbons for her daughter's 6 dolls. How long will each doll's hair ribbon be?

Writing Exercises

172. Explain how you find the reciprocal of a fraction.
173. Explain how you find the reciprocal of a negative fraction.
174. Rafael wanted to order half a medium pizza at a restaurant. The waiter told him that a medium pizza could be cut into 6 or 8 slices. Would he prefer 3 out of 6 slices or 4 out of 8 slices? Rafael replied that since he wasn't very hungry, he would prefer 3 out of 6 slices. Explain what is wrong with Rafael's reasoning.
175. Give an example from everyday life that demonstrates how $\frac{1}{2} \cdot \frac{2}{3}$ is $\frac{1}{3}$.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify fractions.			
multiply fractions.			
find reciprocals.			
divide fractions.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

4.6: Find Multiples and Factors (Part 1)

Learning Objectives

- Identify multiples of numbers
- Use common divisibility tests
- Find all the factors of a number
- Identify prime and composite numbers

Be prepared!

Before you get started, take this readiness quiz.

1. Which of the following numbers are counting numbers (natural numbers)? $0, 4, 215$ If you missed this problem, review Example 1.1.1.
2. Find the sum of 3, 5, and 7. If you missed the problem, review Section 2.1.

Identify Multiples of Numbers

Annie is counting the shoes in her closet. The shoes are matched in pairs, so she doesn't have to count each one. She counts by twos: $2, 4, 6, 8, 10, 12$ She has 12 shoes in her closet.

The numbers $2, 4, 6, 8, 10, 12$ are called multiples of 2. Multiples of 2 can be written as the product of a counting number and 2. The first six multiples of 2 are given below.

$$\begin{aligned} 1 \cdot 2 &= 2 \\ 2 \cdot 2 &= 4 \\ 3 \cdot 2 &= 6 \\ 4 \cdot 2 &= 8 \\ 5 \cdot 2 &= 10 \\ 6 \cdot 2 &= 12 \end{aligned}$$

A **multiple of a number** is the product of the number and a counting number. So a multiple of 3 would be the product of a counting number and 3. Below are the first six multiples of 3.

$$\begin{aligned} 1 \cdot 3 &= 3 \\ 2 \cdot 3 &= 6 \\ 3 \cdot 3 &= 9 \\ 4 \cdot 3 &= 12 \\ 5 \cdot 3 &= 15 \\ 6 \cdot 3 &= 18 \end{aligned}$$

We can find the multiples of any number by continuing this process. Table $4.6.1$ shows the multiples of 2 through 9 for the first twelve counting numbers.

Table 4.6.1

Counting Number	1	2	3	4	5	6	7	8	9	10	11	12
Multiples of 2	2	4	6	8	10	12	14	16	18	20	22	24
Multiples of 3	3	6	9	12	15	18	21	24	27	30	33	36
Multiples of 4	4	8	12	16	20	24	28	32	36	40	44	48

Counting Number	1	2	3	4	5	6	7	8	9	10	11	12
Multiples of 5	5	10	15	20	25	30	35	40	45	50	55	60
Multiples of 6	6	12	18	24	30	36	42	48	54	60	66	72
Multiples of 7	7	14	21	28	35	42	49	56	63	70	77	84
Multiples of 8	8	16	24	32	40	48	56	64	72	80	88	96
Multiples of 9	9	18	27	36	45	54	63	72	81	90	99	108

Definition: Multiple of a Number

A number is a multiple of n if it is the product of a counting number and n.

Recognizing the patterns for multiples of 2, 5, 10, and 3 will be helpful to you as you continue in this course.

Figure $4.6.1$ shows the counting numbers from 1 to 50. Multiples of 2 are highlighted. Do you notice a pattern?

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50

Figure $4.6.1$: Multiples of 2 between 1 and 50

The last digit of each highlighted number in Figure $4.6.1$ is either 0, 2, 4, 6, or 8. This is true for the product of 2 and any counting number. So, to tell if any number is a multiple of 2 look at the last digit. If it is 0, 2, 4, 6, or 8, then the number is a multiple of 2.

Example 4.6.1: multiples of 2

Determine whether each of the following is a multiple of 2:

a. 489
b. $3,714$

Solution

a.

Is 489 a multiple of 2?	
Is the last digit 0, 2, 4, 6, or 8?	No.
	489 is not a multiple of 2.

b.

Is 3,714 a multiple of 2?	
Is the last digit 0, 2, 4, 6, or 8?	Yes.
	3,714 is a multiple of 2.

Exercise 4.6.1

Determine whether each number is a multiple of 2:

a. 678
b. 21,493

Answer a

yes

Answer b

no

Exercise 4.6.2

Determine whether each number is a multiple of 2:

a. 979
b. 17,780

Answer a

no

Answer b

yes

Now let's look at multiples of 5. Figure 4.6.2 highlights all of the multiples of 5 between 1 and 50. What do you notice about the multiples of 5?

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50

Figure 4.6.2: Multiples of 5 between 1 and 50

All multiples of 5 end with either 5 or 0. Just like we identify multiples of 2 by looking at the last digit, we can identify multiples of 5 by looking at the last digit.

Example 4.6.2: multiples of 5

Determine whether each of the following is a multiple of 5:

a. 579
b. 880

Solution

a.

Is 579 a multiple of 5?	
Is the last digit 5 or 0?	No.
	579 is not a multiple of 5.

b.

Is 880 a multiple of 5?	

Is the last digit 5 or 0?	Yes.
	880 is not a multiple of 5.

Exercise 4.6.3

Determine whether each number is a multiple of 5.

a. 675
b. 1,578

Answer a

yes

Answer b

no

Exercise 4.6.4

Determine whether each number is a multiple of 5.

a. 421
b. 2,690

Answer a

no

Answer b

yes

Figure 4.6.3 highlights the multiples of 10 between 1 and 50. All multiples of 10 all end with a zero.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50

Figure 4.6.3: Multiples of 10 between 1 and 50

Example 4.6.3: multiples of 10

Determine whether each of the following is a multiple of 10:

a. 425
b. 350

Solution

a.

Is 425 a multiple of 10?	
Is the last digit zero?	No.
	425 is not a multiple of 10.

b.

Is 350 a multiple of 10?	
Is the last digit zero?	Yes.
	350 is a multiple of 10.

Exercise 4.6.5

Determine whether each number is a multiple of 10:

a. 179
b. 3,540

Answer a

no

Answer b

yes

Exercise 4.6.6

Determine whether each number is a multiple of 10:

a. 110
b. 7,595

Answer a

yes

Answer b

no

Figure 4.6.4 highlights multiples of 3. The pattern for multiples of 3 is not as obvious as the patterns for multiples of 2, 5, and 10.

1	2	3	4	5	6	7	8	9	10
11	12	13	14	15	16	17	18	19	20
21	22	23	24	25	26	27	28	29	30
31	32	33	34	35	36	37	38	39	40
41	42	43	44	45	46	47	48	49	50

Figure 4.6.4: Multiples of 3 between 1 and 50

Unlike the other patterns we've examined so far, this pattern does not involve the last digit. The pattern for multiples of 3 is based on the sum of the digits. If the sum of the digits of a number is a multiple of 3, then the number itself is a multiple of 3. See Table 4.6.2.

Table 4.6.2

Multiple of 3	3	6	9	12	15	18	21	24
Sum of digits	3	6	9	1 + 2 3	1 + 5 6	1 + 8 9	2 + 1 3	2 + 4 6

Consider the number 42. The digits are 4 and 2, and their sum is $4+2=6$. Since 6 is a multiple of 3, we know that 42 is also a multiple of 3.

Example 4.6.4: multiples of 3

Determine whether each of the given numbers is a multiple of 3:

a. 645
b. 10,519

Solution

a. Is 645 a multiple of 3?

Find the sum of the digits.	6 + 4 + 5 = 15
Is 15 a multiple of 3?	Yes.
If we're not sure, we could add its digits to find out. We can check it by dividing 645 by 3.	645 ÷ 3
The quotient is 215.	3 • 215 = 645

b. Is 10,519 a multiple of 3?

Find the sum of the digits.	1 + 0 + 5 + 1 + 9 = 16
Is 15 a multiple of 3?	No.
So 10,519 is not a multiple of 3 either..	645 ÷ 3
We can check this by dividing by 10,519 by 3.	$3\overline{)10{,}519}$ $3{,}506\text{R}1$

When we divide 10,519 by 3, we do not get a counting number, so 10,519 is not the product of a counting number and 3. It is not a multiple of 3.

Exercise 4.6.7

Determine whether each number is a multiple of 3:

a. 954
b. 3,742

Answer a

yes

Answer b

no

Exercise 4.6.8

Determine whether each number is a multiple of 3:

a. 643
b. 8,379

Answer a

no

Answer b

yes

Look back at the charts where you highlighted the multiples of 2, of 5, and of 10. Notice that the multiples of 10 are the numbers that are multiples of both 2 and 5. That is because $10 = 2 \cdot 5$. Likewise, since $6 = 2 \cdot 3$, the multiples of 6 are the numbers that are multiples of both 2 and 3.

Use Common Divisibility Tests

Another way to say that 375 is a multiple of 5 is to say that 375 is divisible by 5. In fact, $375 \div 5$ is 75, so 375 is $5 \cdot 75$. Notice in Example 4.6.4 that 10,519 is not a multiple 3. When we divided 10,519 by 3 we did not get a counting number, so 10,519 is not divisible by 3.

Definition: Divisibility

If a number m is a multiple of n, then we say that m is divisible by n.

Since multiplication and division are inverse operations, the patterns of multiples that we found can be used as divisibility tests. Table 4.6.3 summarizes divisibility tests for some of the counting numbers between one and ten.

Table 4.6.3: Divisibility tests

A number is divisible by	
2	if the last digit is 0, 2, 4, 6, or 8
3	if the sum of the digits is divisible by 3
5	if the last digit is 5 or 0
6	if divisible by both 2 and 3
10	if the last digit is 0

Example 4.6.5: divisibility

Determine whether 1,290 is divisible by 2, 3, 5, and 10.

Solution

Table 4.6.4 applies the divisibility tests to 1,290. In the far right column, we check the results of the divisibility tests by seeing if the quotient is a whole number.

Table 4.6.4

Divisible by…?	Test	Divisible?	Check
2	Is last digit 0, 2, 4, 6, or 8?	yes	1290 ÷ 2 = 645
3	Is sum of digits divisible by 3? 1 + 2 + 9 + 0 = 12	yes	1290 ÷ 3 = 430
5	Is last digit 5 or 0?	yes	1290 ÷ 5 = 258
10	Is last digit 0?	yes	1290 ÷ 10 = 129

Thus, 1,290 is divisible by 2, 3, 5, and 10.

Exercise 4.6.9

Determine whether the given number is divisible by 2, 3, 5, and 10.

6240

Answer

Divisible by 2, 3, 5, and 10

Exercise 4.6.10

Determine whether the given number is divisible by 2, 3, 5, and 10.

7248

Answer

Divisible by 2 and 3, not 5 or 10

Example 4.6.6: divisibility

Determine whether 5,625 is divisible by 2, 3, 5, and 10.

Solution

Table 4.6.5 applies the divisibility tests to 5,625 and tests the results by finding the quotients.

Table 4.6.5

Divisible by…?	Test	Divisible?	Check
2	Is last digit 0, 2, 4, 6, or 8?	no	5625 ÷ 2 = 2812.5
3	Is sum of digits divisible by 3? 5 + 6 + 2 + 5 = 18	yes	5625 ÷ 3 = 1875
5	Is last digit 5 or 0?	yes	5625 ÷ 5 = 1125
10	Is last digit 0?	no	5625 ÷ 10 = 562.5

Thus, 5,625 is divisible by 3 and 5, but not 2, or 10.

Exercise 4.6.11

Determine whether the given number is divisible by 2, 3, 5, and 10.

4962

Answer

Divisible by 2, 3, not 5 or 10

Exercise 4.6.12

Determine whether the given number is divisible by 2, 3, 5, and 10.

3765

Answer

Divisible by 3 and 5

Find All the Factors of a Number

There are often several ways to talk about the same idea. So far, we've seen that if m is a multiple of n, we can say that m is divisible by n. We know that 72 is the product of 8 and 9, so we can say 72 is a multiple of 8 and 72 is a multiple of 9. We can also

say 72 is divisible by 8 and by 9. Another way to talk about this is to say that 8 and 9 are factors of 72. When we write $72 = 8 \cdot 9$ we can say that we have factored 72.

$$\underbrace{8 \cdot 9}_{\text{factors}} = \underbrace{72}_{\text{product}}$$

Definition: Factors

If $a \bullet b = m$, then a and b are factors of m, and m is the product of a and b.

In algebra, it can be useful to determine all of the factors of a number. This is called factoring a number, and it can help us solve many kinds of problems.

For example, suppose a choreographer is planning a dance for a ballet recital. There are 24 dancers, and for a certain scene, the choreographer wants to arrange the dancers in groups of equal sizes on stage.

In how many ways can the dancers be put into groups of equal size? Answering this question is the same as identifying the factors of 24. Table 4.6.6 summarizes the different ways that the choreographer can arrange the dancers.

Table 4.6.6

Number of Groups	Dancers per Group	Total Dancers
1	24	1 • 24 = 24
2	12	2 • 12= 24
3	8	3 • 8= 24
4	6	4 • 6= 24
6	4	6 • 4= 24
8	3	8 • 3= 24
12	2	12 • 2= 24
24	1	24 • 1= 24

What patterns do you see in Table 4.6.6? Did you notice that the number of groups times the number of dancers per group is always 24? This makes sense, since there are always 24 dancers.

You may notice another pattern if you look carefully at the first two columns. These two columns contain the exact same set of numbers—but in reverse order. They are mirrors of one another, and in fact, both columns list all of the factors of 24, which are:

$$1, 2, 3, 4, 6, 8, 12, 24$$

We can find all the factors of any counting number by systematically dividing the number by each counting number, starting with 1. If the quotient is also a counting number, then the divisor and the quotient are factors of the number. We can stop when the quotient becomes smaller than the divisor.

HOW TO: FIND ALL THE FACTORS OF A COUNTING NUMBER.

Step 1. Divide the number by each of the counting numbers, in order, until the quotient is smaller than the divisor.

- If the quotient is a counting number, the divisor and quotient are a pair of factors.
- If the quotient is not a counting number, the divisor is not a factor.

Step 2. List all the factor pairs.

Step 3. Write all the factors in order from smallest to largest.

Example 4.6.7: factors

Find all the factors of 72.

Solution

Divide 72 by each of the counting numbers starting with 1. If the quotient is a whole number, the divisor and quotient are a pair of factors.

Dividend	Divisor	Quotient	Factors
72	1	72	1, 72
72	2	36	2, 36
72	3	24	3, 24
72	4	18	4, 18
72	5	14.4	–
72	6	12	6, 12
72	7	~10.29	–
72	8	9	8, 9

The next line would have a divisor of 9 and a quotient of 8. The quotient would be smaller than the divisor, so we stop. If we continued, we would end up only listing the same factors again in reverse order. Listing all the factors from smallest to greatest, we have 1, 2, 3, 4, 6, 8, 9, 12, 18, 24, 36, and 72.

Exercise 4.6.13

Find all the factors of the given number: 96

Answer

$1, 2, 3, 4, 6, 8, 12, 16, 24, 32, 48, 96$

Exercise 4.6.14

Find all the factors of the given number: 80

Answer

$1, 2, 4, 5, 8, 10, 16, 20, 40, 80$

4.7: Find Multiples and Factors (Part 2)

Identify Prime and Composite Numbers

Some numbers, like 72, have many factors. Other numbers, such as 7, have only two factors: 1 and the number. A number with only two factors is called a **prime number**. A number with more than two factors is called a **composite number**. The number 1 is neither prime nor composite. It has only one factor, itself.

Definition: Prime Numbers and Composite Numbers

A prime number is a counting number greater than 1 whose only factors are 1 and itself.

A composite number is a counting number that is not prime.

Figure 4.7.5 lists the counting numbers from 2 through 20 along with their factors. The highlighted numbers are prime, since each has only two factors.

Number	Factors	Prime or Composite?		Number	Factor	Prime or Composite?
2	1,2	Prime		12	1,2,3,4,6,12	Composite
3	1,3	Prime		13	1,13	Prime
4	1,2,4	Composite		14	1,2,7,14	Composite
5	1,5	Prime		15	1,3,5,15	Composite
6	1,2,3,6	Composite		16	1,2,4,8,16	Composite
7	1,7	Prime		17	1,17	Prime
8	1,2,4,8	Composite		18	1,2,3,6,9,18	Composite
9	1,3,9	Composite		19	1,19	Prime
10	1,2,5,10	Composite		20	1,2,4,5,10,20	Composite
11	1,11	Prime				

Figure 4.7.5: Factors of the counting numbers from 2 through 20, with prime numbers highlighted

The prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, and 19. There are many larger prime numbers too. In order to determine whether a number is prime or composite, we need to see if the number has any factors other than 1 and itself. To do this, we can test each of the smaller prime numbers in order to see if it is a factor of the number. If none of the prime numbers are factors, then that number is also prime.

HOW TO: DETERMINE IF A NUMBER IS PRIME.

- Step 1. Test each of the primes, in order, to see if it is a factor of the number.
- Step 2. Start with 2 and stop when the quotient is smaller than the divisor or when a prime factor is found.
- Step 3. If the number has a prime factor, then it is a composite number. If it has no prime factors, then the number is prime.

Example 4.7.8: prime or composite

Identify each number as prime or composite:

a. 83
b. 77

Solution

a. Test each prime, in order, to see if it is a factor of 83, starting with 2, as shown. We will stop when the quotient is smaller than the divisor.

Prime	Test	Factor of 83?
2	Last digit of 83 is not 0, 2, 4, 6, or 8.	No.
3	8 + 3 = 11, and 11 is not divisible by 3.	No.

Prime	Test	Factor of 83?
5	The last digit of 83 is not 5 or 0.	No.
7	83 ÷ 7 = 11.857….	No.
11	83 ÷ 11 = 7.545…	No.

We can stop when we get to 11 because the quotient (7.545 . . .) is less than the divisor. We did not find any prime numbers that are factors of 83, so we know 83 is prime.

b. Test each prime, in order, to see if it is a factor of 77.

Prime	Test	Factor of 77?
2	Last digit is not 0, 2, 4, 6, or 8.	No.
3	7 + 7 = 14, and 14 is not divisible by 3.	No.
5	The last digit is not 5 or 0.	No.
7	77 ÷ 7 = 11	Yes.

Since 77 is divisible by 7, we know it is not a prime number. It is composite.

? Exercise 4.7.15

Identify the number as prime or composite: 91

Answer

composite

? Exercise 4.7.16

Identify the number as prime or composite: 137

Answer

prime

  - If the number has a prime factor, then it is a composite number. If it has no prime factors, then the number is prime.

Glossary

multiple of a number

A number is a multiple of n if it is the product of a counting number and n.

divisibility

If a number m is a multiple of n, then we say that m is divisible by n.

prime number

A prime number is a counting number greater than 1 whose only factors are 1 and itself.

composite number

A composite number is a counting number that is not prime.

Practice Makes Perfect

Identify Multiples of Numbers

In the following exercises, list all the multiples less than 50 for the given number.

215. 2
216. 3
217. 4
218. 5
219. 6
220. 7
221. 8
222. 9
223. 10
224. 12

Use Common Divisibility Tests

In the following exercises, use the divisibility tests to determine whether each number is divisible by 2, 3, 4, 5, 6, and 10.

225. 84
226. 96
227. 75
228. 78

229. 168
230. 264
231. 900
232. 800
233. 896

4.8: Prime Factorization and the Least Common Multiple (Part 1)

Learning Objectives

- Find the prime factorization of a composite number
- Find the least common multiple (LCM) of two numbers

be prepared!

Before you get started, take this readiness quiz.

1. Is 810 divisible by $2, 3, 5, 6,$ or 10? If you missed this problem, review Example 2.4.5.
2. Is 127 prime or composite? If you missed this problem, review Example 2.4.8.
3. Write $2 \cdot 2 \cdot 2 \cdot 2$ in exponential notation. If you missed this problem, review Example 2.1.5.

Find the Prime Factorization of a Composite Number

In the previous section, we found the factors of a number. Prime numbers have only two factors, the number 1 and the prime number itself. Composite numbers have more than two factors, and every composite number can be written as a unique product of primes. This is called the **prime factorization** of a number. When we write the prime factorization of a number, we are rewriting the number as a product of primes. Finding the prime factorization of a composite number will help you later in this course.

Definition: Prime Factorization

The prime factorization of a number is the product of prime numbers that equals the number.

You may want to refer to the following list of prime numbers less than 50 as you work through this section.

$$2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47$$

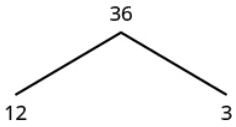
Prime Factorization Using the Factor Tree Method

One way to find the prime factorization of a number is to make a factor tree. We start by writing the number, and then writing it as the product of two factors. We write the factors below the number and connect them to the number with a small line segment—a "branch" of the factor tree.

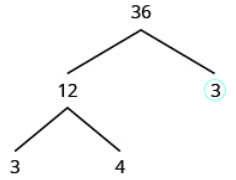
If a factor is prime, we circle it (like a bud on a tree), and do not factor that "branch" any further. If a factor is not prime, we repeat this process, writing it as the product of two factors and adding new branches to the tree.

We continue until all the branches end with a prime. When the factor tree is complete, the circled primes give us the prime factorization.

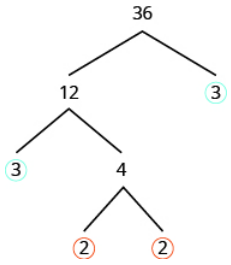
For example, let's find the prime factorization of 36. We can start with any factor pair such as 3 and 12. We write 3 and 12 below 36 with branches connecting them.



The factor 3 is prime, so we circle it. The factor 12 is composite, so we need to find its factors. Let's use 3 and 4. We write these factors on the tree under the 12.



The factor 3 is prime, so we circle it. The factor 4 is composite, and it factors into $2 \bullet 2$. We write these factors under the 4. Since 2 is prime, we circle both $2s$.



The prime factorization is the product of the circled primes. We generally write the prime factorization in order from least to greatest.

$$2 \cdot 2 \cdot 3 \cdot 3$$

In cases like this, where some of the prime factors are repeated, we can write prime factorization in exponential form.

$$2 \cdot 2 \cdot 3 \cdot 3$$

$$2^2 \cdot 3^2$$

Note that we could have started our factor tree with any factor pair of 36. We chose 12 and 3, but the same result would have been the same if we had started with 2 and 18, 4 and 9, or 6 and 6.

HOW TO: FIND THE PRIME FACTORIZATION OF A COMPOSITE NUMBER USING THE TREE METHOD

- Step 1. Find any factor pair of the given number, and use these numbers to create two branches.
- Step 2. If a factor is prime, that branch is complete. Circle the prime.
- Step 3. If a factor is not prime, write it as the product of a factor pair and continue the process.
- Step 4. Write the composite number as the product of all the circled primes.

Example 4.8.1: prime factors

Find the prime factorization of 48 using the factor tree method.

Solution

We can start our tree using any factor pair of 48. Let's use 2 and 24. We circle the 2 because it is prime and so that branch is complete.	Now we will factor 24. Let's use 4 and 6.	
Neither factor is prime, so we do not circle either. We factor the 4, using 2 and 2. We factor 6, using 2 and 3. We circle the 2s and the 3 since they are prime. Now all of the branches end in a prime.	Write the product of the circled numbers.	$2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$
Write in exponential form.	$2^4 \cdot 3$

Check this on your own by multiplying all the factors together. The result should be 48.

Exercise 4.8.1

Find the prime factorization using the factor tree method: 80

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 5$, or $2^4 \cdot 5$

Exercise 4.8.2

Find the prime factorization using the factor tree method: 60

Answer

$2 \cdot 2 \cdot 3 \cdot 5$, or $2^2 \cdot 3 \cdot 5$

Example 4.8.2: prime factors

Find the prime factorization of 84 using the factor tree method.

Solution

We start with the factor pair 4 and 21. Neither factor is prime so we factor them further.	Now the factors are all prime, so we circle them.	Then we write 84 as the product of all circled primes.	$2 \cdot 2 \cdot 3 \cdot 7 = 2^2 \cdot 3 \cdot 7$

Draw a factor tree of 84.

Exercise 4.8.3

Find the prime factorization using the factor tree method: 126

Answer

$2 \cdot 3 \cdot 3 \cdot 7$, or $2 \cdot 3^2 \cdot 7$

Exercise 4.8.4

Find the prime factorization using the factor tree method: 294

Answer

$2 \cdot 3 \cdot 7 \cdot 7$, or $2 \cdot 3 \cdot 7^2$

Prime Factorization Using the Ladder Method

The ladder method is another way to find the prime factors of a composite number. It leads to the same result as the factor tree method. Some people prefer the ladder method to the factor tree method, and vice versa.

To begin building the "ladder," divide the given number by its smallest prime factor. For example, to start the ladder for 36, we divide 36 by 2, the smallest prime factor of 36.

$$2\overline{)36}\quad 18$$

To add a "step" to the ladder, we continue dividing by the same prime until it no longer divides evenly.

$$\begin{array}{r} 9 \\ 2\overline{)18} \\ 2\overline{)\ 36} \end{array}$$

Then we divide by the next prime; so we divide 9 by 3.

$$\begin{array}{r} 3 \\ 3\overline{)9} \\ 2\overline{)18} \\ 2\overline{)\ 36} \end{array}$$

We continue dividing up the ladder in this way until the quotient is prime. Since the quotient, 3, is prime, we stop here. Do you see why the ladder method is sometimes called stacked division?

The prime factorization is the product of all the primes on the sides and top of the ladder.

$$2 \cdot 2 \cdot 3 \cdot 3$$

$$2^2 \cdot 3^2$$

Notice that the result is the same as we obtained with the factor tree method.

HOW TO: FIND THE PRIME FACTORIZATION OF A COMPOSITE NUMBER USING THE LADDER METHOD

Step 1. Divide the number by the smallest prime.

Step 2. Continue dividing by that prime until it no longer divides evenly.

Step 3. Divide by the next prime until it no longer divides evenly.

Step 4. Continue until the quotient is a prime.

Step 5. Write the composite number as the product of all the primes on the sides and top of the ladder.

Example 4.8.3: prime factors

Find the prime factorization of 120 using the ladder method.

Solution

Divide the number by the smallest prime, which is 2.	$2\overline{)120}$ (60)
Continue dividing by 2 until it no longer divides evenly.	$3\overline{)15}$ (5); $2\overline{)30}$; $2\overline{)60}$; $2\overline{)120}$
Divide by the next prime, 3.	$2\overline{)30}$ (15); $2\overline{)60}$; $2\overline{)120}$
The quotient, 5, is prime, so the ladder is complete. Write the prime factorization of 120.	$2 \cdot 2 \cdot 2 \cdot 3 \cdot 5$ $2^3 \cdot 3 \cdot 5$

Check this yourself by multiplying the factors. The result should be 120.

Exercise 4.8.5

Find the prime factorization using the ladder method: 80

Answer

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 5$, or $2^4 \cdot 5$

Exercise 4.8.6

Find the prime factorization using the ladder method: 60

Answer

$2 \cdot 2 \cdot 3 \cdot 5$, or $2^2 \cdot 3 \cdot 5$

Example 4.8.4: prime factors

Find the prime factorization of 48 using the ladder method.

Solution

Divide the number by the smallest prime, 2.	$2\overline{)48}$ (24)
Continue dividing by 2 until it no longer divides evenly.	$3\overline{)6}$ (2); $2\overline{)12}$; $2\overline{)24}$; $2\overline{)48}$
The quotient, 3, is prime, so the ladder is complete. Write the prime factorization of 48.	$2 \bullet 2 \bullet 2 \bullet 2 \bullet 3$ $2^4 \bullet 3$

Exercise 4.8.7

Find the prime factorization using the ladder method: 126

Answer

$2 \cdot 3 \cdot 3 \cdot 7$, or $2 \cdot 3^2 \cdot 7$

Exercise 4.8.8

Find the prime factorization using the ladder method: 294

Answer

$2 \cdot 3 \cdot 7 \cdot 7$, or $2 \cdot 3 \cdot 7^2$

4.9: Prime Factorization and the Least Common Multiple (Part 2)

Find the Least Common Multiple (LCM) of Two Numbers

One of the reasons we look at multiples and primes is to use these techniques to find the least common multiple of two numbers. This will be useful when we add and subtract fractions with different denominators.

Listing Multiples Method

A common multiple of two numbers is a number that is a multiple of both numbers. Suppose we want to find common multiples of 10 and 25. We can list the first several multiples of each number. Then we look for multiples that are common to both lists—these are the common multiples.

$$10\colon\ 10, 20, 30, 40, \mathbf{50}, 60, 70, 80, 90, \mathbf{100}, 110, \ldots$$
$$25\colon\ 25, \mathbf{50}, 75, \mathbf{100}, 125, \ldots$$

We see that 50 and 100 appear in both lists. They are common multiples of 10 and 25. We would find more common multiples if we continued the list of multiples for each.

The smallest number that is a multiple of two numbers is called the **least common multiple** (LCM). So the least LCM of 10 and 25 is 50.

HOW TO: FIND THE LEAST COMMON MULTIPLE (LCM) OF TWO NUMBERS BY LISTING MULTIPLES

Step 1. List the first several multiples of each number.

Step 2. Look for multiples common to both lists. If there are no common multiples in the lists, write out additional multiples for each number.

Step 3. Look for the smallest number that is common to both lists.

Step 4. This number is the LCM.

Example 4.9.5: lcm

Find the LCM of 15 and 20 by listing multiples.

Solution

List the first several multiples of 15 and of 20. Identify the first common multiple.

$$15\colon\ 15, 30, 45, \mathbf{60}, 75, 90, 105, 120$$
$$20\colon\ 20, 40, \mathbf{60}, 80, 100, 120, 140, 160$$

The smallest number to appear on both lists is 60, so 60 is the least common multiple of 15 and 20. Notice that 120 is on both lists, too. It is a common multiple, but it is not the least common multiple.

Exercise 4.9.9

Find the least common multiple (LCM) of the given numbers: 9 and 12

Answer

36

Exercise 4.9.10

Find the least common multiple (LCM) of the given numbers: 18 and 24

Answer

72

Prime Factors Method

Another way to find the least common multiple of two numbers is to use their prime factors. We'll use this method to find the LCM of 12 and 18.

We start by finding the prime factorization of each number.

$$12 = 2 \cdot 2 \cdot 3 \qquad 18 = 2 \cdot 3 \cdot 3$$

Then we write each number as a product of primes, matching primes vertically when possible.

$$\begin{aligned} 12 &= 2 \cdot 2 \cdot 3 \\ 18 &= 2 \cdot \quad 3 \cdot 3 \end{aligned}$$

Now we bring down the primes in each column. The LCM is the product of these factors.

$$\begin{aligned} 12 &= 2 \cdot 2 \cdot 3 \\ 18 &= 2 \cdot \quad 3 \cdot 3 \\ \hline \text{LCM} &= 2 \cdot 2 \cdot 3 \cdot 3 \\ \text{LCM} &= 2 \cdot 2 \cdot 3 \cdot 3 = 36 \end{aligned}$$

Notice that the prime factors of 12 and the prime factors of 18 are included in the LCM. By matching up the common primes, each common prime factor is used only once. This ensures that 36 is the least common multiple.

HOW TO: FIND THE LCM USING THE PRIME FACTORS METHOD

Step 1. Find the prime factorization of each number.

Step 2. Write each number as a product of primes, matching primes vertically when possible.

Step 3. Bring down the primes in each column.

Step 4. Multiply the factors to get the LCM.

Example 4.9.6: lcm

Find the LCM of 15 and 18 using the prime factors method.

Solution

Write each number as a product of primes.	$15 = 3 \cdot 5 \qquad 18 = 2 \cdot 3 \cdot 3$
Write each number as a product of primes, matching primes vertically when possible.	$\begin{aligned} 15 &= \quad 3 \cdot \quad 5 \\ 18 &= 2 \cdot 3 \cdot 3 \end{aligned}$
Bring down the primes in each column.	$\begin{aligned} 15 &= \quad 3 \cdot \quad 5 \\ 18 &= 2 \cdot 3 \cdot 3 \\ \hline \text{LCM} &= 2 \cdot 3 \cdot 3 \cdot 5 \end{aligned}$
Multiply the factors to get the LCM.	LCM = 2 • 3 • 3 • 5 The LCM of 15 and 18 is 90.

Exercise 4.9.11

Find the LCM using the prime factors method: 15 and 20

Answer

60

Exercise 4.9.12

Find the LCM using the prime factors method: 15 and 35

Answer

105

Example 4.9.7: lcm

Find the LCM of 50 and 100 using the prime factors method.

Solution

Write the prime factorization of each number.	$50 = 2 \cdot 5 \cdot 5 \qquad 100 = 2 \cdot 2 \cdot 5 \cdot 5$
Write each number as a product of primes, matching primes vertically when possible.	$50 = \quad 2 \cdot 5 \cdot 5$ $100 = 2 \cdot 2 \cdot 5 \cdot 5$
Bring down the primes in each column.	$50 = \quad 2 \cdot 5 \cdot 5$ $100 = 2 \cdot 2 \cdot 5 \cdot 5$ $\text{LCM} = 2 \cdot 2 \cdot 5 \cdot 5$
Multiply the factors to get the LCM.	LCM = 2 • 2 • 5 • 5 The LCM of 50 and 100 is 100.

Exercise 4.9.13

Find the LCM using the prime factors method: 55, 88

Answer

440

Exercise 4.9.14

Find the LCM using the prime factors method: 60, 72

Answer

360

Key Concepts

- Find the prime factorization of a composite number using the tree method.
  - Find any factor pair of the given number, and use these numbers to create two branches.
  - If a factor is prime, that branch is complete. Circle the prime.
  - If a factor is not prime, write it as the product of a factor pair and continue the process.
  - Write the composite number as the product of all the circled primes.
- Find the prime factorization of a composite number using the ladder method.
  - Divide the number by the smallest prime.
  - Continue dividing by that prime until it no longer divides evenly.
  - Divide by the next prime until it no longer divides evenly.
  - Continue until the quotient is a prime.
  - Write the composite number as the product of all the primes on the sides and top of the ladder.
- Find the LCM by listing multiples.
  - List the first several multiples of each number.
  - Look for multiples common to both lists. If there are no common multiples in the lists, write out additional multiples for each number.
  - Look for the smallest number that is common to both lists.
  - This number is the LCM.
- Find the LCM using the prime factors method.
  - Find the prime factorization of each number.
  - Write each number as a product of primes, matching primes vertically when possible.
  - Bring down the primes in each column.
  - Multiply the factors to get the LCM.

Glossary

least common multiple

The smallest number that is a multiple of two numbers is called the least common multiple (LCM).

prime factorization

The prime factorization of a number is the product of prime numbers that equals the number.

Practice Makes Perfect

Find the Prime Factorization of a Composite Number

In the following exercises, find the prime factorization of each number using the factor tree method.

267. 86
268. 78
269. 132
270. 455
271. 693
272. 420
273. 115
274. 225
275. 2475
276. 1560

In the following exercises, find the prime factorization of each number using the ladder method.

277. 56
278. 72
279. 168
280. 252

281. 391
282. 400
283. 432
284. 627
285. 2160
286. 2520

In the following exercises, find the prime factorization of each number using any method.

287. 150
288. 180
289. 525
290. 444
291. 36
292. 50
293. 350
294. 144

Find the Least Common Multiple (LCM) of Two Numbers

In the following exercises, find the least common multiple (LCM) by listing multiples.

295. 8, 12
296. 4, 3
297. 6, 15
298. 12, 16
299. 30, 40
300. 20, 30
301. 60, 75
302. 44, 55

In the following exercises, find the least common multiple (LCM) by using the prime factors method.

303. 8, 12
304. 12, 16
305. 24, 30
306. 28, 40
307. 70, 84
308. 84, 90

In the following exercises, find the least common multiple (LCM) using any method.

309. 6, 21
310. 9, 15
311. 24, 30
312. 32, 40

Everyday Math

313. **Grocery shopping** Hot dogs are sold in packages of ten, but hot dog buns come in packs of eight. What is the smallest number of hot dogs and buns that can be purchased if you want to have the same number of hot dogs and buns? (Hint: it is the LCM!)
314. **Grocery shopping** Paper plates are sold in packages of 12 and party cups come in packs of 8. What is the smallest number of plates and cups you can purchase if you want to have the same number of each? (Hint: it is the LCM!)

Writing Exercises

315. Do you prefer to find the prime factorization of a composite number by using the factor tree method or the ladder method? Why?
316. Do you prefer to find the LCM by listing multiples or by using the prime factors method? Why?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find the prime factorization of a composite number.			
find the least common multiple (LCM) of two numbers.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

4.10: Multiply and Divide Mixed Numbers and Complex Fractions (Part 1)

Learning Objectives

- Multiply and divide mixed numbers
- Translate phrases to expressions with fractions
- Simplify complex fractions
- Simplify expressions written with a fraction bar

be prepared!

Before you get started, take this readiness quiz.

1. Divide and reduce, if possible: $(4+5) \div (10-7)$. If you missed this problem, review Example 3.2.8.
2. Multiply and write the answer in simplified form: $\frac{1}{8} \cdot \frac{2}{3}$. If you missed this problem, review Example 4.2.7.
3. Convert $2\frac{3}{5}$ into an improper fraction. If you missed this problem, review Example 4.1.11.

Multiply and Divide Mixed Numbers

In the previous section, you learned how to multiply and divide fractions. All of the examples there used either proper or improper fractions. What happens when you are asked to multiply or divide mixed numbers? Remember that we can convert a mixed number to an improper fraction. And you learned how to do that in Visualize Fractions.

Example 4.10.1: multiply

Multiply: $3\frac{1}{3} \cdot \frac{5}{8}$

Solution

Convert $3\frac{1}{3}$ to an improper fraction.	$\frac{10}{3} \cdot \frac{5}{8}$
Multiply.	$\frac{10 \cdot 5}{3 \cdot 8}$
Look for common factors.	$\frac{\cancel{2} \cdot 5 \cdot 5}{3 \cdot \cancel{2} \cdot 4}$
Remove common factors.	$\frac{5 \cdot 5}{3 \cdot 4}$
Simplify.	$\frac{25}{12}$

Notice that we left the answer as an improper fraction, $\frac{25}{12}$, and did not convert it to a mixed number. In algebra, it is preferable to write answers as improper fractions instead of mixed numbers. This avoids any possible confusion between $2\frac{1}{12}$ and $2 \cdot \frac{1}{12}$.

Exercise 4.10.1

Multiply, and write your answer in simplified form: $5\frac{2}{3} \cdot \frac{6}{17}$.

Answer

2

Exercise 4.10.2

Multiply, and write your answer in simplified form: $\frac{3}{7} \cdot 5\frac{1}{4}$.

Answer

$\frac{9}{4}$

HOW TO: MULTIPLY OR DIVIDE MIXED NUMBERS

Step 1. Convert the mixed numbers to improper fractions.

Step 2. Follow the rules for fraction multiplication or division.

Step 3. Simplify if possible.

Example 4.10.2:

Multiply, and write your answer in simplified form: $2\frac{4}{5}\left(-1\frac{7}{8}\right)$.

Solution

Convert mixed numbers to improper fractions.	$\frac{14}{5}\left(-1\frac{7}{8}\right)$
Multiply.	$-\frac{14 \cdot 15}{5 \cdot 8}$
Look for common factors.	$-\frac{\cancel{2} \cdot 7 \cdot \cancel{5} \cdot 3}{\cancel{5} \cdot \cancel{2} \cdot 4}$
Remove common factors.	$-\frac{7 \cdot 3}{4}$
Simplify.	$-\frac{21}{4}$

Exercise 4.10.3

Multiply, and write your answer in simplified form. $5\frac{5}{7}\left(-2\frac{5}{8}\right)$.

Answer

-15

Exercise 4.10.4

Multiply, and write your answer in simplified form. $-3\frac{2}{5} \cdot 4\frac{1}{6}$.

Answer

$-\frac{85}{6}$

Example 4.10.3: divide

Divide, and write your answer in simplified form: $3\frac{4}{7} \div 5$.

Solution

Convert mixed numbers to improper fractions.	$\frac{25}{7} \div \frac{5}{1}$
Multiply the first fraction by the reciprocal of the second.	$\frac{25}{7} \cdot \frac{1}{5}$
Multiply.	$\frac{25 \cdot 1}{7 \cdot 5}$
Look for common factors.	$\frac{\cancel{5} \cdot 5 \cdot 1}{7 \cdot \cancel{5}}$
Remove common factors.	$\frac{5 \cdot 1}{7}$
Simplify.	$\frac{5}{7}$

Exercise 4.10.5

Divide, and write your answer in simplified form: $4\frac{3}{8} \div 7$.

Answer

$\frac{5}{8}$

Exercise 4.10.6

Divide, and write your answer in simplified form: $2\frac{5}{8} \div 3$.

Answer

$\frac{7}{8}$

Example 4.10.4: divide

Divide: $2\frac{1}{2} \div 1\frac{1}{4}$.

Solution

Convert mixed numbers to improper fractions.	$\frac{5}{2} \div \frac{5}{4}$
Multiply the first fraction by the reciprocal of the second.	$\frac{5}{2} \cdot \frac{4}{5}$
Multiply.	$\frac{5 \cdot 4}{2 \cdot 5}$
Look for common factors.	$\frac{\cancel{5} \cdot \cancel{2} \cdot 2}{\cancel{2} \cdot 1 \cdot \cancel{5}}$

Remove common factors.	$\frac{2}{1}$
Simplify.	2

Exercise 4.10.7

Divide, and write your answer in simplified form: $2\frac{2}{3} \div 1\frac{1}{3}$.

Answer

2

Exercise 4.10.8

Divide, and write your answer in simplified form: $3\frac{3}{4} \div 1\frac{1}{2}$.

Answer

$\frac{5}{2}$

Translate Phrases to Expressions with Fractions

The words *quotient* and *ratio* are often used to describe fractions. In Subtract Whole Numbers, we defined quotient as the result of division. The quotient of a and b is the result you get from dividing a by b, or $\frac{a}{b}$. Let's practice translating some phrases into algebraic expressions using these terms.

Example 4.10.5: translate

Translate the phrase into an algebraic expression: "the quotient of $3x$ and 8."

Solution

The keyword is *quotient*; it tells us that the operation is division. Look for the words *of* and *and* to find the numbers to divide.

The quotient **of** $3x$ **and** 8.

This tells us that we need to divide $3x$ by 8. $\frac{3x}{8}$

Exercise 4.10.9

Translate the phrase into an algebraic expression: the quotient of $9s$ and 14.

Answer

$\frac{9s}{14}$

Exercise 4.10.10

Translate the phrase into an algebraic expression: the quotient of $5y$ and 6.

Answer

$\frac{5y}{6}$

Example 4.10.6:

Translate the phrase into an algebraic expression: the quotient of the difference of m and n, and p.

Solution

We are looking for the *quotient* of the *difference* of m and n, and p. This means we want to divide the difference of m and n by p.

$$\frac{m-n}{p}$$

Exercise 4.10.11

Translate the phrase into an algebraic expression: the quotient of the difference of a and b, and cd.

Answer

$$\frac{a-b}{cd}$$

Exercise 4.10.12

Translate the phrase into an algebraic expression: the quotient of the sum of p and q, and r.

Answer

$$\frac{p+q}{r}$$

Simplify Complex Fractions

Our work with fractions so far has included proper fractions, improper fractions, and mixed numbers. Another kind of fraction is called **complex fraction**, which is a fraction in which the numerator or the denominator contains a fraction. Some examples of complex fractions are:

$$\frac{\frac{6}{7}}{3} \quad \frac{\frac{3}{4}}{\frac{5}{8}} \quad \frac{\frac{x}{2}}{\frac{5}{6}}$$

To simplify a complex fraction, remember that the fraction bar means division. So the complex fraction $\frac{\frac{3}{4}}{\frac{5}{8}}$ can be written as $\frac{3}{4} \div \frac{5}{8}$.

Example 4.10.7: simplify

Simplify: $\frac{\frac{3}{4}}{\frac{5}{8}}$.

Solution

Rewrite as division.	$\frac{3}{4} \div \frac{5}{8}$

Multiply the first fraction by the reciprocal of the second.	$\frac{3}{4} \cdot \frac{8}{5}$
Multiply.	$\frac{3 \cdot 8}{4 \cdot 5}$
Look for common factors.	$\frac{3 \cdot \cancel{4} \cdot 2}{\cancel{4} \cdot 5}$
Remove common factors and simplify.	$\frac{6}{5}$

Exercise 4.10.13

Simplify: $\frac{\frac{2}{3}}{\frac{5}{6}}$.

Answer

$\frac{4}{5}$

Exercise 4.10.14

Simplify: $\frac{\frac{3}{7}}{\frac{6}{11}}$.

Answer

$\frac{11}{14}$

HOW TO: SIMPLIFY A COMPLEX FRACTION

Step 1. Rewrite the complex fraction as a division problem.

Step 2. Follow the rules for dividing fractions.

Step 3. Simplify if possible.

Example 4.10.8: simplify

Simplify: $\frac{-\frac{6}{7}}{3}$.

Solution

Rewrite as division.	$-\frac{6}{7} \div 3$
Multiply the first fraction by the reciprocal of the second.	$-\frac{6}{7} \cdot \frac{1}{3}$
Multiply; the product will be negative.	$-\frac{6 \cdot 1}{7 \cdot 3}$

Look for common factors.	$-\frac{\cancel{3}\cdot 2\cdot 1}{7\cdot \cancel{3}}$
Remove common factors and simplify.	$-\frac{2}{7}$

Exercise 4.10.15

Simplify: $\frac{-\frac{8}{7}}{4}$.

Answer

$-\frac{2}{7}$

Exercise 4.10.16

Simplify: $-\frac{3}{\frac{9}{10}}$.

Answer

$-\frac{10}{3}$

Example 4.10.9: simplify

Simplify: $\frac{\frac{x}{2}}{\frac{xy}{6}}$.

Solution

Rewrite as division.	$\frac{x}{2}\div\frac{xy}{6}$
Multiply the first fraction by the reciprocal of the second.	$\frac{x}{2}\cdot\frac{6}{xy}$
Multiply.	$\frac{x\cdot 6}{2\cdot xy}$
Look for common factors.	$\frac{\cancel{x}\cdot 3\cdot \cancel{2}}{\cancel{2}\cdot \cancel{x}\cdot y}$
Remove common factors and simplify.	$\frac{3}{y}$

Exercise 4.10.17

Simplify: $\frac{\frac{a}{8}}{\frac{ab}{6}}$.

Answer

$\frac{3}{4b}$

Exercise 4.10.18

Simplify: $\frac{\frac{p}{2}}{\frac{pq}{8}}$.

Answer

$\frac{4}{q}$

Example 4.10.10: simplify

Simplify: $\frac{2\frac{3}{4}}{\frac{1}{8}}$.

Solution

Rewrite as division.	$2\frac{3}{4} \div \frac{1}{8}$
Change the mixed number to an improper fraction.	$\frac{11}{4} \div \frac{1}{8}$
Multiply the first fraction by the reciprocal of the second.	$\frac{11}{4} \cdot \frac{8}{1}$
Multiply.	$\frac{11 \cdot 8}{4 \cdot 1}$
Look for common factors.	$\frac{11 \cdot \cancel{4} \cdot 2}{\cancel{4} \cdot 1}$
Remove common factors and simplify.	22

Exercise 4.10.19

Simplify: $\frac{\frac{5}{7}}{1\frac{2}{5}}$.

Answer

$\frac{25}{49}$

Exercise 4.10.20

Simplify: $\frac{\frac{8}{5}}{3\frac{1}{5}}$.

Answer

$\frac{1}{2}$

4.11: Multiply and Divide Mixed Numbers and Complex Fractions (Part 2)

Simplify Expressions with a Fraction Bar

Where does the negative sign go in a fraction? Usually, the negative sign is placed in front of the fraction, but you will sometimes see a fraction with a negative numerator or denominator. Remember that fractions represent division. The fraction $-\frac{1}{3}$ could be the result of dividing $\frac{-1}{3}$, a negative by a positive, or of dividing $\frac{1}{-3}$, a positive by a negative. When the numerator and denominator have different signs, the quotient is negative.

$$\frac{-1}{3}=-\frac{1}{3} \quad \frac{negative}{positive}=negative \quad \frac{1}{-3}=-\frac{1}{3} \quad \frac{positive}{negative}=negative$$

If *both* the numerator and denominator are negative, then the fraction itself is positive because we are dividing a negative by a negative.

$$\frac{-1}{-3}=\frac{1}{3} \qquad \frac{negative}{negative}=positive$$

Placement of Negative Sign in a Fraction

For any positive numbers a and b,

$$\frac{-a}{b}=\frac{a}{-b}=-\frac{a}{b} \tag{4.11.1}$$

Example 4.11.11: equivalent fractions

Which of the following fractions are equivalent to $\frac{7}{-8}$?

$$\frac{-7}{-8}, \frac{-7}{8}, \frac{7}{8}, -\frac{7}{8}$$

Solution

The quotient of a positive and a negative is a negative, so $\frac{7}{-8}$ is negative. Of the fractions listed, $\frac{-7}{8}$ and $-\frac{7}{8}$ are also negative.

Exercise 4.11.21

Which of the following fractions are equivalent to $\frac{-3}{5}$?

$$\frac{-3}{-5}, \frac{3}{5}, -\frac{3}{5}, \frac{3}{-5}$$

Answer

$$-\frac{3}{5}, \frac{3}{-5}$$

Exercise 4.11.22

Which of the following fractions are equivalent to $-\frac{2}{7}$?

$$\frac{-2}{-7}, \frac{-2}{7}, \frac{2}{7}, \frac{2}{-7}$$

Answer

$\frac{-2}{7}, \frac{2}{-7}$

Fraction bars act as grouping symbols. The expressions above and below the fraction bar should be treated as if they were in parentheses. For example, $\frac{4+8}{5-3}$ means $(4+8) \div (5-3)$. The order of operations tells us to simplify the numerator and the denominator first—as if there were parentheses—before we divide.

We'll add fraction bars to our set of grouping symbols from Use the Language of Algebra to have a more complete set here.

Grouping Symbols

Parentheses	( )
Brackets	[ ]
Braces	{ }
Absolute value	| |
Fraction Bar	$\frac{\square}{\square}$

HOW TO: SIMPLIFY AN EXPRESSION WITH A FRACTION BAR

Step 1. Simplify the numerator.

Step 2. Simplify the denominator.

Step 3. Simplify the fraction.

Example 4.11.12:

Simplify: $\frac{4+8}{5-3}$.

Solution

Simplify the expression in the numerator.	$\frac{12}{5-3}$
Simplify the expression in the denominator.	$\frac{12}{2}$
Simplify the fraction.	6

Exercise 4.11.23

Simplify: $\frac{4+6}{11-2}$.

Answer

$\frac{10}{9}$

Exercise 4.11.24

Simplify: $\frac{3+5}{18-2}$.

Answer

$\frac{1}{2}$

Example 4.11.13:

Simplify: $\frac{4-2(3)}{2^2+2}$.

Solution

Use the order of operations. Multiply in the numerator and use the exponent in the denominator.	$\frac{4-6}{4+2}$
Simplify the numerator and the denominator.	$\frac{-2}{6}$
Simplify the fraction.	$-\frac{1}{3}$

Exercise 4.11.25

Simplify: $\frac{6-3(5)}{3^2+3}$.

Answer

$\frac{-3}{4}$

Exercise 4.11.26

Simplify: $\frac{4-4(6)}{3^3+3}$.

Answer

$-\frac{2}{3}$

Example 4.11.14: simplify

Simplify: $\frac{(8-4)^2}{8^2-4^2}$.

Solution

Use the order of operations (parentheses first, then exponents).	$\frac{(4)^2}{64-16}$
Simplify the numerator and denominator.	$\frac{16}{48}$
Simplify the fraction.	$\frac{1}{3}$

Exercise 4.11.27

Simplify: $\frac{(11-7)^2}{11^2-7^2}$.

Answer

$\frac{2}{9}$

Exercise 4.11.28

Simplify: $\frac{(6+2)^2}{6^2-2^2}$.

Answer

$\frac{8}{5}$

Example 4.11.15: simplify

Simplify: $\frac{4(-3)+6(-2)}{-3(2)-2}$.

Solution

Multiply.	$\frac{-12+(-12)}{-6-2}$
Simplify.	$\frac{-24}{-8}$
Divide.	3

Exercise 4.11.29

Simplify: $\frac{8(-2)+4(-3)}{-5(2)+3}$.

Answer

4

Exercise 4.11.30

Simplify: $\frac{7(-1)+9(-3)}{-5(3)+2}$.

Answer

2

- Division Involving Mixed Numbers
- Evaluate a Complex Fraction

Key Concepts

- Multiply or divide mixed numbers.
  1. Convert the mixed numbers to improper fractions.
  2. Follow the rules for fraction multiplication or division.
  3. Simplify if possible.
- Simplify a complex fraction.
  1. Rewrite the complex fraction as a division problem.
  2. Follow the rules for dividing fractions.
  3. Simplify if possible.
- Placement of negative sign in a fraction.
  - For any positive numbers a and b, $\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$.
- Simplify an expression with a fraction bar.
  1. Simplify the numerator.
  2. Simplify the denominator.
  3. Simplify the fraction.

Glossary

complex fraction

A complex fraction is a fraction in which the numerator or the denominator contains a fraction.

Practice Makes Perfect

Multiply and Divide Mixed Numbers

In the following exercises, multiply and write the answer in simplified form.

176. $4\frac{3}{8} \cdot \frac{7}{10}$
177. $2\frac{4}{9} \cdot \frac{6}{7}$
178. $\frac{15}{22} \cdot 3\frac{3}{5}$
179. $\frac{25}{36} \cdot 6\frac{3}{10}$
180. $4\frac{2}{3}(-1\frac{1}{8})$
181. $2\frac{2}{5}(-2\frac{2}{9})$
182. $-4\frac{4}{9} \cdot 5\frac{13}{16}$
183. $-1\frac{7}{20} \cdot 2\frac{11}{12}$

In the following exercises, divide, and write your answer in simplified form.

184. $5\frac{1}{3} \div 4$
185. $13\frac{1}{2} \div 9$
186. $-12 \div 3\frac{3}{11}$
187. $-7 \div 5\frac{1}{4}$
188. $6\frac{3}{8} \div 2\frac{1}{8}$
189. $2\frac{1}{5} \div 1\frac{1}{10}$

190. $-9\frac{3}{5} \div (-1\frac{3}{5})$
191. $-18\frac{3}{4} \div (-3\frac{3}{4})$

Translate Phrases to Expressions with Fractions

In the following exercises, translate each English phrase into an algebraic expression.

192. the quotient of 5u and 11
193. the quotient of 7v and 13
194. the quotient of p and q
195. the quotient of a and b
196. the quotient of r and the sum of s and 10
197. the quotient of A and the difference of 3 and B

Simplify Complex Fractions

In the following exercises, simplify the complex fraction.

198. $\frac{\frac{2}{3}}{\frac{8}{9}}$
199. $\frac{\frac{4}{5}}{\frac{8}{15}}$
200. $\frac{-\frac{8}{21}}{\frac{12}{35}}$
201. $\frac{-\frac{9}{16}}{\frac{33}{40}}$
202. $\frac{-\frac{4}{5}}{2}$
203. $\frac{-\frac{9}{10}}{3}$
204. $\frac{2}{\frac{5}{8}}$
205. $\frac{\frac{5}{3}}{10}$
206. $\frac{\frac{m}{3}}{n}$
207. $\frac{\frac{2}{r}}{\frac{5}{s}}$
208. $\frac{-\frac{x}{6}}{-\frac{8}{9}}$

209. $\dfrac{-\frac{3}{8}}{-\frac{y}{12}}$

210. $\dfrac{2\frac{4}{5}}{\frac{1}{10}}$

211. $\dfrac{4\frac{2}{3}}{\frac{1}{6}}$

212. $\dfrac{\frac{7}{9}}{-2\frac{4}{5}}$

213. $\dfrac{\frac{3}{8}}{-6\frac{3}{4}}$

Simplify Expressions with a Fraction Bar

In the following exercises, identify the equivalent fractions.

214. Which of the following fractions are equivalent to $\dfrac{5}{-11}$?

$$\frac{-5}{-11}, \frac{-5}{11}, \frac{5}{11}, -\frac{5}{11} \tag{4.11.2}$$

215. Which of the following fractions are equivalent to $\dfrac{-4}{9}$?

$$\frac{-4}{-9}, \frac{-4}{9}, \frac{4}{9}, -\frac{4}{9} \tag{4.11.3}$$

216. Which of the following fractions are equivalent to $-\dfrac{11}{3}$?

$$\frac{-11}{3}, \frac{11}{3}, \frac{-11}{-3}, \frac{11}{-3} \tag{4.11.4}$$

217. Which of the following fractions are equivalent to $-\dfrac{13}{6}$?

$$\frac{13}{6}, \frac{13}{-6}, \frac{-13}{-6}, \frac{-13}{6} \tag{4.11.5}$$

In the following exercises, simplify.

218. $\dfrac{4+11}{8}$

219. $\dfrac{9+3}{7}$

220. $\dfrac{22+3}{10}$

221. $\dfrac{19-4}{6}$

222. $\dfrac{48}{24-15}$

223. $\dfrac{46}{4+4}$

224. $\dfrac{-6+6}{8+4}$

225. $\frac{-6+3}{17-8}$
226. $\frac{22-14}{19-13}$
227. $\frac{15+9}{18+12}$
228. $\frac{5\cdot 8}{-10}$
229. $\frac{3\cdot 4}{-24}$
230. $\frac{4\cdot 3}{6\cdot 6}$
231. $\frac{6\cdot 6}{9\cdot 2}$
232. $\frac{4^2-1}{25}$
233. $\frac{7^2+1}{60}$
234. $\frac{8\cdot 3+2\cdot 9}{14+3}$
235. $\frac{9\cdot 6-4\cdot 7}{22+3}$
236. $\frac{15\cdot 5-5^2}{2\cdot 10}$
237. $\frac{12\cdot 9-3^2}{3\cdot 18}$
238. $\frac{5\cdot 6-3\cdot 4}{4\cdot 5-2\cdot 3}$
239. $\frac{8\cdot 9-7\cdot 6}{5\cdot 6-9\cdot 2}$
240. $\frac{5^2-3^2}{3-5}$
241. $\frac{6^2-4^2}{4-6}$
242. $\frac{2+4(3)}{-3-2^2}$
243. $\frac{7+3(5)}{-2-3^2}$
244. $\frac{7\cdot 4-2(8-5)}{9\cdot 3-3\cdot 5}$
245. $\frac{9\cdot 7-3(12-8)}{8\cdot 7-6\cdot 6}$
246. $\frac{9(8-2)-3(15-7)}{6(7-1)-3(17-9)}$
247. $\frac{8(9-2)-4(14-9)}{7(8-3)-3(16-9)}$

Everyday Math

248. **Baking** A recipe for chocolate chip cookies calls for $2\frac{1}{4}$ cups of flour. Graciela wants to double the recipe.
    a. How much flour will Graciela need? Show your calculation. Write your result as an improper fraction and as a mixed number.
    b. Measuring cups usually come in sets with cups for $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{3}$, $\frac{1}{2}$, and 1 cup. Draw a diagram to show two different ways that Graciela could measure out the flour needed to double the recipe.

249. **Baking** A booth at the county fair sells fudge by the pound. Their award winning "Chocolate Overdose" fudge contains $2\frac{2}{3}$ cups of chocolate chips per pound.
    a. How many cups of chocolate chips are in a half-pound of the fudge?
    b. The owners of the booth make the fudge in 10 -pound batches. How many chocolate chips do they need to make a 10 -pound batch? Write your results as improper fractions and as a mixed numbers.

Writing Exercises

250. Explain how to find the reciprocal of a mixed number.
251. Explain how to multiply mixed numbers.
252. Randy thinks that $3\frac{1}{2} \cdot 5\frac{1}{4}$ is $15\frac{1}{8}$. Explain what is wrong with Randy's thinking.
253. Explain why $-\frac{1}{2}$, $\frac{-1}{2}$, and $\frac{1}{-2}$ are equivalent.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
multiply and divide mixed numbers.			
translate phrases to expressions with fractions.			
simplify complex fractions.			
simplify expressions written with a fraction bar.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

4.12: Add and Subtract Fractions with Common Denominators

Learning Objectives

- Model fraction addition
- Add fractions with a common denominator
- Model fraction subtraction
- Subtract fractions with a common denominator

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $2x+9+3x-4$. If you missed this problem, review Example 2.2.10.
2. Draw a model of the fraction $\frac{3}{4}$. If you missed this problem, review Example 4.1.2.
3. Simplify: $\frac{3+2}{6}$. If you missed this problem, review Example 4.3.12.

Model Fraction Addition

How many quarters are pictured? One quarter plus 2 quarters equals 3 quarters.

Figure 4.12.1

Remember, quarters are really fractions of a dollar. Quarters are another way to say fourths. So the picture of the coins shows that

$$\begin{matrix} \frac{1}{4} & \frac{2}{4} & \frac{3}{4} \\ one\ quarter + two\ quarters & = & three\ quarters \end{matrix}$$

Let's use fraction circles to model the same example, $\frac{1}{4}+\frac{2}{4}$.

Start with one $\frac{1}{4}$ piece.		$\frac{1}{4}$
Add two more $\frac{1}{4}$ pieces.		$+\frac{2}{4}$
The result is $\frac{3}{4}$.		$\frac{3}{4}$

So again, we see that

$$\frac{1}{4}+\frac{2}{4}=\frac{3}{4}$$

Example 4.12.1: addition

Use a model to find the sum $\frac{3}{8}+\frac{2}{8}$.

Solution

Start with three $\frac{1}{8}$ pieces.		$\frac{3}{8}$
Add two $\frac{1}{8}$ pieces.		$+\frac{2}{8}$
How many $\frac{1}{8}$ pieces are there?		$\frac{5}{8}$

There are five $\frac{1}{8}$ pieces, or five-eighths. The model shows that $\frac{3}{8}+\frac{2}{8}=\frac{5}{8}$.

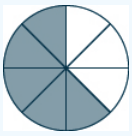
Exercise 4.12.1

Use a model to find each sum. Show a diagram to illustrate your model.

$$\frac{1}{8}+\frac{4}{8}$$

Answer

$\frac{5}{8}$



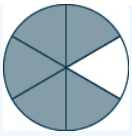
Exercise 4.12.2

Use a model to find each sum. Show a diagram to illustrate your model.

$$\frac{1}{6}+\frac{4}{6}$$

Answer

$\frac{5}{6}$



Add Fractions with a Common Denominator

Example 4.12.1 shows that to add the same-size pieces—meaning that the fractions have the same denominator—we just add the number of pieces.

Definition: Fraction Addition

If a, b, and c are numbers where $c \neq 0$, then

$$\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c} \tag{4.12.1}$$

To add fractions with a common denominator, add the numerators and place the sum over the common denominator.

Example 4.12.2: addition

Find the sum: $\frac{3}{5} + \frac{1}{5}$.

Solution

Add the numerators and place the sum over the common denominator.	$\frac{3+1}{5}$
Simplify.	$\frac{4}{5}$

Exercise 4.12.3

Find each sum: $\frac{3}{6} + \frac{2}{6}$.

Answer

$\frac{5}{6}$

Exercise 4.12.4

Find each sum: $\frac{3}{10} + \frac{7}{10}$.

Answer

1

Example 4.12.3: addition

Find the sum: $\frac{x}{3} + \frac{2}{3}$.

Solution

Add the numerators and place the sum over the common denominator.	$\frac{x+2}{3}$

Note that we cannot simplify this fraction any more. Since x and 2 are not like terms, we cannot combine them.

? Exercise 4.12.5

Find the sum: $\frac{x}{4}+\frac{3}{4}$.

Answer

$\frac{x+3}{4}$

? Exercise 4.12.6

Find the sum: $\frac{y}{8}+\frac{5}{8}$.

Answer

$\frac{y+5}{8}$

✓ Example 4.12.4: addition

Find the sum: $-\frac{9}{d}+\frac{3}{d}$.

Solution

We will begin by rewriting the first fraction with the negative sign in the numerator.

$$-\frac{a}{b}=\frac{-a}{b}$$

Rewrite the first fraction with the negative in the numerator.	$\frac{-9}{d}+\frac{3}{d}$
Add the numerators and place the sum over the common denominator.	$\frac{-9+3}{d}$
Simplify the numerator.	$\frac{-6}{d}$
Rewrite with negative sign in front of the fraction.	$-\frac{6}{d}$

? Exercise 4.12.7

Find the sum: $-\frac{7}{d}+\frac{8}{d}$.

Answer

$\frac{1}{d}$

Exercise 4.12.8

Find the sum: $-\frac{6}{m}+\frac{9}{m}$.

Answer

$\frac{3}{m}$

Example 4.12.5: addition

Find the sum: $\frac{2n}{11}+\frac{5n}{11}$.

Solution

Add the numerators and place the sum over the common denominator.	$\frac{2n+5n}{11}$
Combine like terms.	$\frac{7n}{11}$

Exercise 4.12.9

Find the sum: $\frac{3p}{8}+\frac{6p}{8}$.

Answer

$\frac{9p}{8}$

Exercise 4.12.10

Find the sum: $\frac{2q}{5}+\frac{7q}{5}$.

Answer

$\frac{9q}{5}$

Example 4.12.6: addition

Find the sum: $-\frac{3}{12}+\left(-\frac{5}{12}\right)$.

Solution

Add the numerators and place the sum over the common denominator.	$\frac{-3+(-5)}{12}$
Add.	$\frac{-8}{12}$
Simplify the fraction.	$-\frac{2}{3}$

Exercise 4.12.11

Find each sum: $-\frac{4}{15}+\left(-\frac{6}{15}\right)$.

Answer

$-\frac{2}{3}$

Exercise 4.12.12

Find each sum: $-\frac{5}{21}+\left(-\frac{9}{21}\right)$.

Answer

$-\frac{2}{3}$

Model Fraction Subtraction

Subtracting two fractions with common denominators is much like adding fractions. Think of a pizza that was cut into 12 slices. Suppose five pieces are eaten for dinner. This means that, after dinner, there are seven pieces (or $\frac{7}{12}$ of the pizza) left in the box. If Leonardo eats 2 of these remaining pieces (or $\frac{2}{12}$ of the pizza), how much is left? There would be 5 pieces left (or $\frac{5}{12}$ of the pizza).

$$\frac{7}{12}-\frac{2}{12}=\frac{5}{12}$$

Let's use fraction circles to model the same example, $\frac{7}{12}-\frac{2}{12}$. Start with seven $\frac{1}{12}$ pieces. Take away two $\frac{1}{12}$ pieces. How many twelfths are left?

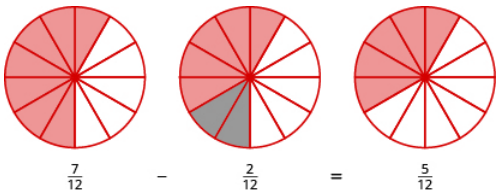


Figure 4.12.2

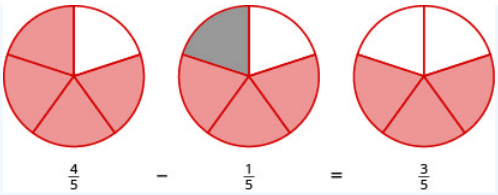
Again, we have five twelfths, $\frac{5}{12}$.

Example 4.12.7: difference

Use fraction circles to find the difference: $\frac{4}{5}-\frac{1}{5}$.

Solution

Start with four $\frac{1}{5}$ pieces. Take away one $\frac{1}{5}$ piece. Count how many fifths are left. There are three $\frac{1}{5}$ pieces left.



Exercise 4.12.13

Use a model to find each difference. Show a diagram to illustrate your model. $\frac{7}{8}-\frac{4}{8}$

Answer

$\frac{3}{8}$, models may differ.

Exercise 4.12.14

Use a model to find each difference. Show a diagram to illustrate your model. $\frac{5}{6}-\frac{4}{6}$

Answer

$\frac{1}{6}$, models may differ.

Subtract Fractions with a Common Denominator

We subtract fractions with a common denominator in much the same way as we add fractions with a common denominator.

Definition: Fraction Subtraction

If a, b, and c are numbers where $c \neq 0$, then

$$\frac{a}{c}-\frac{b}{c}=\frac{a-b}{c} \tag{4.12.2}$$

To subtract fractions with a common denominator, we subtract the numerators and place the difference over the common denominator.

Example 4.12.8: difference

Find the difference: $\frac{23}{24}-\frac{14}{24}$.

Solution

Subtract the numerators and place the difference over the common denominator.	$\frac{23-14}{24}$
Simplify the numerator.	$\frac{9}{24}$
Simplify the fraction by removing common factors.	$\frac{3}{8}$

Exercise 4.12.15

Find the difference: $\frac{19}{28} - \frac{7}{28}$.

Answer

$\frac{3}{7}$

Exercise 4.12.16

Find the difference: $\frac{27}{32} - \frac{11}{32}$.

Answer

$\frac{1}{2}$

Example 4.12.9: difference

Find the difference: $\frac{y}{6} - \frac{1}{6}$.

Solution

Subtract the numerators and place the difference over the common denominator.	$\frac{y-1}{6}$

The fraction is simplified because we cannot combine the terms in the numerator.

Exercise 4.12.17

Find the difference: $\frac{x}{7} - \frac{2}{7}$.

Answer

$\frac{x-2}{7}$

Exercise 4.12.18

Find the difference: $\frac{y}{14} - \frac{13}{14}$.

Answer

$\frac{y-13}{14}$

Example 4.12.10: difference

Find the difference: $-\frac{10}{x} - \frac{4}{x}$.

Solution

Remember, the fraction $-\frac{10}{x}$ can be written as $\frac{-10}{x}$.

Subtract the numerators.	$\frac{-10-4}{x}$
Simplify.	$\frac{-14}{x}$
Rewrite with the negative sign in front of the fraction.	$-\frac{14}{x}$

Exercise 4.12.19

Find the difference: $-\frac{9}{x}-\frac{7}{x}$.

Answer

$-\frac{16}{x}$

Exercise 4.12.20

Find the difference: $-\frac{17}{a}-\frac{5}{a}$.

Answer

$-\frac{22}{a}$

Now lets do an example that involves both addition and subtraction.

Example 4.12.11: simplify

Simplify: $\frac{3}{8}+\left(-\frac{5}{8}\right)-\frac{1}{8}$.

Solution

Combine the numerators over the common denominator.	$\frac{3+(-5)-1}{8}$
Simplify the numerator, working left to right.	$\frac{-2-1}{8}$
Subtract the terms in the numerator.	$\frac{-3}{8}$
Rewrite with the negative sign in front of the fraction.	$-\frac{3}{8}$

Exercise 4.12.21

Simplify: $\frac{2}{5}+\left(-\frac{4}{5}\right)-\frac{3}{5}$.

Answer

-1

Exercise 4.12.22

Simplify: $\frac{5}{9}+\left(-\frac{4}{9}\right)-\frac{7}{9}$.

Answer

$-\frac{2}{3}$

Access Additional Online Resources

- Adding Fractions With Pattern Blocks

- Subtracting Fractions With Like Denominators

Key Concepts

- Fraction Addition
  - If $a, b,$, and c are numbers where $c \neq 0$, then $\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c}$
  - To add fractions, add the numerators and place the sum over the common denominator.
- Fraction Subtraction
  - If $a, b,$, and c are numbers where $c \neq 0$, then $\frac{a}{c}-\frac{b}{c}=\frac{a-b}{c}$
  - To subtract fractions, subtract the numerators and place the difference over the common denominator.

Practice Makes Perfect

Model Fraction Addition

In the following exercises, use a model to add the fractions. Show a diagram to illustrate your model.

254. $\frac{2}{5}+\frac{1}{5}$
255. $\frac{3}{10}+\frac{4}{10}$
256. $\frac{1}{6}+\frac{3}{6}$
257. $\frac{3}{8}+\frac{3}{8}$

Add Fractions with a Common Denominator

In the following exercises, find each sum.

258. $\frac{4}{9}+\frac{1}{9}$
259. $\frac{2}{9}+\frac{5}{9}$
260. $\frac{6}{13}+\frac{7}{13}$
261. $\frac{9}{15}+\frac{7}{15}$
262. $\frac{x}{4}+\frac{3}{4}$
263. $\frac{y}{3}+\frac{2}{3}$
264. $\frac{7}{p}+\frac{9}{p}$

265. $\frac{8}{q}+\frac{6}{q}$
266. $\frac{8b}{9}+\frac{3b}{9}$
267. $\frac{5a}{7}+\frac{4a}{7}$
268. $\frac{-12y}{8}+\frac{3y}{8}$
269. $\frac{-11x}{5}+\frac{7x}{5}$
270. $-\frac{1}{8}+\left(-\frac{3}{8}\right)$
271. $-\frac{1}{8}+\left(-\frac{5}{8}\right)$
272. $-\frac{3}{16}+\left(-\frac{7}{16}\right)$
273. $-\frac{5}{16}+\left(-\frac{9}{16}\right)$
274. $-\frac{8}{17}+\frac{15}{17}$
275. $-\frac{9}{19}+\frac{17}{19}$
276. $-\frac{6}{13}+\left(-\frac{10}{13}\right)+\left(-\frac{12}{13}\right)$
277. $-\frac{5}{12}+\left(-\frac{7}{12}\right)+\left(-\frac{11}{12}\right)$

Model Fraction Subtraction

In the following exercises, use a model to subtract the fractions. Show a diagram to illustrate your model.

278. $\frac{5}{8}-\frac{2}{8}$
279. $\frac{5}{6}-\frac{2}{6}$

Subtract Fractions with a Common Denominator

In the following exercises, find the difference.

280. $\frac{4}{5}-\frac{1}{5}$
281. $\frac{4}{5}-\frac{3}{5}$
282. $\frac{11}{15}-\frac{7}{15}$
283. $\frac{9}{13}-\frac{4}{13}$
284. $\frac{11}{12}-\frac{5}{12}$
285. $\frac{7}{12}-\frac{5}{12}$
286. $\frac{4}{21}-\frac{19}{21}$
287. $-\frac{8}{9}-\frac{16}{9}$
288. $\frac{y}{17}-\frac{9}{17}$
289. $\frac{x}{19}-\frac{8}{19}$
290. $\frac{5y}{8}-\frac{7}{8}$

291. $\frac{11z}{13} - \frac{8}{13}$
292. $-\frac{8}{d} - \frac{3}{d}$
293. $-\frac{7}{c} - \frac{7}{c}$
294. $-\frac{23}{u} - \frac{15}{u}$
295. $-\frac{29}{v} - \frac{26}{v}$
296. $-\frac{6c}{7} - \frac{5c}{7}$
297. $-\frac{12d}{11} - \frac{9d}{11}$
298. $\frac{-4r}{13} - \frac{5r}{13}$
299. $\frac{-7s}{3} - \frac{7s}{3}$
300. $-\frac{3}{5} - \left(-\frac{4}{5}\right)$
301. $-\frac{3}{7} - \left(-\frac{5}{7}\right)$
302. $-\frac{7}{9} - \left(-\frac{5}{9}\right)$
303. $-\frac{8}{11} - \left(-\frac{5}{11}\right)$

Mixed Practice

In the following exercises, perform the indicated operation and write your answers in simplified form.

304. $-\frac{5}{18} \cdot \frac{9}{10}$
305. $-\frac{3}{14} \cdot \frac{7}{12}$
306. $\frac{n}{5} - \frac{4}{5}$
307. $\frac{6}{11} - \frac{s}{11}$
308. $-\frac{7}{24} - \frac{2}{24}$
309. $-\frac{5}{18} - \frac{1}{18}$
310. $\frac{8}{15} \div \frac{12}{5}$
311. $\frac{7}{12} \div \frac{9}{28}$

Everyday Math

312. **Trail Mix** Jacob is mixing together nuts and raisins to make trail mix. He has $\frac{6}{10}$ of a pound of nuts and $\frac{3}{10}$ of a pound of raisins. How much trail mix can he make?
313. **Baking** Janet needs $\frac{5}{8}$ of a cup of flour for a recipe she is making. She only has $\frac{3}{8}$ of a cup of flour and will ask to borrow the rest from her next-door neighbor. How much flour does she have to borrow?

Writing Exercises

314. Greg dropped his case of drill bits and three of the bits fell out. The case has slots for the drill bits, and the slots are arranged in order from smallest to largest. Greg needs to put the bits that fell out back in the case in the empty slots. Where do the three bits go? Explain how you know.

Bits in case: $\frac{1}{16}, \frac{1}{8}, ___, ___, \frac{5}{16}, \frac{3}{8}, ___, \frac{1}{2}, \frac{9}{16}, \frac{5}{8}$.

Bits that fell out: $\frac{7}{16}, \frac{3}{16}, \frac{1}{4}$.

315. After a party, Lupe has $\frac{5}{12}$ of a cheese pizza, $\frac{4}{12}$ of a pepperoni pizza, and $\frac{4}{12}$ of a veggie pizza left. Will all the slices fit into 1 pizza box? Explain your reasoning.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
model fraction addition.			
add fractions with a common denominator.			
model fraction subtraction.			
subtract fractions with a common denominator.			
find the least common denominator (LCD).			
convert fractions to equivalent fractions with the LCD.			

(b) On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

4.13: Add and Subtract Fractions with Different Denominators (Part 1)

Learning Objectives

- Find the least common denominator (LCD)
- Convert fractions to equivalent fractions with the LCD
- Add and subtract fractions with different denominators
- Identify and use fraction operations
- Use the order of operations to simplify complex fractions
- Evaluate variable expressions with fractions

be prepared!

Before you get started, take this readiness quiz.

1. Find two fractions equivalent to $\frac{5}{6}$. If you missed this problem, review Example 4.1.14.
2. Simplify: $\frac{1+5\cdot 3}{2^2+4}$. If you missed this problem, review Example 4.3.13.

Find the Least Common Denominator

In the previous section, we explained how to add and subtract fractions with a common denominator. But how can we add and subtract fractions with unlike denominators?

Let's think about coins again. Can you add one quarter and one dime? You could say there are two coins, but that's not very useful. To find the total value of one quarter plus one dime, you change them to the same kind of unit—cents. One quarter equals 25 cents and one dime equals 10 cents, so the sum is 35 cents. See Figure 4.13.1.

Figure 4.13.1: Together, a quarter and a dime are worth 35 cents, or $\frac{35}{100}$ of a dollar.

Similarly, when we add fractions with different denominators we have to convert them to equivalent fractions with a common denominator. With the coins, when we convert to cents, the denominator is 100. Since there are 100 cents in one dollar, 25 cents is $\frac{25}{100}$ and 10 cents is $\frac{10}{100}$. So we add $\frac{25}{100}+\frac{10}{100}$ to get $\frac{35}{100}$, which is 35 cents.

You have practiced adding and subtracting fractions with common denominators. Now let's see what you need to do with fractions that have different denominators.

First, we will use fraction tiles to model finding the common denominator of $\frac{1}{2}$ and $\frac{1}{3}$. We'll start with one $\frac{1}{2}$ tile and $\frac{1}{3}$ tile. We want to find a common fraction tile that we can use to match *both* $\frac{1}{2}$ and $\frac{1}{3}$ exactly. If we try the $\frac{1}{4}$ pieces, 2 of them exactly match the $\frac{1}{2}$ piece, but they do not exactly match the $\frac{1}{3}$ piece.

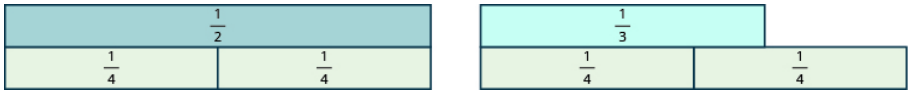

Figure 4.13.2

If we try the $\frac{1}{5}$ pieces, they do not exactly cover the $\frac{1}{2}$ piece or the $\frac{1}{3}$ piece.

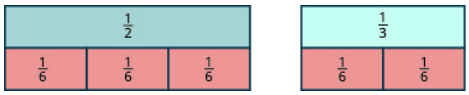

Figure 4.13.3

If we were to try the $\frac{1}{12}$ pieces, they would also work.

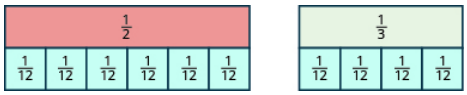

Figure 4.13.4

Even smaller tiles, such as $\frac{1}{24}$ and $\frac{1}{48}$, would also exactly cover the $\frac{1}{2}$ piece and the $\frac{1}{3}$ piece. The denominator of the largest piece that covers both fractions is the **least common denominator** (LCD) of the two fractions. So, the least common denominator of $\frac{1}{2}$ and $\frac{1}{3}$ is 6.

Notice that all of the tiles that cover $\frac{1}{2}$ and $\frac{1}{3}$ have something in common: Their denominators are common multiples of 2 and 3, the denominators of $\frac{1}{2}$ and $\frac{1}{3}$. The least common multiple (LCM) of the denominators is 6, and so we say that 6 is the least common denominator (LCD) of the fractions $\frac{1}{2}$ and $\frac{1}{3}$.

Definition: Least Common Denominator

The least common denominator (LCD) of two fractions is the least common multiple (LCM) of their denominators.

To find the LCD of two fractions, we will find the LCM of their denominators. We follow the procedure we used earlier to find the LCM of two numbers. We only use the denominators of the fractions, not the numerators, when finding the LCD.

Example 4.13.1: lcd

Find the LCD for the fractions $\frac{7}{12}$ and $\frac{5}{18}$.

Solution

Factor each denominator into its primes.	List the primes of 12 and the primes of 18 lining them up in columns when possible.	$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$
Bring down the columns.	$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$ $\text{LCM} = 2 \cdot 2 \cdot 3 \cdot 3$
Multiply the factors. The product is the LCM.	LCM = 36
The LCM of 12 and 18 is 36, so the LCD of $\frac{7}{12}$ and $\frac{5}{18}$ is 36.	LCD of $\frac{7}{12}$ and $\frac{5}{18}$ is 36.

Exercise 4.13.1

Find the least common denominator for the fractions: $\frac{7}{12}$ and $\frac{11}{15}$.

Answer

60

Exercise 4.13.2

Find the least common denominator for the fractions: $\frac{13}{15}$ and $\frac{17}{5}$.

Answer

15

To find the LCD of two fractions, find the LCM of their denominators. Notice how the steps shown below are similar to the steps we took to find the LCM.

HOW TO: FIND THE LEAST COMMON DENOMINATOR (LCD) OF TWO FRACTIONS

Step 1. Factor each denominator into its primes.

Step 2. List the primes, matching primes in columns when possible.

Step 3. Bring down the columns.

Step 4. Multiply the factors. The product is the LCM of the denominators.

Step 5. The LCM of the denominators is the LCD of the fractions.

Example 4.13.2:

Find the least common denominator for the fractions $\frac{8}{15}$ and $\frac{11}{24}$.

Solution

To find the LCD, we find the LCM of the denominators. Find the LCM of 15 and 24.

$$\begin{aligned} 15 &= 3 \cdot 5 \\ 24 &= 2 \cdot 2 \cdot 2 \cdot 3 \\ \hline \text{LCD} &= 2 \cdot 2 \cdot 2 \cdot 3 \cdot 5 \\ \text{LCD} &= 120 \end{aligned}$$

The LCM of 15 and 24 is 120. So, the LCD of $\frac{8}{15}$ and $\frac{11}{24}$ is 120.

Exercise 4.13.3

Find the least common denominator for the fractions: $\frac{13}{24}$ and $\frac{17}{32}$.

Answer

96

Exercise 4.13.4

Find the least common denominator for the fractions: $\frac{9}{28}$ and $\frac{21}{32}$.

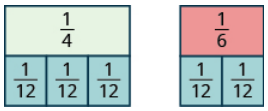
Answer

224

Convert Fractions to Equivalent Fractions with the LCD

Earlier, we used fraction tiles to see that the LCD of $\frac{1}{4}$ and $\frac{1}{6}$ is 12. We saw that three $\frac{1}{12}$ pieces exactly covered $\frac{1}{4}$ and two $\frac{1}{12}$ pieces exactly covered $\frac{1}{6}$, so

$$\frac{1}{4}=\frac{3}{12} \quad and \quad \frac{1}{6}=\frac{2}{12}.$$



We say that $\frac{1}{4}$ and $\frac{3}{12}$ are equivalent fractions and also that $\frac{1}{6}$ and $\frac{2}{12}$ are equivalent fractions.

We can use the Equivalent Fractions Property to algebraically change a fraction to an equivalent one. Remember, two fractions are equivalent if they have the same value. The Equivalent Fractions Property is repeated below for reference.

Definition: Equivalent Fractions Property

If a, b, c are whole numbers where $b \neq 0$, $c \neq 0$, then

$$\frac{a}{b}=\frac{a \cdot c}{b \cdot c} \quad and \quad \frac{a \cdot c}{b \cdot c}=\frac{a}{b} \tag{4.13.1}$$

To add or subtract fractions with different denominators, we will first have to convert each fraction to an equivalent fraction with the LCD. Let's see how to change $\frac{1}{4}$ and $\frac{1}{6}$ to equivalent fractions with denominator 12 without using models.

Example 4.13.3: conversion

Convert $\frac{1}{4}$ and $\frac{1}{6}$ to equivalent fractions with denominator 12, their LCD.

Solution

Find the LCD.	The LCD of $\frac{1}{4}$ and $\frac{1}{6}$ is 12.
Find the number to multiply 4 to get 12.	$4 \cdot 3 = 12$
Find the number to multiply 6 to get 12.	$6 \cdot 2 = 12$
Use the Equivalent Fractions Property to convert each fraction to an equivalent fraction with the LCD, multiplying both the numerator and denominator of each fraction by the same number.	$\frac{1}{4}$ $\quad$ $\frac{1}{6}$ $\frac{1 \cdot 3}{4 \cdot 3}$ $\quad$ $\frac{1 \cdot 2}{6 \cdot 2}$
Simplify the numerators and denominators.	$\frac{3}{12}$ $\quad$ $\frac{2}{12}$

We do not reduce the resulting fractions. If we did, we would get back to our original fractions and lose the common denominator.

Exercise 4.13.5

Change to equivalent fractions with the LCD: $\frac{3}{4}$ and $\frac{5}{6}$, $LCD = 12$

Answer

$\frac{9}{12}, \frac{10}{12}$

Exercise 4.13.6

Change to equivalent fractions with the LCD: $-\frac{7}{12}$ and $\frac{11}{15}$, $LCD = 60$

Answer

$-\frac{35}{60}, \frac{44}{60}$

HOW TO: CONVERT TWO FRACTIONS TO EQUIVALENT FRACTIONS WITH THEIR LCD AS THE COMMON DENOMINATOR

Step 1. Find the LCD.

Step 2. For each fraction, determine the number needed to multiply the denominator to get the LCD.

Step 3. Use the Equivalent Fractions Property to multiply both the numerator and denominator by the number you found in Step 2.

Step 4. Simplify the numerator and denominator.

Example 4.13.4: conversion

Convert $\frac{8}{15}$ and $\frac{11}{24}$ to equivalent fractions with denominator 120, their LCD.

Find the number that must multiply 15 to get 120.	$15 \cdot 8 = 120$
Find the number that must multiply 24 to get 120.	$24 \cdot 5 = 120$
Use the Equivalent Fractions Property.	$\frac{8 \cdot 8}{15 \cdot 8}$ $\frac{11 \cdot 5}{24 \cdot 5}$
Simplify the numerators and denominators.	$\frac{64}{120}$ $\frac{55}{120}$

Exercise 4.13.7

Change to equivalent fractions with the LCD: $\frac{13}{24}$ and $\frac{17}{32}$, LCD 96

Answer

$\frac{52}{96}, \frac{51}{96}$

Exercise 4.13.8

Change to equivalent fractions with the LCD: $\frac{9}{28}$ and $\frac{27}{32}$, LCD 224

Answer

$\frac{72}{224}, \frac{189}{224}$

Add and Subtract Fractions with Different Denominators

Once we have converted two fractions to equivalent forms with common denominators, we can add or subtract them by adding or subtracting the numerators.

HOW TO: ADD OR SUBTRACT FRACTIONS WITH DIFFERENT DENOMINATORS

Step 1. Find the LCD.

Step 2. Convert each fraction to an equivalent form with the LCD as the denominator.

Step 3. Add or subtract the fractions.

Step 4. Write the result in simplified form.

Example 4.13.5: add

Add: $\frac{1}{2}+\frac{1}{3}$.

Solution

Find the LCD of 2, 3.	$2=2$ $3=\quad 3$ $\text{LCD}=2\cdot 3$ $\text{LCD}=6$
Change into equivalent fractions with the LCD 6.	$\frac{1\cdot 3}{2\cdot 3}+\frac{1\cdot 2}{3\cdot 2}$
Simplify the numerators and denominators.	$\frac{3}{6}+\frac{2}{6}$
Add.	$\frac{5}{6}$

Remember, always check to see if the answer can be simplified. Since 5 and 6 have no common factors, the fraction $\frac{5}{6}$ cannot be reduced.

Exercise 4.13.9

Add: $\frac{1}{4}+\frac{1}{3}$.

Answer

$\frac{7}{12}$

Exercise 4.13.10

Add: $\frac{1}{2}+\frac{1}{5}$.

Answer

$\frac{7}{10}$

Example 4.13.6: subtract

Subtract: $\frac{1}{2}-\left(-\frac{1}{4}\right)$.

Solution

Find the LCD of 2 and 4.	$\begin{array}{l} 2=2 \\ 4=2\cdot 2 \\ \hline \text{LCD}=2\cdot 2 \\ \text{LCD}=4 \end{array}$
Rewrite as equivalent fractions using the LCD 4.	$\frac{1\cdot 2}{2\cdot 2}-\left(-\frac{1}{4}\right)$
Simplify the first fraction.	$\frac{2}{4}-\left(-\frac{1}{4}\right)$
Subtract.	$\frac{2-(-1)}{4}$
Simplify.	$\frac{3}{4}$

One of the fractions already had the least common denominator, so we only had to convert the other fraction.

Exercise 4.13.11

Subtract: $\frac{1}{2}-\left(-\frac{1}{8}\right)$.

Answer

$\frac{5}{8}$

Exercise 4.13.12

Subtract: $\frac{1}{3}-\left(-\frac{1}{6}\right)$.

Answer

$\frac{1}{2}$

Example 4.13.7: add

Add: $\frac{7}{12}+\frac{5}{18}$.

Solution

Find the LCD of 12 and 18.	$12 = 2 \cdot 2 \cdot 3$ $18 = 2 \cdot \quad 3 \cdot 3$ $\text{LCD} = 2 \cdot 2 \cdot 3 \cdot 3$ $\text{LCD} = 36$
Rewrite as equivalent fractions with the LCD.	$\frac{7 \cdot 3}{12 \cdot 3} + \frac{5 \cdot 2}{18 \cdot 2}$
Simplify the numerators and denominators.	$\frac{21}{36} + \frac{10}{36}$
Add.	$\frac{31}{36}$

Because 31 is a prime number, it has no factors in common with 36. The answer is simplified.

Exercise 4.13.13

Add: $\frac{7}{12} + \frac{11}{15}$.

Answer

$\frac{79}{60}$

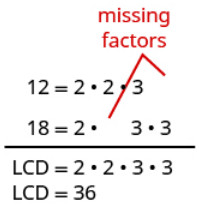
Exercise 4.13.14

Add: $\frac{13}{15} + \frac{17}{20}$.

Answer

$\frac{103}{60}$

When we use the Equivalent Fractions Property, there is a quick way to find the number you need to multiply by to get the LCD. Write the factors of the denominators and the LCD just as you did to find the LCD. The "missing" factors of each denominator are the numbers you need.



The LCD, 36, has 2 factors of 2 and 2 factors of 3. Twelve has two factors of 2, but only one of 3 —so it is 'missing' one 3. We multiplied the numerator and denominator of $\frac{7}{12}$ by 3 to get an equivalent fraction with denominator 36. Eighteen is missing one factor of 2 —so you multiply the numerator and denominator $\frac{5}{18}$ by 2 to get an equivalent fraction with denominator 36. We will apply this method as we subtract the fractions in the next example.

Example 4.13.8: subtract

Subtract: $\frac{7}{15} - \frac{19}{24}$.

Solution

Find the LCD. 15 is 'missing' three factors of 2 24 is 'missing' a factor of 5	$\begin{array}{l} 15 = \quad 3 \cdot 5 \\ 24 = 2 \cdot 2 \cdot 2 \cdot 3 \\ \hline \text{LCD} = 2 \cdot 2 \cdot 2 \cdot 3 \cdot 5 \\ \text{LCD} = 120 \end{array}$
Rewrite as equivalent fractions with the LCD.	$\frac{7 \cdot 8}{15 \cdot 8} - \frac{19 \cdot 5}{24 \cdot 5}$
Simplify each numerator and denominator.	$\frac{56}{120} - \frac{95}{120}$
Subtract.	$-\frac{39}{120}$
Rewrite showing the common factor of 3.	$-\frac{13 \cdot 3}{40 \cdot 3}$
Remove the common factor to simplify.	$-\frac{13}{40}$

? Exercise 4.13.15

Subtract: $\frac{13}{24} - \frac{17}{32}$.

Answer

$\frac{1}{96}$

? Exercise 4.13.16

Subtract: $\frac{21}{32} - \frac{9}{28}$.

Answer

$\frac{75}{224}$

✓ Example 4.13.9: add

Add: $-\frac{11}{30} + \frac{23}{42}$.

Solution

Find the LCD.	$\begin{array}{l} 30 = 2 \cdot 3 \cdot 5 \\ 42 = 2 \cdot 3 \cdot \quad 7 \\ \hline \text{LCD} = 2 \cdot 3 \cdot 5 \cdot 7 \\ \text{LCD} = 210 \end{array}$
Rewrite as equivalent fractions with the LCD.	$-\frac{11 \cdot 7}{30 \cdot 7} + \frac{23 \cdot 5}{42 \cdot 5}$
Simplify each numerator and denominator.	$-\frac{77}{210} + \frac{115}{210}$
Add.	$\frac{38}{210}$
Rewrite showing the common factor of 2.	$\frac{19 \cdot 2}{105 \cdot 2}$
Remove the common factor to simplify.	$\frac{19}{105}$

Exercise 4.13.17

Add: $-\frac{13}{42}+\frac{17}{35}$.

Answer

$\frac{37}{210}$

Exercise 4.13.18

Add: $-\frac{19}{24}+\frac{17}{32}$.

Answer

$-\frac{25}{96}$

In the next example, one of the fractions has a variable in its numerator. We follow the same steps as when both numerators are numbers.

Example 4.13.10: add

Add: $\frac{3}{5}+\frac{x}{8}$.

Solution

The fractions have different denominators.

Find the LCD.	$\begin{array}{l} 5= \quad 5 \\ 8=2\cdot 2\cdot 2 \\ \hline \text{LCD}=2\cdot 2\cdot 2\cdot 5 \\ \text{LCD}=40 \end{array}$
Rewrite as equivalent fractions with the LCD.	$\frac{3\cdot 8}{5\cdot 8}+\frac{x\cdot 5}{8\cdot 5}$
Simplify the numerators and denominators.	$\frac{24}{40}+\frac{5x}{40}$
Add.	$\frac{24+5x}{40}$

We cannot add 24 and $5x$ since they are not like terms, so we cannot simplify the expression any further.

Exercise 4.13.19

Add: $\frac{y}{6}+\frac{7}{9}$.

Answer

$\frac{3y+14}{18}$

Exercise 4.13.20

Add: $\frac{x}{6}+\frac{7}{15}$.

Answer

$$\frac{5x+14}{30}$$

4.14: Add and Subtract Fractions with Different Denominators (Part 2)

Identify and Use Fraction Operations

By now in this chapter, you have practiced multiplying, dividing, adding, and subtracting fractions. The following table summarizes these four fraction operations. Remember: You need a common denominator to add or subtract fractions, but not to multiply or divide fractions.

Summary of Fraction Operations

Fraction multiplication: Multiply the numerators and multiply the denominators.

$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd} \tag{4.14.1}$$

Fraction division: Multiply the first fraction by the reciprocal of the second.

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c} \tag{4.14.2}$$

Fraction addition: Add the numerators and place the sum over the common denominator. If the fractions have different denominators, first convert them to equivalent forms with the LCD.

$$\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c} \tag{4.14.3}$$

Fraction subtraction: Subtract the numerators and place the difference over the common denominator. If the fractions have different denominators, first convert them to equivalent forms with the LCD.

$$\frac{a}{c} - \frac{a}{c} = \frac{a-b}{c} \tag{4.14.4}$$

Example 4.14.11: simplify

Simplify:

a. $-\frac{1}{4} + \frac{1}{6}$

b. $-\frac{1}{4} \div \frac{1}{6}$

Solution

First we ask ourselves, “What is the operation?”

a. The operation is addition. Do the fractions have a common denominator? No.

Find the LCD.	$\begin{array}{l} 4 = 2 \cdot 2 \\ 6 = 2 \cdot \quad 3 \\ \hline \text{LCD} = 2 \cdot 2 \cdot 3 \\ \text{LCD} = 12 \end{array}$
Rewrite each fraction as an equivalent fraction with the LCD.	$-\frac{1 \cdot 3}{4 \cdot 3} + \frac{1 \cdot 2}{6 \cdot 2}$
Simplify the numerators and denominators.	$-\frac{3}{12} + \frac{2}{12}$
Add the numerators and place the sum over the common denominator.	$-\frac{1}{12}$
Check to see if the answer can be simplified. It cannot.	

b. The operation is division. We do not need a common denominator.

To divide fractions, multiply the first fraction by the reciprocal of the second.	$-\frac{1}{4} \cdot \frac{6}{1}$
Multiply.	$-\frac{6}{4}$
Simplify.	$-\frac{3}{2}$

Exercise 4.14.21

Simplify:

a. $-\frac{3}{4}-\frac{1}{6}$

b. $-\frac{3}{4} \cdot \frac{1}{6}$

Answer a

$-\frac{11}{12}$

Answer b

$-\frac{1}{8}$

Exercise 4.14.22

Simplify:

a. $\frac{5}{6} \div\left(-\frac{1}{4}\right)$

b. $\frac{5}{6}-\left(-\frac{1}{4}\right)$

Answer a

$-\frac{10}{3}$

Answer b

$\frac{13}{12}$

Example 4.14.12: simplify

Simplify:

a. $\frac{5x}{6}-\frac{3}{10}$

b. $\frac{5x}{6} \cdot \frac{3}{10}$

Solution

a. The operation is subtraction. The fractions do not have a common denominator.

Rewrite each fraction as an equivalent fraction with the LCD, 30.	$\frac{5x \cdot 5}{6 \cdot 5}-\frac{3 \cdot 3}{10 \cdot 3}$

	$\frac{25x}{30}-\frac{9}{30}$
Subtract the numerators and place the difference over the common denominator.	$\frac{25x-9}{30}$

b. The operation is multiplication; no need for a common denominator.

To multiply fractions, multiply the numerators and multiply the denominators.	$\frac{5x\cdot 3}{6\cdot 10}$
Rewrite, showing common factors.	$\frac{\cancel{5}\cdot x\cdot \cancel{3}}{2\cdot \cancel{3}\cdot 2\cdot \cancel{5}}$
Remove common factors to simplify.	$\frac{x}{4}$

? Exercise 4.14.23

Simplify:

a. $\frac{3a}{4}-\frac{8}{9}$

b. $\frac{3a}{4}\cdot\frac{8}{9}$

Answer a

$\frac{27a-32}{36}$

Answer b

$\frac{2a}{3}$

? Exercise 4.14.24

Simplify:

a. $\frac{4k}{5}+\frac{5}{6}$

b. $\frac{4k}{5}\div\frac{5}{6}$

Answer a

$\frac{24k+25}{30}$

Answer b

$\frac{24k}{25}$

Use the Order of Operations to Simplify Complex Fractions

In Multiply and Divide Mixed Numbers and Complex Fractions, we saw that a complex fraction is a fraction in which the numerator or denominator contains a fraction. We simplified complex fractions by rewriting them as division problems. For example,

$$\frac{\frac{3}{4}}{\frac{5}{8}} = \frac{3}{4} \div \frac{5}{8}$$

Now we will look at complex fractions in which the numerator or denominator can be simplified. To follow the order of operations, we simplify the numerator and denominator separately first. Then we divide the numerator by the denominator.

HOW TO: SIMPLIFY COMPLEX FRACTIONS

Step 1. Simplify the numerator.

Step 2. Simplify the denominator.

Step 3. Divide the numerator by the denominator.

Step 4. Simplify if possible.

Example 4.14.13: simplify

Simplify: $\frac{\left(\frac{1}{2}\right)^2}{4+3^2}$.

Solution

Simplify the numerator.	$\frac{\frac{1}{4}}{4+3^2}$
Simplify the term with the exponent in the denominator.	$\frac{\frac{1}{4}}{4+9}$
Add the terms in the denominator.	$\frac{\frac{1}{4}}{13}$
Divide the numerator by the denominator.	$\frac{1}{4} \div 13$
Rewrite as multiplication by the reciprocal.	$\frac{1}{4} \cdot \frac{1}{13}$
Multiply.	$\frac{1}{52}$

Exercise 4.14.25

Simplify: $\frac{\left(\frac{1}{3}\right)^2}{2^3+2}$.

Answer

$\frac{1}{90}$

Exercise 4.14.26

Simplify: $\dfrac{1+4^2}{\left(\frac{1}{4}\right)^2}$.

Answer

272

Example 4.14.14: simplify

Simplify: $\dfrac{\frac{1}{2}+\frac{2}{3}}{\frac{3}{4}-\frac{1}{6}}$.

Solution

Rewrite numerator with the LCD of 6 and denominator with LCD of 12.	$\dfrac{\frac{3}{6}+\frac{4}{6}}{\frac{9}{12}-\frac{2}{12}}$
Add in the numerator. Subtract in the denominator.	$\dfrac{\frac{7}{6}}{\frac{7}{12}}$
Divide the numerator by the denominator.	$\frac{7}{6} \div \frac{7}{12}$
Rewrite as multiplication by the reciprocal.	$\frac{7}{6} \cdot \frac{12}{7}$
Rewrite, showing common factors.	$\dfrac{\cancel{7} \cdot \cancel{6} \cdot 2}{\cancel{6}\cancel{7} \cdot 1}$
Simplify.	2

Exercise 4.14.27

Simplify: $\dfrac{\frac{1}{3}+\frac{1}{2}}{\frac{3}{4}-\frac{1}{3}}$.

Answer

2

Exercise 4.14.28

Simplify: $\dfrac{\frac{2}{3}-\frac{1}{2}}{\frac{1}{4}+\frac{1}{3}}$.

Answer

$\frac{2}{7}$

Evaluate Variable Expressions with Fractions

We have evaluated expressions before, but now we can also evaluate expressions with fractions. Remember, to evaluate an expression, we substitute the value of the variable into the expression and then simplify.

Example 4.14.15: evaluate

Evaluate $x+\frac{1}{3}$ when

a. $x=-\frac{1}{3}$

b. $x=-\frac{3}{4}$

Solution

a. To evaluate $x+\frac{1}{3}$ when $x=-\frac{1}{3}$, substitute $-\frac{1}{3}$ for x in the expression.

Substitute $-\frac{1}{3}$ for x.	$-\frac{1}{3}+\frac{1}{3}$
Simplify.	0

b. To evaluate $x+\frac{1}{3}$ when $x=-\frac{3}{4}$, we substitute $-\frac{3}{4}$ for x in the expression.

Substitute $-\frac{3}{4}$ for x.	$-\frac{1}{3}+\frac{1}{3}$
Rewrite as equivalent fractions with the LCD, 12.	$-\frac{3\cdot 3}{4\cdot 3}+\frac{1\cdot 4}{3\cdot 4}$
Simplify the numerators and denominators.	$-\frac{9}{12}+\frac{4}{12}$
Add.	$-\frac{5}{12}$

Exercise 4.14.29

Evaluate $x+\frac{3}{4}$ when:

a. $x=-\frac{7}{4}$

b. $x=-\frac{5}{4}$

Answer a

-1

Answer b

$-\frac{1}{2}$

Exercise 4.14.30

Evaluate $y+\frac{1}{2}$ when:

a. $y=\frac{2}{3}$

b. $y=-\frac{3}{4}$

Answer a

$\frac{7}{6}$

Answer b

$-\frac{1}{4}$

Example 4.14.16: evaluate

Evaluate $y-\frac{5}{6}$ when $y=-\frac{2}{3}$.

Solution

We substitute $-\frac{2}{3}$ for y in the expression.

Substitute $-\frac{2}{3}$ for y.	$-\frac{2}{3}-\frac{5}{6}$
Rewrite as equivalent fractions with the LCD, 6.	$-\frac{4}{6}-\frac{5}{6}$
Subtract.	$-\frac{9}{6}$
Simplify.	$-\frac{3}{2}$

Exercise 4.14.31

Evaluate $y-\frac{1}{2}$ when $y=-\frac{1}{4}$.

Answer

$-\frac{3}{4}$

Exercise 4.14.32

Evaluate $x-\frac{3}{8}$ when $x=-\frac{5}{2}$.

Answer

$-\frac{23}{8}$

Example 4.14.17:

Evaluate $2x^2y$ when $x = \frac{1}{4}$ and $y = -\frac{2}{3}$.

Solution

Substitute the values into the expression. In $2x^2y$, the exponent applies only to x.

Substitute $\frac{1}{4}$ for x and $-\frac{2}{3}$ for y.	$2\left(\frac{1}{4}\right)^2\left(-\frac{2}{3}\right)$
Simplify exponents first.	$2\left(\frac{1}{16}\right)\left(-\frac{2}{3}\right)$
Multiply. The product will be negative.	$-\frac{2}{1}\cdot\frac{1}{16}\cdot\frac{2}{3}$
Simplify.	$-\frac{4}{48}$
Remove the common factors.	$-\frac{1\cdot\cancel{4}}{\cancel{4}\cdot 12}$
Simplify.	$-\frac{1}{12}$

Exercise 4.14.33

Evaluate: $3ab^2$ when $a = -\frac{2}{3}$ and $b = -\frac{1}{2}$.

Answer

$-\frac{1}{2}$

Exercise 4.14.34

Evaluate: $4c^3d$ when $c = -\frac{1}{2}$ and $d = -\frac{4}{3}$.

Answer

$\frac{2}{3}$

Example 4.14.18: evaluate

Evaluate: $\frac{p+q}{r}$ when $p = -4$, $q = -2$, and $r = 8$.

Solution

We substitute the values into the expression and simplify.

Substitute -4 for p, -2 for q and 8 for r.	$\frac{-4+(-2)}{8}$
Add in the numerator first.	$-\frac{6}{8}$
Simplify.	$-\frac{3}{4}$

Exercise 4.14.35

Evaluate: $\frac{a+b}{c}$ when $a=-8$, $b=-7$, and $c=6$.

Answer

$-\frac{5}{2}$

Exercise 4.14.36

Evaluate: $\frac{x+y}{z}$ when $x=9$, $y=-18$, and $z=-6$.

Answer

$\frac{3}{2}$

Practice Makes Perfect

Find the Least Common Denominator (LCD)

In the following exercises, find the least common denominator (LCD) for each set of fractions.

316. $\frac{2}{3}$ and $\frac{3}{4}$
317. $\frac{3}{4}$ and $\frac{2}{5}$
318. $\frac{7}{12}$ and $\frac{5}{8}$
319. $\frac{9}{16}$ and $\frac{7}{12}$
320. $\frac{13}{30}$ and $\frac{25}{42}$
321. $\frac{23}{30}$ and $\frac{5}{48}$
322. $\frac{21}{35}$ and $\frac{39}{56}$
323. $\frac{18}{35}$ and $\frac{33}{49}$
324. $\frac{2}{3}$, $\frac{1}{6}$ and $\frac{3}{4}$
325. $\frac{2}{3}$, $\frac{1}{4}$ and $\frac{3}{5}$

Convert Fractions to Equivalent Fractions with the LCD

In the following exercises, convert to equivalent fractions using the LCD.

326. $\frac{1}{3}$ and $\frac{1}{4}$, LCD = 12
327. $\frac{1}{4}$ and $\frac{1}{5}$, LCD = 20
328. $\frac{5}{12}$ and $\frac{7}{8}$, LCD = 24
329. $\frac{7}{12}$ and $\frac{5}{8}$, LCD = 24
330. $\frac{13}{16}$ and $-\frac{11}{12}$, LCD = 48
331. $\frac{11}{16}$ and $-\frac{5}{12}$, LCD = 48

332. $\frac{1}{3}$, $\frac{5}{6}$, and $\frac{3}{4}$, LCD = 12
333. $\frac{1}{3}$, $\frac{3}{4}$, and $\frac{3}{5}$, LCD = 60

Add and Subtract Fractions with Different Denominators

In the following exercises, add or subtract. Write the result in simplified form.

334. $\frac{1}{3}+\frac{1}{5}$
335. $\frac{1}{4}+\frac{1}{5}$
336. $\frac{1}{2}+\frac{1}{7}$
337. $\frac{1}{3}+\frac{1}{8}$
338. $\frac{1}{3}-\left(-\frac{1}{9}\right)$
339. $\frac{1}{4}-\left(-\frac{1}{8}\right)$
340. $\frac{1}{5}-\left(-\frac{1}{10}\right)$
341. $\frac{1}{2}-\left(-\frac{1}{6}\right)$
342. $\frac{2}{3}+\frac{3}{4}$
343. $\frac{3}{4}+\frac{2}{5}$
344. $\frac{7}{12}+\frac{5}{8}$
345. $\frac{5}{12}+\frac{3}{8}$
346. $\frac{7}{12}-\frac{9}{16}$
347. $\frac{7}{16}-\frac{5}{12}$
348. $\frac{11}{12}-\frac{3}{8}$
349. $\frac{5}{8}-\frac{7}{12}$
350. $\frac{2}{3}-\frac{3}{8}$
351. $\frac{5}{6}-\frac{3}{4}$
352. $-\frac{11}{30}+\frac{27}{40}$
353. $-\frac{9}{20}+\frac{17}{30}$
354. $-\frac{13}{30}+\frac{25}{42}$
355. $-\frac{23}{30}+\frac{5}{48}$
356. $-\frac{39}{56}-\frac{22}{35}$
357. $-\frac{33}{49}-\frac{18}{35}$
358. $-\frac{2}{3}-\left(-\frac{3}{4}\right)$
359. $-\frac{3}{4}-\left(-\frac{4}{5}\right)$

360. $-\frac{9}{16}-\left(-\frac{4}{5}\right)$
361. $-\frac{7}{20}-\left(-\frac{5}{8}\right)$
362. $1+\frac{7}{8}$
363. $1+\frac{5}{6}$
364. $1-\frac{5}{9}$
365. $1-\frac{3}{10}$
366. $\frac{x}{3}+\frac{1}{4}$
367. $\frac{y}{2}+\frac{2}{3}$
368. $\frac{y}{4}-\frac{3}{5}$
369. $\frac{x}{5}-\frac{1}{4}$

Identify and Use Fraction Operations

In the following exercises, perform the indicated operations. Write your answers in simplified form.

370. (a) $\frac{3}{4}+\frac{1}{6}$ (b) $\frac{3}{4}\div\frac{1}{6}$
371. (a) $\frac{2}{3}+\frac{1}{6}$ (b) $\frac{2}{3}\div\frac{1}{6}$
372. (a) $-\frac{2}{5}-\frac{1}{8}$ (b) $-\frac{2}{5}\cdot\frac{1}{8}$
373. (a) $-\frac{4}{5}-\frac{1}{8}$ (b) $-\frac{4}{5}\cdot\frac{1}{8}$
374. (a) $\frac{5n}{6}\div\frac{8}{15}$ (b) $\frac{5n}{6}-\frac{8}{15}$
375. (a) $\frac{3a}{8}\div\frac{7}{12}$ (b) $\frac{3a}{8}-\frac{7}{12}$
376. (a) $\frac{9}{10}\cdot\left(-\frac{11d}{12}\right)$ (b) $\frac{9}{10}+\left(-\frac{11d}{12}\right)$
377. (a) $\frac{4}{15}\cdot\left(-\frac{5}{q}\right)$ (b) $\frac{4}{15}+\left(-\frac{5}{q}\right)$
378. $-\frac{3}{8}\div\left(-\frac{3}{10}\right)$
379. $-\frac{5}{12}\div\left(-\frac{5}{9}\right)$
380. $-\frac{3}{8}+\frac{5}{12}$
381. $-\frac{1}{8}+\frac{7}{12}$
382. $\frac{5}{6}-\frac{1}{9}$
383. $\frac{5}{9}-\frac{1}{6}$
384. $\frac{3}{8}\cdot\left(-\frac{10}{21}\right)$
385. $\frac{7}{12}\cdot\left(-\frac{8}{35}\right)$
386. $-\frac{7}{15}-\frac{y}{4}$
387. $-\frac{3}{8}-\frac{x}{11}$

388. $\frac{11}{12a} \cdot \frac{9a}{16}$

389. $\frac{10y}{13} \cdot \frac{8}{15y}$

Use the Order of Operations to Simplify Complex Fractions

In the following exercises, simplify.

390. $\frac{\left(\frac{1}{5}\right)^2}{2+3^2}$

391. $\frac{\left(\frac{1}{3}\right)^2}{5+2^2}$

392. $\frac{2^3+4^2}{\left(\frac{2}{3}\right)^2}$

393. $\frac{3^3-3^2}{\left(\frac{3}{4}\right)^2}$

394. $\frac{\left(\frac{3}{5}\right)^2}{\left(\frac{3}{7}\right)^2}$

395. $\frac{\left(\frac{3}{4}\right)^2}{\left(\frac{5}{8}\right)^2}$

396. $\frac{2}{\frac{1}{3}+\frac{1}{5}}$

397. $\frac{5}{\frac{1}{4}+\frac{1}{3}}$

398. $\frac{\frac{2}{3}+\frac{1}{2}}{\frac{3}{4}-\frac{2}{3}}$

399. $\frac{\frac{3}{4}+\frac{1}{2}}{\frac{5}{6}-\frac{2}{3}}$

400. $\frac{\frac{7}{8}-\frac{2}{3}}{\frac{1}{2}+\frac{3}{8}}$

401. $\frac{\frac{3}{4}-\frac{3}{5}}{\frac{1}{4}+\frac{2}{5}}$

Mixed Practice

In the following exercises, simplify.

402. $\frac{1}{2}+\frac{2}{3}\cdot\frac{5}{12}$
403. $\frac{1}{3}+\frac{2}{5}\cdot\frac{3}{4}$
404. $1-\frac{3}{5}\div\frac{1}{10}$
405. $1-\frac{5}{6}\div\frac{1}{12}$
406. $\frac{2}{3}+\frac{1}{6}+\frac{3}{4}$
407. $\frac{2}{3}+\frac{1}{4}+\frac{3}{5}$
408. $\frac{3}{8}-\frac{1}{6}+\frac{3}{4}$
409. $\frac{2}{5}+\frac{5}{8}-\frac{3}{4}$
410. $12\left(\frac{9}{20}-\frac{4}{15}\right)$
411. $8\left(\frac{15}{16}-\frac{5}{6}\right)$
412. $\dfrac{\frac{5}{8}+\frac{1}{6}}{\frac{19}{24}}$
413. $\dfrac{\frac{1}{6}+\frac{3}{10}}{\frac{14}{30}}$
414. $\left(\frac{5}{9}+\frac{1}{6}\right)\div\left(\frac{2}{3}-\frac{1}{2}\right)$
415. $\left(\frac{3}{4}+\frac{1}{6}\right)\div\left(\frac{5}{8}-\frac{1}{3}\right)$

In the following exercises, evaluate the given expression. Express your answers in simplified form, using improper fractions if necessary.

416. $x+\frac{1}{2}$ when
    a. $x=-\frac{1}{8}$
    b. $x=-\frac{1}{2}$
417. $x+\frac{2}{3}$ when
    a. $x=-\frac{1}{6}$
    b. $x=-\frac{5}{3}$
418. $x+\left(-\frac{5}{6}\right)$ when
    a. $x=\frac{1}{3}$
    b. $x=-\frac{1}{6}$
419. $x+\left(-\frac{11}{12}\right)$ when
    a. $x=\frac{11}{12}$

b. $x = \frac{3}{4}$

420. $x - \frac{2}{5}$ when

a. $x = \frac{3}{5}$

b. $x = -\frac{3}{5}$

421. $x - \frac{1}{3}$ when

a. $x = \frac{2}{3}$

b. $x = -\frac{2}{3}$

422. $\frac{7}{10} - w$ when

a. $w = \frac{1}{2}$

b. $w = -\frac{1}{2}$

423. $\frac{5}{12} - w$ when

a. $w = \frac{1}{4}$

b. $w = -\frac{1}{4}$

424. $4p^2q$ when $p = -\frac{1}{2}$ and $q = \frac{5}{9}$

425. $5m^2n$ when $m = -\frac{2}{5}$ and $n = \frac{1}{3}$

426. $2x^2y^3$ when $x = -\frac{2}{3}$ and $y = -\frac{1}{2}$

427. $8u^2v^3$ when $u = -\frac{3}{4}$ and $v = -\frac{1}{2}$

428. $\frac{u+v}{w}$ when $u = -4$, $v = -8$, $w = 2$

429. $\frac{m+n}{p}$ when $m = -6$, $n = -2$, $p = 4$

430. $\frac{a+b}{a-b}$ when $a = -3$, $b = 8$

431. $\frac{r-s}{r+s}$ when $r = 10$, $s = -5$

Everyday Math

432. **Decorating** Laronda is making covers for the throw pillows on her sofa. For each pillow cover, she needs $\frac{3}{16}$ yard of print fabric and $\frac{3}{8}$ yard of solid fabric. What is the total amount of fabric Laronda needs for each pillow cover?

433. **Baking** Vanessa is baking chocolate chip cookies and oatmeal cookies. She needs $1\frac{1}{4}$ cups of sugar for the chocolate chip cookies, and $1\frac{1}{8}$ cups for the oatmeal cookies How much sugar does she need altogether?

Writing Exercises

434. Explain why it is necessary to have a common denominator to add or subtract fractions.

435. Explain how to find the LCD of two fractions.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add and subtract fractions with different denominators.			
identify and use fraction operations.			
use the order of operations to simplify complex fractions.			
evaluate variable expressions with fractions.			

(b) After looking at the checklist, do you think you are well prepared for the next section? Why or why not?

4.15: Add and Subtract Mixed Numbers (Part 1)

Learning Objectives

- Model addition of mixed numbers with a common denominator
- Add mixed numbers with a common denominator
- Model subtraction of mixed numbers
- Subtract mixed numbers with a common denominator
- Add and subtract mixed numbers with different denominators

be prepared!

Before you get started, take this readiness quiz.

1. Draw figure to model $\frac{7}{3}$. If you missed this problem, review Example 4.1.6.
2. Change $\frac{11}{4}$ to a mixed number. If you missed this problem, review Example 4.1.9.
3. Change $3\frac{1}{2}$ to an improper fraction. If you missed this problem, review Example 4.1.11.

Model Addition of Mixed Numbers with a Common Denominator

So far, we've added and subtracted proper and improper fractions, but not mixed numbers. Let's begin by thinking about addition of mixed numbers using money.

If Ron has 1 dollar and 1 quarter, he has $1\frac{1}{4}$ dollars. If Don has 2 dollars and 1 quarter, he has $2\frac{1}{4}$ dollars. What if Ron and Don put their money together? They would have 3 dollars and 2 quarters. They add the dollars and add the quarters. This makes $3\frac{2}{4}$ dollars. Because two quarters is half a dollar, they would have 3 and a half dollars, or $3\frac{1}{2}$ dollars.

$$\begin{array}{r} 1\frac{1}{4} \\ +2\frac{1}{4} \\ \hline \end{array}$$

$$3\frac{2}{4} = 3\frac{1}{2}$$

When you added the dollars and then added the quarters, you were adding the whole numbers and then adding the fractions.

$$1\frac{1}{4} + 2\frac{1}{4}$$

We can use fraction circles to model this same example:

Start with $1\frac{1}{4}$.	one whole and one $\frac{1}{4}$ pieces		$1\frac{1}{4}$
Add $2\frac{1}{4}$ more.	two wholes and one $\frac{1}{4}$ pieces		$+2\frac{1}{4}$
The sum is:	three wholes and two $\frac{1}{4}$'s		$3\frac{2}{4} = 3\frac{1}{2}$

Example 4.15.1: model

Model $2\frac{1}{3} + 1\frac{2}{3}$ and give the sum.

Solution

We will use fraction circles, whole circles for the whole numbers and $\frac{1}{3}$ pieces for the fractions.

two wholes and one $\frac{1}{3}$		$2\frac{1}{3}$
plus one whole and two $\frac{1}{3}$s		$+1\frac{2}{3}$
sum is three wholes and three $\frac{1}{3}$s		$3\frac{3}{3} = 4$

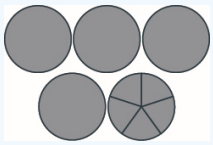
This is the same as 4 wholes. So, $2\frac{1}{3}+1\frac{2}{3}=4$.

Exercise 4.15.1

Use a model to add the following. Draw a picture to illustrate your model. $1\frac{2}{5}+3\frac{3}{5}$

Answer

5

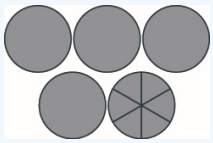


Exercise 4.15.2

Use a model to add the following. Draw a picture to illustrate your model. $2\frac{1}{6}+2\frac{5}{6}$

Answer

5



Example 4.15.2: model

Model $1\frac{3}{5}+2\frac{3}{5}$ and give the sum as a mixed number.

Solution

We will use fraction circles, whole circles for the whole numbers and $\frac{1}{5}$ pieces for the fractions.

one whole and three $\frac{1}{5}$s		$1\frac{3}{5}$
plus two wholes and three $\frac{1}{5}$s	+	$+2\frac{3}{5}$
sum is three wholes and six $\frac{1}{5}$s		$3\frac{6}{5}=4\frac{1}{5}$

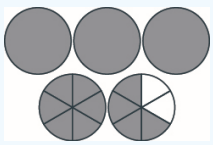
Adding the whole circles and fifth pieces, we got a sum of $3\frac{6}{5}$. We can see that $\frac{6}{5}$ is equivalent to $1\frac{1}{5}$, so we add that to the 3 to get $4\frac{1}{5}$.

Exercise 4.15.3

Model, and give the sum as a mixed number. Draw a picture to illustrate your model. $2\frac{5}{6}+1\frac{5}{6}$

Answer

$4\frac{2}{3}$

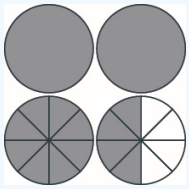


Exercise 4.15.4

Model, and give the sum as a mixed number. Draw a picture to illustrate your model. $1\frac{5}{8}+1\frac{7}{8}$

Answer

$3\frac{1}{2}$



Add Mixed Numbers

Modeling with fraction circles helps illustrate the process for adding mixed numbers: We add the whole numbers and add the fractions, and then we simplify the result, if possible.

HOW TO: ADD MIXED NUMBERS WITH A COMMON DENOMINATOR

Step 1. Add the whole numbers.

Step 2. Add the fractions.

Step 3. Simplify, if possible.

Example 4.15.3: add

Add: $3\frac{4}{9}+2\frac{2}{9}$.

Solution

Add the whole numbers.	$\begin{array}{r} 3\frac{4}{9} \\ +2\frac{2}{9} \\ \hline 5 \end{array}$
Add the fractions.	$\begin{array}{r} 3\frac{4}{9} \\ +2\frac{2}{9} \\ \hline 5\frac{6}{9} \end{array}$
Simplify the fraction.	$\begin{array}{r} 3\frac{4}{9} \\ +2\frac{2}{9} \\ \hline 5\frac{6}{9}=5\frac{2}{3} \end{array}$

Exercise 4.15.5

Find the sum: $4\frac{4}{7}+1\frac{2}{7}$.

Answer

$5\frac{6}{7}$

Exercise 4.15.6

Find the sum: $2\frac{3}{11}+5\frac{6}{11}$.

Answer

$7\frac{9}{11}$

In Example 4.15.3, the sum of the fractions was a proper fraction. Now we will work through an example where the sum is an improper fraction.

Example 4.15.4: add

Find the sum: $9\frac{5}{9}+5\frac{7}{9}$.

Solution

Add the whole numbers and then add the fractions.	$\begin{array}{r} 9\frac{5}{9} \\ +5\frac{7}{9} \\ \hline 14\frac{12}{9} \end{array}$
Rewrite $\frac{12}{9}$ as an improper fraction.	$14+1\frac{3}{9}$
Add.	$15\frac{3}{9}$
Simplify.	$15\frac{1}{3}$

Exercise 4.15.7

Find the sum: $8\frac{7}{8}+7\frac{5}{8}$.

Answer

$16\frac{1}{2}$

Exercise 4.15.8

Find the sum: $6\frac{7}{9}+8\frac{5}{9}$.

Answer

$15\frac{1}{3}$

An alternate method for adding mixed numbers is to convert the mixed numbers to improper fractions and then add the improper fractions. This method is usually written horizontally.

Example 4.15.5: add

Add by converting the mixed numbers to improper fractions: $3\frac{7}{8}+4\frac{3}{8}$.

Solution

Convert to improper fractions.	$\frac{31}{8}+\frac{35}{8}$
Add the fractions.	$\frac{31+35}{8}$
Simplify the numerator.	$\frac{66}{8}$
Rewrite as a mixed number.	$8\frac{2}{8}$
Simplify the fraction.	$8\frac{1}{4}$

Since the problem was given in mixed number form, we will write the sum as a mixed number.

Exercise 4.15.9

Find the sum by converting the mixed numbers to improper fractions: $5\frac{5}{9}+3\frac{7}{9}$

Answer

$9\frac{1}{3}$

Exercise 4.15.10

Find the sum by converting the mixed numbers to improper fractions: $3\frac{7}{10}+2\frac{9}{10}$

Answer

$6\frac{3}{5}$

Table 4.15.1 compares the two methods of addition, using the expression $3\frac{2}{5}+6\frac{4}{5}$ as an example. Which way do you prefer?

Table 4.15.1

Mixed Numbers	Improper Fractions
$\begin{array}{r} 3\frac{2}{5} \\ +6\frac{4}{5} \\ \hline 9\frac{6}{5} \end{array}$	$3\frac{2}{5}+6\frac{4}{5}$
$9+\frac{6}{5}$	$\frac{17}{5}+\frac{34}{5}$
$9+1\frac{1}{5}$	$\frac{51}{5}$
$10\frac{1}{5}$	$10\frac{1}{5}$

Model Subtraction of Mixed Numbers

Let's think of pizzas again to model subtraction of mixed numbers with a common denominator. Suppose you just baked a whole pizza and want to give your brother half of the pizza. What do you have to do to the pizza to give him half? You have to cut it into at least two pieces. Then you can give him half.

We will use fraction circles (pizzas!) to help us visualize the process. Start with one whole.

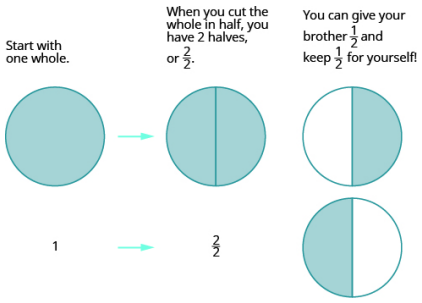


Figure 4.15.1

Algebraically, you would write:

$$\begin{array}{r} 1 \\ -\frac{1}{2} \end{array} \rightarrow \begin{array}{r} \frac{2}{2} \\ -\frac{1}{2} \end{array} \rightarrow \begin{array}{r} \frac{2}{2} \\ -\frac{1}{2} \\ \hline \frac{1}{2} \end{array}$$

Example 4.15.6: subtract

Use a model to subtract: $1-\frac{1}{3}$.

Solution

	Model	Math Notation
Rewrite vertically. Start with one whole.		$\begin{array}{r} 1 \\ -\frac{1}{3} \end{array}$
Since $\frac{1}{3}$ has denominator 3, cut the whole into 3 pieces. The 1 whole becomes $\frac{3}{3}$.		$\begin{array}{r} \frac{3}{3} \\ -\frac{1}{3} \end{array}$
Take away $\frac{1}{3}$. There are $\frac{2}{3}$ left.		$\begin{array}{r} \frac{3}{3} \\ -\frac{1}{3} \\ \hline \frac{2}{3} \end{array}$

Exercise 4.15.11

Use a model to subtract: $1-\frac{1}{4}$.

Answer

$\frac{3}{4}$

Exercise 4.15.12

Use a model to subtract: $1 - \frac{1}{5}$.

Answer

$\frac{4}{5}$

What if we start with more than one whole? Let's find out.

Example 4.15.7: subtract

Use a model to subtract: $2 - \frac{3}{4}$.

Solution

	Model	Math Notation
Rewrite vertically. Start with two wholes.		$\begin{array}{r} 2 \\ -\frac{3}{4} \\ \hline \end{array}$
Since $\frac{3}{4}$ has denominator 4, cut one of the wholes into 4 pieces. You have 1 whole and $\frac{4}{4}$.		$\begin{array}{r} 1\frac{4}{4} \\ -\frac{3}{4} \\ \hline \end{array}$
Take away $\frac{3}{4}$. There is $1\frac{1}{4}$ left.		$\begin{array}{r} 1\frac{4}{4} \\ -\frac{3}{4} \\ \hline 1\frac{1}{4} \end{array}$

Exercise 4.15.13

Use a model to subtract: $2 - \frac{1}{5}$.

Answer

$\frac{9}{5}$

Exercise 4.15.14

Use a model to subtract: $2 - \frac{1}{3}$.

Answer

$\frac{5}{3}$

In the next example, we'll subtract more than one whole.

Example 4.15.8: subtract

Use a model to subtract: $2 - 1\frac{2}{5}$.

Solution

	Model	Math Notation
Rewrite vertically. Start with two wholes.		$\begin{array}{r} 2 \\ -1\frac{2}{5} \\ \hline \end{array}$
Since $\frac{2}{5}$ has denominator 5, cut one of the wholes into 5 pieces. You have 1 whole and $\frac{5}{5}$.		$\begin{array}{r} 1\frac{5}{5} \\ -1\frac{2}{5} \\ \hline \end{array}$
Take away $1\frac{2}{5}$. There is $\frac{3}{5}$ left.		$\begin{array}{r} 1\frac{5}{5} \\ -1\frac{2}{5} \\ \hline \frac{3}{5} \end{array}$

Exercise 4.15.15

Use a model to subtract: $2-1\frac{1}{3}$.

Answer

$\frac{2}{3}$

Exercise 4.15.16

Use a model to subtract: $2-1\frac{1}{4}$.

Answer

$\frac{3}{4}$

What if you start with a mixed number and need to subtract a fraction? Think about this situation: You need to put three quarters in a parking meter, but you have only a $1 bill and one quarter. What could you do? You could change the dollar bill into 4 quarters. The value of 4 quarters is the same as one dollar bill, but the 4 quarters are more useful for the parking meter. Now, instead of having a $1 bill and one quarter, you have 5 quarters and can put 3 quarters in the meter.

This models what happens when we subtract a fraction from a mixed number. We subtracted three quarters from one dollar and one quarter.

We can also model this using fraction circles, much like we did for addition of mixed numbers.

Example 4.15.9: subtract

Use a model to subtract: $1\frac{1}{4}-\frac{3}{4}$

Solution

Rewrite vertically. Start with one whole and one fourth.		$\begin{array}{r} 1\frac{1}{4} \\ -\frac{3}{4} \\ \hline \end{array}$
Since the fractions have denominator 4, cut the whole into 4 pieces. You now have $\frac{4}{4}$ and $\frac{1}{4}$ which is $\frac{5}{4}$.		$\begin{array}{r} \frac{5}{4} \\ -\frac{3}{4} \\ \hline \end{array}$
Take away $\frac{3}{4}$. There is $\frac{1}{2}$ left.		\begin{split} & \dfrac{5}{4}\\\textcolor{red}{- & \dfrac}3}{4}}\\ \hline \\

Exercise 4.15.17

Use a model to subtract. Draw a picture to illustrate your model. $1\frac{1}{3}-\frac{2}{3}$

Answer

Exercise 4.15.18

Use a model to subtract. Draw a picture to illustrate your model. $1\frac{1}{5}-\frac{4}{5}$

Answer

4.16: Add and Subtract Mixed Numbers (Part 2)

Subtract Mixed Numbers with a Common Denominator

Now we will subtract mixed numbers without using a model. But it may help to picture the model in your mind as you read the steps.

HOW TO: Subtract mixed numbers with common denominators

Step 1. Rewrite the problem in vertical form.

Step 2. Compare the two fractions.

- If the top fraction is larger than the bottom fraction, go to Step 3.
- If not, in the top mixed number, take one whole and add it to the fraction part, making a mixed number with an improper fraction.

Step 3. Subtract the fractions.

Step 4. Subtract the whole numbers.

Step 5. Simplify, if possible.

Example 4.16.10: subtract

Find the difference: $5\frac{3}{5}-2\frac{4}{5}$.

Solution

Rewrite the problem in vertical form.	$5\frac{3}{5}$ $-2\frac{4}{5}$
Since $\frac{3}{5}$ is less than $\frac{4}{5}$, take 1 from the 5 and add it to the $\frac{3}{5}$: $\left(\frac{5}{5}+\frac{3}{5}=\frac{8}{5}\right)$	$5\frac{3}{5} \rightarrow 4\frac{8}{5}$ $-2\frac{4}{5} \quad -2\frac{4}{5}$
Subtract the fractions.	$4\frac{8}{5}$ $-2\frac{4}{5}$ $\frac{4}{5}$
Subtract the whole parts. The result is in simplest form.	$4\frac{8}{5}$ $-2\frac{4}{5}$ $2\frac{4}{5}$

Since the problem was given with mixed numbers, we leave the result as mixed numbers.

Exercise 4.16.19

Find the difference: $6\frac{4}{9}-3\frac{7}{9}$.

Answer

$2\frac{2}{3}$

Exercise 4.16.20

Find the difference: $4\frac{4}{7}-2\frac{6}{7}$.

Answer

$1\frac{5}{7}$

Just as we did with addition, we could subtract mixed numbers by converting them first to improper fractions. We should write the answer in the form it was given, so if we are given mixed numbers to subtract we will write the answer as a mixed number.

HOW TO: SUBTRACT MIXED NUMBERS WITH COMMON DENOMINATORS AS IMPROPER FRACTIONS

Step 1. Rewrite the mixed numbers as improper fractions.

Step 2. Subtract the numerators.

Step 3. Write the answer as a mixed number, simplifying the fraction part, if possible.

Example 4.16.11: subtract

Find the difference by converting to improper fractions: $9\frac{6}{11}-7\frac{10}{11}$.

Solution

Rewrite as improper fractions.	$\frac{105}{11}-\frac{87}{11}$
Subtract the numerators.	$\frac{18}{11}$
Rewrite as a mixed number.	$1\frac{7}{11}$

Exercise 4.16.21

Find the difference by converting to improper fractions: $6\frac{4}{9}-3\frac{7}{9}$.

Answer

$2\frac{2}{3}$

Exercise 4.16.22

Find the difference by converting to improper fractions: $4\frac{4}{7}-2\frac{6}{7}$.

Answer

$1\frac{5}{7}$

Add and Subtract Mixed Numbers with Different Denominators

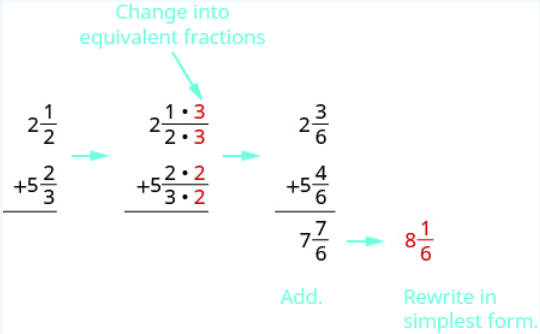
To add or subtract mixed numbers with different denominators, we first convert the fractions to equivalent fractions with the LCD. Then we can follow all the steps we used above for adding or subtracting fractions with like denominators.

Example 4.16.12: add

Add: $2\frac{1}{2}+5\frac{2}{3}$.

Solution

Since the denominators are different, we rewrite the fractions as equivalent fractions with the LCD, 6. Then we will add and simplify.



We write the answer as a mixed number because we were given mixed numbers in the problem.

Exercise 4.16.23

Add: $1\frac{5}{6}+4\frac{3}{4}$.

Answer

$6\frac{7}{12}$

Exercise 4.16.24

Add: $3\frac{4}{5}+8\frac{1}{2}$.

Answer

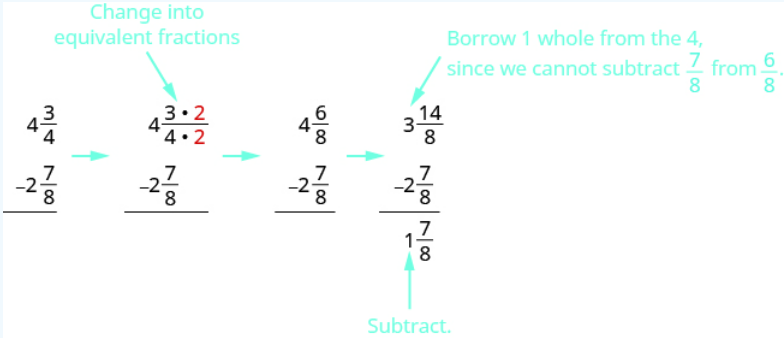
$12\frac{3}{10}$

Example 4.16.13: subtract

Subtract: $4\frac{3}{4}-2\frac{7}{8}$.

Solution

Since the denominators of the fractions are different, we will rewrite them as equivalent fractions with the LCD 8. Once in that form, we will subtract. But we will need to borrow 1 first.



We were given mixed numbers, so we leave the answer as a mixed number.

Exercise 4.16.25

Find the difference: $8\frac{1}{2}-3\frac{4}{5}$.

Answer

$4\frac{7}{10}$

Exercise 4.16.26

Find the difference: $4\frac{3}{4}-1\frac{5}{6}$.

Answer

$2\frac{11}{12}$

Example 4.16.14:

Subtract: $3\frac{5}{11}-4\frac{3}{4}$.

Solution

We can see the answer will be negative since we are subtracting 4 from 3. Generally, when we know the answer will be negative it is easier to subtract with improper fractions rather than mixed numbers.

Change to equivalent fractions with the LCD.	$3\frac{5\cdot 4}{11\cdot 4}-4\frac{3\cdot 11}{4\cdot 11}$ $3\frac{20}{44}-4\frac{33}{44}$
Rewrite as improper fractions.	$\frac{152}{44}-\frac{209}{44}$
Subtract.	$-\frac{57}{44}$

Rewrite as a mixed number.	$-1\frac{13}{44}$

Exercise 4.16.27

Subtract: $1\frac{3}{4}-6\frac{7}{8}$.

Answer

$-\frac{41}{8}$

Exercise 4.16.28

Subtract: $10\frac{3}{7}-22\frac{4}{9}$.

Answer

$-\frac{757}{63}$

Practice Makes Perfect

Model Addition of Mixed Numbers

In the following exercises, use a model to find the sum. Draw a picture to illustrate your model.

436. $1\frac{1}{5}+3\frac{1}{5}$
437. $2\frac{1}{3}+1\frac{1}{3}$
438. $1\frac{3}{8}+1\frac{7}{8}$
439. $1\frac{5}{6}+1\frac{5}{6}$

Add Mixed Numbers with a Common Denominator

In the following exercises, add.

440. $5\frac{1}{3}+6\frac{1}{3}$
441. $2\frac{4}{9}+5\frac{1}{9}$
442. $4\frac{5}{8}+9\frac{3}{8}$
443. $7\frac{9}{10}+3\frac{1}{10}$
444. $3\frac{4}{5}+6\frac{4}{5}$
445. $9\frac{2}{3}+1\frac{2}{3}$
446. $6\frac{9}{10}+8\frac{3}{10}$

447. $8\frac{4}{9}+2\frac{8}{9}$

Model Subtraction of Mixed Numbers

In the following exercises, use a model to find the difference. Draw a picture to illustrate your model.

448. $1\frac{1}{6}-\frac{1}{6}$
449. $1\frac{1}{8}-\frac{1}{8}$

Subtract Mixed Numbers with a Common Denominator

In the following exercises, find the difference.

450. $2\frac{7}{8}-1\frac{3}{8}$
451. $2\frac{7}{12}-1\frac{5}{12}$
452. $8\frac{3}{7}-4\frac{4}{7}$
453. $19\frac{13}{15}-13\frac{7}{15}$
454. $8\frac{3}{7}-4\frac{4}{7}$
455. $5\frac{2}{9}-3\frac{4}{9}$
456. $2\frac{5}{8}-1\frac{7}{8}$
457. $2\frac{5}{12}-1\frac{7}{12}$

Add and Subtract Mixed Numbers with Different Denominators

In the following exercises, write the sum or difference as a mixed number in simplified form.

458. $3\frac{1}{4}+6\frac{1}{3}$
459. $2\frac{1}{6}+5\frac{3}{4}$
460. $1\frac{5}{8}+4\frac{1}{2}$
461. $7\frac{2}{3}+8\frac{1}{2}$
462. $2\frac{5}{12}-1\frac{7}{12}$
463. $6\frac{4}{5}-1\frac{1}{4}$
464. $2\frac{2}{3}-3\frac{1}{2}$
465. $2\frac{7}{8}-4\frac{1}{3}$

Mixed Practice

In the following exercises, perform the indicated operation and write the result as a mixed number in simplified form.

466. $2\frac{5}{8}\cdot 1\frac{3}{4}$
467. $1\frac{2}{3}\cdot 4\frac{1}{6}$
468. $\frac{2}{7}+\frac{4}{7}$
469. $\frac{2}{9}+\frac{5}{9}$

470. $1\frac{5}{12} \div \frac{1}{12}$
471. $2\frac{3}{10} \div \frac{1}{10}$
472. $13\frac{5}{12} - 9\frac{7}{12}$
473. $15\frac{5}{8} - 6\frac{7}{8}$
474. $\frac{5}{9} - \frac{4}{9}$
475. $\frac{11}{15} - \frac{7}{15}$
476. $4 - \frac{3}{4}$
477. $6 - \frac{2}{5}$
478. $\frac{9}{20} \div \frac{3}{4}$
479. $\frac{7}{24} \div \frac{14}{3}$
480. $9\frac{6}{11} + 7\frac{10}{11}$
481. $8\frac{5}{13} + 4\frac{9}{13}$
482. $3\frac{2}{5} + 5\frac{3}{4}$
483. $2\frac{5}{6} + 4\frac{1}{5}$
484. $\frac{8}{15} \cdot \frac{10}{19}$
485. $\frac{5}{12} \cdot \frac{8}{9}$
486. $6\frac{7}{8} - 2\frac{1}{3}$
487. $6\frac{5}{9} - 4\frac{2}{5}$
488. $5\frac{2}{9} - 4\frac{4}{5}$
489. $4\frac{3}{8} - 3\frac{2}{3}$

Everyday Math

490. **Sewing** Renata is sewing matching shirts for her husband and son. According to the patterns she will use, she needs $2\frac{3}{8}$ yards of fabric for her husband's shirt and $1\frac{1}{8}$ yards of fabric for her son's shirt. How much fabric does she need to make both shirts?
491. **Sewing** Pauline has $3\frac{1}{4}$ yards of fabric to make a jacket. The jacket uses $2\frac{2}{3}$ yards. How much fabric will she have left after making the jacket?
492. **Printing** Nishant is printing invitations on his computer. The paper is $8\frac{1}{2}$ inches wide, and he sets the print area to have a $1\frac{1}{2}$-inch border on each side. How wide is the print area on the sheet of paper?
493. **Framing a picture** Tessa bought a picture frame for her son's graduation picture. The picture is 8 inches wide. The picture frame is $2\frac{5}{8}$ inches wide on each side. How wide will the framed picture be?

Writing Exercises

494. Draw a diagram and use it to explain how to add $1\frac{5}{8} + 2\frac{7}{8}$.
495. Edgar will have to pay $3.75 in tolls to drive to the city.

a. Explain how he can make change from a $10 bill before he leaves so that he has the exact amount he needs.

b. How is Edgar's situation similar to how you subtract $10 - 3\frac{3}{4}$?

496. Add $4\frac{5}{12} + 3\frac{7}{8}$ twice, first by leaving them as mixed numbers and then by rewriting as improper fractions. Which method do you prefer, and why?

497. Subtract $3\frac{7}{8} - 4\frac{5}{12}$ twice, first by leaving them as mixed numbers and then by rewriting as improper fractions. Which method do you prefer, and why?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
model addition of mixed numbers common with a denominator.			
add mixed numbers with a common denominator.			
model subtraction of mixed numbers.			
subtract mixed numbers with a common denominator.			
add and subtract mixed numbers with different denominators.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

4.17: Complex Rational Expressions

Learning Objectives

- Simplify complex rational expressions by multiplying the numerator by the reciprocal of the divisor.
- Simplify complex rational expressions by multiplying numerator and denominator by the least common denominator (LCD).

Definitions

A complex fraction is a fraction where the numerator or denominator consists of one or more fractions. For example,

$$\frac{\frac{3}{4}}{\frac{1}{2}}$$

Simplifying such a fraction requires us to find an equivalent fraction with integer numerator and denominator. One way to do this is to divide. Recall that dividing fractions involves multiplying by the reciprocal of the divisor.

$$\frac{\frac{3}{4}}{\frac{1}{2}} = \frac{3}{\cancel{4}_{2}} \cdot \frac{\overset{1}{\cancel{2}}}{1} = \frac{3}{2} \qquad Method\ 1:\ using\ division$$

An alternative method for simplifying this complex fraction involves multiplying both the numerator and denominator by the LCD of all the given fractions. In this case, the LCD = 4.

$$\frac{\frac{3}{4} \cdot 4}{\frac{1}{2} \cdot 4} = \frac{3}{2} \qquad Method\ 2:\ using\ the\ LCD$$

A complex rational expression is defined as a rational expression that contains one or more rational expressions in the numerator or denominator or both. For example,

$$\frac{\frac{1}{2} + \frac{1}{x}}{\frac{1}{4} - \frac{1}{x^2}}$$

We simplify a complex rational expression by finding an equivalent fraction where the numerator and denominator are polynomials. As illustrated above, there are two methods for simplifying complex rational expressions, and we will outline the steps for both methods. For the sake of clarity, assume that variable expressions used as denominators are nonzero.

Method 1: Simplify Using Division

We begin our discussion on simplifying complex rational expressions using division. Before we can multiply by the reciprocal of the divisor, we must simplify the numerator and denominator separately. The goal is to first obtain single algebraic fractions in the numerator and the denominator. The steps for simplifying a complex algebraic fraction are illustrated in the following example.

Example 4.17.1

Simplify:

$$\frac{\frac{1}{2} + \frac{1}{x}}{\frac{1}{4} - \frac{1}{x^2}}$$

Solution:

Step 1: Simplify the numerator and denominator. The goal is to obtain a single algebraic fraction divided by another single algebraic fraction. In this example, find equivalent terms with a common denominator in both the numerator and denominator before adding and subtracting.

$$\frac{\frac{1}{2}+\frac{1}{x}}{\frac{1}{4}-\frac{1}{x^2}} = \frac{\frac{1}{2}\cdot\frac{x}{x}+\frac{1}{x}\cdot\frac{2}{2}}{\frac{1}{4}\cdot\frac{x^2}{x^2}-\frac{1}{x^2}\cdot\frac{4}{4}}$$

$$= \frac{\frac{x}{2x}+\frac{2}{2x}}{\frac{x^2}{4x^2}-\frac{4}{4x^2}}$$ *Equivalent fractions with common denominators*

$$= \frac{\frac{x+2}{2x}}{\frac{x^2-4}{4x^2}}$$ *Add the fractions in the numerator and denominator.*

At this point we have a single algebraic fraction divided by a single algebraic fraction.

Step 2: Multiply the numerator by the reciprocal of the divisor.

$$\frac{\frac{x+2}{2x}}{\frac{x^2-4}{4x^2}} = \frac{x+2}{2x}\cdot\frac{4x^2}{x^2-4}$$

Step 3: Factor all numerators and denominators completely.

$$= \frac{x+2}{2x}\cdot\frac{4x^2}{(x+2)(x-2)}$$

Step 4: Cancel all common factors.

$$= \frac{4x^2\cdot(x+2)}{2x(x+2)(x-2)}$$

$$= \frac{\overset{2x}{\cancel{4x^2}}\cdot\cancel{(x+2)}}{\cancel{2x}\cancel{(x+2)}(x-2)}$$

$$= \frac{2x}{(x-2)}$$

Answer:

$$\frac{2x}{x-2}$$

Example 4.17.2

Simplify:

Solution:

Answer:

$$-\frac{1}{2}$$

Example 4.17.3

Simplify:

$$\frac{1-\frac{4}{x}-\frac{21}{x^2}}{1-\frac{2}{x}-\frac{15}{x^2}}$$

Solution:

The LCD of the rational expressions in both the numerator and denominator is x^2. Multiply by the appropriate factors to obtain equivalent terms with this as the denominator and then subtract.

$$\begin{aligned}\frac{1-\frac{4}{x}-\frac{21}{x^2}}{1-\frac{2}{x}-\frac{15}{x^2}} &= \frac{\frac{1}{1}\cdot\frac{x^2}{x^2}-\frac{4}{x}\cdot\frac{x}{x}-\frac{21}{x^2}}{\frac{1}{1}\cdot\frac{x^2}{x^2}-\frac{2}{x}\cdot\frac{x}{x}-\frac{15}{x^2}} \\ &= \frac{\frac{x^2}{x^2}-\frac{4x}{x^2}-\frac{21}{x^2}}{\frac{x^2}{x^2}-\frac{2x}{x^2}-\frac{15}{x^2}} \\ &= \frac{\frac{x^2-4x-21}{x^2}}{\frac{x^2-2x-15}{x^2}}\end{aligned}$$

We now have a single rational expression divided by another single rational expression. Next, multiply the numerator by the reciprocal of the divisor and then factor and cancel.

Answer:

$\frac{x-7}{x-5}$

Example 4.17.4

Simplify:

$$\frac{1-\frac{1}{x^2}}{\frac{1}{x}-1}$$

Solution:

$$\begin{aligned}\frac{1-\frac{1}{x^2}}{\frac{1}{x}-1} &= \frac{\frac{1}{1}\cdot\frac{x^2}{x^2}-\frac{1}{x^2}}{\frac{1}{x}-\frac{1}{1}\cdot\frac{x}{x}} \\ &= \frac{\frac{x^2-1}{x^2}}{\frac{1-x}{x}} \\ &= \frac{x^2-1}{x^2}\cdot\frac{x}{1-x} \\ &= \frac{(x+1)\,(x-1)}{x^2}\cdot\frac{x}{-1\cdot\,(x-1)} \\ &= \frac{x+1}{-1\cdot x} \\ &= -\frac{x+1}{x}\end{aligned}$$

Answer:

$$-\frac{x+1}{x}$$

Exercise 4.17.1

Simplify:

$$\frac{\frac{1}{81}-\frac{1}{x^2}}{\frac{1}{9}+\frac{1}{x}}$$

Answer

$\frac{x-9}{9x}$

https://math.libretexts.org/@go/page/47244

Method 2: Simplify Using the LCD

An alternative method for simplifying complex rational expressions involves clearing the fractions by multiplying the expression by a special form of 1. In this method, multiply the numerator and denominator by the least common denominator (LCD) of all given fractions.

Example 4.17.5

Simplify:

$$\frac{\frac{1}{2}+\frac{1}{x}}{\frac{1}{4}-\frac{1}{x^2}}$$

Solution:

Step 1: Determine the LCD of all the fractions in the numerator and denominator. In this case, the denominators of the given fractions are $2, x, 4$, and x^2. Therefore, the LCD is $4x^2$.

Step 2: Multiply the numerator and denominator by the LCD. This step should clear the fractions in both the numerator and denominator.

$$\begin{aligned}\frac{\frac{1}{2}+\frac{1}{x}}{\frac{1}{4}-\frac{1}{x^2}} &= \frac{\left(\frac{1}{2}+\frac{1}{x}\right)\cdot 4x^2}{\left(\frac{1}{4}-\frac{1}{x^2}\right)\cdot 4x^2} && \textit{Distribute.}\\ &= \frac{\frac{1}{2}\cdot 4x^2+\frac{1}{x}\cdot 4x^2}{\frac{1}{4}\cdot 4x^2-\frac{1}{x^2}\cdot 4x^2} && \textit{Cancel.}\\ &= \frac{2x^2+4x}{x^2-4}\end{aligned}$$

This leaves us with a single algebraic fraction with a polynomial in the numerator and in the denominator.

Step 3: Factor the numerator and denominator completely.

$$\begin{aligned}&= \frac{2x^2+4x}{x^2-4}\\ &= \frac{2x(x+2)}{(x+2)(x-2)}\end{aligned}$$

Step 4: Cancel all common factors.

$$\begin{aligned}&= \frac{2x\,\cancel{(x+2)}}{\cancel{(x+2)}(x-2)}\\ &= \frac{2x}{x-2}\end{aligned}$$

Answer:

$$\frac{2x}{x-2}$$

Note

This was the same problem that we began this section with, and the results here are the same. It is worth taking the time to compare the steps involved using both methods on the same problem.

Example 4.17.6

Simplify:

$$\frac{1-\frac{2}{x}-\frac{15}{x^2}}{3-\frac{14}{x}-\frac{5}{x^2}}$$

Solution:

Considering all of the denominators, we find that the LCD is x^2. Therefore, multiply the numerator and denominator by x^2:

At this point, we have a rational expression that can be simplified by factoring and then canceling the common factors.

$$= \frac{(x+3)\,\cancel{(x-5)}}{(3x+1)\,\cancel{(x-5)}} \qquad \textit{Cancel.}$$

$$= \frac{x+3}{3x+1}$$

Answer:

$$\frac{x+3}{3x+1}$$

It is important to point out that multiplying the numerator and denominator by the same nonzero factor is equivalent to multiplying by 1 and does not change the problem. Because $\frac{x^2}{x^2} = 1$, we can multiply the numerator and denominator by x^2 in the previous example and obtain an equivalent expression.

Example 4.17.7

Simplify:

$$\frac{\frac{1}{x+1}+\frac{3}{x-3}}{\frac{2}{x-3}-\frac{1}{x+1}}$$

Solution:

The LCM of all the denominators is $(x+1)(x-3)$. Begin by multiplying the numerator and denominator by these factors.

$$\begin{aligned}
\frac{\frac{1}{x+1}+\frac{3}{x-3}}{\frac{2}{x-3}-\frac{1}{x+1}} &= \frac{\left(\frac{1}{x+1}+\frac{3}{x-3}\right)\cdot(x+1)(x-3)}{\left(\frac{2}{x-3}-\frac{1}{x+1}\right)\cdot(x+1)(x-3)} && \textit{Distribute.}\\
&= \frac{\frac{1\,\cancel{(x+1)}\,\cancel{(x-3)}}{\cancel{x+1}}+\frac{3(x+1)\,\cancel{(x-3)}}{\cancel{x-3}}}{\frac{2(x+1)\,\cancel{(x-3)}}{\cancel{x-3}}-\frac{1\,\cancel{(x+1)}\,\cancel{(x-3)}}{\cancel{x+1}}} && \textit{Cancel.}\\
&= \frac{(x-3)+3(x+1)}{2(x+1)-1(x-3)} && \textit{Simplify.}\\
&= \frac{x-3+3x+3}{2x+2-x+3}\\
&= \frac{4x}{x+5}
\end{aligned}$$

Answer:

$$\frac{4x}{x+5}$$

Exercise 4.17.2

Simplify:

$$\frac{\frac{1}{y}-\frac{1}{4}}{\frac{1}{16}-\frac{1}{y^2}}$$

Answer

$$-\frac{4y}{y+4}$$

Key Takeaways

- Complex rational expressions can be simplified into equivalent expressions with a polynomial numerator and polynomial denominator.

- One method of simplifying a complex rational expression requires us to first write the numerator and denominator as a single algebraic fraction. Then multiply the numerator by the reciprocal of the divisor and simplify the result.
- Another method for simplifying a complex rational expression requires that we multiply it by a special form of 1. Multiply the numerator and denominator by the LCM of all the denominators as a means to clear the fractions. After doing this, simplify the remaining rational expression.
- An algebraic fraction is reduced to lowest terms if the numerator and denominator are polynomials that share no common factors other than 1.

Exercise 4.17.3 Complex Rational Expressions

Simplify. (Assume all denominators are nonzero.)

1. $\frac{\frac{1}{2}}{\frac{5}{4}}$
2. $\frac{\frac{7}{8}}{\frac{5}{4}}$
3. $\frac{\frac{10}{3}}{\frac{20}{9}}$
4. $-\frac{\frac{4}{21}}{\frac{8}{7}}$
5. $\frac{\frac{2}{3}}{\frac{5}{6}}$
6. $\frac{\frac{7}{4}}{\frac{14}{3}}$
7. $\frac{1-\frac{3}{2}}{\frac{5}{4}-\frac{1}{3}}$
8. $\frac{\frac{1}{2}-5}{\frac{1}{2}+\frac{1}{3}}$
9. $\frac{1+\frac{3}{2}}{1-\frac{1}{4}}$
10. $\frac{2-\frac{1}{2}}{1+\frac{3}{4}}$
11. $\frac{\frac{5x^2}{x+1}}{\frac{25x}{x+1}}$
12. $\frac{\frac{7+x}{7x}}{\frac{x+7}{14x^2}}$
13. $\frac{\frac{3y}{x}}{\frac{y^2}{x-1}}$
14. $\frac{\frac{5a^2}{b-1}}{\frac{15a^3}{(b-1)^2}}$
15. $\frac{1+\frac{1}{x}}{2-\frac{1}{x}}$
16. $\frac{\frac{2}{x}+1}{3-\frac{1}{x}}$
17. $\frac{\frac{2}{3y}-4}{6-\frac{1}{y}}$
18. $\frac{\frac{5}{y-12}}{\frac{10-y}{y^2}}$
19. $\frac{\frac{1}{5}-\frac{1}{x}}{\frac{1}{25}-\frac{1}{x^2}}$
20. $\frac{\frac{1}{x}+\frac{1}{5}}{\frac{1}{25}-\frac{1}{x^2}}$
21. $\frac{\frac{1}{x}-\frac{1}{3}}{\frac{1}{9}-\frac{1}{x^2}}$

22. $\dfrac{\frac{1}{4}+\frac{1}{x}}{\frac{1}{x^2}-\frac{1}{16}}$
23. $\dfrac{16-\frac{1}{x^2}}{\frac{1}{x}-4}$
24. $\dfrac{2-\frac{1}{y}}{1-\frac{1}{4y^2}}$
25. $\dfrac{\frac{1}{x}+\frac{1}{y}}{\frac{1}{y^2}-\frac{1}{x^2}}$
26. $\dfrac{\frac{1}{2x}-\frac{4}{3}}{\frac{1}{4x^2}-\frac{16}{9}}$
27. $\dfrac{\frac{2}{25}-\frac{1}{2x^2}}{\frac{1}{5}-\frac{1}{2x}}$
28. $\dfrac{\frac{4}{25}-\frac{1}{4x^2}}{\frac{1}{5}+\frac{1}{4x}}$
29. $\dfrac{\frac{1}{y}-\frac{1}{x}}{4-\frac{2}{xy}}$
30. $\dfrac{\frac{1}{ab}+2}{\frac{1}{a}+\frac{1}{b}}$
31. $\dfrac{\frac{1}{y}+\frac{1}{x}}{xy}$
32. $\dfrac{\frac{3}{x}}{\frac{1}{3}-\frac{1}{x}}$
33. $\dfrac{1-\frac{4}{x}-\frac{21}{x^2}}{1-\frac{2}{x}-\frac{15}{x^2}}$
34. $\dfrac{1-\frac{3}{x}-\frac{4}{x^2}}{1-\frac{16}{x^2}}$
35. $\dfrac{3-\frac{1}{2x}-\frac{1}{2x^2}}{2-\frac{2}{x}+\frac{1}{2x^2}}$
36. $\dfrac{\frac{1}{2}-\frac{5}{x}+\frac{12}{x^2}}{\frac{1}{2}-\frac{6}{x}+\frac{18}{x^2}}$
37. $\dfrac{\frac{1}{x}-\frac{4}{3x^2}}{3-\frac{8}{x}+\frac{16}{3x^2}}$
38. $\dfrac{1+\frac{3}{10x}-\frac{1}{10x^2}}{\frac{3}{5}-\frac{1}{10x}-\frac{1}{5x^2}}$
39. $\dfrac{x-1}{1+\frac{4}{x}}-\dfrac{5}{x^2}$
40. $2-\dfrac{5}{2x}-\dfrac{3x}{24x+3}$
41. $\dfrac{\frac{1}{x-3}+\frac{2}{x}}{\frac{1}{x}-\frac{3}{x-3}}$
42. $\dfrac{\frac{14}{x}-5+\frac{1}{x^2}}{\frac{1}{x^2}+\frac{13}{x}-10}$
43. $\dfrac{\frac{1}{x+5}+\frac{4}{x-2}}{\frac{2}{x-2}-\frac{1}{x+5}}$
44. $\dfrac{\frac{3}{x-1}-\frac{2}{x+3}}{\frac{2}{x+3}+\frac{1}{x-3}}$
45. $\dfrac{\frac{x}{x+1}-\frac{2}{x+3}}{\frac{x}{3x+4}+\frac{1}{x+1}}$
46. $\dfrac{\frac{x}{x-9}+\frac{2}{x+1}}{\frac{x}{7x-9}-\frac{1}{x+1}}$
47. $\dfrac{\frac{x}{3x+2}-\frac{1}{x+2}}{\frac{x}{x+2}-\frac{2}{x+2}}$

48. $\frac{\frac{x}{x-4}+\frac{1}{x+2}}{\frac{x}{3x+4}+\frac{1}{x+2}}$
49. $\frac{\frac{a}{3-8b^3}}{\frac{2}{\frac{7}{a}-\frac{2}{b}}}$
50. $\frac{\frac{27a}{3+b^3}}{\frac{\frac{a}{b}}{3a+b}}$
51. $\frac{\frac{1}{b^3}+\frac{1}{a^3}}{\frac{1}{b}+\frac{1}{a}}$
52. $\frac{\frac{1}{b^3}-\frac{1}{a^3}}{\frac{1}{a}-\frac{1}{b}}$
53. $\frac{\frac{x^2+y^2}{\frac{x}{y}+2}}{\frac{x^2-y^2}{\frac{2}{xy}}}$
54. $\frac{x}{\frac{y+4+4yx}{xy+3+2yx}}$
55. $1+\frac{1}{1+\frac{1}{2}}$
56. $2-\frac{1}{1+\frac{1}{3}}$
57. $\frac{1}{1+\frac{1}{1+\frac{1}{1+x}}}$
58. $\frac{x+\frac{1}{x}}{1-\frac{1}{x}+1}$
59. $\frac{1-\frac{1}{x}}{x-\frac{1}{x}}$
60. $\frac{\frac{1}{x}-x}{x-\frac{1}{x^2}}$

Answer

1. $\frac{2}{5}$
3. $\frac{3}{2}$
5. $\frac{4}{5}$
7. $-\frac{6}{11}$
9. $\frac{10}{3}$
11. $\frac{x}{5}$
13. $\frac{3(x-1)}{yx}$
15. $\frac{x+1}{2x-1}$
17. $-\frac{2}{3}$
19. $\frac{5x}{x+5}$
21. $-\frac{3x}{x+3}$
23. $-\frac{4x+1}{x}$
25. $\frac{xy}{x-y}$
27. $\frac{2x+5}{5x}$
29. $\frac{x-y}{4xy-2}$
31. $\frac{x+y}{y^2x^2}$

33. $\frac{x-7}{x-5}$

35. $\frac{3x+1}{2x-1}$

37. $\frac{1}{3x-4}$

39. $\frac{x(x-1)}{x+4}-\frac{5}{x^2}$

41. $\frac{3x-6}{-2x-3}$

43. $\frac{5x+18}{x+12}$

45. $\frac{(x-1)(3x+4)}{(x+2)(x+3)}$

47. $\frac{x+1}{3x+2}$

49. $\frac{7b-2a}{2b\left(3-8b^3\right)}$

51. $\frac{a^2-ba+b^2}{b^2a^2}$

53. $\frac{2\left(x^2+y^2\right)}{x(x+2y)(x^2-y^2)}$

55. $\frac{5}{3}$

57. $\frac{x+1}{x+2}$

59. $\frac{1}{x+1}$

Exercise 4.17.4 Discussion Board Topics

1. Choose a problem from this exercise set and clearly work it out on paper, explaining each step in words. Scan your page and post it on the discussion board.
2. Explain why we need to simplify the numerator and denominator to a single algebraic fraction before multiplying by the reciprocal of the divisor.
3. Two methods for simplifying complex rational expressions have been presented in this section. Which of the two methods do you feel is more efficient, and why?

Answer

1. Answers may vary

3. Answers may vary

4.18: Solve Equations with Fractions (Part 1)

Learning Objectives

- Determine whether a fraction is a solution of an equation
- Solve equations with fractions using the Addition, Subtraction, and Division Properties of Equality
- Solve equations using the Multiplication Property of Equality
- Translate sentences to equations and solve

be prepared!

Before you get started, take this readiness quiz. If you miss a problem, go back to the section listed and review the material.

1. Evaluate $x+4$ when $x=-3$ If you missed this problem, review Example 3.2.10.
2. Solve: $2y-3=9$. If you missed this problem, review Example 3.5.2.
3. Solve: $y-3=-9$ If you missed this problem, review Example 4.2.10.

Determine Whether a Fraction is a Solution of an Equation

As we saw in Solve Equations with the Subtraction and Addition Properties of Equality and Solve Equations Using Integers; The Division Property of Equality, a solution of an equation is a value that makes a true statement when substituted for the variable in the equation. In those sections, we found whole number and integer solutions to equations. Now that we have worked with fractions, we are ready to find fraction solutions to equations.

The steps we take to determine whether a number is a solution to an equation are the same whether the solution is a whole number, an integer, or a fraction.

HOW TO: DETERMINE WHETHER A NUMBER IS A Solution TO AN EQUATION

Step 1. Substitute the number for the variable in the equation.

Step 2. Simplify the expressions on both sides of the equation.

Step 3. Determine whether the resulting equation is true. If it is true, the number is a solution. If it is not true, the number is not a solution.

Example 4.18.1: find solution

Determine whether each of the following is a solution of $x-\frac{3}{10}=\frac{1}{2}$.

a. $x=1$

b. $x=\frac{4}{5}$

c. $x=-\frac{4}{5}$

Solution

a.

Substitute 1 for x.	$1-\frac{3}{10}\stackrel{?}{=}\frac{1}{2}$
Change to fractions with a LCD of 10.	$\frac{10}{10}-\frac{3}{10}\stackrel{?}{=}\frac{5}{10}$
Subtract.	$\frac{7}{10}\stackrel{?}{=}\frac{5}{10}$

Since $x=1$ does not result in a true equation, 1 is not a solution to the equation.

b.

Substitute $\frac{4}{5}$ for x.	$\frac{4}{5}-\frac{3}{10}\stackrel{?}{=}\frac{1}{2}$
	$\frac{8}{10}-\frac{3}{10}\stackrel{?}{=}\frac{5}{10}$
Subtract.	$\frac{5}{10}=\frac{5}{10}$ ✓

Since $x=\frac{4}{5}$ results in a true equation, $\frac{4}{5}$ is a solution to the equation $x-\frac{3}{10}=\frac{1}{2}$.

c.

Substitute $-\frac{4}{5}$ for x.	$-\frac{4}{5}-\frac{3}{10}\stackrel{?}{=}\frac{1}{2}$
	$-\frac{8}{10}-\frac{3}{10}\stackrel{?}{=}\frac{5}{10}$
Subtract.	$\frac{11}{10}\neq\frac{5}{10}$

Since $x=-\frac{4}{5}$ does not result in a true equation, $-\frac{4}{5}$ is not a solution to the equation.

Exercise 4.18.1

Determine whether each number is a solution of the given equation. $x-\frac{2}{3}=\frac{1}{6}$

a. $x=1$
b. $x=\frac{5}{6}$
c. $x=-\frac{5}{6}$

Answer a

no

Answer b

yes

Answer c

no

Exercise 4.18.2

Determine whether each number is a solution of the given equation. $y-\frac{1}{4}=\frac{3}{8}$

a. $y=1$
b. $y=-\frac{5}{8}$
c. $y=\frac{5}{8}$

Answer a

no

Answer b

no

Answer c

yes

Solve Equations with Fractions using the Addition, Subtraction, and Division Properties of Equality

In Solve Equations with the Subtraction and Addition Properties of Equality and Solve Equations Using Integers; The Division Property of Equality, we solved equations using the Addition, Subtraction, and Division Properties of Equality. We will use these same properties to solve equations with fractions.

Addition, Subtraction, and Division Properties of Equality

For any numbers a, b, and c,

Table 4.18.1

if $a = b$, then $a + c = b + c$.	Addition Property of Equality
if $a = b$, then $a - c = b - c$.	Subtraction Property of Equality
if $a = b$, then $ac = bc$, $c \neq 0$.	Division Property of Equality

In other words, when you add or subtract the same quantity from both sides of an equation, or divide both sides by the same quantity, you still have equality.

Example 4.18.2: solve

Solve: $y + \frac{9}{16} = \frac{5}{16}$.

Solution

Subtract $\frac{9}{16}$ from each side to undo the addition.	$y + \frac{9}{16} - \frac{9}{16} = \frac{5}{16} - \frac{9}{16}$
Simplify on each side of the equation.	$y + 0 = -\frac{4}{16}$
Simplify the fraction.	$y = -\frac{1}{4}$

Check:

Substitute y = (− \dfrac{1}{4}\).	$-\frac{1}{4} + \frac{9}{16} \stackrel{?}{=} \frac{5}{16}$
Rewrite as fractions with the LCD.	\textcolor{red}{- \dfrac{4}{16}} + \dfrac{9}{16} \stackrel{?}{=} \dfrac{5}{16}\)
Add.	$\frac{5}{16} \stackrel{?}{=} \frac{5}{16}$ ✓

Since $y = -\frac{1}{4}$ makes $y + \frac{9}{16} = \frac{5}{16}$ a true statement, we know we have found the solution to this equation.

Exercise 4.18.3

Solve: $y + \frac{11}{12} = \frac{5}{12}$.

Answer

$-\frac{1}{2}$

Exercise 4.18.4

Solve: $y+\frac{8}{15}=\frac{4}{15}$.

Answer

$-\frac{4}{15}$

We used the Subtraction Property of Equality in Example 4.18.2 Now we'll use the Addition Property of Equality.

Example 4.18.3: solve

Solve: a $-\frac{5}{9}=-\frac{8}{9}$.

Solution

Add $\frac{5}{9}$ from each side to undo the addition.	$a-\frac{5}{9}+\frac{5}{9}=-\frac{8}{9}+\frac{5}{9}$
Simplify on each side of the equation.	$a+0=-\frac{3}{9}$
Simplify the fraction.	$a=-\frac{1}{3}$

Check:

Substitute a = $-\frac{1}{3}$.	$-\frac{1}{3}-\frac{5}{9}\stackrel{?}{=}-\frac{8}{9}$
Change to common denominator.	$-\frac{3}{9}-\frac{5}{9}\stackrel{?}{=}-\frac{8}{9}$
Subtract.	$-\frac{8}{9}=-\frac{8}{9}$ ✓

Since $a=-\frac{1}{3}$ makes the equation true, we know that $a=-\frac{1}{3}$ is the solution to the equation.

Exercise 4.18.5

Solve: $a-\frac{3}{5}=-\frac{8}{5}$.

Answer

-1

Exercise 4.18.6

Solve: $n-\frac{3}{7}=-\frac{9}{7}$.

Answer

$-\frac{6}{7}$

The next example may not seem to have a fraction, but let's see what happens when we solve it.

Example 4.18.4: solve

Solve: $10q = 44$.

Solution

Divide both sides by 10 to undo the multiplication.	$\frac{10q}{10} = \frac{44}{10}$
Simplify.	$q = \frac{22}{5}$

Check:

Substitute $q = \frac{22}{5}$ into the original equation.	$10\left(\frac{22}{5}\right) \stackrel{?}{=} 44$
Simplify.	$\cancel{10}^{2}\left(\frac{22}{\cancel{5}}\right) \stackrel{?}{=} 44$
Multiply.	$44 = 44$ ✓

The solution to the equation was the fraction $\frac{22}{5}$. We leave it as an improper fraction.

Exercise 4.18.7

Solve: $12u = -76$.

Answer

$-\frac{19}{3}$

Exercise 4.18.8

Solve: $8m = 92$.

Answer

$\frac{23}{2}$

Solve Equations with Fractions Using the Multiplication Property of Equality

Consider the equation $\frac{x}{4} = 3$. We want to know what number divided by 4 gives 3. So to "undo" the division, we will need to multiply by 4. The *Multiplication Property of Equality* will allow us to do this. This property says that if we start with two equal quantities and multiply both by the same number, the results are equal.

Definition: The Multiplication Property of Equality

For any numbers a, b, and c, if $a = b$, then $ac = bc$. If you multiply both sides of an equation by the same quantity, you still have equality.

Let's use the Multiplication Property of Equality to solve the equation $\frac{x}{7} = -9$.

Example 4.18.5: solve

Solve: $\frac{x}{7} = -9$.

Solution

Use the Multiplication Property of Equality to multiply both sides by 7 . This will isolate the variable.	$7 \cdot \frac{x}{7} = 7(-9)$
Multiply.	$\frac{7x}{7} = -63$
Simplify.	$x = -63$
Check. Substitute -63 for x in the original equation.	$\frac{-63}{7} \stackrel{?}{=} -9$
The equation is true.	$-9 = -9$; ✓

Exercise 4.18.9

Solve: $\frac{f}{5} = -25$.

Answer

-125

Exercise 4.18.10

Solve: $\frac{h}{9} = -27$.

Answer

-243

Example 4.18.6:solve

Solve: $\frac{p}{-8} = -40$.

Solution

Here, p is divided by -8. We must multiply by -8 to isolate p.

Multiply both sides by −8.	$-8\left(\frac{p}{-8}\right) = -8(-40)$
Multiply.	$\frac{-8p}{-8} = 320$
Simplify.	$p = 320$

Check:

Substitute p = 320.	$\frac{320}{-8} \stackrel{?}{=} -40$
The equation is true.	$-40 = -40$ ✓

Exercise 4.18.11

Solve: $\frac{c}{-7} = -35$.

Answer

245

Exercise 4.18.12

Solve: $\frac{x}{-11} = -12$.

Answer

132

Solve Equations with a Coefficient of -1

Look at the equation $-y = 15$. Does it look as if y is already isolated? But there is a negative sign in front of y, so it is not isolated.

There are three different ways to isolate the variable in this type of equation. We will show all three ways in Example 4.18.7.

Example 4.18.7: solve

Solve: $-y = 15$.

Solution

One way to solve the equation is to rewrite $-y$ as $-1y$, and then use the Division Property of Equality to isolate y.

Rewrite −y as −1y.	$-1y = 15$
Divide both sides by −1.	$\frac{-1y}{-1} = \frac{15}{-1}$
Simplify each side.	$y = -15$

Another way to solve this equation is to multiply both sides of the equation by −1.

Multiply both sides by −1.	$-1(-y) = -1(15)$
Simplify each side.	$y = -15$

The third way to solve the equation is to read $-y$ as "the opposite of y." What number has 15 as its opposite? The opposite of 15 is -15. So $y = -15$.

For all three methods, we isolated y is isolated and solved the equation.

Check:

Substitute y = −15.	$-(15) \stackrel{?}{=} (15)$
Simplify. The equation is true.	$15 = 15$ ✓

Exercise 4.18.13

Solve: $-y = 48$.

Answer

-48

Exercise 4.18.14

Solve: $-c = -23$.

Answer

23

4.19: Solve Equations with Fractions (Part 2)

Solve Equations with a Fraction Coefficient

When we have an equation with a fraction coefficient we can use the Multiplication Property of Equality to make the coefficient equal to 1. For example, in the equation:

$$\frac{3}{4}x = 24$$

The coefficient of x is $\frac{3}{4}$. To solve for x, we need its coefficient to be 1. Since the product of a number and its reciprocal is 1, our strategy here will be to isolate x by multiplying by the reciprocal of $\frac{3}{4}$. We will do this in Example 4.19.1.

Example 4.19.8: solve

Solve: $\frac{3}{4}x = 24$.

Solution

Multiply both sides by the reciprocal of the coefficient.	$\frac{4}{3} \cdot \frac{3}{4}x = \frac{4}{3} \cdot 24$
Simplify.	$1x = \frac{4}{3} \cdot \frac{24}{1}$
Multiply.	$x = 32$

Check:

Substitute x = 32.	$\frac{3}{4} \cdot 32 \stackrel{?}{=} 24$
Rewrite 32 as a fraction.	$\frac{3}{4} \cdot \frac{32}{1} \stackrel{?}{=} 24$
Multiply. The equation is true.	$24 = 24$ ✓

Notice that in the equation $\frac{3}{4}x = 24$, we could have divided both sides by $\frac{3}{4}$ to get x by itself. Dividing is the same as multiplying by the reciprocal, so we would get the same result. But most people agree that multiplying by the reciprocal is easier.

Exercise 4.19.15

Solve: $\frac{2}{5}n = 14$.

Answer

35

Exercise 4.19.16

Solve: $\frac{5}{6}y = 15$.

Answer

18

Example 4.19.9: solve

Solve: $-\frac{3}{8}w = 72$.

Solution

The coefficient is a negative fraction. Remember that a number and its reciprocal have the same sign, so the reciprocal of the coefficient must also be negative.

Multiply both sides by the reciprocal of $-\frac{3}{8}$.	$-\frac{8}{3}\left(-\frac{3}{8}w\right) = \left(-\frac{8}{3}\right)72$
Simplify; reciprocals multiply to one.	$1w = -\frac{8}{3} \cdot \frac{72}{1}$
Multiply.	$w = -192$

Check:

Let w = −192.	$-\frac{3}{8}(-192) \stackrel{?}{=} 72$
Multiply. It checks.	$72 = 72$ ✓

Exercise 4.19.17

Solve: $-\frac{4}{7}a = 52$.

Answer

-91

Exercise 4.19.18

Solve: $-\frac{7}{9}w = 84$.

Answer

-108

Translate Sentences to Equations and Solve

Now we have covered all four properties of equality—subtraction, addition, division, and multiplication. We'll list them all together here for easy reference.

Table 4.19.2

Subtraction Property of Equality: For any real numbers a, b, and c, if a = b, then a − c = b − c.	**Addition Property of Equality**: For any real numbers a, b, and c, if a = b, then a + c = b + c.
Division Property of Equality: For any numbers a, b, and c, where c ≠ 0 if a = b, then $\frac{a}{c} = \frac{b}{c}$.	**Multiplication Property of Equality**: For any real numbers a, b, and c if a = b, then ac = bc.

When you add, subtract, multiply or divide the same quantity from both sides of an equation, you still have equality. In the next few examples, we'll translate sentences into equations and then solve the equations. It might be helpful to review the translation table in Evaluate, Simplify, and Translate Expressions.

Example 4.19.10: solve

Translate and solve: n divided by 6 is -24.

Solution

Translate.	$\underbrace{\frac{n}{6}}_{n \text{ divided by } 6} \underbrace{=}_{\text{is}} \underbrace{-24}_{24}$
Multiply both sides by 6.	$6 \cdot \frac{n}{6} = 6(-24)$
Simplify.	$n = -144$
Check:	Is −144 divided by 6 equal to −24?
Translate.	$\frac{-144}{6} \stackrel{?}{=} -24$
Simplify. It checks.	$-24 = -24$ ✓

Exercise 4.19.19

Translate and solve: n divided by 7 is equal to -21.

Answer

$\frac{n}{7} = -21$; $n = -147$

Exercise 4.19.20

Translate and solve: n divided by 8 is equal to -56.

Answer

$\frac{n}{8} = -56$; $n = -448$

Example 4.19.11: solve

Translate and solve: The quotient of q and -5 is 70.

Solution

Translate.	$\underbrace{\frac{q}{-5}}_{\text{The quotient of } q \text{ and } -5} \underbrace{=}_{\text{is}} \underbrace{70}_{70}$
Multiply both sides by −5.	$-5\left(\frac{q}{-5}\right) = -5(70)$
Simplify.	$q = -350$
Check:	Is the quotient of −350 and −5 equal to 70?
Translate.	$\frac{-350}{-5} \stackrel{?}{=} 70$
Simplify. It checks.	$70 = 70$ ✓

Exercise 4.19.21

Translate and solve: The quotient of q and -8 is 72.

Answer

$\frac{q}{-8} = 72; q = -576$

Exercise 4.19.22

Translate and solve: The quotient of p and -9 is 81.

Answer

$\frac{p}{-9} = 81; p = -729$

Example 4.19.12: solve

Translate and solve: Two-thirds of f is 18.

Solution

Translate.	$\underbrace{\frac{2}{3}f}_{\text{Two-thirds of } f} \quad \underbrace{=}_{\text{is}} \quad \underbrace{18}_{18}$
Multiply both sides by $\frac{3}{2}$.	$\frac{3}{2} \cdot \frac{2}{3}f = \frac{3}{2} \cdot 18$
Simplify.	$f = 27$
Check:	Is two-thirds of 27 equal to 18?
Translate.	$\frac{2}{3}(27) \stackrel{?}{=} 18$
Simplify. It checks.	$18 = 18$ ✓

Exercise 4.19.23

Translate and solve: Two-fifths of f is 16.

Answer

$\frac{2}{5}f = 16; f = 40$

Exercise 4.19.24

Translate and solve: Three-fourths of f is 21.

Answer

$\frac{3}{4}f = 21; f = 28$

Example 4.19.13: solve

Translate and solve: The quotient of m and $\frac{5}{6}$ is $\frac{3}{4}$.

Solution

Translate.	$\frac{\frac{m}{5}}{6} = \frac{3}{4}$
Multiply both sides by $frac56$ to isolate m.	$\frac{5}{6}\left(\frac{\frac{m}{5}}{6}\right) = \frac{5}{6}\left(\frac{3}{4}\right)$
Simplify.	$m = \frac{5 \cdot 3}{6 \cdot 4}$
Remove common factors and multiply.	$m = \frac{5}{8}$

Check:

Is the quotient of $\frac{5}{8}$ and $\frac{5}{6}$ equal to $\frac{3}{4}$?	$\frac{\frac{5}{8}}{\frac{5}{6}} \stackrel{?}{=} \frac{3}{4}$
Rewrite as division.	$\frac{5}{8} \div \frac{5}{6} \stackrel{?}{=} \frac{3}{4}$
Multiply the first fraction by the reciprocal of the second.	$\frac{5}{8} \cdot \frac{6}{5} \stackrel{?}{=} \frac{3}{4}$
Simplify.	$\frac{3}{4} = \frac{3}{4}$ ✓

Our solution checks.

Exercise 4.19.25

Translate and solve. The quotient of n and $\frac{2}{3}$ is $\frac{5}{12}$.

Answer

$\frac{\frac{n}{2}}{3} = \frac{5}{12}$; $n = \frac{5}{18}$

Exercise 4.19.26

Translate and solve. The quotient of c and $\frac{3}{8}$ is $\frac{4}{9}$.

Answer

$\frac{\frac{c}{3}}{8} = \frac{4}{9}$; $c = \frac{1}{6}$

Example 4.19.14: solve

Translate and solve: The sum of three-eighths and x is three and one-half.

Solution

Translate.	The sum of three-eighths and x is three and one-half $\frac{3}{8}+x = 3\frac{1}{2}$
Use the Subtraction Property of Equality to subtract $\frac{3}{8}$ from both sides.	$\frac{3}{8}+x-\frac{3}{8}=3\frac{1}{2}-\frac{3}{8}$
Combine like terms on the left side.	$x=3\frac{1}{2}-\frac{3}{8}$
Convert mixed number to improper fraction.	$x=3\frac{1}{2}-\frac{3}{8}$
Convert to equivalent fractions with LCD of 8.	$x=\frac{7}{2}-\frac{3}{8}$
Subtract.	$x=\frac{25}{8}$
Write as a mixed number.	$x=3\frac{1}{8}$

We write the answer as a mixed number because the original problem used a mixed number. Check: Is the sum of three-eighths and $3\frac{1}{8}$ equal to three and one-half?

Add.	$3\frac{4}{8} \stackrel{?}{=} 3\frac{1}{2}$
Simplify.	$3\frac{1}{2}=3\frac{1}{2}$

The solution checks.

Exercise 4.19.27

Translate and solve: The sum of five-eighths and x is one-fourth.

Answer

$\frac{5}{8}+x=\frac{1}{4}$; $x=-\frac{3}{8}$

Exercise 4.19.28

Translate and solve: The difference of one-and-three-fourths and x is five-sixths.

Answer

$1\frac{3}{4}-x=\frac{5}{6}$; $x=\frac{11}{12}$

Practice Makes Perfect

Determine Whether a Fraction is a Solution of an Equation

In the following exercises, determine whether each number is a solution of the given equation.

498. $x - \frac{2}{5} = \frac{1}{10}$:
   a. $x = 1$
   b. $x = \frac{1}{2}$
   c. $x = -\frac{1}{2}$

499. $y - \frac{1}{2} = \frac{5}{12}$:
   a. $y = 1$
   b. $y = \frac{3}{4}$
   c. $y = -\frac{3}{4}$

500. $h + \frac{3}{4} = \frac{2}{5}$:
   a. $h = 1$
   b. $h = \frac{7}{20}$
   c. $h = -\frac{7}{20}$

501. $k + \frac{2}{5} = \frac{5}{6}$:
   a. $k = 1$
   b. $k = \frac{13}{30}$
   c. $k = -\frac{13}{30}$

Solve Equations with Fractions using the Addition, Subtraction, and Division Properties of Equality

In the following exercises, solve.

502. $y + \frac{1}{3} = \frac{4}{3}$
503. $m + \frac{3}{8} = \frac{7}{8}$
504. $f + \frac{9}{10} = \frac{2}{5}$
505. $h + \frac{5}{6} = \frac{1}{6}$
506. $a - \frac{5}{8} = -\frac{7}{8}$
507. $c - \frac{1}{4} = -\frac{5}{4}$
508. $x - \left(-\frac{3}{20}\right) = -\frac{11}{20}$
509. $z - \left(-\frac{5}{12}\right) = -\frac{7}{12}$
510. $n - \frac{1}{6} = \frac{3}{4}$
511. $p - \frac{3}{10} = \frac{5}{8}$

512. $s + \left(-\frac{1}{2}\right) = -\frac{8}{9}$
513. $k + \left(-\frac{1}{3}\right) = -\frac{4}{5}$
514. $5j = 17$
515. $7k = 18$
516. $-4w = 26$
517. $-9v = 33$

Solve Equations with Fractions Using the Multiplication Property of Equality

In the following exercises, solve.

518. $\frac{f}{4} = -20$
519. $\frac{b}{3} = -9$
520. $\frac{y}{7} = -21$
521. $\frac{x}{8} = -32$
522. $\frac{p}{-5} = -40$
523. $\frac{q}{-4} = -40$
524. $\frac{r}{-12} = -6$
525. $\frac{s}{-15} = -3$
526. $-x = 23$
527. $-y = 42$
528. $-h = -\frac{5}{12}$
529. $-k = -\frac{17}{20}$
530. $\frac{4}{5}n = 20$
531. $\frac{3}{10}p = 30$
532. $\frac{3}{8}q = -48$
533. $\frac{5}{2}m = -40$
534. $-\frac{2}{9}a = 16$
535. $-\frac{3}{7}b = 9$
536. $-\frac{6}{11}u = -24$
537. $-\frac{5}{12}v = -15$

Mixed Practice

In the following exercises, solve.

538. $3x = 0$
539. $8y = 0$
540. $4f = \frac{4}{5}$
541. $7g = \frac{7}{9}$

542. $p + \frac{2}{3} = \frac{1}{12}$
543. $q + \frac{5}{6} = \frac{1}{12}$
544. $\frac{7}{8}m = \frac{1}{10}$
545. $\frac{1}{4}n = \frac{7}{10}$
546. $-\frac{2}{5} = x + \frac{3}{4}$
547. $-\frac{2}{3} = y + \frac{3}{8}$
548. $\frac{11}{20} = -f$
549. $\frac{8}{15} = -d$

Translate Sentences to Equations and Solve

In the following exercises, translate to an algebraic equation and solve.

550. n divided by eight is −16.
551. n divided by six is −24.
552. m divided by −9 is −7.
553. m divided by −7 is −8.
554. The quotient of f and −3 is −18.
555. The quotient of f and −4 is −20.
556. The quotient of g and twelve is 8.
557. The quotient of g and nine is 14.
558. Three-fourths of q is 12.
559. Two-fifths of q is 20.
560. Seven-tenths of p is −63.
561. Four-ninths of p is −28.
562. m divided by 4 equals negative 6.
563. The quotient of h and 2 is 43.
564. Three-fourths of z is the same as 15.
565. The quotient of a and $\frac{2}{3}$ is $\frac{3}{4}$.
566. The sum of five-sixths and x is $\frac{1}{2}$.
567. The sum of three-fourths and x is $\frac{1}{8}$.
568. The difference of y and one-fourth is $-\frac{1}{8}$.
569. The difference of y and one-third is $-\frac{1}{6}$.

Everyday Math

570. **Shopping** Teresa bought a pair of shoes on sale for $48. The sale price was $\frac{2}{3}$ of the regular price. Find the regular price of the shoes by solving the equation $\frac{2}{3}p = 48$
571. **Playhouse** The table in a child's playhouse is $\frac{3}{5}$ of an adult-size table. The playhouse table is 18 inches high. Find the height of an adult-size table by solving the equation $\frac{3}{5}h = 18$.

Writing Exercises

572. Example 4.100 describes three methods to solve the equation $-y = 15$. Which method do you prefer? Why?

573. Richard thinks the solution to the equation $\frac{3}{4}x = 24$ is 16. Explain why Richard is wrong.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether a fraction is a solution of an equation.			
solve equations with fractions using the addition, subtraction, and division properties of equality.			
solve equations using the multiplication property of equality.			
translate sentences to equations and solve.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

4.E: Fractions (Exercises)

4.1 - Visualize Fractions

In the following exercises, name the fraction of each figure that is shaded.

574.

575.

In the following exercises, name the improper fractions. Then write each improper fraction as a mixed number.

576. 
577.

In the following exercises, convert the improper fraction to a mixed number.

578. $\frac{58}{15}$

579. $\frac{63}{11}$

In the following exercises, convert the mixed number to an improper fraction.

580. $12\frac{1}{4}$

581. $9\frac{4}{5}$

582. Find three fractions equivalent to $\frac{2}{5}$. Show your work, using figures or algebra.

583. Find three fractions equivalent to $-\frac{4}{3}$. Show your work, using figures or algebra.

In the following exercises, locate the numbers on a number line.

584. $\frac{5}{8}, \frac{4}{3}, 3\frac{3}{4}, 4$

585. $\frac{1}{4}, -\frac{1}{4}, 1\frac{1}{3}, -1\frac{1}{3}, \frac{7}{2}, -\frac{7}{2}$

In the following exercises, order each pair of numbers, using < or >.

586. $-1 ___ -\frac{2}{5}$

587. $-2\frac{1}{2} ___ -3$

4.2 - Multiply and Divide Fractions

In the following exercises, simplify.

588. $-\frac{63}{84}$
589. $-\frac{90}{120}$
590. $-\frac{14a}{14b}$
591. $-\frac{8x}{8y}$

In the following exercises, multiply.

592. $\frac{2}{5} \cdot \frac{8}{13}$
593. $-\frac{1}{3} \cdot \frac{12}{7}$
594. $\frac{2}{9} \cdot \left(-\frac{45}{32}\right)$
595. $6\text{m} \cdot \frac{4}{11}$
596. $-\frac{1}{4}\ (-32)$
597. $3\frac{1}{5} \cdot 1\frac{7}{8}$

In the following exercises, find the reciprocal.

598. $\frac{2}{9}$
599. $\frac{15}{4}$
600. 3
601. $-\frac{1}{4}$
602. Fill in the chart.

	Opposite	Absolute Value	Reciprocal
$-\frac{5}{13}$			
$\frac{3}{10}$			
$\frac{9}{4}$			
-12			

In the following exercises, divide.

603. $\frac{2}{3} \div \frac{1}{6}$
604. $\left(-\frac{3x}{5}\right) \div \left(-\frac{2y}{3}\right)$
605. $\frac{4}{5} \div 3$
606. $8 \div 2\frac{2}{3}$
607. $8\frac{2}{3} \div 1\frac{1}{12}$

4.3 - Multiply and Divide Mixed Numbers and Complex Fractions

In the following exercises, perform the indicated operation.

608. $3\frac{1}{5} \cdot 1\frac{7}{8}$
609. $-5\frac{7}{12} \cdot 4\frac{4}{11}$
610. $8 \div 2\frac{2}{3}$
611. $8\frac{2}{3} \div 1\frac{1}{12}$

In the following exercises, translate the English phrase into an algebraic expression.

612. the quotient of 8 and y
613. the quotient of V and the difference of h and 6

In the following exercises, simplify the complex fraction.

614. $\dfrac{\frac{5}{8}}{\frac{4}{5}}$
615. $\dfrac{\frac{8}{9}}{-4}$
616. $\dfrac{\frac{n}{4}}{\frac{3}{8}}$
617. $\dfrac{-1\frac{5}{6}}{-\frac{1}{12}}$

In the following exercises, simplify.

618. $\dfrac{5+16}{5}$
619. $\dfrac{8 \cdot 4 - 5^2}{3 \cdot 12}$
620. $\dfrac{8 \cdot 7 + 5(8-10)}{9 \cdot 3 - 6 \cdot 4}$

4.4 - Add and Subtract Fractions with Common Denominators

In the following exercises, add.

621. $\frac{3}{8} + \frac{2}{8}$
622. $\frac{4}{5} + \frac{1}{5}$
623. $\frac{2}{5} + \frac{1}{5}$
624. $\frac{15}{32} + \frac{9}{32}$
625. $\frac{x}{10} + \frac{7}{10}$

In the following exercises, subtract.

626. $\frac{8}{11} - \frac{6}{11}$
627. $\frac{11}{12} - \frac{5}{12}$
628. $\frac{4}{5} - \frac{y}{5}$

629. $-\frac{31}{30}-\frac{7}{30}$
630. $\frac{3}{2}-\left(\frac{3}{2}\right)$
631. $\frac{11}{15}-\frac{5}{15}-\left(-\frac{2}{15}\right)$

4.5 - Add and Subtract Fractions with Different Denominators

In the following exercises, find the least common denominator.

632. $\frac{1}{3}$ and $\frac{1}{12}$
633. $\frac{1}{3}$ and $\frac{4}{5}$
634. $\frac{8}{15}$ and $\frac{11}{20}$
635. $\frac{3}{4}$, $\frac{1}{6}$, and $\frac{5}{10}$

In the following exercises, change to equivalent fractions using the given LCD.

636. $\frac{1}{3}$ and $\frac{1}{5}$, LCD = 15
637. $\frac{3}{8}$ and $\frac{5}{6}$, LCD = 24
638. $-\frac{9}{16}$ and $\frac{5}{12}$, LCD = 48
639. $\frac{1}{3}$, $\frac{3}{4}$ and $\frac{4}{5}$, LCD = 60

In the following exercises, perform the indicated operations and simplify.

640. $\frac{1}{5}+\frac{2}{3}$
641. $\frac{11}{12}-\frac{2}{3}$
642. $-\frac{9}{10}-\frac{3}{4}$
643. $-\frac{11}{36}-\frac{11}{20}$
644. $-\frac{22}{25}+\frac{9}{40}$
645. $\frac{y}{10}-\frac{1}{3}$
646. $\frac{2}{5}+\left(-\frac{5}{9}\right)$
647. $\frac{4}{11}\div\frac{2}{7d}$
648. $\frac{2}{5}+\left(-\frac{3n}{8}\right)\left(-\frac{2}{9n}\right)$
649. $\frac{\left(\frac{2}{3}\right)^2}{\left(\frac{5}{8}\right)^2}$
650. $\left(\frac{11}{12}+\frac{3}{8}\right)\div\left(\frac{5}{6}-\frac{1}{10}\right)$

In the following exercises, evaluate.

651. y − $\frac{4}{5}$ when (a) y = $-\frac{4}{5}$ (b) y = $\frac{1}{4}$

652. $6mn^2$ when m = $\frac{3}{4}$ and n = $-\frac{1}{3}$

4.6 - Add and Subtract Mixed Numbers

In the following exercises, perform the indicated operation.

653. $4\frac{1}{3}+9\frac{1}{3}$

654. $6\frac{2}{5}+7\frac{3}{5}$

655. $5\frac{8}{11}+2\frac{4}{11}$

656. $3\frac{5}{8}+3\frac{7}{8}$

657. $9\frac{13}{20}-4\frac{11}{20}$

658. $2\frac{3}{10}-1\frac{9}{10}$

659. $2\frac{11}{12}-1\frac{7}{12}$

660. $8\frac{6}{11}-2\frac{9}{11}$

4.7 - Solve Equations with Fractions

In the following exercises, determine whether the each number is a solution of the given equation.

661. x − $\frac{1}{2}$ = $\frac{1}{6}$:
   a. x = 1
   b. x = $\frac{2}{3}$
   c. x = $-\frac{1}{3}$

662. y + $\frac{3}{5}$ = $\frac{5}{9}$:
   a. y = $\frac{1}{2}$
   b. y = $\frac{52}{45}$
   c. y = $-\frac{2}{45}$

In the following exercises, solve the equation.

663. n + $\frac{9}{11}$ = $\frac{4}{11}$

664. x − $\frac{1}{6}$ = $\frac{7}{6}$

665. h − $\left(-\frac{7}{8}\right)$ = $-\frac{2}{5}$

666. $\frac{x}{5}$ = −10

667. −z = 23

In the following exercises, translate and solve.

668. The sum of two-thirds and n is $-\frac{3}{5}$.

669. The difference of q and one-tenth is $\frac{1}{2}$.

670. The quotient of p and −4 is −8.

671. Three-eighths of y is 24.

PRACTICE TEST

Convert the improper fraction to a mixed number.

672. $\frac{19}{5}$

Convert the mixed number to an improper fraction.

673. $3\frac{2}{7}$

Locate the numbers on a number line.

674. $\frac{1}{2}, 1\frac{2}{3}, -2\frac{3}{4}$, and $\frac{9}{4}$

In the following exercises, simplify.

675. $\frac{5}{20}$

676. $\frac{18r}{27s}$

677. $\frac{1}{3} \cdot \frac{3}{4}$

678. $\frac{3}{5} \cdot 15$

679. $-36\text{u}\left(-\frac{4}{9}\right)$

680. $-5\frac{7}{12} \cdot 4\frac{4}{11}$

681. $-\frac{5}{6} \div \frac{5}{12}$

682. $\frac{7}{11} \div \left(-\frac{7}{11}\right)$

683. $\frac{9a}{10} \div \frac{15a}{8}$

684. $-6\frac{2}{5} \div 4$

685. $\left(-15\frac{5}{6}\right) \div \left(-3\frac{1}{6}\right)$

686. $\dfrac{\frac{-6}{6}}{\frac{11}{}}$

687. $\dfrac{\frac{p}{2}}{\frac{q}{5}}$

688. $\dfrac{-\frac{4}{15}}{-2\frac{2}{3}}$

689. $\frac{9^2 - 4^2}{9 - 4}$

690. $\frac{2}{d} + \frac{9}{d}$

691. $-\frac{3}{13} + \left(-\frac{4}{13}\right)$

692. $-\frac{22}{25} + \frac{9}{40}$

693. $\frac{2}{5} + \left(-\frac{7}{5}\right)$

694. $-\frac{3}{10}+\left(-\frac{5}{8}\right)$

695. $-\frac{3}{4} \div \frac{x}{3}$

696. $\frac{2^3-2^2}{\left(\frac{3}{4}\right)^2}$

697. $\frac{\frac{5}{14}+\frac{1}{8}}{\frac{9}{56}}$

Evaluate.

698. x + $\frac{1}{3}$ when (a) x = $\frac{2}{3}$ (b) x = $-\frac{5}{6}$

In the following exercises, solve the equation.

699. y + $\frac{3}{5}$ = $\frac{7}{5}$

700. a − $\frac{3}{10}$ = $-\frac{9}{10}$

701. f + $\left(-\frac{2}{3}\right)$ = $\frac{5}{12}$

702. $\frac{m}{-2}$ = −16

703. $-\frac{2}{3}$c = 18

704. Translate and solve: The quotient of p and −4 is −8. Solve for p.

4.S: Fractions (Summary)

Key Terms

complex fraction	A fraction in which the numerator or the denominator contains a fraction.
equivalent fractions	Two or more fractions that have the same value.
fraction	A fraction is written $\frac{a}{b}$. in a fraction, a is the numerator and b is the denominator. A fraction represents parts of a whole. The denominator b is the number of equal parts the whole has been divided into, and the numerator a indicates how many parts are included.
least common denominator (LCD)	The least common denominator (LCD) of two fractions is the least common multiple (LCM) of their denominators.
mixed number	A mixed number consists of a whole number a and a fraction $\frac{b}{c}$ where c ≠ 0. It is written as $a\frac{b}{c}$, where c ≠ 0.
proper and improper fractions	The fraction $\frac{a}{b}$ is proper if a < b and improper if a > b.
reciprocal	The reciprocal of the fraction $\frac{a}{b}$ is $\frac{b}{a}$ where a ≠ 0 and b ≠ 0.
simplified fraction	A fraction is considered simplified if there are no common factors in the numerator and denominator.

Key Concepts

4.1 - Visualize Fractions

- **Property of One**
  - Any number, except zero, divided by itself is one. $\frac{a}{a}$ = 1, where a ≠ 0.
- **Mixed Numbers**
  - A mixed number consists of a whole number a and a fraction $\frac{b}{c}$ where c ≠ 0.
  - It is written as follows: $a\frac{b}{c} \quad c \neq 0$
- **Proper and Improper Fractions**
  - The fraction $\frac{a}{b}$ is a proper fraction if a < b and an improper fraction if a ≥ b .
- **Convert an improper fraction to a mixed number**.
  1. Divide the denominator into the numerator.
  2. Identify the quotient, remainder, and divisor.
  3. Write the mixed number as $quotient\frac{remainder}{divisor}$.
- **Convert a mixed number to an improper fraction**.
  1. Multiply the whole number by the denominator.
  2. Add the numerator to the product found in Step 1.
  3. Write the final sum over the original denominator.
- **Equivalent Fractions Property**: If a, b, and c are numbers where b ≠ 0, c ≠ 0, then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$.

4.2 - Multiply and Divide Fractions

- **Equivalent Fractions Property**
  - If a, b, c are numbers where b ≠ 0, c ≠ 0, then $\frac{a}{b} = \frac{a \cdot c}{b \cdot c}$ and $\frac{a \cdot c}{b \cdot c} = \frac{a}{b}$.
- **Simplify a fraction**.
  1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers.
  2. Simplify, using the equivalent fractions property, by removing common factors.
  3. Multiply any remaining factors.
- **Fraction Multiplication**
  - If a, b, c, and d are numbers where b ≠ 0 and d ≠ 0, then $\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$.
- **Reciprocal**
  - A number and its reciprocal have a product of 1. $\frac{a}{b} \cdot \frac{b}{a} = 1$.
  - Table 4.98

Opposite	Absolute Value	Reciprocal
has opposite sign	is never negative	has same sign, fraction inverts

- **Fraction Division**
  - If a, b, c, and d are numbers where b ≠ 0, c ≠ 0, and d ≠ 0, then $\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \cdot \frac{d}{c}$.
  - To divide fractions, multiply the first fraction by the reciprocal of the second.

4.3 - Multiply and Divide Mixed Numbers and Complex Fractions

- **Multiply or divide mixed numbers**.
  1. Convert the mixed numbers to improper fractions.
  2. Follow the rules for fraction multiplication or division.
  3. Simplify if possible.
- **Simplify a complex fraction**.
  1. Rewrite the complex fraction as a division problem.
  2. Follow the rules for dividing fractions.
  3. Simplify if possible.
- **Placement of negative sign in a fraction**.
  - For any positive numbers a and b, $\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$.
- **Simplify an expression with a fraction bar**.
  1. Simplify the numerator.
  2. Simplify the denominator.
  3. Simplify the fraction.

4.4 - Add and Subtract Fractions with Common Denominators

- **Fraction Addition**
  - If a, b, and c are numbers where c ≠ 0, then $\frac{a}{c} + \frac{b}{c} = \frac{a+c}{c}$.
  - To add fractions, add the numerators and place the sum over the common denominator.
- **Fraction Subtraction**
  - If a, b, and c are numbers where c ≠ 0, then $\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$.
  - To subtract fractions, subtract the numerators and place the difference over the common denominator.

4.5 - Add and Subtract Fractions with Different Denominators

- **Find the least common denominator (LCD) of two fractions**.
  1. Factor each denominator into its primes.
  2. List the primes, matching primes in columns when possible.
  3. Bring down the columns.
  4. Multiply the factors. The product is the LCM of the denominators.
  5. The LCM of the denominators is the LCD of the fractions.
- **Equivalent Fractions Property**
  - If a, b, and c are whole numbers where b ≠ 0, c ≠ 0 then $\frac{a}{b}=\frac{a\cdot c}{b\cdot c}$ and $\frac{a\cdot c}{b\cdot c}=\frac{a}{b}$.
- **Convert two fractions to equivalent fractions with their LCD as the common denominator**.
  1. Find the LCD.
  2. For each fraction, determine the number needed to multiply the denominator to get the LCD.
  3. Use the Equivalent Fractions Property to multiply the numerator and denominator by the number from Step 2.
  4. Simplify the numerator and denominator.
- **Add or subtract fractions with different denominators**.
  1. Find the LCD.
  2. Convert each fraction to an equivalent form with the LCD as the denominator.
  3. Add or subtract the fractions.
  4. Write the result in simplified form.
- **Summary of Fraction Operations**
  - *Fraction multiplication*: Multiply the numerators and multiply the denominators. $\frac{a}{b}\cdot\frac{c}{d}=\frac{ac}{bd}$.
  - *Fraction division*: Multiply the first fraction by the reciprocal of the second. $\frac{a}{b}\div\frac{c}{d}=\frac{a}{b}\cdot\frac{d}{c}$.
  - *Fraction addition*: Add the numerators and place the sum over the common denominator. If the fractions have different denominators, first convert them to equivalent forms with the LCD. $\frac{a}{c}+\frac{b}{c}=\frac{a+b}{c}$.
  - *Fraction subtraction*: Subtract the numerators and place the difference over the common denominator. If the fractions have different denominators, first convert them to equivalent forms with the LCD. $\frac{a}{c}-\frac{b}{c}=\frac{a-b}{c}$.
- **Simplify complex fractions**.
  1. Simplify the numerator.
  2. Simplify the denominator.
  3. Divide the numerator by the denominator.
  4. Simplify if possible.

4.6 - Add and Subtract Mixed Numbers

- **Add mixed numbers with a common denominator**.
  1. Add the whole numbers.
  2. Add the fractions.
  3. Simplify, if possible.
- **Subtract mixed numbers with common denominators**.
  1. Rewrite the problem in vertical form.
  2. Compare the two fractions. If the top fraction is larger than the bottom fraction, go to Step 3. If not, in the top mixed number, take one whole and add it to the fraction part, making a mixed number with an improper fraction.
  3. Subtract the fractions.
  4. Subtract the whole numbers.
  5. Simplify, if possible.
- **Subtract mixed numbers with common denominators as improper fractions.**
  1. Rewrite the mixed numbers as improper fractions.

2. Subtract the numerators.
3. Write the answer as a mixed number, simplifying the fraction part, if possible.

4.7 - Solve Equations with Fractions

- Determine whether a number is a solution to an equation.
  1. Substitute the number for the variable in the equation.
  2. Simplify the expressions on both sides of the equation.
  3. Determine whether the resulting equation is true. If it is true, the number is a solution. If it is not true, the number is not a solution.
- Addition, Subtraction, and Division Properties of Equality: For any numbers a, b, and c,
  - if a = b, then a + c = b + c. *Addition Property of Equality*
  - if a = b, then a - c = b - c. *Subtraction Property of Equality*
  - if a = b, then $\frac{a}{c} = \frac{b}{c}$, c ≠ 0. *Division Property of Equality*
- **The Multiplication Property of Equality**
  - For any numbers ab and c, a = b, then ac = bc.
  - If you multiply both sides of an equation by the same quantity, you still have equality.

CHAPTER OVERVIEW

5: Decimals

Gasoline price changes all the time. They might go down for a period of time, but then they usually rise again. One thing that stays the same is that the price is not usually a whole number. Instead, it is shown using a decimal point to describe the cost in dollars and cents. We use decimal numbers all the time, especially when dealing with money. In this chapter, we will explore decimal numbers and how to perform operations using them.

5.1: Decimals (Part 1)

Learning Objectives

- Name decimals
- Write decimals
- Convert decimals to fractions or mixed numbers
- Locate decimals on the number line
- Order decimals
- Round decimals

be prepared!

Before you get started, take this readiness quiz.

1. Name the number 4,926,015 in words. If you missed this problem, review Example 1.1.4.
2. Round 748 to the nearest ten. If you missed this problem, review Example 1.2.9.
3. Locate $\frac{3}{10}$ on a number line. If you missed this problem, review Example 4.2.16.

Name Decimals

You probably already know quite a bit about decimals based on your experience with money. Suppose you buy a sandwich and a bottle of water for lunch. If the sandwich costs \$3.45, the bottle of water costs \$1.25, and the total sales tax is \$0.33, what is the total cost of your lunch?

$$\begin{array}{rl} \$3.45 & Sandwich \\ \$1.25 & Water \\ +\$0.33 & Tax \\ \hline \$5.03 & Total \end{array}$$

The total is \$5.03. Suppose you pay with a \$5 bill and 3 pennies. Should you wait for change? No, \$5 and 3 pennies is the same as \$5.03.

Because 100 pennies = \$1, each penny is worth $\frac{1}{100}$ of a dollar. We write the value of one penny as \$0.01, since 0.01 = $\frac{1}{100}$.

Writing a number with a decimal is known as decimal notation. It is a way of showing parts of a whole when the whole is a power of ten. In other words, decimals are another way of writing fractions whose denominators are powers of ten. Just as the counting numbers are based on powers of ten, decimals are based on powers of ten. Table 5.1.1 shows the counting numbers.

Table 5.1.1

Counting number	Name
1	One
10 = 10	Ten
10 • 10 = 100	One hundred
10 • 10 • 10 = 1000	One thousand
10 • 10 • 10 • 10 = 10,000	Ten thousand

How are decimals related to fractions? Table 5.1.2 shows the relation.

Table 5.1.2

Decimal	Fraction	Name

Decimal	Fraction	Name
0.1	$\frac{1}{10}$	One tenth
0.01	$\frac{1}{100}$	One hundredth
0.001	$\frac{1}{1000}$	One thousandth
0.0001	$\frac{1}{10,000}$	One ten-thousandth

When we name a whole number, the name corresponds to the place value based on the powers of ten. In Whole Numbers, we learned to read 10,000 as *ten thousand*. Likewise, the names of the decimal places correspond to their fraction values. Notice how the place value names in Figure 5.1.1 relate to the names of the fractions from Table 5.1.2.

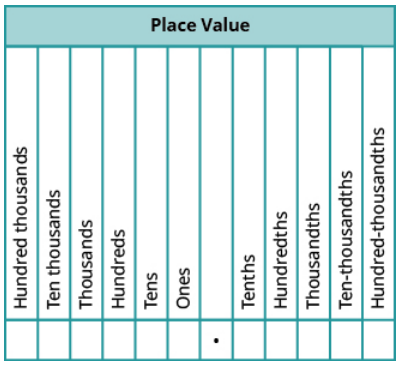

Figure 5.1.1 - This chart illustrates place values to the left and right of the decimal point.

Notice two important facts shown in Figure 5.1.1.

- The “th” at the end of the name means the number is a fraction. “One thousand” is a number larger than one, but “one thousandth” is a number smaller than one.
- The tenths place is the first place to the right of the decimal, but the tens place is two places to the left of the decimal.

Remember that $5.03 lunch? We read $5.03 as *five dollars and three cents*. Naming decimals (those that don’t represent money) is done in a similar way. We read the number 5.03 as *five and three hundredths*.

We sometimes need to translate a number written in decimal notation into words. As shown in Figure 5.1.2, we write the amount on a check in both words and numbers.

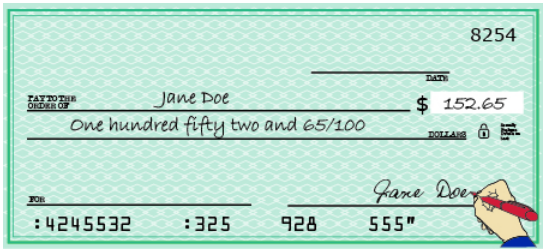

Figure 5.1.2 - When we write a check, we write the amount as a decimal number as well as in words. The bank looks at the check to make sure both numbers match. This helps prevent errors.

Let’s try naming a decimal, such as 15.68.	
We start by naming the number to the left of the decimal.	fifteen_____
We use the word “and” to indicate the decimal point.	fifteen and_____

Then we name the number to the right of the decimal point as if it were a whole number.	fifteen and sixty-eight_____
Last, name the decimal place of the last digit.	fifteen and sixty-eight hundredths

The number 15.68 is read *fifteen and sixty-eight hundredths*.

HOW TO: NAME A DECIMAL NUMBER

- Name the number to the left of the decimal point.
- Write “and” for the decimal point.
- Name the “number” part to the right of the decimal point as if it were a whole number.
- Name the decimal place of the last digit.

Example 5.1.1:

Name each decimal: (a) 4.3 (b) 2.45 (c) 0.009 (d) −15.571.

Solution

(a) 4.3

Name the number to the left of the decimal point.	four_____
Write "and" for the decimal point.	four and_____
Name the number to the right of the decimal point as if it were a whole number.	four and three_____
Name the decimal place of the last digit.	four and three tenths

(b) 2.45

Name the number to the left of the decimal point.	two_____
Write "and" for the decimal point.	two and_____
Name the number to the right of the decimal point as if it were a whole number.	two and forty-five_____
Name the decimal place of the last digit.	two and forty-five hundredths

(c) 0.009

Name the number to the left of the decimal point.	Zero is the number to the left of the decimal; it is not included in the name.
Name the number to the right of the decimal point as if it were a whole number.	nine_____
Name the decimal place of the last digit.	nine thousandths

(d) −15.571

Name the number to the left of the decimal point.	negative fifteen
Write "and" for the decimal point.	negative fifteen and_____
Name the number to the right of the decimal point as if it were a whole number.	negative fifteen and five hundred seventyone_____

Name the decimal place of the last digit.	negative fifteen and five hundred seventyone thousandths

Exercise 5.1.1:

Name each decimal: (a) 6.7 (b) 19.58 (c) 0.018 (d) −2.053

Answer a

six and seven tenths

Answer b

nineteen and fifty-eight hundredths

Answer c

eighteen thousandths

Answer d

negative two and fifty-three thousandths

Exercise 5.1.2:

Name each decimal: (a) 5.8 (b) 3.57 (c) 0.005 (d) −13.461

Answer a

five and eight tenths three and fifty-seven hundredths

Answer b

three and fifty-seven hundredths

Answer c

five thousandths

Answer d

negative thirteen and four hundred sixty-one thousandths

Write Decimals

Now we will translate the name of a decimal number into decimal notation. We will reverse the procedure we just used. Let's start by writing the number six and seventeen hundredths:

The word *and* tells us to place a decimal point.	___.___
The word before *and* is the whole number; write it to the left of the decimal point.	6._____
The decimal part is seventeen hundredths. Mark two places to the right of the decimal point for hundredths.	6._ _
Write the numerals for seventeen in the places marked.	6.17

Example 5.1.2:

Write fourteen and thirty-seven hundredths as a decimal.

Solution

Place a decimal point under the word ‘and’.	_____. _____
Translate the words before ‘and’ into the whole number and place it to the left of the decimal point.	14. _____
Mark two places to the right of the decimal point for “hundredths”.	14.__ __
Translate the words after “and” and write the number to the right of the decimal point.	14.37

Fourteen and thirty-seven hundredths is written 14.37.

Exercise 5.1.3:

Write as a decimal: thirteen and sixty-eight hundredths.

Answer

13.68

Exercise 5.1.4:

Write as a decimal: five and eight hundred ninety-four thousandths.

Answer

5.894

HOW TO: WRITE A DECIMAL NUMBER FROM ITS NAME

Step 1. Look for the word “and”—it locates the decimal point.

Step 2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.

- Place a decimal point under the word “and.” Translate the words before “and” into the whole number and place it to the left of the decimal point.
- If there is no “and,” write a “0” with a decimal point to its right.

Step 3. Translate the words after “and” into the number to the right of the decimal point. Write the number in the spaces—putting the final digit in the last place.

Step 4. Fill in zeros for place holders as needed.

The second bullet in Step 2 is needed for decimals that have no whole number part, like ‘nine thousandths’. We recognize them by the words that indicate the place value after the decimal – such as ‘tenths’ or ‘hundredths.’ Since there is no whole number, there is no ‘and.’ We start by placing a zero to the left of the decimal and continue by filling in the numbers to the right, as we did above.

Example 5.1.3:

Write twenty-four thousandths as a decimal.

Solution

Look for the word "and".	There is no "and" so start with 0.
To the right of the decimal point, put three decimal places for thousandths.	0. __ __ __ tenths hundredths thousandths
Write the number 24 with the 4 in the thousandths place.	0. __ 2 4 tenths hundredths thousandths
Put zeros as placeholders in the remaining decimal places.	0.024

So, twenty-four thousandths is written 0.024

Exercise 5.1.5:

Write as a decimal: fifty-eight thousandths.

Answer

0.058

Exercise 5.1.6:

Write as a decimal: sixty-seven thousandths.

Answer

0.067

Before we move on to our next objective, think about money again. We know that $1 is the same as $1.00. The way we write $1 (or $1.00) depends on the context. In the same way, integers can be written as decimals with as many zeros as needed to the right of the decimal.

$$\begin{aligned} 5 &= 5.0 \qquad -2 = -2.0 \\ 5 &= 5.00 \qquad -2 = -2.00 \\ 5 &= 5.000 \qquad -2 = -2.000 \end{aligned}$$

$$and\ so\ on\ldots$$

Convert Decimals to Fractions or Mixed Numbers

We often need to rewrite decimals as fractions or mixed numbers. Let's go back to our lunch order to see how we can convert decimal numbers to fractions. We know that $5.03 means 5 dollars and 3 cents. Since there are 100 cents in one dollar, 3 cents means $\frac{3}{100}$ of a dollar, so 0.03 = $\frac{3}{100}$.

We convert decimals to fractions by identifying the place value of the farthest right digit. In the decimal 0.03, the 3 is in the hundredths place, so 100 is the denominator of the fraction equivalent to 0.03.

$$0.03 = \frac{3}{100}$$

For our $5.03 lunch, we can write the decimal 5.03 as a mixed number.

$$5.03 = 5\frac{3}{100}$$

Notice that when the number to the left of the decimal is zero, we get a proper fraction. When the number to the left of the decimal is not zero, we get a mixed number.

HOW TO: CONVERT A DECIMAL NUMBER TO A FRACTION OR MIXED NUMBER

Step 1. Look at the number to the left of the decimal.

- If it is zero, the decimal converts to a proper fraction.
- If it is not zero, the decimal converts to a mixed number.
  - Write the whole number.

Step 2. Determine the place value of the final digit.

Step 3. Write the fraction.

- numerator—the 'numbers' to the right of the decimal point
- denominator—the place value corresponding to the final digit

Step 4. Simplify the fraction, if possible.

Example 5.1.4:

Write each of the following decimal numbers as a fraction or a mixed number: (a) 4.09 (b) 3.7 (c) −0.286

Solution

(a) 4.09

There is a 4 to the left of the decimal point. Write "4" as the whole number part of the mixed number.	$4\frac{\square}{\square}$
Determine the place value of the final digit.	4. 0 9 tenths hundredths
Write the fraction. Write 9 in the numerator as it is the number to the right of the decimal point.	$4\frac{9}{\square}$
Write 100 in the denominator as the place value of the final digit, 9, is hundredth.	$4\frac{9}{100}$
The fraction is in simplest form.	So, $4.09 = 4\frac{9}{100}$

Did you notice that the number of zeros in the denominator is the same as the number of decimal places?

(b) 3.7

There is a 3 to the left of the decimal point. Write "3" as the whole number part of the mixed number.	$3\frac{\square}{\square}$
Determine the place value of the final digit.	3. 7 tenths
Write the fraction. Write 7 in the numerator as it is the number to the right of the decimal point.	$3\frac{7}{\square}$
Write 10 in the denominator as the place value of the final digit, 7, is tenths.	$3\frac{7}{10}$
The fraction is in simplest form.	So, $3.7 = 3\frac{7}{10}$

(c) −0.286

There is a 0 to the left of the decimal point. Write a negative sign before the fraction.	$-\frac{\square}{\square}$
Determine the place value of the final digit and write it in the denominator.	$-0.\underset{\text{tenths}}{2}\underset{\text{hundredths}}{8}\underset{\text{thousandths}}{6}$
Write the fraction. Write 286 in the numerator as it is the number to the right of the decimal point. Write 1,000 in the denominator as the place value of the final digit, 6, is thousandths.	$-\frac{286}{1000}$
We remove a common factor of 2 to simplify the fraction.	$-\frac{143}{500}$

? Exercise 5.1.7:

Write as a fraction or mixed number. Simplify the answer if possible. (a) 5.3 (b) 6.07 (c) −0.234

Answer a

$5\frac{3}{10}$

Answer b

$6\frac{7}{100}$

Answer c

$-\frac{234}{1000}$

? Exercise 5.1.8:

Write as a fraction or mixed number. Simplify the answer if possible. (a) 8.7 (b) 1.03 (c) −0.024

Answer a

$8\frac{7}{10}$

Answer b

$1\frac{3}{100}$

Answer c

$-\frac{24}{1000}$

5.2: Decimals (Part 2)

Locate Decimals on the Number Line

Since decimals are forms of fractions, locating decimals on the number line is similar to locating fractions on the number line.

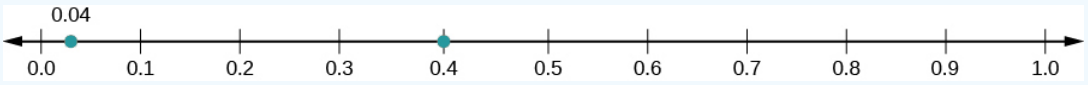
Example 5.2.5:

Locate 0.4 on a number line.

Solution

The decimal 0.4 is equivalent to $\frac{4}{10}$, so 0.4 is located between 0 and 1. On a number line, divide the interval between 0 and 1 into 10 equal parts and place marks to separate the parts.

Label the marks 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0. We write 0 as 0.0 and 1 as 1.0, so that the numbers are consistently in tenths. Finally, mark 0.4 on the number line.



Exercise 5.2.9:

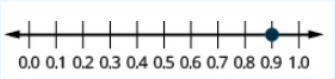
Locate 0.6 on a number line.

Answer

Exercise 5.2.10:

Locate 0.9 on a number line.

Answer



Example 5.2.6:

Locate −0.74 on a number line.

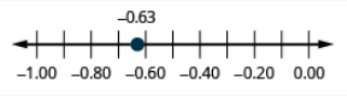
Solution

The decimal −0.74 is equivalent to $-\frac{74}{100}$, so it is located between 0 and −1. On a number line, mark off and label the multiples of -0.10 in the interval between 0 and −1 (−0.10, −0.20, etc.) and mark −0.74 between −0.70 and −0.80, a little closer to −0.70.

Exercise 5.2.11:

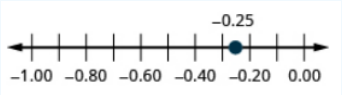
Locate −0.63 on a number line.

Answer



Exercise 5.2.12:

Locate −0.25 on a number line.



Answer

Order Decimals

Which is larger, 0.04 or 0.40?

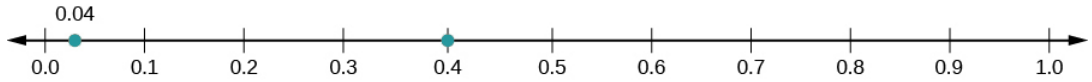
If you think of this as money, you know that $0.40 (forty cents) is greater than $0.04 (four cents). So, 0.40 > 0.04.

In previous chapters, we used the number line to order numbers.

a < b: 'a is less than b' when a is to the left of b on the number line

a > b: 'a is greater than b' when a is to the right of b on the number line

Where are 0.04 and 0.40 located on the number line?



We see that 0.40 is to the right of 0.04. So we know 0.40 > 0.04.

How does 0.31 compare to 0.308? This doesn't translate into money to make the comparison easy. But if we convert 0.31 and 0.308 to fractions, we can tell which is larger.

	0.31		0.308	
Convert to fractions.	$\frac{31}{100}$	(5.2.1)	$\frac{308}{1000}$	(5.2.2)
We need a common denominator to compare them.	$\frac{31 \cdot 10}{100 \cdot 10}$	(5.2.3)	$\frac{308}{1000}$	(5.2.4)
	$\frac{310}{1000}$	(5.2.5)	$\frac{308}{1000}$	(5.2.6)

Because 310 > 308, we know that $\frac{310}{1000} > \frac{308}{1000}$. Therefore, 0.31 > 0.308.

Notice what we did in converting 0.31 to a fraction—we started with the fraction $\frac{31}{100}$ and ended with the equivalent fraction $\frac{310}{1000}$. Converting $\frac{310}{1000}$ back to a decimal gives 0.310. So 0.31 is equivalent to 0.310. Writing zeros at the end of a decimal does

not change its value.

$$\frac{31}{100} = \frac{310}{1000} \quad and \quad 0.31 = 0.310 \tag{5.2.7}$$

If two decimals have the same value, they are said to be equivalent decimals.

$$0.31 = 0.310 \tag{5.2.8}$$

We say 0.31 and 0.310 are equivalent decimals.

HOW TO: ORDER DECIMALS

Step 1. Check to see if both numbers have the same number of decimal places. If not, write zeros at the end of the one with fewer digits to make them match.

Step 2. Compare the numbers to the right of the decimal point as if they were whole numbers.

Step 3. Order the numbers using the appropriate inequality sign.

Example 5.2.7:

Order the following decimals using < or >: (a) 0.64 __0.6 (b) 0.83 __0.803

Solution

(a) 0.64 __0.6

Check to see if both numbers have the same number of decimal places. They do not, so write one zero at the right of 0.6.	0.64 __0.60
Compare the numbers to the right of the decimal point as if they were whole numbers.	64 > 60
Order the numbers using the appropriate inequality sign.	0.64 > 0.60 0.64 > 0.6

(b) 0.83 __0.803

Check to see if both numbers have the same number of decimal places. They do not, so write one zero at the right of 0.83.	0.830 __0.803
Compare the numbers to the right of the decimal point as if they were whole numbers.	830 > 803
Order the numbers using the appropriate inequality sign.	0.830 > 0.803 0.83 > 0.803

Exercise 5.2.13:

Order each of the following pairs of numbers, using < or >: (a) 0.42__0.4 (b) 0.76__0.706

Answer a

>

Answer b

>

Exercise 5.2.14:

Order each of the following pairs of numbers, using < or >: (a) 0.1__0.18 (b) 0.305__0.35

Answer a

<

Answer b

<

When we order negative decimals, it is important to remember how to order negative integers. Recall that larger numbers are to the right on the number line. For example, because −2 lies to the right of −3 on the number line, we know that −2 > −3. Similarly, smaller numbers lie to the left on the number line. For example, because −9 lies to the left of −6 on the number line, we know that −9 < −6.

If we zoomed in on the interval between 0 and −1, we would see in the same way that −0.2 > −0.3 and −0.9 < −0.6.

Example 5.2.8:

Use < or > to order. −0.1__−0.8.

Solution

Write the numbers one under the other, lining up the decimal points.	−0.1 −0.8
They have the same number of digits.	
Since −1 > −8, −1 tenth is greater than −8 tenths.	−0.1 > −0.8

Exercise 5.2.15:

Order each of the following pairs of numbers, using < or >: −0.3___−0.5

Answer

>

Exercise 5.2.16:

Order each of the following pairs of numbers, using < or >: −0.6___−0.7

Answer

>

Round Decimals

In the United States, gasoline prices are usually written with the decimal part as thousandths of a dollar. For example, a gas station might post the price of unleaded gas at $3.279 per gallon. But if you were to buy exactly one gallon of gas at this price, you would pay $3.28 , because the final price would be rounded to the nearest cent. In Whole Numbers, we saw that we round numbers to get an approximate value when the exact value is not needed. Suppose we wanted to round $2.72 to the nearest dollar. Is it closer to $2 or to $3? What if we wanted to round $2.72 to the nearest ten cents; is it closer to $2.70 or to $2.80? The number lines in Figure 5.2.3 can help us answer those questions.

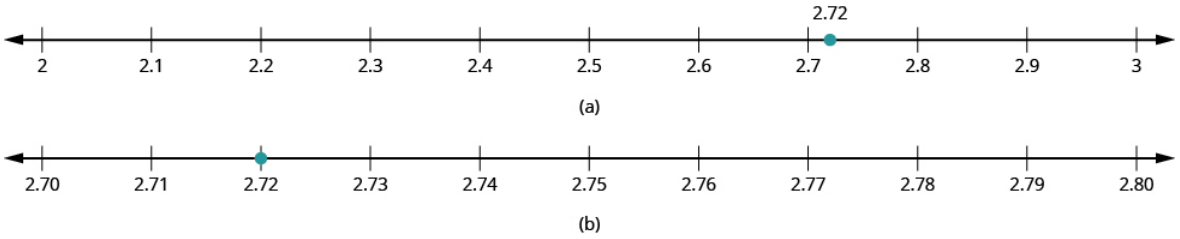


Figure 5.2.3 - (b) We see that 2.72 is closer to 3 than to 2. So, 2.72 rounded to the nearest whole number is 3. (b) We see that 2.72 is closer to 2.70 than 2.80. So we say that 2.72 rounded to the nearest tenth is 2.7.

Can we round decimals without number lines? Yes! We use a method based on the one we used to round whole numbers.

HOW TO: ROUND A DECIMAL

Step 1. Locate the given place value and mark it with an arrow.

Step 2. Underline the digit to the right of the given place value.

Step 3. Is this digit greater than or equal to 5?

- Yes - add 1 to the digit in the given place value.
- No - do not change the digit in the given place value

Step 4. Rewrite the number, removing all digits to the right of the given place value.

Example 5.2.9:

Round 18.379 to the nearest hundredth.

Solution

Locate the hundredths place and mark it with an arrow.	hundredths place ↓ 18.379
Underline the digit to the right of the 7.	hundredths place ↓ 18.379
Because 9 is greater than or equal to 5, add 1 to the 7.	18.379 (add 1 / delete)
Rewrite the number, deleting all digits to the right of the hundredths place.	18.38

18.38 is 18.379 rounded to the nearest hundredth.

Exercise 5.2.17:

Round to the nearest hundredth: 1.047.

Answer

1.05

Exercise 5.2.18:

Round to the nearest hundredth: 9.173.

Answer

9.17

Example 5.2.10:

Round 18.379 to the nearest (a) tenth (b) whole number.

Solution

(a) Round 18.379 to the nearest tenth.

Locate the tenths place and mark it with an arrow.	
Underline the digit to the right of the tenths digit.	
Because 7 is greater than or equal to 5, add 1 to the 3.	Rewrite the number, deleting all digits to the right of the tenths place.	18.4

So, 18.379 rounded to the nearest tenth is 18.4.

(b) Round 18.379 to the nearest whole number.

Locate the ones place and mark it with an arrow.	
Underline the digit to the right of the ones place.	
Since 3 is not greater than or equal to 5, do not add 1 to the 8.	Rewrite the number, deleting all digits to the right of the ones place.	18

So 18.379 rounded to the nearest whole number is 18.

Exercise 5.2.19:

Round 6.582 to the nearest (a) hundredth (b) tenth (c) whole number.

Answer a

6.58

Answer b

6.6

Answer c

7

Exercise 5.2.20:

Round 15.2175 to the nearest (a) thousandth (b) hundredth (c) tenth.

Answer a

15.218

Answer b

15.22

Answer c

15.2

Introduction to Decimal Notation

Write a Number in Decimal Notation from Words

Identify Decimals on the Number Line

Rounding Decimals

Writing a Decimal as a Simplified Fraction

Practice Makes Perfect

Name Decimals In the following exercises, name each decimal.

1. 5.5
2. 7.8
3. 5.01
4. 14.02
5. 8.71
6. 2.64
7. 0.002
8. 0.005
9. 0.381
10. 0.479
11. −17.9
12. −31.4

Write Decimals

In the following exercises, translate the name into a decimal number.

13. Eight and three hundredths
14. Nine and seven hundredths
15. Twenty-nine and eighty-one hundredths
16. Sixty-one and seventy-four hundredths
17. Seven tenths
18. Six tenths

19. One thousandth
20. Nine thousandths
21. Twenty-nine thousandths
22. Thirty-five thousandths
23. Negative eleven and nine ten-thousandths
24. Negative fifty-nine and two ten-thousandths
25. Thirteen and three hundred ninety-five ten thousandths
26. Thirty and two hundred seventy-nine thousandths

Convert Decimals to Fractions or Mixed Numbers

In the following exercises, convert each decimal to a fraction or mixed number.

27. 1.99
28. 5.83
29. 15.7
30. 18.1
31. 0.239
32. 0.373
33. 0.13
34. 0.19
35. 0.011
36. 0.049
37. −0.00007
38. −0.00003
39. 6.4
40. 5.2
41. 7.05
42. 9.04
43. 4.006
44. 2.008
45. 10.25
46. 12.75
47. 1.324
48. 2.482
49. 14.125
50. 20.375

Locate Decimals on the Number Line

In the following exercises, locate each number on a number line.

51. 0.8
52. 0.3
53. −0.2
54. −0.9
55. 3.1
56. 2.7
57. −2.5
58. −1.6

Order Decimals

In the following exercises, order each of the following pairs of numbers, using < or >.

59. 0.9__0.6
60. 0.7__0.8
61. 0.37__0.63

62. 0.86__0.69
63. 0.6__0.59
64. 0.27__0.3
65. 0.91__0.901
66. 0.415__0.41
67. −0.5__−0.3
68. −0.1_−0.4
69. −0.62_−0.619
70. −7.31_−7.3

Round Decimals

In the following exercises, round each number to the nearest tenth.

71. 0.67
72. 0.49
73. 2.84
74. 4.63

In the following exercises, round each number to the nearest hundredth.

75. 0.845
76. 0.761
77. 5.7932
78. 3.6284
79. 0.299
80. 0.697
81. 4.098
82. 7.096

In the following exercises, round each number to the nearest (a) hundredth (b) tenth (c) whole number.

83. 5.781
84. 1.638
85. 63.479
86. 84.281

Everyday Math

87. **Salary Increase** Danny got a raise and now makes $58,965.95 a year. Round this number to the nearest: (a) dollar (b) thousand dollars (c) ten thousand dollars.
88. **New Car Purchase** Selena's new car cost $23,795.95. Round this number to the nearest: (a) dollar (b) thousand dollars (c) ten thousand dollars.
89. **Sales Tax** Hyo Jin lives in San Diego. She bought a refrigerator for $1624.99 and when the clerk calculated the sales tax it came out to exactly $142.186625. Round the sales tax to the nearest (a) penny (b) dollar.
90. **Sales Tax** Jennifer bought a $1,038.99 dining room set for her home in Cincinnati. She calculated the sales tax to be exactly $67.53435. Round the sales tax to the nearest (a) penny (b) dollar.

Writing Exercises

91. How does your knowledge of money help you learn about decimals?
92. Explain how you write "three and nine hundredths" as a decimal.
93. Jim ran a 100-meter race in 12.32 seconds. Tim ran the same race in 12.3 seconds. Who had the faster time, Jim or Tim? How do you know?
94. Gerry saw a sign advertising postcards marked for sale at "10 for 0.99¢." What is wrong with the advertised price?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
name decimals.			
write decimals.			
convert decimals to fractions or mixed numbers.			
locate decimals on the number line.			
order decimals.			
round decimals.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

5.3: Decimal Operations (Part 1)

Learning Objectives

- Add and subtract decimals
- Multiply decimals
- Divide decimals
- Use decimals in money applications

be prepared!

Before you get started, take this readiness quiz.

1. Simplify $\frac{70}{100}$. If you missed this problem, review Example 4.3.1.
2. Multiply $\frac{3}{10} \cdot \frac{9}{10}$. If you missed this problem, review Example 4.3.7.
3. Divide $-36 \div (-9)$. If you missed this problem, review Example 3.7.3.

Add and Subtract Decimals

Let's take one more look at the lunch order from the start of Decimals, this time noticing how the numbers were added together.

$$\begin{array}{rl} \$3.45 & Sandwich \\ \$1.25 & Water \\ +\$0.33 & Tax \\ \hline \$5.03 & Total \end{array}$$

All three items (sandwich, water, tax) were priced in dollars and cents, so we lined up the dollars under the dollars and the cents under the cents, with the decimal points lined up between them. Then we just added each column, as if we were adding whole numbers. By lining up decimals this way, we can add or subtract the corresponding place values just as we did with whole numbers.

HOW TO: ADD OR SUBTRACT DECIMALS

Step 1. Write the numbers vertically so the decimal points line up.

Step 2. Use zeros as place holders, as needed.

Step 3. Add or subtract the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.

Example 5.3.1:

Add: 3.7 + 12.4.

Solution

Write the numbers vertically so the decimal points line up.	$\begin{array}{r} 3.7 \\ +12.4 \\ \hline \end{array}$
Place holders are not needed since both numbers have the same number of decimal places.	

Add the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.	$\begin{array}{r} {\scriptstyle 1} \\ 3.7 \\ +12.4 \\ \hline 16.1 \end{array}$

Exercise 5.3.1:

Add: 5.7 + 11.9.

Answer

17.6

Exercise 5.3.2:

Add: 18.32 + 14.79.

Answer

13.11

Example 5.3.2:

Add: 23.5 + 41.38.

Solution

Write the numbers vertically so the decimal points line up.	$\begin{array}{r} 23.5 \\ +41.38 \\ \hline \end{array}$
Place 0 as a place holder after the 5 in 23.5, so that both numbers have two decimal places.	$\begin{array}{r} 23.50 \\ +41.38 \\ \hline \end{array}$
Add the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.	$\begin{array}{r} 23.50 \\ +41.38 \\ \hline 64.88 \end{array}$

Exercise 5.3.3:

Add: 4.8 + 11.69.

Answer

16.49

Exercise 5.3.4:

Add: 5.123 + 18.47.

Answer

23.593

How much change would you get if you handed the cashier a $20 bill for a $14.65 purchase? We will show the steps to calculate this in the next example.

Example 5.3.3:

Subtract: $20 - 14.65$.

Solution

Write the numbers vertically so the decimal points line up. Remember 20 is a whole number, so place the decimal point after the 0.	$\begin{array}{r} 20. \\ -14.65 \\ \hline \end{array}$
Place two zeros after the decimal point in 20, as place holders so that both numbers have two decimal places.	$\begin{array}{r} 20.00 \\ -14.65 \\ \hline \end{array}$
Subtract the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.	$\begin{array}{r} {\scriptstyle 9}\ \ {\scriptstyle 9}\ \ {\scriptstyle 9} \\ 1\ \cancel{10}\ \cancel{10}\ \cancel{10} \\ \cancel{2}\ \cancel{0}.\ \cancel{0}\ \cancel{0} \\ -1\ 4\ .\ 6\ 5 \\ \hline 5\ .\ 3\ 5 \end{array}$

Exercise 5.3.5:

Subtract: $10 - 9.58$.

Answer

0.42

Exercise 5.3.6:

Subtract: $50 - 37.42$.

Answer

12.58

Example 5.3.4:

Subtract: $2.51 - 7.4$.

Solution

If we subtract 7.4 from 2.51, the answer will be negative since $7.4 > 2.51$. To subtract easily, we can subtract 2.51 from 7.4. Then we will place the negative sign in the result.

Write the numbers vertically so the decimal points line up.	$\begin{array}{r} 7.4 \\ -2.51 \\ \hline \end{array}$
Place zero after the 4 in 7.4 as a place holder, so that both numbers have two decimal places.	$\begin{array}{r} 7.40 \\ -2.51 \\ \hline \end{array}$

Subtract and place the decimal in the answer.	$\begin{array}{r} 7.40 \\ -2.51 \\ \hline 4.89 \end{array}$
Remember that we are really subtracting 2.51 − 7.4 so the answer is negative.	2.51 − 7.4 = − 4.89

Exercise 5.3.7:

Subtract: 4.77 − 6.3.

Answer

-1.53

Exercise 5.3.8:

Subtract: 8.12 − 11.7.

Answer

-3.58

Multiply Decimals

Multiplying decimals is very much like multiplying whole numbers—we just have to determine where to place the decimal point. The procedure for multiplying decimals will make sense if we first review multiplying fractions.

Do you remember how to multiply fractions? To multiply fractions, you multiply the numerators and then multiply the denominators. So let's see what we would get as the product of decimals by converting them to fractions first. We will do two examples side-by-side in Table 5.22. Look for a pattern.

Table 5.3.1

	A	B
	(0.3)(0.7)	(0.2)(0.46)
Convert to fractions.	$\left(\frac{3}{10}\right)\left(\frac{7}{10}\right)$ (5.3.1)	$\left(\frac{2}{10}\right)\left(\frac{46}{100}\right)$ (5.3.2)
Multiply.	$\frac{21}{100}$ (5.3.3)	$\frac{92}{1000}$ (5.3.4)
Convert back to decimals	0.21	0.092

There is a pattern that we can use. In A, we multiplied two numbers that each had one decimal place, and the product had two decimal places. In B, we multiplied a number with one decimal place by a number with two decimal places, and the product had three decimal places.

How many decimal places would you expect for the product of (0.01)(0.004)? If you said "five", you recognized the pattern. When we multiply two numbers with decimals, we count all the decimal places in the factors—in this case two plus three—to get the number of decimal places in the product—in this case five.

$$\underbrace{(0.01)}_{2\text{ places}}\ \underbrace{(0.004)}_{3\text{ places}} = \underbrace{0.00004}_{5\text{ places}}$$

$$\left(\frac{1}{100}\right)\left(\frac{4}{1000}\right) = \frac{4}{100{,}000}$$

Once we know how to determine the number of digits after the decimal point, we can multiply decimal numbers without converting them to fractions first. The number of decimal places in the product is the sum of the number of decimal places in the factors.

The rules for multiplying positive and negative numbers apply to decimals, too, of course.

Definition: Multiplying Two Numbers

When multiplying two numbers,

- if their signs are the same, the product is positive.
- if their signs are different, the product is negative.

When you multiply signed decimals, first determine the sign of the product and then multiply as if the numbers were both positive. Finally, write the product with the appropriate sign.

HOW TO: MULTIPLY DECIMAL NUMBERS

Step 1. Determine the sign of the product.

Step 2. Write the numbers in vertical format, lining up the numbers on the right.

Step 3. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.

Step 4. Place the decimal point. The number of decimal places in the product is the sum of the number of decimal places in the factors. If needed, use zeros as placeholders.

Step 5. Write the product with the appropriate sign.

Example 5.3.5:

Multiply: (3.9)(4.075).

Solution

Determine the sign of the product. The signs are the same.	The product will be positive.
Write the numbers in vertical format, lining up the numbers on the right.	$\begin{array}{r} 4.075 \\ \times 3.9 \\ \hline \end{array}$
Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.	$\begin{array}{r} 4.075 \\ \times 3.9 \\ \hline 36675 \\ 12225 \\ \hline 158925 \end{array}$
Place the decimal point. Add the number of decimal places in the factors (1 + 3). Place the decimal point 4 places from the right.	$\begin{array}{rl} 4.075 & 3\ places \\ \times 3.9 & 1\ place \\ \hline 36675 & \\ 12225 & \\ \hline 158925 & 4\ places \end{array}$
The product is positive.	(3.9)(4.075) = 15.8925

Exercise 5.3.9:

Multiply: 4.5(6.107).

Answer

27.4815

Exercise 5.3.10:

Multiply: 10.79(8.12).

Answer

87.6148

Example 5.3.6:

Multiply: (−8.2)(5.19).

Solution

The signs are different.	The product will be negative.
Write in vertical format, lining up the numbers on the right.	$\begin{array}{r} 5.19 \\ \times 8.2 \\ \hline \end{array}$
Multiply.	$\begin{array}{r} 5.19 \\ \times 8.2 \\ \hline 1038 \\ 4152 \\ \hline 42558 \end{array}$
Place the decimal point 3 places from the right. (−8.2)(5.19) 1 place 2 places	$\begin{array}{r} 5.19 \\ \times 8.2 \\ \hline 1038 \\ 4152 \\ \hline 42.558 \end{array}$
The product is negative.	(−8.2)(5.19) = −42.558

Exercise 5.3.11:

Multiply: (4.63)(−2.9).

Answer

−13.427

Exercise 5.3.12:

Multiply: (−7.78)(4.9).

Answer

-38.122

In the next example, we'll need to add several placeholder zeros to properly place the decimal point.

Example 5.3.7:

Multiply: (0.03)(0.045).

Solution

The product is positive.	(0.03)(0.045)
Write in vertical format, lining up the numbers on the right.	0.045 $\times 0.03$
Multiply.	0.045 $\times 0.03$ 135
The decimal point must be 5 places from the right. (0.03)(0.045) 2 places 3 places Add zeros as needed to get the 5 places.	0.045 $\times 0.03$ 0.00135
The product is positive.	(0.03)(0.045) = 0.00135

Exercise 5.3.13:

Multiply: (0.04)(0.087).

Answer

0.00348

Exercise 5.3.14:

Multiply: (0.09)(0.067).

Answer

0.00603

Multiply by Powers of 10

In many fields, especially in the sciences, it is common to multiply decimals by powers of 10. Let's see what happens when we multiply 1.9436 by some powers of 10.

1.9436(10)	1.9436(100)	1.9436(1000)
1.9436 × 10 19.4360	1.9436 × 100 194.3600	1.9436 × 1000 1943.6000

Look at the results without the final zeros. Do you notice a pattern?

$$1.9436(10) = 19.436$$
$$1.9436(100) = 194.36$$
$$1.9436(1000) = 1943.6$$

The number of places that the decimal point moved is the same as the number of zeros in the power of ten. Table 5.26 summarizes the results.

Table 5.3.2

Multiply by	Number of zeros	Number of places decimal point moves
10	1	1 place to the right
100	2	2 places to the right
1,000	3	3 places to the right
10,000	4	4 places to the right

We can use this pattern as a shortcut to multiply by powers of ten instead of multiplying using the vertical format. We can count the zeros in the power of 10 and then move the decimal point that same of places to the right. So, for example, to multiply 45.86 by 100, move the decimal point 2 places to the right.

$$45.86 \times 100 = 4586.$$

Sometimes when we need to move the decimal point, there are not enough decimal places. In that case, we use zeros as placeholders. For example, let's multiply 2.4 by 100. We need to move the decimal point 2 places to the right. Since there is only one digit to the right of the decimal point, we must write a 0 in the hundredths place.

$$2.4 \times 100 = 240.$$

HOW TO: MULTIPLY A DECIMAL BY A POWER OF 10

Step 1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.

Step 2. Write zeros at the end of the number as placeholders if needed.

Example 5.3.8:

Multiply 5.63 by factors of (a) 10 (b) 100 (c) 1000.

Solution

By looking at the number of zeros in the multiple of ten, we see the number of places we need to move the decimal to the right.

(a) 5.63(10)

There is 1 zero in 10, so move the decimal point 1 place to the right.	5.63
	56.3

(b) 5.63(100)

There are 2 zeros in 100, so move the decimal point 2 places to the right.	5.63
	563

(c) 5.63(1000)

There are 3 zeros in 1000, so move the decimal point 3 places to the right.	5.63

A zero must be added at the end.	5,630

Exercise 5.3.15:

Multiply 2.58 by factors of (a) 10 (b) 100 (c) 1000.

Answer a

25.8

Answer b

258

Answer c

$2,580$

Exercise 5.3.16:

Multiply 14.2 by factors of (a) 10 (b) 100 (c) 1000.

Answer a

142

Answer b

$1,420$

Answer c

$14,200$

5.4: Decimal Operations (Part 2)

Divide Decimals

Just as with multiplication, division of decimals is very much like dividing whole numbers. We just have to figure out where the decimal point must be placed.

To understand decimal division, let's consider the multiplication problem

$$(0.2)(4) = 0.8 \tag{5.4.1}$$

Remember, a multiplication problem can be rephrased as a division problem. So we can write 0.8 ÷ 4 = 0.2 We can think of this as "If we divide 8 tenths into four groups, how many are in each group?" Figure 5.4.1 shows that there are four groups of two-tenths in eight-tenths. So 0.8 ÷ 4 = 0.2.

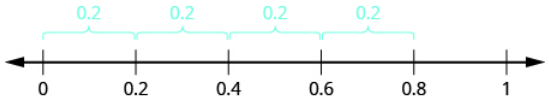

Figure 5.4.1

Using long division notation, we would write

$$4\overline{)0.8}\quad 0.2$$

Notice that the decimal point in the quotient is directly above the decimal point in the dividend.

To divide a decimal by a whole number, we place the decimal point in the quotient above the decimal point in the dividend and then divide as usual. Sometimes we need to use extra zeros at the end of the dividend to keep dividing until there is no remainder.

HOW TO: DIVIDE A DECIMAL BY A WHOLE NUMBER

Step 1. Write as long division, placing the decimal point in the quotient above the decimal point in the dividend.

Step 2. Divide as usual.

Example 5.4.9:

Divide: 0.12 ÷ 3.

Solution

Write as long division, placing the decimal point in the quotient above the decimal point in the dividend.	$3\overline{)0.12}$
Divide as usual. Since 3 does not go into 0 or 1 we use zeros as placeholders.	$3\overline{)0.12}\quad 0.04$ 12 0

0.12 ÷ 3 = 0.04

Exercise 5.4.17:

Divide: 0.28 ÷ 4.

Answer

0.07

Exercise 5.4.18:

Divide: 0.56 ÷ 7.

Answer

0.08

In everyday life, we divide whole numbers into decimals—money—to find the price of one item. For example, suppose a case of 24 water bottles cost $3.99. To find the price per water bottle, we would divide $3.99 by 24, and round the answer to the nearest cent (hundredth).

Example 5.4.10:

Divide: $3.99 ÷ 24.

Solution

Place the decimal point in the quotient above the decimal point in the dividend.	$24\overline{)3.99}$
Divide as usual. When do we stop? Since this division involves money, we round it to the nearest cent (hundredth). To do this, we must carry the division to the thousandths place.	$\begin{array}{r} 0.166 \\ 24\overline{)3.990} \\ \underline{24} \\ 159 \\ \underline{144} \\ 150 \\ \underline{144} \\ 6 \end{array}$
Round to the nearest cent.	$\$0.166 \approx \$0.17$ (5.4.2)

$3.99 ÷ 24 ≈ $0.17

This means the price per bottle is 17 cents.

Exercise 5.4.19:

Divide: $6.99 ÷ 36.

Answer

$0.19

Exercise 5.4.20:

Divide: $4.99 ÷ 12.

Answer

$0.42

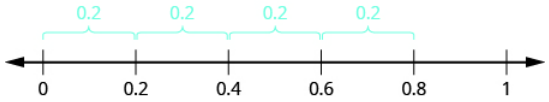
Divide a Decimal by Another Decimal

So far, we have divided a decimal by a whole number. What happens when we divide a decimal by another decimal? Let's look at the same multiplication problem we looked at earlier, but in a different way.

$$(0.2)(4) = 0.8 \quad (5.4.3)$$

Remember, again, that a multiplication problem can be rephrased as a division problem. This time we ask, “Ho w many times does 0.2 go into 0.8?” Because (0.2)(4) = 0.8, we can say that 0.2 goes into 0.8 four times. This means that 0.8 divided by 0.2 is 4.

$$0.8 \div 0.2 = 4 \tag{5.4.4}$$



We would get the same answer, 4, if we divide 8 by 2, both whole numbers. Why is this so? Let’s think about the division problem as a fraction.

$$\frac{0.8}{0.2} \tag{5.4.5}$$

$$\frac{(0.8)10}{(0.2)10} \tag{5.4.6}$$

$$\frac{8}{2} \tag{5.4.7}$$

$$4 \tag{5.4.8}$$

We multiplied the numerator and denominator by 10 and ended up just dividing 8 by 2. To divide decimals, we multiply both the numerator and denominator by the same power of 10 to make the denominator a whole number. Because of the Equivalent Fractions Property, we haven’t changed the value of the fraction. The effect is to move the decimal points in the numerator and denominator the same number of places to the right.

We use the rules for dividing positive and negative numbers with decimals, too. When dividing signed decimals, first determine the sign of the quotient and then divide as if the numbers were both positive. Finally, write the quotient with the appropriate sign. It may help to review the vocabulary for division:

$a \div b$ — a dividend, b divisor

$\frac{a}{b}$ — a dividend, b divisor

$b\overline{)a}$ — b divisor, a dividend

HOW TO: DIVIDE DECIMAL NUMBERS

Step 1. Determine the sign of the quotient.

Step 2. Make the divisor a whole number by moving the decimal point all the way to the right. Move the decimal point in the dividend the same number of places to the right, writing zeros as needed.

Step 3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.

Step 4. Write the quotient with the appropriate sign.

Example 5.4.11:

Divide: −2.89 ÷ (3.4).

Solution

Determine the sign of the quotient.	The quotient will be negative.
Make the divisor the whole number by 'moving' the decimal point all the way to the right. 'Move' the decimal point in the dividend the same number of places to the right.	$3.4\overline{)2.89}$
Divide. Place the decimal point in the quotient above the decimal point in the dividend. Add zeros as needed until the remainder is zero.	$34.\overline{)28.90}$ → 0.85; 272; 170; 170; 0

Write the quotient with the appropriate sign.	$-2.89 \div (3.4) = -0.85$

Exercise 5.4.21:

Divide: $-1.989 \div 5.1$.

Answer

-0.39

Exercise 5.4.22:

Divide: $-2.04 \div 5.1$.

Answer

-0.4

Example 5.4.12:

Divide: $-25.65 \div (-0.06)$.

Solution

The signs are the same.	The quotient is positive.
Make the divisor a whole number by 'moving' the decimal point all the way to the right. 'Move' the decimal point in the dividend the same number of places.	$0.06\overline{)25.65}$
Divide. Place the decimal point in the quotient above the decimal point in the dividend.	$\begin{array}{r} 427.5 \\ 006.\overline{)2565.0} \\ -24 \\ \hline 16 \\ -12 \\ \hline 45 \\ -42 \\ \hline 30 \\ 30 \\ \hline \end{array}$
Write the quotient with the appropriate sign.	$-25.65 \div (-0.06) = 427.5$

Exercise 5.4.23:

Divide: $-23.492 \div (-0.04)$.

Answer

587.3

Exercise 5.4.24:

Divide: $-4.11 \div (-0.12)$.

Answer

34.25

Now we will divide a whole number by a decimal number.

Example 5.4.13

Divide: 4 ÷ (0.05).

Solution

The signs are the same.	The quotient is positive.
Make the divisor a whole number by 'moving' the decimal point all the way to the right. Move the decimal point in the dividend the same number of places, adding zeros as needed.	$0.05\overline{)4.00}$
Divide. Place the decimal point in the quotient above the decimal point in the dividend.	$\begin{array}{r} 80. \\ 5\overline{)400.} \\ \underline{40} \\ 00 \\ \underline{00} \end{array}$
Write the quotient with the appropriate sign.	4 ÷ 0.05 = 80

We can relate this example to money. How many nickels are there in four dollars? Because 4 ÷ 0.05 = 80, there are 80 nickels in $4.

Exercise 5.4.25:

Divide: 6 ÷ 0.03.

Answer

200

Exercise 5.4.26:

Divide: 7 ÷ 0.02

Answer

350

Use Decimals in Money Applications

We often apply decimals in real life, and most of the applications involving money. The Strategy for Applications we used in The Language of Algebra gives us a plan to follow to help find the answer. Take a moment to review that strategy now.

Strategy for Applications

1. Identify what you are asked to find.
2. Write a phrase that gives the information to find it.
3. Translate the phrase to an expression.
4. Simplify the expression.
5. Answer the question with a complete sentence.

Example 5.4.14:

Paul received $50 for his birthday. He spent $31.64 on a video game. How much of Paul's birthday money was left?

Solution

What are you asked to find?	How much did Paul have left?
Write a phrase.	$50 less $31.64
Translate.	$50 - 31.64$
Simplify.	18.36
Write a sentence.	Paul has $18.36 left.

Exercise 5.4.27:

Nicole earned $35 for babysitting her cousins, then went to the bookstore and spent $18.48 on books and coffee. How much of her babysitting money was left?

Answer

$16.52

Exercise 5.4.28:

Amber bought a pair of shoes for $24.75 and a purse for $36.90. The sales tax was $4.32. How much did Amber spend?

Answer

$65.97

Example 5.4.15:

Jessie put 8 gallons of gas in her car. One gallon of gas costs $3.529. How much does Jessie owe for the gas? (Round the answer to the nearest cent.)

Solution

What are you asked to find?	How much did Jessie owe for all the gas?
Write a phrase.	8 times the cost of one gallon of gas
Translate.	8($3.529)
Simplify.	$28.232
Round to the nearest cent.	$28.23
Write a sentence.	Jessie owes $28.23 for her gas purchase.

Exercise 5.4.29:

Hector put 13 gallons of gas into his car. One gallon of gas costs $3.175. How much did Hector owe for the gas? Round to the nearest cent.

Answer

$41.28

Exercise 5.4.30:

Christopher bought 5 pizzas for the team. Each pizza cost $9.75. How much did all the pizzas cost?

Answer

$48.75

Example 5.4.16:

Four friends went out for dinner. They shared a large pizza and a pitcher of soda. The total cost of their dinner was $31.76. If they divide the cost equally, how much should each friend pay?

Solution

What are you asked to find?	How much should each friend pay?
Write a phrase.	$31.76 divided equally among the four friends.
Translate to an expression.	$31.76 ÷ 4
Simplify.	$7.94
Write a sentence.	Each friend should pay $7.94 for his share of the dinner.

Exercise 5.4.31:

Six friends went out for dinner. The total cost of their dinner was $92.82. If they divide the bill equally, how much should each friend pay?

Answer

$15.47

Exercise 5.4.32:

Chad worked 40 hours last week and his paycheck was $570. How much does he earn per hour?

Answer

$14.25

Be careful to follow the order of operations in the next example. Remember to multiply before you add.

Example 5.4.17:

Marla buys 6 bananas that cost $0.22 each and 4 oranges that cost $0.49 each. How much is the total cost of the fruit?

Solution

What are you asked to find?	How much is the total cost of the fruit?
Write a phrase.	6 times the cost of each banana plus 4 times the cost of each orange
Translate to an expression.	6($0.22) + 4($0.49)
Simplify.	$1.32 + $1.96
Add.	$3.28

Write a sentence.	Marla's total cost for the fruit is $3.28.

Exercise 5.4.33:

Suzanne buys 3 cans of beans that cost $0.75 each and 6 cans of corn that cost $0.62 each. How much is the total cost of these groceries?

Answer

$5.97

Exercise 5.4.34:

Lydia bought movie tickets for the family. She bought two adult tickets for $9.50 each and four children's tickets for $6.00 each. How much did the tickets cost Lydia in all?

Answer

$43.00

173. (1.43 + 0.27) ÷ (0.9 − 0.05)
174. (1.5 − 0.06) ÷ (0.12 + 0.24)
175. [$75.42 + 0.18($75.42)] ÷ 5
176. [$56.31 + 0.22($56.31)] ÷ 4

Use Decimals in Money Applications

In the following exercises, use the strategy for applications to solve.

177. **Spending money** Brenda got $40 from the ATM. She spent $15.11 on a pair of earrings. How much money did she have left?
178. **Spending money** Marissa found $20 in her pocket. She spent $4.82 on a smoothie. How much of the $20 did she have left?
179. **Shopping** Adam bought a t-shirt for $18.49 and a book for $8.92 The sales tax was $1.65. How much did Adam spend?
180. **Restaurant** Roberto's restaurant bill was $20.45 for the entrée and $3.15 for the drink. He left a $4.40 tip. How much did Roberto spend?
181. **Coupon** Emily bought a box of cereal that cost $4.29. She had a coupon for $0.55 off, and the store doubled the coupon. How much did she pay for the box of cereal?
182. **Coupon** Diana bought a can of coffee that cost $7.99. She had a coupon for $0.75 off, and the store doubled the coupon. How much did she pay for the can of coffee?
183. **Diet** Leo took part in a diet program. He weighed 190 pounds at the start of the program. During the first week, he lost 4.3 pounds. During the second week, he had lost 2.8 pounds. The third week, he gained 0.7 pounds. The fourth week, he lost 1.9 pounds. What did Leo weigh at the end of the fourth week?
184. **Snowpack** On April 1, the snowpack at the ski resort was 4 meters deep, but the next few days were very warm. By April 5, the snow depth was 1.6 meters less. On April 8, it snowed and added 2.1 meters of snow. What was the total depth of the snow?
185. **Coffee** Noriko bought 4 coffees for herself and her coworkers. Each coffee was $3.75. How much did she pay for all the coffees?
186. **Subway Fare** Arianna spends $4.50 per day on subway fare. Last week she rode the subway 6 days. How much did she spend for the subway fares? 187. Income Mayra earns $9.25 per hour. Last week she worked 32 hours. How much did she earn?
187. **Income** Peter earns $8.75 per hour. Last week he worked 19 hours. How much did he earn?
188. **Hourly Wage** Alan got his first paycheck from his new job. He worked 30 hours and earned $382.50. How much does he earn per hour?
189. **Hourly Wage** Maria got her first paycheck from her new job. She worked 25 hours and earned $362.50. How much does she earn per hour?
190. **Restaurant** Jeannette and her friends love to order mud pie at their favorite restaurant. They always share just one piece of pie among themselves. With tax and tip, the total cost is $6.00. How much does each girl pay if the total number sharing the mud pie is (a) 2? (b) 3? (c) 4? (d) 5? (e) 6?
191. **Pizza** Alex and his friends go out for pizza and video games once a week. They share the cost of a $15.60 pizza equally. How much does each person pay if the total number sharing the pizza is (a) 2? (b) 3? (c) 4? (d) 5? (e) 6?

192. **Fast Food** At their favorite fast food restaurant, the Carlson family orders 4 burgers that cost $3.29 each and 2 orders of fries at $2.74 each. What is the total cost of the order?
193. **Home Goods** Chelsea needs towels to take with her to college. She buys 2 bath towels that cost $9.99 each and 6 washcloths that cost $2.99 each. What is the total cost for the bath towels and washcloths?
194. **Zoo** The Lewis and Chousmith families are planning to go to the zoo together. Adult tickets cost $29.95 and children's tickets cost $19.95. What will the total cost be for 4 adults and 7 children?
195. **Ice Skating** Jasmine wants to have her birthday party at the local ice skating rink. It will cost $8.25 per child and $12.95 per adult. What will the total cost be for 12 children and 3 adults?

Everyday Math

197. **Paycheck** Annie has two jobs. She gets paid $14.04 per hour for tutoring at City College and $8.75 per hour at a coffee shop. Last week she tutored for 8 hours and worked at the coffee shop for 15 hours. (a) How much did she earn? (b) If she had worked all 23 hours as a tutor instead of working both jobs, how much more would she have earned?
198. **Paycheck** Jake has two jobs. He gets paid $7.95 per hour at the college cafeteria and $20.25 at the art gallery. Last week he worked 12 hours at the cafeteria and 5 hours at the art gallery. (a) How much did he earn? (b) If he had worked all 17 hours at the art gallery instead of working both jobs, how much more would he have earned?

Writing Exercises

199. In the 2010 winter Olympics, two skiers took the silver and bronze medals in the Men's Super-G ski event. The silver medalist's time was 1 minute 30.62 seconds and bronze medalist's time was 1 minute 30.65 seconds. Whose time was faster? Find the difference in their times and then write the name of that decimal.
200. Find the quotient of 0.12 ÷ 0.04 and explain in words all the steps taken.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
add and subtract decimals.			
multiply decimals.			
divide decimals.			
use decimals in money applications.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

5.5: Decimals and Fractions (Part 1)

Learning Objectives

- Convert fractions to decimals
- Order decimals and fractions
- Simplify expressions using the order of operations
- Find the circumference and area of circles

be prepared!

Before you get started, take this readiness quiz.

1. Divide: 0.24 ÷ 8. If you missed this problem, review Example 5.4.9.
2. Order 0.64__0.6 using < or >. If you missed this problem, review Example 5.2.7.
3. Order −0.2__−0.1 using < or >. If you missed this problem, review Example 5.2.8.

Convert Fractions to Decimals

In Decimals, we learned to convert decimals to fractions. Now we will do the reverse—convert fractions to decimals. Remember that the fraction bar indicates division. So $\frac{4}{5}$ can be written $4 \div 5$ or $5\overline{)4}$. This means that we can convert a fraction to a decimal by treating it as a division problem.

Note: Convert a Fraction to a Decimal

To convert a fraction to a decimal, divide the numerator of the fraction by the denominator of the fraction.

Example 5.5.1:

Write the fraction $\frac{3}{4}$ as a decimal.

Solution

A fraction bar means division, so we can write the fraction 3 4 using division.	$4\overline{)3}$
Divide.	$\begin{array}{r} 0.75 \\ 4\overline{)3.00} \\ \underline{28} \\ 20 \\ \underline{20} \\ 0 \end{array}$

So the fraction $\frac{3}{4}$ is equal to 0.75.

Exercise 5.5.1:

Write the fraction as a decimal: $\frac{1}{4}$.

Answer

0.25

Exercise 5.5.2:

Write the fraction as a decimal: $\frac{3}{8}$.

Answer

0.375

Example 5.5.2:

Write the fraction $-\frac{7}{2}$ as a decimal.

Solution

The value of this fraction is negative. After dividing, the value of the decimal will be negative. We do the division ignoring the sign, and then write the negative sign in the answer.	$-\frac{7}{2}$ (5.5.1)
Divide 7 by 2.	$2\overline{)7.0}$ $\underline{6}$ 10 $\underline{10}$ 0

So, $-\frac{7}{2} = -3.5$.

Exercise 5.5.3:

Write the fraction as a decimal: $-\frac{9}{4}$.

Answer

-2.25

Exercise 5.5.4:

Write the fraction as a decimal: $-\frac{11}{2}$.

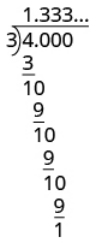
Answer

-5.5

Repeating Decimals

So far, in all the examples converting fractions to decimals the division resulted in a remainder of zero. This is not always the case. Let's see what happens when we convert the fraction $\frac{4}{3}$ to a decimal. First, notice that $\frac{4}{3}$ is an improper fraction. Its value is greater than 1. The equivalent decimal will also be greater than 1.

We divide 4 by 3.



No matter how many more zeros we write, there will always be a remainder of 1, and the threes in the quotient will go on forever. The number 1.333… is called a repeating decimal. Remember that the "…" means that the pattern repeats.

Definition: Repeating Decimal

A repeating decimal is a decimal in which the last digit or group of digits repeats endlessly.

How do you know how many 'repeats' to write? Instead of writing 1.333 … we use a shorthand notation by placing a line over the digits that repeat. The repeating decimal 1.333 … is written $1.\overline{3}$. The line above the 3 tells you that the 3 repeats endlessly. So 1.333… = $1.\overline{3}$. For other decimals, two or more digits might repeat. Table 5.5.1 shows some more examples of repeating decimals.

Table 5.5.1

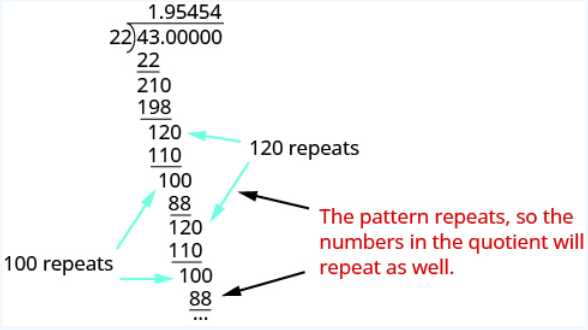
1.333… = $1.\overline{3}$	3 is the repeating digit
4.1666… = $4.1\overline{6}$	6 is the repeating digit
4.161616… = $4.\overline{16}$	16 is the repeating block
0.271271271… = $0.\overline{271}$	271 is the repeating block

Example 5.5.3:

Write $\frac{43}{22}$ as a decimal.

Solution

Divide 43 by 22.



Notice that the differences of 120 and 100 repeat, so there is a repeat in the digits of the quotient; 54 will repeat endlessly. The first decimal place in the quotient, 9, is not part of the pattern. So,

$$\frac{43}{22} = 1.9\overline{54} \tag{5.5.2}$$

Exercise 5.5.5:

Write as a decimal: $\frac{27}{11}$.

Answer

$2.\overline{45}$

Exercise 5.5.6:

Write as a decimal: $\frac{51}{22}$.

Answer

$2.3\overline{18}$

It is useful to convert between fractions and decimals when we need to add or subtract numbers in different forms. To add a fraction and a decimal, for example, we would need to either convert the fraction to a decimal or the decimal to a fraction.

Example 5.5.4:

Simplify: $\frac{7}{8} + 6.4$.

Solution

Change $\frac{7}{8}$ to a decimal.	$\begin{array}{r} 0.875 \\ 8\overline{)7.000} \\ \underline{64} \\ 60 \\ \underline{56} \\ 40 \\ \underline{40} \\ 0 \end{array}$	$0.875 + 6.4$
Add.		7.275

Exercise 5.5.7:

Simplify: $\frac{3}{8} + 4.9$.

Answer

5.275

Exercise 5.5.8:

Simplify: $5.7 + \frac{13}{20}$.

Answer

6.35

Order Decimals and Fractions

In Decimals, we compared two decimals and determined which was larger. To compare a decimal to a fraction, we will first convert the fraction to a decimal and then compare the decimals.

Example 5.5.5:

Order $\frac{3}{8}$ __ 0.4 using < or >.

Solution

Convert $\frac{3}{8}$ to a decimal.	0.375__0.4
Compare 0.375 to 0.4	0.375 < 0.4
Rewrite with the original fraction.	$\frac{3}{8}$ < 0.4

Exercise 5.5.9:

Order each of the following pairs of numbers, using < or >.

$$\frac{17}{20} __ 0.82 \tag{5.5.3}$$

Answer

>

Exercise 5.5.10:

Order each of the following pairs of numbers, using < or >.

$$\frac{3}{4} __ 0.785 \tag{5.5.4}$$

Answer

<

When ordering negative numbers, remember that larger numbers are to the right on the number line and any positive number is greater than any negative number.

Example 5.5.6:

Order −0.5___$-\frac{3}{4}$ using < or >.

Solution

Convert $-\frac{3}{4}$ to a decimal.	−0.5___−0.75
Compare −0.5 to −0.75.	−0.5 > −0.75
Rewrite the inequality with the original fraction.	$-0.5 > -\frac{3}{4}$

Exercise 5.5.11:

Order each of the following pairs of numbers, using < or >:

$$-\frac{5}{8}__-0.58 \tag{5.5.5}$$

Answer

$<$

Exercise 5.5.12:

Order each of the following pairs of numbers, using < or >:

$$-0.53__-\frac{11}{20} \tag{5.5.6}$$

Answer

$>$

Example 5.5.7:

Write the numbers $\frac{13}{20}$, 0.61, $\frac{11}{16}$ in order from smallest to largest.

Solution

Convert the fractions to decimals.	0.65, 0.61, 0.6875
Write the smallest decimal number first.	0.61, ____, _____
Write the next larger decimal number in the middle place.	0.61, 0.65, _____
Write the last decimal number (the larger) in the third place.	0.61, 0.65, 0.6875
Rewrite the list with the original fractions.	0.61, $\frac{13}{20}$, $\frac{11}{16}$

Exercise 5.5.13:

Write each set of numbers in order from smallest to largest: $\frac{7}{8}$, $\frac{4}{5}$, 0.82.

Answer

$\frac{4}{5}$, 0.82 $\frac{7}{8}$

Exercise 5.5.14:

Write each set of numbers in order from smallest to largest: 0.835, $\frac{13}{16}$, $\frac{3}{4}$.

Answer

$\frac{3}{4}$, $\frac{13}{16}$, 0.835

Simplify Expressions Using the Order of Operations

The order of operations introduced in Use the Language of Algebra also applies to decimals. Do you remember what the phrase "Please excuse my dear Aunt Sally" stands for?

Example 5.5.8:

Simplify the expressions: (a) $7(18.3 - 21.7)$ (b) $\frac{2}{3}(8.3 - 3.8)$

Solution

(a) $7(18.3 - 21.7)$

Simplify inside parentheses.	$7(-3.4)$
Multiply.	-23.8

(b) $\frac{2}{3}(8.3 - 3.8)$

Simplify inside parentheses.	$\frac{2}{3}(4.5)$	(5.5.7)
Write 4.5 as a fraction.	$\frac{2}{3}\left(\frac{4.5}{1}\right)$	(5.5.8)
Multiply.	$\frac{9}{3}$	(5.5.9)
Simplify.	3	(5.5.10)

Exercise 5.5.15:

Simplify: (a) $8(14.6 - 37.5)$ (b) $\frac{3}{5}(9.6 - 2.1)$.

Answer a

-183.2

Answer b

4.5

Exercise 5.5.16:

Simplify: (a) $25(25.69 - 56.74)$ (b) $\frac{2}{7}(11.9 - 4.2)$.

Answer a

-776.25

Answer b

2.2

Example 5.5.9:

Simplify each expression: (a) $6 \div 0.6 + (0.2)4 - (0.1)^2$ (b) $\left(\frac{1}{10}\right)^2 + (3.5)(0.9)$

Solution

(a) $6 \div 0.6 + (0.2)4 - (0.1)^2$

Simplify exponents.	$6 \div 0.6 + (0.2)4 - 0.01$
Divide.	$10 + (0.2)4 - 0.01$
Multiply.	$10 + 0.8 - 0.01$
Add.	$10.8 - 0.01$
Subtract.	10.79

(b) $\left(\frac{1}{10}\right)^2 + (3.5)(0.9)$

Simplify exponents.	$\frac{1}{100} + (3.5)(0.9)$
Multiply.	$\frac{1}{100} + 3.15$
Convert $\frac{1}{100}$ to a decimal.	$0.01 + 3.15$
Add.	3.16

Exercise 5.5.17:

Simplify: $9 \div 0.9 + (0.4)3 - (0.2)^2$.

Answer

11.16

Exercise 5.5.18:

Simplify: $\left(\frac{1}{2}\right)^2 + (0.3)(4.2)$.

Answer

1.51

5.6: Decimals and Fractions (Part 2)

Find the Circumference and Area of Circles

The properties of circles have been studied for over 2,000 years. All circles have exactly the same shape, but their sizes are affected by the length of the **radius**, a line segment from the center to any point on the circle. A line segment that passes through a circle's center connecting two points on the circle is called a **diameter**. The diameter is twice as long as the radius. See Figure 5.6.1.

The size of a circle can be measured in two ways. The distance around a circle is called its **circumference**.

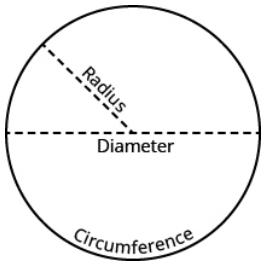

Figure 5.6.1

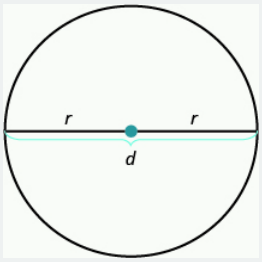
Archimedes discovered that for circles of all different sizes, dividing the circumference by the diameter always gives the same number. The value of this number is pi, symbolized by Greek letter π (pronounced pie). However, the exact value of π cannot be calculated since the decimal never ends or repeats (we will learn more about numbers like this in The Properties of Real Numbers.)

If we want the exact circumference or area of a circle, we leave the symbol π in the answer. We can get an approximate answer by substituting 3.14 as the value of π. We use the symbol ≈ to show that the result is approximate, not exact.

Note: Properties of Circles



r is the length of the radius.

d is the length of the diameter.

The circumference is $2\pi r$.

$$C = 2\pi r \tag{5.6.1}$$

The area is πr^2.

$$A = \pi r^2 \tag{5.6.2}$$

Since the diameter is twice the radius, another way to find the circumference is to use the formula $C = \pi d$.

Suppose we want to find the exact area of a circle of radius 10 inches. To calculate the area, we would evaluate the formula for the area when r = 10 inches and leave the answer in terms of π.

$$\begin{aligned} A &= \pi r^2 \\ A &= \pi(10^2) \\ A &= \pi \cdot 100 \end{aligned}$$

We write π after the 100. So the exact value of the area is A = 100π square inches. To approximate the area, we would substitute $\pi \approx 3.14$.

$$\begin{aligned} A &= 100\pi \\ &\approx 100 \cdot 3.14 \\ &\approx 314 \ square\ inches \end{aligned}$$

Remember to use square units, such as square inches, when you calculate the area.

Example 5.6.10:

A circle has radius 10 centimeters. Approximate its (a) circumference and (b) area.

Solution

(a) Find the circumference when r = 10.

Write the formula for circumference.	$C = 2\pi r$
Substitute 3.14 for π and 10 for r.	$C \approx 2(3.14)(10)$
Multiply.	C ≈ 62.8 centimeters

(b) Find the area when r = 10.

Write the formula for area.	$A = \pi r^2$
Substitute 3.14 for π and 10 for r.	$A \approx (3.14)(10)^2$
Multiply.	A ≈ 314 square centimeters

Exercise 5.6.19:

A circle has radius 50 inches. Approximate its (a) circumference and (b) area.

Answer a

314 in.

Answer b

7850 sq. in.

Exercise 5.6.20:

A circle has radius 100 feet. Approximate its (a) circumference and (b) area.

Answer a

628 ft.

Answer b

31,400 sq. ft.

Example 5.6.11:

A circle has radius 42.5 centimeters. Approximate its (a) circumference and (b) area.

Solution

(a) Find the circumference when r = 42.5.

Write the formula for circumference.	$C = 2\pi r$
Substitute 3.14 for π and 42.5 for r.	$C \approx 2(3.14)(42.5)$
Multiply.	C ≈ 266.9 centimeters

(b) Find the area when r = 42.5.

Write the formula for area.	$A = \pi r^2$
Substitute 3.14 for π and 42.5 for r.	$A \approx (3.14)(42.5)^2$
Multiply.	A ≈ 5671.625 square centimeters

? Exercise 5.6.21:

A circle has radius 51.8 centimeters. Approximate its (a) circumference and (b) area.

Answer a

325.304 cm

Answer b

8425.3736 sq. cm

? Exercise 5.6.22:

A circle has radius 26.4 meters. Approximate its (a) circumference and (b) area.

Answer a

165.792 m

Answer b

2188.4544 sq. m

Approximate π with a Fraction

Convert the fraction $\frac{22}{7}$ to a decimal. If you use your calculator, the decimal number will fill up the display and show 3.14285714. But if we round that number to two decimal places, we get 3.14, the decimal approximation of π. When we have a circle with radius given as a fraction, we can substitute $\frac{22}{7}$ for π instead of 3.14. And, since $\frac{22}{7}$ is also an approximation of π, we will use the ≈ symbol to show we have an approximate value.

✓ Example 5.6.12:

A circle has radius $\frac{14}{15}$ meter. Approximate its (a) circumference and (b) area.

Solution

(a) Find the circumference when r = $\frac{14}{15}$

Write the formula for circumference.	$C = 2\pi r$

Substitute $\frac{22}{7}$ for π and $\frac{14}{15}$ for r .	$C \approx 2\left(\frac{22}{7}\right)\left(\frac{14}{15}\right)$	(5.6.3)
Multiply.	C ≈ $\frac{88}{15}$ meters	

.(b) Find the area when r = $\frac{14}{15}$.

Write the formula for area.	$A = \pi r^2$	
Substitute $\frac{22}{7}$ for π and $\frac{14}{15}$ for r.	$A \approx \left(\frac{22}{7}\right)\left(\frac{14}{15}\right)^2$	(5.6.4)
Multiply.	A ≈ $\frac{616}{225}$ square meters	

? Exercise 5.6.23:

A circle has radius $\frac{5}{21}$ meters. Approximate its (a) circumference and (b) area.

Answer a

$\frac{220}{147}$ m

Answer b

$\frac{550}{3087}$ sq. m

? Exercise 5.6.24:

A circle has radius $\frac{10}{33}$ inches. Approximate its (a) circumference and (b) area.

Answer a

$\frac{40}{21}$ in.

Answer b

$\frac{200}{693}$ sq. in.

Converting a Fraction to a Decimal - Part 2

Convert a Fraction to a Decimal (repeating)

Compare Fractions and Decimals using Inequality Symbols

Determine the Area of a Circle

Determine the Circumference of a Circle

Practice Makes Perfect

Convert Fractions to Decimals

In the following exercises, convert each fraction to a decimal.

201. $\frac{2}{5}$
202. $\frac{4}{5}$
203. $-\frac{3}{8}$
204. $-\frac{5}{8}$
205. $\frac{17}{20}$
206. $\frac{13}{20}$
207. $\frac{11}{4}$
208. $\frac{17}{4}$
209. $-\frac{310}{25}$
210. $-\frac{284}{25}$
211. $\frac{5}{9}$
212. $\frac{2}{9}$
213. $\frac{15}{11}$
214. $\frac{18}{11}$
215. $\frac{15}{111}$
216. $\frac{25}{111}$

In the following exercises, simplify the expression.

217. $\frac{1}{2}$ + 6.5
218. $\frac{1}{4}$ + 10.75
219. 2.4 + $\frac{5}{8}$
220. 3.9 + $\frac{9}{20}$
221. 9.73 + $\frac{17}{20}$
222. 6.29 + $\frac{21}{40}$

Order Decimals and Fractions

In the following exercises, order each pair of numbers, using < or >.

223. $\frac{1}{8}$ ___ 0.8
224. $\frac{1}{4}$ ___ 0.4
225. $\frac{2}{5}$ ___ 0.25
226. $\frac{3}{5}$ ___ 0.35

227. $0.725 ___ \frac{3}{4}$
228. $0.92 ___ \frac{7}{8}$
229. $0.66 ___ \frac{2}{3}$
230. $0.83 ___ \frac{5}{6}$
231. $-0.75 ___ -\frac{4}{5}$
232. $-0.44 ___ -\frac{9}{20}$
233. $-\frac{3}{4} ___ -0.925$
234. $-\frac{2}{3} ___ -0.632$

In the following exercises, write each set of numbers in order from least to greatest.

235. $\frac{3}{5}, \frac{9}{16}, 0.55$
236. $\frac{3}{8}, \frac{7}{20}, 0.36$
237. $0.702, \frac{13}{20}, \frac{5}{8}$
238. $0.15, \frac{3}{16}, \frac{1}{5}$
239. $-0.3, -\frac{1}{3}, -\frac{7}{20}$
240. $-0.2, -\frac{3}{20}, -\frac{1}{6}$
241. $-\frac{3}{4}, -\frac{7}{9}, -0.7$
242. $-\frac{8}{9}, -\frac{4}{5}, -0.9$

Simplify Expressions Using the Order of Operations

In the following exercises, simplify.

243. $10(25.1 - 43.8)$
244. $30(18.1 - 32.5)$
245. $62(9.75 - 4.99)$
246. $42(8.45 - 5.97)$
247. $\frac{3}{4}(12.4 - 4.2)$
248. $\frac{4}{5}(8.6 + 3.9)$
249. $\frac{5}{12}(30.58 + 17.9)$
250. $\frac{9}{16}(21.96 - 9.8)$
251. $10 \div 0.1 + (1.8)4 - (0.3)^2$
252. $5 \div 0.5 + (3.9)6 - (0.7)^2$
253. $(37.1 + 52.7) \div (12.5 \div 62.5)$
254. $(11.4 + 16.2) \div (18 \div 60)$
255. $\left(\frac{1}{5}\right)^2 + (1.4)(6.5)$
256. $\left(\frac{1}{2}\right)^2 + (2.1)(8.3)$
257. $-\frac{9}{10} \cdot \frac{8}{15} + 0.25$

258. $-\frac{3}{8} \cdot \frac{14}{15} + 0.72$

Mixed Practice

In the following exercises, simplify. Give the answer as a decimal.

259. $3\frac{1}{4} - 6.5$
260. $5\frac{2}{5} - 8.75$
261. $10.86 \div \frac{2}{3}$
262. $5.79 \div \frac{3}{4}$
263. $\frac{7}{8}(103.48) + 1\frac{1}{2}(361)$
264. $\frac{5}{16}(117.6) + 2\frac{1}{3}(699)$
265. $3.6\left(\frac{9}{8} - 2.72\right)$
266. $5.1\left(\frac{12}{5} - 3.91\right)$

Find the Circumference and Area of Circles

In the following exercises, approximate the (a) circumference and (b) area of each circle. If measurements are given in fractions, leave answers in fraction form.

267. radius = 5 in.
268. radius = 20 in.
269. radius = 9 ft.
270. radius = 4 ft.
271. radius = 46 cm
272. radius = 38 cm
273. radius = 18.6 m
274. radius = 57.3 m
275. radius = $\frac{7}{10}$ mile
276. radius = $\frac{7}{11}$ mile
277. radius = $\frac{3}{8}$ yard
278. radius = $\frac{5}{12}$ yard
279. diameter = $\frac{5}{6}$ m
280. diameter = $\frac{3}{4}$ m

Everyday Math

281. Kelly wants to buy a pair of boots that are on sale for $\frac{2}{3}$ of the original price. The original price of the boots is $84.99. What is the sale price of the shoes?
282. An architect is planning to put a circular mosaic in the entry of a new building. The mosaic will be in the shape of a circle with radius of 6 feet. How many square feet of tile will be needed for the mosaic? (Round your answer up to the next whole number.)

Writing Exercises

283. Is it easier for you to convert a decimal to a fraction or a fraction to a decimal? Explain.
284. Describe a situation in your life in which you might need to find the area or circumference of a circle.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section

I can...	Confidently	With some help	No-I don't get it!
convert fractions to decimals.			
order decimals and fractions.			
simplify expressions using the order of operations.			
find the circumference and area of circles.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

5.7: Rational and Irrational Numbers

Learning Objectives

- Identify rational numbers and irrational numbers
- Classify different types of real numbers

be prepared!

Before you get started, take this readiness quiz.

1. Write 3.19 as an improper fraction. If you missed this problem, review Example 5.1.4.
2. Write $\frac{5}{11}$ as a decimal. If you missed this problem, review Example 5.5.3.
3. Simplify: $\sqrt{144}$. If you missed this problem, review Example 5.12.1.

Identify Rational Numbers and Irrational Numbers

Congratulations! You have completed the first six chapters of this book! It's time to take stock of what you have done so far in this course and think about what is ahead. You have learned how to add, subtract, multiply, and divide whole numbers, fractions, integers, and decimals. You have become familiar with the language and symbols of algebra, and have simplified and evaluated algebraic expressions. You have solved many different types of applications. You have established a good solid foundation that you need so you can be successful in algebra.

In this chapter, we'll make sure your skills are firmly set. We'll take another look at the kinds of numbers we have worked with in all previous chapters. We'll work with properties of numbers that will help you improve your number sense. And we'll practice using them in ways that we'll use when we solve equations and complete other procedures in algebra.

We have already described numbers as counting numbers, whole numbers, and integers. Do you remember what the difference is among these types of numbers?

counting numbers	1, 2, 3, 4…
whole numbers	0, 1, 2, 3, 4…
integers	…−3, −2, −1, 0, 1, 2, 3, 4…

Rational Numbers

What type of numbers would you get if you started with all the integers and then included all the fractions? The numbers you would have form the set of rational numbers. A **rational number** is a number that can be written as a ratio of two integers.

Definition: Rational Numbers

A rational number is a number that can be written in the form $\frac{p}{q}$, where p and q are integers and q ≠ 0.

All fractions, both positive and negative, are rational numbers. A few examples are

$$\frac{4}{5}, -\frac{7}{8}, \frac{13}{4}, \text{ and } -\frac{20}{3} \tag{5.7.1}$$

Each numerator and each denominator is an integer.

We need to look at all the numbers we have used so far and verify that they are rational. The definition of rational numbers tells us that all fractions are rational. We will now look at the counting numbers, whole numbers, integers, and decimals to make sure they are rational.

Are integers rational numbers? To decide if an integer is a rational number, we try to write it as a ratio of two integers. An easy way to do this is to write it as a fraction with denominator one.

$$3 = \frac{3}{1} \quad -8 = \frac{-8}{1} \quad 0 = \frac{0}{1} \tag{5.7.2}$$

Since any integer can be written as the ratio of two integers, all integers are rational numbers. Remember that all the counting numbers and all the whole numbers are also integers, and so they, too, are rational.

What about decimals? Are they rational? Let's look at a few to see if we can write each of them as the ratio of two integers. We've already seen that integers are rational numbers. The integer −8 could be written as the decimal −8.0. So, clearly, some decimals are rational.

Think about the decimal 7.3. Can we write it as a ratio of two integers? Because 7.3 means $7\frac{3}{10}$, we can write it as an improper fraction, $7\frac{3}{10}$. So 7.3 is the ratio of the integers 73 and 10. It is a rational number.

In general, any decimal that ends after a number of digits (such as 7.3 or −1.2684) is a rational number. We can use the reciprocal (or multiplicative inverse) of the place value of the last digit as the denominator when writing the decimal as a fraction.

Example 5.7.1:

Write each as the ratio of two integers: (a) −15 (b) 6.81 (c) $-3\frac{6}{7}$.

Solution

(a) −15

Write the integer as a fraction with denominator 1.	$\frac{-15}{1}$	(5.7.3)

(b) 6.81

Write the decimal as a mixed number.	$6\frac{81}{100}$	(5.7.4)
Then convert it to an improper fraction.	$\frac{681}{100}$	(5.7.5)

(c) $-3\frac{6}{7}$

Convert the mixed number to an improper fraction.	$-\frac{27}{7}$	(5.7.6)

Exercise 5.7.1:

Write each as the ratio of two integers: (a) −24 (b) 3.57.

Answer a

$\frac{-24}{1}$

Answer b

$\frac{357}{100}$

? Exercise 5.7.2:

Write each as the ratio of two integers: (a) −19 (b) 8.41.

Answer a

$\frac{-19}{1}$

Answer b

$\frac{841}{100}$

Let's look at the decimal form of the numbers we know are rational. We have seen that every integer is a rational number, since a = $\frac{a}{1}$ for any integer, a. We can also change any integer to a decimal by adding a decimal point and a zero.

$$\begin{array}{ll} Integer & -2,\quad -1,\quad 0,\quad 1,\quad 2,\ 3 \\ Decimal & -2.0, -1.0, 0.0, 1.0, 2.0, 3.0 \end{array}$$

These decimal numbers stop.

We have also seen that every fraction is a rational number. Look at the decimal form of the fractions we just considered.

$$\begin{array}{ll} Ratio\ of\ Integers & \frac{4}{5},\quad -\frac{7}{8},\quad \frac{13}{4},\quad -\frac{20}{3} \\ Decimal\ forms & 0.8, -0.875, 3.25, -6.666\ldots \\ & \qquad\qquad\qquad\quad -6.\overline{66} \end{array}$$

These decimals either stop or repeat.

What do these examples tell you? Every rational number can be written both as a ratio of integers and as a decimal that either stops or repeats. The table below shows the numbers we looked at expressed as a ratio of integers and as a decimal.

Rational Numbers		
	Fractions	**Integers**
Number	$\frac{4}{5}, -\frac{7}{8}, \frac{13}{4}, \frac{-20}{3}$ (5.7.7)	$-2, -1, 0, 1, 2, 3$ (5.7.8)
Ratio of Integer	$\frac{4}{5}, \frac{-7}{8}, \frac{13}{4}, \frac{-20}{3}$ (5.7.9)	$\frac{-2}{1}, \frac{-1}{1}, \frac{0}{1}, \frac{1}{1}, \frac{2}{1}, \frac{3}{1}$ (5.7.10)
Decimal number	$0.8, -0.875, 3.25, -6.\bar{6}$ (5.7.11)	$-2.0, -1.0, 0.0, 1.0, 2.0, 3.0$ (5.7.1

Irrational Numbers

Are there any decimals that do not stop or repeat? Yes. The number π (the Greek letter pi, pronounced 'pie'), which is very important in describing circles, has a decimal form that does not stop or repeat.

$$\pi = 3.141592654\ldots\ldots \tag{5.7.13}$$

Similarly, the decimal representations of square roots of whole numbers that are not perfect squares never stop and never repeat. For example,

$$\sqrt{5} = 2.236067978\ldots\ldots \tag{5.7.14}$$

A decimal that does not stop and does not repeat cannot be written as the ratio of integers. We call this kind of number an **irrational number**.

Definition: Irrational Number

An irrational number is a number that cannot be written as the ratio of two integers. Its decimal form does not stop and does not repeat.

Let's summarize a method we can use to determine whether a number is rational or irrational.

If the decimal form of a number

- stops or repeats, the number is rational.
- does not stop and does not repeat, the number is irrational.

Example 5.7.2:

Identify each of the following as rational or irrational: (a) $0.58\overline{3}$ (b) 0.475 (c) 3.605551275…

Solution

(a) $0.58\overline{3}$

The bar above the 3 indicates that it repeats. Therefore, 0.583 – is a repeating decimal, and is therefore a rational number.

(b) 0.475

This decimal stops after the 5, so it is a rational number.

(c) 3.605551275…

The ellipsis (…) means that this number does not stop. There is no repeating pattern of digits. Since the number doesn't stop and doesn't repeat, it is irrational.

Exercise 5.7.3:

Identify each of the following as rational or irrational: (a) 0.29 (b) $0.81\overline{6}$ (c) 2.515115111…

Answer a

rational

Answer b

rational

Answer c

irrational

Exercise 5.7.4:

Identify each of the following as rational or irrational: (a) $0.2\overline{3}$ (b) 0.125 (c) 0.418302…

Answer a

rational

Answer b

rational

Answer c

irrational

Let's think about square roots now. Square roots of perfect squares are always whole numbers, so they are rational. But the decimal forms of square roots of numbers that are not perfect squares never stop and never repeat, so these square roots are irrational.

Example 5.7.3:

Identify each of the following as rational or irrational: (a) 36 (b) 44

Solution

(a) The number 36 is a perfect square, since $6^2 = 36$. So $\sqrt{36} = 6$. Therefore $\sqrt{36}$ is rational.

(b)Remember that $6^2 = 36$ and $7^2 = 49$, so 44 is not a perfect square. This means $\sqrt{44}$ is irrational.

Exercise 5.7.5:

Identify each of the following as rational or irrational: (a) $\sqrt{81}$ (b) $\sqrt{17}$

Answer a

rational

Answer b

irrational

Exercise 5.7.6:

Identify each of the following as rational or irrational: (a) $\sqrt{116}$ (b) $\sqrt{121}$

Answer a

irrational

Answer b

rational

Classify Real Numbers

We have seen that all counting numbers are whole numbers, all whole numbers are integers, and all integers are rational numbers. Irrational numbers are a separate category of their own. When we put together the rational numbers and the irrational numbers, we get the set of **real numbers**. Figure 5.7.1 illustrates how the number sets are related.

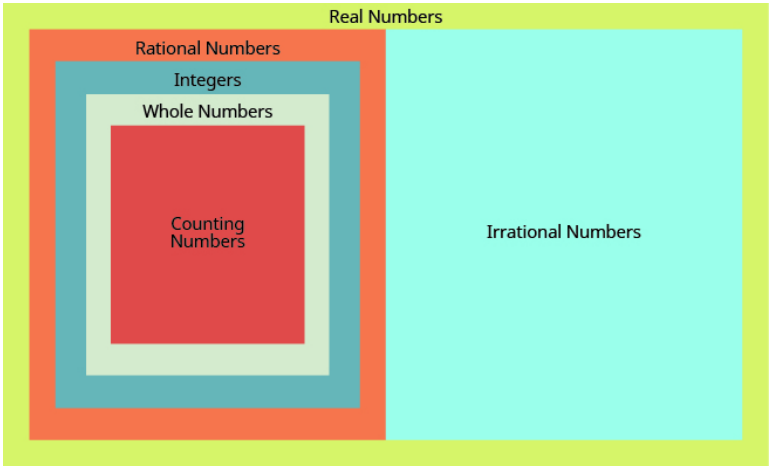

Figure 5.7.1 - This diagram illustrates the relationships between the different types of real numbers.

Definition: Real Numbers

Real numbers are numbers that are either rational or irrational.

Does the term “real numbers” seem strange to you? Are there any numbers that are not “real”, and, if so, what could they be? For centuries, the only numbers people knew about were what we now call the real numbers. Then mathematicians discovered the set of *imaginary numbers*. You won't encounter imaginary numbers in this course, but you will later on in your studies of algebra.

Example 5.7.4:

Determine whether each of the numbers in the following list is a (a) whole number, (b) integer, (c) rational number, (d) irrational number, and (e) real number.

$$-7, \frac{14}{5}, 8, \sqrt{5}, 5.9, -\sqrt{64} \tag{5.7.15}$$

Solution

a. The whole numbers are 0, 1, 2, 3,… The number 8 is the only whole number given.
b. The integers are the whole numbers, their opposites, and 0. From the given numbers, −7 and 8 are integers. Also, notice that 64 is the square of 8 so $-\sqrt{64} = -8$. So the integers are −7, 8, $-\sqrt{64}$.
c. Since all integers are rational, the numbers −7, 8, and $-\sqrt{64}$ are also rational. Rational numbers also include fractions and decimals that terminate or repeat, so $\frac{14}{5}$ and 5.9 are rational.
d. The number 5 is not a perfect square, so $\sqrt{5}$ is irrational.
e. All of the numbers listed are real.

We'll summarize the results in a table.

Number	Whole	Integer	Rational	Irrational	Real
-7		✓	✓		✓
$\frac{14}{5}$			✓		✓
8	✓	✓	✓		✓
$\sqrt{5}$				✓	✓
5.9			✓		✓
$-\sqrt{64}$		✓	✓		✓

Exercise 5.7.7:

Determine whether each number is a (a) whole number,(b) integer,(c) rational number,(d) irrational number, and (e) real number: $-3, -\sqrt{2}, 0.\overline{3}, \frac{9}{5}, 4, \sqrt{49}$.

Answer

Number	Whole	Integer	Rational	Irrational	Real
-3		✓	✓		✓
$-\sqrt{2}$				✓	✓
$0.\overline{3}$			✓		✓
$\frac{9}{5}$			✓		✓
4	✓	✓	✓		✓

Number	Whole	Integer	Rational	Irrational	Real
$\sqrt{49}$	✓	✓	✓		✓
-3		✓	✓		✓
				✓	✓
$0.\overline{3}$			✓		✓
4	✓	✓	✓		✓

? Exercise 5.7.8:

Determine whether each number is a (a) whole number,(b) integer,(c) rational number,(d) irrational number, and (e) real number:

$-\sqrt{25}, -\frac{3}{8}, \frac{9}{5}1, 6, \sqrt{121}, 2.041975\ldots$

Answer

Number	Whole	Integer	Rational	Irrational	Real
$\sqrt{49}$	✓	✓	✓		✓
$-\sqrt{25}$		✓	✓		✓
$-\frac{3}{8}$			✓		✓
-1		✓	✓		✓
6	✓	✓	✓		✓
$\sqrt{121}$	✓	✓	✓		✓
$2.041975\ldots$				✓	✓

Sets of Real Numbers

Real Numbers

Practice Makes Perfect

Rational Numbers

In the following exercises, write as the ratio of two integers.

1. (a) 5 (b) 3.19
2. (a) 8 (b) −1.61
3. (a) −12 (b) 9.279
4. (a) −16 (b) 4.399

In the following exercises, determine which of the given numbers are rational and which are irrational.

5. 0.75, $0.22\overline{3}$, 1.39174…
6. 0.36, 0.94729…, $2.52\overline{8}$
7. $0.\overline{45}$, 1.919293…, 3.59
8. $0.1\overline{3}$, 0.42982…, 1.875

In the following exercises, identify whether each number is rational or irrational.

9. (a) 25 (b) 30
10. (a) 44 (b) 49
11. (a) 164 (b) 169
12. (a) 225 (b) 216

Classifying Real Numbers

In the following exercises, determine whether each number is whole, integer, rational, irrational, and real.

13. $-8, 0, 1.95286...., \frac{12}{5}, \sqrt{36}, 9$

14. -9 , $-3\frac{4}{9}, -\sqrt{9}, 0.4\overline{09}, \frac{11}{6}, 7$
15. $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$

Everyday Math

16. **Field trip** All the 5th graders at Lincoln Elementary School will go on a field trip to the science museum. Counting all the children, teachers, and chaperones, there will be 147 people. Each bus holds 44 people.
    a. How many buses will be needed?
    b. Why must the answer be a whole number?
    c. Why shouldn't you round the answer the usual way?
17. **Child care** Serena wants to open a licensed child care center. Her state requires that there be no more than 12 children for each teacher. She would like her child care center to serve 40 children.
    a. How many teachers will be needed?
    b. Why must the answer be a whole number?
    c. Why shouldn't you round the answer the usual way?

Writing Exercises

18. In your own words, explain the difference between a rational number and an irrational number.
19. Explain how the sets of numbers (counting, whole, integer, rational, irrationals, reals) are related to each other.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
identify rational and irrational numbers.			
classify different types of real numbers.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

5.8: Averages and Probability (Part 1)

Learning Objectives

- Calculate the mean of a set of numbers
- Find the median of a set of numbers
- Find the mode of a set of numbers
- Apply the basic definition of probability

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $\frac{4+9+2}{3}$. If you missed this problem, review Example 4.6.12.
2. Simplify: 4(8) + 6(3). If you missed this problem, review Example 2.2.8.
3. Convert $\frac{5}{2}$ to a decimal. If you missed this problem, review Example 5.5.1.

One application of decimals that arises often is finding the *average* of a set of numbers. What do you think of when you hear the word *average*? Is it your grade point average, the average rent for an apartment in your city, the batting average of a player on your favorite baseball team? The average is a typical value in a set of numerical data. Calculating an average sometimes involves working with decimal numbers. In this section, we will look at three different ways to calculate an average.

Calculate the Mean of a Set of Numbers

The mean is often called the arithmetic average. It is computed by dividing the sum of the values by the number of values. Students want to know the mean of their test scores. Climatologists report that the mean temperature has, or has not, changed. City planners are interested in the mean household size.

Suppose Ethan's first three test scores were 85, 88, and 94. To find the mean score, he would add them and divide by 3.

$$\frac{85+88+94}{3} \tag{5.8.1}$$

$$\frac{267}{3} \tag{5.8.2}$$

$$89 \tag{5.8.3}$$

His mean test score is 89 points.

Definition: The Mean

The mean of a set of n numbers is the arithmetic average of the numbers.

$$mean = \frac{sum\ of\ values\ in\ data\ set}{n} \tag{5.8.4}$$

HOW TO: CALCULATE THE MEAN OF A SET OF NUMBERS

Step 1. Write the formula for the mean

$$mean = \frac{sum\ of\ values\ in\ data\ set}{n} \tag{5.8.5}$$

Step 2. Find the sum of all the values in the set. Write the sum in the numerator.

Step 3. Count the number, n, of values in the set. Write this number in the denominator.

Step 4. Simplify the fraction.

Step 5. Check to see that the mean is reasonable. It should be greater than the least number and less than the greatest number in the set.

Example 5.8.1:

Find the mean of the numbers 8, 12, 15, 9, and 6.

Solution

Write the formula for the mean.	$$mean = \frac{sum\ of\ values\ in\ data\ set}{n} \quad (5.8.6)$$
Write the sum of the numbers in the numerator.	$$mean = \frac{8+12+15+9+6}{n} \quad (5.8.7)$$
Count how many numbers are in the set. There are 5 numbers in the set, so n = 5.	$$mean = \frac{8+12+15+9+6}{5} \quad (5.8.8)$$
Add the numbers in the numerator.	$$mean = \frac{50}{5} \quad (5.8.9)$$
Then divide.	mean = 10
Check to see that the mean is 'typical': 10 is neither less than 6 nor greater than 15.	The mean is 10.

Exercise 5.8.1:

Find the mean of the numbers: 8, 9, 7, 12, 10, 5.

Answer

8.5

Exercise 5.8.2:

Find the mean of the numbers: 9, 13, 11, 7, 5.

Answer

9

Example 5.8.2:

The ages of the members of a family who got together for a birthday celebration were 16, 26, 53, 56, 65, 70, 93, and 97 years. Find the mean age.

Solution

Write the formula for the mean.	$$mean = \frac{sum\ of\ values\ in\ data\ set}{n} \quad (5.8.10)$$
Write the sum of the numbers in the numerator.	$$mean = \frac{16+26+53+56+65+70+93+97}{n} \quad (5.8.1$$
Count how many numbers are in the set. Call this n and write it in the denominator.	$$mean = \frac{16+26+53+56+65+70+93+97}{8} \quad (5.8.1$$

Simplify the fraction.	$$mean = \frac{476}{5}$$	(5.8.13)
	mean = 59.5	

Is 59.5 ‘typical’? Y es, it is neither less than 16 nor greater than 97. The mean age is 59.5 years.

? Exercise 5.8.3:

The ages of the four students in Ben’s carpool are 25, 18, 21, and 22. Find the mean age of the students.

Answer

21.5 years

? Exercise 5.8.4:

Yen counted the number of emails she received last week. The numbers were 4, 9, 15, 12, 10, 12, and 8. Find the mean number of emails

Answer

10

Did you notice that in the last example, while all the numbers were whole numbers, the mean was 59.5, a number with one decimal place? It is customary to report the mean to one more decimal place than the original numbers. In the next example, all the numbers represent money, and it will make sense to report the mean in dollars and cents.

✓ Example 5.8.3:

For the past four months, Daisy’s cell phone bills were $42.75, $50.12, $41.54, $48.15. Find the mean cost of Daisy’s cell phone bills.

Solution

Write the formula for the mean.	$$mean = \frac{sum\ of\ all\ the\ numbers}{n}$$	(5.8.14)
Write the sum of the numbers in the numerator.	$$mean = \frac{sum\ of\ all\ the\ numbers}{4}$$	(5.8.15)
Count how many numbers are in the set. Call this n and write it in the denominator.	$$mean = \frac{42.75 + 50.12 + 41.54 + 48.15}{4}$$	(5.8.16)
Simplify the fraction.	$$mean = \frac{182.56}{4}$$	(5.8.17)
	mean = 45.64	

Does $45.64 seem ‘typical’ of this set of numbers? Yes, it is neither less than $41.54 nor greater than $50.12. The mean cost of her cell phone bill was $45.64.

? Exercise 5.8.5:

Last week Ray recorded how much he spent for lunch each workday. He spent $6.50, $7.25, $4.90, $5.30, and $12.00. Find the mean of how much he spent each day.

Answer

$7.19

Exercise 5.8.6:

Lisa has kept the receipts from the past four trips to the gas station. The receipts show the following amounts: $34.87, $42.31, $38.04, and $43.26. Find the mean.

Answer

$39.62

Find the Median of a Set of Numbers

When Ann, Bianca, Dora, Eve, and Francine sing together on stage, they line up in order of their heights. Their heights, in inches, are shown in Table 5.70.

Table 5.70

Ann	Bianca	Dora	Eve	Francine
59	60	65	68	70

Dora is in the middle of the group. Her height, 65″, is the *median* of the girls' heights. Half of the heights are less than or equal to Dora's height, and half are greater than or equal. The median is the middle value.

Definition: Median

The median of a set of data values is the middle value.

- Half the data values are less than or equal to the median.
- Half the data values are greater than or equal to the median.

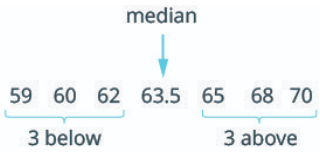
What if Carmen, the pianist, joins the singing group on stage? Carmen is 62 inches tall, so she fits in the height order between Bianca and Dora. Now the data set looks like this:

$$59, 60, 62, 65, 68, 70 \tag{5.8.18}$$

There is no single middle value. The heights of the six girls can be divided into two equal parts.

$$\underbrace{59, 60, 62}\quad\underbrace{65, 68, 70} \tag{5.8.19}$$

Statisticians have agreed that in cases like this the median is the mean of the two values closest to the middle. So the median is the mean of 62 and 65, $\frac{62+65}{2}$. The median height is 63.5 inches.



Notice that when the number of girls was 5, the median was the third height, but when the number of girls was 6, the median was the mean of the third and fourth heights. In general, when the number of values is odd, the median will be the one value in the middle, but when the number is even, the median is the mean of the two middle values.

HOW TO: FIND THE MEDIAN OF A SET OF NUMBERS

Step 1. List the numbers from smallest to largest.

Step 2. Count how many numbers are in the set. Call this n.

Step 3. Is n odd or even?

- If n is an odd number, the median is the middle value.
- If n is an even number, the median is the mean of the two middle values.

Example 5.8.4:

Find the median of 12, 13, 19, 9, 11, 15, and 18.

Solution

List the numbers in order from smallest to largest.	9, 11, 12, 13, 15, 18, 19
Count how many numbers are in the set. Call this n.	n = 7
Is n odd or even?	odd
The median is the middle value.	The middle is the number in the 4th position.	So the median of the data is 13.

Exercise 5.8.7:

Find the median of the data set: 43, 38, 51, 40, 46.

Answer

43

Exercise 5.8.8:

Find the median of the data set: 15, 35, 20, 45, 50, 25, 30.

Answer

30

Example 5.8.5:

Kristen received the following scores on her weekly math quizzes: 83, 79, 85, 86, 92, 100, 76, 90, 88, and 64. Find her median score.

Solution

List the numbers in order from smallest to largest.	64, 76, 79, 83, 85, 86, 88, 90, 92, 100
Count the number of data values in the set. Call this n.	n = 10
Is n odd or even?	even

The median is the mean of the two middle values, the 5th and 6th numbers.	64, 76, 79, 83, **85,** **86,** 88, 90, 92, 100 5 numbers 5 numbers
Find the mean of 85 and 86.	mean = 85.5

Kristen's median score is 85.5.

Exercise 5.8.9:

Find the median of the data set: 8, 7, 5, 10, 9, 12.

Answer

8.5

Exercise 5.8.10:

Find the median of the data set: 21, 25, 19, 17, 22, 18, 20, 24.

Answer

20.5

Identify the Mode of a Set of Numbers

The *average* is one number in a set of numbers that is somehow typical of the whole set of numbers. The mean and median are both often called the average. Yes, it can be confusing when the word average refers to two different numbers, the mean and the median! In fact, there is a third number that is also an average. This average is the **mode**. The mode of a set of numbers is the number that occurs the most. The **frequency**, is the number of times a number occurs. So the mode of a set of numbers is the number with the highest frequency.

Definition: mode

The mode of a set of numbers is the number with the highest frequency.

Suppose Jolene kept track of the number of miles she ran since the start of the month, as shown in Figure 5.7.

Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
				1 2 mi New Year's day	2	3 15 mi
4 8 mi	5	6 3 mi	7 8 mi	8	9 5 mi	10 8 mi
11	12	13	14	15	16	17

Figure 5.7

If we list the numbers in order it is easier to identify the one with the highest frequency.

$$2, 3, 5, 8, 8, 8, 15 \tag{5.8.20}$$

Jolene ran 8 miles three times, and every other distance is listed only once. So the mode of the data is 8 miles.

HOW TO: IDENTIFY THE MODE OF A SET OF NUMBERS

Step 1. List the data values in numerical order.

Step 2. Count the number of times each value appears.

Step 3. The mode is the value with the highest frequency.

Example 5.8.6:

The ages of students in a college math class are listed below. Identify the mode.

18, 18, 18, 18, 19, 19, 19, 20, 20, 20, 20, 20, 20, 20, 21, 21, 22, 22, 22, 22, 22, 23, 24, 24, 25, 29, 30, 40, 44

Solution

The ages are already listed in order. We will make a table of frequencies to help identify the age with the highest frequency.

Age	18	19	20	21	22	23	24	25	29	30	40	44
Frequency	4	3	7	2	5	1	2	1	1	1	1	1

Now look for the highest frequency. The highest frequency is 7, which corresponds to the age 20. So the mode of the ages in this class is 20 years.

Exercise 5.8.11:

The number of sick days employees used last year: 3, 6, 2, 3, 7, 5, 6, 2, 4, 2. Identify the mode.

Answer

2

Exercise 5.8.12:

The number of handbags owned by women in a book club: 5, 6, 3, 1, 5, 8, 1, 5, 8, 5. Identify the mode.

Answer

5

Example 5.8.7:

The data lists the heights (in inches) of students in a statistics class. Identify the mode.

56	61	63	64	65	66	67	67
60	62	63	64	65	66	67	70
60	63	63	64	66	66	67	74
61	63	64	65	66	67	67	

Solution

List each number with its frequency.

Number	56	60	61	62	63	64	65	66	67	70	74
Frequency	1	2	2	1	5	4	3	5	6	1	1

Now look for the highest frequency. The highest frequency is 6, which corresponds to the height 67 inches. So the mode of this set of heights is 67 inches.

Exercise 5.8.13:

The ages of the students in a statistics class are listed here: 19, 20, 23, 23, 38, 21, 19, 21, 19, 21, 20, 43, 20, 23, 17, 21, 21, 20, 29, 18, 28. What is the mode?

Answer

21

Exercise 5.8.14:

Students listed the number of members in their household as follows: 6, 2, 5, 6, 3, 7, 5, 6, 5, 3, 4, 4, 5, 7, 6, 4, 5, 2, 1, 5. What is the mode?

Answer

5

Some data sets do not have a mode because no value appears more than any other. And some data sets have more than one mode. In a given set, if two or more data values have the same highest frequency, we say they are all modes.

This page titled 5.8: Averages and Probability (Part 1) is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

5.9: Averages and Probability (Part 2)

Use the Basic Definition of Probability

The probability of an event tells us how likely that event is to occur. We usually write probabilities as fractions or decimals. For example, picture a fruit bowl that contains five pieces of fruit - three bananas and two apples.

If you want to choose one piece of fruit to eat for a snack and don't care what it is, there is a $\frac{3}{5}$ probability you will choose a banana, because there are three bananas out of the total of five pieces of fruit. The probability of an event is the number of favorable outcomes divided by the total number of outcomes.

$$\text{Probability of an event} = \frac{\text{number of favorable outcomes}}{\text{total number of outcomes}}$$

$$\text{Probability of choosing a banana} = \frac{3}{5} \begin{array}{l} \leftarrow \text{There are 3 bananas.} \\ \leftarrow \text{There are 5 pieces of fruit.} \end{array}$$

Definition: Probability

The probability of an event is the number of favorable outcomes divided by the total number of outcomes possible.

$$Probability = \frac{number\ of\ favorable\ outcomes}{total\ number\ of\ outcomes} \tag{5.9.1}$$

Converting the fraction $\frac{3}{5}$ to a decimal, we would say there is a 0.6 probability of choosing a banana.

$$\text{Probability of choosing a banana} = \frac{3}{5}$$

$$\text{Probability of choosing a banana} = 0.6$$

This basic definition of probability assumes that all the outcomes are equally likely to occur. If you study probabilities in a later math class, you'll learn about several other ways to calculate probabilities.

Example 5.9.8:

The ski club is holding a raffle to raise money. They sold 100 tickets. All of the tickets are placed in a jar. One ticket will be pulled out of the jar at random, and the winner will receive a prize. Cherie bought one raffle ticket. (a) Find the probability she will win the prize. (b) Convert the fraction to a decimal.

Solution

(a)

What are you asked to find?	The probability Cherie wins the prize.
What is the number of favorable outcomes?	1, because Cherie has 1 ticket.
Use the definition of probability.	$Probability\ of\ an\ event = \frac{number\ of\ favorable\ outcomes}{total\ number\ of\ outcomes}$
Substitute into the numerator and denominator.	Probability Cherie wins = $\frac{1}{100}$

(b)

Write the probability as a fraction.	Probability = $\frac{1}{100}$
Convert the fraction to a decimal.	Probability = 0.01

Exercise 5.9.15:

Ignaly is attending a fashion show where the guests are seated at tables of ten. One guest from each table will be selected at random to receive a door prize. (a) Find the probability Ignaly will win the door prize for her table. (b) Convert the fraction to a decimal.

Answer a

$\frac{1}{10}$

Answer b

0.1

Exercise 5.9.16:

Hoang is among 20 people available to sit on a jury. One person will be chosen at random from the 20. (a) Find the probability Hoang will be chosen. (b) Convert the fraction to a decimal.

Answer a

$\frac{1}{20}$

Answer b

0.05

Example 5.9.9:

Three women and five men interviewed for a job. One of the candidates will be offered the job. (a) Find the probability the job is offered to a woman. (b) Convert the fraction to a decimal.

Solution

What are you asked to find?	The probability the job is offered to a woman.
What is the number of favorable outcomes?	3, because there are three women.
What are the total number of outcomes?	8, because 8 people interviewed.
Use the definition of probability.	$Probability\ of\ an\ event = \frac{number\ of\ favorable\ outcomes}{total\ number\ of\ outcomes}$
Substitute into the numerator and denominator.	Probability = $\frac{3}{8}$

(b)

Write the probability as a fraction.	Probability = $\frac{3}{8}$
Convert the fraction to a decimal.	Probability = 0.375

Exercise 5.9.17:

A bowl of Halloween candy contains 5 chocolate candies and 3 lemon candies. Tanya will choose one piece of candy at random.(a) Find the probability Tanya will choose a chocolate candy.(b) Convert the fraction to a decimal.

Answer a

$\frac{5}{8}$

Answer b

0.625

Exercise 5.9.18:

Dan has 2 pairs of black socks and 6 pairs of blue socks. He will choose one pair at random to wear tomorrow. (a) Find the probability Dan will choose a pair of black socks (b) Convert the fraction to a decimal.

Answer a

$\frac{2}{8}$

Answer b

0.25

Mean, Median, and Mode

Find the Mean of a Data Set

Find the Median of a Data Set

Find the Mode of a Data Set

Practice Makes Perfect

Calculate the Mean of a Set of Numbers

In the following exercises, find the mean.

357. 3, 8, 2, 2, 5
358. 6, 1, 9, 3, 4, 7
359. 65, 13, 48, 32, 19, 33
360. 34, 45, 29, 61, and 41
361. 202, 241, 265, 274
362. 525, 532, 558, 574
363. 12.45, 12.99, 10.50, 11.25, 9.99, 12.72
364. 28.8, 32.9, 32.5, 27.9, 30.4, 32.5, 31.6, 32.7
365. Four girls leaving a mall were asked how much money they had just spent. The amounts were $0, $14.95, $35.25, and $25.16. Find the mean amount of money spent.
366. Juan bought 5 shirts to wear to his new job. The costs of the shirts were $32.95, $38.50, $30.00, $17.45, and $24.25. Find the mean cost.
367. The number of minutes it took Jim to ride his bike to school for each of the past six days was 21, 18, 16, 19, 24, and 19. Find the mean number of minutes.
368. Norris bought six books for his classes this semester. The costs of the books were $74.28, $120.95, $52.40, $10.59, $35.89, and $59.24. Find the mean cost.
369. The top eight hitters in a softball league have batting averages of .373, .360, .321, .321, .320, .312, .311, and .311. Find the mean of the batting averages. Round your answer to the nearest thousandth.
370. The monthly snowfall at a ski resort over a six-month period was 60.3, 79.7, 50.9, 28.0, 47.4, and 46.1 inches. Find the mean snowfall.

Find the Median of a Set of Numbers

In the following exercises, find the median.

371. 24, 19, 18, 29, 21
372. 48, 51, 46, 42, 50
373. 65, 56, 35, 34, 44, 39, 55, 52, 45
374. 121, 115, 135, 109, 136, 147, 127, 119, 110
375. 4, 8, 1, 5, 14, 3, 1, 12
376. 3, 9, 2, 6, 20, 3, 3, 10
377. 99.2, 101.9, 98.6, 99.5, 100.8, 99.8
378. 28.8, 32.9, 32.5, 27.9, 30.4, 32.5, 31.6, 32.7
379. Last week Ray recorded how much he spent for lunch each workday. He spent $6.50, $7.25, $4.90, $5.30, and $12.00 . Find the median.
380. Michaela is in charge of 6 two-year olds at a daycare center. Their ages, in months, are 25, 24, 28, 32, 29, and 31. Find the median age.
381. Brian is teaching a swim class for 6 three-year olds. Their ages, in months, are 38, 41, 45, 36, 40, and 42. Find the median age.
382. Sal recorded the amount he spent for gas each week for the past 8 weeks. The amounts were $38.65, $32.18, $40.23, $51.50, $43.68, $30.96, $41.37, and $44.72. Find the median amount.

Identify the Mode of a Set of Numbers

In the following exercises, identify the mode.

383. 2, 5, 1, 5, 2, 1, 2, 3, 2, 3, 1
384. 8, 5, 1, 3, 7, 1, 1, 7, 1, 8, 7

385. 18, 22, 17, 20, 19, 20, 22, 19, 29, 18, 23, 25, 22, 24, 23, 22, 18, 20, 22, 20
386. 42, 28, 32, 35, 24, 32, 48, 32, 32, 24, 35, 28, 30, 35, 45, 32, 28, 32, 42, 42, 30
387. The number of children per house on one block: 1, 4, 2, 3, 3, 2, 6, 2, 4, 2, 0, 3, 0.
388. The number of movies watched each month last year: 2, 0, 3, 0, 0, 8, 6, 5, 0, 1, 2, 3.
389. The number of units being taken by students in one class: 12, 5, 11, 10, 10, 11, 5, 11, 11, 11, 10, 12.
390. The number of hours of sleep per night for the past two weeks: 8, 5, 7, 8, 8, 6, 6, 6, 6, 9, 7, 8, 8, 8.

Use the Basic Definition of Probability

In the following exercises, express the probability as both a fraction and a decimal. (Round to three decimal places, if necessary.)

391. Josue is in a book club with 20 members. One member is chosen at random each month to select the next month's book. Find the probability that Josue will be chosen next month.
392. Jessica is one of eight kindergarten teachers at Mandela Elementary School. One of the kindergarten teachers will be selected at random to attend a summer workshop. Find the probability that Jessica will be selected.
393. There are 24 people who work in Dane's department. Next week, one person will be selected at random to bring in doughnuts. Find the probability that Dane will be selected. Round your answer to the nearest thousandth.
394. Monica has two strawberry yogurts and six banana yogurts in her refrigerator. She will choose one yogurt at random to take to work. Find the probability Monica will choose a strawberry yogurt.
395. Michel has four rock CDs and six country CDs in his car. He will pick one CD to play on his way to work. Find the probability Michel will pick a rock CD.
396. Noah is planning his summer camping trip. He can't decide among six campgrounds at the beach and twelve campgrounds in the mountains, so he will choose one campground at random. Find the probability that Noah will choose a campground at the beach.
397. Donovan is considering transferring to a 4-year college. He is considering 10 out-of state colleges and 4 colleges in his state. He will choose one college at random to visit during spring break. Find the probability that Donovan will choose an out-of-state college.
398. There are 258,890,850 number combinations possible in the Mega Millions lottery. One winning jackpot ticket will be chosen at random. Brent chooses his favorite number combination and buys one ticket. Find the probability Brent will win the jackpot. Round the decimal to the first digit that is not zero, then write the name of the decimal.

Everyday Math

399. Joaquin gets paid every Friday. His paychecks for the past 8 Fridays were $315, $236.25, $236.25, $236.25 $315, $315, $236.25, $393.75. Find the (a) mean (b) median, and (c) mode.
400. The cash register receipts each day last week at a coffee shop were $1,845, $1,520, $1,438, $1,682, $1,850, $2,721, $2,539. Find the (a) mean, (b) median, and (c) mode.

Writing Exercises

401. Explain in your own words the difference between the mean, median, and mode of a set of numbers.
402. Make an example of probability that relates to your life. Write your answer as a fraction and explain what the numerator and denominator represent.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
calculate the mean of a set of numbers.			
find the median of a set of numbers.			
find the mode of a set of numbers.			
use the basic definition of probability.			

(b) After looking at the checklist, do you think you are well prepared for the next section? Why or why not?

5.10: Ratios and Rate (Part 1)

Learning Objectives

- Write a ratio as a fraction
- Write a rate as a fraction
- Find unit rates
- Find unit price
- Translate phrases to expressions with fractions

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $\frac{16}{24}$. If you missed this problem, review Example 4.3.1.
2. Divide: 2.76 ÷ 11.5. If you missed this problem, review Example 5.4.9.
3. Simplify: $\frac{1\frac{1}{2}}{2\frac{3}{4}}$. If you missed this problem, review Example 4.5.7.

Write a Ratio as a Fraction

When you apply for a mortgage, the loan officer will compare your total debt to your total income to decide if you qualify for the loan. This comparison is called the debt-to-income ratio. A **ratio** compares two quantities that are measured with the same unit. If we compare a and b , the ratio is written as a to b, $\frac{a}{b}$, or a:b.

Definition: ratios

A ratio compares two numbers or two quantities that are measured with the same unit. The ratio of a to b is written a to b, $\frac{a}{b}$, or a:b.

In this section, we will use the fraction notation. When a ratio is written in fraction form, the fraction should be simplified. If it is an improper fraction, we do not change it to a mixed number. Because a ratio compares two quantities, we would leave a ratio as $\frac{4}{1}$ instead of simplifying it to 4 so that we can see the two parts of the ratio.

Example 5.10.1:

Write each ratio as a fraction: (a) 15 to 27 (b) 45 to 18.

Solution

(a) 15 to 27

Write as a fraction with the first number in the numerator and the second in the denominator.	$\frac{15}{27}$	(5.10.1)
Simplify the fraction.	$\frac{5}{9}$	(5.10.2)

(b) 45 to 18

Write as a fraction with the first number in the numerator and the second in the denominator.	$\frac{45}{18}$	(5.10.3)
Simplify.	$\frac{5}{2}$	(5.10.4)

We leave the ratio in (b) as an improper fraction.

? Exercise 5.10.1:

Write each ratio as a fraction: (a) 21 to 56 (b) 48 to 32.

Answer a

$\frac{3}{8}$

Answer b

$\frac{3}{2}$

? Exercise 5.10.2:

Write each ratio as a fraction: (a) 27 to 72 (b) 51 to 34.

Answer a

$\frac{1}{1}$

Answer b

$\frac{3}{2}$

Ratios Involving Decimals

We will often work with ratios of decimals, especially when we have ratios involving money. In these cases, we can eliminate the decimals by using the Equivalent Fractions Property to convert the ratio to a fraction with whole numbers in the numerator and denominator.

For example, consider the ratio 0.8 to 0.05. We can write it as a fraction with decimals and then multiply the numerator and denominator by 100 to eliminate the decimals.

$$\frac{0.8}{0.05} \tag{5.10.5}$$

$$\frac{(0.8)100}{(0.05)100} \tag{5.10.6}$$

$$\frac{80}{5} \tag{5.10.7}$$

Do you see a shortcut to find the equivalent fraction? Notice that 0.8 = $\frac{8}{10}$ and 0.05 = $\frac{5}{100}$. The least common denominator of $\frac{8}{10}$ and 5 100 is 100. By multiplying the numerator and denominator of $\frac{0.8}{0.05}$ by 100, we 'moved' the decimal two places to the right to get the equivalent fraction with no decimals. Now that we understand the math behind the process, we can find the fraction with no decimals like this:

$$\frac{0.80}{0.05}$$

"Move" the decimal 2 places.	$\frac{80}{5}$	(5.10.8)
Simplify.	$\frac{16}{1}$	(5.10.9)

You do not have to write out every step when you multiply the numerator and denominator by powers of ten. As long as you move both decimal places the same number of places, the ratio will remain the same.

Example 5.10.2:

Write each ratio as a fraction of whole numbers: (a) 4.8 to 11.2 (b) 2.7 to 0.54

Solution

(a) 4.8 to 11.2

Write as a fraction.	$\frac{4.8}{11.2}$	(5.10.10)
Rewrite as an equivalent fraction without decimals, by moving both decimal points 1 place to the right.	$\frac{48}{112}$	(5.10.11)
Simplify.	$\frac{3}{7}$	(5.10.12)

So 4.8 to 11.2 is equivalent to $\frac{3}{7}$.

(b) 2.7 to 0.54

Write as a fraction.	$\frac{2.7}{0.54}$	(5.10.13)
The numerator has one decimal place and the denominator has 2. To clear both decimals we need to move the decimal 2 places to the right.	$\frac{270}{54}$	(5.10.14)
Simplify.	$\frac{5}{1}$	(5.10.15)

So 2.7 to 0.54 is equivalent to $\frac{5}{1}$.

Exercise 5.10.3:

Write each ratio as a fraction: (a) 4.6 to 11.5 (b) 2.3 to 0.69.

Answer a

$\frac{2}{5}$

Answer b

$\frac{10}{3}$

Exercise 5.10.4:

Write each ratio as a fraction: (a) 3.4 to 15.3 (b) 3.4 to 0.68.

Answer a

$\frac{2}{9}$

Answer b

$\frac{5}{1}$

Some ratios compare two mixed numbers. Remember that to divide mixed numbers, you first rewrite them as improper fractions.

Example 5.10.3:

Write the ratio of $1\frac{1}{4}$ to $2\frac{3}{8}$ as a fraction.

Solution

Write as a fraction.	$\frac{1\frac{1}{4}}{2\frac{3}{8}}$	(5.10.16)
Convert the numerator and denominator to improper fractions.	$\frac{\frac{5}{4}}{\frac{19}{8}}$	(5.10.17)
Rewrite as a division of fractions.	$\frac{5}{4} \div \frac{19}{8}$	(5.10.18)
Invert the divisor and multiply.	$\frac{5}{4} \cdot \frac{8}{19}$	(5.10.19)
Simplify.	$\frac{10}{19}$	(5.10.20)

Exercise 5.10.5:

Write each ratio as a fraction: $1\frac{3}{4}$ to $2\frac{5}{8}$.

Answer

\(\dfrac{2}{3}\

Exercise 5.10.6:

Write each ratio as a fraction: $1\frac{1}{8}$ to $2\frac{3}{4}$.

Answer

$\frac{9}{22}$

Applications of Ratios

One real-world application of ratios that affects many people involves measuring cholesterol in blood. The ratio of total cholesterol to HDL cholesterol is one way doctors assess a person's overall health. A ratio of less than 5 to 1 is considered good.

Example 5.10.4:

Hector's total cholesterol is 249 mg/dl and his HDL cholesterol is 39 mg/dl. (a) Find the ratio of his total cholesterol to his HDL cholesterol. (b) Assuming that a ratio less than 5 to 1 is considered good, what would you suggest to Hector?

Solution

(a) First, write the words that express the ratio. We want to know the ratio of Hector's total cholesterol to his HDL cholesterol.

Write as a fraction.	$\frac{total\ cholesterol}{HDL\ cholesterol}$	(5.10.21)
Substitute the values.	$\frac{249}{39}$	(5.10.22)
Simplify.	$\frac{83}{13}$	(5.10.23)

(b) Is Hector's cholesterol ratio ok? If we divide 83 by 13 we obtain approximately 6.4, so $\frac{83}{13} \approx \frac{6.4}{1}$. Hector's cholesterol ratio is high! Hector should either lower his total cholesterol or raise his HDL cholesterol.

Exercise 5.10.7:

Find the patient's ratio of total cholesterol to HDL cholesterol using the given information. Total cholesterol is 185 mg/dL and HDL cholesterol is 40 mg/dL.

Answer

\(\dfrac{37}{8}\

Exercise 5.10.8:

Find the patient’s ratio of total cholesterol to HDL cholesterol using the given information. Total cholesterol is 204 mg/dL and HDL cholesterol is 38 mg/dL.

Answer

\(\dfrac{102}{19}\

Ratios of Two Measurements in Different Units

To find the ratio of two measurements, we must make sure the quantities have been measured with the same unit. If the measurements are not in the same units, we must first convert them to the same units.

We know that to simplify a fraction, we divide out common factors. Similarly in a ratio of measurements, we divide out the common unit.

Example 5.10.5:

The Americans with Disabilities Act (ADA) Guidelines for wheel chair ramps require a maximum vertical rise of 1 inch for every 1 foot of horizontal run. What is the ratio of the rise to the run?

Solution

In a ratio, the measurements must be in the same units. We can change feet to inches, or inches to feet. It is usually easier to convert to the smaller unit, since this avoids introducing more fractions into the problem. Write the words that express the ratio.

Write the ratio as a fraction.	$\frac{rise}{run}$	(5.10.24)
Substitute in the given values.	$\frac{1\ inch}{1\ foot}$	(5.10.25)
Convert 1 foot to inches.	$\frac{1\ inch}{12\ inches}$	(5.10.26)
Simplify, dividing out common factors and units.	$\frac{1}{12}$	(5.10.27)

So the ratio of rise to run is 1 to 12. This means that the ramp should rise 1 inch for every 12 inches of horizontal run to comply with the guidelines.

Exercise 5.10.9:

Find the ratio of the first length to the second length: 32 inches to 1 foot.

Answer

\(\dfrac{8}{3}\

Exercise 5.10.10:

Find the ratio of the first length to the second length: 1 foot to 54 inches.

Answer a

\(\dfrac{2}{9}\

Write a Rate as a Fraction

Frequently we want to compare two different types of measurements, such as miles to gallons. To make this comparison, we use a **rate**. Examples of rates are 120 miles in 2 hours, 160 words in 4 minutes, and $5 dollars per 64 ounces.

Definition: rate

A rate compares two quantities of different units. A rate is usually written as a fraction.

When writing a fraction as a rate, we put the first given amount with its units in the numerator and the second amount with its units in the denominator. When rates are simplified, the units remain in the numerator and denominator.

Example 5.10.6:

Bob drove his car 525 miles in 9 hours. Write this rate as a fraction.

Solution

Write as a fraction, with 525 miles in the numerator and 9 hours in the denominator.	$\frac{525\ miles}{9\ hours}$	(5.10.28)
	$\frac{175\ miles}{3\ hours}$	(5.10.29)

So 525 miles in 9 hours is equivalent to $\frac{175\ miles}{3\ hours}$.

Exercise 5.10.11:

Write the rate as a fraction: 492 miles in 8 hours.

Answer

$\frac{123\ miles}{2\ hours}$

Exercise 5.10.12:

Write the rate as a fraction: 242 miles in 6 hours.

Answer

$\frac{121\ miles}{3\ hours}$

5.11: Ratios and Rate (Part 2)

Find Unit Rates

In the last example, we calculated that Bob was driving at a rate of $\frac{175\ miles}{3\ hours}$. This tells us that every three hours, Bob will travel 175 miles. This is correct, but not very useful. We usually want the rate to reflect the number of miles in one hour. A rate that has a denominator of 1 unit is referred to as a **unit rate**.

Definition: Unit rate

A unit rate is a rate with denominator of 1 unit.

Unit rates are very common in our lives. For example, when we say that we are driving at a speed of 68 miles per hour we mean that we travel 68 miles in 1 hour. We would write this rate as 68 miles/hour (read 68 miles per hour). The common abbreviation for this is 68 mph. Note that when no number is written before a unit, it is assumed to be 1. So 68 miles/hour really means 68 miles/1 hour.

Two rates we often use when driving can be written in different forms, as shown:

Example	Rate	Write	Abbreviate	Read
68 miles in 1 hour	$\frac{68\ miles}{1\ hour}$ (5.11.1)	68 miles/hour	68 mph	68 miles per hour
36 miles to 1 gallon	$\frac{36\ miles}{1\ gallon}$ (5.11.2)	36 miles/gallon	36 mpg	36 miles per gallon

Another example of unit rate that you may already know about is hourly pay rate. It is usually expressed as the amount of money earned for one hour of work. For example, if you are paid $12.50 for each hour you work, you could write that your hourly (unit) pay rate is $12.50/hour (read $12.50 per hour.)

To convert a rate to a unit rate, we divide the numerator by the denominator. This gives us a denominator of 1.

Example 5.11.7:

Anita was paid $384 last week for working 32 hours. What is Anita's hourly pay rate?

Solution

Start with a rate of dollars to hours. Then divide.	$384 last week for 32 hours	
Write as a rate.	$\frac{\$384}{32\ hours}$	(5.11.3)
Divide the numerator by the denominator.	$\frac{\$12}{1\ hour}$	(5.11.4)
Rewrite as a rate.	$12 / hour	

Anita's hourly pay rate is $12 per hour.

Exercise 5.11.13:

Find the unit rate: $630 for 35 hours.

Answer

$18 / hour

Exercise 5.11.14:

Find the unit rate: $684 for 36 hours.

Answer

$19 / hour

Example 5.11.8:

Sven drives his car 455 miles, using 14 gallons of gasoline. How many miles per gallon does his car get?

Solution

Start with a rate of miles to gallons. Then divide.

Write as a rate.	$\frac{455\ miles}{14\ gallons}$	(5.11.5)
Divide 455 by 14 to get the unit rate.	$\frac{32.5\ miles}{1\ gallon}$	(5.11.6)

Sven's car gets 32.5 miles/gallon, or 32.5 mpg.

Exercise 5.11.15:

Find the unit rate: 423 miles to 18 gallons of gas.

Answer

23.5 mpg

Exercise 5.11.16:

Find the unit rate: 406 miles to 14.5 gallons of gas.

Answer

28 mpg

Find Unit Price

Sometimes we buy common household items 'in bulk', where several items are packaged together and sold for one price. To compare the prices of different sized packages, we need to find the unit price. To find the unit price, divide the total price by the number of items. A **unit price** is a unit rate for one item.

Definition: unit price

A unit price is a unit rate that gives the price of one item.

Example 5.11.9:

The grocery store charges $3.99 for a case of 24 bottles of water. What is the unit price?

Solution

What are we asked to find? We are asked to find the unit price, which is the price per bottle.

Write as a rate.	$\frac{\$3.99}{24\ bottles}$	(5.11.7)
Divide to find the unit price.	$\frac{\$0.16625}{1\ bottle}$	(5.11.8)
Round the result to the nearest penny.	$\frac{\$0.17}{1\ bottle}$	(5.11.9)

The unit price is approximately $0.17 per bottle. Each bottle costs about $0.17.

Exercise 5.11.17:

Find the unit price. Round your answer to the nearest cent if necessary: 24-pack of juice boxes for $6.99

Answer

$\frac{\$0.29}{1\ box}$

Exercise 5.11.18:

Find the unit price. Round your answer to the nearest cent if necessary: 24-pack of bottles of ice tea for $12.72

Answer

$\frac{\$0.53}{1\ bottle}$

Unit prices are very useful if you comparison shop. The *better buy* is the item with the lower unit price. Most grocery stores list the unit price of each item on the shelves.

Example 5.11.10:

Paul is shopping for laundry detergent. At the grocery store, the liquid detergent is priced at $14.99 for 64 loads of laundry and the same brand of powder detergent is priced at $15.99 for 80 loads. Which is the better buy, the liquid or the powder detergent?

Solution

To compare the prices, we first find the unit price for each type of detergent.

	Liquid	Powder

Write as a rate.	$\frac{\$14.99}{64\ loads}$	(5.11.10)	$\frac{\$15.99}{80\ loads}$	(5.11.11)
Find the unit price.	$\frac{\$0.234\ldots}{1\ load}$	(5.11.12)	$\frac{\$0.199\ldots}{1\ load}$	(5.11.13)
Round to the nearest cent.	\$0.23/load (23 cents per load.)		\$0.20/load (20 cents per load)	

Now we compare the unit prices. The unit price of the liquid detergent is about \$0.23 per load and the unit price of the powder detergent is about \$0.20 per load. The powder is the better buy.

? Exercise 5.11.19:

Find each unit price and then determine the better buy. Round to the nearest cent if necessary.

Brand A Storage Bags, \$4.59 for 40 count, or Brand B Storage Bags, \$3.99 for 30 count

Answer

Brand A costs \$0.12 per bag. Brand B costs \$0.13 per bag. Brand A is the better buy

? Exercise 5.11.20:

Find each unit price and then determine the better buy. Round to the nearest cent if necessary.

Brand C Chicken Noodle Soup, \$1.89 for 26 ounces, or Brand D Chicken Noodle Soup, \$0.95 for 10.75 ounces

Answer

Brand C costs \$0.07 per ounce. Brand D costs \$0.09 per ounce. Brand C is the better buy

Notice in Example 5.11.10that we rounded the unit price to the nearest cent. Sometimes we may need to carry the division to one more place to see the difference between the unit prices.

Translate Phrases to Expressions with Fractions

Have you noticed that the examples in this section used the comparison words *ratio of, to, per, in, for, on*, and *from*? When you translate phrases that include these words, you should think either ratio or rate. If the units measure the same quantity (length, time, etc.), you have a ratio. If the units are different, you have a rate. In both cases, you write a fraction.

✓ Example 5.11.11:

Translate the word phrase into an algebraic expression: (a) 427 miles per h hours (b) x students to 3 teachers (c) y dollars for 18 hours

Solution

(a) 427 miles per h hours

Write as a rate.	$\frac{427\ miles}{h\ hours}$	(5.11.14)

(b) x students to 3 teachers

Write as a rate.	$\frac{x\ students}{3\ teachers}$	(5.11.15)

(c) y dollars for 18 hours

Write as a rate.	$\frac{\$y}{18\ hours}$	(5.11.16)

Exercise 5.11.21:

Translate the word phrase into an algebraic expression. (a) 689 miles per h hours (b) y parents to 22 students (c) d dollars for 9 minutes

Answer a

$$\frac{689\ mi}{h\ hours}$$

Answer b

$$\frac{y\ parents}{22\ students}$$

Answer c

$$\frac{\$d}{9\ min}$$

Exercise 5.11.22:

Translate the word phrase into an algebraic expression. (a) m miles per 9 hours (b) x students to 8 buses (c) y dollars for 40 hours

Answer a

$$\frac{m\ mi}{9\ h}$$

Answer b

$$\frac{x\ students}{8\ buses}$$

Answer c

$$\frac{\$y}{40\ h}$$

Rates and Unit Rates

Unit Rate for Cell Phone Plan

Practice Makes Perfect

Write a Ratio as a Fraction

In the following exercises, write each ratio as a fraction.

403. 20 to 36
404. 20 to 32
405. 42 to 48
406. 45 to 54
407. 49 to 21
408. 56 to 16
409. 84 to 36
410. 6.4 to 0.8
411. 0.56 to 2.8
412. 1.26 to 4.2
413. $1\frac{2}{3}$ to $2\frac{5}{6}$
414. $1\frac{3}{4}$ to $2\frac{5}{8}$
415. $4\frac{1}{6}$ to $3\frac{1}{3}$
416. $5\frac{3}{5}$ to $3\frac{3}{5}$
417. \$18 to \$63
418. \$16 to \$72
419. \$1.21 to \$0.44
420. \$1.38 to \$0.69
421. 28 ounces to 84 ounces
422. 32 ounces to 128 ounces
423. 12 feet to 46 feet
424. 15 feet to 57 feet
425. 246 milligrams to 45 milligrams
426. 304 milligrams to 48 milligrams
427. total cholesterol of 175 to HDL cholesterol of 45
428. total cholesterol of 215 to HDL cholesterol of 55
429. 27 inches to 1 foot 430. 28 inches to 1 foot

Write a Rate as a Fraction

In the following exercises, write each rate as a fraction.

431. 140 calories per 12 ounces
432. 180 calories per 16 ounces
433. 8.2 pounds per 3 square inches
434. 9.5 pounds per 4 square inches
435. 488 miles in 7 hours
436. 527 miles in 9 hours
437. \$595 for 40 hours
438. \$798 for 40 hours

Find Unit Rates

In the following exercises, find the unit rate. Round to two decimal places, if necessary.

439. 140 calories per 12 ounces
440. 180 calories per 16 ounces
441. 8.2 pounds per 3 square inches
442. 9.5 pounds per 4 square inches

443. 488 miles in 7 hours
444. 527 miles in 9 hours
445. $595 for 40 hours
446. $798 for 40 hours
447. 576 miles on 18 gallons of gas
448. 435 miles on 15 gallons of gas
449. 43 pounds in 16 weeks
450. 57 pounds in 24 weeks
451. 46 beats in 0.5 minute
452. 54 beats in 0.5 minute
453. The bindery at a printing plant assembles 96,000 magazines in 12 hours. How many magazines are assembled in one hour?
454. The pressroom at a printing plant prints 540,000 sections in 12 hours. How many sections are printed per hour?

Find Unit Price

In the following exercises, find the unit price. Round to the nearest cent.

455. Soap bars at 8 for $8.69
456. Soap bars at 4 for $3.39
457. Women's sports socks at 6 pairs for $7.99
458. Men's dress socks at 3 pairs for $8.49
459. Snack packs of cookies at 12 for $5.79
460. Granola bars at 5 for $3.69
461. CD-RW discs at 25 for $14.99
462. CDs at 50 for $4.49
463. The grocery store has a special on macaroni and cheese. The price is $3.87 for 3 boxes. How much does each box cost?
464. The pet store has a special on cat food. The price is $4.32 for 12 cans. How much does each can cost?

In the following exercises, find each unit price and then identify the better buy. Round to three decimal places.

465. Mouthwash, 50.7-ounce size for $6.99 or 33.8-ounce size for $4.79
466. Toothpaste, 6 ounce size for $3.19 or 7.8-ounce size for $5.19
467. Breakfast cereal, 18 ounces for $3.99 or 14 ounces for $3.29
468. Breakfast Cereal, 10.7 ounces for $2.69 or 14.8 ounces for $3.69
469. Ketchup, 40-ounce regular bottle for $2.99 or 64-ounce squeeze bottle for $4.39
470. Mayonnaise, 15-ounce regular bottle for $3.49 or 22-ounce squeeze bottle for $4.99
471. Cheese, $6.49 for 1 lb. block or $3.39 for $\frac{1}{2}$ lb. block
472. Candy, $10.99 for a 1 lb. bag or $2.89 for $\frac{1}{4}$ lb. of loose candy

Translate Phrases to Expressions with Fractions

In the following exercises, translate the English phrase into an algebraic expression.

473. 793 miles per p hours
474. 78 feet per r seconds
475. $3 for 0.5 lbs.
476. j beats in 0.5 minutes
477. 105 calories in x ounces
478. 400 minutes for m dollars
479. the ratio of y and 5x
480. the ratio of 12x and y

Everyday Math

481. One elementary school in Ohio has 684 students and 45 teachers. Write the student-to-teacher ratio as a unit rate.
482. The average American produces about 1,600 pounds of paper trash per year (365 days). How many pounds of paper trash does the average American produce each day? (Round to the nearest tenth of a pound.)

483. A popular fast food burger weighs 7.5 ounces and contains 540 calories, 29 grams of fat, 43 grams of carbohydrates, and 25 grams of protein. Find the unit rate of (a) calories per ounce (b) grams of fat per ounce (c) grams of carbohydrates per ounce (d) grams of protein per ounce. Round to two decimal places.
484. A 16-ounce chocolate mocha coffee with whipped cream contains 470 calories, 18 grams of fat, 63 grams of carbohydrates, and 15 grams of protein. Find the unit rate of (a) calories per ounce (b) grams of fat per ounce (c) grams of carbohydrates per ounce (d) grams of protein per ounce.

Writing Exercises

485. Would you prefer the ratio of your income to your friend's income to be 3/1 or 1/3? Explain your reasoning.
486. The parking lot at the airport charges $0.75 for every 15 minutes. (a) How much does it cost to park for 1 hour? (b) Explain how you got your answer to part (a). Was your reasoning based on the unit cost or did you use another method?
487. Kathryn ate a 4-ounce cup of frozen yogurt and then went for a swim. The frozen yogurt had 115 calories. Swimming burns 422 calories per hour. For how many minutes should Kathryn swim to burn off the calories in the frozen yogurt? Explain your reasoning.
488. Mollie had a 16-ounce cappuccino at her neighborhood coffee shop. The cappuccino had 110 calories. If Mollie walks for one hour, she burns 246 calories. For how many minutes must Mollie walk to burn off the calories in the cappuccino? Explain your reasoning.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
write a ratio as a fraction.			
write a rate as a fraction.			
find unit rates.			
find unit price.			
translate phrases to expressions with fractions.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

5.12: Simplify and Use Square Roots (Part 1)

Learning Objectives

- Simplify expressions with square roots
- Estimate square roots
- Approximate square roots
- Simplify variable expressions with square roots
- Use square roots in applications

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $(-9)^2$. If you missed this problem, review Example 3.7.6.
2. Round 3.846 to the nearest hundredth. If you missed this problem, review Example 5.2.9.
3. Evaluate 12d for d = 80. If you missed this problem, review Example 2.3.2.

Simplify Expressions with Square Roots

To start this section, we need to review some important vocabulary and notation. Remember that when a number n is multiplied by itself, we can write this as n^2, which we read aloud as "n squared." For example, 8^2 is read as "8 squared." We call 64 the *square* of 8 because $8^2 = 64$. Similarly, 121 is the square of 11, because $11^2 = 121$.

Definition: square of a number

If $n^2 = m$, then m is the square of n.

Modeling Squares

Do you know why we use the word *square*? If we construct a square with three tiles on each side, the total number of tiles would be nine.

This is why we say that the square of three is nine.

$$3^2 = 9 \tag{5.12.1}$$

The number 9 is called a perfect square because it is the square of a whole number.

The chart shows the squares of the counting numbers 1 through 15. You can refer to it to help you identify the perfect squares.

Number	n	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Square	n^2	1	4	9	16	25	36	49	64	81	100	121	144	169	196	225

Definition: perfect squares

A perfect square is the square of a whole number.

What happens when you square a negative number?

$$\begin{aligned}(-8)^2 &= (-8)(-8)\\ &= 64\end{aligned}$$

When we multiply two negative numbers, the product is always positive. So, the square of a negative number is always positive. The chart shows the squares of the negative integers from −1 to −15.

Number	n	−1	−2	−3	−4	−5	−6	−7	−8	−9	−10	−11	−12	−13	−14	−15
Square	n^2	1	4	9	16	25	36	49	64	81	100	121	144	169	196	225

Did you notice that these squares are the same as the squares of the positive numbers?

Square Roots

Sometimes we will need to look at the relationship between numbers and their squares in reverse. Because $10^2 = 100$, we say 100 is the square of 10. We can also say that 10 is a square root of 100.

Definition: Square Root of a Number

A number whose square is m is called a square root of m. If $n^2 = m$, then n is a square root of m.

Notice $(-10)^2 = 100$ also, so −10 is also a square root of 100. Therefore, both 10 and −10 are square roots of 100. So, every positive number has two square roots: one positive and one negative.

What if we only want the positive square root of a positive number? The *radical sign*, $\sqrt{}$, stands for the positive square root. The positive square root is also called the **principal square root**.

Definition: Square Root Notation

$\sqrt{m}$ is read as "the square root of m." If $m = n^2$, then $m = n$ for $n \geq 0$.

radical sign → $\sqrt{m}$ ← radicand

We can also use the radical sign for the square root of zero. Because $0^2 = 0$, $\sqrt{0} = 0$. Notice that zero has only one square root. The chart shows the square roots of the first 15 perfect square numbers.

$\sqrt{1}$	$\sqrt{4}$	$\sqrt{9}$	$\sqrt{16}$	$\sqrt{25}$	$\sqrt{36}$	$\sqrt{49}$	$\sqrt{64}$	$\sqrt{81}$	$\sqrt{100}$	$\sqrt{121}$	$\sqrt{144}$	$\sqrt{169}$	$\sqrt{196}$	$\sqrt{225}$
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Example 5.12.1:

Simplify: (a) $\sqrt{25}$ (b) $\sqrt{121}$.

Solution

(a) $\sqrt{25}$

Since $5^2 = 25$	5

(b) $\sqrt{121}$

Since $11^2 = 121$	11

Exercise 5.12.1:

Simplify: (a) $\sqrt{36}$ (b) $\sqrt{169}$.

Answer a

6

Answer b

13

Exercise 5.12.2:

Simplify: (a) $\sqrt{16}$ (b) $\sqrt{196}$.

Answer a

4

Answer b

14

Every positive number has two square roots and the radical sign indicates the positive one. We write $\sqrt{100} = 10$. If we want to find the negative square root of a number, we place a negative in front of the radical sign. For example, $-\sqrt{100} = -10$.

Example 5.12.2:

Simplify. (a) $-\sqrt{9}$ (b) $-\sqrt{144}$.

Solution

(a) $-\sqrt{9}$

The negative is in front of the radical sign.	-3

(b) $-\sqrt{144}$

The negative is in front of the radical sign.	-12

Exercise 5.12.3:

Simplify: (a) $-\sqrt{4}$ (b) $-\sqrt{225}$.

Answer a

-2

Answer b

-15

Exercise 5.12.4:

Simplify: (a) $-\sqrt{81}$ (b) $-\sqrt{64}$.

Answer a

-9

Answer b

-8

Square Root of a Negative Number

Can we simplify $\sqrt{-25}$? Is there a number whose square is -25?

$$(\ )^2 = -25? \tag{5.12.2}$$

None of the numbers that we have dealt with so far have a square that is −25. Why? Any positive number squared is positive, and any negative number squared is also positive. In the next chapter we will see that all the numbers we work with are called the real numbers. So we say there is no real number equal to $\sqrt{-25}$. If we are asked to find the square root of any negative number, we say that the solution is not a real number.

Example 5.12.3:

Simplify: (a) $\sqrt{-169}$ (b) $-\sqrt{121}$.

Solution

(a) There is no real number whose square is −169. Therefore, $\sqrt{-169}$ is not a real number.

(b) The negative is in front of the radical sign, so we find the opposite of the square root of 121.

The negative is in front of the radical.	-11

Exercise 5.12.5:

Simplify: (a) $\sqrt{-196}$ (b) $-\sqrt{81}$.

Answer a

not a real number

Answer b

-9

Exercise 5.12.6:

Simplify: (a) $-\sqrt{49}$ (b) $\sqrt{-121}$.

Answer a

-7

Answer b

not a real number

Square Roots and the Order of Operations

When using the order of operations to simplify an expression that has square roots, we treat the radical sign as a grouping symbol. We simplify any expressions under the radical sign before performing other operations.

Example 5.12.4:

Simplify: (a) $\sqrt{25}+\sqrt{144}$ (b) $\sqrt{25+144}$.

Solution

(a)

Use the order of operations.	$\sqrt{25}+\sqrt{144}$	(5.12.3)
Simplify each radical.	5 + 12	
Add.	17	

(b)

Use the order of operations.	$\sqrt{25+144}$	(5.12.4)
Add under the radical sign.	$\sqrt{169}$	(5.12.5)
Simplify.	13	

Exercise 5.12.7:

Simplify: (a) $\sqrt{9}+\sqrt{16}$ (b) $\sqrt{9+16}$.

Answer a

7

Answer b

5

Exercise 5.12.8:

Simplify: (a) $\sqrt{64+225}$ (b) $\sqrt{64}+\sqrt{225}$.

Answer a

17

Answer b

23

Notice the different answers in parts (a) and (b) of Example 5.12.4 It is important to follow the order of operations correctly. In (a), we took each square root first and then added them. In (b), we added under the radical sign first and then found the square root.

Estimate Square Roots

So far we have only worked with square roots of perfect squares. The square roots of other numbers are not whole numbers.

Number	Square root
4	$\sqrt{4}=2$
5	$\sqrt{5}$
6	$\sqrt{6}$
7	$\sqrt{7}$
8	$\sqrt{8}$
9	$\sqrt{9}=3$

We might conclude that the square roots of numbers between 4 and 9 will be between 2 and 3, and they will not be whole numbers. Based on the pattern in the table above, we could say that $\sqrt{5}$ is between 2 and 3. Using inequality symbols, we write

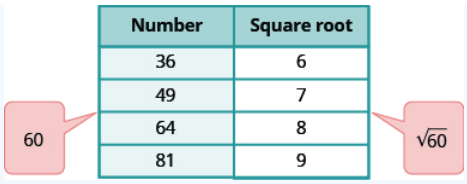
$$2<\sqrt{5}<3 \tag{5.12.6}$$

Example 5.12.5:

Estimate $\sqrt{60}$ between two consecutive whole numbers.

Solution

Think of the perfect squares closest to 60. Make a small table of these perfect squares and their squares roots.



Locate 60 between two consecutive perfect squares.	$49 < 60 < 64$	
$\sqrt{60}$ is between their square roots.	$7 < \sqrt{60} < 8$	$(5.12.7)$

? Exercise 5.12.9:

Estimate $\sqrt{38}$ between two consecutive whole numbers.

Answer

$6 < \sqrt{38} < 7$

? Exercise 5.12.10:

Estimate $\sqrt{84}$ between two consecutive whole numbers.

Answer

$9 < \sqrt{84} < 10$

5.13: Simplify and Use Square Roots (Part 2)

Approximate Square Roots with a Calculator

There are mathematical methods to approximate square roots, but it is much more convenient to use a calculator to find square roots. Find the $\sqrt{\ }$ or $\sqrt{x}$ key on your calculator. You will to use this key to approximate square roots. When you use your calculator to find the square root of a number that is not a perfect square, the answer that you see is not the exact number. It is an approximation, to the number of digits shown on your calculator's display. The symbol for an approximation is ≈ and it is read *approximately*.

Suppose your calculator has a 10-digit display. Using it to find the square root of 5 will give 2.236067977. This is the approximate square root of 5. When we report the answer, we should use the "approximately equal to" sign instead of an equal sign.

$$\sqrt{5} \approx 2.236067978 \tag{5.13.1}$$

You will seldom use this many digits for applications in algebra. So, if you wanted to round $\sqrt{5}$ to two decimal places, you would write

$$\sqrt{5} \approx 2.24 \tag{5.13.2}$$

How do we know these values are approximations and not the exact values? Look at what happens when we square them.

$$2.236067978^2 = 5.000000002$$
$$2.24^2 = 5.0176$$

The squares are close, but not exactly equal, to 5.

Example 5.13.6:

Round $\sqrt{17}$ to two decimal places using a calculator.

Solution

Use the calculator square root key.	4.123105626	
Round to two decimal places.	4.12	
	$\sqrt{17} \approx 4.12$	(5.13.3)

Exercise 5.13.11:

Round $\sqrt{11}$ to two decimal places.

Answer

≈ 3.32

Exercise 5.13.12:

Round $\sqrt{13}$ to two decimal places

Answer

≈ 3.61

Simplify Variable Expressions with Square Roots

Expressions with square root that we have looked at so far have not had any variables. What happens when we have to find a square root of a variable expression?

Consider $\sqrt{9x^2}$, where x ≥ 0. Can you think of an expression whose square is $9x^2$?

$$(?)^2 = 9x^2$$
$$(3x)^2 = 9x^2$$
$$so\ \sqrt{9x^2} = 3x$$

When we use a variable in a square root expression, for our work, we will assume that the variable represents a nonnegative number. In every example and exercise that follows, each variable in a square root expression is greater than or equal to zero.

Example 5.13.7:

Simplify: x^2.

Solution

Think about what we would have to square to get x^2. Algebraically, $(?)^2 = x^2$

Since $(x)^2 = x^2$	x

Exercise 5.13.13:

Simplify: $\sqrt{y^2}$.

Answer

y

Exercise 5.13.14:

Simplify: $\sqrt{m^2}$.

Answer

m

Example 5.13.8:

Simplify: $\sqrt{16x^2}$.

Solution

Since $(4x)^2 = 16x^2$	4x

Exercise 5.13.15:

Simplify: $\sqrt{64x^2}$.

Answer

$8x$

Exercise 5.13.16:

Simplify: $\sqrt{169y^2}$.

Answer

$13y$

Example 5.13.9:

Simplify: $-\sqrt{81y^2}$.

Solution

Since $(9y)^2 = 81y^2$	-9y

Exercise 5.13.17:

Simplify: $-\sqrt{121y^2}$.

Answer

$-11y$

Exercise 5.13.18:

Simplify: $-\sqrt{100p^2}$.

Answer

$-10p$

Example 5.13.10:

Simplify: $\sqrt{36x^2y^2}$.

Solution

Since $(6xy)^2 = 36x^2 y^2$	6xy

Exercise 5.13.19:

Simplify: $\sqrt{100a^2b^2}$.

Answer

$10ab$

Exercise 5.13.20:

Simplify: $\sqrt{225m^2n^2}$.

Answer

$10mn$

Use Square Roots in Applications

As you progress through your college courses, you'll encounter several applications of square roots. Once again, if we use our strategy for applications, it will give us a plan for finding the answer!

HOW TO: USE A STRATEGY FOR APPLICATIONS WITH SQUARE ROOTS

Step 1. Identify what you are asked to find.

Step 2. Write a phrase that gives the information to find it.

Step 3. Translate the phrase to an expression.

Step 4. Simplify the expression.

Step 5. Write a complete sentence that answers the question.

Square Roots and Area

We have solved applications with area before. If we were given the length of the sides of a square, we could find its area by squaring the length of its sides. Now we can find the length of the sides of a square if we are given the area, by finding the square root of the area.

If the area of the square is A square units, the length of a side is A units. See Table 5.13.1.

Table 5.13.1

Area (square units)	Length of side (units)	
9	$\sqrt{9}=3$	(5.13.4)
144	$\sqrt{144}=12$	(5.13.5)
A	$\sqrt{A}$	(5.13.6)

Example 5.13.11:

Mike and Lychelle want to make a square patio. They have enough concrete for an area of 200 square feet. To the nearest tenth of a foot, how long can a side of their square patio be?

Solution

We know the area of the square is 200 square feet and want to find the length of the side. If the area of the square is A square units, the length of a side is $\sqrt{A}$ units.

What are you asked to find?	The length of each side of a square patio	
Write a phrase.	The length of a side	
Translate to an expression.	$\sqrt{A}$	(5.13.7)
Evaluate $\sqrt{A}$ when A = 200.	$\sqrt{200}$	(5.13.8)
Use your calculator.	14.142135...	
Round to one decimal place.	14.1 feet	
Write a sentence.	Each side of the patio should be 14.1 feet.	

Exercise 5.13.21:

Katie wants to plant a square lawn in her front yard. She has enough sod to cover an area of 370 square feet. To the nearest tenth of a foot, how long can a side of her square lawn be?

Answer

19.2 feet

Exercise 5.13.22:

Sergio wants to make a square mosaic as an inlay for a table he is building. He has enough tile to cover an area of 2704 square centimeters. How long can a side of his mosaic be?

Answer

52 centimeters

Square Roots and Gravity

Another application of square roots involves gravity. On Earth, if an object is dropped from a height of h feet, the time in seconds it will take to reach the ground is found by evaluating the expression $\frac{\sqrt{h}}{4}$. For example, if an object is dropped from a height of 64 feet, we can find the time it takes to reach the ground by evaluating $\frac{\sqrt{64}}{4}$.

Take the square root of 64.	$\frac{8}{4}$	(5.13.9)
Simplify the fraction.	2	

It would take 2 seconds for an object dropped from a height of 64 feet to reach the ground.

Example 5.13.12:

Christy dropped her sunglasses from a bridge 400 feet above a river. How many seconds does it take for the sunglasses to reach the river?

Solution

What are you asked to find?	The number of seconds it takes for the sunglasses to reach the river	
Write a phrase.	The time it will take to reach the river	
Translate to an expression.	$\frac{\sqrt{h}}{4}$	(5.13.10)
Evaluate $\frac{\sqrt{h}}{4}$ when h = 400.	$\frac{\sqrt{400}}{4}$	(5.13.11)
Find the square root of 400.	14.142135...	
Simplify.	14.1 feet	
Write a sentence.	Each side of the patio should be 14.1 feet.	

Exercise 5.13.23:

A helicopter drops a rescue package from a height of 1296 feet. How many seconds does it take for the package to reach the ground?

Answer

9 seconds

Exercise 5.13.24:

A window washer drops a squeegee from a platform 196 feet above the sidewalk. How many seconds does it take for the squeegee to reach the sidewalk?

Answer

3.5 seconds

Square Roots and Accident Investigations

Police officers investigating car accidents measure the length of the skid marks on the pavement. Then they use square roots to determine the speed, in miles per hour, a car was going before applying the brakes. According to some formulas, if the length of the skid marks is d feet, then the speed of the car can be found by evaluating $\sqrt{24d}$.

Example 5.13.13:

After a car accident, the skid marks for one car measured 190 feet. To the nearest tenth, what was the speed of the car (in mph) before the brakes were applied?

Solution

What are you asked to find?	The speed of the car before the brakes were applied	
Write a phrase.	The speed of the car	
Translate to an expression.	$\sqrt{24d}$	(5.13.12)
Evaluate $\sqrt{24d}$ when d = 190.	$\sqrt{24 \cdot 190}$	(5.13.13)
Multiply.	$\sqrt{4,560}$	(5.13.14)
Use your calculator.	67.527772...	
Round to tenths.	67.5	
Write a sentence.	The speed of the car was approximately 67.5 miles per hour.	

Exercise 5.13.25:

An accident investigator measured the skid marks of a car and found their length was 76 feet. To the nearest tenth, what was the speed of the car before the brakes were applied?

Answer

42.7 mph

Exercise 5.13.26:

The skid marks of a vehicle involved in an accident were 122 feet long. To the nearest tenth, how fast had the vehicle been going before the brakes were applied?

Answer

54.1 mph

Introduction to Square Roots

Estimating Square Roots with a Calculator

Practice Makes Perfect

Simplify Expressions with Square Roots

In the following exercises, simplify.

489. $\sqrt{36}$
490. $\sqrt{4}$
491. $\sqrt{64}$
492. $\sqrt{144}$
493. $-\sqrt{4}$
494. $-\sqrt{100}$
495. $-\sqrt{1}$
496. $-\sqrt{121}$
497. $\sqrt{-121}$
498. $\sqrt{-36}$
499. $\sqrt{-9}$
500. $\sqrt{-49}$
501. $\sqrt{9+16}$
502. $\sqrt{25+144}$
503. $\sqrt{9}+\sqrt{16}$
504. $\sqrt{25}+\sqrt{144}$

Estimate Square Roots

In the following exercises, estimate each square root between two consecutive whole numbers.

505. $\sqrt{70}$
506. $\sqrt{5}$
507. $\sqrt{200}$
508. $\sqrt{172}$

Approximate Square Roots with a Calculator

In the following exercises, use a calculator to approximate each square root and round to two decimal places.

509. $\sqrt{19}$
510. $\sqrt{21}$
511. $\sqrt{53}$
512. $\sqrt{47}$

Simplify Variable Expressions with Square Roots

In the following exercises, simplify. (Assume all variables are greater than or equal to zero.)

513. $\sqrt{y^2}$
514. $\sqrt{b^2}$
515. $\sqrt{49x^2}$
516. $\sqrt{100y^2}$
517. $-\sqrt{64a^2}$
518. $-\sqrt{25x^2}$
519. $\sqrt{144x^2y^2}$
520. $\sqrt{196a^2b^2}$

Use Square Roots in Applications

In the following exercises, solve. Round to one decimal place.

521. **Landscaping** Reed wants to have a square garden plot in his backyard. He has enough compost to cover an area of 75 square feet. How long can a side of his garden be?
522. **Landscaping** Vince wants to make a square patio in his yard. He has enough concrete to pave an area of 130 square feet. How long can a side of his patio be?
523. **Gravity** An airplane dropped a flare from a height of 1,024 feet above a lake. How many seconds did it take for the flare to reach the water?
524. **Gravity** A hang glider dropped his cell phone from a height of 350 feet. How many seconds did it take for the cell phone to reach the ground?
525. **Gravity** A construction worker dropped a hammer while building the Grand Canyon skywalk, 4,000 feet above the Colorado River. How many seconds did it take for the hammer to reach the river?
526. **Accident investigation** The skid marks from a car involved in an accident measured 54 feet. What was the speed of the car before the brakes were applied?
527. **Accident investigation** The skid marks from a car involved in an accident measured 216 feet. What was the speed of the car before the brakes were applied?
528. **Accident investigation** An accident investigator measured the skid marks of one of the vehicles involved in an accident. The length of the skid marks was 175 feet. What was the speed of the vehicle before the brakes were applied?
529. **Accident investigation** An accident investigator measured the skid marks of one of the vehicles involved in an accident. The length of the skid marks was 117 feet. What was the speed of the vehicle before the brakes were applied?

Everyday Math

530. **Decorating** Denise wants to install a square accent of designer tiles in her new shower. She can afford to buy 625 square centimeters of the designer tiles. How long can a side of the accent be?
531. **Decorating** Morris wants to have a square mosaic inlaid in his new patio. His budget allows for 2,025 tiles. Each tile is square with an area of one square inch. How long can a side of the mosaic be?

Writing Exercises

532. Why is there no real number equal to $\sqrt{-64}$?
533. What is the difference between 9^2 and $\sqrt{9}$?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions with square roots.			
estimate square roots.			
approximate square roots.			
simplify variable expressions with square roots.			
use square roots in applications.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

5.14: Commutative and Associative Properties (Part 1)

Learning Objectives

- Use the commutative and associative properties
- Evaluate expressions using the commutative and associative properties
- Simplify expressions using the commutative and associative properties

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: 7y + 2 + y + 13. If you missed this problem, review Example 2.3.10.
2. Multiply: $\frac{2}{3} \cdot 18$. If you missed this problem, review Example 4.3.10.
3. Find the opposite of 15. If you missed this problem, review Example 3.1.3.

In the next few sections, we will take a look at the properties of real numbers. Many of these properties will describe things you already know, but it will help to give names to the properties and define them formally. This way we'll be able to refer to them and use them as we solve equations in the next chapter.

Use the Commutative and Associative Properties

Think about adding two numbers, such as 5 and 3.

$$\begin{array}{cc} 5+3 & 3+5 \\ 8 & 8 \end{array}$$

The results are the same. 5 + 3 = 3 + 5

Notice, the order in which we add does not matter. The same is true when multiplying 5 and 3.

$$\begin{array}{cc} 5 \cdot 3 & 3 \cdot 5 \\ 15 & 15 \end{array}$$

Again, the results are the same! 5 • 3 = 3 • 5. The order in which we multiply does not matter. These examples illustrate the commutative properties of addition and multiplication.

Definition: Commutative Properties

Commutative Property of Addition: if a and b are real numbers, then a + b = b + a

Commutative Property of Multiplication: if a and b are real numbers, then a • b = b • a

The commutative properties have to do with order. If you change the order of the numbers when adding or multiplying, the result is the same.

Example 5.14.1:

Use the commutative properties to rewrite the following expressions: (a) −1 + 3 = _____ (b) 4 • 9 = _____

Solution

(a) −1 + 3 = _____

Use the commutative property of addition to change the order.	−1 + 3 = 3 + (−1)

(b) 4 • 9 = _____

Use the commutative property of multiplication to change the order.	4 • 9 = 9 • 4

Exercise 5.14.1:

Use the commutative properties to rewrite the following expressions: (a) −4 + 7 = _____ (b) 6 • 12 = _____

Answer a

$$-4+7=7+(-4)$$

Answer b

$$6 \cdot 12 = 12 \cdot 6$$

Exercise 5.14.2:

Use the commutative properties to rewrite the following expressions: (a) 14 + (-2) = _____ (b) 3(-5) = _____

Answer a

$$14+(-2)=-2+14$$

Answer b

$$3(-5)=(-5)3$$

What about subtraction? Does order matter when we subtract numbers? Does 7 − 3 give the same result as 3 − 7?

$$\begin{array}{cc} 7-3 & 3-7 \\ 4 & -4 \\ & 4 \neq -4 \end{array}$$

The results are not the same. 7 − 3 ≠ 3 − 7

Since changing the order of the subtraction did not give the same result, we can say that subtraction is not commutative. Let's see what happens when we divide two numbers. Is division commutative?

$$\begin{array}{cc} 12 \div 4 & 4 \div 12 \\ \frac{12}{4} & \frac{4}{12} \\ 3 & \frac{1}{3} \\ & 3 \neq \frac{1}{3} \end{array}$$

The results are not the same. So 12 ÷ 4 ≠ 4 ÷ 12

Since changing the order of the division did not give the same result, division is not commutative.

Addition and multiplication are commutative. Subtraction and division are not commutative.

Suppose you were asked to simplify this expression.

$$7+8+2 \tag{5.14.1}$$

How would you do it and what would your answer be?

Some people would think 7 + 8 is 15 and then 15 + 2 is 17. Others might start with 8 + 2 makes 10 and then 7 + 10 makes 17.

Both ways give the same result, as shown in Figure 5.14.1. (Remember that parentheses are grouping symbols that indicate which operations should be done first.)

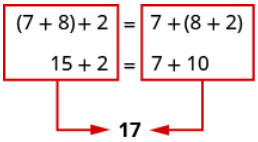

Figure 5.14.1

When adding three numbers, changing the grouping of the numbers does not change the result. This is known as the Associative Property of Addition.

The same principle holds true for multiplication as well. Suppose we want to find the value of the following expression:

$$5 \cdot \frac{1}{3} \cdot 3 \tag{5.14.2}$$

Changing the grouping of the numbers gives the same result, as shown in Figure 5.14.2

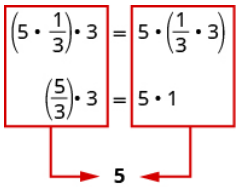

Figure 5.14.2

When multiplying three numbers, changing the grouping of the numbers does not change the result. This is known as the Associative Property of Multiplication.

If we multiply three numbers, changing the grouping does not affect the product. You probably know this, but the terminology may be new to you. These examples illustrate the *Associative Properties*.

Definition: Associative Properties

Associative Property of Addition: if a, b, and c are real numbers, then (a + b) + c = a + (b + c)

Associative Property of Multiplication: if a, b, and c are real numbers, then (a • b) • c = a • (b • c)

Example 5.14.2:

Use the associative properties to rewrite the following: (a) (3 + 0.6) + 0.4 = _____ (b) $\left(-4 \cdot \frac{2}{5}\right) \cdot 15$ = _____

Solution

(a) (3 + 0.6) + 0.4 = _____

Change the grouping.	(3 + 0.6) + 0.4 = 3 + (0.6 + 0.4)

Notice that 0.6 + 0.4 is 1, so the addition will be easier if we group as shown on the right.

(b) $\left(-4 \cdot \frac{2}{5}\right) \cdot 15$ = _____

Change the grouping.	(3 + 0.6) + 0.4 = 3 + (0.6 + 0.4)

Notice that $\frac{2}{5} \cdot 15$ is 6. The multiplication will be easier if we group as shown on the right.

Exercise 5.14.3:

Use the associative properties to rewrite the following: (a) (1 + 0.7) + 0.3 = _____ (b) (−9 • 8) • $\frac{3}{4}$ = _____

Answer a

$(1+0.7)+0.3=1+(0.7+0.3)$

Answer b

$(-9\cdot 8)\cdot \frac{3}{4}=-9\left(8\cdot \frac{3}{4}\right)$

Exercise 5.14.4:

Use the associative properties to rewrite the following: (a) (4 + 0.6) + 0.4 = _____ (b) (−2 • 12) • $\frac{5}{6}$ = _____

Answer a

$(4+0.6)+0.4=4+(0.6+0.4)$

Answer b

$(-2\cdot 12)\cdot \frac{5}{6}=-2\left(12\cdot \frac{5}{6}\right)$

Besides using the associative properties to make calculations easier, we will often use it to simplify expressions with variables.

Example 5.14.3:

Use the Associative Property of Multiplication to simplify: 6(3x).

Solution

Change the grouping.	(6 • 3)x
Multiply in the parentheses.	18x

Notice that we can multiply 6 • 3, but we could not multiply 3 • x without having a value for x.

Exercise 5.14.5:

Use the Associative Property of Multiplication to simplify the given expression: 8(4x).

Answer

$32x$

Exercise 5.14.6:

Use the Associative Property of Multiplication to simplify the given expression: −9(7y).

Answer

$-63y$

Evaluate Expressions using the Commutative and Associative Properties

The commutative and associative properties can make it easier to evaluate some algebraic expressions. Since order does not matter when adding or multiplying three or more terms, we can rearrange and re-group terms to make our work easier, as the next several

examples illustrate.

Example 5.14.4:

Evaluate each expression when $x = \frac{7}{8}$. (a) x + 0.37 + (− x) (b) x + (− x) + 0.37

Solution

(a) x + 0.37 + (− x)

Substitute $\frac{7}{8}$ for x.	$\frac{7}{8} + 0.37 + \left(-\frac{7}{8}\right)$	(5.14.3)
Convert fractions to decimals.	0.875 + 0.37 + (-0.875)	
Add left to right.	1.245 - 0.875	
Subtract.	0.37	

(b) x + (− x) + 0.37

Substitute $\frac{7}{8}$ for x.	$\frac{7}{8} + \left(-\frac{7}{8}\right) + 0.37$	(5.14.4)
Add opposites first.	0.37	

What was the difference between part (a) and part (b)? Only the order changed. By the Commutative Property of Addition, x + 0.37 + (− x) = x + (− x) + 0.37. But wasn't part (b) much easier?

Exercise 5.14.7:

Evaluate each expression when $y = \frac{3}{8}$: (a) y + 0.84 + (− y) (b) y + (− y) + 0.84.

Answer a

0.84

Answer b

0.84

Exercise 5.14.8:

Evaluate each expression when $f = \frac{17}{20}$: (a) f + 0.975 + (− f) (b) f + (− f) + 0.975.

Answer a

0.975

Answer b

0.975

Let's do one more, this time with multiplication.

Example 5.14.5:

Evaluate each expression when n = 17. (a) $\frac{4}{3}\left(\frac{3}{4}n\right)$ (b) $\left(\frac{4}{3}\cdot\frac{3}{4}\right)n$

Solution

(a) $\frac{4}{3}\left(\frac{3}{4}n\right)$

Substitute 17 for n.	$\frac{4}{3}\left(\frac{3}{4}\cdot 17\right)$	(5.14.5)
Multiply in the parentheses first.	$\frac{4}{3}\left(\frac{51}{4}\right)$	(5.14.6)
Multiply again.	17	(5.14.7)

(b) $\left(\frac{4}{3}\cdot\frac{3}{4}\right)n$

Substitute 17 for n.	$\left(\frac{4}{3}\cdot\frac{3}{4}\right)\cdot 17$	(5.14.8)
Multiply. The product of reciprocals is 1.	$(1)\cdot 17$	(5.14.9)
Multiply again.	17	(5.14.10)

What was the difference between part (a) and part (b) here? Only the grouping changed. By the Associative Property of Multiplication, $\frac{4}{3}\left(\frac{3}{4}n\right)=\left(\frac{4}{3}\cdot\frac{3}{4}\right)n$. By carefully choosing how to group the factors, we can make the work easier.

Exercise 5.14.9:

Evaluate each expression when p = 24. (a) $\frac{5}{9}\left(\frac{9}{5}p\right)$ (b) $\left(\frac{5}{9}\cdot\frac{9}{5}\right)p$

Answer a

24

Answer b

24

Exercise 5.14.10:

Evaluate each expression when q = 15. (a) $\frac{7}{11}\left(\frac{11}{7}q\right)$ (b) $\left(\frac{7}{11}\cdot\frac{11}{7}\right)q$

Answer a

15

Answer b

15

This page titled 5.14: Commutative and Associative Properties (Part 1) is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

5.15: Commutative and Associative Properties (Part 2)

Simplify Expressions Using the Commutative and Associative Properties

When we have to simplify algebraic expressions, we can often make the work easier by applying the Commutative or Associative Property first instead of automatically following the order of operations. Notice that in Example 7.2.4 part (b) was easier to simplify than part (a) because the opposites were next to each other and their sum is 0. Likewise, part (b) in Example 7.2.5 was easier, with the reciprocals grouped together, because their product is 1. In the next few examples, we'll use our number sense to look for ways to apply these properties to make our work easier.

Example 5.15.6:

Simplify: −84n + (−73n) + 84n.

Solution

Notice the first and third terms are opposites, so we can use the commutative property of addition to reorder the terms.

Re-order the terms.	−84n + 84n + (−73n)
Add left to right.	0 + (−73n)
Add.	−73n

Exercise 5.15.11:

Simplify: −27a + (−48a) + 27a.

Answer

$-48a$

Exercise 5.15.12:

Simplify: 39x + (−92x) + (−39x).

Answer

$-92x$

Now we will see how recognizing reciprocals is helpful. Before multiplying left to right, look for reciprocals—their product is 1.

Example 5.15.7:

Simplify: $\frac{7}{15} \cdot \frac{8}{23} \cdot \frac{15}{7}$.

Solution

Notice the first and third terms are reciprocals, so we can use the Commutative Property of Multiplication to reorder the factors.

Re-order the terms.	$\frac{7}{15} \cdot \frac{15}{7} \cdot \frac{8}{23}$	(5.15.1)
Multiply left to right.	$1 \cdot \frac{8}{23}$	(5.15.2)

Multiply.	$\frac{8}{23}$	(5.15.3)

Exercise 5.15.13:

Simplify: $\frac{9}{16} \cdot \frac{5}{49} \cdot \frac{16}{9}$.

Answer

$\frac{5}{49}$

Exercise 5.15.14:

Simplify: $\frac{6}{17} \cdot \frac{11}{25} \cdot \frac{17}{6}$.

Answer

$\frac{11}{25}$

In expressions where we need to add or subtract three or more fractions, combine those with a common denominator first.

Example 5.15.8:

Simplify: $\left(\frac{5}{13} + \frac{3}{4}\right) + \frac{1}{4}$.

Solution

Notice that the second and third terms have a common denominator, so this work will be easier if we change the grouping.

Group the terms with a common denominator.	$\frac{5}{13} + \left(\frac{3}{4} + \frac{1}{4}\right)$	(5.15.4)
Add in the parentheses first.	$\frac{5}{13} + \left(\frac{4}{4}\right)$	(5.15.5)
Simplify the fraction.	$\frac{5}{13} + 1$	(5.15.6)
Add.	$1\frac{5}{13}$	(5.15.7)
Convert to an improper fraction.	$\frac{18}{13}$	(5.15.8)

Exercise 5.15.15:

Simplify: $\left(\frac{7}{15} + \frac{5}{8}\right) + \frac{3}{8}$.

Answer

$\frac{22}{15}$

Exercise 5.15.16:

Simplify: $\left(\frac{2}{9}+\frac{7}{12}\right)+\frac{5}{12}$.

Answer

$\frac{11}{9}$

When adding and subtracting three or more terms involving decimals, look for terms that combine to give whole numbers.

Example 5.15.9:

Simplify: (6.47q + 9.99q) + 1.01q.

Solution

Notice that the sum of the second and third coefficients is a whole number.

Change the grouping.	6.47q + (9.99q + 1.01q)
Add in the parentheses first.	6.47q + (11.00q)
Add.	17.47q

Many people have good number sense when they deal with money. Think about adding 99 cents and 1 cent. Do you see how this applies to adding 9.99 + 1.01?

Exercise 5.15.17:

Simplify: (5.58c + 8.75c) + 1.25c.

Answer

$15.58c$

Exercise 5.15.18:

Simplify: (8.79d + 3.55d) + 5.45d.

Answer

$17.79d$

No matter what you are doing, it is always a good idea to think ahead. When simplifying an expression, think about what your steps will be. The next example will show you how using the Associative Property of Multiplication can make your work easier if you plan ahead.

Example 5.15.10:

Simplify the expression: [1.67(8)](0.25).

Solution

Notice that multiplying (8)(0.25) is easier than multiplying 1.67(8) because it gives a whole number. (Think about having 8 quarters—that makes $2.)

Regroup.	1.67[(8)(0.25)]
Multiply in the brackets first.	1.67[2]
Multiply.	3.34

? Exercise 5.15.19:

Simplify: [1.17(4)](2.25).

Answer

10.53

? Exercise 5.15.20:

Simplify: [3.52(8)](2.5).

Answer

70.4

When simplifying expressions that contain variables, we can use the commutative and associative properties to re-order or regroup terms, as shown in the next pair of examples.

✓ Example 5.15.11:

Simplify: 6(9x).

Solution

Use the associative property of multiplication to re-group.	(6 • 9)x
Multiply in the parentheses.	54x

? Exercise 5.15.21:

Simplify: 8(3y).

Answer

$24y$

? Exercise 5.15.22:

Simplify: 12(5z).

Answer

$60z$

In The Language of Algebra, we learned to combine like terms by rearranging an expression so the like terms were together. We simplified the expression 3x + 7 + 4x + 5 by rewriting it as 3x + 4x + 7 + 5 and then simplified it to 7x + 12. We were using the Commutative Property of Addition.

Example 5.15.12:

Simplify: 18p + 6q + (−15p) + 5q.

Solution

Use the Commutative Property of Addition to re-order so that like terms are together.

Re-order terms.	18p + (−15p) + 6q + 5q
Combine like terms.	3p + 11q

Exercise 5.15.23:

Simplify: 23r + 14s + 9r + (−15s).

Answer

$32r - s$

Exercise 5.15.24:

Simplify: 37m + 21n + 4m + (−15n).

Answer

$41m + 6n$

Practice Makes Perfect

Use the Commutative and Associative Properties

In the following exercises, use the commutative properties to rewrite the given expression.

20. 8 + 9 = ___
21. 7 + 6 = ___
22. 8(−12) = ___
23. 7(−13) = ___
24. (−19)(−14) = ___
25. (−12)(−18) = ___
26. −11 + 8 = ___
27. −15 + 7 = ___
28. x + 4 = ___
29. y + 1 = ___
30. −2a = ___
31. −3m = ___

In the following exercises, use the associative properties to rewrite the given expression.

32. (11 + 9) + 14 = ___
33. (21 + 14) + 9 = ___
34. (12 · 5) • 7 = ___
35. (14 · 6) • 9 = ___
36. (−7 + 9) + 8 = ___
37. (−2 + 6) + 7 = ___
38. \(\left(16 \cdot \dfrac{4}{5}\right) • 15 = ___
39. \(\left(13 \cdot \dfrac{2}{3}\right) • 18 = ___
40. 3(4x) = ___

41. 4(7x) = ___
42. (12 + x) + 28 = ___
43. (17 + y) + 33 = ___

Evaluate Expressions using the Commutative and Associative Properties

In the following exercises, evaluate each expression for the given value.

44. If y = $\frac{5}{8}$, evaluate:
    a. y + 0.49 + (− y)
    b. y + (− y) + 0.49
45. If z = $\frac{7}{8}$, evaluate:
    a. z + 0.97 + (− z)
    b. z + (− z) + 0.97
46. If c = $-\frac{11}{4}$, evaluate:
    a. c + 3.125 + (− c)
    b. c + (− c) + 3.125
47. If d = $-\frac{9}{4}$, evaluate:
    a. d + 2.375 + (− d)
    b. d + (− d) + 2.375
48. If j = 11, evaluate:
    a. $\frac{5}{6}\left(\frac{6}{5}j\right)$
    b. $\left(\frac{5}{6}\cdot\frac{6}{5}\right)j$
49. If k = 21, evaluate:
    a. $\frac{4}{13}\left(\frac{13}{4}k\right)$
    b. $\left(\frac{4}{13}\cdot\frac{13}{4}\right)k$
50. If m = −25, evaluate:
    a. $-\frac{3}{7}\left(\frac{7}{3}m\right)$
    b. $\left(-\frac{3}{7}\cdot\frac{7}{3}\right)m$
51. If n = −8, evaluate:
    a. $-\frac{5}{21}\left(\frac{21}{5}n\right)$
    b. $\left(-\frac{5}{21}\cdot\frac{21}{5}\right)n$

Simplify Expressions Using the Commutative and Associative Properties

In the following exercises, simplify.

52. −45a + 15 + 45a
53. 9y + 23 + (−9y)
54. $\frac{1}{2}+\frac{7}{8}+\left(-\frac{1}{2}\right)$
55. $\frac{2}{5}+\frac{5}{12}+\left(-\frac{2}{5}\right)$

56. $\frac{3}{20} \cdot \frac{49}{11} \cdot \frac{20}{3}$
57. $\frac{13}{18} \cdot \frac{25}{7} \cdot \frac{18}{13}$
58. $\frac{7}{12} \cdot \frac{9}{17} \cdot \frac{24}{7}$
59. $\frac{3}{10} \cdot \frac{13}{23} \cdot \frac{50}{3}$
60. $-24 \cdot 7 \cdot \frac{3}{8}$
61. $-36 \cdot 11 \cdot \frac{4}{9}$
62. $\left(\frac{5}{6} + \frac{8}{15}\right) + \frac{7}{15}$
63. $\left(\frac{1}{12} + \frac{4}{9}\right) + \frac{5}{9}$
64. $\frac{5}{13} + \frac{3}{4} + \frac{1}{4}$
65. $\frac{8}{15} + \frac{5}{7} + \frac{2}{7}$
66. (4.33p + 1.09p) + 3.91p
67. (5.89d + 2.75d) + 1.25d
68. 17(0.25)(4)
69. 36(0.2)(5)
70. [2.48(12)](0.5)
71. [9.731(4)](0.75)
72. 7(4a)
73. 9(8w)
74. −15(5m)
75. −23(2n)
76. $12\left(\frac{5}{6}p\right)$
77. $20\left(\frac{3}{5}q\right)$
78. 14x + 19y + 25x + 3y
79. 15u + 11v + 27u + 19v
80. 43m + (−12n) + (−16m) + (−9n)
81. −22p + 17q + (−35p) + (−27q)
82. $\frac{3}{8}g + \frac{1}{12}h + \frac{7}{8}g + \frac{5}{12}h$
83. $\frac{5}{6}a + \frac{3}{10}b + \frac{1}{6}a + \frac{9}{10}b$
84. 6.8p + 9.14q + (−4.37p) + (−0.88q)
85. 9.6m + 7.22n + (−2.19m) + (−0.65n)

Everyday Math

86. Stamps Allie and Loren need to buy stamps. Allie needs four \$0.49 stamps and nine \$0.02 stamps. Loren needs eight \$0.49 stamps and three \$0.02 stamps.
    a. How much will Allie's stamps cost?
    b. How much will Loren's stamps cost?
    c. What is the total cost of the girls' stamps?
    d. How many \$0.49 stamps do the girls need altogether? How much will they cost?
    e. How many \$0.02 stamps do the girls need altogether? How much will they cost?
87. Counting Cash Grant is totaling up the cash from a fundraising dinner. In one envelope, he has twenty-three \$5 bills, eighteen \$10 bills, and thirty-four \$20 bills. In another envelope, he has fourteen \$5 bills, nine \$10 bills, and twenty-seven \$20 bills.

a. How much money is in the first envelope?
b. How much money is in the second envelope?
c. What is the total value of all the cash?
d. What is the value of all the $5 bills?
e. What is the value of all $10 bills?
f. What is the value of all $20 bills?

Writing Exercises

88. In your own words, state the Commutative Property of Addition and explain why it is useful.
89. In your own words, state the Associative Property of Multiplication and explain why it is useful.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the Commutative and Associative Properties.			
evaluate expressions using the Commutative and Associative Properties.			
simplify expressions using the Commutative and Associative Properties.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

5.16: Distributive Property

Learning Objectives

- Simplify expressions using the distributive property
- Evaluate expressions using the distributive property

be prepared!

Before you get started, take this readiness quiz.

1. Multiply: 3(0.25). If you missed this problem, review Example 5.3.5
2. Simplify: 10 − (−2)(3). If you missed this problem, review Example 3.7.5.
3. Combine like terms: 9y + 17 + 3y − 2. If you missed this problem, review Example 2.3.10.

Simplify Expressions Using the Distributive Property

Suppose three friends are going to the movies. They each need $9.25; that is, 9 dollars and 1 quarter. How much money do they need all together? You can think about the dollars separately from the quarters.

$3 \times 9 = 27$

$3 \times \$0.25 = \$0.75$

They need 3 times $9, so $27, and 3 times 1 quarter, so 75 cents. In total, they need $27.75. If you think about doing the math in this way, you are using the Distributive Property.

Definition: Distributive Property

If a, b, c are real numbers, then a(b + c) = ab + ac.

Back to our friends at the movies, we could show the math steps we take to find the total amount of money they need like this:

$$\begin{aligned} &3(9.25) \\ &3(9+0.25) \\ &3(9)+3(0.25) \\ &27+0.75 \\ &27.75 \end{aligned}$$

In algebra, we use the Distributive Property to remove parentheses as we simplify expressions. For example, if we are asked to simplify the expression 3(x + 4), the order of operations says to work in the parentheses first. But we cannot add x and 4, since they are not like terms. So we use the Distributive Property, as shown in Example 5.16.1.

Example 5.16.1:

Simplify: 3(x + 4).

Solution

Distribute.	3 • x + 3 • 4
Multiply.	3x + 12

Exercise 5.16.1:

Simplify: 4(x + 2).

Answer

$4x + 8$

Exercise 5.16.2:

Simplify: 6(x + 7).

Answer

6x + 42

Some students find it helpful to draw in arrows to remind them how to use the Distributive Property. Then the first step in Example 7.17 would look like this:

$$3 \cdot x + 3 \cdot 4 \tag{5.16.1}$$

Example 5.16.2:

Simplify: 6(5y + 1).

Solution

Distribute.	$6 \cdot 5y + 6 \cdot 1$	(5.16.2)
Multiply.	$30y + 6$	(5.16.3)

Exercise 5.16.3:

Simplify: 9(3y + 8).

Answer

27y + 72

Exercise 5.16.4:

Simplify: 5(5w + 9).

Answer

25w + 45

The distributive property can be used to simplify expressions that look slightly different from a(b + c). Here are two other forms.

Definition: Distributive Property

If a, b, c are real numbers, then

$$a(b+c)=ab+ac\$\$Other forms\$\$a(b-c)=ab-ac\$\$\$\$(b+c)a=ba+ca \tag{5.16.4}$$

Example 5.16.3:

Simplify: 2(x − 3).

Solution

Distribute.	$2\cdot x+2\cdot 3$	(5.16.5)
Multiply.	$2x-6$	(5.16.6)

Exercise 5.16.5:

Simplify: 7(x − 6).

Answer

7x - 42

Exercise 5.16.6:

Simplify: 8(x − 5).

Answer

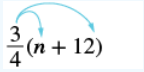
8x - 40

Do you remember how to multiply a fraction by a whole number? We'll need to do that in the next two examples.

Example 5.16.4:

Simplify: $\frac{3}{4}$(n + 12).

Solution



Distribute.	$\frac{3}{4} \cdot n + \frac{3}{4} \cdot 12$	(5.16.7)
Multiply.	$\frac{3}{4}n + 9$	(5.16.8)

Exercise 5.16.7:

Simplify: $\frac{2}{5}$(p + 10).

Answer

$\frac{2}{5}p + 4$

Exercise 5.16.8:

Simplify: $\frac{3}{7}$(u + 21).

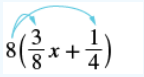
Answer

$\frac{3}{7}u + 9$

Example 5.16.5:

Simplify: $8\left(\frac{3}{8}x + \frac{1}{4}\right)$.

Solution



Distribute.	$8 \cdot \frac{3}{8}x + 8 \cdot \frac{1}{4}$	(5.16.9)
Multiply.	$3x + 2$	(5.16.10)

Exercise 5.16.9:

Simplify: $6\left(\frac{5}{6}y + \frac{1}{2}\right)$.

Answer

5y + 3

Exercise 5.16.10:

Simplify: $12\left(\frac{1}{3}n + \frac{3}{4}\right)$.

Answer

4n + 9

Using the Distributive Property as shown in the next example will be very useful when we solve money applications later.

Example 5.16.6:

Simplify: 100(0.3 + 0.25q).

Solution

Distribute.	$100(0.3)+100(0.25q)$	(5.16.11)
Multiply.	$30+25q$	(5.16.12)

Exercise 5.16.11:

Simplify: 100(0.7 + 0.15p).

Answer

70 + 15p

Exercise 5.16.12:

Simplify: 100(0.04 + 0.35d).

Answer

4 + 35d

In the next example we'll multiply by a variable. We'll need to do this in a later chapter.

Example 5.16.7:

Simplify: $m(n-4)$.

Solution

Distribute.	$m\cdot n-m\cdot 4$	(5.16.13)
Multiply.	$mn-4m$	(5.16.14)

Notice that we wrote m • 4 as 4m. We can do this because of the Commutative Property of Multiplication. When a term is the product of a number and a variable, we write the number first.

Exercise 5.16.13:

Simplify: r(s − 2).

Answer

rs - 2r

Exercise 5.16.14:

Simplify: y(z − 8).

Answer

yz - 8y

The next example will use the 'backwards' form of the Distributive Property, (b + c)a = ba + ca.

Example 5.16.8:

Simplify: (x + 8)p.

Solution

$$(x+8)p$$

Distribute.	$px+8p$	(5.16.15)

Exercise 5.16.15:

Simplify: (x + 2)p.

Answer

xp + 2p

Exercise 5.16.16:

Simplify: (y + 4)q.

Answer

yq + 4q

When you distribute a negative number, you need to be extra careful to get the signs correct.

Example 5.16.9:

Simplify: −2(4y + 1).

Solution

$$-2(4y+1)$$

Distribute.	$-2\cdot 4y+(-2)\cdot 1$	(5.16.16)

Simplify.	$-8y-2$	(5.16.17)

Exercise 5.16.17:

Simplify: −3(6m + 5).

Answer

-18m - 15

Exercise 5.16.18:

Simplify: −6(8n + 11).

Answer

-48n - 66

Example 5.16.10:

Simplify: −11(4 − 3a).

Solution

Distribute.	$-11\cdot 4-(-11)\cdot 3a$	(5.16.18)
Multiply.	$-44-(-33a)$	(5.16.19)
Simplify.	$-44+33a$	(5.16.20)

You could also write the result as 33a − 44. Do you know why?

Exercise 5.16.19:

Simplify: −5(2 − 3a).

Answer

-10 + 15a

Exercise 5.16.20:

Simplify: −7(8 − 15y).

Answer

-56 + 105y

In the next example, we will show how to use the Distributive Property to find the opposite of an expression. Remember, −a = −1 • a.

Example 5.16.11:

Simplify: −(y + 5).

Solution

Multiplying by −1 results in the opposite.	$-1(y+5)$	(5.16.21)
Distribute.	$-1\cdot y+(-1)\cdot 5$	(5.16.22)
Simplify.	$-y+(-5)$	(5.16.23)
Simplify.	$-y-5$	(5.16.24)

Exercise 5.16.21:

Simplify: −(z − 11).

Answer

-z + 11

Exercise 5.16.22:

Simplify: −(x − 4).

Answer

-x + 4

Sometimes we need to use the Distributive Property as part of the order of operations. Start by looking at the parentheses. If the expression inside the parentheses cannot be simplified, the next step would be multiply using the distributive property, which removes the parentheses. The next two examples will illustrate this.

Example 5.16.12:

Simplify: 8 − 2(x + 3).

Solution

Distribute.	$8-2\cdot x-2\cdot 3$	(5.16.25)
Multiply.	$8-2x-6$	(5.16.26)
Combine like terms.	$-2x+2$	(5.16.27)

Exercise 5.16.23:

Simplify: 9 − 3(x + 2).

Answer

-3x + 3

Exercise 5.16.24:

Simplify: 7x − 5(x + 4).

Answer

2x - 20

Example 5.16.13:

Simplify: 4(x − 8) − (x + 3).

Solution

Distribute.	$4x - 32 - x - 3$	(5.16.28)
Combine like terms.	$3x - 35$	(5.16.29)

Exercise 5.16.25:

Simplify: 6(x − 9) − (x + 12).

Answer

5x - 66

Exercise 5.16.26:

Simplify: 8(x − 1) − (x + 5).

Answer

7x - 13

Evaluate Expressions Using the Distributive Property

Some students need to be convinced that the Distributive Property always works. In the examples below, we will practice evaluating some of the expressions from previous examples; in part (a), we will evaluate the form with parentheses, and in part (b) we will evaluate the form we got after distributing. If we evaluate both expressions correctly, this will show that they are indeed equal.

Example 5.16.14:

When y = 10 evaluate: (a) 6(5y + 1) (b) 6 • 5y + 6 • 1.

Solution

(a) 6(5y + 1)

Substitute 10 for y.	$6(5 \cdot 10 + 1)$	(5.16.30)
Simplify in the parentheses.	$6(51)$	(5.16.31)
Multiply.	306	(5.16.32)

(b) 6 • 5y + 6 • 1

Substitute 10 for y.	$6 \cdot 5 \cdot 10 + 6 \cdot 1$	(5.16.33)
Simplify.	$300 + 6$	(5.16.34)
Add.	306	(5.16.35)

Notice, the answers are the same. When y = 10, 6(5y + 1) = 6 • 5y + 6 • 1. Try it yourself for a different value of y.

? Exercise 5.16.27:

Evaluate when w = 3: (a) 5(5w + 9) (b) 5 • 5w + 5 • 9.

Answer a

120

Answer b

120

? Exercise 5.16.28:

Evaluate when y = 2: (a) 9(3y + 8) (b) 9 • 3y + 9 • 8.

Answer a

126

Answer b

126

✓ Example 5.16.15:

When y = 3, evaluate (a) −2(4y + 1) (b) −2 • 4y + (−2) • 1.

Solution

(a) −2(4y + 1)

Substitute 3 for y.	$-2(4 \cdot 3 + 1)$	(5.16.36)
Simplify in the parentheses.	$-2(13)$	(5.16.37)
Multiply.	-26	(5.16.38)

(b) −2 • 4y + (−2) • 1

Substitute 3 for y.	$-2 \cdot 4 \cdot 3 + (-2) \cdot 1$	(5.16.39)
Multiply.	$-24 - 2$	(5.16.40)

Subtract.	-26	(5.16.41)
The answers are the same when y = 3.	$-2(4y+1)=-8y-2$	(5.16.42)

? Exercise 5.16.29:

Evaluate when n = −2: (a) −6(8n + 11) (b) −6 • 8n + (−6) • 11.

Answer a

30

Answer b

30

? Exercise 5.16.30:

Evaluate when m = −1: (a) −3(6m + 5) (b) −3 • 6m + (−3) • 5.

Answer a

3

Answer b

3

✓ Example 5.16.16:

When y = 35 evaluate (a) −(y + 5) and (b) −y − 5 to show that −(y + 5) = −y − 5.

Solution

(a) −(y + 5)

Substitute 35 for y.	$-(35+5)$	(5.16.43)
Add in the parentheses.	$-(40)$	(5.16.44)
Simplify.	-40	(5.16.45)

(b) −y − 5

Substitute 35 for y.	$-35-5$	(5.16.46)
Simplify.	-40	(5.16.47)
The answers are the same when y = 35, demonstrating that	$-(y+5)=-y-5$	(5.16.48)

Exercise 5.16.31:

Evaluate when x = 36: (a) −(x − 4) (b) −x + 4 to show that −(x − 4) = − x + 4.

Answer a

-32

Answer b

-32

Exercise 5.16.32:

Evaluate when z = 55: (a) −(z − 10) (b) −z + 10 to show that −(z − 10) = − z + 10.

Answer a

-45

Answer b

-45

Model Distribution

The Distributive Property

Practice Makes Perfect

Simplify Expressions Using the Distributive Property

In the following exercises, simplify using the distributive property.

90. 4(x + 8)
91. 3(a + 9)
92. 8(4y + 9)
93. 9(3w + 7)
94. 6(c − 13)
95. 7(y − 13)
96. 7(3p − 8)
97. 5(7u − 4)
98. $\frac{1}{2}$(n + 8)
99. $\frac{1}{3}$(u + 9)
100. $\frac{1}{4}$(3q + 12)
101. $\frac{1}{5}$(4m + 20)
102. $9\left(\frac{5}{9}y-\frac{1}{3}\right)$
103. $10\left(\frac{3}{10}x-\frac{2}{5}\right)$
104. $12\left(\frac{1}{4}+\frac{2}{3}r\right)$
105. $12\left(\frac{1}{6}+\frac{3}{4}s\right)$

106. r(s − 18)
107. u(v − 10)
108. (y + 4)p
109. (a + 7)x
110. −2(y + 13)
111. −3(a + 11)
112. −7(4p + 1)
113. −9(9a + 4)
114. −3(x − 6)
115. −4(q − 7)
116. −9(3a − 7)
117. −6(7x − 8)
118. −(r + 7)
119. −(q + 11)
120. −(3x − 7)
121. −(5p − 4)

140. 6(7y + 8) − (30y − 15)
141. 7(3n + 9) − (4n − 13)

Evaluate Expressions Using the Distributive Property

In the following exercises, evaluate both expressions for the given value.

142. If v = −2, evaluate
    a. 6(4v + 7)
    b. 6 · 4v + 6 · 7
143. If u = −1, evaluate
    a. 8(5u + 12)
    b. 8 · 5u + 8 · 12
144. If $n = \frac{2}{3}$, evaluate
    a. $3\left(n+\frac{5}{6}\right)$
    b. $3 \cdot n + 3 \cdot \frac{5}{6}$
145. If y = 3 4 , evaluate

a. $4\left(y+3\frac{8}{}\right)$

b. $4 \cdot y + 4 \cdot \frac{3}{8}$

146. If $y = \frac{7}{12}$, evaluate

a. $-3(4y + 15)$

b. $3 \cdot 4y + (-3) \cdot 15$

147. If $p = \frac{23}{30}$, evaluate

a. $-6(5p + 11)$

b. $-6 \cdot 5p + (-6) \cdot 11$

148. If m = 0.4, evaluate

a. $-10(3m - 0.9)$

b. $-10 \cdot 3m - (-10)(0.9)$

149. If n = 0.75, evaluate

a. $-100(5n + 1.5)$

b. $-100 \cdot 5n + (-100)(1.5)$

150. If y = −25, evaluate

a. $-(y - 25)$

b. $-y + 25$

151. If w = −80, evaluate

a. $-(w - 80)$

b. $-w + 80$

152. If p = 0.19, evaluate

a. $-(p + 0.72)$

b. $-p - 0.72$

153. If q = 0.55, evaluate

a. $-(q + 0.48)$

b. $-q - 0.48$

Everyday Math

154. **Buying by the case** Joe can buy his favorite ice tea at a convenience store for $1.99 per bottle. At the grocery store, he can buy a case of 12 bottles for $23.88.

a. Use the distributive property to find the cost of 12 bottles bought individually at the convenience store. (Hint: notice that $1.99 is $2 − $0.01.)

b. Is it a bargain to buy the iced tea at the grocery store by the case?

155. **Multi-pack purchase** Adele's shampoo sells for $3.97 per bottle at the drug store. At the warehouse store, the same shampoo is sold as a 3-pack for $10.49.

a. Show how you can use the distributive property to find the cost of 3 bottles bought individually at the drug store.

b. How much would Adele save by buying the 3-pack at the warehouse store?

Writing Exercises

156. Simplify $8\left(x-\frac{1}{4}\right)$ using the distributive property and explain each step.

157. Explain how you can multiply 4($5.97) without paper or a calculator by thinking of $5.97 as 6 − 0.03 and then using the distributive property.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
simplify expressions using the Distributive Property.			
evaluate expressions using the Distributive Property.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

5.17: Properties of Identity, Inverses, and Zero

Learning Objectives

- Recognize the identity properties of addition and multiplication
- Use the inverse properties of addition and multiplication
- Use the properties of zero
- Simplify expressions using the properties of identities, inverses, and zero

be prepared!

Before you get started, take this readiness quiz.

1. Find the opposite of −4. If you missed this problem, review Example 3.1.3.
2. Find the reciprocal of $\frac{5}{2}$. If you missed this problem, review Example 4.4.11.
3. Multiply: $\frac{3a}{5} \cdot \frac{9}{2a}$. If you missed this problem, review Example 4.3.9.

Recognize the Identity Properties of Addition and Multiplication

What happens when we add zero to any number? Adding zero doesn't change the value. For this reason, we call 0 the **additive identity**. For example,

$$\begin{array}{lll} 13+0 & -14\ +0 & 0+(-3x) \\ 13 & -14 & -3x \end{array}$$

Definition: Identity Properties

The identity property of addition: for any real number a,

$$a+0=a \qquad 0+a=a \tag{5.17.1}$$

0 is called the additive identity

The identity property of multiplication: for any real number a

$$a \cdot 1=a \qquad 1 \cdot a=a \tag{5.17.2}$$

1 is called the multiplicative identity

Example 5.17.1:

Identify whether each equation demonstrates the identity property of addition or multiplication. (a) 7 + 0 = 7 (b) −16(1) = −16

Solution

(a) 7 + 0 = 7

We are adding 0.	We are using the identity property of addition.

(b) −16(1) = −16

We are multiplying by 1.	We are using the identity property of multiplication.

Exercise 5.17.1:

Identify whether each equation demonstrates the identity property of addition or multiplication: (a) 23 + 0 = 23 (b) −37(1) = −37.

Answer a

identity property of addition

Answer b

identity property of multiplication

Exercise 5.17.2:

Identify whether each equation demonstrates the identity property of addition or multiplication: (a) 1 • 29 = 29 (b) 14 + 0 = 14.

Answer a

identity property of multiplication

Answer b

additive identity

Use the Inverse Properties of Addition and Multiplication

What number added to 5 gives the additive identity, 0?

5 + _____ = 0	We know $5+(-5)=0$

What number added to −6 gives the additive identity, 0?

-6 + _____ = 0	We know $-6+(6)=0$

Notice that in each case, the missing number was the opposite of the number. We call −a the **additive inverse** of a. The opposite of a number is its additive inverse. A number and its opposite add to 0, which is the additive identity.

What number multiplied by $\frac{2}{3}$ gives the multiplicative identity, 1? In other words, two-thirds times what results in 1?

$\frac{2}{3}\cdot$ _____ = 1	We know $\frac{2}{3}\cdot\frac{3}{2}=1$

What number multiplied by 2 gives the multiplicative identity, 1? In other words two times what results in 1?

2 • _____ = 1	We know $2\cdot\frac{1}{2}=1$

Notice that in each case, the missing number was the reciprocal of the number.

We call $\frac{1}{a}$ the **multiplicative inverse** of a ($a \neq 0$). The reciprocal of a number is its multiplicative inverse. A number and its reciprocal multiply to 1, which is the multiplicative identity.

We'll formally state the Inverse Properties here:

Definition: Inverse Properties

Inverse Property of Addition for any real number a,

$$a+(-a)=0 \tag{5.17.3}$$

−a is the additive inverse of a.

Inverse Property of Multiplication for any real number a ≠ 0,

$$a\cdot\frac{1}{a}=1 \tag{5.17.4}$$

$\frac{1}{a}$ is the multiplicative inverse of a.

Example 5.17.2:

Find the additive inverse of each expression: (a) 13 (b) $-\frac{5}{8}$ (c) 0.6.

Solution

To find the additive inverse, we find the opposite.

a. The additive inverse of 13 is its opposite, −13.
b. The additive inverse of $-\frac{5}{8}$ is its opposite, $\frac{5}{8}$.
c. The additive inverse of 0.6 is its opposite, −0.6.

Exercise 5.17.3:

Find the additive inverse of each expression: (a) 18 (b) $\frac{7}{9}$ (c) 1.2.

Answer a

-18

Answer b

$-\frac{7}{9}$

Answer c

-1.2

Exercise 5.17.4:

Find the additive inverse of each expression: (a) 47(b) $\frac{7}{13}$ (c) 8.4.

Answer a

-47

Answer b

$-\frac{7}{13}$

Answer c

-8.4

Example 5.17.3:

Find the multiplicative inverse: (a) 9 (b) $-\frac{1}{9}$ (c) 0.9.

Solution

To find the additive inverse, we find the opposite.

a. The multiplicative inverse of 9 is its reciprocal, $\frac{1}{9}$.

b. The multiplicative inverse of $-\frac{1}{9}$ is its reciprocal, -9.

c. To find the multiplicative inverse of 0.9, we first convert 0.9 to a fraction, $\frac{9}{10}$. Then we find the reciprocal, $\frac{10}{9}$.

Exercise 5.17.5:

Find the multiplicative inverse: (a) 5 (b) $-\frac{1}{7}$ (c) 0.3.

Answer a

$\frac{1}{5}$

Answer b

-7

Answer c

$\frac{10}{3}$

Exercise 5.17.6:

Find the multiplicative inverse: (a) 18 (b) $-\frac{4}{5}$ (c) 0.6.

Answer a

$\frac{1}{18}$

Answer b

$-\frac{5}{4}$

Answer c

$\frac{5}{3}$

Use the Properties of Zero

We have already learned that zero is the additive identity, since it can be added to any number without changing the number's identity. But zero also has some special properties when it comes to multiplication and division.

Multiplication by Zero

What happens when you multiply a number by 0? Multiplying by 0 makes the product equal zero. The product of any real number and 0 is 0.

Definition: Multiplication by Zero

For any real number a,

$$a \cdot 0 = 0 \qquad 0 \cdot a = 0 \tag{5.17.5}$$

Example 5.17.4:

Simplify: (a) $-8 \cdot 0$ (b) $\frac{5}{12} \cdot 0$ (c) $0(2.94)$.

Solution

(a) $-8 \cdot 0$

The product of any real number and 0 is 0.	0

(b) $\frac{5}{12} \cdot 0$

The product of any real number and 0 is 0.	0

(c) $0(2.94)$

The product of any real number and 0 is 0.	0

Exercise 5.17.7:

Simplify: (a) $-14 \cdot 0$ (b) $0 \cdot \frac{2}{3}$ (c) $(16.5) \cdot 0$.

Answer a

0

Answer b

0

Answer c

0

Exercise 5.17.8:

Simplify: (a) $(1.95) \cdot 0$ (b) $0(-17)$ (c) $0 \cdot \frac{5}{4}$.

Answer a

0

Answer b

0

Answer c

0

Dividing with Zero

What about dividing with 0? Think about a real example: if there are no cookies in the cookie jar and three people want to share them, how many cookies would each person get? There are 0 cookies to share, so each person gets 0 cookies.

$$0 \div 3 = 0 \tag{5.17.6}$$

Remember that we can always check division with the related multiplication fact. So, we know that

$$0 \div 3 = 0 \; because \; 0 \cdot 3 = 0. \tag{5.17.7}$$

Definition: Division of Zero

For any real number a, except 0, $\frac{0}{a}$ = 0 and 0 ÷ a = 0.

Zero divided by any real number except zero is zero.

Example 5.17.5:

Simplify: (a) 0 ÷ 5 (b) $\frac{0}{-2}$ (c) $0 \div \frac{7}{8}$.

Solution

(a) 0 ÷ 5

Zero divided by any real number, except 0, is zero.	0

(b) $\frac{0}{-2}$

Zero divided by any real number, except 0, is zero.	0

(c) $0 \div \frac{7}{8}$

Zero divided by any real number, except 0, is zero.	0

Exercise 5.17.9:

Simplify: (a) 0 ÷ 11 (b) $\frac{0}{-6}$ (c) $0 \div \frac{3}{10}$.

Answer a

0

Answer b

0

Answer c

0

Exercise 5.17.10:

Simplify: (a) $0 \div \frac{8}{3}$ (b) 0 ÷ (-10) (c) 0 ÷ 12.75.

Answer a

0

Answer b

0

Answer c

0

Now let's think about dividing a number by zero. What is the result of dividing 4 by 0? Think about the related multiplication fact. Is there a number that multiplied by 0 gives 4?

$$4 \div 0 = ___ \text{ means } ___ \cdot 0 = 4$$

Since any real number multiplied by 0 equals 0, there is no real number that can be multiplied by 0 to obtain 4. We can conclude that there is no answer to $4 \div 0$, and so we say that division by zero is undefined.

Definition: Division by Zero

For any real number a, $\frac{a}{0}$, and $a \div 0$ are undefined.

Division *by* zero is undefined.

Example 5.17.6:

Simplify: (a) $7.5 \div 0$ (b) $\frac{-32}{0}$ (c) $\frac{4}{9} \div 0$.

Solution

(a) $7.5 \div 0$

Division by zero is undefined.	undefined

(b) $\frac{-32}{0}$

Division by zero is undefined.	undefined

(c) $\frac{4}{9} \div 0$

Division by zero is undefined.	undefined

Exercise 5.17.11:

Simplify: (a) $16.4 \div 0$ (b) $\frac{-2}{0}$ (c) $\frac{1}{5} \div 0$.

Answer a

undefined

Answer b

undefined

Answer c

undefined

Exercise 5.17.12:

Simplify: (a) $\frac{-5}{0}$ (b) $96.9 \div 0$ (c) $\frac{4}{15} \div 0$.

Answer a

undefined

Answer b

undefined

Answer c

undefined

We summarize the properties of zero.

Definition: properties of zero

Multiplication by Zero: For any real number a,

$$a \cdot 0 = 0 \qquad 0 \cdot a = 0 \tag{5.17.8}$$

The product of any number and 0 is 0.

Division by Zero: For any real number a, a ≠ 0

$$\frac{0}{a} = 0 \tag{5.17.9}$$

Zero divided by any real number, except itself, is zero.

$$\frac{a}{0} \; is \; undefined. \tag{5.17.10}$$

Division by zero is undefined.

Simplify Expressions using the Properties of Identities, Inverses, and Zero

We will now practice using the properties of identities, inverses, and zero to simplify expressions.

Example 5.17.7:

Simplify: 3x + 15 − 3x.

Solution

Notice the additive inverses, 3x and −3x.	0 + 15
Add.	15

Exercise 5.17.13:

Simplify: −12z + 9 + 12z.

Answer

9

Exercise 5.17.14:

Simplify: −25u − 18 + 25u.

Answer

-18

Example 5.17.8:

Simplify: 4(0.25q).

Solution

Regroup, using the associative property.	[4(0.25)]q
Multiply.	1.00q
Simplify; 1 is the multiplicative identity.	q

Exercise 5.17.15:

Simplify: 2(0.5p).

Answer

p

Exercise 5.17.16:

Simplify: 25(0.04r).

Answer

r

Example 5.17.9:

Simplify: $\frac{0}{n+5}$, where n ≠ −5.

Solution

Zero divided by any real number except itself is zero.	0

Exercise 5.17.17:

Simplify: $\frac{0}{m+7}$, where m ≠ −7.

Answer

0

Exercise 5.17.18:

Simplify: $\frac{0}{d-4}$, where d ≠ 4.

Answer

0

Example 5.17.10:

Simplify: $\frac{10-3p}{0}$.

Solution

Division by zero is undefined.	undefined

Exercise 5.17.19:

Simplify: $\frac{18-6c}{0}$.

Answer

undefined

Exercise 5.17.20:

Simplify: $\frac{15-4q}{0}$.

Answer

undefined

Example 5.17.11:

Simplify: $\frac{3}{4} \cdot \frac{4}{3}$ (6x + 12).

Solution

We cannot combine the terms in parentheses, so we multiply the two fractions first.

Multiply; the product of reciprocals is 1.	1(6x + 12)
Simplify by recognizing the multiplicative identity.	6x + 12

Exercise 5.17.21:

Simplify: $\frac{2}{5} \cdot \frac{5}{2}$ (20y+ 50).

Answer

20y + 50

Exercise 5.17.22:

Simplify: $\frac{3}{8} \cdot \frac{8}{3}(12z+16)$.

Answer

12z + 16

All the properties of real numbers we have used in this chapter are summarized in Table 5.17.1.

Table 5.17.1: Properties of Real Numbers

Property	Of Addition	Of Multiplication
Commutative Property		
If a and b are real numbers then…	a + b = b + a	a • b = b • a
Associative Property		
If a, b, and c are real numbers then…	(a + b) + c = a + (b + c)	(a • b) • c = (b • c)
Identity Property	0 is the additive identity	1 is the multiplicative identity
For any real number a,	a + 0 = a 0 + a = a	a • 1 = a 1 • a = a
Inverse Property	−a is the additive inverse of a	a, a ≠ 0 1/a is the multiplicative inverse of a
For any real number a,	a + (−a) = 0	a • 1/a = 1
Distributive Property		
If a, b, c are real numbers, then a(b + c) = ab + ac		
Properties of Zero		
For any real number a,	a • 0 = 0 0 • a = 0	
For any real number a where a ≠ 0	$\frac{0}{a} = 0$ $\frac{a}{0}$ is undefined

Multiplying and Dividing Involving Zero

Practice Makes Perfect

Recognize the Identity Properties of Addition and Multiplication

In the following exercises, identify whether each example is using the identity property of addition or multiplication.

158. 101 + 0 = 101
159. $\frac{3}{5}(1) = \frac{3}{5}$
160. −9 • 1 = −9
161. 0 + 64 = 64

Use the Inverse Properties of Addition and Multiplication

In the following exercises, find the multiplicative inverse.

162. 8
163. 14
164. −17
165. −19
166. $\frac{7}{12}$
167. $\frac{8}{13}$
168. $-\frac{3}{10}$
169. $-\frac{5}{12}$
170. 0.8
171. 0.4
172. −0.2
173. −0.5

Use the Properties of Zero

In the following exercises, simplify using the properties of zero.

174. 48 • 0
175. $\frac{0}{6}$
176. $\frac{3}{0}$
177. 22 • 0
178. $0 \div \frac{11}{12}$
179. $\frac{6}{0}$
180. $\frac{0}{3}$
181. $0 \div \frac{7}{15}$
182. $0 \cdot \frac{8}{15}$
183. (−3.14)(0)
184. 5.72 ÷ 0
185. $\frac{\frac{1}{10}}{0}$

Simplify Expressions using the Properties of Identities, Inverses, and Zero

In the following exercises, simplify using the properties of identities, inverses, and zero.

186. 19a + 44 − 19a
187. 27c + 16 − 27c
188. 38 + 11r − 38
189. 92 + 31s − 92
190. 10(0.1d)
191. 100(0.01p)
192. 5(0.6q)
193. 40(0.05n)
194. $\frac{0}{r+20}$, where r ≠ −20

195. $\frac{0}{s+13}$, where s ≠ −13

196. $\frac{0}{u-4.99}$, where u ≠ 4.99

197. $\frac{0}{v-65.1}$, where v ≠ 65.1

198. $0 \div \left(x-\frac{1}{2}\right)$, where x ≠ $\frac{1}{2}$

199. $0 \div \left(y-\frac{1}{6}\right)$, where y ≠ $\frac{1}{6}$

200. $\frac{32-5a}{0}$, where 32 − 5a ≠ 0

201. $\frac{28-9b}{0}$, where 28 − 9b ≠ 0

202. $\frac{2.1+0.4c}{0}$, where 2.1 + 0.4c ≠ 0

203. $\frac{1.75+9f}{0}$, where 1.75 + 9 f ≠ 0

204. \left\dfrac{3}{4} + \dfrac{9}{10}m \right) \div 0, where $\frac{3}{4}+\frac{9}{10}m \neq 0$

205. $\left(\frac{5}{16}n-\frac{3}{7}\right) \div 0$, where $\frac{5}{16}n-\frac{3}{7} \neq 0$

206. $\frac{9}{10} \cdot \frac{10}{9}$ (18p − 21)

207. $\frac{5}{7} \cdot \frac{7}{5}$ (20q − 35)

208. $15 \cdot \frac{3}{5}$(4d + 10)

209. $18 \cdot \frac{5}{6}$(15h + 24)

Everyday Math

210. **Insurance copayment** Carrie had to have 5 fillings done. Each filling cost $80. Her dental insurance required her to pay 20% of the cost. Calculate Carrie's cost
    a. by finding her copay for each filling, then finding her total cost for 5 fillings, and
    b. by multiplying 5(0.20)(80).
    c. Which of the Properties of Real Numbers did you use for part (b)?

211. **Cooking time** Helen bought a 24-pound turkey for her family's Thanksgiving dinner and wants to know what time to put the turkey in the oven. She wants to allow 20 minutes per pound cooking time.
    a. Calculate the length of time needed to roast the turkey by multiplying 24 · 20 to find the number of minutes and then multiplying the product by 1 60 to convert minutes into hours.
    b. Multiply $24\left(20 \cdot \frac{1}{60}\right)$.
    c. Which of the Properties of Real Numbers allows you to multiply $24\left(20 \cdot \frac{1}{60}\right)$ instead of $(24 \cdot 20)\frac{1}{60}$?

Writing Exercises

212. In your own words, describe the difference between the additive inverse and the multiplicative inverse of a number.

213. How can the use of the properties of real numbers make it easier to simplify expressions?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
recognize the Identity Properties of Addition and Multiplication.			
use the Inverse Properties of Addition and Multiplication.			
use the Properties of Zero.			
simplify expressions using the properties of identities, inverses, and zero.			

(b) On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

5.18: Solve Equations with Decimals

Learning Objectives

- Determine whether a decimal is a solution of an equation
- Solve equations with decimals
- Translate to an equation and solve

be prepared!

Before you get started, take this readiness quiz.

1. Evaluate $x + \frac{2}{3}$ when $x = -\frac{1}{4}$. If you missed this problem, review Example 4.9.15.
2. Evaluate $15 - y$ when $y = -5$. If you missed this problem, review Example 3.6.12.
3. Solve $\frac{n}{-7} = 42$. If you missed this problem, review Example 4.12.5.

Determine Whether a Decimal is a Solution of an Equation

Solving equations with decimals is important in our everyday lives because money is usually written with decimals. When applications involve money, such as shopping for yourself, making your family's budget, or planning for the future of your business, you'll be solving equations with decimals.

Now that we've worked with decimals, we are ready to find solutions to equations involving decimals. The steps we take to determine whether a number is a solution to an equation are the same whether the solution is a whole number, an integer, a fraction, or a decimal. We'll list these steps here again for easy reference.

HOW TO: DETERMINE WHETHER A NUMBER IS A Solution TO AN EQUATION

- Step 1. Substitute the number for the variable in the equation.
- Step 2. Simplify the expressions on both sides of the equation.
- Step 3. Determine whether the resulting equation is true.
  - If so, the number is a solution.
  - If not, the number is not a solution.

Example 5.18.1:

Determine whether each of the following is a solution of $x - 0.7 = 1.5$: (a) $x = 1$ (b) $x = -0.8$ (c) $x = 2.2$

Solution

(a) $x - 0.7 = 1.5$

Substitute 1 for x.	$1 - 0.7 \stackrel{?}{=} 1.5$	(5.18.1)
Subtract.	$0.3 \neq 1.5$	(5.18.2)

Since $x = 1$ does not result in a true equation, 1 is not a solution to the equation.

(b) $x - 0.7 = 1.5$

Substitute -0.8 for x.	$-0.8 - 0.7 \stackrel{?}{=} 1.5$	(5.18.3)
Subtract.	$-1.5 \neq 1.5$	(5.18.4)

Since x = −0.8 does not result in a true equation, −0.8 is not a solution to the equation.

(c) x - 0.7 = 1.5

Substitute 2.2 for x.	$2.2 - 0.7 \stackrel{?}{=} 1.5$	(5.18.5)
Subtract.	$1.5 = 1.5$ ✓	(5.18.6)

Since x = 2.2 results in a true equation, 2.2 is a solution to the equation.

Exercise 5.18.1:

Determine whether each value is a solution of the given equation. x − 0.6 = 1.3: (a) x = 0.7 (b) x = 1.9 (c) x = −0.7

Answer a

no

Answer b

yes

Answer c

no

Exercise 5.18.2:

Determine whether each value is a solution of the given equation. y − 0.4 = 1.7: (a) y = 2.1 (b) y = 1.3 (c) −1.3

Answer a

yes

Answer b

no

Answer c

no

Solve Equations with Decimals

In previous chapters, we solved equations using the Properties of Equality. We will use these same properties to solve equations with decimals.

Properties of Equality

Subtraction Property of Equality For any numbers a, b, and c, If a = b, then a − c = b − c.	**Addition Property of Equality** For any numbers a, b, and c, If a = b, then a + c = b + c.
The Division Property of Equality For any numbers a, b, and c, and c ≠ 0 If a = b, then $\frac{a}{c} = \frac{b}{c}$	**The Multiplication Property of Equality** For any numbers a, b, and c, If a = b, then ac = bc

When you add, subtract, multiply or divide the same quantity from both sides of an equation, you still have equality.

Example 5.18.2:

Solve: y + 2.3 = −4.7.

Solution

We will use the Subtraction Property of Equality to isolate the variable.

Subtract 2.3 from each side, to undo the addition.	$y+2.3-2.3=-4.7-2.3$	(5.18.7)
Simplify.	$y=-7$	(5.18.8)

Check:

Substitute y = −7.	$-7+2.3\stackrel{?}{=}-4.7$	(5.18.9)
Simplify.	$-4.7=-4.7$ ✓	(5.18.10)

Since y = −7 makes y + 2.3 = −4.7 a true statement, we know we have found a solution to this equation.

Exercise 5.18.3:

Solve: y + 2.7 = −5.3.

Answer

$y=-8$

Exercise 5.18.4:

Solve: y + 3.6 = −4.8.

Answer

$y=-8.4$

Example 5.18.3:

Solve: a − 4.75 = −1.39.

Solution

We will use the Addition Property of Equality.

Add 4.75 to each side, to undo the subtraction.	$a-4.75+4.75=-1.39+4.75$	(5.18.11)
Simplify.	$a=3.36$	(5.18.12)

Check:

Substitute a = 3.36.	$3.36-4.75\stackrel{?}{=}-1.39$	(5.18.13)

	$-1.39 = -1.39$ ✓	(5.18.14)

Since the result is a true statement, a = 3.36 is a solution to the equation.

? Exercise 5.18.5:

Solve: a − 3.93 = −2.86.

Answer

$a = 1.07$

? Exercise 5.18.6:

Solve: n − 3.47 = −2.64.

Answer

$n = 0.83$

✓ Example 5.18.4:

Solve: −4.8 = 0.8n.

Solution

We will use the Division Property of Equality. Use the Properties of Equality to find a value for n.

We must divide both sides by 0.8 to isolate n.	$\frac{-4.8}{0.8} = \frac{0.8n}{08}$	(5.18.15)
Simplify.	$-6 = n$	(5.18.16)

Check:

Substitute n = -6.	$-4.8 \stackrel{?}{=} 0.8(-6)$	(5.18.17)
	$-4.8 = -4.8$ ✓	(5.18.18)

Since n = −6 makes −4.8 = 0.8n a true statement, we know we have a solution.

? Exercise 5.18.7:

Solve: −8.4 = 0.7b.

Answer

$b = -12$

Exercise 5.18.8:

Solve: −5.6 = 0.7c.

Answer

$c = -8$

Example 5.18.5:

Solve: $\frac{p}{-1.8} = -6.5$.

Solution

We will use the Multiplication Property of Equality.

Here, p is divided by −1.8. We must multiply by −1.8 to isolate p.	$-1.8\left(\frac{p}{-1.8}\right) = -1.8(-6.5)$	(5.18.19)
Multiply.	$p = 11.7$	(5.18.20)

Check:

Substitute p = 11.7.	$\frac{11.7}{-1.8} \stackrel{?}{=} -6.5$	(5.18.21)
	$-6.5 = -6.5$ ✓	(5.18.22)

A solution to $\frac{p}{-1.8} = -6.5$ is p = 11.7.

Exercise 5.18.9:

Solve: $\frac{c}{-2.6} = -4.5$.

Answer

$c = -11.7$

Exercise 5.18.10:

Solve: $\frac{b}{-1.2} = -5.4$.

Answer

$b = 6.48$

Translate to an Equation and Solve

Now that we have solved equations with decimals, we are ready to translate word sentences to equations and solve. Remember to look for words and phrases that indicate the operations to use.

Example 5.18.6:

Translate and solve: The difference of n and 4.3 is 2.1.

Solution

Translate.	$\underbrace{\text{The difference of } n \text{ and } 4.3}_{n-4.3}\ \underbrace{\text{is}}_{=}\ \underbrace{2.1.}_{2.1}$	
Add 4.3 to both sides of the equation.	$n-4.3+4.3=2.1+4.3$	(5.18.23)
Simplify.	$n=6.4$	(5.18.24)

Check:

Let n = 6.4.	Is the difference of 6.4 and 4.3 equal to 2.1?	
Translate.	$6.4-4.3\stackrel{?}{=}2.1$	(5.18.25)
Simplify.	$2.1=2.1$ ✓	(5.18.26)

Exercise 5.18.11:

Translate and solve: The difference of y and 4.9 is 2.8.

Answer

$y-4.9=2.8;\ y=7.7$

Exercise 5.18.12:

Translate and solve: The difference of z and 5.7 is 3.4.

Answer

$z-5.7=3.4;\ z=9.1$

Example 5.18.7:

Translate and solve: The product of −3.1 and x is 5.27.

Solution

Translate.	$\underbrace{\text{The product of } 3.1 \text{ and } x}_{-3.1x}\ \underbrace{\text{is}}_{=}\ \underbrace{5.27.}_{5.27}$	
Divide both sides by −3.1.	$\frac{-3.1x}{-3.1}=\frac{5.27}{-3.1}$	(5.18.27)
Simplify.	$x=-1.7$	(5.18.28)

Check:

Let x = −1.7.	Is the product of −3.1 and −1.7 equal to 5.27?	
Translate.	$-3.1(-1.7) \stackrel{?}{=} 5.27$	(5.18.29)
Simplify.	$5.27 = 5.27$ ✓	(5.18.30)

? Exercise 5.18.13:

Translate and solve: The product of −4.3 and x is 12.04.

Answer

$-4.3x = 12.04; x = -2.8$

? Exercise 5.18.14:

Translate and solve: The product of −3.1 and m is 26.66.

Answer

$-3.1m = 26.66; m = -8.6$

✓ Example 5.18.8:

Translate and solve: The quotient of p and −2.4 is 6.5.

Solution

Translate.	$\underbrace{\frac{p}{-2.4}}_{\text{The quotient of } p \text{ and } -2.4} \underbrace{=}_{\text{is}} \underbrace{6.5}_{6.5.}$	
Multiply both sides by −2.4.	$-2.4\left(\frac{p}{-2.4}\right) = -2.4(6.5)$	(5.18.31)
Simplify.	$p = -15.6$	(5.18.32)

Check:

Let p = −15.6.	Is the quotient of −15.6 and −2.4 equal to 6.5?	
Translate.	$\frac{-15.6}{-2.4} \stackrel{?}{=} 6.5$	(5.18.33)
Simplify.	$6.5 = 6.5$ ✓	(5.18.34)

? Exercise 5.18.15:

Translate and solve: The quotient of q and −3.4 is 4.5.

Answer

$\frac{1}{-3.4} = 4.5; q = -15.3$

Exercise 5.18.16:

Translate and solve: The quotient of r and −2.6 is 2.5.

Answer

$\frac{r}{-2.6} = 2.5; r = -6.5$

Example 5.18.9:

Translate and solve: The sum of n and 2.9 is 1.7.

Solution

Translate.	$\underbrace{n + 2.9}_{\text{The sum of } n \text{ and } 2.9} \underbrace{=}_{\text{is}} \underbrace{1.7}_{1.7.}$	
Subtract 2.9 from each side.	$n + 2.9 - 2.9 = 1.7 - 2.9$	(5.18.35)
Simplify.	$n = -1.2$	(5.18.36)

Check:

Let n = −1.2.	Is the sum −1.2 and 2.9 equal to 1.7?	
Translate.	$-1.2 + 2.9 \stackrel{?}{=} 1.7$	(5.18.37)
Simplify.	$1.7 = 1.7$ ✓	(5.18.38)

Exercise 5.18.17:

Translate and solve: The sum of j and 3.8 is 2.6.

Answer

$j + 3.8 = 2.6; j = -1.2$

Exercise 5.18.18:

Translate and solve: The sum of k and 4.7 is 0.3.

Answer

$k + 4.7 = 0.3; k = -4.4$

Solving One Step Equations Involving Decimals

Solve a One Step Equation With Decimals by Adding and Subtracting

Solve a One Step Equation With Decimals by Multiplying

Solve a One Step Equation With Decimals by Dividing

Practice Makes Perfect

Determine Whether a Decimal is a Solution of an Equation

In the following exercises, determine whether each number is a solution of the given equation.

285. $x - 0.8 = 2.3$
   a. $x = 2$
   b. $x = -1.5$
   c. $x = 3.1$

286. $y + 0.6 = -3.4$
   a. $y = -4$
   b. $y = -2.8$
   c. $y = 2.6$

287. $\frac{h}{1.5} = -4.3$
   a. $h = 6.45$
   b. $h = -6.45$
   c. $h = -2.1$

288. $0.75k = -3.6$
   a. $k = -0.48$
   b. $k = -4.8$
   c. $k = -2.7$

Solve Equations with Decimals

In the following exercises, solve the equation.

289. $y + 2.9 = 5.7$
290. $m + 4.6 = 6.5$
291. $f + 3.45 = 2.6$
292. $h + 4.37 = 3.5$
293. $a + 6.2 = -1.7$
294. $b + 5.8 = -2.3$
295. $c + 1.15 = -3.5$
296. $d + 2.35 = -4.8$
297. $n - 2.6 = 1.8$
298. $p - 3.6 = 1.7$
299. $x - 0.4 = -3.9$
300. $y - 0.6 = -4.5$
301. $j - 1.82 = -6.5$
302. $k - 3.19 = -4.6$
303. $m - 0.25 = -1.67$
304. $q - 0.47 = -1.53$
305. $0.5x = 3.5$
306. $0.4p = 9.2$
307. $-1.7c = 8.5$
308. $-2.9x = 5.8$
309. $-1.4p = -4.2$
310. $-2.8m = -8.4$
311. $-120 = 1.5q$
312. $-75 = 1.5y$
313. $0.24x = 4.8$
314. $0.18n = 5.4$
315. $-3.4z = -9.18$

316. −2.7u = −9.72
317. $\frac{a}{0.4}$ = −20
318. $\frac{b}{0.3}$ = −9
319. $\frac{x}{0.7}$ = −0.4
320. $\frac{y}{0.8}$ = −0.7
321. $\frac{p}{-5}$ = −1.65
322. $\frac{q}{-4}$ = −5.92
323. $\frac{r}{-1.2}$ = −6
324. $\frac{s}{-1.5}$ = −3

Mixed Practice

In the following exercises, solve the equation. Then check your solution.

325. x − 5 = −11
326. $-\frac{2}{5}$ = x + (\dfrac{3}{4}\)
327. p + 8 = −2
328. p + $\frac{2}{3} = \frac{1}{12}$
329. −4.2m = −33.6
330. q + 9.5 = −14
331. q + $\frac{5}{6} = \frac{1}{12}$
332. $\frac{8.6}{15}$ = − d
333. $\frac{7}{8}m = \frac{1}{10}$
334. $\frac{j}{-6.2}$ = −3
335. $-\frac{2}{3}$ = y + $\frac{3}{8}$
336. s − 1.75 = −3.2
337. $\frac{11}{20}$ = − f
338. −3.6b = 2.52
339. −4.2a = 3.36
340. −9.1n = −63.7
341. r − 1.25 = −2.7
342. $\frac{1}{4}n = \frac{7}{10}$
343. $\frac{h}{-3}$ = −8
344. y − 7.82 = −16

Translate to an Equation and Solve

In the following exercises, translate and solve.

345. The difference of n and 1.9 is 3.4.
346. The difference n and 1.5 is 0.8.
347. The product of −6.2 and x is −4.96.
348. The product of −4.6 and x is −3.22.
349. The quotient of y and −1.7 is −5.

350. The quotient of z and −3.6 is 3.
351. The sum of n and −7.3 is 2.4.
352. The sum of n and −5.1 is 3.8.

Everyday Math

353. Shawn bought a pair of shoes on sale for $78. Solve the equation 0.75p = 78 to find the original price of the shoes, p.
354. Mary bought a new refrigerator. The total price including sales tax was $1,350. Find the retail price, r, of the refrigerator before tax by solving the equation 1.08r = 1,350.

Writing Exercises

355. Think about solving the equation 1.2y = 60, but do not actually solve it. Do you think the solution should be greater than 60 or less than 60? Explain your reasoning. Then solve the equation to see if your thinking was correct.
356. Think about solving the equation 0.8x = 200, but do not actually solve it. Do you think the solution should be greater than 200 or less than 200? Explain your reasoning. Then solve the equation to see if your thinking was correct.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
determine whether a decimal is a solution of an equation.			
solve equations with decimals.			
translate to an equation and solve.			

(b) On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

5.E: Decimals (Exercises)

5.1 - Decimals

Name Decimals

In the following exercises, name each decimal.

534. 0.8
535. 0.375
536. 0.007
537. 5.24
538. −12.5632
539. −4.09

Write Decimals

In the following exercises, write as a decimal.

540. three tenths
541. nine hundredths
542. twenty-seven hundredths
543. ten and thirty-five thousandths
544. negative twenty and three tenths
545. negative five hundredths

Convert Decimals to Fractions or Mixed Numbers

In the following exercises, convert each decimal to a fraction. Simplify the answer if possible.

546. 0.43
547. 0.825
548. 9.7
549. 3.64

Locate Decimals on the Number Line

550. (a) 0.6 (b) −0.9 (c) 2.2 (d) −1.3

Order Decimals

In the following exercises, order each of the following pairs of numbers, using < or >.

551. 0.6___0.8
552. 0.2___0.15
553. 0.803____0.83
554. −0.56____−0.562

Round Decimals

In the following exercises, round each number to the nearest: (a) hundredth (b) tenth (c) whole number.

555. 12.529
556. 4.8447
557. 5.897

5.2 - Decimal Operations

Add and Subtract Decimals

In the following exercises, add or subtract.

558. 5.75 + 8.46
559. 32.89 − 8.22

560. 24 − 19.31
561. 10.2 + 14.631
562. −6.4 + (−2.9)
563. 1.83 − 4.2

Multiply Decimals

In the following exercises, multiply.

564. (0.3)(0.7)
565. (−6.4)(0.25)
566. (−3.35)(−12.7)
567. (15.4)(1000)

Divide Decimals

In the following exercises, divide.

568. 0.48 ÷ 6
569. 4.32 ÷ 24
570. $6.29 ÷ 12
571. (−0.8) ÷ (−0.2)
572. 1.65 ÷ 0.15
573. 9 ÷ 0.045

Use Decimals in Money Applications

In the following exercises, use the strategy for applications to solve.

574. Miranda got $40 from her ATM. She spent $9.32 on lunch and $16.99 on a book. How much money did she have left? Round to the nearest cent if necessary.
575. Jessie put 8 gallons of gas in her car. One gallon of gas costs $3.528. How much did Jessie owe for all the gas?
576. A pack of 16 water bottles cost $6.72. How much did each bottle cost?
577. Alice bought a roll of paper towels that cost $2.49. She had a coupon for $0.35 off, and the store doubled the coupon. How much did Alice pay for the paper towels?

5.3 - Decimals and Fractions

Convert Fractions to Decimals

In the following exercises, convert each fraction to a decimal.

578. $\frac{3}{5}$
579. $\frac{7}{8}$
580. $-\frac{19}{20}$
581. $-\frac{21}{4}$
582. $\frac{1}{3}$
583. $\frac{6}{11}$

Order Decimals and Fractions

In the following exercises, order each pair of numbers, using < or >.

584. $\frac{1}{2}$ ___0.2
585. $\frac{3}{5}$ ___0.

586. $-\frac{7}{8}$ ___ −0.84

587. $-\frac{5}{12}$ ___ −0.42

588. 0.625___$\frac{13}{20}$

589. 0.33___$\frac{5}{16}$

In the following exercises, write each set of numbers in order from least to greatest.

590. $\frac{2}{3}$, $\frac{17}{20}$, 0.65

591. $\frac{7}{9}$, 0.75, $\frac{11}{15}$

Simplify Expressions Using the Order of Operations

In the following exercises, simplify.

592. 4(10.3 − 5.8)

593. $\frac{3}{4}$(15.44 − 7.4)

594. 30 ÷ (0.45 + 0.15)

595. 1.6 + $\frac{3}{8}$

596. 52(0.5) + $(0.4)^2$

597. $-\frac{2}{5} \cdot \frac{9}{10}$ + 0.14

Find the Circumference and Area of Circles

In the following exercises, approximate the (a) circumference and (b) area of each circle.

598. radius = 6 in.

599. radius = 3.5 ft.

600. radius = 7 33 m

601. diameter = 11 cm

5.4 - Solve Equations with Decimals

Determine Whether a Decimal is a Solution of an Equation

In the following exercises, determine whether the each number is a solution of the given equation.

602. x − 0.4 = 2.1

a. x = 1.7

b. x = 2.5

603. y + 3.2 = −1.5

a. y = 1.7

b. y = −4.7

604. $\frac{u}{2.5}$ = −12.5

a. u = −5

b. u = −31.25

605. 0.45v = −40.5

a. v = −18.225

b. v = −90

Solve Equations with Decimals

In the following exercises, solve.

606. m + 3.8 = 7.5
607. h + 5.91 = 2.4
608. a + 2.26 = −1.1
609. p − 4.3 = −1.65
610. x − 0.24 = −8.6
611. j − 7.42 = −3.7
612. 0.6p = 13.2
613. −8.6x = 34.4
614. −22.32 = −2.4z
615. $\frac{a}{0.3} = -24$
616. $\frac{p}{-7} = -4.2$
617. $\frac{s}{-2.5} = -10$

Translate to an Equation and Solve

In the following exercises, translate and solve.

618. The difference of n and 15.2 is 4.4.
619. The product of −5.9 and x is −3.54.
620. The quotient of y and −1.8 is −9.
621. The sum of m and −4.03 is 6.8.

5.5 - Averages and Probability

Find the Mean of a Set of Numbers

In the following exercises, find the mean of the numbers.

622. 2, 4, 1, 0, 1, and 1
623. $270, $310.50, $243.75, and $252.15
624. Each workday last week, Yoshie kept track of the number of minutes she had to wait for the bus. She waited 3, 0, 8, 1, and 8 minutes. Find the mean
625. In the last three months, Raul's water bills were $31.45, $48.76, and $42.60. Find the mean.

Find the Median of a Set of Numbers

In the following exercises, find the median.

626. 41, 45, 32, 60, 58
627. 25, 23, 24, 26, 29, 19, 18, 32
628. The ages of the eight men in Jerry's model train club are 52, 63, 45, 51, 55, 75, 60, and 59. Find the median age.
629. The number of clients at Miranda's beauty salon each weekday last week were 18, 7, 12, 16, and 20. Find the median number of clients.

Find the Mode of a Set of Numbers

In the following exercises, identify the mode of the numbers.

630. 6, 4, 4, 5, 6, 6, 4, 4, 4, 3, 5
631. The number of siblings of a group of students: 2, 0, 3, 2, 4, 1, 6, 5, 4, 1, 2, 3

Use the Basic Definition of Probability

In the following exercises, solve. (Round decimals to three places.)

632. The Sustainability Club sells 200 tickets to a raffle, and Albert buys one ticket. One ticket will be selected at random to win the grand prize. Find the probability Albert will win the grand prize. Express your answer as a fraction and as a decimal.

633. Luc has to read 3 novels and 12 short stories for his literature class. The professor will choose one reading at random for the final exam. Find the probability that the professor will choose a novel for the final exam. Express your answer as a fraction and as a decimal.

5.6 - Ratios and Rate

Write a Ratio as a Fraction

In the following exercises, write each ratio as a fraction. Simplify the answer if possible.

634. 28 to 40
635. 56 to 32
636. 3.5 to 0.5
637. 1.2 to 1.8
638. $1\frac{3}{4}$ to $1\frac{5}{8}$
639. $2\frac{1}{3}$ to $5\frac{1}{4}$
640. 64 ounces to 30 ounces
641. 28 inches to 3 feet

Write a Rate as a Fraction

In the following exercises, write each rate as a fraction. Simplify the answer if possible.

642. 180 calories per 8 ounces 643. 90 pounds per 7.5 square inches
643. 126 miles in 4 hours 645. $612.50 for 35 hours

Find Unit Rates

In the following exercises, find the unit rate.

646. 180 calories per 8 ounces
647. 90 pounds per 7.5 square inches
648. 126 miles in 4 hours
649. $612.50 for 35 hours

Find Unit Price

In the following exercises, find the unit price.

650. T-shirts: 3 for $8.97
651. Highlighters: 6 for $2.52
652. An office supply store sells a box of pens for $11. The box contains 12 pens. How much does each pen cost?
653. Anna bought a pack of 8 kitchen towels for $13.20. How much did each towel cost? Round to the nearest cent if necessary.

In the following exercises, find each unit price and then determine the better buy.

654. Shampoo: 12 ounces for $4.29 or 22 ounces for $7.29?
655. Vitamins: 60 tablets for $6.49 or 100 for $11.99?

Translate Phrases to Expressions with Fractions

In the following exercises, translate the English phrase into an algebraic expression.

656. 535 miles per h hours
657. a adults to 45 children
658. the ratio of 4y and the difference of x and 10
659. the ratio of 19 and the sum of 3 and n

5.7 - Simplify and Use Square Roots

Simplify Expressions with Square Roots

In the following exercises, simplify.

660. $\sqrt{64}$
661. $\sqrt{144}$
662. $-\sqrt{25}$
663. $-\sqrt{81}$
664. $-\sqrt{9}$
665. $\sqrt{-36}$
666. $\sqrt{64}+\sqrt{225}$
667. $\sqrt{64+225}$

Estimate Square Roots

In the following exercises, estimate each square root between two consecutive whole numbers.

668. $\sqrt{28}$
669. $\sqrt{155}$

Approximate Square Roots

In the following exercises, approximate each square root and round to two decimal places.

670. $\sqrt{15}$
671. $\sqrt{57}$

Simplify Variable Expressions with Square Roots

In the following exercises, simplify. (Assume all variables are greater than or equal to zero.)

672. $\sqrt{q^2}$
673. $\sqrt{64b^2}$
674. $-\sqrt{121a^2}$
675. $\sqrt{225m^2n^2}$
676. $-\sqrt{100q^2}$
677. $\sqrt{49y^2}$
678. $\sqrt{4a^2b^2}$
679. $\sqrt{121c^2d^2}$

Use Square Roots in Applications

In the following exercises, solve. Round to one decimal place.

680. **Art** Diego has 225 square inch tiles. He wants to use them to make a square mosaic. How long can each side of the mosaic be?
681. **Landscaping** Janet wants to plant a square flower garden in her yard. She has enough topsoil to cover an area of 30 square feet. How long can a side of the flower garden be?
682. **Gravity** A hiker dropped a granola bar from a lookout spot 576 feet above a valley. How long did it take the granola bar to reach the valley floor?
683. **Accident investigation** The skid marks of a car involved in an accident were 216 feet. How fast had the car been going before applying the brakes?

PRACTICE TEST

684. Write six and thirty-four thousandths as a decimal.
685. Write 1.73 as a fraction.
686. Write 5 8 as a decimal.
687. Round 16.749 to the nearest (a) tenth (b) hundredth (c) whole number
688. Write the numbers $\frac{4}{5}$, −0.1, 0.804, $\frac{2}{9}$, −7.4, 0.21 in order from smallest to largest.

In the following exercises, simplify each expression.

689. 15.4 + 3.02
690. 20 − 5.71
691. (0.64)(0.3)
692. (−4.2)(100)
693. 0.96 ÷ (−12)
694. −5 ÷ 0.025
695. −0.6 ÷ (−0.3)
696. (0.7) 2
697. 24 ÷ (0.1 + 0.02)
698. 4(10.3 − 5.8)
699. 1.6 + $\frac{3}{8}$
700. $\frac{2}{3}$(14.65 − 4.6)

In the following exercises, solve.

701. m + 3.7 = 2.5
702. $\frac{h}{0.5}$ = 4.38
703. −6.5y = −57.2
704. 1.94 = a − 2.6
705. Three friends went out to dinner and agreed to split the bill evenly. The bill was $79.35. How much should each person pay?
706. A circle has radius 12. Find the (a) circumference and (b) area. [Use 3.14 for π.]
707. The ages, in months, of 10 children in a preschool class are: 55, 55, 50, 51, 52, 50, 53, 51, 55, 49. Find the (a) mean (b) median (c) mode
708. Of the 16 nurses in Doreen's department, 12 are women and 4 are men. One of the nurses will be assigned at random to work an extra shift next week. (a) Find the probability a woman nurse will be assigned the extra shift. (b) Convert the fraction to a decimal.
709. Find each unit price and then the better buy. Laundry detergent: 64 ounces for $10.99 or 48 ounces for $8.49

In the following exercises, simplify.

710. $\sqrt{36+64}$
711. $\sqrt{144n^2}$
712. Estimate $\sqrt{54}$ to between two whole numbers.
713. Yanet wants a square patio in her backyard. She has 225 square feet of tile. How long can a side of the patio be?

5.E: The Properties of Real Numbers (Exercises)

7.1 - Rational and Irrational Numbers

In the following exercises, write as the ratio of two integers.

302. 6
303. −5
304. 2.9
305. 1.8

In the following exercises, determine which of the numbers is rational.

306. 0.42, $0.\overline{3}$, 2.56813…
307. 0.75319…, $0.\overline{16}$, 1.95

In the following exercises, identify whether each given number is rational or irrational.

308. (a) 49 (b) 55
309. (a) 72 (b) 64

In the following exercises, list the (a) whole numbers, (b) integers, (c) rational numbers, (d) irrational numbers, (e) real numbers for each set of numbers.

310. −9, 0, 0.361...., $\frac{8}{9}$, $\sqrt{16}$, 9
311. −5, $-2\frac{1}{4}$, $-\sqrt{4}$, $0.\overline{25}$, $\frac{13}{5}$, 4

7.2 - Commutative and Associative Properties

In the following exercises, use the commutative property to rewrite the given expression.

312. 6 + 4 = ____
313. −14 • 5 = ____
314. 3n = ____
315. a + 8 = ____

In the following exercises, use the associative property to rewrite the given expression.

316. (13 • 5) • 2 = _____
317. (22 + 7) + 3 = _____
318. (4 + 9x) + x = _____
319. $\frac{1}{2}$(22y) = _____

In the following exercises, evaluate each expression for the given value.

320. If y = $\frac{11}{12}$, evaluate:
    a. y + 0.7 + (− y)
    b. y + (− y) + 0.7
321. If z = $-\frac{5}{3}$, evaluate:
    a. z + 5.39 + (− z)
    b. z + (− z) + 5.39
322. If k = 65, evaluate:
    a. $\frac{4}{9}\left(\frac{9}{4}k\right)$
    b. $\left(\frac{4}{9}\cdot\frac{9}{4}\right)k$

323. If m = −13, evaluate:
   a. $-\frac{2}{5}\left(\frac{5}{2}m\right)$
   b. $\left(-\frac{2}{5}\cdot\frac{5}{2}\right)m$

In the following exercises, simplify using the commutative and associative properties.

324. 6y + 37 + (−6y)
325. $\frac{1}{4}+\frac{11}{15}+\left(-\frac{1}{4}\right)$
326. $\frac{14}{11}\cdot\frac{35}{9}\cdot\frac{14}{11}$
327. −18 • 15 • $\frac{2}{9}$
328. $\left(\frac{7}{12}+\frac{4}{5}\right)+\frac{1}{5}$
329. (3.98d + 0.75d) + 1.25d
330. −12(4m)
331. $30\left(\frac{5}{6}q\right)$
332. 11x + 8y + 16x + 15y
333. 52m + (−20n) + (−18m) + (−5n)

7.3 - Distributive Property

In the following exercises, simplify using the distributive property.

334. 7(x + 9)
335. 9(u − 4)
336. −3(6m − 1)
337. −8(−7a − 12)
338. $\frac{1}{3}$(15n − 6)
339. (y + 10) • p
340. (a − 4) − (6a + 9)
341. 4(x + 3) − 8(x − 7)

In the following exercises, evaluate using the distributive property.

342. If u = 2, evaluate
   a. 3(8u + 9) and
   b. 3 • 8u + 3 • 9 to show that 3(8u + 9) = 3 • 8u + 3 • 9
343. If n = 7 8 , evaluate
   a. $8\left(n+\frac{1}{4}\right)$ and
   b. 8 • n + 8 • $\frac{1}{4}$ to show that $8\left(n+\frac{1}{4}\right)$ = 8 • n + 8 • $\frac{1}{4}$
344. If d = 14, evaluate
   a. −100(0.1d + 0.35) and
   b. −100 • (0.1d) + (−100)(0.35) to show that −100(0.1d + 0.35) = −100 • (0.1d) + (−100)(0.35)
345. If y = −18, evaluate
   a. −(y − 18) and
   b. −y + 18 to show that −(y − 18) = − y + 18

7.4 - Properties of Identities, Inverses, and Zero

In the following exercises, identify whether each example is using the identity property of addition or multiplication.

346. $-35(1) = -35$
347. $29 + 0 = 29$
348. $(6x + 0) + 4x = 6x + 4x$
349. $9 \cdot 1 + (-3) = 9 + (-3)$

In the following exercises, find the additive inverse.

350. -32
351. 19.4
352. $\frac{3}{5}$
353. $-\frac{7}{15}$

In the following exercises, find the multiplicative inverse.

354. $\frac{9}{2}$
355. -5
356. $\frac{1}{10}$
357. $-\frac{4}{9}$

In the following exercises, simplify.

358. $83 \cdot 0$
359. $\frac{0}{9}$
360. $\frac{5}{0}$
361. $0 \div \frac{2}{3}$
362. $43 + 39 + (-43)$
363. $(n + 6.75) + 0.25$
364. $\frac{5}{13} \cdot 57 \cdot \frac{13}{5}$
365. $\frac{1}{6} \cdot 17 \cdot 12$
366. $\frac{2}{3} \cdot 28 \cdot \frac{3}{7}$
367. $9(6x - 11) + 15$

7.5 - Systems of Measurement

In the following exercises, convert between U.S. units. Round to the nearest tenth.

368. A floral arbor is 7 feet tall. Convert the height to inches.
369. A picture frame is 42 inches wide. Convert the width to feet.
370. Kelly is 5 feet 4 inches tall. Convert her height to inches.
371. A playground is 45 feet wide. Convert the width to yards.
372. The height of Mount Shasta is 14,179 feet. Convert the height to miles.
373. Shamu weighs 4.5 tons. Convert the weight to pounds.
374. The play lasted $1\frac{3}{4}$ hours. Convert the time to minutes.
375. How many tablespoons are in a quart?
376. Naomi's baby weighed 5 pounds 14 ounces at birth. Convert the weight to ounces.
377. Trinh needs 30 cups of paint for her class art project. Convert the volume to gallons.

In the following exercises, solve, and state your answer in mixed units.

378. John caught 4 lobsters. The weights of the lobsters were 1 pound 9 ounces, 1 pound 12 ounces, 4 pounds 2 ounces, and 2 pounds 15 ounces. What was the total weight of the lobsters?
379. Every day last week, Pedro recorded the amount of time he spent reading. He read for 50, 25, 83, 45, 32, 60, and 135 minutes. How much time, in hours and minutes, did Pedro spend reading?
380. Fouad is 6 feet 2 inches tall. If he stands on a rung of a ladder 8 feet 10 inches high, how high off the ground is the top of Fouad's head?
381. Dalila wants to make pillow covers. Each cover takes 30 inches of fabric. How many yards and inches of fabric does she need for 4 pillow covers?

In the following exercises, convert between metric units.

382. Donna is 1.7 meters tall. Convert her height to centimeters.
383. Mount Everest is 8,850 meters tall. Convert the height to kilometers.
384. One cup of yogurt contains 488 milligrams of calcium. Convert this to grams.
385. One cup of yogurt contains 13 grams of protein. Convert this to milligrams.
386. Sergio weighed 2.9 kilograms at birth. Convert this to grams.
387. A bottle of water contained 650 milliliters. Convert this to liters.

In the following exercises, solve.

388. Minh is 2 meters tall. His daughter is 88 centimeters tall. How much taller, in meters, is Minh than his daughter?
389. Selma had a 1-liter bottle of water. If she drank 145 milliliters, how much water, in milliliters, was left in the bottle?
390. One serving of cranberry juice contains 30 grams of sugar. How many kilograms of sugar are in 30 servings of cranberry juice?
391. One ounce of tofu provides 2 grams of protein. How many milligrams of protein are provided by 5 ounces of tofu?

In the following exercises, convert between U.S. and metric units. Round to the nearest tenth.

392. Majid is 69 inches tall. Convert his height to centimeters.
393. A college basketball court is 84 feet long. Convert this length to meters.
394. Caroline walked 2.5 kilometers. Convert this length to miles.
395. Lucas weighs 78 kilograms. Convert his weight to pounds.
396. Steve's car holds 55 liters of gas. Convert this to gallons.
397. A box of books weighs 25 pounds. Convert this weight to kilograms.

In the following exercises, convert the Fahrenheit temperatures to degrees Celsius. Round to the nearest tenth.

398. 95°F
399. 23°F
400. 20°F
401. 64°F

In the following exercises, convert the Celsius temperatures to degrees Fahrenheit. Round to the nearest tenth.

402. 30°C
403. −5°C
404. −12°C
405. 24°C

PRACTICE TEST

406. For the numbers 0.18349…, $0.\overline{2}$, 1.67, list the (a) rational numbers and (b) irrational numbers.
407. Is $\sqrt{144}$ rational or irrational?
408. From the numbers −4, $-1\frac{1}{2}$, 0, $\frac{5}{8}$, $\sqrt{2}$, 7, which are (a) integers (b) rational (c) irrational (d) real numbers?
409. Rewrite using the commutative property: x • 14 = _____
410. Rewrite the expression using the associative property: (y + 6) + 3 = _____
411. Rewrite the expression using the associative property: (8 · 2) · 5 = _____

412. Evaluate $\frac{3}{16}\left(\frac{16}{3}n\right)$ when n = 42.

413. For the number $\frac{2}{5}$ find the (a) additive inverse (b) multiplicative inverse.

In the following exercises, simplify the given expression.

414. $\frac{3}{4}(-29)\left(\frac{4}{3}\right)$

415. −3 + 15y + 3

416. (1.27q + 0.25q) + 0.75q

417. $\left(\frac{8}{15}+\frac{2}{9}\right)+\frac{7}{9}$

418. $-18\left(\frac{3}{2}n\right)$

419. 14y + (−6z) + 16y + 2z

420. 9(q + 9)

421. 6(5x − 4)

422. −10(0.4n + 0.7)

423. $\frac{1}{4}$(8a + 12)

424. m(n + 2)

425. 8(6p − 1) + 2(9p + 3)

426. (12a + 4) − (9a + 6)

427. $\frac{0}{8}$

428. $\frac{4.5}{0}$

429. $0 \div \left(\frac{2}{3}\right)$

In the following exercises, solve using the appropriate unit conversions.

430. Azize walked $4\frac{1}{2}$ miles. Convert this distance to feet. (1 mile = 5,280 feet).

431. One cup of milk contains 276 milligrams of calcium. Convert this to grams. (1 milligram = 0.001 gram)

432. Larry had 5 phone customer phone calls yesterday. The calls lasted 28, 44, 9, 75, and 55 minutes. How much time, in hours and minutes, did Larry spend on the phone? (1 hour = 60 minutes)

433. Janice ran 15 kilometers. Convert this distance to miles. Round to the nearest hundredth of a mile. (1 mile = 1.61 kilometers)

434. Yolie is 63 inches tall. Convert her height to centimeters. Round to the nearest centimeter. (1 inch = 2.54 centimeters)

435. Use the formula F = $\frac{9}{5}$C + 32 to convert 35°C to degrees F.

5.S: Decimals (Summary)

Key Terms

circumference of a circle	The distance around a circle
diameter of a circle	A line segment that passes through a circle's center connecting two points on the circle.
equivalent decimals	Two decimals are equivalent decimals if they convert to equivalent fractions.
mean	The mean of a set of n numbers is the arithmetic average of the numbers. $$mean = \frac{sum\ of\ values\ in\ data\ set}{n} \quad (5.S.1)$$
median	The median of a set of data values is the middle value. Half the data values are less than or equal to the median. Half the data values are greater than or equal to the median.
mode	The mode of a set of numbers is the number with the highest frequency.
radius of a circle	A line segment from the center to any point on the circle.
rate	A comparison of two quantities with different units. A rate is usually written as a fraction.
ratio	A comparison of two numbers or two quantities that are measured with the same unit. The ratio of a to b is written a to b, $\frac{a}{b}$, or a : b.
repeating decimal	A decimal in which the last digit or group of digits repeats endlessly.
unit price	A unit rate that gives the price of one item.
unit rate	A rate with denominator of 1 unit.

Key Concepts

5.1 - Decimals

- **Name a decimal number.**
  1. Name the number to the left of the decimal point.
  2. Write "and" for the decimal point.
  3. Name the "number" part to the right of the decimal point as if it were a whole number.
  4. Name the decimal place of the last digit.
- **Write a decimal number from its name.**
  1. Look for the word "and"—it locates the decimal point. Place a decimal point under the word "and." Translate the words before "and" into the whole number and place it to the left of the decimal point. If there is no "and," write a "0" with a decimal point to its right.
  2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.
  3. Translate the words after "and" into the number to the right of the decimal point. Write the number in the spaces—putting the final digit in the last place.
  4. Fill in zeros for place holders as needed.
- **Convert a decimal number to a fraction or mixed number.**

1. Look at the number to the left of the decimal. If it is zero, the decimal converts to a proper fraction. If it is not zero, the decimal converts to a mixed number. Write the whole number.
2. Determine the place value of the final digit.
3. Write the fraction. numerator—the ‘numbers’ to the right of the decimal point denominator—the place value corresponding to the final digit
4. Simplify the fraction, if possible.

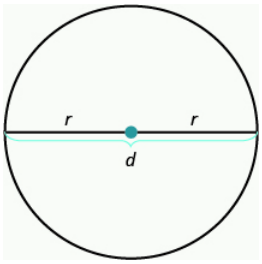
- **Order decimals.**
  1. Check to see if both numbers have the same number of decimal places. If not, write zeros at the end of the one with fewer digits to make them match.
  2. Compare the numbers to the right of the decimal point as if they were whole numbers.
  3. Order the numbers using the appropriate inequality sign.
- Round a decimal.
  1. Locate the given place value and mark it with an arrow.
  2. Underline the digit to the right of the given place value.
  3. Is this digit greater than or equal to 5? Yes - add 1 to the digit in the given place value. No - do not change the digit in the given place value
  4. Rewrite the number, removing all digits to the right of the given place value.

5.2 - Decimal Operations

- **Add or subtract decimals.**
  1. Write the numbers vertically so the decimal points line up.
  2. Use zeros as place holders, as needed.
  3. Add or subtract the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.
- **Multiply decimal numbers.**
  1. Determine the sign of the product.
  2. Write the numbers in vertical format, lining up the numbers on the right.
  3. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
  4. Place the decimal point. The number of decimal places in the product is the sum of the number of decimal places in the factors. If needed, use zeros as placeholders.
  5. Write the product with the appropriate sign.
- **Multiply a decimal by a power of 10.**
  1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
  2. Write zeros at the end of the number as placeholders if needed.
- **Divide a decimal by a whole number.**
  1. Write as long division, placing the decimal point in the quotient above the decimal point in the dividend.
  2. Divide as usual.
- **Divide decimal numbers.**
  1. Determine the sign of the quotient.
  2. Make the divisor a whole number by moving the decimal point all the way to the right. Move the decimal point in the dividend the same number of places to the right, writing zeros as needed.
  3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
  4. Write the quotient with the appropriate sign.
- **Strategy for Applications**
  1. Identify what you are asked to find.
  2. Write a phrase that gives the information to find it.
  3. Translate the phrase to an expression.
  4. Simplify the expression.
  5. Answer the question with a complete sentence.

5.3 - Decimals and Fractions

- **Convert a Fraction to a Decimal**: To convert a fraction to a decimal, divide the numerator of the fraction by the denominator of the fraction.
- **Properties of Circles**



r is the length of the radius

d is the length of the diameter

The circumference is $2\pi r$.

$$C = 2\pi r \tag{5.S.2}$$

The area is πr^2.

$$A = \pi r^2 \tag{5.S.3}$$

5.4 - Solve Equations with Decimals

- **Determine whether a number is a solution to an equation.**
  - Substitute the number for the variable in the equation.
  - Simplify the expressions on both sides of the equation.
  - Determine whether the resulting equation is true. If so, the number is a solution. If not, the number is not a solution.
- **Properties of Equality**

Table $5.S.1$

Subtraction Property of Equality For any numbers a, b, and c, if a = b then a − c = b − c.	**Addition Property of Equality** For any numbers a, b, and c, if a = b then a + c = b + c.
Division of Property of Equality For any numbers a, b, and c ≠ 0, if a = b then \(\dfrac{a}{c} = \dfrac{b}{c}).	**Multiplication Property of Equality** For any numbers a, b, and c, if a = b then a • c = b • c.

5.5 - Averages and Probability

- **Calculate the mean of a set of numbers.**
  1. Write the formula for the mean

$$mean = \frac{sum\ of\ values\ in\ data\ set}{n} \tag{5.S.4}$$

  2. Find the sum of all the values in the set. Write the sum in the numerator.
  3. Count the number, n, of values in the set. Write this number in the denominator.
  4. Simplify the fraction.
  5. Check to see that the mean is reasonable. It should be greater than the least number and less than the greatest number in the set.
- **Find the median of a set of numbers.**
  1. List the numbers from least to greatest.
  2. Count how many numbers are in the set. Call this n.
  3. Is n odd or even? If n is an odd number, the median is the middle value. If n is an even number, the median is the mean of the two middle values.

- **Identify the mode of a set of numbers.**
  1. List the data values in numerical order.
  2. Count the number of times each value appears.
  3. The mode is the value with the highest frequency.

5.7 - Simplify and Use Square Roots

- **Square Root Notation**: $\sqrt{m}$ is read 'the square root of m '
  - If $m = n^2$, then $\sqrt{m} = n$, for $n \geq 0$.

- **Use a strategy for applications with square roots.**
  - Identify what you are asked to find.
  - Write a phrase that gives the information to find it.
  - Translate the phrase to an expression.
  - Simplify the expression.
  - Write a complete sentence that answers the question.

5.S: The Properties of Real Numbers (Summary)

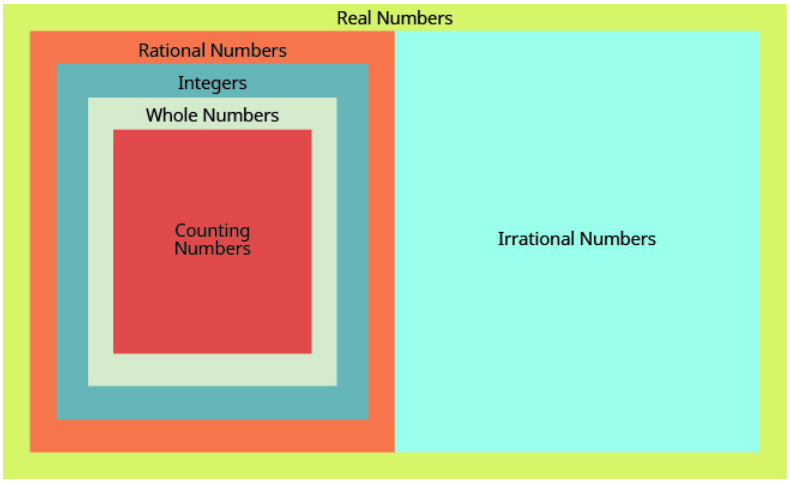
Key Terms

Additive Identity	The additive identity is 0. When zero is added to any number, it does not change the value.
Additive Inverse	The opposite of a number is its additive inverse. The additive inverse of a is $-a$.
Irrational number	A number that cannot be written as the ratio of two integers. Its decimal form does not stop and does not repeat.
Multiplicative Identity	The multiplicative identity is 1. When one multiplies any number, it does not change the value.
Multiplicative Inverse	The reciprocal of a number is its multiplicative inverse. The multiplicative inverse of a is $\frac{1}{a}$.
Rational number	A number that can be written in the form $\frac{p}{q}$, where p and q are integers and q ≠ 0. Its decimal form stops or repeats.
Real number	A number that is either rational or irrational.

Key Concepts

7.1 - Rational and Irrational Numbers

- Real numbers



7.2 - Commutative and Associative Properties

- Commutative Properties
  - **Commutative Property of Addition**: If a, b are real numbers, then a + b = b + a
  - **Commutative Property of Multiplication**: If a, b are real numbers, then a • b = b • a
- Associative Properties
  - **Associative Property of Addition**: If a, b, c are real numbers then (a + b) + c = a + (b + c)
  - **Associative Property of Multiplication**: If a, b, c are real numbers then (a • b) • c = a • (b • c)

7.3 - Distributive Property

- **Distributive Property**:
  - If a, b, c are real numbers then

- a(b + c) = ab + ac
- (b + c)a = ba + ca
- a(b - c) = ab - ac

7.4 - Properties of Identity, Inverses, and Zero

- Identity Properties
  - **Identity Property of Addition**: For any real number a: a + 0 = a, 0 + a = a
    - 0 is the additive identity
  - **Identity Property of Multiplication**: For any real number a: a • 1 = a, 1 • a = a
    - 1 is the multiplicative identity
- Inverse Properties
  - **Inverse Property of Addition**: For any real number a: a + (- a) = 0
    - - a is the additive inverse of a
  - **Inverse Property of Multiplication**: For any real number a: (a ≠ 0) a • $\frac{1}{a}$ = 1
    - $\frac{1}{a}$ is the multiplicative inverse of a
- Properties of Zero
  - **Multiplication by Zero**: For any real number a, a • 0 = 0, 0 • a = 0
    - The product of any number and 0 is 0.
  - **Division of Zero**: For any real number a, $\frac{0}{a} = 0$, $0 \div a = 0$
    - Zero divided by any real number, except itself, is zero.
  - **Division by Zero**: For any real number a, $\frac{a}{0}$ is undefined and a ÷ 0 is undefined.
    - Division by zero is undefined.

This page titled 6: Ratio, Proportion, and Measurement is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

6.1: Ratio and Proportion

From the beginnings of the human race, we've long compared one quantity with another, a comparison that is called a ratio in mathematics. "Their tribe has twice as many cattle as ours" or "Two baskets of wheat cost 12 ducats" are examples of ratios that ring from distant times. Indeed, the concept of a ratio cannot be assigned to any one individual or class of individual. In his *History of Mathematics*, D. E. Smith writes:

> *It is rather profitless to speculate as to the domain in which the concept of ratio first appeared. The idea that one tribe is twice as large as another and the idea that one leather strap is only half as long as another both involve the notion of ratio; both are such as would develop early in the history of the race, and yet one has to do with ratio of numbers and the other with the ratio of geometric magnitudes. Indeed, when we come to the Greek writers we find Nicomachus including ratio in his arithmetic, Eudoxus in his geometry, and Theon of Smyrna in his chapter on music.*

Examples and applications of ratios are limitless: speed is a ratio that compares changes in distance with respect to time, acceleration is a ratio that compares changes in speed with respect to time, and percentages compare the part with the whole. We've already studied one classic ratio, the ratio of the circumference of a circle to its diameter, which gives us the definition of π.

One of the most famous ratios in history involves the division of a line segment AB into two segments AC and CB by selecting a point C on the segment AB.

The idea is to select a point C on the segment AB so that

$$\frac{AB}{AC} = \frac{AC}{CB}.$$

This ratio has a special name, the **Golden Ratio**, and has an exact value equal to $(1+\sqrt{5})/2$. The Golden Ratio has been known since the time of Euclid. Ancient and modern architects have long held that the most pleasing rectangular shape is the one whose ratio of length to width is equal to the Golden Ratio.

The comparison of two ratios, such as $AB/AC = AC/CB$, is called a *proportion*. Proportions are used in a number of practical ways. For example, if 5 cans of tomato sauce cost 2 dollars, we can find the number of cans that can be purchased with 10 dollars by comparing two ratios in a proportion:

$$\frac{5 \text{ cans of tomato sauce}}{2 \text{ dollars}} = \frac{\text{x cans of tomato sauce}}{10 \text{ dollars}}$$

Any discussion of ratio involves comparing two quantities, so the units of each quantity become extremely important. Two different systems of units are used when measuring length, capacity, and time: the *American* system of units and the *metric* system of units. In this chapter we will discuss both systems and explain how to convert quantities measured in one system to quantities measured in the other system.

Let's begin the journey.

- **6.1: Ratio and Proportion** by David Arnold is licensed CC BY-NC-SA 3.0.

6.2: Introduction to Ratios and Rates

We use *ratios* to compare two numeric quantities or quantities with the same units.

Ratio

A *ratio* is the quotient of two numerical quantities or two quantities with the same physical units.

For example, ancient Greek geometers believed that the most pleasing rectangle to the eye had length and width such that the ratio of length to width was a specific number, called the *Golden Ratio*, approximately equal to 1.6180339887.... Architects to this day use this ratio in their designs.

There are a number of equivalent ways of expressing ratios, three of which we will use in this text: fraction notation, “to” notation, and “colon” notation.

- 3/4 is a ratio, read as “the ratio of 3 to 4.”
- 3 to 4 is a ratio, read as “the ratio of 3 to 4.”
- 3:4 is a ratio, read as “the ratio of 3 to 4.”

Example 1

Express each of the following ratios as a fraction reduced to lowest terms: (a) 36 to 24, and (b) 0.12 : 0.18.

Solution

(a) To express the ratio “36 to 24” as a fraction, place 36 over 24 and reduce.

$$\begin{aligned}\frac{36}{24} &= \frac{3\cdot 12}{2\cdot 12} && \text{Factor.}\\ &= \frac{3\cdot \cancel{12}}{2\cdot \cancel{12}} && \text{Cancel common factor.}\\ &= \frac{3}{2}\end{aligned}$$

Thus, the ratio 36 to 24 equals 3/2.

(b) To express the ratio “0.12:0.18” as a fraction, place 0.12 over 0.18 and reduce.

$$\begin{aligned}\frac{0.12}{0.18} &= \frac{(0.18)(100)}{(0.18)(100)} && \text{Multiply numerator and denominator by 100.}\\ &= \frac{12}{18} && \text{Move each decimal 2 places right.}\\ &= \frac{2\cdot 6}{3\cdot 6} && \text{Factor.}\\ &= \frac{2\cdot \cancel{6}}{3\cdot \cancel{6}} && \text{Cancel.}\\ &= \frac{2}{3}\end{aligned}$$

Thus, the ratio 0.12:0.18 equals 2/3.

Exercise

Express 0.12 : 0.3 as a fraction reduced to lowest terms.

Answer

2/5

Example 2

For the rectangle that follows, express the ratio of length to width as a fraction reduced to lowest terms.

Solution.

The ratio length to width can be expressed as a fraction and reduced as follows.

$$\frac{\text{length}}{\text{width}} = \frac{3\frac{1}{4}\text{ ft}}{2\frac{1}{2}\text{ ft}} \quad \text{Length to width as a fraction.}$$

$$= \frac{3\frac{1}{4}\ \cancel{\text{ft}}}{2\frac{1}{2}\ \cancel{\text{ft}}} \quad \text{Cancel common units.}$$

$$= \frac{\frac{13}{4}}{\frac{5}{2}} \quad \text{Mixed to improper fractions.}$$

Invert and multiply, factor, and cancel common factors.

$$= \frac{13}{4} \cdot \frac{2}{5} \quad \text{Invert and multiply.}$$

$$= \frac{26}{20} \quad \text{Multiply numerators and denominators.}$$

$$= \frac{13 \cdot 2}{10 \cdot 2} \quad \text{Factor numerator and denominator.}$$

$$= \frac{13 \cdot \cancel{2}}{10 \cdot \cancel{2}} \quad \text{Cancel common factors.}$$

$$= \frac{13}{10}$$

Hence, the ratio length to width is 13/10.

Exercise

A rectangle has length $8\frac{1}{4}$ inches and width $3\frac{1}{2}$ inches. Express the ratio of length to width as a fraction reduced to lowest terms.

Answer

33/14

Rates

We now introduce the concept of *rate*, a special type of ratio.

Rate

A *rate* is a quotient of two measurements with different units.

The physical interpretation of a rate in terms of its units is an important skill.

Example 3

An automobile travels 224 miles on 12 gallons of gasoline. Express the ratio distance traveled to gas consumption as a fraction reduced to lowest terms. Write a short sentence explaining the physical significance of your solution. Include units in your description.

Solution

Place miles traveled over gallons of gasoline consumed and reduce.

$$\begin{aligned} \frac{224 \text{ mi}}{12 \text{ gal}} &= \frac{56 \cdot 4 \text{ mi}}{3 \cdot 4 \text{ gal}} && \text{Factor.} \\ &= \frac{56 \cdot \cancel{4} \text{ mi}}{3 \cdot \cancel{4} \text{ gal}} && \text{Cancel common factor.} \\ &= \frac{56 \text{ mi}}{3 \text{ gal}} \end{aligned}$$

Thus, the rate is 56 miles to 3 gallons of gasoline. In plain-speak, this means that the automobile travels 56 miles on 3 gallons of gasoline.

Exercise

Lanny travels 180 kilometers on 14 liters of gasoline. Express the ratio distance traveled to gas consumption as a fraction reduced to lowest terms.

Answer

90/7 kilometers per litre

Unit Rates

When making comparisons, it is helpful to have a rate in a form where the denominator is 1. Such rates are given a special name.

Unit Rate

A *unit rate* is a rate whose denominator is 1.

Example 4

Herman drives 120 miles in 4 hours. Find his average rate of speed.

Solution

Place the distance traveled over the time it takes to drive that distance.

$$\begin{aligned} \frac{120 \text{ miles}}{4 \text{ hours}} &= \frac{30 \text{ miles}}{1 \text{ hour}} && \text{Divide: } 120/4 = 30. \\ &= 30 \text{ miles/hour} \end{aligned}$$

Hence, Herman's average rate of speed is 30 miles per hour.

Exercise

Jacob drives 120 kilometers in 3 hours. Find his average rate of speed.

Answer

40 kilometers per hour

Example 5

Aditya works 8.5 hours and receives $95 for his efforts. What is his hourly salary rate?

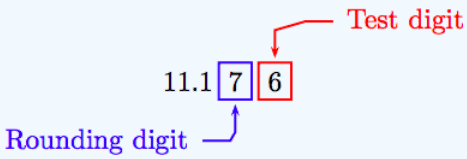
Solution

Let's place money earned over hours worked to get the following rate:

$$\frac{95 \text{ dollars}}{8.5 \text{ hours}}$$

We will get a much better idea of Aditya's salary rate if we express the rate with a denominator of 1. To do so, divide. Push the decimal in the divisor to the far right, then move the decimal an equal number of places in the dividend. As we are dealing with dollars and cents, we will round our answer to the nearest hundredth.

$$\begin{array}{r} 11.176 \\ 85\overline{)950.000} \\ 85 \\ \hline 100 \\ 85 \\ \hline 15\,0 \\ 8\,5 \\ \hline 6\,50 \\ 5\,95 \\ \hline 550 \\ 510 \\ \hline 40 \end{array}$$



Because the test digit is greater than or equal to 5, we add 1 to the rounding digit and truncate; i.e., 95/8.5 ≈ 11.18. Hence,

$$\begin{aligned} \frac{95 \text{ dollars}}{8.5 \text{ hours}} &= \frac{11.18 \text{ dollars}}{1 \text{ hour}} \quad \text{Divide: } 95/8.5 \approx 11.18. \\ &= 11.18 \text{ dollars/hour}. \end{aligned}$$

That is, his salary rate is 11.18 dollars per hour.

Exercise

Frannie works 5.5 hours and receives $120 for her efforts. What is her hourly salary rate? Round your answer to the nearest penny.

Answer

$21.82 per hour

Example 6

One automobile travels 422 miles on 15 gallons of gasoline. A second automobile travels 354 miles on 13 gallons of gasoline. Which automobile gets the better gas mileage?

Solution

Decimal division (rounded to the nearest tenth) reveals the better gas mileage.

In the case of the first automobile, we get the following rate:

$$\frac{422\text{ mi}}{15\text{gal}}$$

Divide.

$$\begin{array}{r} 28.13 \\ 15\overline{)422.00} \\ \underline{30} \\ 122 \\ \underline{120} \\ 20 \\ \underline{15} \\ 50 \\ \underline{45} \\ 5 \end{array}$$

To the nearest tenth, 28.1.

In the case of the second automobile, we get the following rate:

$$\frac{354\text{ mi}}{13\text{ gal}}$$

Divide.

$$\begin{array}{r} 27.23 \\ 13\overline{)354.00} \\ \underline{26} \\ 94 \\ \underline{91} \\ 30 \\ \underline{26} \\ 40 \\ \underline{39} \\ 1 \end{array}$$

To the nearest tenth, 27.2.

In the case of the first automobile, the mileage rate is 28.1 mi/1 gal, which can be read "28.1 miles per gallon." In the case of the second automobile, the mileage rate is 27.2 mi/1 gal, which can be read "27.2 miles per gallon." Therefore, the first automobile gets the better gas mileage.

? Exercise

Alicia works 8 hours and makes $100. Connie works 10 hours and makes $122. Which woman works at the larger hourly rate?

Answer

Alicia

Exercises

In Exercises 1-24, express the given ratio as a fraction reduced to lowest terms.

1. 0.14 : 0.44
2. 0.74 : 0.2
3. 0.05 : 0.75
4. 0.78 : 0.4
5. 0.1:0.95
6. 0.93 : 0.39
7. $2\frac{2}{9} : 1\frac{1}{3}$
8. $3\frac{2}{3} : 2\frac{4}{9}$
9. 0.36 : 0.6
10. 0.58 : 0.42
11. 15 : 21
12. 77 : 121
13. $2\frac{8}{9} : 2\frac{2}{3}$
14. $1\frac{2}{3} : 3\frac{8}{9}$

15. $3\frac{8}{9} : 2\frac{1}{3}$

16. $1\frac{5}{9} : 1\frac{1}{3}$

17. $2\frac{5}{8} : 1\frac{3}{4}$

18. $2\frac{4}{9} : 1\frac{1}{3}$

19. 10 : 35

20. 132 : 84

21. 9 : 33

22. 35 : 10

23. 27 : 99

24. 12 : 28

---

25. One automobile travels 271.8 miles on 10.1 gallons of gasoline. A second automobile travels 257.9 miles on 11.1 gallons of gasoline. Which automobile gets the better gas mileage?

26. One automobile travels 202.9 miles on 13.9 gallons of gasoline. A second automobile travels 221.6 miles on 11.8 gallons of gasoline. Which automobile gets the better gas mileage?

27. Todd is paid 183 dollars for 8.25 hours work. What is his hourly salary rate, rounded to the nearest penny?

28. David is paid 105 dollars for 8.5 hours work. What is his hourly salary rate, rounded to the nearest penny?

29. An automobile travels 140 miles in 4 hours. Find the average rate of speed.

30. An automobile travels 120 miles in 5 hours. Find the average rate of speed.

31. Judah is paid 187 dollars for 8 hours work. What is his hourly salary rate, rounded to the nearest penny?

32. Judah is paid 181 dollars for 8.75 hours work. What is his hourly salary rate, rounded to the nearest penny?

33. One automobile travels 234.2 miles on 10.8 gallons of gasoline. A second automobile travels 270.5 miles on 10.8 gallons of gasoline. Which automobile gets the better gas mileage?

34. One automobile travels 297.6 miles on 10.7 gallons of gasoline. A second automobile travels 298.1 miles on 12.6 gallons of gasoline. Which automobile gets the better gas mileage?

35. An automobile travels 180 miles in 5 hours. Find the average rate of speed.

36. An automobile travels 220 miles in 5 hours. Find the average rate of speed.

---

37. **Antarctic trek.** Seven women on a 562-mile Antarctic ski trek reached the South Pole 38 days after they began their adventure. What was the ladies' average rate of speed per day? Round your result to the nearest tenth of a mile. *Associated Press-Times-Standard 12/31/09 After 562-mile ski trek, seven women reach the South Pole.*

Answers

1. $\frac{7}{22}$
3. $\frac{1}{15}$
5. $\frac{2}{19}$
7. $\frac{5}{3}$
9. $\frac{3}{5}$
11. $\frac{5}{7}$
13. $\frac{13}{12}$
15. $\frac{5}{3}$

17. $\frac{3}{2}$
19. $\frac{2}{7}$
21. $\frac{3}{11}$
23. $\frac{3}{11}$
25. The first automobile has the better mileage per gallon.
27. 22.18 dollars/hr
29. 35 mi/hr
31. 23.38 dollars/hr
33. The second automobile has the better mileage per gallon.
35. 36 mi/hr
37. 14.8 miles per day

This page titled 6.2: Introduction to Ratios and Rates is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

- **6.2: Introduction to Ratios and Rates** by David Arnold is licensed CC BY-NC-SA 3.0.

6.3: Introduction to Proportion

In Section 6.1, we introduced the concepts or ratio and rate. In this section, we equate these ratios in a construct called a *proportion*.

Proportions

A *proportion* is a statement that equates two ratios or rates.

For example, each of the equations

$$\frac{1}{3}=\frac{2}{6},\ \frac{15\text{ miles}}{2\text{ hours}}=\frac{30\text{ miles}}{4\text{ hours}},\text{ and }\frac{a}{b}=\frac{c}{d}$$

compare two ratios or rates and is a proportion.

The proportion

$$\frac{1}{3}=\frac{2}{6}$$

is read “one is to three as two is to six.” The four numbers that make up this proportion are called the *terms* of the proportion and are ordered in a natural manner.

$$\begin{aligned}\text{First term}\longrightarrow\frac{1}{3}&=\frac{2}{6}\longleftarrow\text{Third term}\\ \text{Second term}\longrightarrow\frac{1}{3}&=\frac{2}{6}\longleftarrow\text{Fourth term}\end{aligned}$$

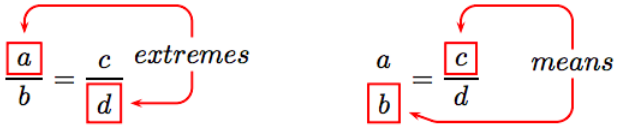
Extremes and Means

The first and fourth terms are called the *extremes* of the proportion. The second and third terms are called the *means* of the proportion.

In the proportion

$$\frac{a}{b}=\frac{c}{d},$$

the terms *a* and *d* are the extremes; the terms *b* and *c* are the means.



If we multiply both sides of the proportion by the common denominator,

$$bd\left(\frac{a}{b}\right)=bd\left(\frac{c}{d}\right)$$

then cancel,

$$b\cancel{d}\left(\frac{a}{\cancel{b}}\right)=b\,\cancel{d}\left(\frac{c}{\cancel{d}}\right)$$

we get the following result.

$$ad=bc$$

This leads to the following observation.

Product of Extremes and Means

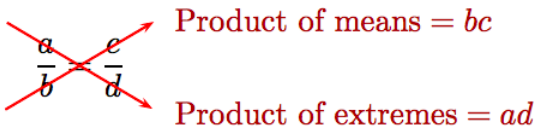
In the proportion

$$\frac{a}{b} = \frac{c}{d}$$

the product of the means equals the product of the extremes. That is,

$$ad = bc.$$

We can get an equivalent result using a technique called *cross multiplication*.

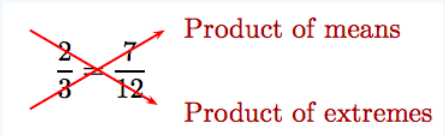


Example 1

Which of the following is a valid proportion: (a) $\frac{2}{3} = \frac{7}{12}$, or (b) $\frac{4}{9} = \frac{12}{27}$.

Solution

(a) Cross multiply

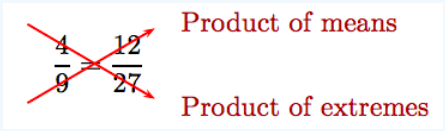


to get

$$24 = 21.$$

Hence, the product of the extremes does not equal the product of the means, so 2/3=7/12 is **not** a valid proportion.

(b) Cross multiply



to get

$$108 = 108.$$

Hence, the product of the extremes equals the product of the means, so 4/9 = 12/27 **is** a valid proportion.

Exercise

Is the following a valid proportion? $\frac{4}{3} = \frac{16}{11}$

Answer

No

Solving Proportions

We already have all the tools needed to solve proportions. Let's begin with the first example.

Example 2

Solve the proportion for x: $\frac{3}{4} = \frac{x}{12}$.

Solution

Cross multiply, then solve the resulting equation.

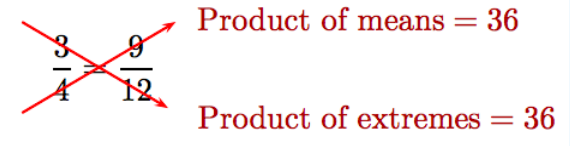
$$\begin{aligned} \frac{3}{4} &= \frac{x}{12} && \text{Original proportion.} \\ 4 \cdot x &= 3 \cdot 12 && \text{Products of means and extremes are equal.} \\ 4x &= 36 && \text{Simplify.} \\ \frac{4x}{4} &= \frac{36}{4} && \text{Divide both sides by 4.} \\ x &= 9 && \text{Simplify.} \end{aligned}$$

Check

Substitute 9 for x into the original proportion and check.

$$\begin{aligned} \frac{3}{4} &= \frac{x}{12} && \text{Original proportion.} \\ \frac{3}{4} &= \frac{9}{12} && \text{Substitute 9 for } x. \end{aligned}$$

Cross multiply.



Thus, the solution 9 checks.

Exercise

Solve the proportion for n: $\frac{2}{3} = \frac{n}{9}$

Answer

6

Example 3

Solve the proportion for n: $\frac{3}{2} = \frac{24}{n}$.

Solution

Cross multiply, then solve the resulting equation.

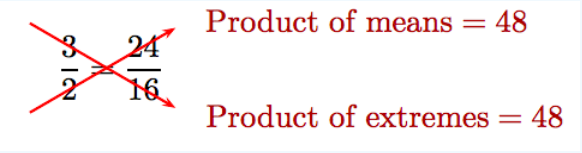
$$\begin{aligned} \frac{3}{2} &= \frac{24}{n} && \text{Original proportion.} \\ 3 \cdot n &= 2 \cdot 24 && \text{Products of means and extremes are equal.} \\ 3n &= 48 && \text{Simplify.} \\ \frac{3n}{3} &= \frac{48}{3} && \text{Divide both sides by 3.} \\ n &= 16 && \text{Simplify.} \end{aligned}$$

Check

Substitute 16 for n into the original proportion and check.

$$\frac{3}{2} = \frac{24}{n} \quad \text{Original proportion.}$$
$$\frac{3}{2} = \frac{24}{16} \quad \text{Substitute 16 for } n.$$

Cross multiply.



Thus, the solution 16 checks.

? Exercise

Solve the proportion for m: $\frac{9}{6} = \frac{m}{4}$

Answer

6

✔ Example 4

Solve the proportion for x: $\frac{2x+1}{15} = \frac{1}{3}$.

Solution

Cross multiply, then solve the resulting equation.

$$\frac{2x+1}{15} = \frac{1}{3} \quad \text{Original proportion.}$$
$$3(2x+1) = 15(1) \quad \text{Products f means and extremes are equal.}$$
$$6x+3 = 15 \quad \text{On the left, distribute. On the right, multiply.}$$
$$6x+3-3 = 15-3 \quad \text{Subtract 3 from both sides.}$$
$$6x = 12 \quad \text{Simplify.}$$
$$\frac{6x}{6} = \frac{12}{6} \quad \text{Divide both sides by 6.}$$
$$x = 2 \quad \text{Simplify both sides.}$$

Check

We'll leave it to our readers to check this solution.

? Exercise

Solve the proportion for y: $\frac{6+2y}{18} = \frac{8}{9}$

Answer

5

Applications

A number of practical applications involve solving a proportion.

Example 5

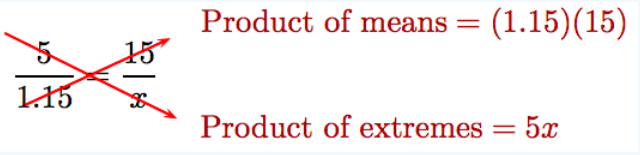
If 5 oranges cost \$1.15, what will be the cost for 15 oranges (assuming an equal rate)?

Solution

Let x represent the cost for 15 oranges. Assuming the rate for 5 oranges at \$1.15 equals the rate for 15 oranges at an unknown cost x, we set up the following proportion.

$$\frac{5}{1.15} = \frac{15}{x}$$

Cross multiply



to get

$$5x = 17.25.$$

Solve for x.

$$\frac{5x}{5} = \frac{17.25}{5}$$
$$x = 3.45$$

Thus, 15 oranges cost \$3.45.

Exercise

If 7 apples cost \$3.15, how much will 10 apples cost (assuming an equal rate)?

Answer

\$4.50

Checking Units is Extremely Important

When setting up a proportion, check to make sure that both numerators have the same units and both denominators have the same units.

For example, in Example 5, both numerators have “oranges” as units and both denominators have “dollars” as units.

$$\begin{array}{rcl} \text{Oranges} \longrightarrow & \frac{5}{1.15} = \frac{15}{x} & \longleftarrow \text{Oranges} \\ \text{Dollars} \longrightarrow & & \longleftarrow \text{Dollars} \end{array}$$

This proportion is set up correctly, because both numerators have the same units and both denominators have the same units. On the other hand, if we had set the proportion up incorrectly as follows,

$$\begin{array}{rcl} \text{Oranges} \longrightarrow & \frac{5}{1.15} = \frac{x}{15} & \longleftarrow \text{Dollars} \\ \text{Dollars} \longrightarrow & & \longleftarrow \text{Oranges} \end{array}$$

a quick check of the units reveals the error; i.e., the numerators have different units and the denominators have different units. Checking units helps us avoid errors!

Example 6

Dylan and David are planning a backpacking trip in Yosemite National Park. On their map, the legend indicates that 1.2 centimeters represents 2 miles. How long is their trip if the route measures 10.6 centimeters on the map? Round your answer to the nearest tenth of a mile.

Solution

Let's set up the proportion with units.

$$\frac{1.2 \text{ cm}}{2 \text{ mi}} = \frac{10.6 \text{ cm}}{x \text{ mi}}$$

Note how including the units aids in the setup of the proportion. Now, let's drop the units and solve for x.

$$\begin{aligned}
\frac{1.2}{2} &= \frac{10.6}{x} && \text{Original proportion.} \\
1.2x &= (2)(10.6) && \text{Cross multiply.} \\
1.2x &= 21.2 && \text{Simplify right-side hand.} \\
\frac{1.2x}{1.2} &= \frac{21.2}{1.2} && \text{Divide both sides by 1.2.} \\
x &\approx 17.66 && \text{On the right: Divide.}
\end{aligned}$$

We carried the division on the right one decimal place past the tenths place. The rounding digit is a 6 and the following test digit is a 6. Add 1 to the rounding digit and truncate.

To the nearest tenth of a mile, the backpacking route is approximately 17.7 miles.

Exercise

Eloise and Susannah are planning a trip is Sequoia National Park. On their map, 3 inches represents 50 miles. How long is their trip if the route measures $4\frac{1}{2}$ inches on the map?

Answer

75 miles

Example 7

A recipe making 2 dozen cookies requires $1\frac{3}{4}$ cups of flour, among other ingredients. If the baker wishes to make twice that number of cookies, how much flour is required?

Solution

Twice 2 dozen is 4 dozen cookies. Let x represent the amount of flour needed for 4 dozen cookies. Assuming an equal rate for 2 dozen cookies (2 dozen requires 1 3 4 cups of flour), we set up the following proportion. Again, using units helps us craft the correct proportion.

$$\frac{2 \text{ dozen}}{1\frac{3}{4} \text{ cups}} = \frac{4 \text{ dozen}}{x \text{ cups}}$$

Note how including the units aids in the setup of the proportion. Now, let's drop the units and solve for x.

$$\begin{aligned}
\frac{2}{1\frac{3}{4}} &= \frac{4}{x} && \text{Original proportion.} \\
2x &= 1\frac{3}{4} \cdot 4 && \text{Cross multiply.} \\
2x &= \frac{7}{4} \cdot 4 && \text{Change to improper fraction.} \\
2x &= 7 && \text{Multiply.}
\end{aligned}$$

Divide both sides of the equation by 2 and finish.

$$\frac{2x}{2} = \frac{7}{2} \quad \text{Divide both sides by 2.}$$
$$x = \frac{7}{2}$$

Change the improper fraction to a mixed fraction. Thus, it will take $3\frac{1}{2}$ cups of flour to make 4 dozen cookies.

? Exercise

Dough for 3 pizzas requires $8\frac{1}{2}$ cups of flour. If the baker wishes to make 9 pizzas, how many cups of flour are required?

Answer

$25\frac{1}{2}$ cups

Exercises

In Exercises 1-12, which of the following is a true proportion?

1. $\frac{9}{7} = \frac{27}{21}$, $\frac{4}{3} = \frac{9}{7}$, $\frac{7}{2} = \frac{8}{9}$, $\frac{4}{8} = \frac{9}{6}$
2. $\frac{6}{7} = \frac{18}{21}$, $\frac{2}{3} = \frac{8}{6}$, $\frac{4}{3} = \frac{3}{2}$, $\frac{8}{9} = \frac{3}{8}$
3. $\frac{7}{6} = \frac{28}{24}$, $\frac{5}{6} = \frac{5}{4}$, $\frac{9}{5} = \frac{7}{3}$, $\frac{9}{2} = \frac{8}{9}$
4. $\frac{7}{6} = \frac{2}{8}$, $\frac{4}{5} = \frac{5}{7}$, $\frac{3}{4} = \frac{15}{20}$, $\frac{8}{4} = \frac{8}{7}$
5. $\frac{6}{5} = \frac{24}{20}$, $\frac{7}{3} = \frac{2}{4}$, $\frac{2}{4} = \frac{2}{6}$, $\frac{5}{2} = \frac{2}{8}$
6. $\frac{9}{8} = \frac{4}{3}$, $\frac{5}{7} = \frac{10}{14}$, $\frac{8}{6} = \frac{5}{4}$, $\frac{8}{5} = \frac{2}{6}$
7. $\frac{3}{5} = \frac{2}{8}$, $\frac{3}{7} = \frac{6}{14}$, $\frac{5}{6} = \frac{2}{4}$, $\frac{7}{4} = \frac{5}{9}$
8. $\frac{7}{3} = \frac{7}{6}$, $\frac{4}{7} = \frac{8}{14}$, $\frac{5}{3} = \frac{7}{8}$, $\frac{5}{7} = \frac{6}{9}$
9. $\frac{5}{4} = \frac{25}{20}$, $\frac{9}{3} = \frac{9}{6}$, $\frac{7}{4} = \frac{3}{6}$, $\frac{3}{5} = \frac{9}{4}$
10. $\frac{7}{6} = \frac{6}{9}$, $\frac{7}{3} = \frac{2}{5}$, $\frac{6}{7} = \frac{30}{35}$, $\frac{4}{7} = \frac{2}{8}$
11. $\frac{9}{7} = \frac{4}{3}$, $\frac{9}{4} = \frac{7}{9}$, $\frac{3}{5} = \frac{6}{10}$, $\frac{3}{9} = \frac{9}{5}$
12. $\frac{4}{3} = \frac{8}{7}$, $\frac{2}{6} = \frac{5}{8}$, $\frac{7}{2} = \frac{3}{6}$, $\frac{9}{4} = \frac{36}{16}$

In Exercises 13-36, solve the given proportion.

13. $\frac{17}{3} = \frac{x}{18}$
14. $\frac{16}{5} = \frac{x}{20}$
15. $\frac{6x+10}{6} = \frac{11}{3}$
16. $\frac{4x+8}{12} = \frac{5}{3}$
17. $\frac{17}{9} = \frac{x}{18}$
18. $\frac{8}{9} = \frac{x}{18}$
19. $\frac{11}{2} = \frac{x}{8}$
20. $\frac{11}{4} = \frac{x}{8}$
21. $\frac{7x+15}{15} = \frac{10}{3}$
22. $\frac{7x+3}{8} = \frac{5}{4}$

23. $\frac{11}{2} = \frac{x}{10}$

24. $\frac{19}{6} = \frac{x}{18}$

25. $\frac{5x+8}{12} = \frac{2}{3}$

26. $\frac{3x+12}{6} = \frac{3}{2}$

27. $\frac{2}{15} = \frac{24}{x}$

28. $\frac{7}{8} = \frac{14}{x}$

29. $\frac{3}{16} = \frac{6}{x}$

30. $\frac{4}{21} = \frac{12}{x}$

31. $\frac{5}{22} = \frac{20}{x}$

32. $\frac{3}{22} = \frac{21}{x}$

33. $\frac{2x+10}{6} = \frac{14}{3}$

34. $\frac{2x+9}{9} = \frac{13}{3}$

35. $\frac{7}{2} = \frac{21}{x}$

36. $\frac{2}{15} = \frac{18}{x}$

---

37. If 13 dog bones cost $1.97, what will be the cost for 7 dog bones (assuming an equal rate)? Round your answer to the nearest penny.

38. If 2 watermelons cost $3.89, what will be the cost for 11 watermelons (assuming an equal rate)? Round your answer to the nearest penny.

39. If 7 bananas cost $2.55, what will be the cost for 14 bananas (assuming an equal rate)? Round your answer to the nearest penny.

40. If 2 apples cost $2.05, what will be the cost for 8 apples (assuming an equal rate)? Round your answer to the nearest penny.

41. If 13 oranges cost $3.61, what will be the cost for 11 oranges (assuming an equal rate)? Round your answer to the nearest penny.

42. If 3 watermelons cost $1.05, what will be the cost for 9 watermelons (assuming an equal rate)? Round your answer to the nearest penny.

43. If 3 dog bones cost $1.23, what will be the cost for 13 dog bones (assuming an equal rate)? Round your answer to the nearest penny.

44. If 3 watermelons cost $4.41, what will be the cost for 7 watermelons (assuming an equal rate)? Round your answer to the nearest penny.

45. If 3 apples cost $3.24, what will be the cost for 13 apples (assuming an equal rate)? Round your answer to the nearest penny.

46. If 6 apples cost $3.43, what will be the cost for 7 apples (assuming an equal rate)? Round your answer to the nearest penny.

47. If 4 dog bones cost $1.03, what will be the cost for 8 dog bones (assuming an equal rate)? Round your answer to the nearest penny.

48. If 4 oranges cost $4.28, what will be the cost for 3 oranges (assuming an equal rate)? Round your answer to the nearest penny.

49. **Two rolls.** In Haiti, two flat rolls cost 5 gourdes, about 12 cents. How many cents would 20 rolls cost? Associated Press-Times-Standard 02/18/10 Haiti's earthquake camps turning into shanty towns.

50. **Turbines.** As proposed, the Shell Wind Energy project consists of 25 ridge-top turbines that can generate up to 50 megawatts, or enough to supply electricity to about 1, 000 homes. Estimate the number of ridge-top turbines that would be needed to supply electricity to 70, 000 homes, the approximate number of properties in Humboldt County, CA. *John Driscoll Times-Standard 12/24/09 Wind power project goes under analysis.*

51. **Dumptrucks.** U.S. Highway 199 had a landslide where as much as 3, 000 cubic yards of material fell on the road, reportedly requiring about 200 large dumptrucks to remove. Only a week earlier, 40, 000 cubic yards of material fell on Highway 96. Estimate the number of dumptrucks needed for that slide rounded to the nearest whole number. *Associated Press-Times-Standard 03/09/10 Another highway closed by slide.*

52. **Timber sales.** Alaska's 26, 000 square mile Tongass National Forest plan allows for timber sales of up to 267 million board-feet per year – enough for nearly 27, 000 two-bedroom homes, but demand for timber is far short of that. Less than 25 million board-feet was logged in the forest in 2009. Forest Service officials have said they hope to increase logging in the Tongass to about 100 million board-feet per year. *Associated Press-Times-Standard 02/18/10 Industry loses lawsuit over logging in Alaska.*

i) Estimate the number of 2-bedroom homes that 25 million board-feet of timber would build.

ii) How many 2-bedroom homes would 100 million board-feet of timber build?

53. **Costly spill.** In Australia, penalties on ships causing oil spills are approximately $1.75 million Australian dollars, equivalent to about $1.64 million US dollars. After an oil tanker was grounded onto a coral reef, Australian officials are considering raising the fine to $10 million Australian dollars. What will the new fine be in US dollars? Round your answer to the nearest hundredth of a million dollars. *Associated Press-Times-Standard 04/13/10 Ship that leaked oil on Great Barrier Reef removed.*

6.4: Unit Conversion - American System

In this section we will develop a technique for converting units used in the American system. We begin with a discussion of common measurements of length in the United States.

Units of Length

The most common units of length are the inch, foot, yard, and mile. Our focus will be on the technique used to convert from one unit of length to another.

American Units of Length

Facts relating common units of length.

- 1 foot (ft) = 12 inches (in)
- 1 yard (yd) = 3 feet (ft)
- 1 mile (mi) = 5280 feet (ft)

Take for example, the fact that there are 3 feet in 1 yard, which can be stated as an equation, using the common abbreviations for feet (ft) and yards (yd).

$$3 \text{ ft} = 1 \text{ yd}$$

If we divide both sides of the equation by 3 ft,

$$\frac{3 \text{ ft}}{3 \text{ ft}} = \frac{1 \text{ yd}}{3 \text{ ft}},$$

or equivalently,

$$1 = \frac{1 \text{ yd}}{3 \text{ ft}}.$$

The key observation is the fact that the ratio 1 yd/3 ft equals the number 1. Consequently, multiplying by the "conversion factor" 1 yd/3 ft is equivalent to multiplying by 1. This can be used to change a measurement in feet to yards.

Example 1

Change 36 feet to yards.

Solution

Multiply by the conversion factor 1 yd/3 ft.

$$\begin{aligned} 36 \text{ ft} &= 36 \text{ ft} \cdot 1 && \text{Multiplicative Identity Property.} \\ &= 36 \text{ ft} \cdot \frac{1 \text{ yd}}{3 \text{ ft}} && \text{Replace 1 with 1 yd/3 ft.} \\ &= 36 \ \cancel{\text{ft}} \cdot \frac{1 \text{ yd}}{3 \ \cancel{\text{ft}}} && \text{Cancel common unit.} \\ &= \frac{36 \cdot 1}{3} \text{ yd} && \text{Multiply fractions.} \\ &= \frac{36}{3} \text{ yd} && \text{Simplify.} \\ &= 12 \text{ yd} && \text{Divide.} \end{aligned}$$

Hence, 36 feet equals 12 yards.

Exercise

Change 81 feet to yards.

Answer

27 yards

On the other hand, we can start again with

$$3 \text{ ft} = 1 \text{ yd}$$

and divide both sides of the equation by 1 yd.

$$\frac{3 \text{ ft}}{1 \text{ yd}} = \frac{1 \text{ yd}}{1 \text{ yd}}$$

This gives the conversion factor

$$\frac{3 \text{ ft}}{1 \text{ yd}} = 1.$$

The key observation is the fact that the ratio 3 ft/1 yd equals the number 1. Consequently, multiplying by the "conversion factor" 3 ft/1 yd is equivalent to multiplying by 1. This can be used to change a measurement in yards to feet.

Example 2

Change 18 yards to feet.

Solution

Multiply by the conversion factor 3 ft/1 yd.

\[\begin{aligned} 18 \text{ yd} = 18 \text{ yd} \cdot 1 ~ & \textcolor{red}{ \text{ Multiplicative Identity Property.}} \\ = 18 \text{ yd} \cdot \frac{1 \text{ ft}}{1 \text{ yd}} ~ & \textcolor{red}{ \text{ Replace 1 with 3 ft/1 yd.} } \\ = 18 \cancel{ \text{ yd}} \cdot \frac{3 \text{ ft}}{1 \cancel{ \text{ yd}}} ~ & \textcolor{red}{ \text{ Cancel common unit.}} \\ = \frac{18 \cdot 3}{1} \text{ ft} ~ & \textcolor{red}{ \text{ Multiply fractions.}} \\ = 54 \text{ ft} ~ & \textcolor{red}{ \text{ Simplify.}} \end{aligned}\nonumber \]

Hence, 18 yards equals 54 feet.

Exercise

Change 15 yards to feet.

Answer

45 feet

Another common comparison is the fact that there are 12 inches in 1 foot. This can be represented as an equation using the common abbreviation for inches (in) and feet (ft).

$$12 \text{ in} = 1 \text{ ft}$$

Dividing both sides by 12 in

$$\frac{12 \text{ in}}{12 \text{ in}} = \frac{1 \text{ ft}}{12 \text{ in}},$$

yields the conversion factor

$$1 = \frac{1 \text{ ft}}{12 \text{ in}}.$$

The key observation is the fact that the ratio 1 ft/12 in equals the number 1. Consequently, multiplying by the "conversion factor" 1 ft/12 in is equivalent to multiplying by 1. This can be used to change a measurement in inches to feet.

Example 3

Change 24 inches to feet.

Solution

Multiply by the conversion factor 1 ft/12 in.

$$\begin{aligned} 24 \text{ in} &= 24 \text{ in} \cdot 1 && \text{Multiplicative Identity Property.} \\ &= 24 \text{ in} \cdot \frac{1 \text{ ft}}{12 \text{ in}} && \text{Replace 1 with 1 ft/12 in.} \\ &= 24 \ \cancel{\text{in}} \cdot \frac{1 \text{ in}}{12 \ \cancel{\text{in}}} && \text{Cancel common unit.} \\ &= \frac{24 \cdot 1}{12} \text{ ft} && \text{Multiply fractions.} \\ &= 2 \text{ ft} && \text{Simplify.} \end{aligned}$$

Hence, 24 inches equals 2 feet.

Exercise

Change 48 inches to feet.

Answer

4 feet

We provide a summary of conversion factors for units of length in Table 6.1.

Table 6.1: Conversion factors for units of length.

Convert	Conversion Factor	Convert	Conversion Factor
feet to inches	12 in/1 ft	inches to feet	1 ft/12 in
yards to feet	3 ft/1 yd	feet to yards	1 yd/3 ft
miles to feet	5280 ft/1 mi	feet to miles	1 mi/5280 ft

Some conversions require more than one application of a conversion factor.

Example 4

Change 4 yards to inches.

Solution

We multiply by a chain of conversion factors, the first to change yards to feet, the second to change feet to inches.

$$\begin{aligned} 4 \text{ yd} &= 4 \text{ yd} \cdot \frac{3 \text{ ft}}{1 \text{ yd}} \cdot \frac{12 \text{ in}}{1 \text{ ft}} && \text{Multiply by conversion factors.} \\ &= 4 \ \cancel{\text{yd}} \cdot \frac{3 \ \cancel{\text{ft}}}{1 \ \cancel{\text{yd}}} \cdot \frac{12 \text{ in}}{1 \ \cancel{\text{ft}}} && \text{Cancel common units.} \\ &= \frac{4 \cdot 3 \cdot 12}{1 \cdot 1} \text{ in} && \text{Multiply fractions.} \\ &= 144 \text{ in} && \text{Simplify.} \end{aligned}$$

Hence, 4 yards equals 144 inches.

Exercise

Change 8 yards to inches.

Answer

288 inches

Example 5

Change 2 miles to yards.

Solution

We multiply by a chain of conversion factors, the first to change miles to feet, the second to change feet to yards.

$$2\text{ mi} = 2\text{ mi} \cdot \frac{5280\text{ ft}}{1\text{ mi}} \cdot \frac{1\text{ yd}}{3\text{ ft}} \quad \text{Multiply by conversion factors.}$$

$$= 2\ \cancel{\text{mi}} \cdot \frac{5280\ \cancel{\text{ft}}}{1\ \cancel{\text{mi}}} \cdot \frac{1\text{ yd}}{3\ \cancel{\text{ft}}} \quad \text{Cancel common units.}$$

$$= \frac{2 \cdot 5280 \cdot 1}{1 \cdot 3}\text{ yd} \quad \text{Multiply fractions.}$$

$$= 3520\text{ yd} \quad \text{Simplify.}$$

Hence, 2 miles equals 3,520 yards.

Exercise

Change 5 miles to yards.

Answer

8,800 yards

Units of Weight

The most common units of weight are the ounce, pound, and ton. Our focus will remain on how to convert from one unit to another.

American Units of Weight

Facts relating common units of weight.

- 1 pound (lb) = 16 ounces (oz)
- 1 ton = 2000 pounds (lb)

The above facts lead to the conversion factors in Table 6.2.

Table 6.2: Conversion factors for units of weight.

Convert	Conversion Factor	Convert	Conversion Factor
pounds to ounces	16 oz/1 lb	ounces to pounds	1 lb/16 oz
tons to pounds	2000 lb/1 ton	pounds to tons	1 ton/2000 lb

Example 6

Change $2\frac{1}{2}$ pounds to ounces.

Solution

Multiply by the appropriate conversion factor.

$$
\begin{aligned}
2\frac{1}{2}\ \text{lb} &= 2\frac{1}{2}\ \text{lb} \cdot \frac{16\ \text{oz}}{1\ \text{lb}} && \text{Multiply by conversion factor.}\\
&= 2\frac{1}{2}\ \cancel{\text{lb}} \cdot \frac{16\ \text{oz}}{1\ \cancel{\text{lb}}} && \text{Cancel common units.}\\
&= \left(2\frac{1}{2} \cdot 16\right)\ \text{oz} && \text{Multiply fractions.}\\
&= \left(\frac{5}{2} \cdot 16\right)\ \text{oz} && \text{Mixed to improper fraction.}\\
&= \frac{80}{2}\ \text{oz} && \text{Multiply.}\\
&= 40\ \text{oz} && \text{Divide.}
\end{aligned}
$$

Hence, $2\frac{1}{2}$ pounds equals 40 ounces.

Exercise

Change $6\frac{1}{4}$ pounds to ounces.

Answer

100 ounces

Example 7

Change 3.2 tons to ounces.

Solution

This exercise requires multiplying by a chain of conversion factors.

$$
\begin{aligned}
3.2\ \text{ton} &= 3.2\ \text{ton} \cdot \frac{2000\ \text{lb}}{1\ \text{ton}} \cdot \frac{16\ \text{oz}}{1\ \text{lb}} && \text{Multiply by conversion factors.}\\
&= 3.2\ \cancel{\text{ton}} \cdot \frac{2000\ \cancel{\text{lb}}}{1\ \cancel{\text{ton}}} \cdot \frac{16\ \text{oz}}{1\ \cancel{\text{lb}}} && \text{Cancel common units.}\\
&= \frac{3.2 \cdot 2000 \cdot 16}{1 \cdot 1}\ \text{oz} && \text{Multiply fractions.}\\
&= 102,400\ \text{oz} && \text{Simplify.}
\end{aligned}
$$

Hence, 3.2 tons equals 102,400 ounces.

Exercise

Change 4.1 tons to ounces.

Answer

128,000 ounces

Units of Volume

The most common units of volume are fluid ounces, cups, pints, quarts, and gallons. We will focus on converting from one unit to another.

American Units of Volume

Facts relating common units of volume.

- 1 cup (c) = 8 fluid ounces (fl oz)
- 1 pint (pt) = 2 cups (c)
- 1 quart (qt) = 2 pints (pt)
- 1 gallon (gal) = 4 quarts (qt)

These facts lead to the conversion factors listed in Table 6.3.

Table 6.3: Conversion factors for units of volume.

Convert	Conversion Factor	Convert	Conversion Factor
cups to ounces	8 fl oz/1 c	ounces to cups	1c/8 fl oz
pints to cups	2 c/1 pt	cups to pints	1 pt/2 c
quarts to pints	2 pt/1 qt	pints to quarts	1 qt/2 pt
gallons to quarts	4 qt/1 gal	quarts to gallons	1 gal/4 qt

Example 8

Change 5.6 gallons to pints.

Solution

This exercise requires multiplying by a chain of conversion factors.

$$5.6\ \text{gal} = 5.6\ \text{gal} \cdot \frac{4\ \text{qt}}{1\ \text{gal}} \cdot \frac{2\ \text{pt}}{1\ \text{qt}} \quad \text{Multiply by conversion factors.}$$

$$= 5.6\ \cancel{\text{gal}} \cdot \frac{4\ \cancel{\text{qt}}}{1\ \cancel{\text{gal}}} \cdot \frac{2\ \text{pt}}{1\ \cancel{\text{qt}}} \quad \text{Cancel common units.}$$

$$= \frac{5.6 \cdot 4 \cdot 2}{1 \cdot 1}\ \text{pt} \quad \text{Multiply fractions.}$$

$$= 44.8\ \text{pt} \quad \text{Simplify.}$$

Hence, 5.6 gallons equals 44.8 pints.

Exercise

Change 3.2 gallons to pints.

Answer

25.6 pints

Units of Time

The most common units of time are seconds, minutes, hours, days, and years.

American Units of Time

Facts relating common units of time.

- 1 minute (min) = 60 seconds (s)
- 1 hour (hr) = 60 minutes (min)
- 1 day (day) = 24 hours (hr)
- 1 year (yr) = 365 days (day)

These facts lead to the conversion factors in Table 6.4.

Table 6.4: Conversion factors for units of time.

Convert	Conversion Factor	Convert	Conversion Factor
minutes to seconds	60 s/1 min	seconds to minutes	1 min/60 s
hours to minutes	60 min/1 hr	minutes to hours	1 hr/60 min
days to hours	24 hr/1 day	hours to days	1 day/24 hr
years to days	365 day/1 yr	days to years	1 yr/365 day

Example 9

How many seconds in a year?

Solution

A chain of conversion factors is needed.

$$1\text{ yr} = 1\text{ yr} \cdot \frac{365\text{ day}}{1\text{ yr}} \cdot \frac{24\text{ hr}}{1\text{ day}} \cdot \frac{60\text{ min}}{1\text{ hr}} \cdot \frac{60\text{ s}}{1\text{ min}} \quad \text{Conversion factors.}$$

$$= 1\ \cancel{\text{yr}} \cdot \frac{365\ \cancel{\text{day}}}{1\ \cancel{\text{yr}}} \cdot \frac{24\ \cancel{\text{hr}}}{1\ \cancel{\text{day}}} \cdot \frac{60\ \cancel{\text{min}}}{1\ \cancel{\text{hr}}} \cdot \frac{60\text{ s}}{1\ \cancel{\text{min}}} \quad \text{Cancel common units.}$$

$$= \frac{1 \cdot 365 \cdot 24 \cdot 60 \cdot 60}{1 \cdot 1 \cdot 1 \cdot 1}\text{ s} \quad \text{Multiply fractions.}$$

$$= 31,536,000\text{ s} \quad \text{Simplify.}$$

Thus, 1 year equals 31,536,000 seconds.

Exercise

How many seconds in a day?

Answer

86,400 seconds

Converting Units of Speed

Ever wonder how fast a baseball is moving?

Example 10

A professional pitcher can throw a baseball at 95 miles per hour. How fast is this in feet per second? Round your answer to the nearest foot per second.

Solution

There are 5280 feet in a mile, 60 minutes in an hour, and 60 seconds in a minute.

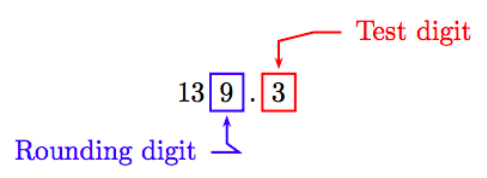
$$95\frac{\text{mi}}{\text{h}} \approx 95\frac{\text{mi}}{\text{h}} \cdot \frac{5280\ \text{ft}}{1\ \text{mi}} \cdot \frac{1\ \text{h}}{60\ \text{min}} \cdot \frac{1\ \text{min}}{60\ \text{s}} \quad \text{Conversion factors.}$$

$$\approx 95\frac{\cancel{\text{mi}}}{\cancel{\text{h}}} \cdot \frac{5280\ \text{ft}}{1\ \cancel{\text{mi}}} \cdot \frac{1\ \cancel{\text{h}}}{60\ \cancel{\text{min}}} \cdot \frac{1\ \cancel{\text{min}}}{60\ \text{s}} \quad \text{Cancel common units.}$$

$$\approx \frac{95 \cdot 5280 \cdot 1 \cdot 1}{1 \cdot 60 \cdot 60}\frac{\text{ft}}{\text{s}} \quad \text{Multiply fractions.}$$

$$\approx 139.3\frac{\text{ft}}{\text{s}} \quad \text{Multiply and divide.}$$

To round to the nearest foot per second, identify the rounding and test digits.



Because the test digit is less than 5, leave the rounding digit alone and truncate. Thus, to the nearest foot per second, the speed is approximately 139 feet per second.

Whew! Since the batter stands at home plate, which is about 60 feet from where the pitch is delivered, the batter has less than 1/2 a second to react to the pitch!

? Exercise

A women's softball pitcher can throw her fastball at 60 miles per hour. How fast is this in feet per second? Round your answer to the nearest foot per second.

Answer

88 feet per second

Exercises

1. Change 8 yards to feet.
2. Change 60 yards to feet.
3. Change 261 feet to yards.
4. Change 126 feet to yards.
5. Change 235 inches to yards. Round your answer to the nearest tenth of a yard.
6. Change 244 inches to yards. Round your answer to the nearest tenth of a yard.
7. Change 141 feet to yards.
8. Change 78 feet to yards.
9. Change 2.8 miles to feet.
10. Change 4.9 miles to feet.
11. Change 104 inches to yards. Round your answer to the nearest tenth of a yard.
12. Change 101 inches to yards. Round your answer to the nearest tenth of a yard.
13. Change 168,372 inches to miles, correct to the nearest tenth of a mile.
14. Change 198,550 inches to miles, correct to the nearest tenth of a mile.
15. Change 82 feet to inches.
16. Change 80 feet to inches.

17. Change 2.9 yards to inches. Round your answer to the nearest inch.
18. Change 4.5 yards to inches. Round your answer to the nearest inch.
19. Change 25,756 feet to miles. Round your answer to the nearest tenth of a mile.
20. Change 19,257 feet to miles. Round your answer to the nearest tenth of a mile.
21. Change 5 yards to feet.
22. Change 20 yards to feet.
23. Change 169,312 inches to miles, correct to the nearest tenth of a mile.
24. Change 162,211 inches to miles, correct to the nearest tenth of a mile.
25. Change 1.5 yards to inches. Round your answer to the nearest inch.
26. Change 2.1 yards to inches. Round your answer to the nearest inch.
27. Change 360 inches to feet.
28. Change 768 inches to feet.
29. Change 48 inches to feet.
30. Change 528 inches to feet.
31. Change 15,363 feet to miles. Round your answer to the nearest tenth of a mile.
32. Change 8,540 feet to miles. Round your answer to the nearest tenth of a mile.

This page titled 6.4: Unit Conversion - American System is shared under a CC BY-NC-SA license and was authored, remixed, and/or curated by David Arnold.

- **6.4: Unit Conversion - American System** by David Arnold is licensed CC BY-NC-SA 3.0.

6.5: Unit Conversion- Metric System

The metric system of units is the standard system of units preferred by scientists. It is based on the base ten number system and its decimal format is more friendly to users of this system. There is a common set of prefixes adopted by the metric system to indicate a power of ten to apply to the base unit.

Metric System Preferences

This is a list of standard prefixes for the metric system and their meanings.

$$\begin{array}{ll} \text{deka} = 10 & \text{deci} = 1/10 \\ \text{hecto} = 100 & \text{centi} = 1/100 \\ \text{kilo} = 1000 & \text{milli} = 1/1000 \end{array}$$

Thus, for example, a decameter is 10 meters, a hectoliter is 100 liters, and a kilogram is 1000 grams. Similarly, a decimeter is 1/10 of a meter, a centiliter is 1/100 of a liter, and a milligram is 1/1000 of a gram.

Units of Length

The standard measure of length in the metric system is the meter.

> *Historically, the meter was defined by the French Academy of Sciences as the length between two marks on a platinum-iridium bar, which was designed to represent 110,000,000 of the distance from the equator to the north pole through Paris. In 1983, it was redefined by the International Bureau of Weights and Measures (BIPM) as the distance travelled by light in free space in 1299,792,458 of a second. (Wikipedia)*

We can apply the standard prefixes to get the following result.

Metric Units of Length

These units of length are used in the metric system.

Unit Length	Unit Abbreviation
1 kilometer = 1000 meters	km
1 hectometer = 100 meters	hm
1 dekameter = 10 meters	dam
1 meter	m
1 decimeter = $\frac{1}{10}$ meter	dm
1 centimeter = $\frac{1}{100}$ meter	cm
1 millimeter = $\frac{1}{1000}$ meter	mm

We can use these facts to build conversion factors as we did in Section 6.3. For example, because

$$1 \text{ km} = 1000 \text{ m},$$

we can divide both sides by 1000 m to produce the conversion factor

$$1 = \frac{1 \text{ km}}{1000 \text{ m}}.$$

This conversion factor can help change meters into kilometers.

Before using this conversion factor in an example, we repeat here the rules for multiplying and dividing by powers of ten. We will be making heavy use of these rules in this section.

Multiplying and Dividing by Powers of Ten

- Multiplying a decimal number by 10^n will move the decimal point n places to the right. For example, $3.2567 \cdot 10^2 = 3.2567 \cdot 100 = 325.67$.
- Dividing a decimal number by 10^n will move the decimal point n places to the left. For example, $3.2567/10^2 = 3.2567/100 = 0.032567$.

And now the example.

Example 1

Change 2,326 meters to kilometers.

Solution

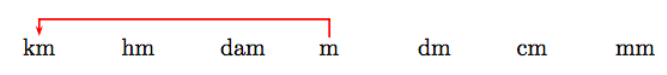
Multiply by the conversion factor 1 km/1000m.

$$\begin{aligned} 2326\ \text{m} &= 2326\ \text{m} \cdot \frac{1\ \text{km}}{1000\ \text{m}} && \text{Apply conversion factor.} \\ &= 2326\ \cancel{\text{m}} \cdot \frac{1\ \text{km}}{1000\ \cancel{\text{m}}} && \text{Cancel common units.} \\ &= \frac{2326 \cdot 1}{1000}\ \text{km} && \text{Multiply fractions.} \\ &= 2.326\ \text{km} && \text{Simplify.} \end{aligned}$$

In the last step, note that dividing by 1000 moves the decimal point three places to the left. Thus, 2326 meters is equal to 2.326 kilometers.

Alternate Solution

A second solution depends upon the fact that multiplying or dividing by a power of ten will move the decimal point right or left a number of places equal to the number of zeros present in the multiplier or divisor. Thus, as we saw above, dividing by 1000 moved the decimal point 3 places to the left. Suppose that we arrange the metric units of length in order, from largest to smallest, as shown below.



Note that we must move 3 places left to move from the meters (m) abbreviation to the kilometers (km) abbreviation. In like manner, if we write 2,326 meters as 2,326.0meters, then we can convert to kilometers by moving the decimal 3 places to the left.

$$2,326.0\ \text{m} = 2.236\ 0\ \text{km} = 2.326\ \text{km}$$

Exercise

Change 1,156 meters to kilometers

Answer

1.156 kilometers

Example 2

Change 537 centimeters to meters.

Solution

We know that

$$1\text{ cm} = \frac{1}{100}\text{ m},$$

or multiplying both sides of this result by 100,

$$100\text{ cm} = 1\text{ m}.$$

Dividing both sides of this last result by 100 cm, we obtain the conversion factor 1 m/100 cm.

$$\begin{aligned} 537\text{ cm} &= 537\text{ cm} \cdot \frac{1\text{ m}}{100\text{ cm}} && \text{Apply conversion factor.} \\ &= 537\ \cancel{\text{cm}} \cdot \frac{1\text{ m}}{100\ \cancel{\text{cm}}} && \text{Cancel common units.} \\ &= \frac{537 \cdot 1}{100}\text{ m} && \text{Multiply fractions.} \\ &= 5.37\text{ m} \end{aligned}$$

In the last step, note that dividing by 100 moves the decimal point two places to the left. Alternately, we can set up our ordered list of units.

Note that we must move 2 places left to move from the centimeters (cm) abbreviation to the meters (m) abbreviation. In like manner, if we write 537 centimeters as 537.0 centimeters, then we can convert to meters by moving the decimal 2 places to the left.

Sometimes more than one conversion factor is needed.

Exercise

Change 276 centimeters to meters.

Answer

2.76 meters

Example 3

Change 10.2 dekameters to centimeters.

Solution

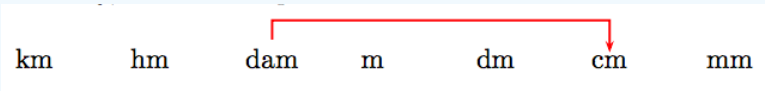
We have two facts:

- 1 dam=10 m, which yields the conversion factor 10 m/1 dam.
- 1 cm=(1/100) m or 100 cm=1 m, which yields the conversion factor 100 cm/1 m.

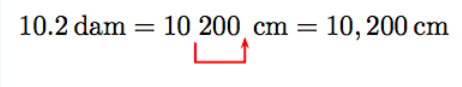
$$
\begin{aligned}
10.2\ \text{dam} &= 10.2\ \text{dam} \cdot \frac{10\ \text{m}}{1\ \text{dam}} \cdot \frac{100\ \text{cm}}{1\ \text{m}} && \text{Apply conversion factor.} \\
&= 10.2\ \cancel{\text{dam}} \cdot \frac{10\ \cancel{\text{m}}}{1\ \cancel{\text{dam}}} \cdot \frac{100\ \text{cm}}{1\ \cancel{\text{m}}} && \text{Cancel common units.} \\
&= \frac{10.2 \cdot 10 \cdot 100}{1}\ \text{cm} && \text{Multiply fractions.} \\
&= 10,200\ \text{cm}
\end{aligned}
$$

In the last step, note that multiplying by 10, then by 100, moves the decimal point three places to the right.

Alternately, we can set up our ordered list of units.



Note that we must move 3 places right to move from the dekameters (dam) abbreviation to the centimeters (cm) abbreviation. In like manner, we can convert 10.2 dekameters to centimeters by moving the decimal 3 places to the right.



Exercise

Change 13.5 dekameters to centimeters

Answer

13,500 centimeters

Units of Mass

The fundamental unit of mass in the metric system is called a gram. Originally, it was defined to be equal to one cubic centimeter of water measured at the temperature of melting ice. Now it is simply defined as 1/1000 of a kilogram, which is defined by a physical prototype preserved by the International Bureau of Weights and Measures (Wikipedia). The mass of an object is not the same as an object's weight, but rather a resistance to motion when an external force is applied.

The same metric system prefixes apply.

Metric Units of Mass

These units of mass are used in the metric system.

Units of Mass	Unit Abbreviation
1 kilogram = 1000 grams	kg
1 hectogram = 100 grams	hg
1 dekagram = 10 grams	dag
1 gram	g
1 decigram = $\frac{1}{10}$ gram	dg
1 centigram = $\frac{1}{100}$ gram	cg
1 milligram = $\frac{1}{1000}$ gram	mg

Example 4

Convert 0.025 dekagrams to milligrams.

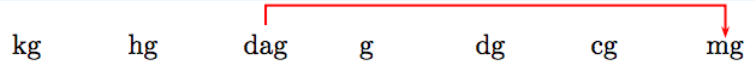
Solution

We'll use two conversion factors:

- 1 dag=10 g, which yields the conversion factor 10 g/1 dag.
- 1 mg=(1/1000) g, which yields the conversion factor 1000 mg/1 g.

$$\begin{aligned} 0.025\ \text{dag} &= 0.025\ \text{dag} \cdot \frac{10\ \text{g}}{1\ \text{dag}} \cdot \frac{1000\ \text{mg}}{1\ \text{g}} && \text{Apply conversion factor.} \\ &= 0.025\ \cancel{\text{dag}} \cdot \frac{10\ \cancel{\text{g}}}{1\ \cancel{\text{dag}}} \cdot \frac{1000\ \text{mg}}{1\ \cancel{\text{g}}} && \text{Cancel common units.} \\ &= \frac{0.025 \cdot 10 \cdot 1000}{1}\ \text{mg} && \text{Multiply fractions.} \\ &= 250\ \text{mg} \end{aligned}$$

Alternately, we can set up our ordered list of units.



Note that we must move 4 places right to move from the dekagrams (dag) abbreviation to the milligrams (mg) abbreviation. In like manner, we can convert 0.025 dekagrams to milligrams by moving the decimal 4 places to the right.

$$0.0250\ \text{dag} = 0\ 0250.\ \text{mg} = 250\ \text{mg}$$

Exercise

Convert 0.05 dekagrams to milligrams.

Answer

500 milligrams

Units of Volume

The fundamental unit of volume in the metric system is called a litre. Originally, one litre was defined as the volume of one kilogram of water measured at 4° C at 760 millimeters of mercury (Wikipedia). Currently, 1 litre is defined as 1 cubic decimeter (imagine a cube with each edge 1/10 of a meter).

The same metric system prefixes apply.

Metric Units of Volume

These units of volume are used in the metric system.

Unit of Volume	Unit Abbreviation
1 kilolitre = 1000 litres	kL
1 hectolitre = 100 litres	hL
1 dekalitre = 10 litres	daL
1 litre	L
1 decilitre = $\frac{1}{10}$ litre	dL

1 centilitre = $\frac{1}{100}$ litre	cL
1 millilitre = $\frac{1}{1000}$ litre	mL

Example 5

Convert 11,725 millilitres to dekalitres.

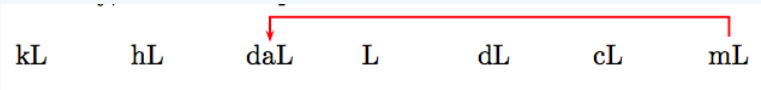
Solution

We'll use two conversion factors:

- 1 daL=10 L, which yields the conversion factor 1 daL/10 L.
- 1 mL=(1/1000) L, which yields the conversion factor 1 L/1000 mL.

$$\begin{aligned} 11,725\ \text{mL} &= 11,725\ \text{mL} \cdot \frac{1\ \text{L}}{1000\ \text{mL}} \cdot \frac{1\ \text{daL}}{10\ \text{L}} && \text{Apply conversion factors.} \\ &= 11,725\ \cancel{\text{mL}} \cdot \frac{1\ \cancel{\text{L}}}{1000\ \cancel{\text{mL}}} \cdot \frac{1\ \text{daL}}{10\ \cancel{\text{L}}} && \text{Cancel common units.} \\ &= \frac{11,725 \cdot 1 \cdot 1}{1000 \cdot 10}\ \text{daL} && \text{Multiply fractions.} \\ &= 1.1725\ \text{daL} \end{aligned}$$

Alternately, we can set up our ordered list of units.



Note that we must move 4 places left to move from the millitres (mL) abbreviation to the dekalitres (daL) abbreviation. In like manner, we can convert 11,725 millilitres to dekalitres by moving the decimal 4 places to the left.

$$11,725.0\ \text{mL} = 1.1725\ 0\ \text{daL} = 1.1725\ \text{daL}$$

Exercise

Convert 5,763 millilitres to dekalitres.

Answer

0.5763 dekalitres

6.6: American Units to Metric Units and Vice-Versa

We often need to convert from the American system of units to the metric system of units or vice-versa (imagine traveling to a European country using the metric system). That will be our focus in this section.

Converting Units of Length

One meter is slightly longer than one yard. Indeed,

$$1\text{ m} \approx 1.0936\text{ yd}. \tag{6.6.1}$$

If we divide both sides of this equation by 1.0936, then

$$\frac{1\text{ m}}{1.0936} \approx \frac{1.0936\text{ yd}}{1.0936}$$
$$0.9144\text{ m} \approx 1\text{ yd}$$

Further conversions can be made. For example, to change meters to feet, we make the following conversions.

$$\begin{aligned} 1\text{ m} &\approx 1\text{ m} \cdot 1\frac{\text{yd}}{0.9144\text{ m}} \cdot \frac{3\text{ ft}}{1\text{ yd}} && \text{Apply conversion factors.} \\ &\approx 1\ \cancel{\text{m}} \cdot \frac{1\ \cancel{\text{yd}}}{0.9144\ \cancel{\text{m}}} \cdot \frac{3\text{ ft}}{1\ \cancel{\text{yd}}} && \text{Cancel common units.} \\ &\approx \frac{1 \cdot 1 \cdot 3}{0.9144 \cdot 1}\text{ ft} && \text{Multiply fractions.} \\ &\approx 3.2808\text{ ft} \end{aligned}$$

Table 6.5 shows some of the most common conversions between American units of length and metric units of length.

Table 6.5: Length conversions: American — Metric.

American to Metric	Metric to American
1 in ≈ 2.54 cm	1 cm ≈ 0.3937 in
1 ft ≈ 0.3048 m	1 m ≈ 3.2808 ft
1 yd ≈ 0.9144 m	1 m ≈ 1.0936 yd
1 mi ≈ 1.6093 km	1 km ≈ 0.6214 mi

Example 1

A car's speedometer shows that a family has currently traveled 154 miles in route to their vacation destination. Convert this distance to kilometers.

Solution

Choose 1 mi = 1.6093 km from Table 6.5.

$$\begin{aligned} 154\text{ mi} &\approx 154\text{ mi} \cdot \frac{1.6093\text{ km}}{1\text{ mi}} && \text{Apply conversion factor.} \\ &\approx 154\ \cancel{\text{mi}} \cdot \frac{1.6093\text{ km}}{1\ \cancel{\text{mi}}} && \text{Cancel common units.} \\ &\approx \frac{154 \cdot 1.6093}{1}\text{ km} && \text{Multiply fractions.} \\ &\approx 247.8\text{ km} \end{aligned}$$

Hence, 154 miles is approximately 247.8 kilometers.

Alternate Solution

Note that this would work equally well if we chose 1 km ≈ 0.6214 mi from Table 6.5.

$$\begin{aligned} 154\text{ mi} &\approx 154\text{ mi} \cdot \frac{1\text{ km}}{0.6214\text{ mi}} && \text{Apply conversion factor.} \\ &\approx 154\ \cancel{\text{mi}} \cdot \frac{1\text{ km}}{0.6214\ \cancel{\text{mi}}} && \text{Cancel common units.} \\ &\approx \frac{154 \cdot 1}{0.6214}\text{ km} && \text{Multiply fractions.} \\ &\approx 247.8\text{ km} \end{aligned}$$

? Exercise

Change 227 miles to kilometers. Round to the nearest tenth of a kilometer.

Answer

365.3 kilometers

Converting Units of Weight and Mass

It is known that

$$1\text{ kg} \approx 2.2\text{ lb}. \tag{6.6.2}$$

Dividing both sides of this equation by 2.2,

$$\frac{1\text{ kg}}{2.2} \approx \frac{2.2\text{ lb}}{2.2}$$

$$0.454\text{ kg} \approx 1\text{lb}$$

A summary of the more common conversion factors regarding mass and weight are given in Table 6.6.

Table 6.6: Mass—Weight conversions: American — Metric.

American to Metric	Metric to American
1 oz ≈ 28.35 g	1 g ≈ 0.035 oz
1 lb ≈ 0.454 kg	1 kg ≈ 2.2 lb

✓ Example 2

Change 2.3 kilograms to ounces.

Solution

One kilogram weighs 2.2 pounds and there are 16 ounces in a pound.

$$\begin{aligned} 2.3\text{ kg} &\approx 2.3\text{ kg} \cdot \frac{2.2\text{ lb}}{1\text{ kg}} \cdot \frac{16\text{ oz}}{1\text{ lb}} && \text{Apply conversion factors.} \\ &\approx 2.3\ \cancel{\text{kg}} \cdot \frac{2.2\ \cancel{\text{lb}}}{1\ \cancel{\text{kg}}} \cdot \frac{16\text{ oz}}{1\ \cancel{\text{lb}}} && \text{Cancel common units.} \\ &\approx \frac{2.3 \cdot 2.2 \cdot 16}{1 \cdot 1}\text{ oz} && \text{Multiply fractions.} \\ &\approx 80.96\text{ oz} \end{aligned}$$

Hence, 2.3 kilograms weighs 80.96 ounces.

Alternate Solution

Another approach uses the facts that 1 kilogram equals 1000 grams and 1 ounce equals 28.35 grams.

$$\begin{aligned} 2.3\text{ kg} &\approx 2.3\text{ kg} \cdot \frac{1000\text{ g}}{1\text{ kg}} \cdot \frac{1\text{ oz}}{28.35\text{ g}} && \text{Apply conversion factors.} \\ &\approx 2.3\ \cancel{\text{kg}} \cdot \frac{1000\ \cancel{\text{g}}}{1\ \cancel{\text{kg}}} \cdot \frac{1\text{ oz}}{28.35\ \cancel{\text{g}}} && \text{Cancel common units.} \\ &\approx \frac{2.3 \cdot 1000 \cdot 1}{1 \cdot 28.35}\text{ oz} && \text{Multiply fractions.} \\ &\approx 81.13\text{ oz} \end{aligned}$$

Roundoff Error

Why the discrepancy in answers? This difference in approximations is due to something called *round-off error*. Indeed, in the first calculation, we used a conversion factor that is rounded to the nearest tenth; i.e., 1 kg ≈ 2.2 lb. If we use a more accurate conversion factor to change kilograms to pounds, namely 1 kg ≈ 2.2046 lb, we get the following result.

$$\begin{aligned} 2.3\text{ kg} &\approx 2.3\text{ kg} \cdot \frac{2.2046\text{ lb}}{1\text{ kg}} \cdot \frac{16\text{ oz}}{1\text{ lb}} && \text{Apply conversion factors.} \\ &\approx 2.3\ \cancel{\text{kg}} \cdot \frac{2.2046\ \cancel{\text{lb}}}{1\ \cancel{\text{kg}}} \cdot \frac{16\text{oz}}{1\ \cancel{\text{lb}}} && \text{Cancel common units.} \\ &\approx \frac{2.3 \cdot 2.2046 \cdot 16}{1 \cdot 1}\text{ oz} && \text{Multiply fractions.} \\ &\approx 81.13\text{ oz} \end{aligned}$$

Note that this result is in better agreement with the second result above.

? Exercise

Change 5.7 kilograms to ounces. Round to the nearest ounce.

Answer

201 ounces

Important Observation

To obtain better approximations, you need to use a conversion factor that is more accurate. Any time you feel you need more accuracy, you might try an online conversion utility, such as the one at: www.france-property-and-information.com/metric_conversion_table.htm

Converting Units of Volume

It is known that

$$1\text{ qt} \approx 0.946\text{ L}.$$

Dividing both sides of this equation by 0.946,

$$1\text{ L} \approx 1.06\text{ qt}.$$

Again, these conversion factors for volume have been well worked out by scientists. The more common conversion factors for volume are shown in Table 6.7.

American to Metric	Metric to American
1 fl oz ≈ 0.030 L	1 L ≈ 33.8 fl oz
1 pt ≈ 0.473 L	1 L ≈ 2.1 pt
1 qt ≈ 0.946 L	1 L ≈ 1.06 qt
1 gal ≈ 3.785 L	1 L ≈ 0.264 gal

Table 6.7: Volume conversions: American — Metric.

Example 3

Change 2.5 dekalitres to gallons.

Solution

Recall that 1 daL = 10 L and 1 L = 0.264 gal.

$$\begin{aligned} 2.5 \text{ daL} &\approx 2.5 \text{ daL} \cdot \frac{10 \text{ L}}{1 \text{ daL}} \cdot \frac{0.264 \text{ gal}}{1 \text{ L}} && \text{Apply conversion factors.} \\ &\approx 2.5 \ \cancel{\text{daL}} \cdot \frac{10 \ \cancel{\text{L}}}{1 \ \cancel{\text{daL}}} \cdot \frac{0.264 \text{ gal}}{1 \ \cancel{\text{L}}} && \text{Cancel common units.} \\ &\approx \frac{2.5 \cdot 10 \cdot 0.264}{1 \cdot 1} \text{ gal} && \text{Multiply fractions.} \\ &\approx 6.6 \text{ gal} \end{aligned}$$

Hence, 2.5 dekalitres is approximately equal to 6.6 gallons.

Exercise

Change 3.2 dekalitres to gallons.Round your answer to the nearest tenth of a gallon.

Answer

0.8 gallons

Converting Units of Speed

Modern speedometers often show a car's speed in both miles per hour and kilometers per hour.

Example 4

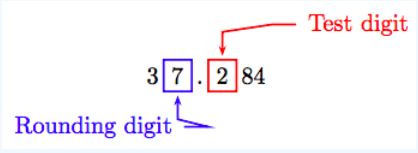
A car's speedometer is showing it speeding along at 60 kilometers per hour. How fast is it traveling in miles per hour? Round your answer to the nearest mile per hour.

Solution

From Table 6.5, 1 km ≈ 0.6214 mi.

$$\begin{aligned} 60 \frac{\text{km}}{\text{h}} &\approx 60 \frac{\text{km}}{\text{h}} \cdot \frac{0.6214 \text{ mi}}{1 \text{ km}} && \text{Apply conversion factor.} \\ &\approx 60 \frac{\cancel{\text{km}}}{\text{h}} \cdot \frac{0.6214 \text{ mi}}{1 \ \cancel{\text{km}}} && \text{Cancel common units.} \\ &\approx \frac{60 \cdot 0.6214}{1} \frac{\text{mi}}{\text{h}} && \text{Multiply fractions.} \\ &\approx 37.284 \frac{\text{mi}}{\text{h}} \end{aligned}$$

To round to the nearest mile per hour, identify the rounding and test digits.



Because the test digit is less than 5, leave the rounding digit alone and truncate. Thus, to the nearest mile per hour, the speed is approximately 37 miles per hour.

Exercise

A car's speedometer registers 45 kilometers per hour. Change this speed to miles per hour. Round your answer to the nearest mile per hour.

Answer

28 miles per hour

Exercises

1. Use the conversion 1 in = 2.54 cm to convert 68 inches to centimeters, rounded to the nearest tenth of a centimeter.
2. Use the conversion 1 in = 2.54 cm to convert 42 inches to centimeters, rounded to the nearest tenth of a centimeter.
3. Use the conversion 1 in = 2.54 cm to convert 44 centimeters to inches, rounded to the nearest tenth of a inch.
4. Use the conversion 1 in = 2.54 cm to convert 22 centimeters to inches, rounded to the nearest tenth of a inch.
5. Use the conversion 1 mi = 1.6093 km to convert 79 miles to kilometers, rounded to the nearest tenth of a kilometer.
6. Use the conversion 1 mi = 1.6093 km to convert 39 miles to kilometers, rounded to the nearest tenth of a kilometer.
7. Use the conversion 1 yd = 0.9144 m to convert 1489 centimeters to yards, rounded to the nearest tenth of a yard.
8. Use the conversion 1 yd = 0.9144 m to convert 1522 centimeters to yards, rounded to the nearest tenth of a yard.
9. Use the conversion 1 yd = 0.9144 m to convert 28 yards to centimeters, rounded to the nearest tenth of a centimeter.
10. Use the conversion 1 yd = 0.9144 m to convert 34 yards to centimeters, rounded to the nearest tenth of a centimeter.
11. Use the conversion 1 m = 3.2808 ft to convert 8.6 meters to inches, rounded to the nearest tenth of a inch.
12. Use the conversion 1 m = 3.2808 ft to convert 8.3 meters to inches, rounded to the nearest tenth of a inch.
13. Use the conversion 1 in = 2.54 cm to convert 60 inches to centimeters, rounded to the nearest tenth of a centimeter.
14. Use the conversion 1 in = 2.54 cm to convert 75 inches to centimeters, rounded to the nearest tenth of a centimeter.
15. Use the conversion 1 m = 3.2808 ft to convert 208 inches to meters, rounded to the nearest tenth of a inch.
16. Use the conversion 1 m = 3.2808 ft to convert 228 inches to meters, rounded to the nearest tenth of a inch.
17. Use the conversion 1 m = 1.0936 yd to convert 20 yards to meters, rounded to the nearest tenth of a meter.
18. Use the conversion 1 m = 1.0936 yd to convert 44 yards to meters, rounded to the nearest tenth of a meter.
19. Use the conversion 1 mi = 1.6093 km to convert 29 miles to kilometers, rounded to the nearest tenth of a kilometer.
20. Use the conversion 1 mi = 1.6093 km to convert 15 miles to kilometers, rounded to the nearest tenth of a kilometer.
21. Use the conversion 1 m = 1.0936 yd to convert 8.2 meters to yards, rounded to the nearest tenth of a yard.
22. Use the conversion 1 m = 1.0936 yd to convert 6.9 meters to yards, rounded to the nearest tenth of a yard.
23. Use the conversion 1 mi = 1.6093 km to convert 4.9 kilometers to miles, rounded to the nearest tenth of a mile.
24. Use the conversion 1 mi = 1.6093 km to convert 4.2 kilometers to miles, rounded to the nearest tenth of a mile.
25. Use the conversion 1 m = 1.0936 yd to convert 25 yards to meters, rounded to the nearest tenth of a meter.
26. Use the conversion 1 m = 1.0936 yd to convert 2 yards to meters, rounded to the nearest tenth of a meter.
27. Use the conversion 1 in = 2.54 cm to convert 47 centimeters to inches, rounded to the nearest tenth of a inch.
28. Use the conversion 1 in = 2.54 cm to convert 19 centimeters to inches, rounded to the nearest tenth of a inch.
29. Use the conversion 1 mi = 1.6093 km to convert 8.3 kilometers to miles, rounded to the nearest tenth of a mile.
30. Use the conversion 1 mi = 1.6093 km to convert 4.8 kilometers to miles, rounded to the nearest tenth of a mile.

31. Use the conversion 1 yd = 0.9144 m to convert 41 yards to centimeters, rounded to the nearest tenth of a centimeter.
32. Use the conversion 1 yd = 0.9144 m to convert 20 yards to centimeters, rounded to the nearest tenth of a centimeter.
33. Use the conversion 1 m = 3.2808 ft to convert 3.7 meters to inches, rounded to the nearest tenth of a inch.
34. Use the conversion 1 m = 3.2808 ft to convert 7.9 meters to inches, rounded to the nearest tenth of a inch.
35. Use the conversion 1 yd = 0.9144 m to convert 1323 centimeters to yards, rounded to the nearest tenth of a yard.
36. Use the conversion 1 yd = 0.9144 m to convert 1715 centimeters to yards, rounded to the nearest tenth of a yard.
37. Use the conversion 1 m = 1.0936 yd to convert 8.4 meters to yards, rounded to the nearest tenth of a yard.
38. Use the conversion 1 m = 1.0936 yd to convert 7.3 meters to yards, rounded to the nearest tenth of a yard.
39. Use the conversion 1 m = 3.2808 ft to convert 289 inches to meters, rounded to the nearest tenth of a inch.
40. Use the conversion 1 m = 3.2808 ft to convert 251 inches to meters, rounded to the nearest tenth of a inch.

41. Use the conversion 1 kg = 2.2 lb to convert 15.8 kilograms to pounds, rounded to the nearest tenth of a pound.
42. Use the conversion 1 kg = 2.2 lb to convert 19.4 kilograms to pounds, rounded to the nearest tenth of a pound.
43. Use the conversion 1 oz = 28.35 g to convert 35 ounces to grams, rounded to the nearest tenth of a gram.
44. Use the conversion 1 oz = 28.35 g to convert 33 ounces to grams, rounded to the nearest tenth of a gram.
45. Use the conversion 1 kg = 2.2 lb to convert 2.48 kilograms to ounces, rounded to the nearest tenth of a ounce.
46. Use the conversion 1 kg = 2.2 lb to convert 3.74 kilograms to ounces, rounded to the nearest tenth of a ounce.
47. Use the conversion 1 kg = 2.2 lb to convert 2.35 kilograms to ounces, rounded to the nearest tenth of a ounce.
48. Use the conversion 1 kg = 2.2 lb to convert 3.57 kilograms to ounces, rounded to the nearest tenth of a ounce.
49. Use the conversion 1 kg = 2.2 lb to convert 15 pounds to kilograms, rounded to the nearest tenth of a kilogram.
50. Use the conversion 1 kg = 2.2 lb to convert 27 pounds to kilograms, rounded to the nearest tenth of a kilogram.
51. Use the conversion 1 kg = 2.2 lb to convert 10.4 kilograms to pounds, rounded to the nearest tenth of a pound.
52. Use the conversion 1 kg = 2.2 lb to convert 17.7 kilograms to pounds, rounded to the nearest tenth of a pound.
53. Use the conversion 1 kg = 2.2 lb to convert 352 ounces to kilograms, rounded to the nearest tenth of a kilogram.
54. Use the conversion 1 kg = 2.2 lb to convert 326 ounces to kilograms, rounded to the nearest tenth of a kilogram.
55. Use the conversion 1 oz = 28.35 g to convert 96 grams to ounces, rounded to the nearest tenth of a ounce.
56. Use the conversion 1 oz = 28.35 g to convert 100 grams to ounces, rounded to the nearest tenth of a ounce.
57. Use the conversion 1 oz = 28.35 g to convert 14 ounces to grams, rounded to the nearest tenth of a gram.
58. Use the conversion 1 oz = 28.35 g to convert 29 ounces to grams, rounded to the nearest tenth of a gram.
59. Use the conversion 1 kg = 2.2 lb to convert 54 pounds to kilograms, rounded to the nearest tenth of a kilogram.
60. Use the conversion 1 kg = 2.2 lb to convert 82 pounds to kilograms, rounded to the nearest tenth of a kilogram.
61. Use the conversion 1 oz = 28.35 g to convert 92 grams to ounces, rounded to the nearest tenth of a ounce.
62. Use the conversion 1 oz = 28.35 g to convert 103 grams to ounces, rounded to the nearest tenth of a ounce.
63. Use the conversion 1 kg = 2.2 lb to convert 388 ounces to kilograms, rounded to the nearest tenth of a kilogram.
64. Use the conversion 1 kg = 2.2 lb to convert 395 ounces to kilograms, rounded to the nearest tenth of a kilogram.

---

65. Use the conversion 1 qt = 0.946 L to convert 55.1 litres to quarts, rounded to the nearest tenth of a quart.
66. Use the conversion 1 qt = 0.946 L to convert 50.3 litres to quarts, rounded to the nearest tenth of a quart.
67. Use the conversion 1 L = 33.8 fl oz to convert 72073 fluid ounces to kilolitres, rounded to the nearest tenth of a kilolitre.
68. Use the conversion 1 L = 33.8 fl oz to convert 56279 fluid ounces to kilolitres, rounded to the nearest tenth of a kilolitre.

69. Use the conversion 1 L = 33.8 fl oz to convert 2.5 kilolitres to fluid ounces.

70. Use the conversion 1 L = 33.8 fl oz to convert 4.5 kilolitres to fluid ounces.

71. Use the conversion 1 qt = 0.946 L to convert 24 quarts to litres, rounded to the nearest tenth of a litre.

72. Use the conversion 1 qt = 0.946 L to convert 21 quarts to litres, rounded to the nearest tenth of a litre.

73. Use the conversion 1 qt = 0.946 L to convert 30 quarts to litres, rounded to the nearest tenth of a litre.

74. Use the conversion 1 qt = 0.946 L to convert 22 quarts to litres, rounded to the nearest tenth of a litre.

75. Use the conversion 1 gal = 3.785 L to convert 11.8 gallons to litres, rounded to the nearest tenth of a litre.

76. Use the conversion 1 gal = 3.785 L to convert 13.5 gallons to litres, rounded to the nearest tenth of a litre.

77. Use the conversion 1 gal = 3.785 L to convert 50.5 litres to gallons, rounded to the nearest tenth of a gallon.

78. Use the conversion 1 gal = 3.785 L to convert 55.9 litres to gallons, rounded to the nearest tenth of a gallon.

79. Use the conversion 1 L = 33.8 fl oz to convert 8.3 kilolitres to fluid ounces.

80. Use the conversion 1 L = 33.8 fl oz to convert 5.3 kilolitres to fluid ounces.

81. Use the conversion 1 qt = 0.946 L to convert 42.4 litres to quarts, rounded to the nearest tenth of a quart.

82. Use the conversion 1 qt = 0.946 L to convert 55.4 litres to quarts, rounded to the nearest tenth of a quart.

83. Use the conversion 1 gal = 3.785 L to convert 17.2 gallons to litres, rounded to the nearest tenth of a litre.

84. Use the conversion 1 gal = 3.785 L to convert 19.6 gallons to litres, rounded to the nearest tenth of a litre.

85. Use the conversion 1 L = 33.8 fl oz to convert 51274 fluid ounces to kilolitres, rounded to the nearest tenth of a kilolitre.

86. Use the conversion 1 L = 33.8 fl oz to convert 82164 fluid ounces to kilolitres, rounded to the nearest tenth of a kilolitre.

87. Use the conversion 1 gal = 3.785 L to convert 55.6 litres to gallons, rounded to the nearest tenth of a gallon.

88. Use the conversion 1 gal = 3.785 L to convert 59.2 litres to gallons, rounded to the nearest tenth of a gallon.

---

89. Change 60 miles per hour to kilometers per hour. Round your answer to the nearest kilometer per hour.

90. Change 56 miles per hour to kilometers per hour. Round your answer to the nearest kilometer per hour.

91. Change 77 miles per hour to kilometers per hour. Round your answer to the nearest kilometer per hour.

92. Change 57 miles per hour to kilometers per hour. Round your answer to the nearest kilometer per hour.

93. Change 42 kilometers per hour to miles per hour. Round your answer to the nearest mile per hour.

94. Change 56 kilometers per hour to miles per hour. Round your answer to the nearest mile per hour.

95. Change 62 kilometers per hour to miles per hour. Round your answer to the nearest mile per hour.

96. Change 63 kilometers per hour to miles per hour. Round your answer to the nearest mile per hour.

---

97. **Tallest tower.** The world's tallest tower in Dubai has 160 floors at a height of 2, 717 feet. Convert the height of the tower to the nearest tenth of a meter. *Associated Press-Times-Standard 02/09/10 World's tallest tower closed a month after opening.*

98. **High peaks.** For the first time, foreigners will be allowed to climb nearly 100 high-altitude Himalayan peaks on the Indian side of Kashmir, peaks ranging from 9, 840 feet to nearly 26, 246 feet. Convert the highest of the peaks to the nearest tenth of a meter. *Associated Press-TimesStandard 04/11/10 India opens Himalayan peaks to foreigners.*

99. **Ancient find.** In the southern Egyptian town of Luxor, a 3, 400-year-old 4-meter statue of Thoth, the ancient Egyptian god of Wisdom and Magic, was unearthed. Convert the height of the statue to the nearest tenth of a foot. *Associated Press-Times-Standard 03/17/10 3,400-year-old statues unearthed in Egypt.*

100. **Arctic wind.** Blizzard condition winds in the Arctic blew 80 miles per hour. Find the wind speed to the nearest kilometer per hour. *Associated Press-Times-Standard 12/31/09 After 562-mile ski trek, seven women reach the South Pole.*

101. **Solar plane.** The Solar Impulse lifted off from a military airport at a speed no faster than 28 miles per hour. Convert the speed of the solar-powered plane to the nearest kilometer per hour. *Associated Press-Times-Standard 04/09/10 Solar-powered plane makes successful maiden flight.*

Answers

1. 172.7 centimeters
3. 17.3 inches
5. 127.1 kilometers
7. 16.3 yards
9. 2560.3 centimeters
11. 338.6 inches

6.7: Use a Problem Solving Strategy (Part 1)

Learning Objectives

- Approach word problems with a positive attitude
- Use a problem solving strategy for word problems
- Solve number problems

be prepared!

Before you get started, take this readiness quiz.

1. Translate “6 less than twice x” into an algebraic expression. If you missed this problem, review Example 2.4.13.
2. Solve: $\frac{2}{3}x = 24$. If you missed this problem, review Example 8.3.4.
3. Solve: $3x + 8 = 14$. If you missed this problem, review Example 8.4.1.

Approach Word Problems with a Positive Attitude

The world is full of word problems. How much money do I need to fill the car with gas? How much should I tip the server at a restaurant? How many socks should I pack for vacation? How big a turkey do I need to buy for Thanksgiving dinner, and what time do I need to put it in the oven? If my sister and I buy our mother a present, how much will each of us pay?

Now that we can solve equations, we are ready to apply our new skills to word problems. Do you know anyone who has had negative experiences in the past with word problems? Have you ever had thoughts like the student in Figure 6.7.1?

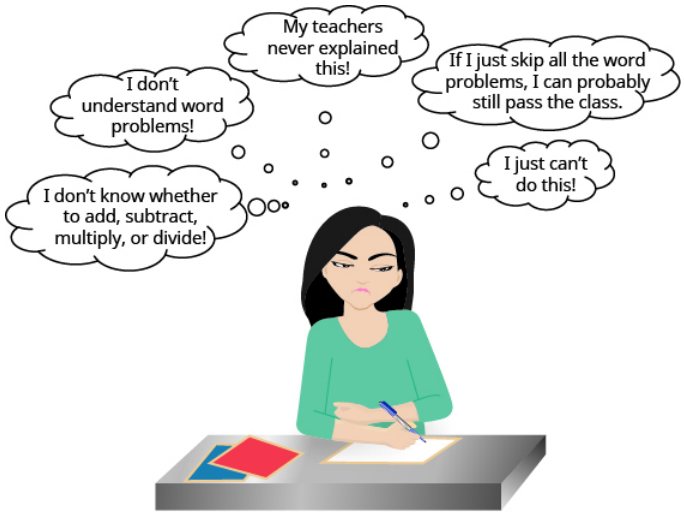

Figure 6.7.1 - Negative thoughts about word problems can be barriers to success.

When we feel we have no control, and continue repeating negative thoughts, we set up barriers to success. We need to calm our fears and change our negative feelings.

Start with a fresh slate and begin to think positive thoughts like the student in Figure 6.7.2. Read the positive thoughts and say them out loud.

Figure 6.7.2 - When it comes to word problems, a positive attitude is a big step toward success.

If we take control and believe we can be successful, we will be able to master word problems.

Think of something that you can do now but couldn't do three years ago. Whether it's driving a car, snowboarding, cooking a gourmet meal, or speaking a new language, you have been able to learn and master a new skill. Word problems are no different. Even if you have struggled with word problems in the past, you have acquired many new math skills that will help you succeed now!

Use a Problem-solving Strategy for Word Problems

In earlier chapters, you translated word phrases into algebraic expressions, using some basic mathematical vocabulary and symbols. Since then you've increased your math vocabulary as you learned about more algebraic procedures, and you've had more practice translating from words into algebra.

You have also translated word sentences into algebraic equations and solved some word problems. The word problems applied math to everyday situations. You had to restate the situation in one sentence, assign a variable, and then write an equation to solve. This method works as long as the situation is familiar to you and the math is not too complicated.

Now we'll develop a strategy you can use to solve any word problem. This strategy will help you become successful with word problems. We'll demonstrate the strategy as we solve the following problem.

Example 6.7.1:

Pete bought a shirt on sale for $18, which is one-half the original price. What was the original price of the shirt?

Solution

Step 1. **Read** the problem. Make sure you understand all the words and ideas. You may need to read the problem two or more times. If there are words you don't understand, look them up in a dictionary or on the Internet.

- *In this problem, do you understand what is being discussed? Do you understand every word?*

Step 2. **Identify** what you are looking for. It's hard to find something if you are not sure what it is! Read the problem again and look for words that tell you what you are looking for!

- *In this problem, the words "what was the original price of the shirt" tell you that what you are looking for: the original price of the shirt.*

Step 3. **Name** what you are looking for. Choose a variable to represent that quantity. You can use any letter for the variable, but it may help to choose one that helps you remember what it represents.

- *Let p = the original price of the shirt.*

Step 4. **Translate** into an equation. It may help to first restate the problem in one sentence, with all the important information. Then translate the sentence into an equation.

18	is	one-half	of	the original price .
18	=	$\frac{1}{2}$	·	p

Step 5. **Solve** the equation using good algebra techniques. Even if you know the answer right away, using algebra will better prepare you to solve problems that do not have obvious answers.

Write the equation.	$18 = \frac{1}{2}p$
Multiply both sides by 2.	$2 \cdot 18 = 2 \cdot \frac{1}{2}p$
Simplify.	$36 = p$

Step 6. **Check** the answer in the problem and make sure it makes sense.

- *We found that p = 36, which means the original price was $36. Does $36 make sense in the problem? Yes, because 18 is one-half of 36, and the shirt was on sale at half the original price.*

Step 7. **Answer** the question with a complete sentence.

- *The problem asked "What was the original price of the shirt?" The answer to the question is: "The original price of the shirt was $36."*

If this were a homework exercise, our work might look like this:

Let p = the original price.	18 is one-half the original price. $18 = \frac{1}{2}p$ $2 \cdot 18 = 2 \cdot \frac{1}{2}p$ $36 = p$
Check: Is $36 a reasonable price for a shirt? *Yes.* Is 18 one-half of 36? *Yes.*	The original price of the shirt was $36.

? Exercise 6.7.1:

Joaquin bought a bookcase on sale for $120, which was two-thirds the original price. What was the original price of the bookcase?

Answer

$180

? Exercise 6.7.2:

Two-fifths of the people in the senior center dining room are men. If there are 16 men, what is the total number of people in the dining room?

Answer

40

We list the steps we took to solve the previous example.

Problem-Solving Strategy

- Step 1. **Read** the word problem. Make sure you understand all the words and ideas. You may need to read the problem two or more times. If there are words you don't understand, look them up in a dictionary or on the internet.
- Step 2. **Identify** what you are looking for.
- Step 3. **Name** what you are looking for. Choose a variable to represent that quantity.
- Step 4. **Translate** into an equation. It may be helpful to first restate the problem in one sentence before translating.
- Step 5. **Solve** the equation using good algebra techniques.
- Step 6. **Check** the answer in the problem. Make sure it makes sense.
- Step 7. **Answer** the question with a complete sentence.

Let's use this approach with another example.

Example 6.7.2:

Yash brought apples and bananas to a picnic. The number of apples was three more than twice the number of bananas. Yash brought 11 apples to the picnic. How many bananas did he bring?

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	How many bananas did he bring?
Step 3. **Name** what you are looking for. Choose a variable to represent the number of bananas.	Let b = number of bananas
Step 4. **Translate**. Restate the problem in one sentence with all the important information. Translate into an equation.	$\underbrace{\text{The number of apples}}_{11}\ \underbrace{\text{was}}_{=}\ \underbrace{3}_{3}\ \underbrace{\text{more than}}_{+}\ \underbrace{\text{twice the number of bananas}}_{2b}.$
Step 5. **Solve** the equation.	$11 = 3b + 3 \quad (6.7.1)$
Subtract 3 from each side.	$11 - 3 = 2b + 3 - 3$
Simplify.	$8 = 2b$
Divide each side by 2.	$\frac{8}{2} = \frac{2b}{2}$
Simplify.	$4 = b$
Step 6. **Check**: First, is our answer reasonable? Yes, bringing four bananas to a picnic seems reasonable. The problem says the number of apples was three more than twice the number of bananas. If there are four bananas, does that make eleven apples? Twice 4 bananas is 8. Three more than 8 is 11.	
Step 7. **Answer** the question.	Yash brought 4 bananas to the picnic.

Exercise 6.7.3:

Guillermo bought textbooks and notebooks at the bookstore. The number of textbooks was 3 more than the number of notebooks. He bought 5 textbooks. How many notebooks did he buy?

Answer

2

Exercise 6.7.4:

Gerry worked Sudoku puzzles and crossword puzzles this week. The number of Sudoku puzzles he completed is seven more than the number of crossword puzzles. He completed 14 Sudoku puzzles. How many crossword puzzles did he complete?

Answer

7

In Solve Sales Tax, Commission, and Discount Applications, we learned how to translate and solve basic percent equations and used them to solve sales tax and commission applications. In the next example, we will apply our Problem Solving Strategy to more applications of percent.

Example 6.7.3:

Nga's car insurance premium increased by $60, which was 8% of the original cost. What was the original cost of the premium?

Solution

Step 1. **Read** the problem. Remember, if there are words you don't understand, look them up.		
Step 2. **Identify** what you are looking for.	the original cost of the premium	
Step 3. **Name**. Choose a variable to represent the original cost of premium.	Let c = the original cost	
Step 4. **Translate**. Restate as one sentence. Translate into an equation.	$\underbrace{\$60}_{60}$ $\underbrace{\text{was}}_{=}$ $\underbrace{8\%}_{0.08}$ $\underbrace{\text{of}}_{\cdot}$ $\underbrace{\text{the original cost}}_{c}$.	
Step 5. **Solve** the equation.	$60 = 0.08c$	(6.7.2)
Divide both sides by 0.08.	$\frac{60}{0.08} = \frac{0.08c}{0.08}$	(6.7.3)
Simplify.	$c = 750$	(6.7.4)
Step 6. **Check**: Is our answer reasonable? Yes, a $750 premium on auto insurance is reasonable. Now let's check our algebra. Is 8% of 750 equal to 60?	$750 = c$ $0.08(750) = 60$ $60 = 60$ ✓	
Step 7. **Answer** the question.	The original cost of Nga's premium was $750.	

Exercise 6.7.5:

Pilar's rent increased by 4%. The increase was $38. What was the original amount of Pilar's rent?

Answer

$950

Exercise 6.7.6:

Steve saves 12% of his paycheck each month. If he saved $504 last month, how much was his paycheck?

Answer

$4200

Solve Number Problems

Now we will translate and solve **number problems**. In number problems, you are given some clues about one or more numbers, and you use these clues to build an equation. Number problems don't usually arise on an everyday basis, but they provide a good introduction to practicing the Problem Solving Strategy. Remember to look for clue words such as *difference*, *of*, and *and*.

Example 6.7.4:

The difference of a number and six is 13. Find the number.

Solution

Step 1. **Read** the problem. Do you understand all the words?	
Step 2. **Identify** what you are looking for.	the number
Step 3. **Name**. Choose a variable to represent the number.	Let n = the number
Step 4. **Translate**. Restate as one sentence. Translate into an equation.	$\underbrace{\text{The difference of a number and 6}}\ \underbrace{\text{is}}\ \underbrace{\text{13.}}$ $n-6 \quad = \quad 13$
Step 5. **Solve** the equation. Add 6 to both sides. Simplify.	$n-6=13$ $n-+6=13+6$ $n=19$
Step 6. **Check**: The difference of 19 and 6 is 13. It checks.	
Step 7. **Answer** the question.	The number is 19.

Exercise 6.7.7:

The difference of a number and eight is 17. Find the number.

Answer

25

Exercise 6.7.8:

The difference of a number and eleven is −7. Find the number.

Answer

4

Example 6.7.5:

The sum of twice a number and seven is 15. Find the number.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	the number
Step 3. **Name**. Choose a variable to represent the number.	Let n = the number
Step 4. **Translate**. Restate the problem as one sentence. Translate into an equation.	$\underbrace{\text{The sum of twice a number}}_{2 \cdot n}\ \underbrace{\text{and}}_{+}\ \underbrace{7}_{7}\ \underbrace{\text{is}}_{=}\ \underbrace{15.}_{15}$
Step 5. **Solve** the equation.	$2n + 7 = 15$ (6.7.5)
Subtract 7 from each side and simplify.	$2n = 8$ (6.7.6)
Divide each side by 2 and simplify.	$n = 4$ (6.7.7)
Step 6. **Check**: is the sum of twice 4 and 7 equal to 15?	$2 \cdot 4 + 7 = 15$ $8 + 7 = 15$ $15 = 15$ ✓
Step 7. **Answer** the question.	The number is 4.

? Exercise 6.7.9:

The sum of four times a number and two is 14. Find the number.

Answer

3

? Exercise 6.7.10:

The sum of three times a number and seven is 25. Find the number.

Answer

6

This page titled 6.7: Use a Problem Solving Strategy (Part 1) is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

6.8: Use a Problem Solving Strategy (Part 2)

Some number word problems ask you to find two or more numbers. It may be tempting to name them all with different variables, but so far we have only solved equations with one variable. We will define the numbers in terms of the same variable. Be sure to read the problem carefully to discover how all the numbers relate to each other.

Example 6.8.6:

One number is five more than another. The sum of the numbers is twenty-one. Find the numbers.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	You are looking for two numbers.
Step 3. **Name**. Choose a variable to represent the first number. What do you know about the second number? Translate.	Let n = 1st number. One number is five more than another. x + 5 = 2nd number
Step 4. **Translate**. Restate the problem as one sentence with all the important information. Translate into an equation. Substitute the variable expressions.	The sum of the numbers is 21. The sum of the 1st number and the 2nd number is 21. $\underbrace{1^{st}\text{ number}}_{n} + \underbrace{2^{nd}\text{ number}}_{n+5} = 21$
Step 5. **Solve** the equation.	$n+n+5=21$ (9.1.15)
Combine like terms.	$2n+5=21$ (9.1.16)
Subtract five from both sides and simplify.	$2n=16$ (9.1.17)
Divide by two and simplify.	$n=8$ $1^{st}\ number$ (9.1.18)
Find the second number too.	$n+5$ $2^{nd}\ number$ (9.1.19)
Substitute n = 8.	$8+5$ (9.1.20)
Step 6. **Check**: Do these numbers check in the problem? Is one number 5 more than the other? Is thirteen, 5 more than 8? Yes.	$13 \stackrel{?}{=} 8+5$ $13=13$ ✓
Is the sum of the two numbers 21?	$8+13=21$ $21=21$ ✓
Step 7. **Answer** the question.	The numbers are 8 and 13.

Exercise 6.8.11:

One number is six more than another. The sum of the numbers is twenty-four. Find the numbers.

Answer

9, 15

Exercise 6.8.12:

The sum of two numbers is fifty-eight. One number is four more than the other. Find the numbers.

Answer

27, 31

Example 6.8.7:

The sum of two numbers is negative fourteen. One number is four less than the other. Find the numbers.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	two numbers
Step 3. **Name**. Choose a variable. What do you know about the second number? Translate.	Let n = 1st number One number is 4 less than the other. n - 4 = 2nd number
Step 4. **Translate**. Write as one sentence. Translate into an equation. Substitute the variable expressions.	The sum of two numbers is negative fourteen. $\underbrace{1^{st}\text{ number}}_{n} + \underbrace{2^{nd}\text{ number}}_{n-4} = -14$ $n + n - 4 = -14$
Step 5. **Solve** the equation.	$n + n - 4 = -14$ (9.1.21)
Combine like terms.	$2n - 4 = -14$ (9.1.22)
Add 4 to each side and simplify.	$2n = -10$ (9.1.23)
Divide by 2.	$n = -5$ 1^{st} number (9.1.24)
Substitute n = −5 to find the 2nd number.	$n-4$ 2^{nd} number $-5-4$ -9
Step 6. **Check**: Is −9 four less than −5?	$-5-4 \stackrel{?}{=} -9$ $-9 = -9$ ✓
Is their sum −14?	$-5+(-9) \stackrel{?}{=} -14$ $-14 = -14$ ✓
Step 7. **Answer** the question.	The numbers are −5 and −9.

Exercise 6.8.13:

The sum of two numbers is negative twenty-three. One number is 7 less than the other. Find the numbers.

Answer

-8, -15

Exercise 6.8.14:

The sum of two numbers is negative eighteen. One number is 40 more than the other. Find the numbers.

Answer

-29, 11

Example 6.8.8:

One number is ten more than twice another. Their sum is one. Find the numbers.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	two numbers
Step 3. **Name**. Choose a variable. One number is ten more than twice another.	Let x = 1st number 2x + 10 = 2nd number
Step 4. **Translate**. Restate as one sentence.	Their sum is one.
Translate into an equation.	$\underbrace{\text{The sum of the two numbers}}\ \underbrace{\text{is}}\ \underbrace{1.}$ $x+(2x+10) = 1$
Step 5. **Solve** the equation.	$x+2x+10=1$ (9.1.25)
Combine like terms.	$3x+10=1$ (9.1.26)
Subtract 10 from each side.	$3x=-9$ (9.1.27)
Divide each side by 3 to get the first number.	$x=-3$ (9.1.28)
Substitute to get the second number.	$2x+10$ $2(-3)+10$ 4
Step 6. **Check**: Is 4 ten more than twice −3?	$2(-3)+10 \stackrel{?}{=} 4$ $-6+10=4$ $4=4$ ✓
Is their sum 1?	$-3+4 \stackrel{?}{=} 1$ $1=1$ ✓
Step 7. **Answer** the question.	The numbers are −3 and 4.

Exercise 6.8.15:

One number is eight more than twice another. Their sum is negative four. Find the numbers.

Answer

-4, 0

Exercise 6.8.16:

One number is three more than three times another. Their sum is negative five. Find the numbers.

Answer

-2, -3

Consecutive integers are integers that immediately follow each other. Some examples of consecutive integers are:

$$\ldots 1, 2, 3, 4, \ldots \tag{9.1.29}$$

$$\ldots -10, -9, -8, -7, \ldots \tag{9.1.30}$$

$$\ldots 150, 151, 152, 153, \ldots \tag{9.1.31}$$

Notice that each number is one more than the number preceding it. So if we define the first integer as n, the next consecutive integer is n + 1. The one after that is one more than n + 1, so it is n + 1 + 1, or n + 2.

$$\begin{aligned} n &\quad 1^{st}\ integer \\ n+1 &\quad 2^{nd}\ consecutive\ integer \\ n+2 &\quad 3^{rd}\ consecutive\ integer \end{aligned}$$

Example 6.8.9:

The sum of two consecutive integers is 47. Find the numbers.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	two consecutive integers
Step 3. **Name**.	Let n = 1st integer n + 1 = next consecutive integer
Step 4. **Translate**. Restate as one sentence. Translate into an equation.	The sum of the integers is 47. $n + n + 1 = 47$
Step 5. **Solve** the equation.	$n + n + 1 = 47$ (9.1.32)
Combine like terms.	$2n + 1 = 47$ (9.1.33)
Subtract 1 from each side.	$2n = 46$ (9.1.34)
Divide each side by 2.	$n = 23$ $1^{st}\ integer$ (9.1.35)
Substitute to get the second number.	$n+1$ $2^{nd}\ integer$ $23+1$ 24
Step 6. **Check**.	$23 + 24 \stackrel{?}{=} 47$ $47 = 47$ ✓
Step 7. **Answer** the question.	The two consecutive integers are 23 and 24.

Exercise 6.8.17:

The sum of two consecutive integers is 95. Find the numbers.

Answer

47, 48

Exercise 6.8.18:

The sum of two consecutive integers is −31. Find the numbers.

Answer

-15, -16

Example 6.8.10:

Find three consecutive integers whose sum is 42.

Solution

Step 1. **Read** the problem.	
Step 2. **Identify** what you are looking for.	three consecutive integers
Step 3. **Name**.	Let n = 1st integer n + 1 = 2nd consecutive integer n + 2 = 3rd consecutive integer
Step 4. **Translate**. Restate as one sentence. Translate into an equation.	$\underbrace{\text{The sum of the three integers}}\ \underbrace{\text{is}}\ \underbrace{42.}$ $n + n+1 + n+2 = 42$
Step 5. **Solve** the equation.	$n+n+1+n+2=42$ (9.1.36)
Combine like terms.	$3n+3=42$ (9.1.37)
Subtract 3 from each side.	$3n=39$ (9.1.38)
Divide each side by 3.	$n=13$ $1^{st}\ integer$ (9.1.39)
Substitute to get the second number.	$n+1$ $2^{nd}\ integer$ $13+1$ 24
Substitute to get the third number.	$n+2$ $3^{rd}\ integer$ $13+2$ 15
Step 6. **Check**.	$13+14+15 \stackrel{?}{=} 42$ $42=42$ ✓
Step 7. **Answer** the question.	The three consecutive integers are 13, 14, and 15.

Exercise 6.8.19:

Find three consecutive integers whose sum is 96.

Answer

31, 32, 33

Exercise 6.8.20:

Find three consecutive integers whose sum is −36.

Answer

-11, -12, -13

Practice Makes Perfect

Use a Problem-solving Strategy for Word Problems

In the following exercises, use the problem-solving strategy for word problems to solve. Answer in complete sentences.

1. Two-thirds of the children in the fourth-grade class are girls. If there are 20 girls, what is the total number of children in the class?
2. Three-fifths of the members of the school choir are women. If there are 24 women, what is the total number of choir members?
3. Zachary has 25 country music CDs, which is one-fifth of his CD collection. How many CDs does Zachary have?
4. One-fourth of the candies in a bag of are red. If there are 23 red candies, how many candies are in the bag?
5. There are 16 girls in a school club. The number of girls is 4 more than twice the number of boys. Find the number of boys in the club.
6. There are 18 Cub Scouts in Troop 645. The number of scouts is 3 more than five times the number of adult leaders. Find the number of adult leaders.
7. Lee is emptying dishes and glasses from the dishwasher. The number of dishes is 8 less than the number of glasses. If there are 9 dishes, what is the number of glasses?
8. The number of puppies in the pet store window is twelve less than the number of dogs in the store. If there are 6 puppies in the window, what is the number of dogs in the store?
9. After 3 months on a diet, Lisa had lost 12% of her original weight. She lost 21 pounds. What was Lisa's original weight?
10. Tricia got a 6% raise on her weekly salary. The raise was $30 per week. What was her original weekly salary?
11. Tim left a $9 tip for a $50 restaurant bill. What percent tip did he leave?
12. Rashid left a $15 tip for a $75 restaurant bill. What percent tip did he leave?
13. Yuki bought a dress on sale for $72. The sale price was 60% of the original price. What was the original price of the dress?
14. Kim bought a pair of shoes on sale for $40.50. The sale price was 45% of the original price. What was the original price of the shoes?

Solve Number Problems

In the following exercises, solve each number word problem.

15. The sum of a number and eight is 12. Find the number.
16. The sum of a number and nine is 17. Find the number.
17. The difference of a number and twelve is 3. Find the number.
18. The difference of a number and eight is 4. Find the number.
19. The sum of three times a number and eight is 23. Find the number.
20. The sum of twice a number and six is 14. Find the number.
21. The difference of twice a number and seven is 17. Find the number.
22. The difference of four times a number and seven is 21. Find the number.
23. Three times the sum of a number and nine is 12. Find the number.
24. Six times the sum of a number and eight is 30. Find the number.

25. One number is six more than the other. Their sum is forty-two. Find the numbers.
26. One number is five more than the other. Their sum is thirty-three. Find the numbers.
27. The sum of two numbers is twenty. One number is four less than the other. Find the numbers.
28. The sum of two numbers is twenty-seven. One number is seven less than the other. Find the numbers.
29. A number is one more than twice another number. Their sum is negative five. Find the numbers.
30. One number is six more than five times another. Their sum is six. Find the numbers.
31. The sum of two numbers is fourteen. One number is two less than three times the other. Find the numbers.
32. The sum of two numbers is zero. One number is nine less than twice the other. Find the numbers.
33. One number is fourteen less than another. If their sum is increased by seven, the result is 85. Find the numbers.
34. One number is eleven less than another. If their sum is increased by eight, the result is 71. Find the numbers.
35. The sum of two consecutive integers is 77. Find the integers.
36. The sum of two consecutive integers is 89. Find the integers.
37. The sum of two consecutive integers is −23. Find the integers.
38. The sum of two consecutive integers is −37. Find the integers.
39. The sum of three consecutive integers is 78. Find the integers.
40. The sum of three consecutive integers is 60. Find the integers.
41. Find three consecutive integers whose sum is −36.
42. Find three consecutive integers whose sum is −3.

Everyday Math

43. **Shopping** Patty paid $35 for a purse on sale for $10 off the original price. What was the original price of the purse?
44. **Shopping** Travis bought a pair of boots on sale for $25 off the original price. He paid $60 for the boots. What was the original price of the boots?
45. **Shopping** Minh spent $6.25 on 5 sticker books to give his nephews. Find the cost of each sticker book.
46. **Shopping** Alicia bought a package of 8 peaches for $3.20. Find the cost of each peach.
47. **Shopping** Tom paid $1,166.40 for a new refrigerator, including $86.40 tax. What was the price of the refrigerator before tax?
48. **Shopping** Kenji paid $2,279 for a new living room set, including $129 tax. What was the price of the living room set before tax?

Writing Exercises

49. Write a few sentences about your thoughts and opinions of word problems. Are these thoughts positive, negative, or neutral? If they are negative, how might you change your way of thinking in order to do better?
50. When you start to solve a word problem, how do you decide what to let the variable represent?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
approach word problems with a positive attitude.			
use a problem solving strategy for word problems.			
solve number problems.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don’t get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

6.9: Solve a Formula for a Specific Variable

Learning Objectives

- Use the distance, rate, and time formula
- Solve a formula for a specific variable

Be Prepared!

Before you get started, take this readiness quiz.

1. Write 35 miles per gallon as a unit rate. If you missed this problem, review Example 5.11.8.
2. Solve 6x + 24 = 96. If you missed this problem, review Example 8.4.1.
3. Find the simple interest earned after 5 years on $1,000 at an interest rate of 4%. If you missed this problem, review Example 6.4.1.

Use the Distance, Rate, and Time Formula

One formula you'll use often in algebra and in everyday life is the formula for distance traveled by an object moving at a constant speed. The basic idea is probably already familiar to you. Do you know what distance you travel if you drove at a steady rate of 60 miles per hour for 2 hours? (This might happen if you use your car's cruise control while driving on the Interstate.) If you said 120 miles, you already know how to use this formula!

The math to calculate the distance might look like this:

$$distance = \left(\frac{60\ miles}{1\ hour}\right)(2\ hours)$$
$$distance = 120\ miles$$

In general, the formula relating distance, rate, and time is

$$distance = rate \cdot time \tag{6.9.1}$$

Definition: Distance, Rate and Time

For an object moving in at a uniform (constant) rate, the distance traveled, the elapsed time, and the rate are related by the formula

$$d = rt \tag{6.9.2}$$

where d = distance, r = rate, and t = time.

Notice that the units we used above for the rate were miles per hour, which we can write as a ratio $\frac{miles}{hour}$. Then when we multiplied by the time, in hours, the common units 'hour' divided out. The answer was in miles.

Example 6.9.1:

Jamal rides his bike at a uniform rate of 12 miles per hour for $3\frac{1}{2}$ hours. How much distance has he traveled?

Solution

Step 1. **Read** the problem. You may want to create a mini-chart to summarize the information in the problem.	$d = ?$ $r = 12\ mph$ $t = 3\frac{1}{2}\ hours$
Step 2. **Identify** what you are looking for.	distance traveled

Step 3. **Name**. Choose a variable to represent it.	let d = distance
Step 4. **Translate**. Write the appropriate formula for the situation. Substitute in the given information.	$d = rt$ $d = 12 \cdot 3\frac{1}{2}$
Step 5. **Solve** the equation.	d = 42 miles
Step 6. **Check**: Does 42 miles make sense?	Jamal rides 12 miles in 1 hour, 24 miles in 2 hours, 36 miles in 3 hours, 48 miles in 4 hours, 42 miles in $3\frac{1}{2}$ hours is reasonable
Step 7. **Answer** the question with a complete sentence.	Jamal rode 42 miles.

? Exercise 6.9.1:

Lindsay drove for $5\frac{1}{2}$ hours at 60 miles per hour. How much distance did she travel?

Answer

330 mi

? Exercise 6.9.2:

Trinh walked for $2\frac{1}{3}$ hours at 3 miles per hour. How far did she walk?

Answer

7 mi

✓ Example 6.9.2:

Rey is planning to drive from his house in San Diego to visit his grandmother in Sacramento, a distance of 520 miles. If he can drive at a steady rate of 65 miles per hour, how many hours will the trip take?

Solution

Step 1. **Read** the problem. Summarize the information in the problem.	$d = 520\ miles$ $r = 65\ mph$ $t = ?$
Step 2. **Identify** what you are looking for.	how many hours (time)
Step 3. **Name**. Choose a variable to represent it.	let t = time
Step 4. **Translate**. Write the appropriate formula for the situation. Substitute in the given information.	$d = rt$ $520 = 65t$
Step 5. **Solve** the equation.	t = 8

Step 6. **Check**: Substitute the numbers into the formula and make sure the result is a true statement.	$d = rt$ $520 \stackrel{?}{=} 65 \cdot 8$ $520 = 520$ ✓
Step 7. **Answer** the question with a complete sentence. We know the units of time will be hours because we divided miles by miles per hour.	Rey's trip will take 8 hours.

? Exercise 6.9.3:

Lee wants to drive from Phoenix to his brother's apartment in San Francisco, a distance of 770 miles. If he drives at a steady rate of 70 miles per hour, how many hours will the trip take?

Answer

11 hours

? Exercise 6.9.4:

Yesenia is 168 miles from Chicago. If she needs to be in Chicago in 3 hours, at what rate does she need to drive?

Answer

56 mph

Solve a Formula for a Specific Variable

In this chapter, you became familiar with some formulas used in geometry. Formulas are also very useful in the sciences and social sciences—fields such as chemistry, physics, biology, psychology, sociology, and criminal justice. Healthcare workers use formulas, too, even for something as routine as dispensing medicine. The widely used spreadsheet program Microsoft Excel™ relies on formulas to do its calculations. Many teachers use spreadsheets to apply formulas to compute student grades. It is important to be familiar with formulas and be able to manipulate them easily.

In Example 9.57 and Example 9.58, we used the formula d = rt. This formula gives the value of d when you substitute in the values of r and t. But in Example 9.58, we had to find the value of t. We substituted in values of d and r and then used algebra to solve to t. If you had to do this often, you might wonder why there isn't a formula that gives the value of t when you substitute in the values of d and r. We can get a formula like this by solving the formula d = rt for t.

To solve a formula for a specific variable means to get that variable by itself with a coefficient of 1 on one side of the equation and all the other variables and constants on the other side. We will call this solving an equation for a specific variable in general. This process is also called solving a literal equation. The result is another formula, made up only of variables. The formula contains letters, or literals.

Let's try a few examples, starting with the distance, rate, and time formula we used above.

✓ Example 6.9.3:

Solve the formula d = rt for t: (a) when d = 520 and r = 65 (b) in general.

Solution

We'll write the solutions side-by-side so you can see that solving a formula in general uses the same steps as when we have numbers to substitute.

	(a) when d = 520 and r = 65	(b) in general
Write the formula.	d = rt	d = rt

Substitute any given values.	520 = 65t	
Divide to isolate t.	$\frac{520}{65} = \frac{65t}{65}$ (6.9.3)	$\frac{d}{r} = \frac{rt}{r}$ (6.9.4)
Simplify.	$8 = t$ $t = 8$	$\frac{d}{r} = t$ $t = \frac{d}{r}$

Notice that the solution for (a) is the same as that in Example 9.58. We say the formula t = $\frac{d}{r}$ is solved for t. We can use this version of the formula anytime we are given the distance and rate and need to find the time.

? Exercise 6.9.5:

Solve the formula d = rt for r: (a) when d = 180 and t = 4 (b) in general

Answer a

$r = 45$

Answer b

$r = \frac{d}{t}$

? Exercise 6.9.6:

Solve the formula d = rt for r: (a) when d = 780 and t = 12 (b) in general

Answer a

$r = 65$

Answer b

$r = \frac{d}{t}$

We used the formula A = $\frac{1}{2}$bh in Use Properties of Rectangles, Triangles, and Trapezoids to find the area of a triangle when we were given the base and height. In the next example, we will solve this formula for the height.

✓ Example 6.9.4:

The formula for area of a triangle is A = $\frac{1}{2}$bh. Solve this formula for h: (a) when A = 90 and b = 15 (b) in general

Solution

	(a) when A = 90 and b = 15	(b) in general
Write the formula.	A = $\frac{1}{2}$bh	A = $\frac{1}{2}$bh
Substitute any given values.	$90 = \frac{1}{2} \cdot 15 \cdot h$ (6.9.5)	

Clear the fractions.	$2 \cdot 90 = 2 \cdot \frac{1}{2} \cdot 15 \cdot h$ (6.9.6)	$2 \cdot A = 2 \cdot \frac{1}{2} \cdot b \cdot h$ (6.9.7)
Simplify.	180 = 15h	2A = bh
Solve for h.	12 = h	$\frac{2A}{b}$ = h

We can now find the height of a triangle, if we know the area and the base, by using the formula

$$h = \frac{2A}{b} \tag{6.9.8}$$

Exercise 6.9.7:

Use the formula A = $\frac{1}{2}$bh to solve for h: (a) when A = 170 and b = 17 (b) in general

Answer a

$h = 20$

Answer b

$h = \frac{2A}{b}$

Exercise 6.9.8:

Use the formula A = $\frac{1}{2}$bh to solve for b: (a) when A = 62 and h = 31 (b) in general

Answer a

$b = 4$

Answer b

$b = \frac{2A}{h}$

In Solve Simple Interest Applications, we used the formula I = Prt to calculate simple interest, where I is interest, P is principal, r is rate as a decimal, and t is time in years.

Example 6.9.5:

Solve the formula I = Prt to find the principal, P: (a) when I = \$5,600, r = 4%, t = 7 years (b) in general

Solution

	(a) when I = \$5,600, r = 4%, t = 7 years	(b) in general
Write the forumla.	I = Prt	I = Prt
Substitute any given values.	5600 = P(0.04)(7)	I = Prt
Multiply r • t.	5600 = P(0.28)	I = P(rt)
Divide to isolate P.	$\frac{5600}{0.28} = \frac{P(0.28)}{0.28}$ (6.9.9)	$\frac{I}{rt} = \frac{P(rt)}{rt}$ (6.9.10)
Simplify.	20,000 = P	$\frac{I}{rt}$ = P

State the answer.	The principal is $20,000.	$P = \frac{I}{rt}$ (6.9.11)

Exercise 6.9.9:

Use the formula I = Prt. Find t: (a) when I = $2,160, r = 6%, P = $12,000; (b) in general

Answer a

$t = 3$ years

Answer b

$t = \frac{I}{Pr}$

Exercise 6.9.10:

Use the formula I = Prt. Find r: (a) when I = $5,400, P = $9,000, t = 5 years; (b) in general

Answer a

$r = 0.12 = 12\%$

Answer b

$t = \frac{I}{Pt}$

Later in this course, and in future algebra classes, you'll encounter equations that relate two variables, usually x and y. You might be given an equation that is solved for y and need to solve it for x, or vice versa. In the following example, we're given an equation with both x and y on the same side and we'll solve it for y. To do this, we will follow the same steps that we used to solve a formula for a specific variable.

Example 6.9.6:

Solve the formula 3x + 2y = 18 for y: (a) when x = 4 (b) in general

Solution

	(a) when x = 4	(b) in general
Write the equation.	3x + 2y = 18	3x + 2y = 18
Substitute any given values.	3(4) + 2y = 18	3x + 2y = 18
Simplify if possible.	12 + 2y = 18	3x + 2y = 18
Subtract to isolate the y-term.	$12 - 12 + 2y = 18 - 12$ (6.9.12)	$3x - 3x + 2y = 18 - 3x$ (6.9.13)
Simplify.	2y = 6	2y = 18 - 3x
Divide.	$\frac{2y}{2} = \frac{6}{2}$ (6.9.14)	$\frac{2y}{2} = \frac{18 - 3x}{2}$ (6.9.15)
Simplify.	y = 3	$y = \frac{18 - 3x}{2}$ (6.9.16)

Exercise 6.9.11:

Solve the formula 3x + 4y = 10 for y: (a) when x = 2 (b) in general

Answer a

$y = 1$

Answer b

$y = \frac{10-3x}{4}$

Exercise 6.9.12:

Solve the formula 5x + 2y = 18 for y: (a) when x = 4 (b) in general

Answer a

$y = -1$

Answer b

$y = \frac{18-5x}{2}$

In the previous examples, we used the numbers in part (a) as a guide to solving in general in part (b). Do you think you're ready to solve a formula in general without using numbers as a guide?

Example 6.9.7:

Solve the formula P = a + b + c for a.

Solution

We will isolate a on one side of the equation.

We will isolate a on one side of the equation.	
Write the equation.	P = a + b + c
Subtract b and c from both sides to isolate a.	$P - b - c = a + b + c - b - c$ (6.9.17)
Simplify.	P − b − c = a

So, a = P − b − c.

Exercise 6.9.13:

Solve the formula P = a + b + c for b.

Answer

b = P - a - c

Exercise 6.9.14:

Solve the formula P = a + b + c for c.

Answer

c = P - a - b

Example 6.9.8:

Solve the equation 3x + y = 10 for y.

Solution

We will isolate y on one side of the equation.

We will isolate y on one side of the equation.		
Write the equation.	3x + y = 10	
Subtract 3x from both sides to isolate y.	$3x - 3x + y = 10 - 3x$	(6.9.18)
Simplify.	y = 10 - 3x	

Exercise 6.9.15:

Solve the formula 7x + y = 11 for y

Answer

y = 11 - 7x

Exercise 6.9.16:

Solve the formula 11x + y = 8 for y.

Answer

y = 8 - 11x

Example 6.9.9:

Solve the equation 6x + 5y = 13 for y.

Solution

We will isolate y on one side of the equation.

We will isolate y on one side of the equation.		
Write the equation.	6x + 5y = 13	
Subtract to isolate the term with y.	$6x + 5y - 6x = 13 - 6x$	(6.9.19)
Simplify.	5y = 13 - 6x	
Divide 5 to make the coefficient 1.	$\frac{5y}{5} = \frac{13 - 6x}{5}$	(6.9.20)
Simplify.	$y = \frac{13 - 6x}{5}$	(6.9.21)

Exercise 6.9.17:

Solve the formula 4x + 7y = 9 for y.

Answer

$y = \frac{9-4x}{7}$

Exercise 6.9.18:

Solve the formula 5x + 8y = 1 for y.

Answer

$y = \frac{1-5x}{8}$

Solving a Formula for a Specific Variable

Solving a Formula for a Specific Variable

Practice Makes Perfect

Use the Distance, Rate, and Time Formula

In the following exercises, solve.

307. Steve drove for $8\frac{1}{2}$ hours at 72 miles per hour. How much distance did he travel?
308. Socorro drove for $4\frac{5}{6}$ hours at 60 miles per hour. How much distance did she travel?
309. Yuki walked for $1\frac{3}{4}$ hours at 4 miles per hour. How far did she walk?
310. Francie rode her bike for $2\frac{1}{2}$ hours at 12 miles per hour. How far did she ride?
311. Connor wants to drive from Tucson to the Grand Canyon, a distance of 338 miles. If he drives at a steady rate of 52 miles per hour, how many hours will the trip take?
312. Megan is taking the bus from New York City to Montreal. The distance is 384 miles and the bus travels at a steady rate of 64 miles per hour. How long will the bus ride be?
313. Aurelia is driving from Miami to Orlando at a rate of 65 miles per hour. The distance is 235 miles. To the nearest tenth of an hour, how long will the trip take?
314. Kareem wants to ride his bike from St. Louis, Missouri to Champaign, Illinois. The distance is 180 miles. If he rides at a steady rate of 16 miles per hour, how many hours will the trip take?
315. Javier is driving to Bangor, Maine, which is 240 miles away from his current location. If he needs to be in Bangor in 4 hours, at what rate does he need to drive?
316. Alejandra is driving to Cincinnati, Ohio, 450 miles away. If she wants to be there in 6 hours, at what rate does she need to drive?
317. Aisha took the train from Spokane to Seattle. The distance is 280 miles, and the trip took 3.5 hours. What was the speed of the train?
318. Philip got a ride with a friend from Denver to Las Vegas, a distance of 750 miles. If the trip took 10 hours, how fast was the friend driving?

Solve a Formula for a Specific Variable

In the following exercises, use the formula. d = rt.

319. Solve for t: (a) when d = 350 and r = 70 (b) in general
320. Solve for t: (a) when d = 240 and r = 60 (b) in general
321. Solve for t: (a) when d = 510 and r = 60 (b) in general
322. Solve for t: (a) when d = 175 and r = 50 (b) in general
323. Solve for r: (a) when d = 204 and t = 3 (b) in general
324. Solve for r: (a) when d = 420 and t = 6 (b) in general
325. Solve for r: (a) when d = 160 and t = 2.5 (b) in general
326. Solve for r: (a) when d = 180 and t = 4.5 (b) in general.

In the following exercises, use the formula $A = \frac{1}{2}bh$.

327. Solve for b: (a) when A = 126 and h = 18 (b) in general
328. Solve for h: (a) when A = 176 and b = 22 (b) in general
329. Solve for h: (a) when A = 375 and b = 25 (b) in general
330. Solve for b: (a) when A = 65 and h = 13 (b) in general

In the following exercises, use the formula I = Prt.

331. Solve for the principal, P for: (a) I = $5,480, r = 4%, t = 7 years (b) in general
332. Solve for the principal, P for: (a) I = $3,950, r = 6%, t = 5 years (b) in general
333. Solve for the time, t for: (a) I = $2,376, P = $9,000, r = 4.4% (b) in general
334. Solve for the time, t for: (a) I = $624, P = $6,000, r = 5.2% (b) in general

In the following exercises, solve.

335. Solve the formula 2x + 3y = 12 for y: (a) when x = 3 (b) in general
336. Solve the formula 5x + 2y = 10 for y: (a) when x = 4 (b) in general
337. Solve the formula 3x + y = 7 for y: (a) when x = −2 (b) in general
338. Solve the formula 4x + y = 5 for y: (a) when x = −3 (b) in general
339. Solve a + b = 90 for b.
340. Solve a + b = 90 for a.
341. Solve 180 = a + b + c for a.
342. Solve 180 = a + b + c for c.
343. Solve the formula 8x + y = 15 for y.
344. Solve the formula 9x + y = 13 for y.
345. Solve the formula −4x + y = −6 for y.
346. Solve the formula −5x + y = −1 for y.
347. Solve the formula 4x + 3y = 7 for y.
348. Solve the formula 3x + 2y = 11 for y.
349. Solve the formula x − y = −4 for y.
350. Solve the formula x − y = −3 for y.
351. Solve the formula P = 2L + 2W for L.
352. Solve the formula P = 2L + 2W for W.
353. Solve the formula C = πd for d.
354. Solve the formula C = πd for π.
355. Solve the formula V = LWH for L.
356. Solve the formula V = LWH for H.

Everyday Math

357. **Converting temperature** While on a tour in Greece, Tatyana saw that the temperature was 40° Celsius. Solve for F in the formula $C = \frac{5}{9}(F - 32)$ to find the temperature in Fahrenheit.

358. **Converting temperature** Yon was visiting the United States and he saw that the temperature in Seattle was 50° Fahrenheit. Solve for C in the formula $F = \frac{9}{5}C + 32$ to find the temperature in Celsius.

Writing Exercises

359. Solve the equation $2x + 3y = 6$ for y: (a) when $x = -3$ (b) in general (c) Which solution is easier for you? Explain why.
360. Solve the equation $5x - 2y = 10$ for x: (a) when $y = 10$ (b) in general (c) Which solution is easier for you? Explain why.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the distance, rate, and time formula.			
solve a formula for a specific variable.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

6.E: Math Models and Geometry (Exercises)

9.1 - Use a Problem Solving Strategy

Approach Word Problems with a Positive Attitude

In the following exercises, solve.

361. How has your attitude towards solving word problems changed as a result of working through this chapter? Explain.
362. Did the Problem Solving Strategy help you solve word problems in this chapter? Explain.

Use a Problem Solving Strategy for Word Problems

In the following exercises, solve using the problem-solving strategy for word problems. Remember to write a complete sentence to answer each question.

363. Three-fourths of the people at a concert are children. If there are 87 children, what is the total number of people at the concert?
364. There are 9 saxophone players in the band. The number of saxophone players is one less than twice the number of tuba players. Find the number of tuba players
365. Reza was very sick and lost 15% of his original weight. He lost 27 pounds. What was his original weight?
366. Dolores bought a crib on sale for $350. The sale price was 40% of the original price. What was the original price of the crib?

Solve Number Problems

In the following exercises, solve each number word problem.

367. The sum of a number and three is forty-one. Find the number.
368. Twice the difference of a number and ten is fifty-four. Find the number.
369. One number is nine less than another. Their sum is twenty-seven. Find the numbers.
370. The sum of two consecutive integers is −135. Find the numbers.

9.2 - Solve Money Applications

Solve Coin Word Problems

In the following exercises, solve each coin word problem.

371. Francie has $4.35 in dimes and quarters. The number of dimes is 5 more than the number of quarters. How many of each coin does she have?
372. Scott has $0.39 in pennies and nickels. The number of pennies is 8 times the number of nickels. How many of each coin does he have?
373. Paulette has $140 in $5 and $10 bills. The number of $10 bills is one less than twice the number of $5 bills. How many of each does she have?
374. Lenny has $3.69 in pennies, dimes, and quarters. The number of pennies is 3 more than the number of dimes. The number of quarters is twice the number of dimes. How many of each coin does he have?

Solve Ticket and Stamp Word Problems

In the following exercises, solve each ticket or stamp word problem.

375. A church luncheon made $842. Adult tickets cost $10 each and children’s tickets cost $6 each. The number of children was 12 more than twice the number of adults. How many of each ticket were sold?
376. Tickets for a basketball game cost $2 for students and $5 for adults. The number of students was 3 less than 10 times the number of adults. The total amount of money from ticket sales was $619. How many of each ticket were sold?
377. Ana spent $4.06 buying stamps. The number of $0.41 stamps she bought was 5 more than the number of $0.26 stamps. How many of each did she buy?
378. Yumi spent $34.15 buying stamps. The number of $0.56 stamps she bought was 10 less than 4 times the number of $0.41 stamps. How many of each did she buy?

9.3 - Use Properties of Angles, Triangles, and the Pythagorean Theorem

Use Properties of Angles

In the following exercises, solve using properties of angles.

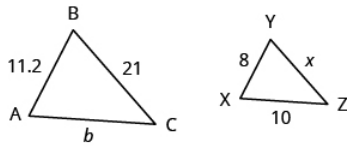
379. What is the supplement of a 48° angle?
380. What is the complement of a 61° angle?
381. Two angles are complementary. The smaller angle is 24° less than the larger angle. Find the measures of both angles.
382. Two angles are supplementary. The larger angle is 45° more than the smaller angle. Find the measures of both angles.

Use Properties of Triangles

In the following exercises, solve using properties of triangles.

383. The measures of two angles of a triangle are 22 and 85 degrees. Find the measure of the third angle.
384. One angle of a right triangle measures 41.5 degrees. What is the measure of the other small angle?
385. One angle of a triangle is 30° more than the smallest angle. The largest angle is the sum of the other angles. Find the measures of all three angles.
386. One angle of a triangle is twice the measure of the smallest angle. The third angle is 60° more than the measure of the smallest angle. Find the measures of all three angles.

In the following exercises, ΔABC is similar to ΔXYZ. Find the length of the indicated side.



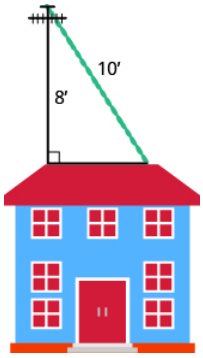
387. side x
388. side b

Use the Pythagorean Theorem

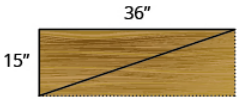
In the following exercises, use the Pythagorean Theorem to find the length of the missing side. Round to the nearest tenth, if necessary

389. 
390. 
391. 
392. 
393. 
394. 
In the following exercises, solve. Approximate to the nearest tenth, if necessary.

395. Sergio needs to attach a wire to hold the antenna to the roof of his house, as shown in the figure. The antenna is 8 feet tall and Sergio has 10 feet of wire. How far from the base of the antenna can he attach the wire?



396. Seong is building shelving in his garage. The shelves are 36 inches wide and 15 inches tall. He wants to put a diagonal brace across the back to stabilize the shelves, as shown. How long should the brace be?



9.4 - Use Properties of Rectangles, Triangles, and Trapezoids

Understand Linear, Square, Cubic Measure

In the following exercises, would you measure each item using linear, square, or cubic measure?

397. amount of sand in a sandbag
398. height of a tree
399. size of a patio
400. length of a highway

In the following exercises, find (a) the perimeter (b) the area of each figure

401.

402.

Use Properties of Rectangles

In the following exercises, find the (a) perimeter (b) area of each rectangle

403. The length of a rectangle is 42 meters and the width is 28 meters.
404. The length of a rectangle is 36 feet and the width is 19 feet.
405. A sidewalk in front of Kathy's house is in the shape of a rectangle 4 feet wide by 45 feet long.
406. A rectangular room is 16 feet wide by 12 feet long.

In the following exercises, solve.

407. Find the length of a rectangle with perimeter of 220 centimeters and width of 85 centimeters.
408. Find the width of a rectangle with perimeter 39 and length 11.
409. The area of a rectangle is 2356 square meters. The length is 38 meters. What is the width?
410. The width of a rectangle is 45 centimeters. The area is 2700 square centimeters. What is the length?
411. The length of a rectangle is 12 centimeters more than the width. The perimeter is 74 centimeters. Find the length and the width.
412. The width of a rectangle is 3 more than twice the length. The perimeter is 96 inches. Find the length and the width.

Use Properties of Triangles

In the following exercises, solve using the properties of triangles.

413. Find the area of a triangle with base 18 inches and height 15 inches.
414. Find the area of a triangle with base 33 centimeters and height 21 centimeters.
415. A triangular road sign has base 30 inches and height 40 inches. What is its area?
416. If a triangular courtyard has sides 9 feet and 12 feet and the perimeter is 32 feet, how long is the third side?
417. A tile in the shape of an isosceles triangle has a base of 6 inches. If the perimeter is 20 inches, find the length of each of the other sides.
418. Find the length of each side of an equilateral triangle with perimeter of 81 yards.
419. The perimeter of a triangle is 59 feet. One side of the triangle is 3 feet longer than the shortest side. The third side is 5 feet longer than the shortest side. Find the length of each side.
420. One side of a triangle is three times the smallest side. The third side is 9 feet more than the shortest side. The perimeter is 39 feet. Find the lengths of all three sides.

Use Properties of Trapezoids

In the following exercises, solve using the properties of trapezoids.

421. The height of a trapezoid is 8 feet and the bases are 11 and 14 feet. What is the area?
422. The height of a trapezoid is 5 yards and the bases are 7 and 10 yards. What is the area?
423. Find the area of the trapezoid with height 25 meters and bases 32.5 and 21.5 meters.
424. A flag is shaped like a trapezoid with height 62 centimeters and the bases are 91.5 and 78.1 centimeters. What is the area of the flag?

9.5 - Solve Geometry Applications: Circles and Irregular Figures

Use Properties of Circle

s In the following exercises, solve using the properties of circles. Round answers to the nearest hundredth.

425. A circular mosaic has radius 3 meters. Find the (a) circumference (b) area of the mosaic
426. A circular fountain has radius 8 feet. Find the (a) circumference (b) area of the fountain
427. Find the diameter of a circle with circumference 150.72 inches.
428. Find the radius of a circle with circumference 345.4 centimeters

Find the Area of Irregular Figures

In the following exercises, find the area of each shaded region.

429. 
430. 
431. 
432. 
433. 
434. 
9.6 - Solve Geometry Applications: Volume and Surface Area

Find Volume and Surface Area of Rectangular Solids

In the following exercises, find the (a) volume (b) surface area of the rectangular solid

435. a rectangular solid with length 14 centimeters, width 4.5 centimeters, and height 10 centimeters
436. a cube with sides that are 3 feet long
437. a cube of tofu with sides 2.5 inches

438. a rectangular carton with length 32 inches, width 18 inches, and height 10 inches

Find Volume and Surface Area of Spheres

In the following exercises, find the (a) volume (b) surface area of the sphere.

439. a sphere with radius 4 yards
440. a sphere with radius 12 meters
441. a baseball with radius 1.45 inches
442. a soccer ball with radius 22 centimeters

Find Volume and Surface Area of Cylinders

In the following exercises, find the (a) volume (b) surface area of the cylinder

443. a cylinder with radius 2 yards and height 6 yards
444. a cylinder with diameter 18 inches and height 40 inches
445. a juice can with diameter 8 centimeters and height 15 centimeters
446. a cylindrical pylon with diameter 0.8 feet and height 2.5 feet

Find Volume of Cones

In the following exercises, find the volume of the cone.

447. a cone with height 5 meters and radius 1 meter
448. a cone with height 24 feet and radius 8 feet
449. a cone-shaped water cup with diameter 2.6 inches and height 2.6 inches
450. a cone-shaped pile of gravel with diameter 6 yards and height 5 yards

9.7 - Solve a Formula for a Specific Variable

Use the Distance, Rate, and Time Formula

In the following exercises, solve using the formula for distance, rate, and time.

451. A plane flew 4 hours at 380 miles per hour. What distance was covered?
452. Gus rode his bike for $1\frac{1}{2}$ hours at 8 miles per hour. How far did he ride?
453. Jack is driving from Bangor to Portland at a rate of 68 miles per hour. The distance is 107 miles. To the nearest tenth of an hour, how long will the trip take?
454. Jasmine took the bus from Pittsburgh to Philadelphia. The distance is 305 miles and the trip took 5 hours. What was the speed of the bus?

Solve a Formula for a Specific Variable

In the following exercises, use the formula d = rt.

455. Solve for t: (a) when d = 403 and r = 65 (b) in general
456. Solve for r: (a) when d = 750 and t = 15 (b) in general

In the following exercises, use the formula $A = \frac{1}{2}bh$.

457. Solve for b: (a) when A = 416 and h = 32 (b) in general
458. Solve for h: (a) when A = 48 and b = 8 (b) in general

In the following exercises, use the formula I = Prt.

459. Solve for the principal, P, for: (a) I = \$720, r = 4%, t = 3 years (b) in general
460. Solve for the time, t for: (a) I = \$3630, P = \$11,000, r = 5.5% (b) in general

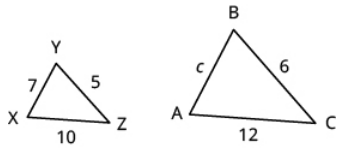
In the following exercises, solve.

461. Solve the formula 6x + 5y = 20 for y: (a) when x = 0 (b) in general
462. Solve the formula 2x + y = 15 for y: (a) when x = −5 (b) in general
463. Solve a + b = 90 for a.

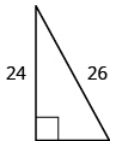
464. Solve 180 = a + b + c for a.
465. Solve the formula 4x + y = 17 for y.
466. Solve the formula −3x + y = −6 for y.
467. Solve the formula P = 2L + 2W for W.
468. Solve the formula V = LWH for H.
469. Describe how you have used two topics from this chapter in your life outside of math class during the past month.

PRACTICE TEST

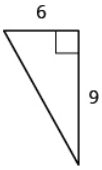
470. Four-fifths of the people on a hike are children. If there are 12 children, what is the total number of people on the hike?
471. The sum of 13 and twice a number is −19. Find the number.
472. One number is 3 less than another number. Their sum is 65. Find the numbers.
473. Bonita has $2.95 in dimes and quarters in her pocket. If she has 5 more dimes than quarters, how many of each coin does she have?
474. At a concert, $1600 in tickets were sold. Adult tickets were $9 each and children's tickets were $4 each. If the number of adult tickets was 30 fewer than twice the number of children's tickets, how many of each kind were sold?
475. Find the complement of a 52° angle.
476. The measure of one angle of a triangle is twice the measure of the smallest angle. The measure of the third angle is 14 more than the measure of the smallest angle. Find the measures of all three angles.
477. The perimeter of an equilateral triangle is 145 feet. Find the length of each side.
478. ΔABC is similar to ΔXYZ. Find the length of side c.



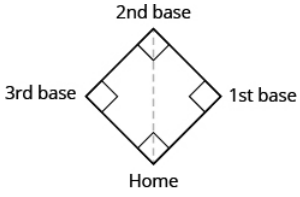
479. Find the length of the missing side. Round to the nearest tenth, if necessary.



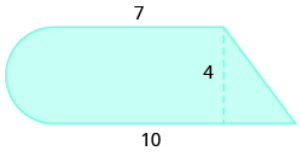
480. Find the length of the missing side. Round to the nearest tenth, if necessary.



481. A baseball diamond is shaped like a square with sides 90 feet long. How far is it from home plate to second base, as shown?



482. The length of a rectangle is 2 feet more than five times the width. The perimeter is 40 feet. Find the dimensions of the rectangle.
483. A triangular poster has base 80 centimeters and height 55 centimeters. Find the area of the poster.
484. A trapezoid has height 14 inches and bases 20 inches and 23 inches. Find the area of the trapezoid.
485. A circular pool has diameter 90 inches. What is its circumference? Round to the nearest tenth.
486. Find the area of the shaded region. Round to the nearest tenth.



487. Find the volume of a rectangular room with width 12 feet, length 15 feet, and height 8 feet.
488. A coffee can is shaped like a cylinder with height 7 inches and radius 5 inches. Find (a) the surface area and (b) the volume of the can. Round to the nearest tenth.
489. A traffic cone has height 75 centimeters. The radius of the base is 20 centimeters. Find the volume of the cone. Round to the nearest tenth.
490. Leon drove from his house in Cincinnati to his sister's house in Cleveland. He drove at a uniform rate of 63 miles per hour and the trip took 4 hours. What was the distance?
491. The Catalina Express takes $1\frac{1}{2}$ hours to travel from Long Beach to Catalina Island, a distance of 22 miles. To the nearest tenth, what is the speed of the boat?
492. Use the formula I = Prt to solve for the principal, P, for: (a) I = $1380, r = 5%, t = 3 years (b) in general
493. Solve the formula A = $\frac{1}{2}$bh for h: (a) when A = 1716 and b = 66 (b) in general
494. Solve x + 5y = 14 for y.

6.S: Math Models and Geometry (Summary)

Key Terms

angle	An angle is formed by two rays that share a common endpoint. Each ray is called a side of the angle.
area	The area is a measure of the surface covered by a figure.
complementary angles	If the sum of the measures of two angles is 90°, then they are called complementary angles.
cone	A cone is a solid figure with one circular base and a vertex.
cube	A cube is a rectangular solid whose length, width, and height are equal.
cylinder	A cylinder is a solid figure with two parallel circles of the same size at the top and bottom.
equilateral triangle	A triangle with all three sides of equal length is called an equilateral triangle.
hypotenuse	The side of the triangle opposite the 90° angle is called the hypotenuse.
irregular figure	A figure that is not a standard geometric shape. Its area cannot be calculated using any of the standard area formulas.
isosceles triangle	A triangle with two sides of equal length is called an isosceles triangle.
legs of a right triangle	The sides of a right triangle adjacent to the right angle
perimeter	The perimeter is a measure of the distance around a figure.
rectangle	A geometric figure that has four sides and four right angles.
right triangle	A triangle that has one 90° angle.
similar figures	In geometry, if two figures have exactly the same shape but different sizes, we say they are similar figures.
supplementary angles	If the sum of the measures of two angles is 180°, then they are called supplementary angles.
trapezoid	A four-sided figure, a quadrilateral, with two sides that are parallel and two sides that are not.
triangle	A geometric figure with three sides and three angles.
vertex of an angle	When two rays meet to form an angle, the common endpoint is called the vertex of the angle.

Key Concepts

9.1 - Use a Problem Solving Strategy

- **Problem Solving Strategy**
  1. Read the word problem. Make sure you understand all the words and ideas. You may need to read the problem two or more times. If there are words you don't understand, look them up in a dictionary or on the internet.
  2. Identify what you are looking for.
  3. Name what you are looking for. Choose a variable to represent that quantity.
  4. Translate into an equation. It may be helpful to first restate the problem in one sentence before translating.

5. Solve the equation using good algebra techniques.
6. Check the answer in the problem. Make sure it makes sense.
7. Answer the question with a complete sentence.

9.2 - Solve Money Applications

- **Finding the Total Value for Coins of the Same Type**
  - For coins of the same type, the total value can be found as follows:

$$number \cdot value = total\ value \tag{6.S.1}$$

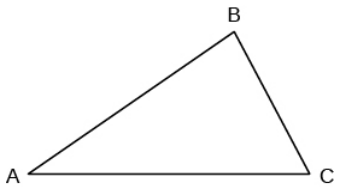
    where number is the number of coins, value is the value of each coin, and total value is the total value of all the coins.
- **Solve a Coin Word Problem**
  1. **Read** the problem. Make sure you understand all the words and ideas, and create a table to organize the information.
  2. **Identify** what you are looking for.
  3. **Name** what you are looking for. Choose a variable to represent that quantity.
     - Use variable expressions to represent the number of each type of coin and write them in the table.
     - Multiply the number times the value to get the total value of each type of coin.
  4. **Translate** into an equation. Write the equation by adding the total values of all the types of coins.
  5. **Solve** the equation using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.

Table 9.16

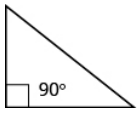
Type	Number	Value ($)	Total Value ($)

9.3 - Use Properties of Angles, Triangles, and the Pythagorean Theorem

- **Supplementary and Complementary Angles**
  - If the sum of the measures of two angles is 180°, then the angles are supplementary.
  - If $\angle A$ and $\angle B$ are supplementary, then $m\angle A + m\angle B = 180$.
  - If the sum of the measures of two angles is 90°, then the angles are complementary.
  - If $\angle A$ and $\angle B$ are complementary, then $m\angle A + m\angle B = 90$.
- **Solve Geometry Applications**
  1. Read the problem and make sure you understand all the words and ideas. Draw a figure and label it with the given information.
  2. Identify what you are looking for.
  3. Name what you are looking for and choose a variable to represent it.
  4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
  5. Solve the equation using good algebra techniques.
  6. Check the answer in the problem and make sure it makes sense.
  7. Answer the question with a complete sentence.
- **Sum of the Measures of the Angles of a Triangle**
  - For any ΔABC, the sum of the measures is 180°
  - $m\angle A + m\angle B = 180$



- **Right Triangle**
  - A right triangle is a triangle that has one 90° angle, which is often marked with a ⌞ symbol.



- **Properties of Similar Triangles**
  - If two triangles are similar, then their corresponding angle measures are equal and their corresponding side lengths have the same ratio.

9.4 - Use Properties of Rectangles, Triangles, and Trapezoids

- **Properties of Rectangles**
  - Rectangles have four sides and four right (90°) angles.
  - The lengths of opposite sides are equal.
  - The perimeter, P , of a rectangle is the sum of twice the length and twice the width.

$$P = 2L + 2W \tag{6.S.2}$$

  - The area, A, of a rectangle is the length times the width.$$A = L \cdot W$
- **Triangle Properties**
  - For any triangle ΔABC , the sum of the measures of the angles is 180°.

$$m\angle A + m\angle B + m\angle C = 180^\circ \tag{6.S.3}$$

  - The perimeter of a triangle is the sum of the lengths of the sides.

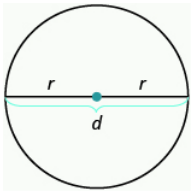
$$P = a + b + c \tag{6.S.4}$$

  - The area of a triangle is one-half the base, b, times the height, h.

$$A = \frac{1}{2}bh \tag{6.S.5}$$

9.5 - Solve Geometry Applications: Circles and Irregular Figures

- **Problem Solving Strategy for Geometry Applications**
  1. Read the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.
  2. Identify what you are looking for.
  3. Name what you are looking for. Choose a variable to represent that quantity.
  4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
  5. Solve the equation using good algebra techniques.
  6. Check the answer in the problem and make sure it makes sense.
  7. Answer the question with a complete sentence.
- **Properties of Circles**
  - d = 2r
  - Circumference: C = 2πr or C = πd
  - Area: $A = \pi r^2$



9.6 - Solve Geometry Applications: Volume and Surface Area

- **Volume and Surface Area of a Rectangular Solid**
  - V = LWH
  - S = 2LH + 2LW + 2WH
- **Volume and Surface Area of a Cube**
  - $V = s^3$
  - $S = 6s^2$
- **Volume and Surface Area of a Sphere**
  - $V = \frac{4}{3}\pi r^3$
  - $S = 4\pi r^2$
- **Volume and Surface Area of a Cylinder**
  - $V = \pi r^2 h$
  - $S = 2\pi r^2 + 2\pi rh$
- **Volume of a Cone**
  - For a cone with radius r and height h: Volume: $V = \frac{1}{3}\pi r^2 h$

9.7 - Solve a Formula for a Specific Variable

- **Distance, Rate, and Time**
  - d = rt

CHAPTER OVERVIEW

7: Percents

When you deposit money in a savings account at a bank, it earns additional money. Figuring out how your money will grow involves understanding and applying concepts of percents. In this chapter, we will find out what percents are and how we can use them to solve problems.

7.1: Understand Percent
7.2: Solve General Applications of Percent
7.3: Solve Sales Tax, Commission, and Discount Applications
7.4: Solve Simple Interest Applications
7.5: Percent Increase or Decrease
7.6: Pie Charts
7.7: Solve Proportions and their Applications (Part 1)
7.8: Solve Proportions and their Applications (Part 2)
7.E: Percents (Exercises)
7.S: Percents (Summary)

Figure 6.1 - Banks provide money for savings and charge money for loans. The interest on savings and loans is usually given as a percent. (credit: Mike Mozart, Flickr)

This page titled 7: Percents is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

7.1: Understand Percent

Learning Objectives

- Use the definition of percent
- Convert percents to fractions and decimals
- Convert decimals and fractions to percents

be prepared!

Before you get started, take this readiness quiz.

1. Translate “the ratio of 33 to 5” into an algebraic expression. If you missed this problem, review Table 2.4.3.
2. Write 3 5 as a decimal. If you missed this problem, review Example 5.5.1.
3. Write 0.62 as a fraction. If you missed this problem, review Example 5.1.4.

Use the Definition of Percent

How many cents are in one dollar? There are 100 cents in a dollar. How many years are in a century? There are 100 years in a century. Does this give you a clue about what the word “per cent” means? It is really two words, “per cent,” and means per one hundred. A **percent** is a ratio whose denominator is 100. We use the percent symbol %, to show percent.

Definition: Percent

A percent is a ratio whose denominator is 100.

According to data from the American Association of Community Colleges (2015), about 57% of community college students are female. This means 57 out of every 100 community college students are female, as Figure 7.1.1 shows. Out of the 100 squares on the grid, 57 are shaded, which we write as the ratio $\frac{57}{100}$.

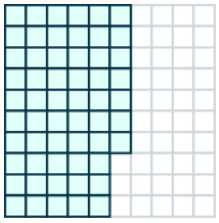

Figure 7.1.1 - Among every 100 community college students, 57 are female.

Similarly, 25% means a ratio of $\frac{25}{100}$, 3% means a ratio of $\frac{3}{100}$ and 100% means a ratio of $\frac{100}{100}$. In words, "one hundred percent" means the total 100% is $\frac{100}{100}$, and since $\frac{100}{100} = 1$, we see that 100% means 1 whole.

Example 7.1.1:

According to the Public Policy Institute of California (2010), 44% of parents of public school children would like their youngest child to earn a graduate degree. Write this percent as a ratio.

Solution

The amount we want to convert is 44%.	44%	
Write the percent as a ratio. Remember that percent means per 100.	$\frac{44}{100}$	(7.1.1)

Exercise 7.1.1:

Write the percent as a ratio. According to a survey, 89% of college students have a smartphone.

Answer

$\frac{89}{100}$

Exercise 7.1.2:

Write the percent as a ratio. A study found that 72% of U.S. teens send text messages regularly.

Answer

$\frac{72}{100}$

Example 7.1.2:

In 2007, according to a U.S. Department of Education report, 21 out of every 100 first-time freshmen college students at 4-year public institutions took at least one remedial course. Write this as a ratio and then as a percent.

Solution

The amount we want to convert is 21 out of 100.	21 out of 100	
Write as a ratio.	$\frac{21}{100}$	(7.1.2)
Convert the 21 per 100 to percent.	21%	

Exercise 7.1.3:

Write as a ratio and then as a percent: The American Association of Community Colleges reported that 62 out of 100 full-time community college students balance their studies with full-time or part time employment.

Answer

$\frac{62}{100}$, 62%

Exercise 7.1.4:

Write as a ratio and then as a percent: In response to a student survey, 41 out of 100 Santa Ana College students expressed a goal of earning an Associate's degree or transferring to a four-year college.

Answer

$\frac{41}{100}$, 41%

Convert Percents to Fractions and Decimals

Since percents are ratios, they can easily be expressed as fractions. Remember that percent means per 100, so the denominator of the fraction is 100.

HOW TO: CONVERT A PERCENT TO A FRACTION

Step 1. Write the percent as a ratio with the denominator 100.

Step 2. Simplify the fraction if possible.

Example 7.1.3:

Convert each percent to a fraction: (a) 36% (b) 125%

Solution

(a) 36%

Write as a ratio with denominator 100.	$\frac{36}{100}$	(7.1.3)
Simplify.	$\frac{9}{25}$	(7.1.4)

(b) 125%

Write as a ratio with denominator 100.	$\frac{125}{100}$	(7.1.5)
Simplify.	$\frac{5}{4}$	(7.1.6)

Exercise 7.1.5:

Convert each percent to a fraction: (a) 48% (b) 110%

Answer a

$\frac{12}{25}$

Answer b

$\frac{11}{10}$

Exercise 7.1.6:

Convert each percent to a fraction: (a) 64% (b) 150%

Answer a

$\frac{16}{25}$

Answer b

$\frac{3}{2}$

The previous example shows that a percent can be greater than 1. We saw that 125% means $\frac{125}{100}$, or $\frac{5}{4}$. These are improper fractions, and their values are greater than one.

Example 7.1.4:

Convert each percent to a fraction: (a) 24.5% (b) $33\frac{1}{3}\%$

Solution

(a) 24.5%

Write as a ratio with denominator 100.	$\frac{24.5}{100}$	(7.1.7)
Clear the decimal by multiplying numerator and denominator by 10.	$\frac{24.5(10)}{100(10)}$	(7.1.8)
Multiply.	$\frac{245}{1000}$	(7.1.9)
Rewrite showing common factors.	$\frac{5 \cdot 49}{5 \cdot 200}$	(7.1.10)
Simplify.	$\frac{49}{200}$	(7.1.11)

(b) $33\frac{1}{3}\%$

Write as a ratio with denominator 100.	$\frac{33\frac{1}{3}}{100}$	(7.1.12)
Write the numerator as an improper fraction.	$\frac{\frac{100}{3}}{100}$	(7.1.13)
Rewrite as fraction division, replacing 100 with $\frac{100}{1}$.	$\frac{100}{3} \div \frac{100}{1}$	(7.1.14)
Multiply by the reciprocal.	$\frac{100}{3} \cdot \frac{1}{100}$	(7.1.15)
Simplify.	$\frac{1}{3}$	(7.1.16)

Exercise 7.1.7:

Convert each percent to a fraction: (a) 64.4% (b) $66\frac{2}{3}\%$

Answer a

$\frac{161}{250}$

Answer b

$\frac{2}{3}$

Exercise 7.1.8:

Convert each percent to a fraction: (a) 42.5% (b) $8\frac{3}{4}\%$

Answer a

$\frac{113}{250}$

Answer b

$\frac{7}{80}$

In Decimals, we learned how to convert fractions to decimals. To convert a percent to a decimal, we first convert it to a fraction and then change the fraction to a decimal.

HOW TO: CONVERT A PERCENT TO A DECIMAL

Step 1. Write the percent as a ratio with the denominator 100.

Step 2. Convert the fraction to a decimal by dividing the numerator by the denominator.

Example 7.1.5:

Convert each percent to a decimal: (a) 6% (b) 78%

Solution

Because we want to change to a decimal, we will leave the fractions with denominator 100 instead of removing common factors.

(a) 6%

Write as a ratio with denominator 100.	$\frac{6}{100}$	(7.1.17)
Change the fraction to a decimal by dividing the numerator by the denominator.	0.06	

(b) 78%

Write as a ratio with denominator 100.	$\frac{78}{100}$	(7.1.18)
Change the fraction to a decimal by dividing the numerator by the denominator.	0.78	

Exercise 7.1.9:

Convert each percent to a decimal: (a) 9% (b) 87%

Answer a

0.09

Answer b

0.87

Exercise 7.1.10:

Convert each percent to a decimal: (a) 3% (b) 91%

Answer a

0.03

Answer b

0.91

Example 7.1.6:

Convert each percent to a decimal: (a) 135% (b) 12.5%

Solution

Write as a ratio with denominator 100.	$\frac{135}{100}$	(7.1.19)
Change the fraction to a decimal by dividing the numerator by the denominator.	1.35	

(b) 12.5%

Write as a ratio with denominator 100.	$\frac{12.5}{100}$	(7.1.20)
Change the fraction to a decimal by dividing the numerator by the denominator.	0.125	

Exercise 7.1.11:

Convert each percent to a decimal: (a) 115% (b) 23.5%

Answer a

1.15

Answer b

0.235

Exercise 7.1.12:

Convert each percent to a decimal: (a) 123% (b) 16.8%

Answer a

1.23

Answer b

0.168

Let's summarize the results from the previous examples in Table 7.1.1, and look for a pattern we could use to quickly convert a percent number to a decimal number.

Table 7.1.1

Percent	Decimal
6%	0.06
78%	0.78
135%	1.35
12.5%	0.125

Do you see the pattern? To convert a percent number to a decimal number, we move the decimal point two places to the left and remove the % sign. (Sometimes the decimal point does not appear in the percent number, but just like we can think of the integer 6 as 6.0, we can think of 6% as 6.0%.) Notice that we may need to add zeros in front of the number when moving the decimal to the left.

Figure 7.1.2 uses the percents in Table 7.1.1 and shows visually how to convert them to decimals by moving the decimal point two places to the left.

Percent	Decimal
006.%	0.06
078.%	0.78
135.%	1.35
012.5%	0.125

Figure 7.1.2

Example 7.1.7:

Among a group of business leaders, 77% believe that poor math and science education in the U.S. will lead to higher unemployment rates. Convert the percent to: (a) a fraction (b) a decimal

Solution

(a)

Write as a ratio with denominator 100.	$\frac{77}{100}$	(7.1.21)

(b)

Change the fraction to a decimal by dividing the numerator by the denominator.	0.77

Exercise 7.1.13:

Twitter's share of web traffic jumped 24% when one celebrity tweeted live on air. Convert the percent to: (a) a fraction and (b) a decimal.

Answer a

$\frac{6}{25}$

Answer b

0.24

Exercise 7.1.14:

The U.S. Census estimated that in 2013, 44% of the population of Boston age 25 or older have a bachelor's or higher degrees. Convert the percent to: (a) a fraction and (b) a decimal.

Answer a

$\frac{22}{50}$

Answer b

0.44

Example 7.1.8:

There are four suits of cards in a deck of cards—hearts, diamonds, clubs, and spades. The probability of randomly choosing a heart from a shuffled deck of cards is 25%. Convert the percent to: (a) a fraction (b) a decimal.

Figure 7.1.3 - (credit: Riles32807, Wikimedia Commons)

Solution

(a)

Write as a ratio with denominator 100.	$\frac{25}{100}$	(7.1.22)
Simplify.	$\frac{1}{4}$	(7.1.23)

(b)

Change the fraction to a decimal by dividing the numerator by the denominator.	0.25

Exercise 7.1.15:

The probability that it will rain Monday is 30%. Convert the percent to: (a) a fraction, and (b) a decimal.

Answer a

$\frac{3}{10}$

Answer b

0.3

Exercise 7.1.16:

The probability of getting heads three times when tossing a coin three times is 12.5%. Convert the percent to: (a) a fraction, and (b) a decimal.

Answer a

$\frac{12.5}{100}$

Answer b

0.125

Convert Decimals and Fractions to Percents

To convert a decimal to a percent, remember that percent means per hundred. If we change the decimal to a fraction whose denominator is 100, it is easy to change that fraction to a percent.

HOW TO: CONVERT A DECIMAL TO A PERCENT

Step 1. Write the decimal as a fraction.

Step 2. If the denominator of the fraction is not 100, rewrite it as an equivalent fraction with denominator 100.

Step 3. Write this ratio as a percent.

Example 7.1.9:

Convert each decimal to a percent: (a) 0.05 (b) 0.83

Solution

(a) 0.05

Write as a fraction. The denominator is 100.	$\frac{5}{100}$	(7.1.24)
Write this ratio as a percent.	5%	

(b)

The denominator is 100.	$\frac{83}{100}$	(7.1.25)
Write this ratio as a percent.	83%	

Exercise 7.1.17:

Convert each decimal to a percent: (a) 0.01 (b) 0.17.

Answer a

1%

Answer b

17%

Exercise 7.1.18:

Convert each decimal to a percent: (a) 0.04 (b) 0.41.

Answer a

4%

Answer b

41%

To convert a mixed number to a percent, we first write it as an improper fraction.

Example 7.1.10:

Convert each decimal to a percent: (a) 1.05 (b) 0.075

Solution

(a) 1.05

Write as a fraction.	$1\frac{5}{100}$	(7.1.26)
Write as an improper fraction. The denominator is 100.	$\frac{105}{100}$	(7.1.27)
Write this ratio as a percent.	105%	

Notice that since 1.05 > 1, the result is more than 100%.

(b) 0.075

Write as a fraction.	$\frac{75}{1,000}$	(7.1.28)
Divide the numerator and denominator by 10, so that the denominator is 100.	$\frac{7.5}{100}$	(7.1.29)
Write this ratio as a percent.	7.5%	

Exercise 7.1.19:

Convert each decimal to a percent: (a) 1.75 (b) 0.0825

Answer a

175%

Answer b

8.25%

Exercise 7.1.20:

Convert each decimal to a percent: (a) 2.25 (b) 0.0925

Answer a

225%

Answer b

9.25%

Let's summarize the results from the previous examples in Table 6.20 so we can look for a pattern.

Table 7.1.2

Decimal	Percent
0.05	5%
0.83	83%
1.05	105%
0.075	7.5%

Do you see the pattern? To convert a decimal to a percent, we move the decimal point two places to the right and then add the percent sign.

Figure 7.1.4 uses the decimal numbers in Table 7.1.2 and shows visually to convert them to percents by moving the decimal point two places to the right and then writing the % sign.

Percent	Decimal
006.%	0.06
078.%	0.78
135.%	1.35
012.5%	0.125

Figure 7.1.4

In Decimals, we learned how to convert fractions to decimals. Now we also know how to change decimals to percents. So to convert a fraction to a percent, we first change it to a decimal and then convert that decimal to a percent.

HOW TO: CONVERT A FRACTION TO A PERCENT

Step 1. Convert the fraction to a decimal.

Step 2. Convert the decimal to a percent.

Example 7.1.11:

Convert each fraction or mixed number to a percent: (a) $\frac{3}{4}$ (b) $\frac{11}{8}$ (c) $2\frac{1}{5}$

Solution

To convert a fraction to a decimal, divide the numerator by the denominator.

(a)

Change to a decimal.	$\frac{3}{4}$	(7.1.30)

Write as a percent by moving the decimal two places.	0.75	
	75%	

(b)

Change to a decimal.	$\frac{11}{8}$	(7.1.31)
Write as a percent by moving the decimal two places.	1.375	
	137.5%	

(c)

Write as an improper fraction.	$2\frac{1}{5}$	(7.1.32)
Change to a decimal.	$\frac{11}{5}$	(7.1.33)
Write as a percent.	2.20	
	220%	

Notice that we needed to add zeros at the end of the number when moving the decimal two places to the right.

? Exercise 7.1.21:

Convert each fraction or mixed number to a percent: (a) $\frac{5}{8}$ (b) $\frac{11}{4}$ (c) $3\frac{2}{5}$

Answer a

62.5%

Answer b

275%

Answer c

340%

? Exercise 7.1.22:

Convert each fraction or mixed number to a percent: (a) $\frac{7}{8}$ (b) $\frac{9}{4}$ (c) $1\frac{3}{5}$

Answer a

87.5%

Answer b

225%

Answer c

160%

Sometimes when changing a fraction to a decimal, the division continues for many decimal places and we will round off the quotient. The number of decimal places we round to will depend on the situation. If the decimal involves money, we round to the hundredths place. For most other cases in this book we will round the number to the nearest thousandth, so the percent will be rounded to the nearest tenth.

Example 7.1.12:

Convert $\frac{5}{7}$ to a percent.

Solution

To change a fraction to a decimal, we divide the numerator by the denominator.

Change to a decimal—rounding to the nearest thousandth.	0.714
Write as a percent.	71.4%

Exercise 7.1.23:

Convert the fraction to a percent: $\frac{3}{7}$

Answer

42.9%

Exercise 7.1.24:

Convert the fraction to a percent: $\frac{4}{7}$

Answer

57.1%

When we first looked at fractions and decimals, we saw that fractions converted to a repeating decimal. When we converted the fraction $\frac{4}{3}$ to a decimal, we wrote the answer as $1.\overline{3}$. We will use this same notation, as well as fraction notation, when we convert fractions to percents in the next example.

Example 7.1.13:

An article in a medical journal claimed that approximately $\frac{1}{3}$ of American adults are obese. Convert the fraction $\frac{1}{3}$ to a percent.

Solution

Change to a decimal.	$3\overline{)1.00}\ 0.33\ldots$ $\underline{9}$ 10 $\underline{9}$ 1
Write as a repeating decimal.	0.333 …
Write as a percent.	$33\frac{1}{3}\%$

We could also write the percent as $33.\overline{3}\%$.

Exercise 7.1.25:

According to the U.S. Census Bureau, about $\frac{1}{9}$ of United States housing units have just 1 bedroom. Convert the fraction to a percent.

Answer

$11.\overline{1}\%$ or $11\frac{1}{9}\%$

Exercise 7.1.26:

According to the U.S. Census Bureau, about $\frac{1}{6}$ of Colorado residents speak a language other than English at home. Convert the fraction to a percent.

Answer

$16.\overline{6}\%$ or $16\frac{2}{3}\%$

Practice Makes Perfect

Use the Definition of Percents

In the following exercises, write each percent as a ratio.

1. In 2014, the unemployment rate for those with only a high school degree was 6.0%.
2. In 2015, among the unemployed, 29% were long-term unemployed.
3. The unemployment rate for those with Bachelor's degrees was 3.2% in 2014.
4. The unemployment rate in Michigan in 2014 was 7.3%.

In the following exercises, write as (a) a ratio and (b) a percent.

5. 57 out of 100 nursing candidates received their degree at a community college.
6. 80 out of 100 firefighters and law enforcement officers were educated at a community college.
7. 42 out of 100 first-time freshmen students attend a community college.
8. 71 out of 100 full-time community college faculty have a master's degree.

Convert Percents to Fractions and Decimals

In the following exercises, convert each percent to a fraction and simplify all fractions.

9. 4%
10. 8%
11. 17%
12. 19%
13. 52%
14. 78%
15. 125%
16. 135%
17. 37.5%
18. 42.5%
19. 18.4%
20. 46.4%
21. $9\frac{1}{2}\%$

22. $8\frac{1}{2}$ %
23. $5\frac{1}{3}$ %
24. $6\frac{2}{3}$ %

In the following exercises, convert each percent to a decimal.

25. 5%
26. 9%
27. 1%
28. 2%
29. 63%
30. 71%
31. 40%
32. 50%
33. 115%
34. 125%
35. 150%
36. 250%
37. 21.4%
38. 39.3%
39. 7.8%
40. 6.4%

In the following exercises, convert each percent to (a) a simplified fraction and (b) a decimal.

41. In 2010, 1.5% of home sales had owner financing. (Source: Bloomberg Businessweek, 5/ 23–29/2011)
42. In 2000, 4.2% of the United States population was of Asian descent. (Source: www.census.gov)
43. According to government data, in 2013 the number of cell phones in India was 70.23% of the population.
44. According to the U.S. Census Bureau, among Americans age 25 or older who had doctorate degrees in 2014, 37.1% are women.
45. A couple plans to have two children. The probability they will have two girls is 25%.
46. Javier will choose one digit at random from 0 through 9. The probability he will choose 3 is 10%.
47. According to the local weather report, the probability of thunderstorms in New York City on July 15 is 60%.
48. A club sells 50 tickets to a raffle. Osbaldo bought one ticket. The probability he will win the raffle is 2%.

Convert Decimals and Fractions to Percents

In the following exercises, convert each decimal to a percent.

49. 0.01
50. 0.03
51. 0.18
52. 0.15
53. 1.35
54. 1.56
55. 3
56. 4
57. 0.009
58. 0.008
59. 0.0875
60. 0.0625
61. 1.5
62. 2.2
63. 2.254
64. 2.317

In the following exercises, convert each fraction to a percent.

65. $\frac{1}{4}$
66. $\frac{1}{5}$
67. $\frac{3}{8}$
68. $\frac{5}{8}$
69. $\frac{7}{4}$
70. $\frac{9}{8}$
71. $6\frac{4}{5}$
72. $5\frac{1}{4}$
73. $\frac{5}{12}$
74. $\frac{11}{12}$
75. $2\frac{2}{3}$
76. $1\frac{2}{3}$
77. $\frac{3}{7}$
78. $\frac{6}{7}$
79. $\frac{5}{9}$
80. $\frac{4}{9}$

In the following exercises, convert each fraction to a percent.

81. $\frac{1}{4}$ of washing machines needed repair.
82. $\frac{1}{5}$ of dishwashers needed repair.

In the following exercises, convert each fraction to a percent.

83. According to the National Center for Health Statistics, in 2012, 7 20 of American adults were obese.
84. The U.S. Census Bureau estimated that in 2013, 85% of Americans lived in the same house as they did 1 year before.

In the following exercises, complete the table.

85. Table 6.26

Fraction	Decimal	Percent
$\frac{1}{2}$ (7.1.34)		
	0.45	
		18%
$\frac{1}{3}$ (7.1.35)		
	0.0008

Everyday Math

87. Sales tax Felipa says she has an easy way to estimate the sales tax when she makes a purchase. The sales tax in her city is 9.05%. She knows this is a little less than 10%.
    a. Convert 10% to a fraction.
    b. Use your answer from (a) to estimate the sales tax Felipa would pay on a $95 dress.
88. Savings Ryan has 25% of each paycheck automatically deposited in his savings account.
    a. Write 25% as a fraction.
    b. Use your answer from (a) to find the amount that goes to savings from Ryan's $2,400 paycheck.
89. Amelio is shopping for textbooks online. He found three sellers that are offering a book he needs for the same price, including shipping. To decide which seller to buy from he is comparing their customer satisfaction ratings. The ratings are given in the chart.

Seller	Rating
A	4/5
B	3.5/4
C	85%

90. Write seller C's rating as a fraction and a decimal.
91. Write seller B's rating as a percent and a decimal.
92. Write seller A's rating as a percent and a decimal.
93. Which seller should Amelio buy from and why?

Writing Exercises

94. Convert 25%, 50%, 75%, and 100% to fractions. Do you notice a pattern? Explain what the pattern is.
95. Convert $\frac{1}{10}, \frac{2}{10}, \frac{3}{10}, \frac{4}{10}, \frac{5}{10}, \frac{6}{10}, \frac{7}{10}, \frac{8}{10}$, and $\frac{9}{10}$ to percents. Do you notice a pattern? Explain what the pattern is.
96. When the Szetos sold their home, the selling price was 500% of what they had paid for the house 30 years ago. Explain what 500% means in this context.
97. According to cnn.com, cell phone use in 2008 was 600% of what it had been in 2001. Explain what 600% means in this context.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the definition of percent.			
convert percents to fractions and decimals.			
convert decimals and fractions to percents.			

(b) If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math, every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no—I don't get it! This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

7.2: Solve General Applications of Percent

Learning Objectives

- Translate and solve basic percent equations
- Solve applications of percent
- Find percent increase and percent decrease

be prepared!

Before you get started, take this readiness quiz.

1. Translate and solve: $\frac{3}{4}$ of x is 24. If you missed this problem, review Example 4.13.11.
2. Simplify: (4.5)(2.38). If you missed this problem, review Example 5.3.5.
3. Solve: 3.5 = 0.7n. If you missed this problem, review Example 5.7.4.

Translate and Solve Basic Percent Equations

We will solve percent equations by using the methods we used to solve equations with fractions or decimals. In the past, you may have solved percent problems by setting them up as proportions. That was the best method available when you did not have the tools of algebra. Now as a prealgebra student, you can translate word sentences into algebraic equations, and then solve the equations.

We'll look at a common application of percent—tips to a server at a restaurant—to see how to set up a basic percent application.

When Aolani and her friends ate dinner at a restaurant, the bill came to $80. They wanted to leave a 20% tip. What amount would the tip be? To solve this, we want to find what *amount* is 20% of $80. The $80 is called the *base*. The amount of the tip would be 0.20(80), or $16 See Figure 7.2.1. To find the amount of the tip, we multiplied the percent by the base.

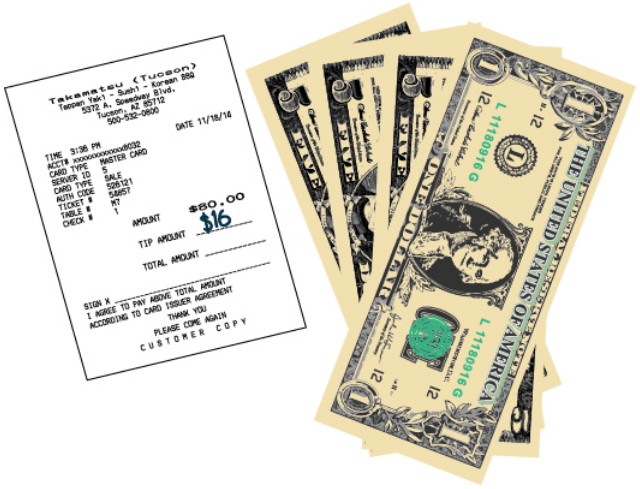

Figure 7.2.1 - A 20% tip for an $80 restaurant bill comes out to $16.

In the next examples, we will find the amount. We must be sure to change the given percent to a decimal when we translate the words into an equation.

Example 7.2.1:

What number is 35% of 90?

Solution

Translate into algebra. Let n = the number.	$\underbrace{\text{What number}}_{n} \quad \underbrace{\text{is}}_{=} \quad \underbrace{35\%}_{0.35} \quad \underbrace{\text{of}}_{\cdot} \quad \underbrace{90?}_{90}$
Multiply.	n = 31.5

31.5 is 35% of 90

? Exercise 7.2.1:

What number is 45% of 80?

Answer

36

? Exercise 7.2.2:

What number is 55% of 60?

Answer

33

✓ Example 7.2.2:

125% of 28 is what number?

Solution

Translate into algebra. Let a = the number.	$\underbrace{125\%}_{1.25} \quad \underbrace{\text{of}}_{\cdot} \quad \underbrace{28}_{28} \quad \underbrace{\text{is}}_{=} \quad \underbrace{\text{what number?}}_{a}$
Multiply.	35 = a

125% of 28 is 35

Remember that a percent over 100 is a number greater than 1. We found that 125% of 28 is 35, which is greater than 28.

? Exercise 7.2.3:

150% of 78 is what number?

Answer

117

? Exercise 7.2.4:

175% of 72 is what number?

Answer

126

In the next examples, we are asked to find the base.

Example 7.2.3:

Translate and solve: 36 is 75% of what number?

Solution

Translate. Let b = the number.	$\underbrace{36}_{36}\ \underbrace{\text{is}}_{=}\ \underbrace{75\%}_{0.75}\ \underbrace{\text{of}}_{.}\ \underbrace{\text{what number?}}_{b}$
Divide both sides by 0.75.	$\frac{36}{0.75}=\frac{0.75b}{0.75}$ (7.2.1)
Simplify.	48 = b

36 is 75% of 48

Exercise 7.2.5:

17 is 25% of what number?

Answer

68

Exercise 7.2.6:

40 is 62.5% of what number?

Answer

64

Example 7.2.4:

6.5% of what number is $1.17?

Solution

Translate. Let b = the number.	$\underbrace{6.5\%}_{0.065}\ \underbrace{\text{of}}_{.}\ \underbrace{\text{what number}}_{b}\ \underbrace{\text{is}}_{=}\ \underbrace{\$1.17?}_{1.17}$
Divide both sides by 0.065.	$\frac{0.065n}{0.065}=\frac{1.17}{0.065}$ (7.2.2)
Simplify.	n = 18

6.5% of $18 is $1.17.

Exercise 7.2.7:

7.5% of what number is $1.95?

Answer

$26

Exercise 7.2.8:

8.5% of what number is $3.06?

Answer

$36

In the next examples, we will solve for the percent.

Example 7.2.5:

What percent of 36 is 9?

Solution

Translate into algebra. Let p = the percent.	$\underbrace{p}_{\text{What percent}} \quad \underbrace{\cdot}_{\text{of}} \quad \underbrace{36}_{36} \quad \underbrace{=}_{\text{is}} \quad \underbrace{9}_{9?}$
Divide by 36.	$\frac{36p}{36} = \frac{9}{36}$ (7.2.3)
Simplify.	$p = \frac{1}{4}$ (7.2.4)
Convert to decimal form.	p = 0.25
Convert to percent.	p = 25%

25% of 36 is 9.

Exercise 7.2.9:

What percent of 76 is 57?

Answer

75%

Exercise 7.2.10:

What percent of 120 is 96?

Answer

80%

Example 7.2.6:

144 is what percent of 96?

Solution

Translate into algebra. Let p = the percent.	$\underbrace{144}_{144} \quad \underbrace{=}_{\text{is}} \quad \underbrace{p}_{\text{what percent}} \quad \underbrace{\cdot}_{\text{of}} \quad \underbrace{96}_{96?}$
Divide by 96.	$\frac{144}{96} = \frac{96p}{96}$ (7.2.5)

Simplify.	1.5 = p
Convert to percent.	150% = p

144 is 150% of 96.

Exercise 7.2.11:

110 is what percent of 88?

Answer

125%

Exercise 7.2.12:

126 is what percent of 72?

Answer

175%

Solve Applications of Percent

Many applications of percent occur in our daily lives, such as tips, sales tax, discount, and interest. To solve these applications we'll translate to a basic percent equation, just like those we solved in the previous examples in this section. Once you translate the sentence into a percent equation, you know how to solve it.

We will update the strategy we used in our earlier applications to include equations now. Notice that we will translate a sentence into an equation.

HOW TO: SOLVE AN APPLICATION

- Step 1. Identify what you are asked to find and choose a variable to represent it.
- Step 2. Write a sentence that gives the information to find it.
- Step 3. Translate the sentence into an equation.
- Step 4. Solve the equation using good algebra techniques.
- Step 5. Check the answer in the problem and make sure it makes sense.
- Step 6. Write a complete sentence that answers the question.

Now that we have the strategy to refer to, and have practiced solving basic percent equations, we are ready to solve percent applications. Be sure to ask yourself if your final answer makes sense—since many of the applications we'll solve involve everyday situations, you can rely on your own experience.

Example 7.2.7:

Dezohn and his girlfriend enjoyed a dinner at a restaurant, and the bill was $68.50. They want to leave an 18% tip. If the tip will be 18% of the total bill, how much should the tip be?

Solution

What are you asked to find?	the amount of the tip
Choose a variable to represent it.	Let t = amount of tip.
Write a sentence that give the information to find it.	The tip is 18% of the total bill.

Translate the sentence into an equation.	$\underbrace{\text{The tip}}_{t}\ \underbrace{\text{is}}_{=}\ \underbrace{18\%}_{0.18}\ \underbrace{\text{of}}_{\cdot}\ \underbrace{\$68.50.}_{\$68.50}$
Multiply.	t = 12.33
Check. Is this answer reasonable?	If we approximate the bill to \$70 and the percent to 20%, we would have a tip of \$14. So a tip of \$12.33 seems reasonable.
Write a complete sentence that answers the question.	The couple should leave a tip of \$12.33.

? Exercise 7.2.13:

Cierra and her sister enjoyed a special dinner in a restaurant, and the bill was \$81.50. If she wants to leave 18% of the total bill as her tip, how much should she leave?

Answer

\$14.67

? Exercise 7.2.14:

Kimngoc had lunch at her favorite restaurant. She wants to leave 15% of the total bill as her tip. If her bill was \$14.40, how much will she leave for the tip?

Answer

\$2.16

✔ Example 7.2.8:

The label on Masao's breakfast cereal said that one serving of cereal provides 85 milligrams (mg) of potassium, which is 2% of the recommended daily amount. What is the total recommended daily amount of potassium?

Nutrition Facts

Serving Size: 1 cup (47g)
Servings Per Container: About 7

Amount Per Serving	Cereal	With Milk
Calories	180	230
Calories from Fat	10	20
	% Daily Value*	
Total Fat 1g	**2%**	**2%**
Saturated Fat 0g	**0%**	**0%**
Trans Fat 0g		
Polyunsaturated Fat 0.5g		
Monounsaturated Fat 0.5g		
Cholesterol 0mg	**0%**	**0%**
Sodium 190mg	**8%**	**11%**
Potassium 85mg	**2%**	**8%**
Total Carbohydrate 40g	**13%**	**15%**
Dietary Fiber 1g	**4%**	**4%**
Sugars 8g		
Protein 3g		

Solution

What are you asked to find?	the total amount of potassium recommended
Choose a variable to represent it.	Let a = total amount of potassium.

Write a sentence that gives the information to find it.	85 mg is 2% of the total amount.
Translate the sentence into an equation.	$\underbrace{85}_{85}\ \underbrace{\text{mg}}\ \underbrace{\text{is}}_{=}\ \underbrace{2\%}_{0.02}\ \underbrace{\text{of}}_{\cdot}\ \underbrace{a}_{a}\ ?$
Divide both sides by 0.02.	$\frac{85}{0.02} = \frac{0.02a}{0.02}$ (7.2.6)
Simplify.	4,250 =a
Check: Is this answer reasonable?	Yes. 2% is a small percent and 85 is a small part of 4,250.
Write a complete sentence that answers the question.	The amount of potassium that is recommended is 4250 mg.

? Exercise 7.2.15:

One serving of wheat square cereal has 7 grams of fiber, which is 29% of the recommended daily amount. What is the total recommended daily amount of fiber?

Answer

24.1 grams

? Exercise 7.2.16:

One serving of rice cereal has 190 mg of sodium, which is 8% of the recommended daily amount. What is the total recommended daily amount of sodium?

Answer

2,375 mg

✓ Example 7.2.9:

Mitzi received some gourmet brownies as a gift. The wrapper said each brownie was 480 calories, and had 240 calories of fat. What percent of the total calories in each brownie comes from fat?

Solution

What are you asked to find?	the percent of the total calories from fat
Choose a variable to represent it.	Let p = percent from fat.
Write a sentence that gives the information to find it.	What percent of 480 is 240?
Translate the sentence into an equation.	$\underbrace{\text{What percent}}_{p}\ \underbrace{\text{of}}_{\cdot}\ \underbrace{480}_{480}\ \underbrace{\text{is}}_{=}\ \underbrace{240?}_{240}$
Divide both sides by 480.	$\frac{p \cdot 480}{480} = \frac{240}{480}$ (7.2.7)
Simplify.	p = 0.5
Convert to percent form.	p = 50%
Check. Is this answer reasonable?	Yes. 240 is half of 480, so 50% makes sense.
Write a complete sentence that answers the question.	Of the total calories in each brownie, 50% is fat.

Exercise 7.2.17:

Veronica is planning to make muffins from a mix. The package says each muffin will be 230 calories and 60 calories will be from fat. What percent of the total calories is from fat? (Round to the nearest whole percent.)

Answer

26%

Exercise 7.2.18:

The brownie mix Ricardo plans to use says that each brownie will be 190 calories, and 70 calories are from fat. What percent of the total calories are from fat?

Answer

37%

Find Percent Increase and Percent Decrease

People in the media often talk about how much an amount has increased or decreased over a certain period of time. They usually express this increase or decrease as a percent.

To find the **percent increase**, first we find the amount of increase, which is the difference between the new amount and the original amount. Then we find what percent the amount of increase is of the original amount.

how to: find percent increase

Step 1. Find the amount of increase.

- increase = new amount − original amount

Step 2. Find the percent increase as a percent of the original amount.

Example 7.2.10:

In 2011, the California governor proposed raising community college fees from $26 per unit to $36 per unit. Find the percent increase. (Round to the nearest tenth of a percent.)

Solution

What are you asked to find?	the percent increase
Choose a variable to represent it.	Let p = percent.
Find the amount of increase.	$\underbrace{36}_{\text{new amount}} - \underbrace{26}_{\text{original amount}} = \underbrace{10}_{\text{increase}}$
Find the percent increase.	The increase is what percent of the original amount?
Translate to an equation.	$\underbrace{10}_{10} \underbrace{\text{ is }}_{=} \underbrace{\text{ what percent }}_{p} \underbrace{\text{ of }}_{\cdot} \underbrace{\text{ 26?}}_{26}$
Divide both sides by 26.	$\frac{10}{26} = \frac{26p}{26}$ (7.2.8)
Round to the nearest thousandth.	0.384 = p
Convert to percent form.	38.4% = p

Write a complete sentence.	The new fees represent a 38.4% increase over the old fees.

Exercise 7.2.19:

In 2011, the IRS increased the deductible mileage cost to 55.5 cents from 51 cents. Find the percent increase. (Round to the nearest tenth of a percent.)

Answer

8.8%

Exercise 7.2.20:

In 1995, the standard bus fare in Chicago was $1.50. In 2008, the standard bus fare was $2.25. Find the percent increase. (Round to the nearest tenth of a percent.)

Answer

50%

Finding the **percent decrease** is very similar to finding the percent increase, but now the amount of decrease is the difference between the original amount and the final amount. Then we find what percent the amount of decrease is of the original amount.

HOW TO: FIND PERCENT DECREASE

Step 1. Find the amount of decrease.

- decrease = original amount − new amount

Step 2. Find the percent decrease as a percent of the original amount.

Example 7.2.11:

The average price of a gallon of gas in one city in June 2014 was $3.71. The average price in that city in July was $3.64. Find the percent decrease.

Solution

The average price of a gallon of gas in one city in June 2014 was $3.71. The average price in that city in July was $3.64. Find the percent decrease.

What are you asked to find?	the percent decrease
Choose a variable to represent it.	Let p = percent.
Find the amount of decrease.	$\underbrace{3.71}_{\text{original amount}} - \underbrace{3.64}_{\text{new amount}} = \underbrace{0.07}_{\text{increase}}$
Find the percent of decrease.	The decrease is what percent of the original amount?
Translate to an equation.	$\underbrace{0.07}_{0.07} \underbrace{\text{is}}_{=} \underbrace{\text{what percent}}_{p} \underbrace{\text{of}}_{\cdot} \underbrace{3.71}_{3.71}$
Divide both sides by 3.71.	$\frac{0.07}{3.71} = \frac{3.71p}{3.71}$ (7.2.9)
Round to the nearest thousandth.	0.019 = p

Convert to percent form.	1.9% = p
Write a complete sentence.	The price of gas decreased 1.9%.

Exercise 7.2.21:

The population of one city was about 672,000 in 2010. The population of the city is projected to be about 630,000 in 2020. Find the percent decrease. (Round to the nearest tenth of a percent.)

Answer

6.3%

Exercise 7.2.22:

Last year Sheila's salary was $42,000. Because of furlough days, this year her salary was $37,800. Find the percent decrease. (Round to the nearest tenth of a percent.)

Answer

10%

Percent Increase and Percent Decrease Visualization

Practice Makes Perfect

Translate and Solve Basic Percent Equations

In the following exercises, translate and solve.

98. What number is 45% of 120?
99. What number is 65% of 100?
100. What number is 24% of 112?
101. What number is 36% of 124?
102. 250% of 65 is what number?
103. 150% of 90 is what number?
104. 800% of 2,250 is what number?
105. 600% of 1,740 is what number?
106. 28 is 25% of what number?
107. 36 is 25% of what number?
108. 81 is 75% of what number?
109. 93 is 75% of what number?
110. 8.2% of what number is $2.87?
111. 6.4% of what number is $2.88?
112. 11.5% of what number is $108.10?
113. 12.3% of what number is $92.25?
114. What percent of 260 is 78?
115. What percent of 215 is 86?
116. What percent of 1,500 is 540?
117. What percent of 1,800 is 846?
118. 30 is what percent of 20?
119. 50 is what percent of 40?
120. 840 is what percent of 480?

121. 790 is what percent of 395?

Solve Applications of Percents

In the following exercises, solve the applications of percents.

122. Geneva treated her parents to dinner at their favorite restaurant. The bill was $74.25. She wants to leave 16% of the total bill as a tip. How much should the tip be?
123. When Hiro and his co-workers had lunch at a restaurant the bill was $90.50. They want to leave 18% of the total bill as a tip. How much should the tip be?
124. Trong has 12% of each paycheck automatically deposited to his savings account. His last paycheck was $2,165. How much money was deposited to Trong's savings account?
125. Cherise deposits 8% of each paycheck into her retirement account. Her last paycheck was $1,485. How much did Cherise deposit into her retirement account?
126. One serving of oatmeal has 8 grams of fiber, which is 33% of the recommended daily amount. What is the total recommended daily amount of fiber?
127. One serving of trail mix has 67 grams of carbohydrates, which is 22% of the recommended daily amount. What is the total recommended daily amount of carbohydrates?
128. A bacon cheeseburger at a popular fast food restaurant contains 2,070 milligrams (mg) of sodium, which is 86% of the recommended daily amount. What is the total recommended daily amount of sodium?
129. A grilled chicken salad at a popular fast food restaurant contains 650 milligrams (mg) of sodium, which is 27% of the recommended daily amount. What is the total recommended daily amount of sodium?
130. The nutrition fact sheet at a fast food restaurant says the fish sandwich has 380 calories, and 171 calories are from fat. What percent of the total calories is from fat?
131. The nutrition fact sheet at a fast food restaurant says a small portion of chicken nuggets has 190 calories, and 114 calories are from fat. What percent of the total calories is from fat?
132. Emma gets paid $3,000 per month. She pays $750 a month for rent. What percent of her monthly pay goes to rent?
133. Dimple gets paid $3,200 per month. She pays $960 a month for rent. What percent of her monthly pay goes to rent?

Find Percent Increase and Percent Decrease

In the following exercises, find the percent increase or percent decrease.

134. Tamanika got a raise in her hourly pay, from $15.50 to $17.55. Find the percent increase.
135. Ayodele got a raise in her hourly pay, from $24.50 to $25.48. Find the percent increase.
136. Annual student fees at the University of California rose from about $4,000 in 2000 to about $9,000 in 2014. Find the percent increase.
137. The price of a share of one stock rose from $12.50 to $50. Find the percent increase.
138. According to Time magazine (7/19/2011) annual global seafood consumption rose from 22 pounds per person in 1960 to 38 pounds per person today. Find the percent increase. (Round to the nearest tenth of a percent.)
139. In one month, the median home price in the Northeast rose from $225,400 to $241,500. Find the percent increase. (Round to the nearest tenth of a percent.)
140. A grocery store reduced the price of a loaf of bread from $2.80 to $2.73. Find the percent decrease.
141. The price of a share of one stock fell from $8.75 to $8.54. Find the percent decrease.
142. Hernando's salary was $49,500 last year. This year his salary was cut to $44,055. Find the percent decrease.
143. From 2000 to 2010, the population of Detroit fell from about 951,000 to about 714,000. Find the percent decrease. (Round to the nearest tenth of a percent.)
144. In one month, the median home price in the West fell from $203,400 to $192,300. Find the percent decrease. (Round to the nearest tenth of a percent.)
145. Sales of video games and consoles fell from $1,150 million to $1,030 million in one year. Find the percent decrease. (Round to the nearest tenth of a percent.)

Everyday Math

146. **Tipping** At the campus coffee cart, a medium coffee costs $1.65. MaryAnne brings $2.00 with her when she buys a cup of coffee and leaves the change as a tip. What percent tip does she leave?

147. **Late Fees** Alison was late paying her credit card bill of $249. She was charged a 5% late fee. What was the amount of the late fee?

Writing Exercises

148. Without solving the problem “44 is 80% of what number”, think about what the solution might be. Should it be a number that is greater than 44 or less than 44? Explain your reasoning.
149. Without solving the problem “What is 20% of 300?” think about what the solution might be. Should it be a number that is greater than 300 or less than 300? Explain your reasoning.
150. After returning from vacation, Alex said he should have packed 50% fewer shorts and 200% more shirts. Explain what Alex meant.
151. Because of road construction in one city, commuters were advised to plan their Monday morning commute to take 150% of their usual commuting time. Explain what this means.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
translate and solve basic percent equations.			
solve applications of percent.			
find percent increase and percent decrease.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

This page titled 7.2: Solve General Applications of Percent is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

7.3: Solve Sales Tax, Commission, and Discount Applications

Learning Objectives

- Solve sales tax applications
- Solve commission applications
- Solve discount applications
- Solve mark-up applications

be prepared!

Before you get started, take this readiness quiz.

1. Solve 0.0875(720) through multiplication. If you missed this problem, review Example 5.3.7.
2. Solve 12.96 ÷ 0.04 through division. If you missed this problem, review Example 5.4.12.

Solve Sales Tax Applications

Sales tax and commissions are applications of percent in our everyday lives. To solve these applications, we will follow the same strategy we used in the section on decimal operations. We show it again here for easy reference.

HOW TO: Solve an application

- Step 1. Identify what you are asked to find and choose a variable to represent it.
- Step 2. Write a sentence that gives the information to find it.
- Step 3. Translate the sentence into an equation.
- Step 4. Solve the equation using good algebra techniques.
- Step 5. Check the answer in the problem and make sure it makes sense.
- Step 6. Write a complete sentence that answers the question.

Remember that whatever the application, once we write the sentence with the given information (Step 2), we can translate it to a percent equation and then solve it.

Do you pay a tax when you shop in your city or state? In many parts of the United States, sales tax is added to the purchase price of an item. See Figure 7.3.1. The sales tax is determined by computing a percent of the purchase price.

To find the sales tax multiply the purchase price by the sales tax rate. Remember to convert the sales tax rate from a percent to a decimal number. Once the sales tax is calculated, it is added to the purchase price. The result is the total cost—this is what the customer pays.

Figure 7.3.1 - The sales tax is calculated as a percent of the purchase price.

Definition: sales tax

The sales tax is a percent of the purchase price.

$$\text{Sales Tax} = \text{Tax Rate} \cdot \text{Purchase Price}$$

$$\text{Total Cost} = \text{Purchase Price} + \text{Sales Tax}$$

Example 7.3.1:

Cathy bought a bicycle in Washington, where the sales tax rate was 6.5% of the purchase price. What was (a) the sales tax and (b) the total cost of a bicycle if the purchase price of the bicycle was $392?

Solution

(a)

Identify what you are asked to find.	What is the sales tax?
Choose a variable to represent it.	Let t = sales tax.
Write a sentence that gives the information to find it.	The sales tax is 6.5% of the purchase price.
Translate into an equation. (Remember to change the percent to a decimal).	$\underbrace{\text{The sales tax}}_{t} \quad \underbrace{\text{is}}_{=} \quad \underbrace{6.5\%}_{0.065} \quad \underbrace{\text{of}}_{\cdot} \quad \underbrace{\text{the \$392 purchase price.}}_{392}$
Simplify.	t = 25.48
Check: Is this answer reasonable?	Yes, because the sales tax amount is less than 10% of the purchase price.
Write a complete sentence that answers the question.	The sales tax is $25.48.

(b)

Identify what you are asked to find.	What is the total cost of the bicycle?
Choose a variable to represent it.	Let c = total cost of bicycle.
Write a sentence that gives the information to find it.	The total cost is the purchase price plus the sales tax.

Translate into an equation. (Remember to change the percent to a decimal).	$\underbrace{c}_{\text{The total cost}} \quad \underbrace{=}_{\text{is}} \quad \underbrace{392}_{\$392} \quad \underbrace{+}_{\text{plus}} \quad \underbrace{25.48}_{\$25.48}$
Simplify.	c = 417.48
Check: Is this answer reasonable?	Yes, because the total cost is a little more than the purchase price.
Write a complete sentence that answers the question.	The total cost of the bicycle is $417.48.

Exercise 7.3.1:

Find (a) the sales tax and (b) the total cost: Alexandra bought a television set for $724 in Boston, where the sales tax rate was 6.25% of the purchase price.

Answer a

$45.25

Answer b

$769.25

Exercise 7.3.2:

Find (a) the sales tax and (b) the total cost: Kim bought a winter coat for $250 in St. Louis, where the sales tax rate was 8.2% of the purchase price.

Answer a

$20.50

Answer b

$270.50

Example 7.3.2:

Evelyn bought a new smartphone for $499 plus tax. She was surprised when she got the receipt and saw that the tax was $42.42. What was the sales tax rate for this purchase?

Solution

Identify what you are asked to find.	What is the sales tax rate?
Choose a variable to represent it.	Let r = sales tax.
Write a sentence that gives the information to find it.	What percent of the price is the sales tax?
Translate into an equation.	$\underbrace{r}_{\text{What percent}} \quad \underbrace{\cdot}_{\text{of}} \quad \underbrace{499}_{\text{the \$499 price}} \quad \underbrace{=}_{\text{is}} \quad \underbrace{42.42}_{\text{the \$42.42 tax?}}$
Divide.	$\frac{499r}{499} = \frac{42.42}{499}$ (7.3.1)
Simplify	r = 0.085

Check. Is this answer reasonable?	Yes, because 8.5% is close to 10%. 10% of $500 is $50, which is close to $42.42.
Write a complete sentence that answers the question.	The sales tax rate is 8.5%.

Exercise 7.3.3:

Diego bought a new car for $26,525. He was surprised that the dealer then added $2,387.25. What was the sales tax rate for this purchase?

Answer

9%

Exercise 7.3.4:

What is the sales tax rate if a $7,594 purchase will have $569.55 of sales tax added to it?

Answer

7.5%

Solve Commission Applications

Sales people often receive a **commission**, or percent of total sales, for their sales. Their income may be just the commission they earn, or it may be their commission added to their hourly wages or salary. The commission they earn is calculated as a certain percent of the price of each item they sell. That percent is called the **rate of commission**.

Definition: commission

A commission is a percentage of total sales as determined by the rate of commission.

$$\text{commission} = \text{rate of commission} \cdot \text{total sales}$$

To find the commission on a sale, multiply the rate of commission by the total sales. Just as we did for computing sales tax, remember to first convert the rate of commission from a percent to a decimal.

Example 7.3.3:

Helene is a realtor. She receives 3% commission when she sells a house. How much commission will she receive for selling a house that costs $260,000?

Solution

Identify what you are asked to find.	What is the commission?
Choose a variable to represent it.	Let c = the commission.
Write a sentence that gives the information to find it.	The commission is 3% of the price.
Translate into an equation.	$\underbrace{\text{The commission}}_{c} \underbrace{\text{is}}_{=} \underbrace{3\%}_{0.03} \underbrace{\text{of}}_{\cdot} \underbrace{\text{the \$260,000 price.}}_{260{,}000}$
Simplify.	c = 7800
Change to percent form.	r = 8.5%
Check. Is this answer reasonable?	Yes. 1% of $260,000 is $2,600, and $7,800 is three times $2,600.

Write a complete sentence that answers the question.	Helene will receive a commission of $7,800.

Exercise 7.3.5:

Bob is a travel agent. He receives 7% commission when he books a cruise for a customer. How much commission will he receive for booking a $3,900 cruise?

Answer

$273

Exercise 7.3.6:

Fernando receives 18% commission when he makes a computer sale. How much commission will he receive for selling a computer for $2,190?

Answer

$394.20

Example 7.3.4:

Rikki earned $87 commission when she sold a $1,450 stove. What rate of commission did she get?

Solution

Identify what you are asked to find.	What is the rate of commission?
Choose a variable to represent it.	Let r = the rate of commission.
Write a sentence that gives the information to find it.	The commission is what percent of the sale?
Translate into an equation.	$\underbrace{87}_{\text{The \$87 commission}} \underbrace{=}_{\text{is}} \underbrace{r}_{\text{what percent}} \underbrace{\cdot}_{\text{of}} \underbrace{1450}_{\text{the \$1450 sale?}}$
Divide.	$\frac{87}{1450} = \frac{1450r}{1450}$ (7.3.2)
Simplify.	0.06 = r
Change to percent form.	r = 6%
Check if this answer is reasonable.	Yes. A 10% commission would have been $145. The 6% commission, $87, is a little more than half of that.
Write a complete sentence that answers the question.	The commission was 6% of the price of the stove.

Exercise 7.3.7:

Homer received $1,140 commission when he sold a car for $28,500. What rate of commission did he get?

Answer

4%

Exercise 7.3.8:

Bernice earned $451 commission when she sold an $8,200 living room set. What rate of commission did she get?

Answer

5.5%

Solve Discount Applications

Applications of discount are very common in retail settings Figure 6.8. When you buy an item on sale, the **original price** of the item has been reduced by some dollar amount. The **discount rate**, usually given as a percent, is used to determine the amount of the discount. To determine the **amount of discount**, we multiply the discount rate by the original price. We summarize the discount model in the box below.

Figure 6.8 - Applications of discounts are common in everyday life. (credit: Charleston's TheDigitel, Flickr)

Definition: discount

An amount of discount is a percent off the original price.

$$\text{amount of discount} = \text{discount rate} \cdot \text{original price}$$

$$\text{sale price} = \text{original price} - \text{discount}$$

The sale price should always be less than the original price. In some cases, the amount of discount is a fixed dollar amount. Then we just find the sale price by subtracting the amount of discount from the original price.

Example 7.3.5:

Jason bought a pair of sunglasses that were on sale for $10 off. The original price of the sunglasses was $39. What was the sale price of the sunglasses?

Solution

Identify what you are asked to find.	What is the sale price?
Choose a variable to represent it.	Let s = the sale price.
Write a sentence that gives the information to find it.	The sale price is the original price minus the discount.
Translate into an equation.	$\underbrace{s}_{\text{The sale price}} \quad \underbrace{=}_{\text{is}} \quad \underbrace{39}_{\text{the original \$39 price}} \quad \underbrace{-}_{\text{minus}} \quad \underbrace{10}_{\text{the \$10 discount.}}$
Simplify.	s = 29
Check if this answer is reasonable.	Yes. The sale price, $29, is less than the original price, $39.

Write a complete sentence that answers the question.	The sale price of the sunglasses was $29.

? Exercise 7.3.9:

Marta bought a dishwasher that was on sale for $75 off. The original price of the dishwasher was $525. What was the sale price of the dishwasher?

Answer

$450

? Exercise 7.3.10:

Orlando bought a pair of shoes that was on sale for $30 off. The original price of the shoes was $112. What was the sale price of the shoes?

Answer

$82

In Example 6.29, the amount of discount was a set amount, $10. In Example 6.30 the discount is given as a percent of the original price.

✓ Example 7.3.6:

Elise bought a dress that was discounted 35% off of the original price of $140. What was (a) the amount of discount and (b) the sale price of the dress?

Solution

(a) Before beginning, you may find it helpful to organize the information in a list. Original price = $140, Discount rate = 35%, Amount of discount = ?

Identify what you are asked to find.	What is the amount of discount?
Choose a variable to represent it.	Let d = the amount of discount.
Write a sentence that gives the information to find it.	The discount is 35% of the original price.
Translate into an equation.	$\underbrace{\text{The discount}}_{s}\ \underbrace{\text{is}}_{=}\ \underbrace{35\%}_{0.35}\ \underbrace{\text{of}}_{\cdot}\ \underbrace{\text{the \$140 original price.}}_{140}$
Simplify.	d = 49
Check if this answer is reasonable.	Yes. A $49 discount is reasonable for a $140 dress.
Write a complete sentence that answers the question.	The amount of discount was $49.

(b) Original price = $140, Amount of discount = $49, Sale price = ?

Identify what you are asked to find.	What is the sale price of the dress?
Choose a variable to represent it.	Let s = the sale price.
Write a sentence that gives the information to find it.	The sale price is the original price minus the discount.
Translate into an equation.	$\underbrace{\text{The sale price}}_{s}\ \underbrace{\text{is}}_{=}\ \underbrace{\text{the \$140}}_{140}\ \underbrace{\text{minus}}_{-}\ \underbrace{\text{the \$49 discount.}}_{49}$

Simplify.	s = 91
Check if this answer is reasonable.	Yes. The sale price, $91, is less than the original price, $140.
Write a complete sentence that answers the question.	The sale price of the dress was $91.

Exercise 7.3.11:

Find (a) the amount of discount and (b) the sale price: Sergio bought a belt that was discounted 40% from an original price of $29.

Answer a

$11.60

Answer b

$17.40

Exercise 7.3.12:

Find (a) the amount of discount and (b) the sale price: Oscar bought a barbecue grill that was discounted 65% from an original price of

$395.

Answer a

$256.75

Answer b

$138.25

There may be times when you buy something on sale and want to know the discount rate. The next example will show this case.

Example 7.3.7:

Jeannette bought a swimsuit at a sale price of $13.95. The original price of the swimsuit was $31. Find the (a) amount of discount and (b) discount rate.

Solution

(a) Before beginning, you may find it helpful to organize the information in a list. Original price = $31, Amount of discount = ?, Sale price = $13.95

Identify what you are asked to find.	What is the amount of discount?
Choose a variable to represent it.	Let d = the amount of discount.
Write a sentence that gives the information to find it.	The discount is the original price minus the sale price.
Translate into an equation.	$\underbrace{\text{The discount}}_{s}\ \underbrace{\text{is}}_{=}\ \underbrace{\text{the \$31 original price}}_{31}\ \underbrace{\text{minus}}_{-}\ \underbrace{\text{the \$13.95 sale price.}}_{13.95}$
Simplify.	d = 17.05
Check if this answer is reasonable.	Yes. The $17.05 discount is less than the original price.
Write a complete sentence that answers the question.	The amount of discount was $17.05.

(b) Before beginning, you may find it helpful to organize the information in a list. Original price = $31, Amount of discount = $17.05, Discount rate = ?

Identify what you are asked to find.	What is the amount of discount?
Choose a variable to represent it.	Let r = the discount rate.
Write a sentence that gives the information to find it.	The discount is what percent of the original price?
Translate into an equation.	$\underbrace{\text{The discount of \$17.05}}_{s}\ \underbrace{\text{is}}_{=}\ \underbrace{\text{what percent}}_{r}\ \underbrace{\text{of}}_{\cdot}\ \underbrace{\text{the \$31 original price.}}_{31}$
Divide.	$\frac{17.05}{31} = \frac{r(31)}{31}$ (7.3.3)
Simplify.	0.55 = r
Check if this answer is reasonable.	The rate of discount was a little more than 50% and the amount of discount is a little more than half of $31.
Write a complete sentence that answers the question.	The rate of discount was 55%.

? Exercise 7.3.13:

Find (a) the amount of discount and (b) the discount rate: Lena bought a kitchen table at the sale price of $375.20. The original price of the table was $560.

Answer a

$184.80

Answer b

33%

? Exercise 7.3.14:

Find (a) the amount of discount and (b) the discount rate: Nick bought a multi-room air conditioner at a sale price of $340. The original price of the air conditioner was $400.

Answer a

$60

Answer b

15%

Solve Mark-up Applications

Applications of mark-up are very common in retail settings. The price a retailer pays for an item is called the **wholesale price**. The retailer then adds a **mark-up** to the wholesale price to get the **list price**, the price he sells the item for. The mark-up is usually calculated as a percent of the wholesale price. The percent is called the **mark-up rate**. To determine the amount of mark-up, multiply the mark-up rate by the wholesale price. We summarize the mark-up model in the box below.

Definition: mark-up

The mark-up is the amount added to the wholesale price.

$$\text{amount of mark-up} = \text{mark-up rate} \cdot \text{wholesale price}$$

$$\text{list price} = \text{wholesale price} + \text{mark up}$$

The list price should always be more than the wholesale price.

Example 7.3.8:

Adam's art gallery bought a photograph at the wholesale price of $250. Adam marked the price up 40%. Find the (a) amount of mark-up and (b) the list price of the photograph.

Solution

(a)

Identify what you are asked to find.	What is the amount of mark-up?
Choose a variable to represent it.	Let m = the amount of each mark-up.
Write a sentence that gives the information to find it.	The mark-up is 40% of the wholesale price.
Translate into an equation.	$\underbrace{\text{The mark-up}}_{m} \ \underbrace{\text{is}}_{=} \ \underbrace{40\%}_{0.40} \ \underbrace{\text{of}}_{\cdot} \ \underbrace{\text{the \$250 wholesale price.}}_{250}$
Simplify.	m = 100
Check if this answer is reasonable.	Yes. The markup rate is less than 50% and $100 is less than half of $250.
Write a complete sentence that answers the question.	The mark-up on the photograph was $100.

(b)

Identify what you are asked to find.	What is the list price?
Choose a variable to represent it.	Let p = the list price.
Write a sentence that gives the information to find it.	The list price is the wholesale price plus the mark-up.
Translate into an equation.	$\underbrace{\text{The list price}}_{p} \ \underbrace{\text{is}}_{=} \ \underbrace{\text{the \$250 wholesale price}}_{250} \ \underbrace{\text{plus}}_{+} \ \underbrace{\text{the \$100 mark-up.}}_{100}$
Simplify.	p = 350
Check if this answer is reasonable.	Yes. The list price, $350, is more than the wholesale price, $250.
Write a complete sentence that answers the question.	The list price of the photograph was $350.

Exercise 7.3.15:

Jim's music store bought a guitar at wholesale price $1,200. Jim marked the price up 50%. Find the (a) amount of mark-up and (b) the list price.

Answer a

600%

Answer b

$1,800

Exercise 7.3.16:

The Auto Resale Store bought Pablo's Toyota for $8,500. They marked the price up 35%. Find the (a) amount of mark-up and (b) the list price.

Answer a

$2,975

Answer b

$11,475

Practice Makes Perfect

Solve Sales Tax Applications

In the following exercises, find (a) the sales tax and (b) the total cost.

152. The cost of a pair of boots was $84. The sales tax rate is 5% of the purchase price.
153. The cost of a refrigerator was $1,242. The sales tax rate is 8% of the purchase price.
154. The cost of a microwave oven was $129. The sales tax rate is 7.5% of the purchase price.
155. The cost of a tablet computer is $350. The sales tax rate is 8.5% of the purchase price.
156. The cost of a file cabinet is $250. The sales tax rate is 6.85% of the purchase price.
157. The cost of a luggage set $400. The sales tax rate is 5.75% of the purchase price.
158. The cost of a 6 -drawer dresser $1,199. The sales tax rate is 5.125% of the purchase price.
159. The cost of a sofa is $1,350. The sales tax rate is 4.225% of the purchase price.

In the following exercises, find the sales tax rate.

160. Shawna bought a mixer for $300. The sales tax on the purchase was $19.50.
161. Orphia bought a coffee table for $400. The sales tax on the purchase was $38.
162. Bopha bought a bedroom set for $3,600. The sales tax on the purchase was $246.60.
163. Ruth bought a washer and dryer set for $2,100. The sales tax on the purchase was $152.25.

Solve Commission Applications

In the following exercises, find the commission.

164. Christopher sold his dinette set for $225 through an online site, which charged him 9% of the selling price as commission. How much was the commission?
165. Michele rented a booth at a craft fair, which charged her 8% commission on her sales. One day her total sales were $193. How much was the commission?
166. Farrah works in a jewelry store and receives 12% commission when she makes a sale. How much commission will she receive for selling a $8,125 ring?
167. Jamal works at a car dealership and receives 9% commission when he sells a car. How much commission will he receive for selling a $32,575 car?
168. Hector receives 17.5% commission when he sells an insurance policy. How much commission will he receive for selling a policy for $4,910?
169. Denise receives 10.5% commission when she books a tour at the travel agency. How much commission will she receive for booking a tour with total cost $7,420?

In the following exercises, find the rate of commission.

170. Dontay is a realtor and earned $11,250 commission on the sale of a $375,000 house. What is his rate of commission?
171. Nevaeh is a cruise specialist and earned $364 commission after booking a cruise that cost $5,200. What is her rate of commission?

172. As a waitress, Emily earned $420 in tips on sales of $2,625 last Saturday night. What was her rate of commission?
173. Alejandra earned $1,393.74 commission on weekly sales of $15,486 as a salesperson at the computer store. What is her rate of commission?
174. Maureen earned $7,052.50 commission when she sold a $45,500 car. What was the rate of commission?
175. Lucas earned $4,487.50 commission when he brought a $35,900 job to his office. What was the rate of commission?

Solve Discount Applications

In the following exercises, find the sale price.

176. Perla bought a cellphone that was on sale for $50 off. The original price of the cellphone was $189.
177. Sophie saw a dress she liked on sale for $15 off. The original price of the dress was $96.
178. Rick wants to buy a tool set with original price $165. Next week the tool set will be on sale for 40% off.
179. Angelo's store is having a sale on TV sets. One set, with an original price of $859, is selling for $125 off.

In the following exercises, find (a) the amount of discount and (b) the sale price.

180. Janelle bought a beach chair on sale at 60% off. The original price was $44.95
181. Errol bought a skateboard helmet on sale at 40% off. The original price was $49.95.
182. Kathy wants to buy a camera that lists for $389. The camera is on sale with a 33% discount.
183. Colleen bought a suit that was discounted 25% from an original price of $245.
184. Erys bought a treadmill on sale at 35% off. The original price was $949.95.
185. Jay bought a guitar on sale at 45% off. The original price was $514.75.

In the following exercises, find (a) the amount of discount and (b) the discount rate. (Round to the nearest tenth of a percent if needed.)

186. Larry and Donna bought a sofa at the sale price of $1,344. The original price of the sofa was $1,920.
187. Hiroshi bought a lawnmower at the sale price of $240. The original price of the lawnmower is $300.
188. Patty bought a baby stroller on sale for $301.75. The original price of the stroller was $355.
189. Bill found a book he wanted on sale for $20.80. The original price of the book was $32.
190. Nikki bought a patio set on sale for $480. The original price was $850.
191. Stella bought a dinette set on sale for $725. The original price was $1,299.

Solve Mark-up Applications

In the following exercises, find (a) the amount of the mark-up and (b) the list price.

192. Daria bought a bracelet at wholesale cost $16 to sell in her handicraft store. She marked the price up 45%.
193. Regina bought a handmade quilt at wholesale cost $120 to sell in her quilt store. She marked the price up 55%.
194. Tom paid $0.60 a pound for tomatoes to sell at his produce store. He added a 33% mark-up.
195. Flora paid her supplier $0.74 a stem for roses to sell at her flower shop. She added an 85% mark-up.
196. Alan bought a used bicycle for $115. After re-conditioning it, he added 225% mark-up and then advertised it for sale.
197. Michael bought a classic car for $8,500. He restored it, then added 150% mark-up before advertising it for sale.

Everyday Math

198. Coupons Yvonne can use two coupons for the same purchase at her favorite department store. One coupon gives her $20 off and the other gives her 25% off. She wants to buy a bedspread that sells for $195.
    a. Calculate the discount price if Yvonne uses the $20 coupon first and then takes 25% off.
    b. Calculate the discount price if Yvonne uses the 25% off coupon first and then uses the $20 coupon.
    c. In which order should Yvonne use the coupons?
199. Cash Back Jason can buy a bag of dog food for $35 at two different stores. One store offers 6% cash back on the purchase plus $5 off his next purchase. The other store offers 20% cash back.
    a. Calculate the total savings from the first store, including the savings on the next purchase.
    b. Calculate the total savings from the second store.
    c. Which store should Jason buy the dog food from? Why?

Writing Exercises

200. Priam bought a jacket that was on sale for 40% off. The original price of the jacket was $150. While the sales clerk figured the price by calculating the amount of discount and then subtracting that amount from $150, Priam found the price faster by calculating 60% of $150.
    a. Explain why Priam was correct.
    b. Will Priam's method work for any original price?
201. Roxy bought a scarf on sale for 50% off. The original price of the scarf was $32.90. Roxy claimed that the price she paid for the scarf was the same as the amount she saved. Was Roxy correct? Explain.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve sales tax applications.			
solve commission applications.			
solve discount applications.			
solve mark-up applications.			

(b) What does this checklist tell you about your mastery of this section? What steps will you take to improve?

7.4: Solve Simple Interest Applications

Learning Objectives

- Use the simple interest formula
- Solve simple interest applications

Be prepared!

Before you get started, take this readiness quiz.

1. Solve 0.6y = 45. If you missed this problem, review Example 5.7.4.
2. Solve $\frac{n}{1.45}$ = 4.6. If you missed this problem, review Example 5.7.5.

Use the Simple Interest Formula

Do you know that banks pay you to let them keep your money? The money you put in the bank is called the **principal**, P, and the bank pays you **interest**, I. The interest is computed as a certain percent of the principal; called the **rate of interest**, r. The rate of interest is usually expressed as a percent per year, and is calculated by using the decimal equivalent of the percent. The variable for time, t, represents the number of years the money is left in the account.

Definition: simple interest

If an amount of money, P, the principal, is invested for a period of t years at an annual interest rate r, the amount of interest, I, earned is

$$I = Prt$$

where

- I = interest
- P = principal
- r = rate
- t = time

Interest earned according to this formula is called simple interest.

The formula we use to calculate simple interest is I = Prt. To use the simple interest formula we substitute in the values for variables that are given, and then solve for the unknown variable. It may be helpful to organize the information by listing all four variables and filling in the given information.

Example 7.4.1

Find the simple interest earned after 3 years on $500 at an interest rate of 6%.

Solution

Organize the given information in a list.

I = ?, P = $500, r = 6%, t = 3 years

We will use the simple interest formula to find the interest.

Write the formula.	I = Prt
Substitute the given information. Remember to write the percent in decimal form.	I = (500)(0.06)(3)
Simplify.	I = 90

Check your answer. Is $90 a reasonable interest earned on $500 in 3 years?	In 3 years the money earned 18%. If we rounded to 20%, the interest would have been 500(0.20) or $100. Yes, $90 is reasonable.
Write a complete sentence that answers the question.	The simple interest is $90.

Exercise 7.4.1:

Find the simple interest earned after 4 years on $800 at an interest rate of 5%.

Answer

$160

Exercise 7.4.2:

Find the simple interest earned after 2 years on $700 at an interest rate of 4%.

Answer

$56

In the next example, we will use the simple interest formula to find the principal.

Example 7.4.2:

Find the principal invested if $178 interest was earned in 2 years at an interest rate of 4%.

Solution

Organize the given information in a list.

$$I = \$178,\ P = ?,\ r = 4\%,\ t = 2 \text{ years}$$

We will use the simple interest formula to find the principal.

Write the formula.	$I = Prt$	
Substitute the given information.	$178 = P(0.04)(2)$	
Divide.	$\frac{178}{0.08} = \frac{0.08P}{0.08}$	(7.4.1)
Simplify.	$2{,}225 = P$	
Check your answer. Is it reasonable that $2,225 would earn $178 in 2 years?	$178 \stackrel{?}{=} 2,225(0.04)(2)$	(7.4.2)
	$178 = 178$ ✓	(7.4.3)
Write a complete sentence that answers the question.	The principal is $2,225.	

Exercise 7.4.3:

Find the principal invested if $495 interest was earned in 3 years at an interest rate of 6%.

Answer

$2,750

Exercise 7.4.4

Find the principal invested if $1,246 interest was earned in 5 years at an interest rate of 7%.

Answer

$3,560

Now we will solve for the rate of interest.

Example 7.4.3

Find the rate if a principal of $8,200 earned $3,772 interest in 4 years.

Solution

Organize the given information.

$$I = \$3{,}772,\ P = \$8{,}200,\ r = ?,\ t = 4 \text{ years}$$

We will use the simple interest formula to find the rate.

Write the formula.	$I = Prt$	
Substitute the given information.	$3{,}772 = 8{,}200r(4)$	
Multiply.	$3{,}772 = 32{,}800r$	
Divide.	$\frac{3,772}{32,800} = \frac{32,800r}{32,800}$	(7.4.4)
Simplify.	$0.115 = r$	
Write as a percent.	$11.5\% = r$	
Check your answer. Is 11.5% a reasonable rate if $3,772 was earned in 4 years?	$3,772 \stackrel{?}{=} 8,200(0.115)(4)$	(7.4.5)
	$3,772 = 3,772$ ✓	(7.4.6)
Write a complete sentence that answers the question.	The rate was 11.5%.	

Exercise 7.4.5:

Find the rate if a principal of $5,000 earned $1,350 interest in 6 years.

Answer

4.5%

Exercise 7.4.6:

Find the rate if a principal of $9,000 earned $1,755 interest in 3 years.

Answer

6.5%

Solve Simple Interest Applications

Applications with simple interest usually involve either investing money or borrowing money. To solve these applications, we continue to use the same strategy for applications that we have used earlier in this chapter. The only difference is that in place of translating to get an equation, we can use the simple interest formula.

We will start by solving a simple interest application to find the interest.

Example 7.4.4:

Nathaly deposited $12,500 in her bank account where it will earn 4% interest. How much interest will Nathaly earn in 5 years?

Solution

We are asked to find the Interest, I. Organize the given information in a list.

$$I = ?,\ P = \$12{,}500,\ r = 4\%,\ t = 5 \text{ years}$$

Write the formula.	$I = Prt$
Substitute the given information.	$I = (12{,}500)(0.04)(5)$
Simplify.	$I = 2{,}500$
Check your answer. Is $2,500 a reasonable interest on $12,500 over 5 years?	At 4% interest per year, in 5 years the interest would be 20% of the principal. Is 20% of $12,500 equal to $2,500? Yes.
Write a complete sentence that answers the question.	The interest is $2,500.

Exercise 7.4.7:

Areli invested a principal of $950 in her bank account with interest rate 3%. How much interest did she earn in 5 years?

Answer

$142.50

Exercise 7.4.8:

Susana invested a principal of $36,000 in her bank account with interest rate 6.5%. How much interest did she earn in 3 years?

Answer

$7,020

There may be times when you know the amount of interest earned on a given principal over a certain length of time, but you don't know the rate. For instance, this might happen when family members lend or borrow money among themselves instead of dealing with a bank. In the next example, we'll show how to solve for the rate.

Example 7.4.5:

Loren lent his brother $3,000 to help him buy a car. In 4 years his brother paid him back the $3,000 plus $660 in interest. What was the rate of interest?

Solution

We are asked to find the rate of interest, r. Organize the given information.

$$I = 660,\ P = \$3{,}000,\ r = ?,\ t = 4 \text{ years}$$

Write the formula.	$I = Prt$

Substitute the given information.	660 = (3,000)r(4)	
Multiply.	660 = (12,000)r	
Divide.	$\frac{660}{12,000} = \frac{(12,000)r}{12,000}$	(7.4.7)
Simplify.	0.055 = r	
Change to percent form.	5.5% = r	
Check your answer. Is 5.5% a reasonable interest rate to pay your brother?	$660 \stackrel{?}{=} (3,000)(0.055)(4)$	(7.4.8)
	$660 = 660$ ✓	(7.4.9)
Write a complete sentence that answers the question.	The rate of interest was 5.5%.	

? Exercise 7.4.9:

Jim lent his sister $5,000 to help her buy a house. In 3 years, she paid him the $5,000, plus $900 interest. What was the rate of interest?

Answer

6%

? Exercise 7.4.10:

Hang borrowed $7,500 from her parents to pay her tuition. In 5 years, she paid them $1,500 interest in addition to the $7,500 she borrowed. What was the rate of interest?

Answer

4%

There may be times when you take a loan for a large purchase and the amount of the principal is not clear. This might happen, for instance, in making a car purchase when the dealer adds the cost of a warranty to the price of the car. In the next example, we will solve a simple interest application for the principal.

✓ Example 7.4.6:

Eduardo noticed that his new car loan papers stated that with an interest rate of 7.5%, he would pay $6,596.25 in interest over 5 years. How much did he borrow to pay for his car?

Solution

We are asked to find the principal, P. Organize the given information.

I = 6,596.25, P = ?, r = 7.5%, t = 5 years

Write the formula.	I = Prt
Substitute the given information.	6,596.25 = P(0.075)(5)
Multiply.	6,596.25 = 0.375P

Divide.	$\frac{6,596.25}{0.375} = \frac{0.375P}{0.375}$	(7.4.10)
Simplify.	17,590 = P	
Check your answer. Is $17,590 a reasonable amount to borrow to buy a car?	$6,596.25 \stackrel{?}{=} (17,590)(0.075)(5)$	(7.4.11)
	$6,596.25 = 6,596.25$ ✓	(7.4.12)
Write a complete sentence that answers the question.	The amount borrowed was $17,590.	

? Exercise 7.4.11:

Sean's new car loan statement said he would pay $4,866.25 in interest from an interest rate of 8.5% over 5 years. How much did he borrow to buy his new car?

Answer

$11,450

? Exercise 7.4.12:

In 5 years, Gloria's bank account earned $2,400 interest at 5%. How much had she deposited in the account?

Answer

$9,600

In the simple interest formula, the rate of interest is given as an annual rate, the rate for one year. So the units of time must be in years. If the time is given in months, we convert it to years.

✓ Example 7.4.7:

Caroline got $900 as graduation gifts and invested it in a 10-month certificate of deposit that earned 2.1% interest. How much interest did this investment earn?

Solution

We are asked to find the interest, I. Organize the given information.

I = ?, P = $900, r = 2.1%, t = 10 months

Write the formula.	I = Prt	
Substitute the given information, converting 10 months to $\frac{10}{12}$ of a year.	$I = \$900(0.021)\left(\frac{10}{12}\right)$	(7.4.13)
Multiply.	I = 15.75	
Check your answer. Is $15.75 a reasonable amount of interest?	If Caroline had invested the $900 for a full year at 2% interest, the amount of interest would have been $18. Yes, $15.75 is reasonable.	
Write a complete sentence that answers the question.	The interest earned was $15.75.	

Exercise 7.4.13:

Adriana invested $4,500 for 8 months in an account that paid 1.9% interest. How much interest did she earn?

Answer

$57.00

Exercise 7.4.14:

Milton invested $2,460 for 20 months in an account that paid 3.5% interest How much interest did he earn?

Answer

$143.50

Practice Makes Perfect

Use the Simple Interest Formula

In the following exercises, use the simple interest formula to fill in the missing information.

202.

Table 7.4.1

Interest	Principal	Rate	Time (years)
	$1200	3%	5

203.

Table 7.4.2

Interest	Principal	Rate	Time (years)
	$1500	2%	4

204.

Table 7.4.3

Interest	Principal	Rate	Time (years)
$4410		4.5%	7

205.

Table 7.4.4

Interest	Principal	Rate	Time (years)
$2212		3.2%	6

206.

Table 7.4.5

Interest	Principal	Rate	Time (years)
$577.08	$4580		2

207.

Table 7.4.6

Interest	Principal	Rate	Time (years)
$528.12	$3260		3

In the following exercises, solve the problem using the simple interest formula.

208. Find the simple interest earned after 5 years on $600 at an interest rate of 3%.
209. Find the simple interest earned after 4 years on $900 at an interest rate of 6%.
210. Find the simple interest earned after 2 years on $8,950 at an interest rate of 3.24%.
211. Find the simple interest earned after 3 years on $6,510 at an interest rate of 2.85%.
212. Find the simple interest earned after 8 years on $15,500 at an interest rate of 11.425%.
213. Find the simple interest earned after 6 years on $23,900 at an interest rate of 12.175%.
214. Find the principal invested if $656 interest was earned in 5 years at an interest rate of 4%.
215. Find the principal invested if $177 interest was earned in 2 years at an interest rate of 3%.
216. Find the principal invested if $70.95 interest was earned in 3 years at an interest rate of 2.75%.
217. Find the principal invested if $636.84 interest was earned in 6 years at an interest rate of 4.35%.
218. Find the principal invested if $15,222.57 interest was earned in 6 years at an interest rate of 10.28%.
219. Find the principal invested if $10,953.70 interest was earned in 5 years at an interest rate of 11.04%.
220. Find the rate if a principal of $5,400 earned $432 interest in 2 years.
221. Find the rate if a principal of $2,600 earned $468 interest in 6 years.
222. Find the rate if a principal of $11,000 earned $1,815 interest in 3 years.
223. Find the rate if a principal of $8,500 earned $3,230 interest in 4 years.

Solve Simple Interest Applications

In the following exercises, solve the problem using the simple interest formula.

224. Casey deposited $1,450 in a bank account with interest rate 4%. How much interest was earned in 2 years?
225. Terrence deposited $5,720 in a bank account with interest rate 6%. How much interest was earned in 4 years?
226. Robin deposited $31,000 in a bank account with interest rate 5.2%. How much interest was earned in 3 years?
227. Carleen deposited $16,400 in a bank account with interest rate 3.9%. How much interest was earned in 8 years?
228. Hilaria borrowed $8,000 from her grandfather to pay for college. Five years later, she paid him back the $8,000, plus $1,200 interest. What was the rate of interest?
229. Kenneth lent his niece $1,200 to buy a computer. Two years later, she paid him back the $1,200, plus $96 interest. What was the rate of interest?
230. Lebron lent his daughter $20,000 to help her buy a condominium. When she sold the condominium four years later, she paid him the $20,000, plus $3,000 interest. What was the rate of interest?
231. Pablo borrowed $50,000 to start a business. Three years later, he repaid the $50,000, plus $9,375 interest. What was the rate of interest?
232. In 10 years, a bank account that paid 5.25% earned $18,375 interest. What was the principal of the account?
233. In 25 years, a bond that paid 4.75% earned $2,375 interest. What was the principal of the bond?
234. Joshua's computer loan statement said he would pay $1,244.34 in interest for a 3 year loan at 12.4%. How much did Joshua borrow to buy the computer?
235. Margaret's car loan statement said she would pay $7,683.20 in interest for a 5 year loan at 9.8%. How much did Margaret borrow to buy the car?
236. Caitlin invested $8,200 in an 18-month certificate of deposit paying 2.7% interest. How much interest did she earn form this investment?
237. Diego invested $6,100 in a 9-month certificate of deposit paying 1.8% interest. How much interest did he earn form this investment?
238. Airin borrowed $3,900 from her parents for the down payment on a car and promised to pay them back in 15 months at a 4% rate of interest. How much interest did she owe her parents?
239. Yuta borrowed $840 from his brother to pay for his textbooks and promised to pay him back in 5 months at a 6% rate of interest. How much interest did Yuta owe his brother?

Everyday Math

240. **Interest on savings** Find the interest rate your local bank pays on savings accounts.
    a. What is the interest rate?
    b. Calculate the amount of interest you would earn on a principal of $8,000 for 5 years.

241. **Interest on a loan** Find the interest rate your local bank charges for a car loan.
    a. What is the interest rate?
    b. Calculate the amount of interest you would pay on a loan of $8,000 for 5 years.

Writing Exercises

242. Why do banks pay interest on money deposited in savings accounts?
243. Why do banks charge interest for lending money?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the simple interest formula.			
solve simple interest applications.			

(b) On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

7.5: Percent Increase or Decrease

A person's salary can increase by a percentage. A town's population can decrease by a percentage. A clothing firm can discount its apparel. These are the types of applications we will investigate in this section.

Percent Increase

Example 1

Add text here.

Solution

Let *x* represent the salesperson's salary increase. Then we can translate the problem into words and symbols.

Salary increase	is	5%	of	original salary
x	$=$	5%	$\cdot$	4000

Solve for *x*.

$$x = 0.05 \cdot 4000 \quad 5\% = 0.05.$$
$$x = 200 \quad \text{Multiply: } 0.05 \cdot 4000 = 200.$$

Therefore, the salary increase is $200. To compute the new salary *N*, we must add this increase to the original salary.

New salary	is	original salary	plus	increase
N	$=$	4000	$+$	200

Thus, the new salary is N = $4, 200 per month.

Alternative Solution

If the salesperson is to receive a 5% increase in his salary, then his new salary will be 105% of his original salary. Let N represent his new monthly salary. Then,

New salary	is	105%	of	original salary
N	$=$	105%	$\cdot$	4000

Solve for *N*.

$$N = 1.05 \cdot 4000 \quad 105\% = 1.05.$$
$$N = 4200 \quad \text{Multiply: } 1.05 \cdot 4000 = 4200.$$

Same answer.

Exercise

A computer technician is granted a 4% salary increase. If the salesperson's current salary is $2,800 per month, what will be his new salary?

Answer

$2,912

Example 2

A salesperson making a salary of $4,500 per month has his salary increased to $5,000 per month. What is the percent increase?

Solution

To find the increase in salary, first subtract the original salary from the new salary.

$$\begin{aligned}\text{Salary increase} &= \text{new salary} - \text{original salary}\\ &= 5000 - 4500\\ &= 500\end{aligned}$$

Hence, the salesperson sees an increase in salary of $500.

Next, let p represent the salesperson's percent salary increase. Then we can translate the problem into words and symbols.

Salary increase	is	what percent	of	original salary
500	=	p	·	4500

The commutative property of multiplication allows us to change the order of multiplication on the right-hand side of this last equation.

$$500 = 4500p$$

Solve for p.

$$\begin{aligned}\frac{500}{4500} &= \frac{4500p}{4500} && \text{Divide both sides by 4500.}\\ \frac{1}{9} &= p && \text{Reduce by dividing numerator and denominator of } 500/4500 \text{ by 500.}\end{aligned}$$

We need to change p = 1/9 to a percent. We can find an exact answer by creating an equivalent fraction with a denominator of 100.

$$\begin{aligned}\frac{1}{9} &= \frac{n}{100} && \text{Make equivalent fraction.}\\ 9n &= 100 && \text{Cross multiply.}\\ \frac{9n}{9} &= \frac{100}{9} && \text{Divide both sides by 9.}\\ n &= 11\frac{1}{9} && \text{Convert } 100/9 \text{ to mixed fraction.}\end{aligned}$$

Hence, the percent increase is

$$p = \frac{1}{9} = \frac{11\frac{1}{9}}{100} = 11\frac{1}{9}\%.$$

Alternative Solution

An alternative approach is to ask what percent of the original salary equals the new salary. In this approach, let p represent the percent of the original salary that equals the new salary.

New salary	is	what percent	of	original salary
5000	=	p	·	4500

Solve for p.

$$\begin{aligned}5000 &= 4500p && \text{Change the order of multiplication.}\\ \frac{5000}{4500} &= \frac{4500p}{4500} && \text{Divide both sides by 4500.}\\ \frac{10}{9} &= p && \text{Reduce: Divide numerator and denominator of } 5000/4500 \text{ by 500.}\end{aligned}$$

We need to change 10/9 to a percent. Again, create an equivalent fraction with a denominator of 100.

$$\begin{aligned} \frac{10}{9} &= \frac{n}{100} && \text{Make equivalent fraction.} \\ 9n &= 1000 && \text{Cross multiply.} \\ \frac{9n}{9} &= \frac{1000}{9} && \text{Divide both sides by 9.} \\ n &= 111\frac{1}{9} && \text{Convert 1000/9 to a mixed fraction.} \end{aligned}$$

Thus,

$$p = \frac{10}{9} = \frac{111\frac{1}{9}}{100} = 111\frac{1}{9}\%.$$

Hence, the new salary is $111\frac{1}{9}\%$ of the original salary. To find the percent increase, subtract 100% from $111\frac{1}{9}\%$.

$$111\frac{1}{9}\% - 100\% = 11\frac{1}{9}\%$$

This represents an $11\frac{1}{9}\%$ increase in salary, which is the same answer garnered by the first solution technique.

? Exercise

A statistician making a salary of $3,200 per month has his salary increased to $3,368 per month. What is the percent increase?

Answer

$5\frac{1}{4}\%$

Percent Decrease

✓ Example 3

Due to a mill closure, the population of Silvertown decreases by 8.5%. If the original population was 10,200 hardy souls, what is the new population?

Solution

Let *x* represent the population decrease. Then we can translate the problem into words and symbols.

Population decrease	is	8.5%	of	original population
x	$=$	8.5%	$\cdot$	10200

Solve for *x*.

$$\begin{aligned} x &= 0.085 \cdot 10200 && 8.5\% = 0.085. \\ x &= 867 && \text{Multiply: } 0.085 \cdot 10200 = 867. \end{aligned}$$

Therefore, the population decrease is 867. To compute the new population P, we must subtract this decrease from the original population.

New population	is	original population	minus	population decrease
P	$=$	10200	$-$	867

Thus, the new population is P = 9,333 hardy souls.

Alternative Solution

Subtract 8.5% from 100% to obtain

$$100\% - 8.5\% = 91.5\%.$$

Thus, if 8.5% of the population leaves town, then 91.5% of the population stays. Thus, the new population P is calculated from the original as follows:

New population	is	91.5%	of	original population
P	$=$	91.5%	$\cdot$	10200

Solve for P.

$$\begin{aligned} P &= 0.915 \cdot 10200 && 91.5\% = 0.915. \\ P &= 9333 && \text{Multiply: } 0.915 \cdot 10200 = 9333. \end{aligned}$$

Same answer.

Exercise

Several retail stores close and the population of Athens decreases by 7.2% as a result. If the original population was 12,500, what is the new population?

Answer

11,600

Example 4

Millertown falls on hard times and its population decreases from 11,256 to 10,923 in the space of one year. What is the percent decrease, rounded to the nearest hundredth of a percent?

Solution

To find the decrease in population, first subtract the current population from the original population.

$$\begin{aligned} \text{Population decrease} &= \text{original population} - \text{current population} \\ &= 11256 - 10923 \\ &= 333 \end{aligned}$$

Hence, the population has decreased by 333 people.

Next, let p represent the percent population decrease. Then we can translate the problem into words and symbols.

Population decrease	is	what percent	of	original population
333	$=$	p	$\cdot$	11256

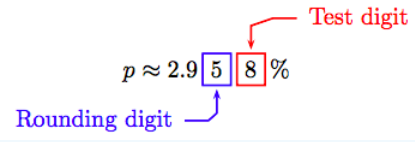
Solve for p.

$$\begin{aligned} \frac{333}{11256} &= \frac{11256p}{11256} && \text{Divide both sides by } 11256. \\ 0.02958 &\approx p && \text{Divide: } 333/11256 \approx 0.02958. \end{aligned}$$

To change p to a percent, move the decimal point two places to the right and append a percent symbol.

$$p \approx 0.02958 \approx 0\,02.958\% \approx 2.958\%.$$

We are asked to round to the nearest hundredth of a percent.



Because the test digit is greater than or equal to 5, add 1 to the rounding digit and truncate. That is,

$$p \approx 2.96\%.$$

Thus, the population of Millertown decreases approximately 2.96%.

Alternative Solution

An alternative approach is to ask what percent of the original population equals the new population.

New population	is	what percent	of	original population
10923	=	p	·	11256

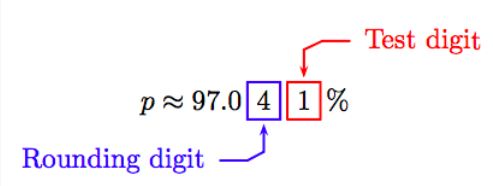
Solve for p.

$$\begin{aligned} 10923 &= 11256p && \text{Change the order of multiplication.} \\ \frac{10923}{11256} &= \frac{11256p}{11256} && \text{Divide both sides by } 11256. \\ 0.97041 &\approx p && \text{Divide: } 10923/11256 \approx 0.97041. \end{aligned}$$

To change p to a percent, move the decimal two places to the right and append a percent symbol.

$$p \approx 0.97041 \approx 0\,97.041\% \approx 97.041\%.$$

We are asked to round to the nearest hundredth of a percent.



Because the test digit is less than 5, leave the rounding digit alone and truncate. That is,

$$p \approx 97.04\%.$$

Thus, 97.04% of the Millertown population remains. To find the percent decrease (the percent who left), subtract 97.04% from 100%.

$$100\% - 97.04\% = 2.96\%$$

Hence, the population of Millertown decreases by 2.96%. Same answer.

? Exercise

A textile mill closure results in the population of the adjacent town decreasing from 8,956 to 7,800. What is the percent decrease in the population, rounded to the nearest tenth of a percent?

Answer

12.9%

Discount

Another important application of percent is the discounting of goods.

✔ Example 5

A pair of skis is marked at $310. However, a sign in the shop indicates that skis are being discounted at 15%. What will be the new selling price of the skis?

Solution

Let D represent the discount (in dollars) given for our pair of skis. Then, in words and symbols:

Discount	is	15%	of	original marked price
D	$=$	15%	$\cdot$	310

Solve for D.

$$D = 0.15 \cdot 310 \quad 15\% = 0.15.$$
$$D = 46.50 \quad \text{Multiply: } 0.15 \cdot 310 = 46.50.$$

Hence, the discount is \$46.50. To find the new selling price, subtract this discount from the original selling price.

$$\begin{aligned} \text{New selling price} &= \text{original selling price} - \text{discount} \\ &= 310 - 46.50 \\ &= 263.50 \end{aligned}$$

Hence, the new selling price is \$263.50.

Alternate Solution

Subtract 15% from 100% to obtain

$$100\% - 15\% = 85\%.$$

That is, if an item is discounted 15%, then its new selling price S is 85% of its original marked price.

New selling price	is	85%	of	original marked price
S	$=$	85%	$\cdot$	310

Solve for S.

$$S = 0.85 \cdot 310 \quad 85\% = 0.85.$$
$$S = 263.50 \quad \text{Multiply: } 0.85 \cdot 310 = 263.50.$$

Thus, the new selling price is \$263.50. Same answer.

? Exercise

A pair of hiking boots is marked at \$200. During a sale, the boots are discounted by 8%. What is the new price of the boots?

Answer

\$184

✔ Example 6

A pair of ski boots marked at \$210 is sold for \$180. Find the percent discount, correct to the nearest tenth of a percent.

Solution

We can find the discount (in dollars) by subtracting the sale price from the original marked price.

$$\begin{aligned} \text{Discount} &= \text{original marked price} - \text{sale price} \\ &= 210 - 180 \\ &= 30 \end{aligned}$$

Hence, the boots are discounted \$30.

Let p represent the percent discount. Then, in words and symbols:

Discount	is	percent discount	of	original marked price
30	$=$	p	$\cdot$	210

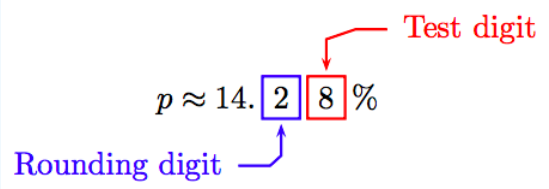
Solve for p.

$$\begin{aligned} 30 &= 210p && \text{Change order of multiplication.} \\ \frac{30}{210} &= \frac{210p}{210} && \text{Divide both sides by 210.} \\ \frac{1}{7} &= p && \text{Reduce: Divide numerator and denominator of } 30/210 \text{ by 30.} \\ p &\approx && \text{Divide: } 1/7 \approx 0.1428. \end{aligned}$$

To change p to a percent, move the decimal point two places to the right and append a percent symbol.

$$p \approx 0.1428 \approx 0\,14.28\% \approx 14.28\%.$$

Round to the nearest tenth of a percent.



Because the test digit is greater than or equal to 5, add 1 to the rounding digit and truncate. Thus, correct to the nearest tenth of a percent, the percent discount is

$$p \approx 14.3\%.$$

Alternate Solution

An alternative approach is to ask what percent p of the original marked price equals the selling price.

New selling price	is	what percent	of	original marked price
180	=	p	·	210

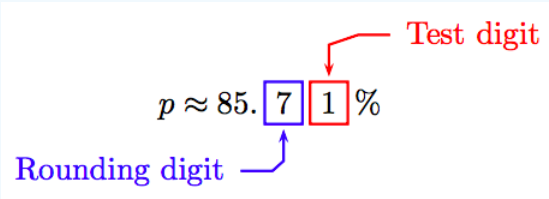
Solve for p.

$$\begin{aligned} 180 &= 210p && \text{Change the order of multiplication.} \\ \frac{180}{210} &= \frac{210p}{210} && \text{Divide both sides by 210.} \\ \frac{6}{7} &= p && \text{Reduce: Divide numerator and denominator of } 180/210 \text{ by 30.} \\ p &\approx && \text{Divide: } 6/7 \approx 0.8571. \end{aligned}$$

To change p to a percent, move the decimal point two places to the right and append a percent symbol.

$$p \approx 0.8571 \approx 0\,85.71\% \approx 85.71\%.$$

Round to the nearest tenth of a percent.



Because the test digit is less than 5, do nothing to the rounding digit and truncate. Thus, correct to the nearest tenth of a percent,

$$p \approx 85.7\%.$$

Thus, the new selling price is 85.7% of the original marked price. Subtract 85.7% from 100%.

$$100\% - 85.7\% = 14.3\%.$$

That is, if the new selling price is 85.7% of the original price, then the percent discount is 14.3%. This is the same answer found with the first method.

? Exercise

A computer marked at $2,000 is sold at a discount for $1,850. Find the percent discount, correct to the nearest tenth of a percent.

Answer

7.5%

Exercises

1. A television set is marked at $447. However, a sign in the shop indicates that the television set is being discounted at 20.5%. What will be the new selling price of the television set? Round your answer to the nearest penny.

2. A stereo set is marked at $380. However, a sign in the shop indicates that the stereo set is being discounted at 7.5%. What will be the new selling price of the stereo set? Round your answer to the nearest penny.

3. Due to a ball bearing plant closure, Anselm falls on hard times and its population decreases from 10,794 to 8,925 in the space of one year. What is the percent decrease, rounded to the nearest hundredth of a percent?

4. Due to a logging mill closure, Carlytown falls on hard times and its population decreases from 12,113 to 10,833 in the space of one year. What is the percent decrease, rounded to the nearest hundredth of a percent?

5. A car rack is marked at $500. However, a sign in the shop indicates that the car rack is being discounted at 3.5%. What will be the new selling price of the car rack? Round your answer to the nearest penny.

6. A car rack is marked at $405. However, a sign in the shop indicates that the car rack is being discounted at 17.5%. What will be the new selling price of the car rack? Round your answer to the nearest penny.

7. Due to a textile mill closure, the population of Silvertown decreases by 4.1%. If the original population was 14,678 hardy souls, what is the new population, correct to the nearest person?

8. Due to a department store closure, the population of Petroria decreases by 5.3%. If the original population was 14,034 hardy souls, what is the new population, correct to the nearest person?

9. A bartender is granted a 4.6% salary increase. If the bartender's current salary is $2,500 per month, find the bartender's new monthly salary, rounded to the nearest dollar.

10. A bartender is granted a 5.5% salary increase. If the bartender's current salary is $2,900 per month, find the bartender's new monthly salary, rounded to the nearest dollar.

11. A car rack marked at $358 is sold for $292. Find the percent discount, correct to the nearest tenth of a percent.

12. A bicycle marked at $328 is sold for $264. Find the percent discount, correct to the nearest tenth of a percent.

13. Due to a auto manufacturing plant closure, Carlytown falls on hard times and its population decreases from 14,393 to 12,623 in the space of one year. What is the percent decrease, rounded to the nearest hundredth of a percent?

14. Due to a ball bearing plant closure, Mayville falls on hard times and its population decreases from 8,494 to 6,609 in the space of one year. What is the percent decrease, rounded to the nearest hundredth of a percent?

15. Due to a auto manufacturing plant closure, the population of Silvertown decreases by 2.4%. If the original population was 8,780 hardy souls, what is the new population, correct to the nearest person?

16. Due to a textile mill closure, the population of Ghosttown decreases by 6.1%. If the original population was 14,320 hardy souls, what is the new population, correct to the nearest person?

17. A clerk making a salary of $2,600 per month has her salary increased to $2,950 per month. Find the percent increase correct to the nearest tenth of a percent.

18. A clerk making a salary of $3,600 per month has her salary increased to $4,100 per month. Find the percent increase correct to the nearest tenth of a percent.

19. A bartender making a salary of $4,200 per month has her salary increased to $4,300 per month. Find the percent increase correct to the nearest tenth of a percent.

20. A bartender making a salary of $3,200 per month has her salary increased to $3,550 per month. Find the percent increase correct to the nearest tenth of a percent.

21. A gardener is granted a 5.1% salary increase. If the gardener's current salary is $3,200 per month, find the gardener's new monthly salary, rounded to the nearest dollar.

22. A secretary is granted a 2.8% salary increase. If the secretary's current salary is $3,600 per month, find the secretary's new monthly salary, rounded to the nearest dollar.

23. A television set marked at $437 is sold for $347. Find the percent discount, correct to the nearest tenth of a percent.

24. A camera marked at $390 is sold for $328. Find the percent discount, correct to the nearest tenth of a percent.

---

25. Suppose that the price of an 8-ounce can of tomato sauce increased from $0.20 to $0.28.

    a) What was the amount of increase?

    b) What was the percent increase?

26. The following table summarizes summertime gasoline prices in San Francisco, CA. The price is the number of dollars required to purchase one gallon of unleaded gasoline. *Data from gasbuddy.com.*

Year	Price per gallon
2003	1.80
2004	2.28
2005	2.57
2006	3.20
2007	3.28
2008	4.61
2009	3.01

What is the percent increase or decrease from 2003 to 2005? Round your answer to the nearest whole percent.

27. Refer to the table of gas prices in Exercise 26. What is the percent increase or decrease from 2005 to 2007? Round your answer to the nearest whole percent.

28. Refer to the table of gas prices in Exercise 26. What is the percent increase or decrease from 2007 to 2009? Round your answer to the nearest whole percent.

29. **Rate hike.** A family paying $858 monthly for health coverage is faced with a 39% hike in rates. What will be their new monthly cost after the increase? *Associated Press-Times-Standard 02/09/10 HHS secretary asks Anthem Blue Cross to justify rate hike.*

30. **Parking fine.** San Francisco's Metropolitan Transportation Agency was expected to consider raising fines for the use of fake, stolen, or borrowed disabled parking tags from $100 to $825. What is the percent increase for this fine? *Associated Press-Times-Standard 01/06/10 Fines for fake disabled parking tags may go up in San Francisco.*

31. **Industrial move.** Regulations in California have caused factory farmers to move out of state. Idaho's industrial dairy went from 180, 000 cows in 1990 to 530, 000 cows in 2009. What is the percent increase for Idaho industrial dairy cows, rounded to the nearest percent? *Associated Press-Times-Standard 02/09/10 Idaho, others prepare for California egg farm exodus.*

32. **Whooping crane.** Whooping crane populations made a remarkable comeback from just 15 birds in 1941 to about 400 birds worldwide in 2010. What is the percent increase for the whooping crane population over the past seventy years, rounded to the nearest percent? *Associated Press-Times-Standard 03/17/10 Plucky whooping crane gives wildlife experts hope.*

33. **Underwater.** The loss of Arctic sea ice will allow for an underwater fiber optic cable that will cut the time it takes to send a message from London to Tokyo from a current 140 milliseconds down to 88 milliseconds. *Associated Press-Times-Standard 01/22/10 Global warming opens up Northwest Passage for underwater fiber optic cable.*

a) What is the estimated percent decrease in communication time?

b) At a cost of $1.2 billion, what is the cost per millisecond of saving (rounded to the nearest dollar)?

34. **Chinook salmon.** During the 2009 season in the Sacramento river basin, a record low 39,500 chinook salmon were recorded, way down from the more than 750,000 counted in 2002. What is the percent decrease in the salmon count from 2002 to 2009, rounded to the nearest percent? *Associated Press-Times-Standard 02/25/10 Feds predict better year for California salmon.*

35. **Daylight hours.** In middle latitudes, summer days can have as many as 14 hours of daylight, while winter days can have a few as 10 hours of daylight. What percent more daylight is there in summer than in winter?

36. **Cyber-experts.** Defense Secretary Robert Gates said the Pentagon will increase the number of cyber-experts it can train each year from 80 to 250 by 2011. What percent increase is this? Round your answer to the nearest percent. *Associated Press Times-Standard 4/19/09*

37. **Home prices.** Real estate data for Humboldt County, California, is given below. *Associated Press-Times-Standard 01/17/10 How is our local real estate market compared to other regions?*

Year	Number of homes sold	Average home price
2000	1,358	$152,257
2005	1,432	$344,500
2009	833	$285,000

a) What percent change in average home price occurred between 2000 and 2009?

b) What percent change in homes sold occurred between 2000 and 2009?

Answers

1. $355.36

3. 17.32%

5. $482.50

7. 14,076 people

9. $2,615

11. 18.4%

13. 12.30%

15. 8,569

17. 13.5%

19. 2.4%

21. $3,363

23. 20.6%

25.

a) $0.08

b) 40%

27. 28% increase

29. $1,193

31. 194% increase

33.

a) 37%

b) About $23,076,923 per millisecond

35. 40% more daylight

37.

a) 87% increase in average home price

b) 39% decrease in home sales

7.6: Pie Charts

In this section we turn our attention to pie charts, but before we do, we need to establish some fundamentals regarding measurement of angles.

If you take a circle and divide it into 360 equal increments, then each increment is called one degree (1°). See Figure 7.2.

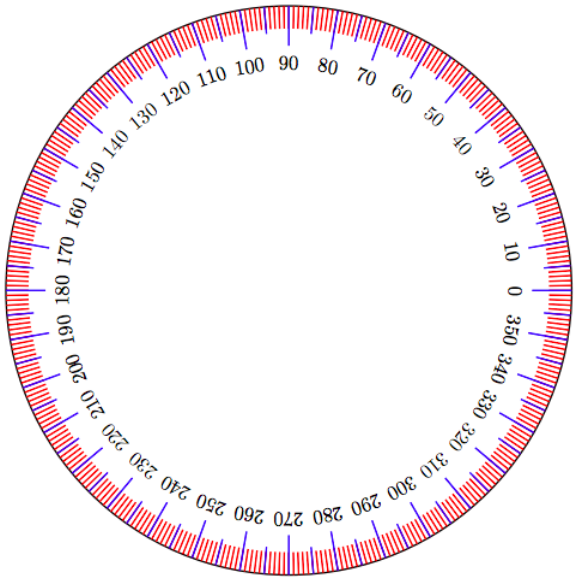

Figure 7.2: There are 360 degrees (360°) in a circle.

A *ray* is a line that starts at a point and then extends indefinitely in one direction. The starting point of the ray is called its *vertex*.

Figure 7.3: A ray with vertex V *extends indefinitely in one direction.*

If two rays have a common vertex, they form what is called an *angle*. In Figure 7.4 we've labeled the first ray as the "Initial Side" of the angle, and the second as the "Terminal Side" of the angle.

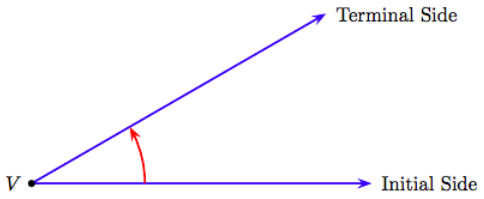

Figure 7.4: Two rays with a common vertex V *form an angle.*

We can find the degree measure of the angle by using a device called a *protractor*. Align the notch in the center of the base of the protractor with the vertex of the angle, then align the base of the protractor with the initial side of the angle. The terminal side of the angle will intersect the protractor edge where we can read the degree measure of the angle (see Figure 7.5). In Figure 7.5, note that the terminal side of the angle passes through the tick mark at the number 30, indicating that the degree measure of this angle is 30°.

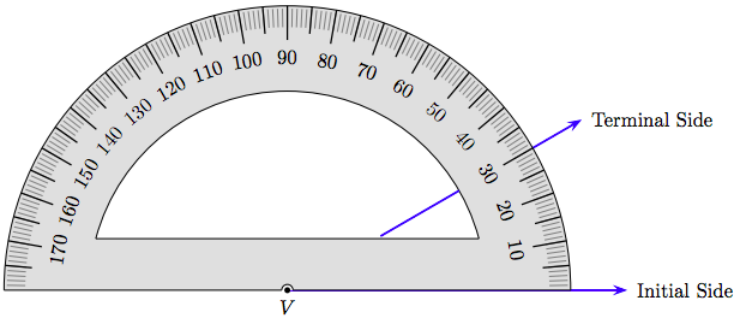

Figure 7.5: The degree measure is 30°.

Pie Charts

Now that we can measure angles, we can turn our attention to constructing *pie charts*.

Pie Chart

A pie chart is a circular chart that is divided into sectors, each sector representing a particular quantity. The area of each sector is a percentage of the area of the whole circle and is determined by calculating the quantity it represents as a percentage of the whole.

Example 1

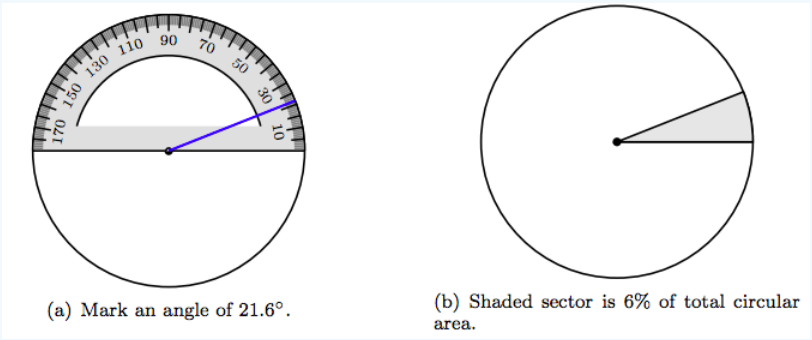
In a recent Gallup poll, 66% of those polled approved of the President's job performance, 28% disapproved, and 6% were undecided. Create a pie chart that displays these percentages.

Solution

Let's begin with 6% undecided. We want to create a sector that is 6% of the area of the whole circle. There are 360 degrees in a full circle, so 6% of this number is

$$\begin{aligned} 6\% \cdot 360^\circ &= 0.06 \cdot 360^\circ \\ &= 21.6^\circ. \end{aligned}$$

Start with a circle, set the baseline notch of the protractor on the center of the circle, then mark an angle of 21.6°, as seen in Figure 7.6(a). Shade the resulting region as shown in Figure 7.6(b), called a *sector*, which represents 6% of the total area of the circle.



(a) Mark an angle of 21.6°.

(b) Shaded sector is 6% of total circular area.

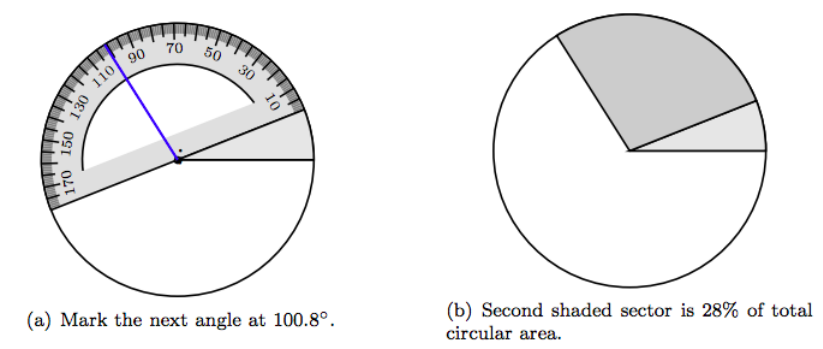
Figure 7.6: Sector with central angle 21.6° represents the 6% of the polling sample that were undecided about the president's performance.

Next, 28% disapproved of the President's job performance. Thus,

$$\begin{aligned} 28\% \cdot 360^\circ &= 0.28 \cdot 360^\circ \\ &= 100.8^\circ. \end{aligned}$$

Therefore, a sector with a central angle of 100.8° will represent 28% job disapproval.

Place the notch on the baseline of your protractor on the center of the circle, then align the baseline of the protractor with the terminal side of the first angle, as shown in Figure 7.7(a). Mark a central angle of 100.8°, as shown in Figure 7.7(a). Shade the resulting second sector with a darker shade of gray, as shown in Figure 7.7(b). This sector contains 28% of the total area of the circle and represents the portion of the polling sample that disapproved of the president's job performance.



(a) Mark the next angle at 100.8°.

(b) Second shaded sector is 28% of total circular area.

Figure 7.7: Sector with central angle 100.8° represents the 28% of the polling sample that disapproved of the president's performance.

Finally, as we've shaded the sectors representing 6% and 28% of the polling data in Figure 7.7(b), the remaining sector in Figure 7.7(b), shaded in white, represents the 66% of the polling sample who approved of the president's job performance (and 66% of the area of the whole circle).

Once you have computed and plotted the correct central angles for each of the sectors, you will want to label your pie chart. One possible annotation method is shown in Figure 7.8.

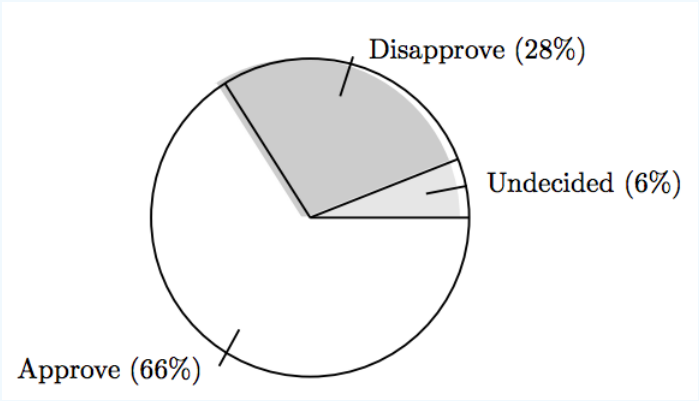


Figure 7.8: Annotating the final pie chart.

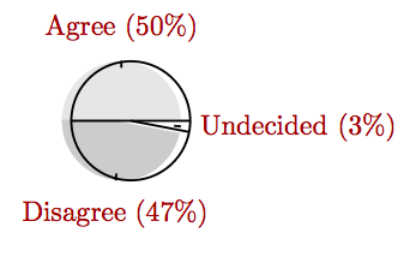
? Exercise

In a recent Gallup poll, 50% of the American public say it is the federal government's responsibility to make sure all Americans have health care, 47% disagree, and 3% were undecided. Create a pie chart that displays these percentages.

Answer



Example 2

One thousand people were polled with the question "Where does your dog sleep during the night?" The responses are shown in the following table.

Location	Number
Outside	30
Another Room	220
On the Bedroom Floor	330
On the Bed	420
Totals	1000

Create a pie chart showing the distribution of these responses.

Solution

The first step is to express the number in each location as a percentage of the totals. For example,

Outside	is	what percent	of	total
30	=	p	·	1000

Solving for p,

$$\frac{1000p}{1000} = \frac{30}{1000} \quad \text{Divide both sides by 1000.}$$
$$p = 0.03 \quad \text{Divide: } 30/1000 = 0.03.$$

Thus, p = 3%. In similar fashion, divide the number in each location by 1000 to find the following percents.

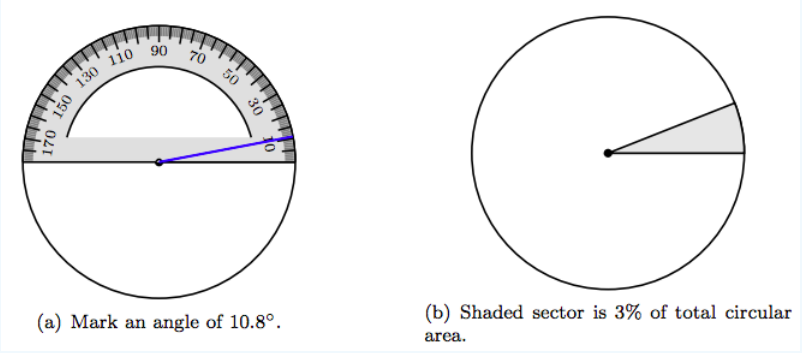
Location	Number	Percent
Outside	30	3%
Another Room	220	22%
On the Bedroom Floor	330	33%
On the Bed	420	42%
Totals	1000	100%

Note that the individual percents must total 100%.

Let's begin with the fact that 3% of the dog owners have their dogs sleep outside. To find the portion of the full circle that represents 3%, we take 3% of 360°.

$$3\% \cdot 360^\circ = 0.03 \cdot 360^\circ$$
$$= 10.8^\circ$$

Start with a circle, set the baseline notch of the protractor on the center of the circle, then mark an angle of 10.8°, as seen in Figure 7.9(a).



(a) Mark an angle of 10.8°.

(b) Shaded sector is 3% of total circular area.

Figure 7.9: Sector with central angle 10.8° represents the 3% of the polling sample that have their dogs sleep outside.

Shade the resulting sector as shown in Figure 7.9(b), which represents 3% of the total area of the circle.

Next, 22% have their dog sleep in another room.

$$\begin{aligned} 22\% \cdot 360^\circ &= 0.22 \cdot 360^\circ \\ &= 79.2^\circ. \end{aligned}$$

Therefore, a sector with a central angle of 79.2° will represent the fact that 22% of the dog owners have their dog sleep in another room.

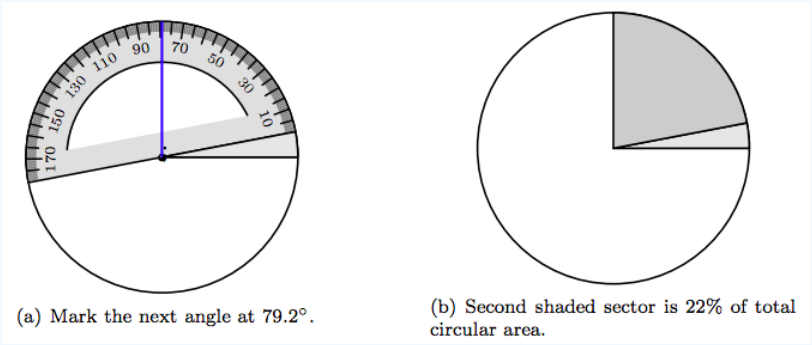
Place the notch on the baseline of your protractor on the center of the circle, then align the baseline of the protractor with the terminal side of the first angle, as shown in Figure 7.10(a). Mark a central angle of $79.2\circ$, as shown in Figure 7.7(a). Shade the resulting second sector with a darker shade of gray, as shown in Figure 7.10(b). This sector contains 22% of the total area of the circle and represents the portion of the polling sample whose dog sleeps in another room.

Next, 33% allow their dog sleep on the bedroom floor.

$$\begin{aligned} 33\% \cdot 360^\circ &= 0.33 \cdot 360^\circ \\ &= 118.8^\circ. \end{aligned}$$

Therefore, a sector with a central angle of 118.8° will represent the fact that 33% of the dog owners allow their dog to sleep on the bedroom floor.

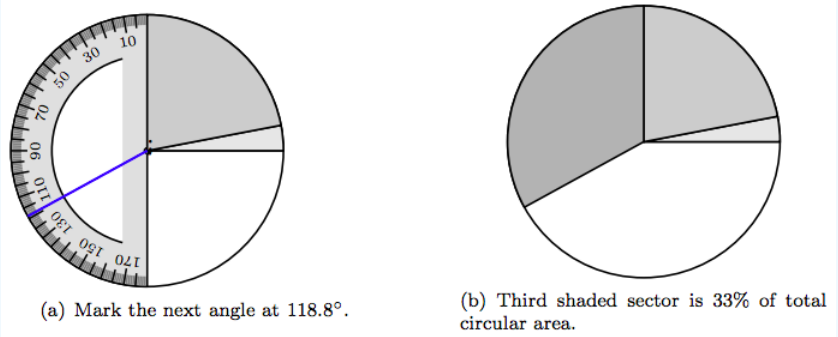
Place the notch on the baseline of your protractor on the center of the circle, then align the baseline of the protractor with the terminal side of the second sector, as shown in Figure 7.11(a). Mark a central angle of 118.8°, as shown in Figure 7.11(a). Shade the resulting second sector with a darker shade of gray, as shown in Figure 7.11(b). This sector contains 33% of the total area of the circle and represents the portion of the polling sample whose dog sleeps on the bedroom floor.



(a) Mark the next angle at 79.2°.

(b) Second shaded sector is 22% of total circular area.

Figure 7.10: Sector with central angle 79.2° represents the 22% of the polling sample whose dogs sleep in another room.



(a) Mark the next angle at 118.8°.

(b) Third shaded sector is 33% of total circular area.

Figure 7.11: Sector with central angle 118.8° represents the 33% of the polling sample whose dogs sleep on the bedroom floor.

Because the first three sectors, shaded in various levels of gray, represent 3%, 22%, and 33% of the total circular area, respectively, the remaining sector (shaded in white) automatically represents

$$100\% - (3\% + 22\% + 33\%) = 42\%$$

of the total circular area. This region represents the percent of dog owners who allow their dogs to sleep on the bed. The final result, with annotations, is shown in Figure 7.1

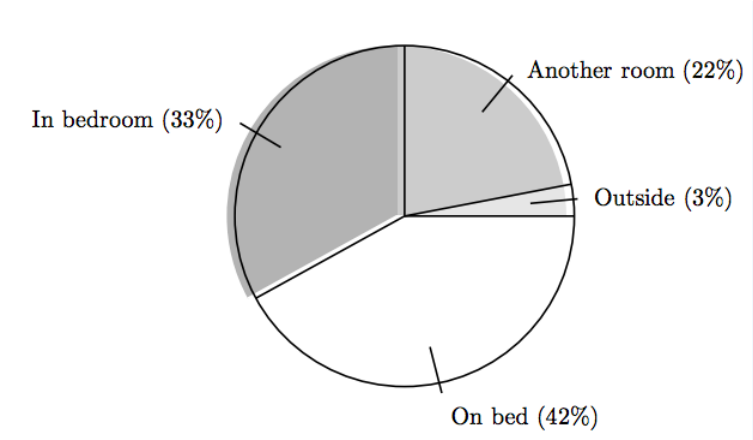


Figure 7.12: Annotating the final pie chart.

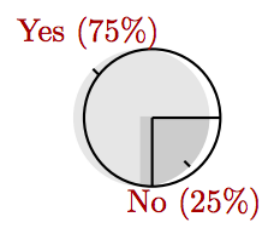
? Exercise

Two hundred people were asked whether they vote “Yes” or “No” on Proposition 8. There were 150 “Yes” votes and 50 “No” votes. Create a pie chart showing the distribution of these responses.

Answer



Exercises

1. In an election for class president, Raven received 21% of the votes, Anita received 27%, Jamal received 24% of the votes, and 28% of the votes were received by other candidates. If a pie chart is created for this data, what will be the degree measure of the central angle of the sector representing Raven’s share of the vote? Round your answer to the nearest degree.

2. In an election for class president, Fernando received 26% of the votes, Luisa received 26%, Ali received 26% of the votes, and 22% of the votes were received by other candidates. If a pie chart is created for this data, what will be the degree measure of the central angle of the sector representing Fernando’s share of the vote? Round your answer to the nearest degree.

3. In an election for class president, Akbar received 23% of the votes, Ali received 27%, Juanita received 30% of the votes, and 20% of the votes were received by other candidates. If a pie chart is created for this data, what will be the degree measure of the central angle of the sector representing Akbar’s share of the vote? Round your answer to the nearest degree.

4. In an election for class president, Kamili received 21% of the votes, Bernardo received 22%, Fernando received 30% of the votes, and 27% of the votes were received by other candidates. If a pie chart is created for this data, what will be the degree measure of the central angle of the sector representing Kamili’s share of the vote? Round your answer to the nearest degree.

5. In an election for class president, Jamal received 30% of the votes, Luisa received 20%, Kamili received 28% of the votes, and 22% of the votes were received by other candidates. If a pie chart is created for this data, what will be the degree measure of the central angle of the sector representing Jamal’s share of the vote? Round your answer to the nearest degree.

6. In an election for class president, Juanita received 30% of the votes, Ali received 24%, Estevan received 24% of the votes, and 22% of the votes were received by other candidates. If a pie chart is created for this data, what will be the degree

measure of the central angle of the sector representing Juanita's share of the vote? Round your answer to the nearest degree.

---

7. In an election for class president, Chin received 5 votes, Mabel received 13 votes, and Juanita received the remaining 32 votes cast. If a pie chart is created for this voting data, what will be the degree measure of the central angle of the sector representing Chin's share of the vote? Round your answer to the nearest degree.

8. In an election for class president, Anita received 11 votes, Jose received 9 votes, and Bernardo received the remaining 30 votes cast. If a pie chart is created for this voting data, what will be the degree measure of the central angle of the sector representing Anita's share of the vote? Round your answer to the nearest degree.

9. In an election for class president, Kamili received 14 votes, Jamal received 9 votes, and Jose received the remaining 27 votes cast. If a pie chart is created for this voting data, what will be the degree measure of the central angle of the sector representing Kamili's share of the vote? Round your answer to the nearest degree.

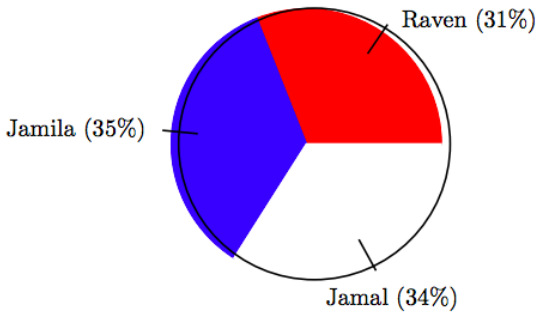
10. In an election for class president, Jun received 13 votes, Abdul received 15 votes, and Raven received the remaining 22 votes cast. If a pie chart is created for this voting data, what will be the degree measure of the central angle of the sector representing Jun's share of the vote? Round your answer to the nearest degree.

11. In an election for class president, Hue received 13 votes, Ali received 6 votes, and Henry received the remaining 31 votes cast. If a pie chart is created for this voting data, what will be the degree measure of the central angle of the sector representing Hue's share of the vote? Round your answer to the nearest degree.

12. In an election for class president, Mercy received 9 votes, Bernardo received 7 votes, and Hans received the remaining 34 votes cast. If a pie chart is created for this voting data, what will be the degree measure of the central angle of the sector representing Mercy's share of the vote? Round your answer to the nearest degree.

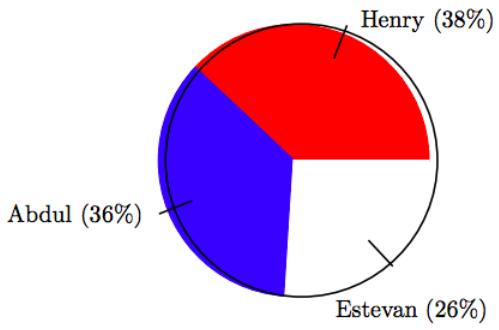
---

13. In an election for class president, the vote distribution among three candidates is shown in the following pie chart.



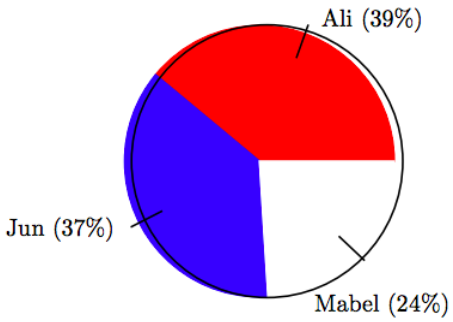
If there were a total of 95 votes cast in the election, find the number of votes that Raven received, correct to the nearest vote.

14. In an election for class president, the vote distribution among three candidates is shown in the following pie chart.



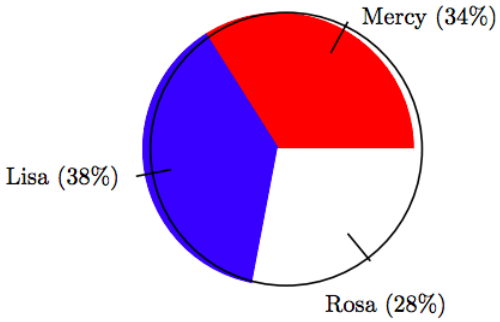
If there were a total of 79 votes cast in the election, find the number of votes that Henry received, correct to the nearest vote.

15. In an election for class president, the vote distribution among three candidates is shown in the following pie chart.



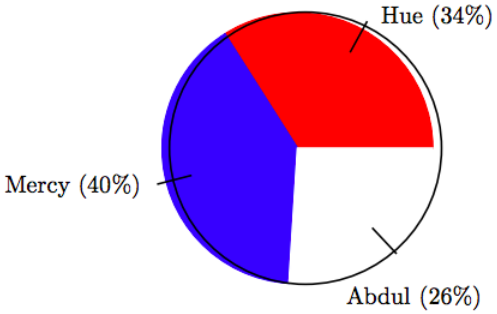
If there were a total of 58 votes cast in the election, find the number of votes that Ali received, correct to the nearest vote.

16. In an election for class president, the vote distribution among three candidates is shown in the following pie chart.



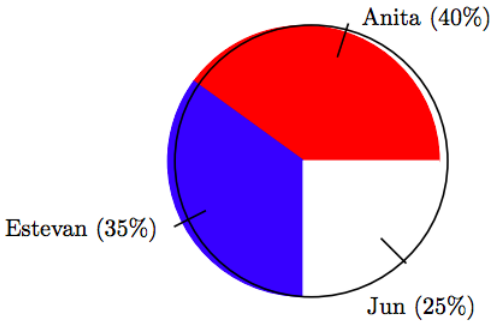
If there were a total of 65 votes cast in the election, find the number of votes that Mercy received, correct to the nearest vote.

17. In an election for class president, the vote distribution among three candidates is shown in the following pie chart.



If there were a total of 95 votes cast in the election, find the number of votes that Hue received, correct to the nearest vote.

18. In an election for class president, the vote distribution among three candidates is shown in the following pie chart.



If there were a total of 75 votes cast in the election, find the number of votes that Anita received, correct to the nearest vote.

---

19. In an election for class president, the vote distribution among three candidates is shown in the following table.

Candidate	Votes
Ali	45
Jamal	34
Jun	52

Use a protractor to help create a pie chart showing the distribution of votes.

20. In an election for class president, the vote distribution among three candidates is shown in the following table.

7.7: Solve Proportions and their Applications (Part 1)

Learning Objectives

- Use the definition of proportion
- Solve proportions
- Solve applications using proportions
- Write percent equations as proportions
- Translate and solve percent proportions

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $\frac{\frac{1}{3}}{4}$. If you missed this problem, review Example 4.5.8.
2. Solve: $\frac{x}{4} = 20$. If you missed this problem, review Example 4.12.5.
3. Write as a rate: Sale rode his bike 24 miles in 2 hours. If you missed this problem, review Example 5.10.6.

Use the Definition of Proportion

In the section on Ratios and Rates we saw some ways they are used in our daily lives. When two ratios or rates are equal, the equation relating them is called a **proportion**.

Definition: proportion

A proportion is an equation of the form $\frac{a}{b} = \frac{c}{d}$, where b ≠ 0, d ≠ 0.

The proportion states two ratios or rates are equal. The proportion is read “a is to b, as c is to d”.

The equation $\frac{1}{2} = \frac{4}{8}$ is a proportion because the two fractions are equal. The proportion $\frac{1}{2} = \frac{4}{8}$ is read “1 is to 2 as 4 is to 8”.

If we compare quantities with units, we have to be sure we are comparing them in the right order. For example, in the proportion $\frac{20\ students}{1\ teacher} = \frac{60\ students}{3\ teachers}$ we compare the number of students to the number of teachers. We put students in the numerators and teachers in the denominators.

Example 7.7.1:

Write each sentence as a proportion: (a) 3 is to 7 as 15 is to 35. (b) 5 hits in 8 at bats is the same as 30 hits in 48 at-bats. (c) $1.50 for 6 ounces is equivalent to $2.25 for 9 ounces.

Solution

(a) 3 is to 7 as 15 is to 35

Write as a proportion.	$\frac{3}{7} = \frac{15}{35}$	(7.7.1)

(b) 5 hits in 8 at bats is the same as 30 hits in 48 at-bats

Write each fraction to compare hits to at-bats.	$\frac{hits}{at-bats} = \frac{hits}{at-bats}$	(7.7.2)

Write as a proportion.	$\frac{5}{8}=\frac{30}{48}$	(7.7.3)

(c) \$1.50 for 6 ounces is equivalent to \$2.25 for 9 ounces

Write each fraction to compare dollars to ounces.	$\frac{\$}{ounces}=\frac{\$}{ounces}$	(7.7.4)
Write as a proportion.	$\frac{1.50}{6}=\frac{2.25}{9}$	(7.7.5)

? Exercise 7.7.1:

Write each sentence as a proportion: (a) 5 is to 9 as 20 is to 36. (b) 7 hits in 11 at-bats is the same as 28 hits in 44 at-bats. (c) \$2.50 for 8 ounces is equivalent to \$3.75 for 12 ounces.

Answer a

$\frac{5}{9}=\frac{20}{36}$

Answer b

$\frac{7}{11}=\frac{28}{44}$

Answer c

$\frac{2.50}{8}=\frac{3.75}{12}$

? Exercise 7.7.2:

Write each sentence as a proportion: (a) 6 is to 7 as 36 is to 42. (b) 8 adults for 36 children is the same as 12 adults for 54 children. (c) \$3.75 for 6 ounces is equivalent to \$2.50 for 4 ounces.

Answer a

$\frac{6}{7}=\frac{36}{42}$

Answer b

$\frac{8}{36}=\frac{12}{54}$

Answer c

$\frac{3.75}{6}=\frac{2.50}{4}$

Look at the proportions $\frac{1}{2}=\frac{4}{8}$ and $\frac{2}{3}=\frac{6}{9}$. From our work with equivalent fractions we know these equations are true. But how do we know if an equation is a proportion with equivalent fractions if it contains fractions with larger numbers? To determine if a proportion is true, we find the **cross products** of each proportion. To find the cross products, we multiply each denominator with the opposite numerator (diagonally across the equal sign). The results are called a cross products because of the cross formed. The cross products of a proportion are equal.

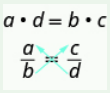
$8 \cdot 1 = 8 \quad 2 \cdot 4 = 8 \qquad 9 \cdot 2 = 18 \quad 3 \cdot 6 = 18$

$\frac{1}{2} \times \frac{4}{8} \qquad \frac{2}{3} \times \frac{6}{9}$

Definition: Cross Products of a Proportion

For any proportion of the form $\frac{a}{b} = \frac{c}{d}$, where b ≠ 0, d ≠ 0, its cross products are equal.

$$a \cdot d = b \cdot c$$



Cross products can be used to test whether a proportion is true. To test whether an equation makes a proportion, we find the cross products. If they are the equal, we have a proportion.

Example 7.7.2:

Determine whether each equation is a proportion: (a) $\frac{4}{9} = \frac{12}{28}$ (b) $\frac{17.5}{37.5} = \frac{7}{15}$

Solution

To determine if the equation is a proportion, we find the cross products. If they are equal, the equation is a proportion.

(a) $\frac{4}{9} = \frac{12}{28}$

Find the cross products.	$\frac{4}{9} \times \frac{12}{28}$ $28 \cdot 4 = 112 \qquad 9 \cdot 12 = 108 \qquad (7.7.6)$

Since the cross products are not equal, 28 · 4 ≠ 9 · 12, the equation is not a proportion.

(b) $\frac{17.5}{37.5} = \frac{7}{15}$

Find the cross products.	$\frac{17.5}{37.5} \times \frac{7}{15}$ $15 \cdot 17.5 = 262.5 \qquad 37.5 \cdot 7 = 262.5 \qquad (7.7.7)$

Since the cross products are equal, 15 • 17.5 = 37.5 • 7, the equation is a proportion.

Exercise 7.7.3:

Determine whether each equation is a proportion: (a) $\frac{7}{9} = \frac{54}{72}$ (b) $\frac{24.5}{45.5} = \frac{7}{13}$

Answer a

no

Answer b

yes

Exercise 7.7.4:

Determine whether each equation is a proportion: (a) $\frac{8}{9} = \frac{56}{73}$ (b) $\frac{28.5}{52.5} = \frac{8}{15}$

Answer a

no

Answer b

no

Solve Proportions

To solve a proportion containing a variable, we remember that the proportion is an equation. All of the techniques we have used so far to solve equations still apply. In the next example, we will solve a proportion by multiplying by the Least Common Denominator (LCD) using the Multiplication Property of Equality.

Example 7.7.3:

Solve: $\frac{x}{63}=\frac{4}{7}$.

Solution

To isolate x, multiply both sides by the LCD, 63.	$63\left(\frac{x}{63}\right)=63\left(\frac{4}{7}\right)$	(7.7.8)
Simplify.	$x=\frac{9\cdot \cancel{7}\cdot 4}{\cancel{7}}$	(7.7.9)
Divide the common factors.	$x=36$	(7.7.10)

Check: To check our answer, we substitute into the original proportion.

Substitute x = 36	$\frac{36}{63}\stackrel{?}{=}\frac{4}{7}$	(7.7.11)
Show common factors.	$\frac{4\cdot 9}{7\cdot 9}\stackrel{?}{=}\frac{4}{7}$	(7.7.12)
Simplify.	$\frac{4}{7}=\frac{4}{7}$ ✓	(7.7.13)

Exercise 7.7.5:

Solve the proportion: $\frac{n}{84}=\frac{11}{12}$.

Answer

77

Exercise 7.7.6:

Solve the proportion: $\frac{y}{96}=\frac{13}{12}$.

Answer

104

When the variable is in a denominator, we'll use the fact that the cross products of a proportion are equal to solve the proportions.

We can find the cross products of the proportion and then set them equal. Then we solve the resulting equation using our familiar techniques.

Example 7.7.4:

Solve: $\frac{144}{a} = \frac{9}{4}$.

Solution

Notice that the variable is in the denominator, so we will solve by finding the cross products and setting them equal.

Find the cross products and set them equal.	4 • 144 = a • 9	
Simplify.	576 = 9a	
Divide both sides by 9.	$\frac{576}{9} = \frac{9a}{9}$	(7.7.14)
Simplify.	$64 = a$	(7.7.15)

Check your answer.

Substitute a = 64	$\frac{144}{64} \stackrel{?}{=} \frac{9}{4}$	(7.7.16)
Show common factors.	$\frac{9 \cdot 16}{4 \cdot 16} \stackrel{?}{=} \frac{9}{4}$	(7.7.17)
Simplify.	$\frac{9}{4} = \frac{9}{4}$ ✓	(7.7.18)

Another method to solve this would be to multiply both sides by the LCD, 4a. Try it and verify that you get the same solution.

Exercise 7.7.7:

Solve the proportion: $\frac{91}{b} = \frac{7}{5}$.

Answer

65

Exercise 7.7.8:

Solve the proportion: $\frac{39}{c} = \frac{13}{8}$.

Answer

24

Example 7.7.5:

Solve: $\frac{52}{91} = \frac{-4}{y}$

Solution

Find the cross products and set them equal.	$\frac{52}{91} \times \frac{-4}{y}$	
	y • 52 = 91(-4)	
Simplify.	52y = -364	
Divide both sides by 52.	$\frac{52y}{52} = \frac{-364}{52}$	(7.7.19)
Simplify.	$y = -7$	(7.7.20)

Check:

Substitute y = -7	$\frac{52}{91} \stackrel{?}{=} \frac{-4}{-7}$	(7.7.21)
Show common factors.	$\frac{13 \cdot 4}{13 \cdot 7} \stackrel{?}{=} \frac{-4}{-7}$	(7.7.22)
Simplify.	$\frac{4}{7} = \frac{4}{7}$ ✓	(7.7.23)

Exercise 7.7.9:

Solve the proportion: $\frac{84}{98} = \frac{-6}{x}$.

Answer

-7

Exercise 7.7.10:

Solve the proportion: $\frac{-7}{y} = \frac{105}{135}$.

Answer

-9

Solve Applications Using Proportions

The strategy for solving applications that we have used earlier in this chapter, also works for proportions, since proportions are equations. When we set up the proportion, we must make sure the units are correct—the units in the numerators match and the units in the denominators match.

Example 7.7.6:

When pediatricians prescribe acetaminophen to children, they prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of the child's weight. If Zoe weighs 80 pounds, how many milliliters of acetaminophen will her doctor prescribe?

Solution

Identify what you are asked to find.	How many ml of acetaminophen the doctor will prescribe?
Choose a variable to represent it.	Let a = ml of acetaminophen.
Write a sentence that gives the information to find it.	If 5 ml is prescribed for every 25 pounds, how much will be prescribed for 80 pounds?
Translate into a proportion.	$\frac{ml}{pounds} = \frac{ml}{pounds}$ (6.5.24)
Substitute given values—be careful of the units.	$\frac{5}{25} = \frac{a}{80}$ (6.5.25)
Multiply both sides by 80.	$80 \cdot \frac{5}{25} = 80 \cdot \frac{a}{80}$ (6.5.26)
Multiply and show common factors.	$\frac{16 \cdot 5 \cdot 5}{5 \cdot 5} = \frac{80a}{80}$ (6.5.27)
Simplify.	$16 = a$ (6.5.28)
Check if the answer is reasonable.	Yes. Since 80 is about 3 times 25, the medicine should be about 3 times 5.
Write a complete sentence.	The pediatrician would prescribe 16 ml of acetaminophen to Zoe.

You could also solve this proportion by setting the cross products equal.

Exercise 7.7.11:

Pediatricians prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of a child's weight. How many milliliters of acetaminophen will the doctor prescribe for Emilia, who weighs 60 pounds?

Answer

12 ml

Exercise 7.7.12:

For every 1 kilogram (kg) of a child's weight, pediatricians prescribe 15 milligrams (mg) of a fever reducer. If Isabella weighs 12 kg, how many milligrams of the fever reducer will the pediatrician prescribe?

Answer

180 mg

Example 7.7.7:

One brand of microwave popcorn has 120 calories per serving. A whole bag of this popcorn has 3.5 servings. How many calories are in a whole bag of this microwave popcorn?

Solution

Identify what you are asked to find.	How many calories are in a whole bag of microwave popcorn?
Choose a variable to represent it.	Let c = number of calories.
Write a sentence that gives the information to find it.	If there are 120 calories per serving, how many calories are in a whole bag with 3.5 servings?
Translate into a proportion.	$\frac{calories}{serving} = \frac{calories}{serving}$ (6.5.29)
Substitute given values.	$\frac{120}{1} = \frac{c}{3.5}$ (6.5.30)
Multiply both sides by 3.5.	$(3.5)\left(\frac{120}{1}\right) = (3.5)\left(\frac{c}{3.5}\right)$ (6.5.31)
Multiply.	$420 = c$ (6.5.32)
Check if the answer is reasonable.	Yes. Since 3.5 is between 3 and 4, the total calories should be between 360 (3 • 120) and 480 (4 • 120).
Write a complete sentence.	The whole bag of microwave popcorn has 420 calories.

Exercise 7.7.13:

Marissa loves the Caramel Macchiato at the coffee shop. The 16 oz. medium size has 240 calories. How many calories will she get if she drinks the large 20 oz. size?

Answer

300

Exercise 7.7.14:

Yaneli loves Starburst candies, but wants to keep her snacks to 100 calories. If the candies have 160 calories for 8 pieces, how many pieces can she have in her snack?

Answer

5

Example 7.7.8:

Josiah went to Mexico for spring break and changed $325 dollars into Mexican pesos. At that time, the exchange rate had $1 U.S. is equal to 12.54 Mexican pesos. How many Mexican pesos did he get for his trip?

Solution

Identify what you are asked to find.	How many Mexican pesos did Josiah get?

Choose a variable to represent it.	Let p = number of pesos.
Write a sentence that gives the information to find it.	If $1 U.S. is equal to 12.54 Mexican pesos, then $325 is how many pesos?
Translate into a proportion.	$\frac{\$}{pesos} = \frac{\$}{pesos}$ (6.5.33)
Substitute given values.	$\frac{1}{12.54} = \frac{325}{p}$ (6.5.34)
The variable is in the denominator, so find the cross products and set them equal.	$p \cdot 1 = 12.54(325)$ (6.5.35)
Simplify.	$c = 4,075.5$ (6.5.36)
Check if the answer is reasonable.	Yes, $100 would be $1,254 pesos. $325 is a little more than 3 times this amount.
Write a complete sentence.	Josiah has 4075.5 pesos for his spring break trip.

? Exercise 7.7.15:

Yurianna is going to Europe and wants to change $800 dollars into Euros. At the current exchange rate, $1 US is equal to 0.738 Euro. How many Euros will she have for her trip?

Answer

590 Euros

? Exercise 7.7.16:

Corey and Nicole are traveling to Japan and need to exchange $600 into Japanese yen. If each dollar is 94.1 yen, how many yen will they get?

Answer

56,460 yen

7.8: Solve Proportions and their Applications (Part 2)

Write Percent Equations As Proportions

Previously, we solved percent equations by applying the properties of equality we have used to solve equations throughout this text. Some people prefer to solve percent equations by using the proportion method. The proportion method for solving percent problems involves a percent proportion. A **percent proportion** is an equation where a percent is equal to an equivalent ratio.

For example, 60% = $\frac{60}{100}$ and we can simplify $\frac{60}{100} = \frac{3}{5}$. Since the equation $\frac{60}{100} = \frac{3}{5}$ shows a percent equal to an equivalent ratio, we call it a **percent proportion**. Using the vocabulary we used earlier:

$$\frac{\text{amount}}{\text{base}} = \frac{\text{percent}}{100}$$
$$\frac{3}{5} = \frac{60}{100}$$

Definition: Percent Proportion

The amount is to the base as the percent is to 100.

$$\frac{amount}{base} = \frac{percent}{100} \tag{6.5.37}$$

If we restate the problem in the words of a proportion, it may be easier to set up the proportion:

The amount is to the base as the percent is to one hundred.

We could also say:

The amount out of the base is the same as the percent out of one hundred.

First we will practice translating into a percent proportion. Later, we'll solve the proportion.

Example 7.8.9:

Translate to a proportion. What number is 75% of 90?

Solution

If you look for the word "of", it may help you identify the base.

Identify the parts of the percent proportion.	$\underbrace{\text{What number}}_{\text{amount}}$ is $\underbrace{75\%}_{\text{percent}}$ of $\underbrace{90?}_{\text{base}}$
Restate as a proportion.	$What\ number\ out\ of\ 90\ is\ the\ same\ as\ 75\ out\ of\ 100?$ (7.8
Set up the proportion. Let n = number.	$\frac{n}{90} = \frac{75}{100}$ (6.5.38)

Exercise 7.8.17

Translate to a proportion: What number is 60% of 105?

Answer

$\frac{n}{105} = \frac{60}{100}$

Exercise 7.8.18

Translate to a proportion: What number is 40% of 85?

Answer

$\frac{n}{85} = \frac{40}{100}$

Example 7.8.10

Translate to a proportion. 19 is 25% of what number?

Solution

Identify the parts of the percent proportion.	$\underbrace{19}_{\text{amount}}$ is $\underbrace{25\%}_{\text{percent}}$ of $\underbrace{\text{what number?}}_{\text{base}}$
Restate as a proportion.	19 *out of* *what number* *is the same as* 25 *out of* 100? (7.8.
Set up the proportion. Let n = number.	$\frac{19}{n} = \frac{25}{100}$ (6.5.39)

Exercise 7.8.19:

Translate to a proportion: 36 is 25% of what number?

Answer

$\frac{36}{n} = \frac{25}{100}$

Exercise 7.8.20:

Translate to a proportion: 27 is 36% of what number?

Answer

$\frac{27}{n} = \frac{36}{100}$

Example 7.8.11:

Translate to a proportion. What percent of 27 is 9?

Solution

Identify the parts of the percent proportion.	$\underbrace{\text{What percent}}_{\text{percent}}$ of $\underbrace{27}_{\text{base}}$ is $\underbrace{9?}_{\text{amount}}$
Restate as a proportion.	9 *out of* 27 *is the same as* *what number* *out of* 100 (7.8.3)
Set up the proportion. Let p = percent.	$\frac{9}{27} = \frac{p}{100}$ (6.5.40)

Exercise 7.8.21:

Translate to a proportion: What percent of 52 is 39?

Answer

$\frac{n}{100} = \frac{39}{52}$

Exercise 7.8.22:

Translate to a proportion: What percent of 92 is 23?

Answer

$\frac{n}{100} = \frac{23}{92}$

Translate and Solve Percent Proportions

Now that we have written percent equations as proportions, we are ready to solve the equations.

Example 7.8.12:

Translate and solve using proportions: What number is 45% of 80?

Solution

Identify the parts of the percent proportion.	$\underbrace{\text{What number}}_{\text{amount}}$ is $\underbrace{45\%}_{\text{percent}}$ of $\underbrace{80?}_{\text{base}}$
Restate as a proportion.	$What\ number\ out\ of\ 80\ is\ the\ same\ as\ 45\ out\ of\ 100?$ (7.8
Set up the proportion. Let n = number.	$\frac{n}{80} = \frac{45}{100}$ (6.5.41)
Find the cross products and set them equal.	$100 \cdot n = 80 \cdot 45$ (6.5.42)
Simplify.	$100n = 3,600$ (6.5.43)
Divide both sides by 100.	$\frac{100n}{100} = \frac{3,600}{100}$ (6.5.44)
Simplify.	$n = 36$ (6.5.45)
Check if the answer is reasonable.	Yes. 45 is a little less than half of 100 and 36 is a little less than half 80.
Write a complete sentence that answers the question.	36 is 45% of 80.

Exercise 7.8.23:

Translate and solve using proportions: What number is 65% of 40?

Answer

26

Exercise 7.8.24:

Translate and solve using proportions: What number is 85% of 40?

Answer

34

In the next example, the percent is more than 100, which is more than one whole. So the unknown number will be more than the base.

Example 7.8.13:

Translate and solve using proportions: 125% of 25 is what number?

Solution

Identify the parts of the percent proportion.	$\underbrace{125\%}_{\text{percent}}$ is $\underbrace{25}_{\text{base}}$ of $\underbrace{\text{what number?}}_{\text{amount}}$

Restate as a proportion.	$What\ number\ out\ of\ 25\ is\ the\ same\ as\ 125\ out\ of\ 100?$	(7.
Set up the proportion. Let n = number.	$\frac{n}{25}=\frac{125}{100}$	(6.5.46)
Find the cross products and set them equal.	$100\cdot n=25\cdot 125$	(6.5.47)
Simplify.	$100n=3,125$	(6.5.48)
Divide both sides by 100.	$\frac{100n}{100}=\frac{3,125}{100}$	(6.5.49)
Simplify.	$n=31.25$	(6.5.50)
Check if the answer is reasonable.	Yes. 125 is more than 100 and 31.25 is more than 25.	
Write a complete sentence that answers the question.	125% of 25 is 31.25.	

Exercise 7.8.25:

Translate and solve using proportions: 125% of 64 is what number?

Answer

80

Exercise 7.8.26:

Translate and solve using proportions: 175% of 84 is what number?

Answer

147

Percents with decimals and money are also used in proportions.

Example 7.8.14:

Translate and solve: 6.5% of what number is $1.56?

Solution

Identify the parts of the percent proportion.	$\underbrace{6.5\%}_{\text{percent}}\ \text{of}\ \underbrace{\text{what number}}_{\text{base}}\ \text{is}\ \underbrace{\$1.56?}_{\text{amount}}$	
Restate as a proportion.	$\$1.56\ out\ of\ what\ number\ is\ the\ same\ as\ 6.5\ out\ of\ 100?$	(
Set up the proportion. Let n = number.	$\frac{1.56}{n}=\frac{6.5}{100}$	(6.5.51)
Find the cross products and set them equal.	$100(1.56)=n\cdot 6.5$	(6.5.52)
Simplify.	$156=6.5n$	(6.5.53)
Divide both sides by 6.5 to isolate the variable.	$\frac{156}{6.5}=\frac{6.5n}{6.5}$	(6.5.54)

Simplify.	$24 = n$	(6.5.55)
Check if the answer is reasonable.	Yes. 6.5% is a small amount and $1.56 is much less than $24.	
Write a complete sentence that answers the question.	6.5% of $24 is $1.56.	

Exercise 7.8.27:

Translate and solve using proportions: 8.5% of what number is $3.23?

Answer

38

Exercise 7.8.28:

Translate and solve using proportions: 7.25% of what number is $4.64?

Answer

64

Example 7.8.15:

Translate and solve using proportions: What percent of 72 is 9?

Solution

Identify the parts of the percent proportion.	$\underbrace{\text{What percent}}_{\text{percent}}\ \text{of}\ \underbrace{72}_{\text{base}}\ \text{is}\ \underbrace{9?}_{\text{amount}}$	
Restate as a proportion.	$9\ out\ of\ 72\ is\ the\ same\ as\ what\ number\ out\ of\ 100?$	(7.8.7
Set up the proportion. Let n = number.	$\frac{9}{72} = \frac{n}{100}$	(6.5.56)
Find the cross products and set them equal.	$72 \cdot n = 100 \cdot 9$	(6.5.57)
Simplify.	$72n = 900$	(6.5.58)
Divide both sides by 72.	$\frac{72n}{72} = \frac{900}{72}$	(6.5.59)
Simplify.	$n = 12.5$	(6.5.60)
Check if the answer is reasonable.	Yes. 9 is $\frac{1}{8}$ of 72 and $\frac{1}{8}$ is 12.5%.	
Write a complete sentence that answers the question.	12.5% of 72 is 9.	

Exercise 7.8.29:

Translate and solve using proportions: What percent of 72 is 27?

Answer

37.5%

Exercise 7.8.30:

Translate and solve using proportions: What percent of 92 is 23?

Answer

25%

Practice Makes Perfect

Use the Definition of Proportion

In the following exercises, write each sentence as a proportion.

244. 4 is to 15 as 36 is to 135.
245. 7 is to 9 as 35 is to 45.
246. 12 is to 5 as 96 is to 40.
247. 15 is to 8 as 75 is to 40.
248. 5 wins in 7 games is the same as 115 wins in 161 games.
249. 4 wins in 9 games is the same as 36 wins in 81 games.
250. 8 campers to 1 counselor is the same as 48 campers to 6 counselors.
251. 6 campers to 1 counselor is the same as 48 campers to 8 counselors.
252. \$9.36 for 18 ounces is the same as \$2.60 for 5 ounces.
253. \$3.92 for 8 ounces is the same as \$1.47 for 3 ounces.
254. \$18.04 for 11 pounds is the same as \$4.92 for 3 pounds.
255. \$12.42 for 27 pounds is the same as \$5.52 for 12 pounds.

In the following exercises, determine whether each equation is a proportion.

256. $\frac{7}{15}=\frac{56}{120}$
257. $\frac{5}{12}=\frac{45}{108}$
258. $\frac{11}{6}=\frac{21}{16}$
259. $\frac{9}{4}=\frac{39}{34}$
260. $\frac{12}{18}=\frac{4.99}{7.56}$
261. $\frac{9}{16}=\frac{2.16}{3.89}$
262. $\frac{13.5}{8.5}=\frac{31.05}{19.55}$
263. $\frac{10.1}{8.4}=\frac{3.03}{2.52}$

Solve Proportions

In the following exercises, solve each proportion.

264. $\frac{x}{56}=\frac{7}{8}$
265. $\frac{n}{91}=\frac{8}{13}$
266. $\frac{49}{63}=\frac{z}{9}$
267. $\frac{56}{72}=\frac{y}{9}$
268. $\frac{5}{a}=\frac{65}{117}$
269. $\frac{4}{b}=\frac{64}{144}$
270. $\frac{98}{154}=\frac{-7}{p}$
271. $\frac{72}{156}=\frac{-6}{q}$

272. $\frac{a}{-8}=\frac{-42}{48}$
273. $\frac{b}{-7}=\frac{-30}{42}$
274. $\frac{2.6}{3.9}=\frac{c}{3}$
275. $\frac{2.7}{3.6}=\frac{d}{4}$
276. $\frac{2.7}{j}=\frac{0.9}{0.2}$
277. $\frac{2.8}{k}=\frac{2.1}{1.5}$
278. $\frac{\frac{1}{2}}{1}=\frac{m}{8}$
279. $\frac{\frac{1}{3}}{3}=\frac{9}{n}$

Solve Applications Using Proportions

In the following exercises, solve the proportion problem.

280. Pediatricians prescribe 5 milliliters (ml) of acetaminophen for every 25 pounds of a child's weight. How many milliliters of acetaminophen will the doctor prescribe for Jocelyn, who weighs 45 pounds?
281. Brianna, who weighs 6 kg, just received her shots and needs a pain killer. The pain killer is prescribed for children at 15 milligrams (mg) for every 1 kilogram (kg) of the child's weight. How many milligrams will the doctor prescribe?
282. At the gym, Carol takes her pulse for 10 sec and counts 19 beats. How many beats per minute is this? Has Carol met her target heart rate of 140 beats per minute?
283. Kevin wants to keep his heart rate at 160 beats per minute while training. During his workout he counts 27 beats in 10 seconds. How many beats per minute is this? Has Kevin met his target heart rate?
284. A new energy drink advertises 106 calories for 8 ounces. How many calories are in 12 ounces of the drink?
285. One 12 ounce can of soda has 150 calories. If Josiah drinks the big 32 ounce size from the local mini-mart, how many calories does he get?
286. Karen eats \(\dfrac{1}{2}) cup of oatmeal that counts for 2 points on her weight loss program. Her husband, Joe, can have 3 points of oatmeal for breakfast. How much oatmeal can he have?
287. An oatmeal cookie recipe calls for $\frac{1}{2}$ cup of butter to make 4 dozen cookies. Hilda needs to make 10 dozen cookies for the bake sale. How many cups of butter will she need?
288. Janice is traveling to Canada and will change $250 US dollars into Canadian dollars. At the current exchange rate, $1 US is equal to $1.01 Canadian. How many Canadian dollars will she get for her trip?
289. Todd is traveling to Mexico and needs to exchange $450 into Mexican pesos. If each dollar is worth 12.29 pesos, how many pesos will he get for his trip?
290. Steve changed $600 into 480 Euros. How many Euros did he receive per US dollar?
291. Martha changed $350 US into 385 Australian dollars. How many Australian dollars did she receive per US dollar?
292. At the laundromat, Lucy changed $12.00 into quarters. How many quarters did she get?
293. When she arrived at a casino, Gerty changed $20 into nickels. How many nickels did she get?
294. Jesse's car gets 30 miles per gallon of gas. If Las Vegas is 285 miles away, how many gallons of gas are needed to get there and then home? If gas is $3.09 per gallon, what is the total cost of the gas for the trip?
295. Danny wants to drive to Phoenix to see his grandfather. Phoenix is 370 miles from Danny's home and his car gets 18.5 miles per gallon. How many gallons of gas will Danny need to get to and from Phoenix? If gas is $3.19 per gallon, what is the total cost for the gas to drive to see his grandfather?
296. Hugh leaves early one morning to drive from his home in Chicago to go to Mount Rushmore, 812 miles away. After 3 hours, he has gone 190 miles. At that rate, how long will the whole drive take?
297. Kelly leaves her home in Seattle to drive to Spokane, a distance of 280 miles. After 2 hours, she has gone 152 miles. At that rate, how long will the whole drive take?
298. Phil wants to fertilize his lawn. Each bag of fertilizer covers about 4,000 square feet of lawn. Phil's lawn is approximately 13,500 square feet. How many bags of fertilizer will he have to buy?
299. April wants to paint the exterior of her house. One gallon of paint covers about 350 square feet, and the exterior of the house measures approximately 2000 square feet. How many gallons of paint will she have to buy?

Write Percent Equations as Proportions

In the following exercises, translate to a proportion.

300. What number is 35% of 250?
301. What number is 75% of 920?
302. What number is 110% of 47?
303. What number is 150% of 64?
304. 45 is 30% of what number?
305. 25 is 80% of what number?
306. 90 is 150% of what number?
307. 77 is 110% of what number?
308. What percent of 85 is 17?
309. What percent of 92 is 46?
310. What percent of 260 is 340?
311. What percent of 180 is 220?

Translate and Solve Percent Proportions

In the following exercises, translate and solve using proportions.

312. What number is 65% of 180?
313. What number is 55% of 300?
314. 18% of 92 is what number?
315. 22% of 74 is what number?
316. 175% of 26 is what number?
317. 250% of 61 is what number?
318. What is 300% of 488?
319. What is 500% of 315?
320. 17% of what number is $7.65?
321. 19% of what number is $6.46?
322. $13.53 is 8.25% of what number?
323. $18.12 is 7.55% of what number?
324. What percent of 56 is 14?
325. What percent of 80 is 28?
326. What percent of 96 is 12?
327. What percent of 120 is 27?

Everyday Math

328. **Mixing a concentrate** Sam bought a large bottle of concentrated cleaning solution at the warehouse store. He must mix the concentrate with water to make a solution for washing his windows. The directions tell him to mix 3 ounces of concentrate with 5 ounces of water. If he puts 12 ounces of concentrate in a bucket, how many ounces of water should he add? How many ounces of the solution will he have altogether?
329. **Mixing a concentrate** Travis is going to wash his car. The directions on the bottle of car wash concentrate say to mix 2 ounces of concentrate with 15 ounces of water. If Travis puts 6 ounces of concentrate in a bucket, how much water must he mix with the concentrate?

Writing Exercises

330. To solve “what number is 45% of 350” do you prefer to use an equation like you did in the section on Decimal Operations or a proportion like you did in this section? Explain your reason.
331. To solve “what percent of 125 is 25” do you prefer to use an equation like you did in the section on Decimal Operations or a proportion like you did in this section? Explain your reason.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use definition of proportion.			
solve proportions.			
solve applications using proportions.			
write percent equations as proportions.			
translate and solve percent proportions.			

(b) Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter? Why or why not?

7.E: Percents (Exercises)

6.1 - Understand Percent

In the following exercises, write each percent as a ratio.

332. 32% admission rate for the university
333. 53.3% rate of college students with student loans

In the following exercises, write as a ratio and then as a percent.

334. 13 out of 100 architects are women.
335. 9 out of every 100 nurses are men.

In the following exercises, convert each percent to a fraction.

336. 48%
337. 175%
338. 64.1%
339. $8\frac{1}{4}\%$

In the following exercises, convert each percent to a decimal.

340. 6%
341. 23%
342. 128%
343. 4.9%

In the following exercises, convert each percent to (a) a simplified fraction and (b) a decimal.

344. In 2012, 13.5% of the United States population was age 65 or over. (Source: www.census.gov)
345. In 2012, 6.5% of the United States population was under 5 years old. (Source: www.census.gov)
346. When a die is tossed, the probability it will land with an even number of dots on the top side is 50%.
347. A couple plans to have three children. The probability they will all be girls is 12.5%.

In the following exercises, convert each decimal to a percent.

348. 0.04
349. 0.15
350. 2.82
351. 3
352. 0.003
353. 1.395

In the following exercises, convert each fraction to a percent.

354. 3 4
355. 11 5
356. 3 5 8
357. 2 9
358. According to the Centers for Disease Control, $\frac{2}{5}$ of adults do not take a vitamin or supplement.
359. According to the Centers for Disease Control, among adults who do take a vitamin or supplement, $\frac{3}{4}$ take a multivitamin.

In the following exercises, translate and solve.

360. What number is 46% of 350?
361. 120% of 55 is what number?
362. 84 is 35% of what number?
363. 15 is 8% of what number?
364. 200% of what number is 50?

365. 7.9% of what number is $4.74?
366. What percent of 120 is 81.6?
367. What percent of 340 is 595?

6.2 - Solve General Applications of Percents

In the following exercises, solve.

368. When Aurelio and his family ate dinner at a restaurant, the bill was $83.50. Aurelio wants to leave 20% of the total bill as a tip. How much should the tip be?
369. One granola bar has 2 grams of fiber, which is 8% of the recommended daily amount. What is the total recommended daily amount of fiber?
370. The nutrition label on a package of granola bars says that each granola bar has 190 calories, and 54 calories are from fat. What percent of the total calories is from fat?
371. Elsa gets paid $4,600 per month. Her car payment is $253. What percent of her monthly pay goes to her car payment?

In the following exercises, solve.

372. Jorge got a raise in his hourly pay, from $19.00 to $19.76. Find the percent increase.
373. Last year Bernard bought a new car for $30,000. This year the car is worth $24,000. Find the percent decrease.

6.3 - Solve Sales Tax, Commission, and Discount Applications

In the following exercises, find (a) the sales tax (b) the total cost.

374. The cost of a lawn mower was $750. The sales tax rate is 6% of the purchase price.
375. The cost of a water heater is $577. The sales tax rate is 8.75% of the purchase price.

In the following exercises, find the sales tax rate.

376. Andy bought a piano for $4,600. The sales tax on the purchase was $333.50.
377. Nahomi bought a purse for $200. The sales tax on the purchase was $16.75.

In the following exercises, find the commission.

378. Ginny is a realtor. She receives 3% commission when she sells a house. How much commission will she receive for selling a house for $380,000?
379. Jackson receives 16.5% commission when he sells a dinette set. How much commission will he receive for selling a dinette set for $895?

In the following exercises, find the rate of commission.

380. Ruben received $675 commission when he sold a $4,500 painting at the art gallery where he works. What was the rate of commission?
381. Tori received $80.75 for selling a $950 membership at her gym. What was her rate of commission?

In the following exercises, find the sale price.

382. Aya bought a pair of shoes that was on sale for $30 off. The original price of the shoes was $75.
383. Takwanna saw a cookware set she liked on sale for $145 off. The original price of the cookware was $312.

In the following exercises, find (a) the amount of discount and (b) the sale price.

384. Nga bought a microwave for her office. The microwave was discounted 30% from an original price of $84.90.
385. Jarrett bought a tie that was discounted 65% from an original price of $45.

In the following exercises, find (a) the amount of discount (b) the discount rate. (Round to the nearest tenth of a percent if needed.)

386. Hilda bought a bedspread on sale for $37. The original price of the bedspread was $50.
387. Tyler bought a phone on sale for $49.99. The original price of the phone was $79.99.

In the following exercises, find (a) the amount of the mark-up (b) the list price.

388. Manny paid $0.80 a pound for apples. He added 60% markup before selling them at his produce stand. What price did he charge for the apples?

389. It cost Noelle $17.40 for the materials she used to make a purse. She added a 325% markup before selling it at her friend's store. What price did she ask for the purse?

6.4 - Solve Simple Interest Applications

In the following exercises, solve the simple interest problem.

390. Find the simple interest earned after 4 years on $2,250 invested at an interest rate of 5%.
391. Find the simple interest earned after 7 years on $12,000 invested at an interest rate of 8.5%.
392. Find the principal invested if $660 interest was earned in 5 years at an interest rate of 3%.
393. Find the interest rate if $2,898 interest was earned from a principal of $23,000 invested for 3 years.
394. Kazuo deposited $10,000 in a bank account with interest rate 4.5%. How much interest was earned in 2 years?
395. Brent invested $23,000 in a friend's business. In 5 years the friend paid him the $23,000 plus $9,200 interest. What was the rate of interest?
396. Fresia lent her son $5,000 for college expenses. Three years later he repaid her the $5,000 plus $375 interest. What was the rate of interest?
397. In 6 years, a bond that paid 5.5% earned $594 interest. What was the principal of the bond?

6.5 - Solve Proportions and their Applications

In the following exercises, write each sentence as a proportion.

398. 3 is to 8 as 12 is to 32.
399. 95 miles to 3 gallons is the same as 475 miles to 15 gallons.
400. 1 teacher to 18 students is the same as 23 teachers to 414 students.
401. $7.35 for 15 ounces is the same as $2.94 for 6 ounces.

In the following exercises, determine whether each equation is a proportion.

402. $\frac{5}{13}=\frac{30}{78}$
403. $\frac{16}{7}=\frac{48}{23}$
404. $\frac{12}{18}=\frac{6.99}{10.99}$
405. $\frac{11.6}{9.2}=\frac{37.12}{29.44}$

In the following exercises, solve each proportion.

406. $\frac{x}{36}=\frac{5}{9}$
407. $\frac{7}{a}=\frac{-6}{84}$
408. $\frac{1.2}{1.8}=\frac{d}{6}$
409. $\frac{\frac{1}{2}}{2}=\frac{m}{20}$

In the following exercises, solve the proportion problem.

410. The children's dosage of acetaminophen is 5 milliliters (ml) for every 25 pounds of a child's weight. How many milliliters of acetaminophen will be prescribed for a 60 pound child?
411. After a workout, Dennis takes his pulse for 10 sec and counts 21 beats. How many beats per minute is this?
412. An 8 ounce serving of ice cream has 272 calories. If Lavonne eats 10 ounces of ice cream, how many calories does she get?
413. Alma is going to Europe and wants to exchange $1,200 into Euros. If each dollar is 0.75 Euros, how many Euros will Alma get?
414. Zack wants to drive from Omaha to Denver, a distance of 494 miles. If his car gets 38 miles to the gallon, how many gallons of gas will Zack need to get to Denver?
415. Teresa is planning a party for 100 people. Each gallon of punch will serve 18 people. How many gallons of punch will she need?

In the following exercises, translate to a proportion.

416. What number is 62% of 395?
417. 42 is 70% of what number?
418. What percent of 1,000 is 15?
419. What percent of 140 is 210?

In the following exercises, translate and solve using proportions.

420. What number is 85% of 900?
421. 6% of what number is $24?
422. $3.51 is 4.5% of what number?
423. What percent of 3,100 is 930?

PRACTICE TEST

In the following exercises, convert each percent to (a) a decimal (b) a simplified fraction.

424. 24%
425. 5%
426. 350%

In the following exercises, convert each fraction to a percent. (Round to 3 decimal places if needed.)

427. $\frac{7}{8}$
428. $\frac{1}{3}$
429. $\frac{11}{12}$

In the following exercises, solve the percent problem.

430. 65 is what percent of 260?
431. What number is 27% of 3,000?
432. 150% of what number is 60?
433. Yuki's monthly paycheck is $3,825. She pays $918 for rent. What percent of her paycheck goes to rent?
434. The total number of vehicles on one freeway dropped from 84,000 to 74,000. Find the percent decrease (round to the nearest tenth of a percent).
435. Kyle bought a bicycle in Denver where the sales tax was 7.72% of the purchase price. The purchase price of the bicycle was $600. What was the total cost?
436. Mara received $31.80 commission when she sold a $795 suit. What was her rate of commission?
437. Kiyoshi bought a television set on sale for $899. The original price was $1,200. Find: (a) the amount of discount (b) the discount rate (round to the nearest tenth of a percent)
438. Oxana bought a dresser at a garage sale for $20. She refinished it, then added a 250% markup before advertising it for sale. What price did she ask for the dresser?
439. Find the simple interest earned after 5 years on $3000 invested at an interest rate of 4.2%.
440. Brenda borrowed $400 from her brother. Two years later, she repaid the $400 plus $50 interest. What was the rate of interest?
441. Write as a proportion: 4 gallons to 144 miles is the same as 10 gallons to 360 miles.
442. Solve for a: $\frac{12}{a} = \frac{-15}{65}$
443. Vin read 10 pages of a book in 12 minutes. At that rate, how long will it take him to read 35 pages?

7.S: Percents (Summary)

Key Terms

commission	A percentage of total sales as determined by the rate of commission
discount	A percent off the original price, determined by the discount rate
mark-up	The amount added to the wholesale price, determined by the mark-up rate
percent	A ratio whose denominator is 100
percent decrease	The percent the amount of decrease is of the original amount
percent increase	The percent the amount of increase is of the original amount
proportion	An equation of the form $\frac{a}{b} = \frac{c}{d}$, where b ≠ 0, d ≠ 0.The proportion states two ratios or rates are equal. The proportion is read " a is to b, as c is to d".
sales tax	A percent of the purchase price
simple interest	If an amount of money, P, the principal, is invested for a period of t years at an annual interest rate r, the amount of interest, I, earned is I = Prt. Interest earned according to this formula is called simple interest.

Key Concepts

6.1 - Understand Percent

- **Convert a percent to a fraction.**
  1. Write the percent as a ratio with the denominator 100.
  2. Simplify the fraction if possible.
- **Convert a percent to a decimal.**
  1. Write the percent as a ratio with the denominator 100.
  2. Convert the fraction to a decimal by dividing the numerator by the denominator.
- **Convert a decimal to a percent.**
  1. Write the decimal as a fraction.
  2. If the denominator of the fraction is not 100, rewrite it as an equivalent fraction with denominator 100.
  3. Write this ratio as a percent.
- **Convert a fraction to a percent.**
  1. Convert the fraction to a decimal.
  2. Convert the decimal to a percent.

6.2 - Solve General Applications of Percent

- **Solve an application.**
  1. Identify what you are asked to find and choose a variable to represent it.
  2. Write a sentence that gives the information to find it.
  3. Translate the sentence into an equation.
  4. Solve the equation using good algebra techniques.
  5. Write a complete sentence that answers the question.
  6. Check the answer in the problem and make sure it makes sense.
- **Find percent increase.**

1. Find the amount of increase: increase = new amount − original amount
2. Find the percent increase as a percent of the original amount.

- **Find percent decrease.**
  1. Find the amount of decrease. decrease = original amount − new amount
  2. Find the percent decrease as a percent of the original amount.

6.3 - Solve Sales Tax, Commission, and Discount Applications

- **Sales Tax**: The sales tax is a percent of the purchase price.
  - sales tax = tax rate • purchase price
  - total cost = purchase price + sales tax
- **Commission**: A commission is a percentage of total sales as determined by the rate of commission.
  - commission = rate of commission • original price
- **Discount**: An amount of discount is a percent off the original price, determined by the discount rate.
  - amount of discount = discount rate • original price
  - sale price = original price – discount
- **Mark-up**: The mark-up is the amount added to the wholesale price, determined by the mark-up rate.
  - amount of mark-up = mark-up rate wholesale price
  - list price = wholesale price + mark up

6.4 - Solve Simple Interest Applications

- **Simple interest**
  - If an amount of money, P, the principal, is invested for a period of t years at an annual interest rate r, the amount of interest, I, earned is I = Prt
  - Interest earned according to this formula is called simple interest.

6.5 - Solve Proportions and their Applications

- **Proportion**
  - A proportion is an equation of the form $\frac{a}{b} = \frac{c}{d}$, where b ≠ 0, d ≠ 0.The proportion states two ratios or rates are equal. The proportion is read “ a is to b, as c is to d”.
- **Cross Products of a Proportion**
  - For any proportion of the form $\frac{a}{b} = \frac{c}{d}$, where b ≠ 0, its cross products are equal: a • d = b • c.
- **Percent Proportion**
  - The amount is to the base as the percent is to 100. $\frac{amount}{base} = \frac{percent}{100}$

CHAPTER OVERVIEW

8: Geometry and Graphing

Which cyclist will win the race? What will the winning time be? How many seconds will separate the winner from the runner-up? One way to summarize the information from the race is by creating a graph. In this chapter, we will discuss the basic concepts of graphing. The applications of graphing go far beyond races. They are used to present information in almost every field, including healthcare, business, and entertainment.

8.1: Solve Geometry Applications- Circles and Irregular Figures

Learning Objectives

- Use the properties of circles
- Find the area of irregular figures

be prepared!

Before you get started, take this readiness quiz.

1. Evaluate x^2 when $x = 5$. If you missed this problem, review Example 2.3.3.
2. Using 3.14 for π, approximate the (a) circumference and (b) the area of a circle with radius 8 inches. If you missed this problem, review Example 5.6.12.
3. Simplify $\frac{22}{7}(0.25)^2$ and round to the nearest thousandth. If you missed this problem, review Example 5.5.9.

In this section, we'll continue working with geometry applications. We will add several new formulas to our collection of formulas. To help you as you do the examples and exercises in this section, we will show the Problem Solving Strategy for Geometry Applications here.

Problem Solving Strategy for Geometry Applications

Step 1. **Read** the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.

Step 2. **Identify** what you are looking for.

Step 3. **Name** what you are looking for. Choose a variable to represent that quantity

Step 4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.

Step 5. **Solve** the equation using good algebra techniques.

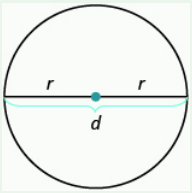
Step 6. **Check** the answer in the problem and make sure it makes sense.

Step 7. **Answer** the question with a complete sentence.

Use the Properties of Circles

Do you remember the properties of circles from Decimals and Fractions? We'll show them here again to refer to as we use them to solve applications.

Definition: Properties of Circles



- r is the length of the radius
- d is the length of the diameter
- $d = 2r$
- Circumference is the perimeter of a circle. The formula for circumference is $C = 2\pi r$
- The formula for area of a circle is $A = \pi r^2$

Remember, that we approximate π with 3.14 or $\frac{22}{7}$ depending on whether the radius of the circle is given as a decimal or a fraction. If you use the π key on your calculator to do the calculations in this section, your answers will be slightly different from the answers shown. That is because the π key uses more than two decimal places.

Example 8.1.1:

A circular sandbox has a radius of 2.5 feet. Find the (a) circumference and (b) area of the sandbox.

Solution

(a)

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the circumference of the circle
Step 3. **Name**. Choose a variable to represent it.	Let c = circumference of the circle
Step 4. **Translate**. Write the appropriate formula. Substitute.	$C = 2\pi r$ $C = 2\pi(2.5)$
Step 5. **Solve** the equation.	$C \approx 2(3.14)(2.5)$ $C \approx 15\ ft$
Step 6. **Check**. Does this answer make sense?	Yes. If we draw a square around the circle, its sides would be 5 ft (twice the radius), so its perimeter would be 20 ft. This is slightly more than the circle's circumference, 15.7 ft. Step 7. **Answer** the question.	The circumference of the sandbox is 15.7 feet.

(b)

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the area of the circle
Step 3. **Name**. Choose a variable to represent it.	Let A = the area of the circle
Step 4. **Translate**. Write the appropriate formula. Substitute.	$A = \pi r^2$ $A = \pi(2.5)^2$

Step 5. **Solve** the equation.	$A \approx (3.14)(2.5)^2$ $A \approx 19.625\ sq.\ ft$
Step 6. **Check**. Does this answer make sense?	Yes. If we draw a square around the circle, its sides would be 5 ft, as shown in part (a). So the area of the square would be 25 sq. ft. This is slightly more than the circle's area, 19.625 sq. ft.
Step 7. **Answer** the question.	The area of the circle is 19.625 square feet.

? Exercise 8.1.1:

A circular mirror has radius of 5 inches. Find the (a) circumference and (b) area of the mirror.

Answer a

31.4 in.

Answer b

78.5 sq. in.

? Exercise 8.1.2:

A circular spa has radius of 4.5 feet. Find the (a) circumference and (b) area of the spa.

Answer a

28.26 ft

Answer b

63.585 sq. ft

We usually see the formula for circumference in terms of the radius r of the circle:

$$C = 2\pi r \tag{8.1.1}$$

But since the diameter of a circle is two times the radius, we could write the formula for the circumference in terms of d.

$$\begin{aligned} & & C &= 2\pi r \\ \textit{Using the commutative property, we get} & & C &= \pi \cdot 2r \\ \textit{Then substituting } d = 2r & & C &= \pi \cdot d \\ \textit{So} & & C &= \pi d \end{aligned}$$

We will use this form of the circumference when we're given the length of the diameter instead of the radius.

✓ Example 8.1.2:

A circular table has a diameter of four feet. What is the circumference of the table?

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the circumference of the table
Step 3. **Name**. Choose a variable to represent it.	Let c = the circumference of the table
Step 4. **Translate**. Write the appropriate formula for the situation. Substitute.	$C = \pi d$ $C = \pi(4)$
Step 5. **Solve** the equation, using 3.14 for π.	$C \approx (3.14)(4)$ $C \approx 12.56\ ft$
Step 6. **Check**.	If we put a square around the circle, its side would be 4. The perimeter would be 16. It makes sense that the circumference of the circle, 12.56, is a little less than 16. Step 7. **Answer** the question.	The diameter of the table is 12.56 square feet.

? Exercise 8.1.3:

Find the circumference of a circular fire pit whose diameter is 5.5 feet.

Answer

17.27 ft

? Exercise 8.1.4:

If the diameter of a circular trampoline is 12 feet, what is its circumference?

Answer

37.68 ft.

Example 8.1.3:

Find the diameter of a circle with a circumference of 47.1 centimeters.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	 $C = 47.1$ cm
Step 2. **Identify** what you are looking for.	the diameter of the circle
Step 3. **Name**. Choose a variable to represent it.	Let d = the diameter of the circle
Step 4. **Translate**. Write the formula. Substitute, using 3.14 to approximate π.	$C = \pi d$ $47.1 \approx 3.14d$
Step 5. **Solve**.	$\frac{47.11}{3.14} \approx \frac{3.14d}{3.14}$ $15 \approx d$
Step 6. **Check**.	$47.1 \stackrel{?}{=} (3.14)(15)$ $47.1 = 47.1$ ✓
Step 7. **Answer** the question.	The diameter of the circle is approximately 15 centimeters.

Exercise 8.1.5:

Find the diameter of a circle with circumference of 94.2 centimeters.

Answer

30 cm

Exercise 8.1.6:

Find the diameter of a circle with circumference of 345.4 feet.

Answer

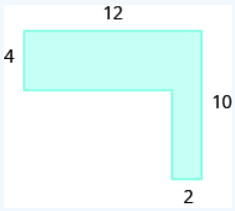
110 ft

Find the Area of Irregular Figures

So far, we have found area for rectangles, triangles, trapezoids, and circles. An **irregular figure** is a figure that is not a standard geometric shape. Its area cannot be calculated using any of the standard area formulas. But some irregular figures are made up of two or more standard geometric shapes. To find the area of one of these irregular figures, we can split it into figures whose formulas we know and then add the areas of the figures.

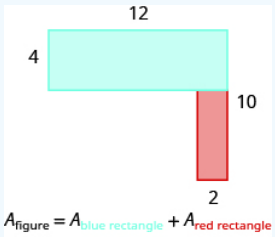
Example 8.1.4:

Find the area of the shaded region.

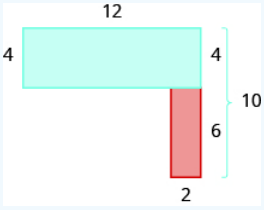


Solution

The given figure is irregular, but we can break it into two rectangles. The area of the shaded region will be the sum of the areas of both rectangles.



The blue rectangle has a width of 12 and a length of 4. The red rectangle has a width of 2, but its length is not labeled. The right side of the figure is the length of the red rectangle plus the length of the blue rectangle. Since the right side of the blue rectangle is 4 units long, the length of the red rectangle must be 6 units.



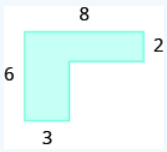
$$
\begin{aligned}
A_{figure} &= A_{rectangle} + A_{rectangle} \\
A_{figure} &= bh + bh \\
A_{figure} &= 12 \cdot 4 + 2 \cdot 6 \\
A_{figure} &= 48 + 12 \\
A_{figure} &= 60
\end{aligned}
$$

The area of the figure is 60 square units.

Is there another way to split this figure into two rectangles? Try it, and make sure you get the same area.

Exercise 8.1.7:

Find the area of each shaded region:

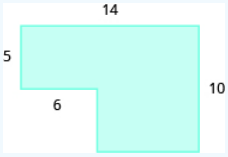


Answer

28 sq. units

Exercise 8.1.8:

Find the area of each shaded region:

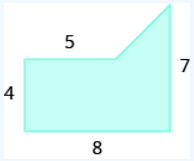


Answer

110 sq. units

Example 8.1.5:

Find the area of the shaded region.



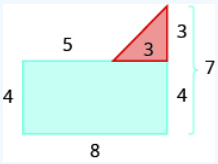
Solution

We can break this irregular figure into a triangle and rectangle. The area of the figure will be the sum of the areas of triangle and rectangle.

The rectangle has a length of 8 units and a width of 4 units.

We need to find the base and height of the triangle.

Since both sides of the rectangle are 4, the vertical side of the triangle is 3, which is 7 − 4. The length of the rectangle is 8, so the base of the triangle will be 3, which is 8 − 4.



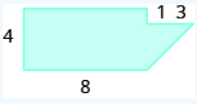
Now we can add the areas to find the area of the irregular figure.

$$\begin{aligned} A_{figure} &= A_{rectangle} + A_{triangle} \\ A_{figure} &= lw + \frac{1}{2}bh \\ A_{figure} &= 8 \cdot 4 + \frac{1}{2} \cdot 3 \cdot 3 \\ A_{figure} &= 32 + 4.5 \\ A_{figure} &= 3.65 \ sq. \ units \end{aligned}$$

The area of the figure is 36.5 square units.

Exercise 8.1.9:

Find the area of each shaded region.

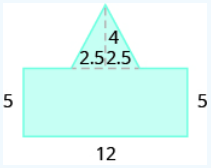


Answer

36.5 sq. units

Exercise 8.1.10:

Find the area of each shaded region.



Answer

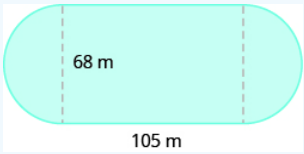
70 sq. units

Example 8.1.6:

A high school track is shaped like a rectangle with a semi-circle (half a circle) on each end. The rectangle has length 105 meters and width 68 meters. Find the area enclosed by the track. Round your answer to the nearest hundredth.

Solution

We will break the figure into a rectangle and two semi-circles. The area of the figure will be the sum of the areas of the rectangle and the semicircles.

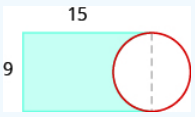


The rectangle has a length of 105 m and a width of 68 m. The semi-circles have a diameter of 68 m, so each has a radius of 34 m.

$$\begin{aligned} A_{figure} &= A_{rectangle} + A_{semicircles} \\ A_{figure} &= bh + 2\left(\frac{1}{2}\pi \cdot r^2\right) \\ A_{figure} &\approx 105 \cdot 68 + 2\left(\frac{1}{2} \cdot 3.14 \cdot 34^2\right) \\ A_{figure} &\approx 7140 + 3629.84 \\ A_{figure} &\approx 10,769.84 \ square \ meters \end{aligned}$$

Exercise 8.1.11:

Find the area:

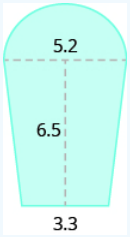


Answer

103.2 sq. units

Exercise 8.1.12:

Find the area:



Answer

38.24 sq. units

Practice Makes Perfect

Use the Properties of Circles

In the following exercises, solve using the properties of circles.

217. The lid of a paint bucket is a circle with radius 7 inches. Find the (a) circumference and (b) area of the lid.
218. An extra-large pizza is a circle with radius 8 inches. Find the (a) circumference and (b) area of the pizza.
219. A farm sprinkler spreads water in a circle with radius of 8.5 feet. Find the (a) circumference and (b) area of the watered circle.
220. A circular rug has radius of 3.5 feet. Find the (a) circumference and (b) area of the rug.
221. A reflecting pool is in the shape of a circle with diameter of 20 feet. What is the circumference of the pool?
222. A turntable is a circle with diameter of 10 inches. What is the circumference of the turntable?
223. A circular saw has a diameter of 12 inches. What is the circumference of the saw?
224. A round coin has a diameter of 3 centimeters. What is the circumference of the coin?
225. A barbecue grill is a circle with a diameter of 2.2 feet. What is the circumference of the grill?
226. The top of a pie tin is a circle with a diameter of 9.5 inches. What is the circumference of the top?
227. A circle has a circumference of 163.28 inches. Find the diameter.
228. A circle has a circumference of 59.66 feet. Find the diameter.
229. A circle has a circumference of 17.27 meters. Find the diameter.
230. A circle has a circumference of 80.07 centimeters. Find the diameter.

In the following exercises, find the radius of the circle with given circumference.

231. A circle has a circumference of 150.72 feet.
232. A circle has a circumference of 251.2 centimeters.
233. A circle has a circumference of 40.82 miles.

234. A circle has a circumference of 78.5 inches.

Find the Area of Irregular Figures

In the following exercises, find the area of the irregular figure. Round your answers to the nearest hundredth.

235.

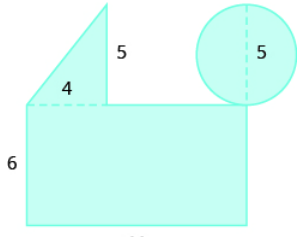
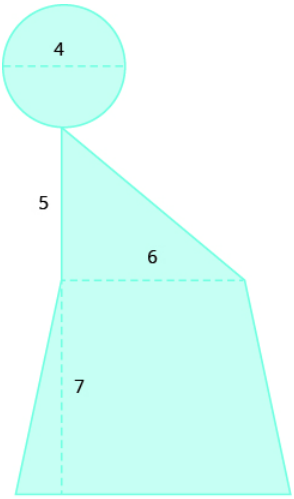
253.





254.

In the following exercises, solve.

255. A city park covers one block plus parts of four more blocks, as shown. The block is a square with sides 250 feet long, and the triangles are isosceles right triangles. Find the area of the park.

256. A gift box will be made from a rectangular piece of cardboard measuring 12 inches by 20 inches, with squares cut out of the corners of the sides, as shown. The sides of the squares are 3 inches. Find the area of the cardboard after the corners are cut out.

257. Perry needs to put in a new lawn. His lot is a rectangle with a length of 120 feet and a width of 100 feet. The house is rectangular and measures 50 feet by 40 feet. His driveway is rectangular and measures 20 feet by 30 feet, as shown. Find the area of Perry's lawn.

258. Denise is planning to put a deck in her back yard. The deck will be a 20-ft by 12-ft rectangle with a semicircle of diameter 6 feet, as shown below. Find the area of the deck.

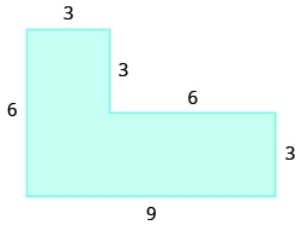
Everyday Math

259. **Area of a Tabletop** Yuki bought a drop-leaf kitchen table. The rectangular part of the table is a 1-ft by 3-ft rectangle with a semicircle at each end, as shown.(a) Find the area of the table with one leaf up. (b) Find the area of the table with both leaves up.

260. **Painting** Leora wants to paint the nursery in her house. The nursery is an 8-ft by 10-ft rectangle, and the ceiling is 8 feet tall. There is a 3-ft by 6.5-ft door on one wall, a 3-ft by 6.5-ft closet door on another wall, and one 4-ft by 3.5-ft window on the third wall. The fourth wall has no doors or windows. If she will only paint the four walls, and not the ceiling or doors, how many square feet will she need to paint?

Writing Exercises

261. Describe two different ways to find the area of this figure, and then show your work to make sure both ways give the same area.



262. A circle has a diameter of 14 feet. Find the area of the circle (a) using 3.14 for π (b) using $\frac{22}{7}$ for π. (c) Which calculation to do prefer? Why?

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the properties of circles.			
find the area of irregular figures.			

(b) After looking at the checklist, do you think you are well prepared for the next section? Why or why not?

This page titled 8.1: Solve Geometry Applications- Circles and Irregular Figures is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

8.2: Use the Rectangular Coordinate System (Part 1)

Learning Objectives

- Plot points on a rectangular coordinate system
- Identify points on a graph
- Verify solutions to an equation in two variables
- Complete a table of solutions to a linear equation
- Find solutions to linear equations in two variables

be prepared!

Before you get started, take this readiness quiz.

1. Evaluate: $x + 3$ when $x = -1$. If you missed this problem, review Example 3.4.10.
2. Evaluate: $2x - 5y$ when $x = 3$, $y = -2$. If you missed this problem, review Example 3.8.106.
3. Solve for y: $40 - 4y = 20$. If you missed this problem, review Example 8.4.1.

Plot Points on a Rectangular Coordinate System

Many maps, such as the Campus Map shown in Figure 8.2.1, use a grid system to identify locations. Do you see the numbers 1, 2, 3, and 4 across the top and bottom of the map and the letters A, B, C, and D along the sides? Every location on the map can be identified by a number and a letter.

For example, the Student Center is in section 2B. It is located in the grid section above the number 2 and next to the letter B. In which grid section is the Stadium? The Stadium is in section 4D.

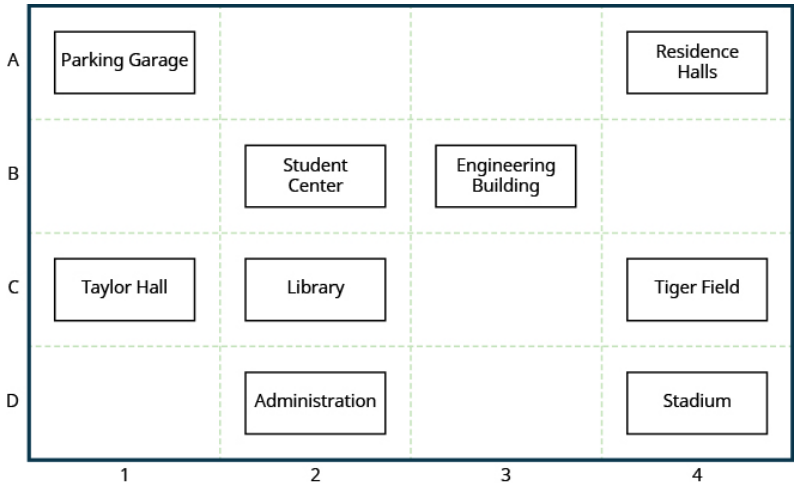

Figure 8.2.1

Example 8.2.1:

Use the map in Figure 8.2.1. (a) Find the grid section of the Residence Halls. (b) What is located in grid section 4C?

Solution

(a) Read the number below the Residence Halls, 4, and the letter to the side, A. So the Residence Halls are in grid section 4A.

(b) Find 4 across the bottom of the map and C along the side. Look below the 4 and next to the C. Tiger Field is in grid section 4C.

Exercise 8.2.1:

Use the map in Figure 8.2.1. (a) Find the grid section of Taylor Hall. (b) What is located in section 3B?

Answer a

1C

Answer b

Engineering Building

Exercise 8.2.1:

Use the map in Figure 8.2.1. (a) Find the grid section of the Parking Garage. (b) What is located in section 2C?

Answer a

1A

Answer b

Library

Just as maps use a grid system to identify locations, a grid system is used in algebra to show a relationship between two variables in a rectangular coordinate system. To create a rectangular coordinate system, start with a horizontal number line. Show both positive and negative numbers as you did before, using a convenient scale unit. This horizontal number line is called the **x-axis**.

Now, make a vertical number line passing through the x-axis at 0. Put the positive numbers above 0 and the negative numbers below 0. See Figure 8.2.2. This vertical line is called the **y-axis**.

Vertical grid lines pass through the integers marked on the x-axis. Horizontal grid lines pass through the integers marked on the y-axis. The resulting grid is the rectangular coordinate system.

The rectangular coordinate system is also called the x-y plane, the coordinate plane, or the Cartesian coordinate system (since it was developed by a mathematician named René Descartes.)

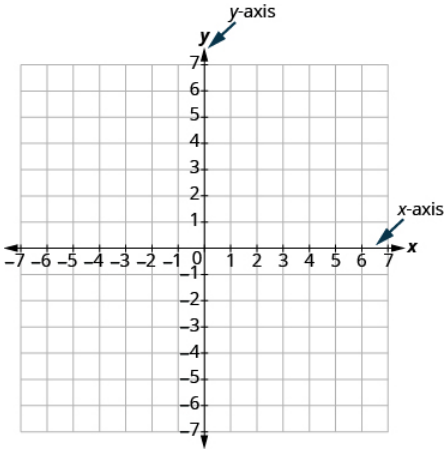

Figure 8.2.2 - The rectangular coordinate system.

The x-axis and the y-axis form the rectangular coordinate system. These axes divide a plane into four areas, called **quadrants**. The quadrants are identified by Roman numerals, beginning on the upper right and proceeding counterclockwise. See Figure 8.2.3.

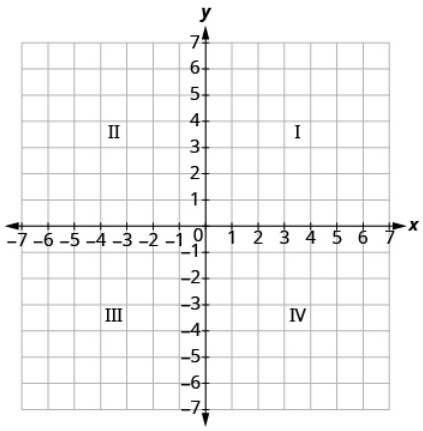

Figure 8.2.3 - The four quadrants of the rectangular coordinate system.

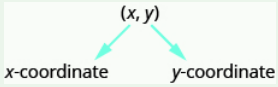
In the rectangular coordinate system, every point is represented by an **ordered pair**. The first number in the ordered pair is the x-coordinate of the point, and the second number is the y-coordinate of the point.

Definition: Ordered pair

An ordered pair, (x, y) gives the coordinates of a point in a rectangular coordinate system. The first number is the x-coordinate. The second number is the y-coordinate.



So how do the coordinates of a point help you locate a point on the x-y plane?

Let's try locating the point (2, 5) . In this ordered pair, the x -coordinate is 2 and the y -coordinate is 5 .

We start by locating the x value, 2, on the x-axis. Then we lightly sketch a vertical line through x = 2, as shown in Figure 8.2.4

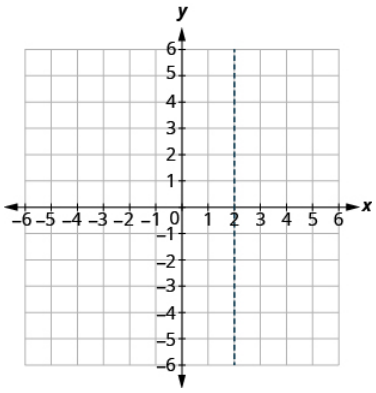


Figure 8.2.4

Now we locate the y value, 5, on the y -axis and sketch a horizontal line through y = 5. The point where these two lines meet is the point with coordinates (2, 5). We plot the point there, as shown in Figure 8.2.5.

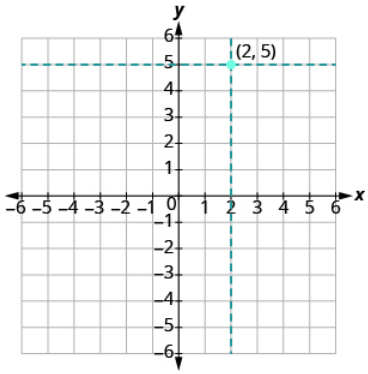

Figure 8.2.5

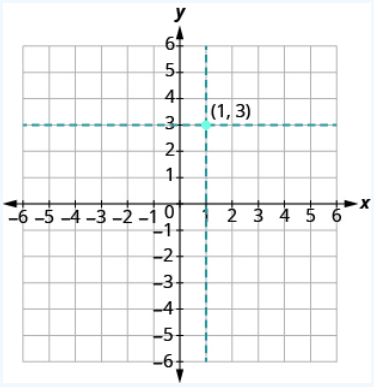
Example 8.2.2:

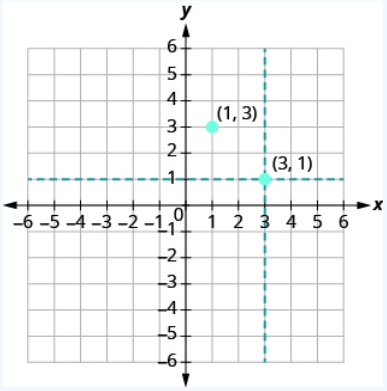
Plot (1, 3) and (3, 1) in the same rectangular coordinate system.

Solution

The coordinate values are the same for both points, but the x and y values are reversed. Let's begin with point (1, 3). The x-coordinate is 1 so find 1 on the x-axis and sketch a vertical line through x = 1. The y-coordinate is 3 so we find 3 on the y-axis and sketch a horizontal line through y = 3. Where the two lines meet, we plot the point (1, 3).



To plot the point (3, 1), we start by locating 3 on the x-axis and sketch a vertical line through x = 3. Then we find 1 on the y-axis and sketch a horizontal line through y = 1. Where the two lines meet, we plot the point (3, 1).

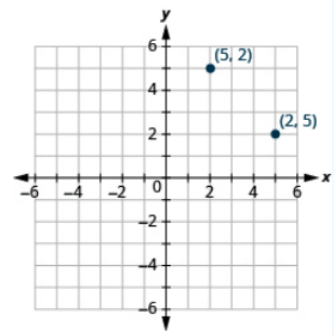


Notice that the order of the coordinates does matter, so, (1, 3) is not the same point as (3, 1).

Exercise 8.2.3:

Plot each point on the same rectangular coordinate system: (2, 5), (5, 2).

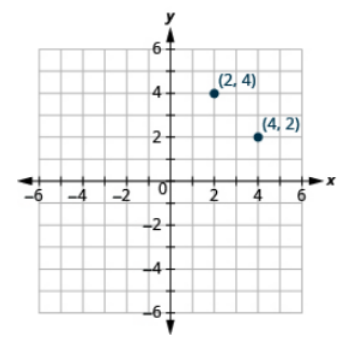
Answer



Exercise 8.2.4:

Plot each point on the same rectangular coordinate system: (4, 2), (2, 4).

Answer



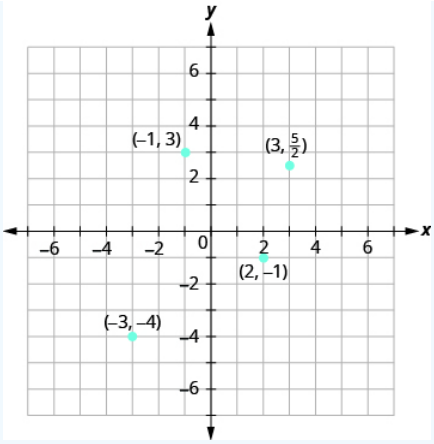
Example 8.2.3:

Plot each point in the rectangular coordinate system and identify the quadrant in which the point is located: (a) (−1, 3) (b) (−3, −4) (c) (2, −3) (d) $\left(3, \frac{5}{2}\right)$

Solution

The first number of the coordinate pair is the x-coordinate, and the second number is the y-coordinate.

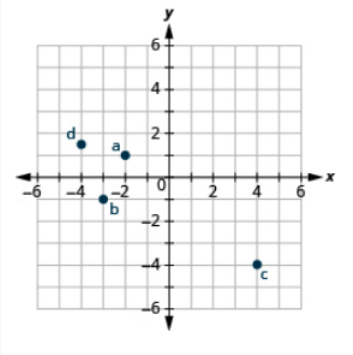
a. Since x = −1, y = 3, the point (−1, 3) is in Quadrant II.
b. Since x = −3, y = −4, the point (−3, −4) is in Quadrant III.
c. Since x = 2, y = −1, the point (2, −1) is in Quadrant lV.
d. Since x = 3, y = $\frac{5}{2}$, the point $\left(3, \frac{5}{2}\right)$ is in Quadrant I. It may be helpful to write $\frac{5}{2}$ as the mixed number, $2\frac{1}{2}$, or decimal, 2.5. Then we know that the point is halfway between 2 and 3 on the y-axis.



Exercise 8.2.5:

Plot each point in the rectangular coordinate system and identify the quadrant in which the point is located: (a) (−2, 1) (b) (−3, −1) (c) (4, −4) (d) $\left(-4, \frac{3}{2}\right)$

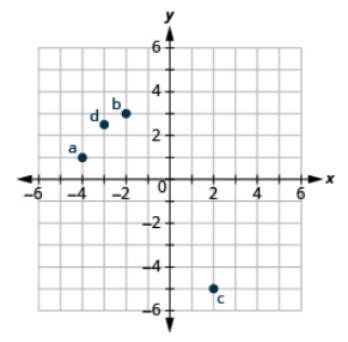
Answer



Exercise 8.2.6:

Plot each point in the rectangular coordinate system and identify the quadrant in which the point is located: (a) (−4, 1) (b) (−2, 3) (c) (2, −5) (d) $\left(-3, \frac{5}{2}\right)$

Answer



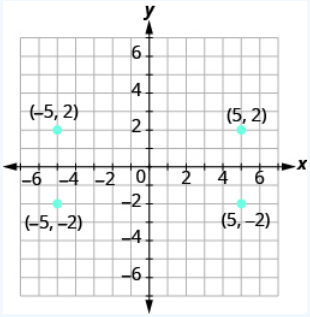
How do the signs affect the location of the points?

Example 8.2.4:

Plot each point: (a) (−5, 2) (b) (−5, −2) (c) (5, 2) (d) (5, −2)

Solution

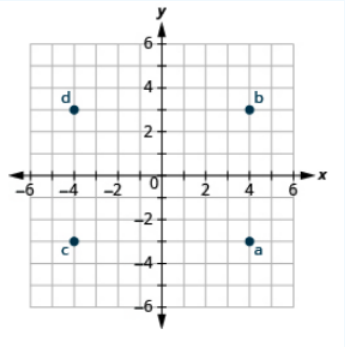
As we locate the x-coordinate and the y-coordinate, we must be careful with the signs.



Exercise 8.2.7:

Plot each point: (a) (4, −3) (b) (4, 3) (c) (−4, −3) (d) (−4, 3)

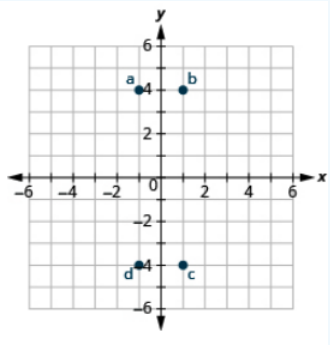
Answer



Exercise 8.2.8:

Plot each point: (a) (−1, 4) (b) (1, 4) (c) (1, −4) (d) (−1, −4)

Answer

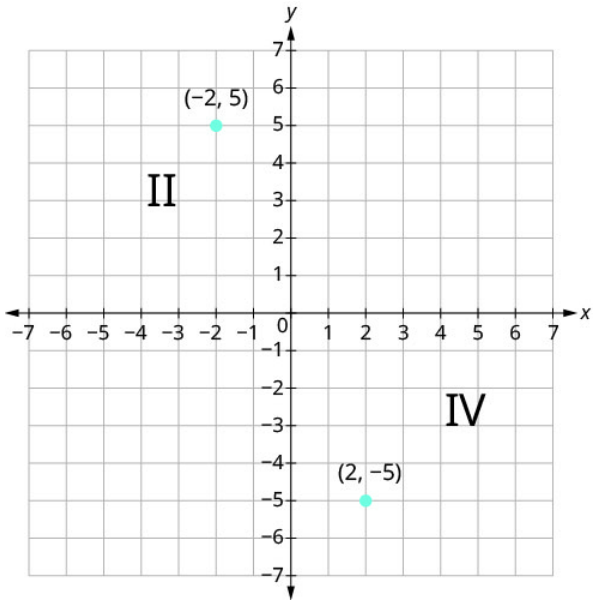


You may have noticed some patterns as you graphed the points in the two previous examples.

For each point in Quadrant IV, what do you notice about the signs of the coordinates?

What about the signs of the coordinates of the points in the third quadrant? The second quadrant? The first quadrant?

Can you tell just by looking at the coordinates in which quadrant the point (−2, 5) is located? In which quadrant is (2, −5) located?



We can summarize sign patterns of the quadrants as follows. Also see Figure 8.2.6.

Table 8.2.1

Quadrant I	Quadrant II	Quadrant III	Quadrant IV
(x,y)	(x,y)	(x,y)	(x,y)
(+,+)	(-,+)	(-,-)	(+,-)

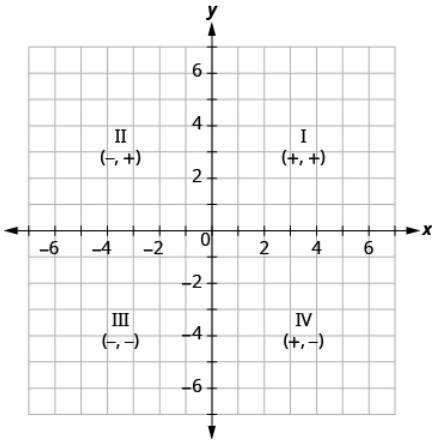


Figure 8.2.6

What if one coordinate is zero? Where is the point (0, 4) located? Where is the point (−2, 0) located? The point (0, 4) is on the y-axis and the point (− 2, 0) is on the x-axis.

Definition: Points on the Axes

Points with a y-coordinate equal to 0 are on the x-axis, and have coordinates (a, 0).

Points with an x-coordinate equal to 0 are on the y-axis, and have coordinates (0, b).

What is the ordered pair of the point where the axes cross? At that point both coordinates are zero, so its ordered pair is (0, 0). The point has a special name. It is called the *origin*.

Definition: the origin

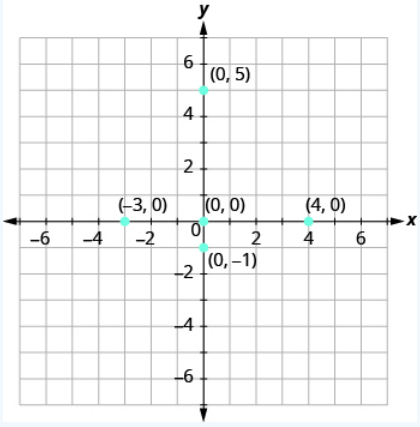
The point (0, 0) is called the origin. It is the point where the x-axis and y-axis intersect.

Example 8.2.5:

Plot each point on a coordinate grid: (a) (0, 5) (b) (4, 0) (c) (−3, 0) (d) (0, 0) (e) (0, −1)

Solution

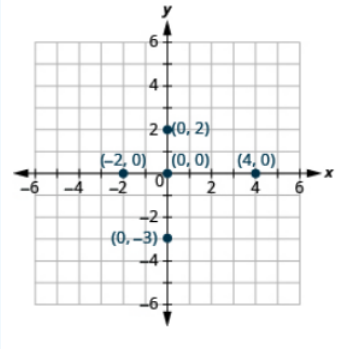
a. Since x = 0, the point whose coordinates are (0, 5) is on the y-axis.
b. Since y = 0, the point whose coordinates are (4, 0) is on the x-axis.
c. Since y = 0, the point whose coordinates are (−3, 0) is on the x-axis.
d. Since x = 0 and y = 0, the point whose coordinates are (0, 0) is the origin.
e. Since x = 0, the point whose coordinates are (0, −1) is on the y-axis.



Exercise 8.2.9:

Plot each point on a coordinate grid: (a) (4, 0) (b) (−2, 0) (c) (0, 0) (d) (0, 2) (e) (0, −3)

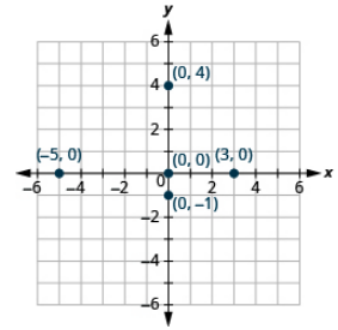
Answer



Exercise 8.2.10:

Plot each point on a coordinate grid: (a) (−5, 0) (b) (3, 0) (c) (0, 0) (d) (0, −1) (e) (0, 4)

Answer

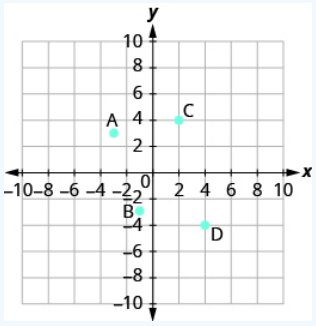


Identify Points on a Graph

In algebra, being able to identify the coordinates of a point shown on a graph is just as important as being able to plot points. To identify the x-coordinate of a point on a graph, read the number on the x-axis directly above or below the point. To identify the y-coordinate of a point, read the number on the y-axis directly to the left or right of the point. Remember, to write the ordered pair using the correct order (x, y).

Example 8.2.6:

Name the ordered pair of each point shown:



Solution

Point A is above −3 on the x-axis, so the x-coordinate of the point is −3. The point is to the left of 3 on the y-axis, so the y-coordinate of the point is 3. The coordinates of the point are (−3, 3).

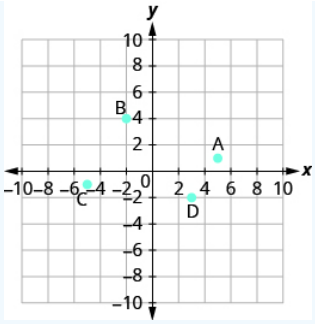
Point B is below −1 on the x-axis, so the x-coordinate of the point is −1. The point is to the left of −3 on the y-axis, so the y-coordinate of the point is −3. The coordinates of the point are (−1, −3).

Point C is above 2 on the x-axis, so the x-coordinate of the point is 2. The point is to the right of 4 on the y-axis, so the y-coordinate of the point is 4. The coordinates of the point are (2, 4).

Point D is below 4 on the x - axis, so the x-coordinate of the point is 4. The point is to the right of −4 on the y-axis, so the y-coordinate of the point is −4. The coordinates of the point are (4, −4)

Exercise 8.2.11:

Name the ordered pair of each point shown:

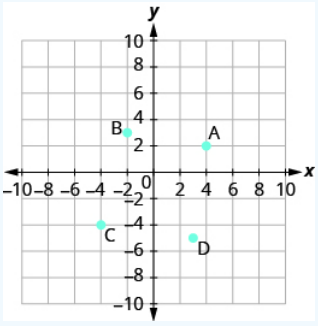


Answer

A: (5,1), B: (−2,4), C: (−5,−1), D: (3,−2)

Exercise 8.2.12:

Name the ordered pair of each point shown:

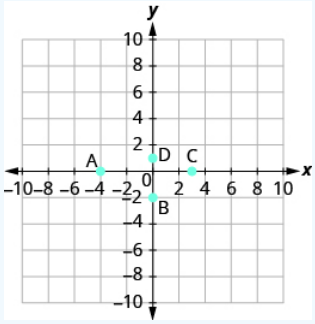


Answer

A: (4,2), B: (−2,3), C: (−4,−4), D: (3,−5)

Example 8.2.7:

Name the ordered pair of each point shown:

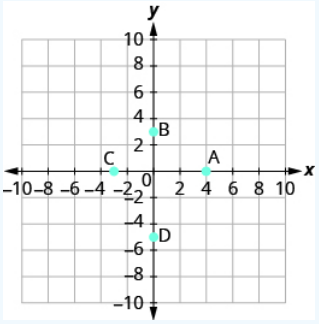


Solution

Point A is on the x-axis at x = − 4.	The coordinates of point A are (− 4, 0).
Point B is on the y-axis at y = − 2.	The coordinates of point B are (0, − 2).
Point C is on the x-axis at x = 3.	The coordinates of point C are (3, 0).
Point D is on the y-axis at y = 1.	The coordinates of point D are (0, 1).

Exercise 8.2.13:

Name the ordered pair of each point shown:

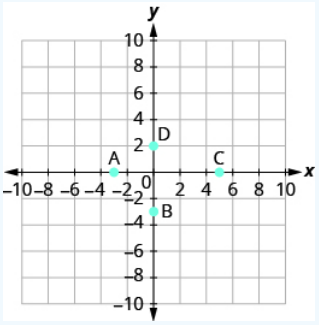


Answer

A: (4,0), B: (0,3), C: (−3,0), D: (0,−5)

Exercise 8.2.14:

Name the ordered pair of each point shown:



Answer

A: (−3,0), B: (0,−3), C: (5,0), D: (0,2)

8.3: Solve Geometry Applications- Volume and Surface Area (Part 1)

Learning Objectives

- Find volume and surface area of rectangular solids
- Find volume and surface area of spheres
- Find volume and surface area of cylinders
- Find volume of cones

be prepared!

Before you get started, take this readiness quiz.

1. Evaluate x^3 when $x = 5$. If you missed this problem, review Example 2.3.3.
2. Evaluate 2^x when $x = 5$. If you missed this problem, review Example 2.3.4.
3. Find the area of a circle with radius $\frac{7}{2}$. If you missed this problem, review Example 5.6.12.

In this section, we will finish our study of geometry applications. We find the volume and surface area of some three-dimensional figures. Since we will be solving applications, we will once again show our Problem-Solving Strategy for Geometry Applications.

Problem Solving Strategy for Geometry Applications

- Step 1. **Read** the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.
- Step 2. **Identify** what you are looking for.
- Step 3. **Name** what you are looking for. Choose a variable to represent that quantity.
- Step 4. **Translate** into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
- Step 5. **Solve** the equation using good algebra techniques.
- Step 6. **Check** the answer in the problem and make sure it makes sense.
- Step 7. **Answer** the question with a complete sentence.

Find Volume and Surface Area of Rectangular Solids

A cheerleading coach is having the squad paint wooden crates with the school colors to stand on at the games. (See Figure 8.3.1). The amount of paint needed to cover the outside of each box is the **surface area**, a square measure of the total area of all the sides. The amount of space inside the crate is the volume, a cubic measure.

Figure 8.3.1 - This wooden crate is in the shape of a rectangular solid.

Each crate is in the shape of a **rectangular solid**. Its dimensions are the length, width, and height. The rectangular solid shown in Figure 8.3.2 has length 4 units, width 2 units, and height 3 units. Can you tell how many cubic units there are altogether? Let's look layer by layer.

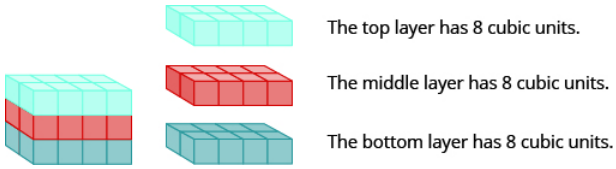

Figure 8.3.2 - Breaking a rectangular solid into layers makes it easier to visualize the number of cubic units it contains. This 4 by 2 by 3 rectangular solid has 24 cubic units.

Altogether there are 24 cubic units. Notice that 24 is the length × width × height.

$$\underset{24}{V} = \underset{4}{L} \cdot \underset{2}{W} \cdot \underset{3}{H}$$

The volume, V, of any rectangular solid is the product of the length, width, and height.

$$V = LWH \tag{8.3.1}$$

We could also write the formula for volume of a rectangular solid in terms of the area of the base. The area of the base, B, is equal to length × width.

$$B = L \cdot W \tag{8.3.2}$$

We can substitute B for L • W in the volume formula to get another form of the volume formula.

$$\begin{aligned} V &= L \cdot W \cdot H \\ V &= (L \cdot W) \cdot H \\ V &= Bh \end{aligned}$$

We now have another version of the volume formula for rectangular solids. Let's see how this works with the 4 × 2 × 3 rectangular solid we started with. See Figure 8.3.3.

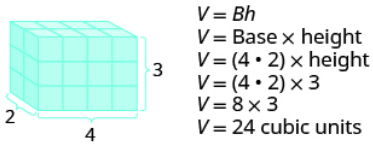

Figure 8.3.3

To find the *surface area* of a rectangular solid, think about finding the area of each of its faces. How many faces does the rectangular solid above have? You can see three of them.

$$\begin{aligned} A_{front} &= L \times W & A_{side} &= L \times W & A_{top} &= L \times W \\ A_{front} &= 4 \cdot 3 & A_{side} &= 2 \cdot 3 & A_{top} &= 4 \cdot 2 \\ A_{front} &= 12 & A_{side} &= 6 & A_{top} &= 8 \end{aligned}$$

Notice for each of the three faces you see, there is an identical opposite face that does not show.

$$\begin{aligned} S &= (front + back) + (left\ side + right\ side) + (top + bottom) \\ S &= (2 \cdot front) + (2 \cdot left\ side) + (2 \cdot top) \\ S &= 2 \cdot 12 + 2 \cdot 6 + 2 \cdot 8 \\ S &= 24 + 12 + 16 \\ S &= 52\ sq.\ units \end{aligned}$$

The surface area S of the rectangular solid shown in Figure 8.3.3 is 52 square units.

In general, to find the surface area of a rectangular solid, remember that each face is a rectangle, so its area is the product of its length and its width (see Figure 8.3.4). Find the area of each face that you see and then multiply each area by two to account for the face on the opposite side.

$$S = 2LH + 2LW + 2WH \tag{8.3.3}$$

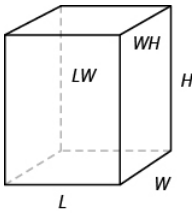

Figure 8.3.4 - For each face of the rectangular solid facing you, there is another face on the opposite side. There are 6 faces in all.

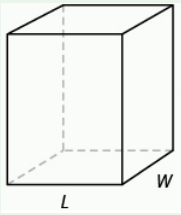
Definition: Volume and Surface Area of a Rectangular Solid

For a rectangular solid with length L, width W, and height H:



Volume: $V = LWH$

Surface Area: $S = 2LH + 2LW + 2WH$

Example 8.3.1:

For a rectangular solid with length 14 cm, height 17 cm, and width 9 cm, find the (a) volume and (b) surface area.

Solution

Step 1 is the same for both (a) and (b), so we will show it just once.

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
(a)

Step 2. **Identify** what you are looking for.	the volume of the rectangular solid
Step 3. **Name**. Choose a variable to represent it.	Let V = volume
Step 4. **Translate**. Write the appropriate formula. Substitute.	$V = LWH$ $V = 14 \cdot 9 \cdot 9 \cdot 17$
Step 5. **Solve** the equation.	$V = 2,142$ (8.3.4)
Step 6. **Check.**	We leave it to you to check your calculations.
Step 7. **Answer** the question.	The volume is 2,142 cubic centimeters.

(b)

Step 2. **Identify** what you are looking for.	the surface area of the solid
Step 3. **Name**. Choose a variable to represent it.	Let S = surface area
Step 4. **Translate**. Write the appropriate formula. Substitute.	$S = 2LH + 2LW + 2WH$ $S = 2(14 \cdot 17) + 2(14 \cdot 9) + 2(9 \cdot 17)$

Step 5. **Solve** the equation.	$S = 1,034$	(8.3.5)
Step 6. **Check.**	Double-check with a calculator.	
Step 7. **Answer** the question.	The surface area is 1,034 square centimeters.	

? Exercise 8.3.1:

Find the (a) volume and (b) surface area of rectangular solid with the: length 8 feet, width 9 feet, and height 11 feet.

Answer a

792 cu. ft

Answer b

518 sq. ft

? Exercise 8.3.2:

Find the (a) volume and (b) surface area of rectangular solid with the: length 15 feet, width 12 feet, and height 8 feet.

Answer a

1,440 cu. ft

Answer b

792 sq. ft

✔ Example 8.3.2:

A rectangular crate has a length of 30 inches, width of 25 inches, and height of 20 inches. Find its (a) volume and (b) surface area.

Solution

Step 1 is the same for both (a) and (b), so we will show it just once.

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
(a)

Step 2. **Identify** what you are looking for.	the volume of the crate	
Step 3. **Name**. Choose a variable to represent it.	let V = volume	
Step 4. **Translate**. Write the appropriate formula. Substitute.	$V = LWH$ $V = 30 \cdot 25 \cdot 20$	
Step 5. **Solve** the equation.	$V = 15,000$	(8.3.6)
Step 6. **Check.**	Double check your math.	

Step 7. **Answer** the question.	The volume is 15,000 cubic inches.

(b)

Step 2. **Identify** what you are looking for.	the surface area of the crate
Step 3. **Name**. Choose a variable to represent it.	the surface area of the crate
Step 4. **Translate**. Write the appropriate formula. Substitute.	$S = 2LH + 2LW + 2WH$ $S = 2(30 \cdot 20) + 2(30 \cdot 25) + 2(25 \cdot 20)$
Step 5. **Solve** the equation.	$S = 3,700$ (8.3.7)
Step 6. **Check.**	Check it yourself!
Step 7. **Answer** the question.	The surface area is 3,700 square inches.

Exercise 8.3.3:

A rectangular box has length 9 feet, width 4 feet, and height 6 feet. Find its (a) volume and (b) surface area.

Answer a

216 cu. ft

Answer b

228 sq. ft

Exercise 8.3.4:

A rectangular suitcase has length 22 inches, width 14 inches, and height 9 inches. Find its (a) volume and (b) surface area.

Answer a

2,772 cu. in

Answer b

1,264 sq. in.

Volume and Surface Area of a Cube

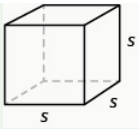
A **cube** is a rectangular solid whose length, width, and height are equal. See Volume and Surface Area of a Cube, below. Substituting, s for the length, width and height into the formulas for volume and surface area of a rectangular solid, we get:

$$\begin{aligned} V &= LWH & S &= 2LH + 2LW + 2WH \\ V &= s \cdot s \cdot s & S &= 2s \cdot s + 2s \cdot s + 2s \cdot s \\ V &= s^3 & S &= 2s^2 + 2s^2 + 2s^2 \\ & & S &= 6s^2 \end{aligned}$$

So for a cube, the formulas for volume and surface area are $V = s^3$ and $S = 6s^2$.

Definition: Volume and Surface Area of a Cube

For any cube with sides of length s,



Volume: $V = s^3$
Surface Area: $S = 6s^2$

Example 8.3.3:

A cube is 2.5 inches on each side. Find its (a) volume and (b) surface area.

Solution

Step 1 is the same for both (a) and (b), so we will show it just once.

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
(a)

Step 2. **Identify** what you are looking for.	the volume of the crate	
Step 3. **Name**. Choose a variable to represent it.	let V = volume	
Step 4. **Translate**. Write the appropriate formula.	$V = s^3$	(8.3.8)
Step 5. **Solve.** Substitute and solve.	$V = (2.5)^3$ $V = 15.625$	
Step 6. **Check.**	Check your work.	
Step 7. **Answer** the question.	The volume is 15.625 cubic inches.	

(b)

Step 2. **Identify** what you are looking for.	the surface area of the crate	
Step 3. **Name**. Choose a variable to represent it.	the surface area of the crate	
Step 4. **Translate**. Write the appropriate formula.	$S = 6s^2$	(8.3.9)
Step 5. **Solve.** Substitute and solve.	$S = 6 \cdot (2.5)^2$ $S = 37.5$	
Step 6. **Check.**	The check is left to you.	
Step 7. **Answer** the question.	The surface area is 37.5 square inches.	

Exercise 8.3.5:

For a cube with side 4.5 meters, find the (a) volume and (b) surface area of the cube.

Answer a

91.125 cu. m

Answer b

121.5 sq. m

Exercise 8.3.6:

For a cube with side 7.3 yards, find the (a) volume and (b) surface area of the cube.

Answer a

389.017 cu. yd.

Answer b

319.74 sq. yd.

Example 8.3.4:

A notepad cube measures 2 inches on each side. Find its (a) volume and (b) surface area.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
(a)

Step 2. **Identify** what you are looking for.	the volume of the crate	
Step 3. **Name**. Choose a variable to represent it.	let V = volume	
Step 4. **Translate**. Write the appropriate formula.	$V = s^3$	(8.3.10)
Step 5. **Solve** the equation.	$V = 2^3$ $V = 8$	
Step 6. **Check.**	Check that you did the calculations correctly.	
Step 7. **Answer** the question.	The volume is 8 cubic inches	

(b)

Step 2. **Identify** what you are looking for.	the surface area of the crate	
Step 3. **Name**. Choose a variable to represent it.	the surface area of the crate	
Step 4. **Translate**. Write the appropriate formula.	$S = 6s^2$	(8.3.11)
Step 5. **Solve** the equation.	$S = 6 \cdot 2^2$ $S = 24$	
Step 6. **Check.**	The check is left to you.	
Step 7. **Answer** the question.	The surface area is 24 square inches.	

Exercise 8.3.7:

A packing box is a cube measuring 4 feet on each side. Find its (a) volume and (b) surface area.

Answer a

64 cu. ft

Answer b

96 sq. ft

Exercise 8.3.8:

A wall is made up of cube-shaped bricks. Each cube is 16 inches on each side. Find the (a) volume and (b) surface area of each cube.

Answer a

4,096 cu. in.

Answer b

1,536

8.4: Use the Rectangular Coordinate System (Part 2)

Verify Solutions to an Equation in Two Variables

All the equations we solved so far have been equations with one variable. In almost every case, when we solved the equation we got exactly one solution. The process of solving an equation ended with a statement such as x = 4. Then we checked the solution by substituting back into the equation.

Here's an example of a linear equation in one variable, and its one solution.

$$\begin{aligned} 3x+5 &= 17 \\ 3x &= 12 \\ x &= 4 \end{aligned}$$

But equations can have more than one variable. Equations with two variables can be written in the general form Ax + By = C. An equation of this form is called a linear equation in two variables.

Definition: Linear Equation

An equation of the form Ax + By = C, where A and B are not both zero, is called a linear equation in two variables.

Notice that the word "line" is in linear.

Here is an example of a linear equation in two variables, x and y:

$$\begin{aligned} Ax+By &= C \\ x+4y &= 8 \\ A=1,\ B=4,\ C &= 8 \end{aligned}$$

Is y = −5x + 1 a linear equation? It does not appear to be in the form Ax + By = C. But we could rewrite it in this form.

	$y=-5x+1$	(8.4.1)
Add 5x to both sides.	$y+5x=-5x+1+5x$	(8.4.2)
Simplify.	$y+5x=1$	(8.4.3)
Use the Commutative Property to put it in Ax + By = C.	$\begin{aligned} Ax+By &= C \\ 5+\ \ y &= 1 \end{aligned}$	

By rewriting y = −5x + 1 as 5x + y = 1, we can see that it is a linear equation in two variables because it can be written in the form Ax + By = C.

Linear equations in two variables have infinitely many solutions. For every number that is substituted for x, there is a corresponding y value. This pair of values is a **solution to the linear equation** and is represented by the ordered pair (x, y). When we substitute these values of x and y into the equation, the result is a true statement because the value on the left side is equal to the value on the right side.

Definition: Solution to a Linear Equation in Two Variables

An ordered pair (x, y) is a solution to the linear equation Ax + By = C, if the equation is a true statement when the x- and y-values of the ordered pair are substituted into the equation.

Example 8.4.8:

Determine which ordered pairs are solutions of the equation x + 4y = 8: (a) (0, 2) (b) (2, −4) (c) (−4, 3)

Solution

Substitute the x- and y-values from each ordered pair into the equation and determine if the result is a true statement.

(a) (0, 2)	(b) (2, −4)	(c) (−4, 3)
$x = 0,\ y = 2$ $x + 4y = 8$ $0 + 4 \cdot 2 \stackrel{?}{=} 8$ $0 + 8 \stackrel{?}{=} 8$ $8 = 8$ ✓	$x = 2,\ y = -4$ $x + 4y = 8$ $2 + 4(-4) \stackrel{?}{=} 8$ $2 + (-16) \stackrel{?}{=} 8$ $-14 \neq 8$	$x = -4,\ y = 3$ $x + 4y = 8$ $-4 + 4 \cdot 3 \stackrel{?}{=} 8$ $-4 + 12 \stackrel{?}{=} 8$ $8 = 8$ ✓
(0, 2) is a solution.	(2, −4) is not a solution.	(−4, 3) is a solution.

Exercise 8.4.15:

Determine which ordered pairs are solutions to the given equation: 2x + 3y = 6

(a) (3, 0) (b) (2, 0) (c) (6, −2)

Answer

(a), (c)

Exercise 8.4.16:

Determine which ordered pairs are solutions to the given equation: 4x − y = 8

(a)(0, 8) (b) (2, 0) (c) (1, −4)

Answer

(b), (c)

Example 8.4.9 :

Determine which ordered pairs are solutions of the equation. y = 5x − 1: (a) (0, −1) (b) (1, 4) (c) (−2, −7)

Solution

Substitute the x- and y-values from each ordered pair into the equation and determine if it results in a true statement.

(a) (0, -1)	(b) (1, 4)	(c) (−2, -7)
$x = 0,\ y = -1$ $y = 5x - 1$ $-1 \stackrel{?}{=} 5(0) - 1$ $-1 \stackrel{?}{=} 0 - 1$ $-1 = -1$ ✓	$x = 1,\ y = 4$ $y = 5x - 1$ $4 \stackrel{?}{=} 5(1) - 1$ $4 \stackrel{?}{=} 5 - 1$ $4 = 4$ ✓	$x = -2,\ y = -7$ $y = 5x - 1$ $-7 \stackrel{?}{=} 5(-2) - 1$ $-7 \stackrel{?}{=} -10 - 1$ $-7 \neq -11$
(0, -1) is a solution.	(1, 4) is a solution.	(−2, -7) is not a solution.

Exercise 8.4.17:

Determine which ordered pairs are solutions of the given equation: y = 4x − 3

(a) (0, 3) (b) (1, 1) (c) (1, 1)

Answer

(b)

Exercise 8.4.18:

Determine which ordered pairs are solutions of the given equation: y = −2x + 6

(a)(0, 6) (b) (1, 4) (c) (−2, −2)

Answer

(a), (b)

Complete a Table of Solutions to a Linear Equation

In the previous examples, we substituted the x- and y-values of a given ordered pair to determine whether or not it was a solution to a linear equation. But how do we find the ordered pairs if they are not given? One way is to choose a value for x and then solve the equation for y. Or, choose a value for y and then solve for x.

We'll start by looking at the solutions to the equation y = 5x − 1 we found in Example 8.4.1. We can summarize this information in a table of solutions.

y = 5x − 1		
x	**y**	**(x, y)**
0	-1	(0, -1)
1	4	(1, 4)

To find a third solution, we'll let x = 2 and solve for y.

	$y = 5x - 1$	(8.4.4)
Substitute x = 2.	$y = 5(2) - 1$	(8.4.5)
Multiply.	$y = 10 - 1$	(8.4.6)
Simplify.	$y = 9$	(8.4.7)

The ordered pair is a solution to y = 5x - 1. We will add it to the table.

y = 5x − 1		
x	**y**	**(x, y)**
0	-1	(0, -1)
1	4	(1, 4)
2	9	(2, 9)

We can find more solutions to the equation by substituting any value of x or any value of y and solving the resulting equation to get another ordered pair that is a solution. There are an infinite number of solutions for this equation.

Example 8.4.10:

Complete the table to find three solutions to the equation $y = 4x - 2$:

y = 4x - 2		
x	**y**	**(x, y)**
0		
-1		
2		

Solution

Substitute $x = 0$, $x = -1$, and $x = 2$ into $y = 4x - 2$.

$x = 0$	$x = -1$	$x = 2$
$y = 4x - 2$	$y = 4x - 2$	$y = 4x - 2$
$y = 4 \cdot 0 - 2$	$y = 4(-1) - 2$	$y = 4 \cdot 2 - 2$
$y = 0 - 2$	$y = -4 - 2$	$y = 8 - 2$
$y = -2$	$y = -6$	$y = 6$
$(0, -2)$	$(-1, -6)$	$(2, 6)$

The results are summarized in the table.

y = 4x - 2		
x	**y**	**(x, y)**
0	-2	(0, -2)
-1	-6	(-1, -6)
2	6	(2, 6)

Exercise 8.4.19:

Complete the table to find three solutions to the equation: $y = 3x - 1$.

y = 3x − 1		
x	**y**	**(x, y)**
0		
-1		
2		

Answer

y = 3x − 1

y = 3x − 1		
x	y	(x, y)
0	-1	(0, -1)
-1	-4	(-1, -4)
2	5	(2, 5)

Exercise 8.4.20:

Complete the table to find three solutions to the equation: y = 6x + 1.

y = 6x + 1		
x	y	(x, y)
0		
1		
-2		

Answer

y = 6x + 1		
x	y	(x, y)
0	1	(0, 1)
-1	7	(1, 7)
2	-11	(-2, -11)

Example 8.4.11:

Complete the table to find three solutions to the equation 5x − 4y = 20:

5x − 4y = 20		
x	y	(x, y)
0		
	0	
	5	

Solution

$x = 0$ $5x - 4y = 20$ $5 \cdot 0 - 4y = 20$ $0 - 4y = 20$ $-4y = 20$ $y = -5$ $(0, -5)$	$y = 0$ $5x - 4y = 20$ $5x - 4 \cdot 0 = 20$ $5x - 0 = 20$ $5x = 20$ $x = 4$ $(4, 0)$	$y = 5$ $5x - 4y = 20$ $5x - 4 \cdot 5 = 20$ $5x - 20 = 20$ $5x = 40$ $x = 8$ $(8, 5)$

The results are summarized in the table.

5x − 4y = 20		
x	**y**	**(x, y)**
0	-5	(0, -5)
4	0	(-4, 0)
8	5	(8, 5)

Exercise 8.4.21:

Complete the table to find three solutions to the equation: 2x − 5y = 20.

2x - 5y = 20		
x	**y**	**(x, y)**
0		
	0	
-5		

Answer

2x - 5y = 20		
x	**y**	**(x, y)**
0	-4	(0, -4)
10	0	(10, 0)
-5	-6	(-5, -6)

Exercise 8.4.22:

Complete the table to find three solutions to the equation: 3x − 4y = 12.

3x - 4y = 12		
x	**y**	**(x, y)**
0		
	0	
-4		

Answer

3x - 4y = 12		
x	**y**	**(x, y)**
0	-3	(0, -3)
4	0	(4, 0)
-4	-6	(-4, -6)

Find Solutions to Linear Equations in Two Variables

To find a solution to a linear equation, we can choose any number we want to substitute into the equation for either x or y. We could choose 1, 100, 1,000, or any other value we want. But it's a good idea to choose a number that's easy to work with. We'll usually choose 0 as one of our values.

Example 8.4.12:

Find a solution to the equation 3x + 2y = 6.

Solution

Step 1: Choose any value for one of the variables in the equation.		We can substitute any value we want for x or any value for y. Let's pick x = 0. What is the value of y if x = 0?
Step 2: Substitute that value into the equation. Solve for the other variable.	Substitute 0 for x. Simplify. Divide both sides by 2.	$3x+2y=6$ $3\cdot 0+2y=6$ $0+2y=6$ $2y=6$ $y=3$
Step 3: Write the solution as an ordered pair.	So, when x = 0, y = 3.	This solution is represented by the ordered pair (0, 3).
Step 4: Check.	Substitute x = 0, y = 3 into the equation 3x + 2y = 6. Is the result a true equation? Yes!	$3x+2y=6$ $3\cdot 0+2\cdot 3 \stackrel{?}{=} 6$ $0+6 \stackrel{?}{=} 6$ $6=6$ ✓

Exercise 8.4.23:

Find a solution to the equation: 4x + 3y = 12.

Answer

Answers will vary

Exercise 8.4.24:

Find a solution to the equation: 2x + 4y = 8.

Answer

Answers will vary

We said that linear equations in two variables have infinitely many solutions, and we've just found one of them. Let's find some other solutions to the equation 3x + 2y = 6.

Example 8.4.13:

Find three more solutions to the equation 3x + 2y = 6.

Solution

To find solutions to 3x + 2y = 6, choose a value for x or y. Remember, we can choose any value we want for x or y. Here we chose 1 for x, and 0 and −3 for y.

Substitute it into the equation.	$y = 0$ $3x + 2y = 6$ $3x + 2(0) = 6$	$x = 1$ $3x + 2y = 6$ $3(1) + 2y = 6$	$y = -3$ $3x + 2y = 6$ $3x + 2(-3) = 6$
Simplify. Solve.	$3x + 0 = 6$ $3x = 6$	$3 + 2y = 6$ $2y = 3$	$3x - 6 = 6$ $3x = 12$
	x = 2	y = $\frac{3}{2}$	x = 4
Write the ordered pair.	(2, 0)	(1, $\frac{3}{2}$)	(4, −3)

Check your answers.

(2, 0)	(1, $\frac{3}{2}$)	(4, −3)
$3x + 2y = 6$ $3 \cdot 2 + 2 \cdot 0 \stackrel{?}{=} 6$ $6 + 0 \stackrel{?}{=} 6$ $6 = 6$ ✓	$3x + 2y = 6$ $3 \cdot 1 + 2 \cdot \frac{3}{2} \stackrel{?}{=} 6$ $3 + 3 \stackrel{?}{=} 6$ $6 = 6$ ✓	$3x + 2y = 6$ $3 \cdot 4 + 2 \cdot (-3) \stackrel{?}{=} 6$ $12 + (-6) \stackrel{?}{=} 6$ $6 = 6$ ✓

So (2, 0), (1, $\frac{3}{2}$) and (4, −3) are all solutions to the equation 3x + 2y = 6. In the previous example, we found that (0, 3) is a solution, too. We can list these solutions in a table.

3x + 2y = 6		
x	**y**	**(x, y)**
0	3	(0, 3)
2	0	(2, 0)
1	$\frac{3}{2}$	(1, $\frac{3}{2}$)
4	-3	(4, -3)

? Exercise 8.4.25:

Find three solutions to the equation: 2x + 3y = 6.

Answer

Answers will vary

? Exercise 8.4.26:

Find three solutions to the equation: 4x + 2y = 8.

Answer

Answers will vary

Let’s find some solutions to another equation now.

Example 8.4.14:

Find three solutions to the equation x − 4y = 8.

Solution

Choose a value for x or y.	x = 0	y = 0	y = 3
Substitute it into the equation.	$0-4y=8 \quad (8.4.8)$	$x-4\cdot 0=8 \quad (8.4.9)$	$x-4\cdot 3=8 \quad (8.4.10)$
Solve.	$-4y=8$ $y=-2$	$x-0=8$ $x=8$	$x-12=8$ $x=20$
Write the ordered pair.	(0, −2)	(8, 0)	(20, 3)

So (0, −2), (8, 0), and (20, 3) are three solutions to the equation x − 4y = 8.

x − 4y = 8		
x	**y**	**(x, y)**
0	-2	(0, -2)
8	0	(8, 0)
20	3	(20, 3)

Remember, there are an infinite number of solutions to each linear equation. Any point you find is a solution if it makes the equation true.

8.5: Graphing Linear Equations (Part 1)

Learning Objectives

- Recognize the relation between the solutions of an equation and its graph
- Graph a linear equation by plotting points
- Graph vertical and horizontal lines

be prepared!

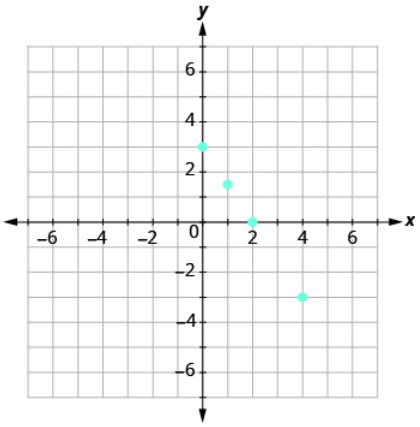
Before you get started, take this readiness quiz.

1. Evaluate: 3x + 2 when x = −1. If you missed this problem, review Example 3.8.10.
2. Solve the formula: 5x + 2y = 20 for y. If you missed this problem, review Example 9.11.6.
3. Simplify: $\frac{3}{8}(-24)$. If you missed this problem, review Example 4.3.10.

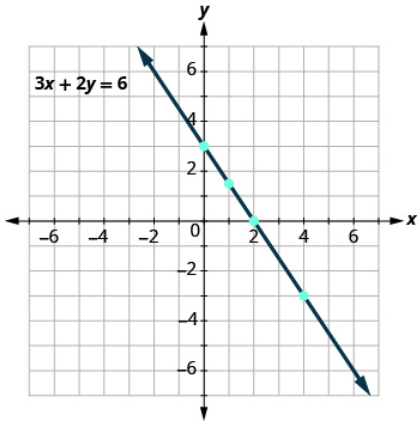
Recognize the Relation Between the Solutions of an Equation and its Graph

In Use the Rectangular Coordinate System, we found a few solutions to the equation 3x + 2y = 6. They are listed in the table below. So, the ordered pairs (0, 3), (2, 0), $\left(1, \frac{3}{2}\right)$, (4, − 3), are some solutions to the equation 3x + 2y = 6. We can plot these solutions in the rectangular coordinate system as shown on the graph at right.

$3x + 2y = 6$		
x	y	(x, y)
0	3	(0, 3)
2	0	(2, 0)
1	$\frac{3}{2}$	$\left(1, \frac{3}{2}\right)$
4	–3	(4, –3)



Notice how the points line up perfectly? We connect the points with a straight line to get the graph of the equation 3x + 2y = 6. Notice the arrows on the ends of each side of the line. These arrows indicate the line continues.



Every point on the line is a solution of the equation. Also, every solution of this equation is a point on this line. Points not on the line are *not* solutions!

Notice that the point whose coordinates are (− 2, 6) is on the line shown in Figure 8.5.1. If you substitute x = − 2 and y = 6 into the equation, you find that it is a solution to the equation.

Test (–2, 6):

$$3x + 2y = 6$$
$$3(-2) + 2(6) \stackrel{?}{=} 6$$
$$-6 + 12 \stackrel{?}{=} 6$$
$$6 = 6 \checkmark$$

So (–2, 6) is a solution to the equation.

What about (4, 1)?

$$3x + 2y = 6$$
$$3 \cdot 4 + 2 \cdot 1 \stackrel{?}{=} 6$$
$$12 + 2 \stackrel{?}{=} 6$$
$$14 \neq 6$$

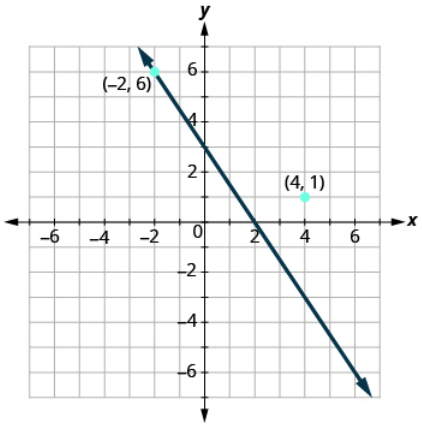


Figure 8.5.1

So (4, 1) is not a solution to the equation 3x + 2y = 6. Therefore the point (4, 1) is not on the line. This is an example of the saying," A picture is worth a thousand words." The line shows you all the solutions to the equation. Every point on the line is a solution of the equation. And, every solution of this equation is on this line. This line is called the *graph* of the equation 3x + 2y = 6.

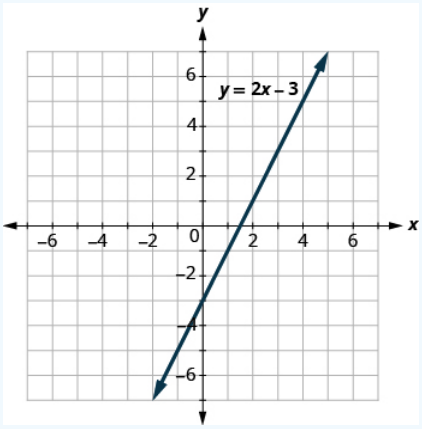
Definition: Graph of a Linear Equation

The graph of a linear equation Ax + By = C is a straight line.

- Every point on the line is a solution of the equation.
- Every solution of this equation is a point on this line.

Example 8.5.1:

The graph of y = 2x − 3 is shown below.



For each ordered pair decide (a) Is the ordered pair a solution to the equation? (b) Is the point on the line?

(a) (0, 3) (b) (3, − 3) (c) (2, − 3) (d) (− 1, − 5)

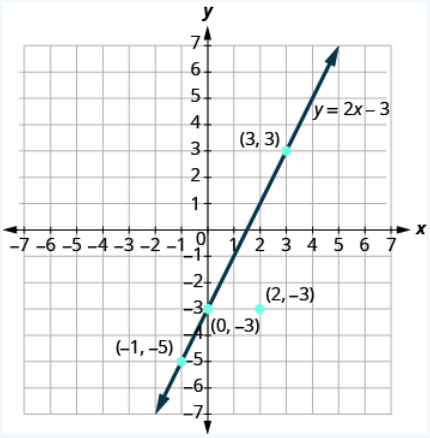
Solution

Substitute the x - and y -values into the equation to check if the ordered pair is a solution to the equation.

(a)

$(a)\ (0,-3)$	$(b)\ (3,3)$	$(c)\ (2,-3)$	$(d)\ (-1,-5)$
$y = 2x-3$	$y = 2x-3$	$y = 2x-3$	$y = 2x-3$
$-3 \stackrel{?}{=} 2(0)-3$	$3 \stackrel{?}{=} 2(3)-3$	$-3 \stackrel{?}{=} 2(2)-3$	$-5 \stackrel{?}{=} 2(-1)-3$
$-3 = -3$ ✓	$3 = 3$ ✓	$-3 \neq 1$	$-5 = -5$ ✓
$(0,-3)$ *is a solution.*	$(3,3)$ *is a solution.*	$(2,-3)$ *is not a solution.*	$(-1,-5)$ *is a solution.*

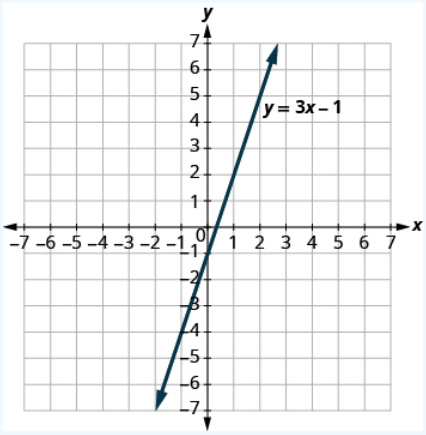
(b) Plot the points A: (0, − 3) B: (3, 3) C: (2, − 3) and D: (− 1, − 5). The points (0, − 3), (3, 3), and (− 1, − 5) are on the line y = 2x − 3, and the point (2, − 3) is not on the line.



The points which are solutions to y = 2x − 3 are on the line, but the point which is not a solution is not on the line.

? Exercise 8.5.1:

The graph of y = 3x − 1 is shown. For each ordered pair, decide (a) is the ordered pair a solution to the equation? (b) is the point on the line?



1. (0, − 1)
2. (2, 2)
3. (3, − 1)
4. (− 1, − 4)

Answer 1.

a. yes, b. no

Answer 2.

a. no, b. no

Answer 3.

a. no, b. no

Answer 4.

a. yes, b. yes

Graph a Linear Equation by Plotting Points

There are several methods that can be used to graph a linear equation. The method we used at the start of this section to graph is called plotting points, or the Point-Plotting Method.

Let's graph the equation y = 2x + 1 by plotting points. We start by finding three points that are solutions to the equation. We can choose any value for x or y, and then solve for the other variable.

Since y is isolated on the left side of the equation, it is easier to choose values for x. We will use 0, 1, and -2 for x for this example. We substitute each value of x into the equation and solve for y.

$x = -2$	$x = 0$	$x = 1$
$y = 2x + 1$	$y = 2x + 1$	$y = 2x + 1$
$y = 2(-2) + 1$	$y = 2(0) + 1$	$y = 2(1) + 1$
$y = -4 + 1$	$y = 0 + 1$	$y = 2 + 1$
$y = -3$	$y = 1$	$y = 3$
$(-2, -3)$	$(0, 1)$	$(1, 3)$

We can organize the solutions in a table. See Table 8.5.1.

Table 8.5.1

y = 2x + 1		
x	**y**	**(x, y)**
0	1	(0, 1)
1	3	(1, 3)
-2	-3	(-2, -3)

Now we plot the points on a rectangular coordinate system. Check that the points line up. If they did not line up, it would mean we made a mistake and should double-check all our work. See Figure 8.5.2.

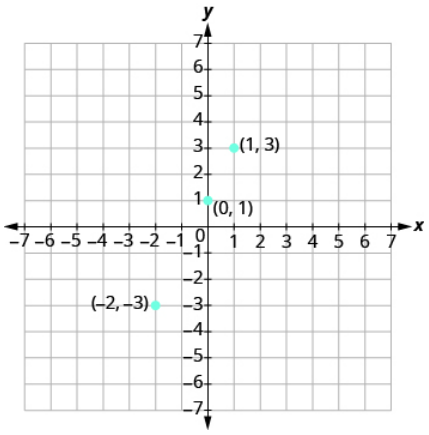


Figure 8.5.2

Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line. The line is the graph of y = 2x + 1.

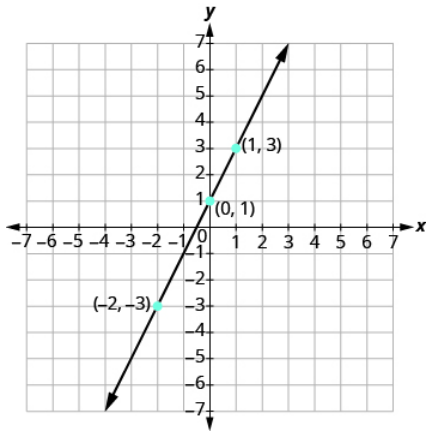

Figure 8.5.3

HOW TO: GRAPH A LINEAR EQUATION BY PLOTTING POINTS

Step 1. Find three points whose coordinates are solutions to the equation. Organize them in a table.

Step 2. Plot the points on a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work.

Step 3. Draw the line through the points. Extend the line to fill the grid and put arrows on both ends of the line.

It is true that it only takes two points to determine a line, but it is a good habit to use three points. If you plot only two points and one of them is incorrect, you can still draw a line but it will not represent the solutions to the equation. It will be the wrong line. If you use three points, and one is incorrect, the points will not line up. This tells you something is wrong and you need to check your work. See Figure 8.5.4.

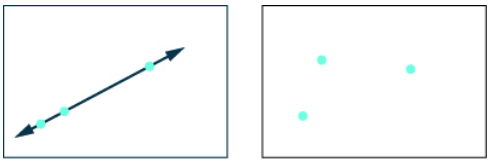

Figure 8.5.4 - Look at the difference between (a) and (b). All three points in (a) line up so we can draw one line through them. The three points in (b) do not line up. We cannot draw a single straight line through all three points.

Example 8.5.2:

Graph the equation y = −3x.

Solution

Find three points that are solutions to the equation. It's easier to choose values for x, and solve for y. Do you see why?

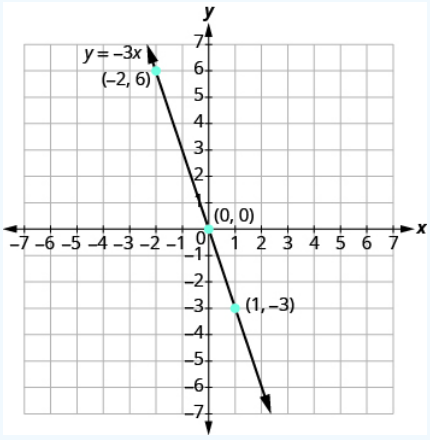
$x = 0$	$x = 1$	$x = -2$
$y = -3x$	$y = -3x$	$y = -3x$
$y = -3(0)$	$y = -3(1)$	$y = -3(-2)$
$y = 0$	$y = -3$	$y = 6$
(0, 0)	(1, −3)	(−2, 6)

List the points in a table.

y = −3x		
x	**y**	**(x, y)**

y = −3x		
0	0	(0, 0)
1	-3	(1, -3)
-2	6	(-2, 6)

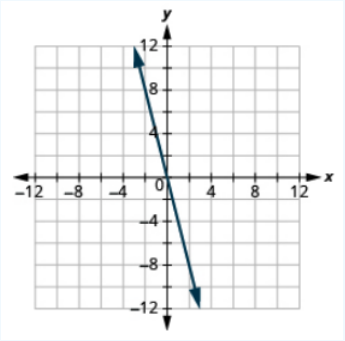
Plot the points, check that they line up, and draw the line as shown.



Exercise 8.5.2:

Graph the equation by plotting points: y = −4x.

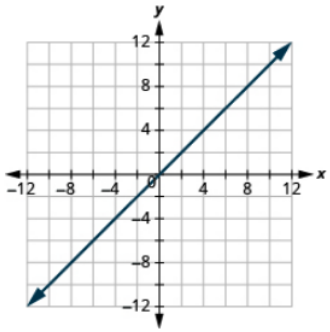
Answer



Exercise 8.5.3:

Graph the equation by plotting points: y = x.

Answer



When an equation includes a fraction as the coefficient of x, we can substitute any numbers for x. But the math is easier if we make 'good' choices for the values of x. This way we will avoid fraction answers, which are hard to graph precisely.

Example 8.5.3:

Graph the equation $y = \frac{1}{2}x + 3$.

Solution

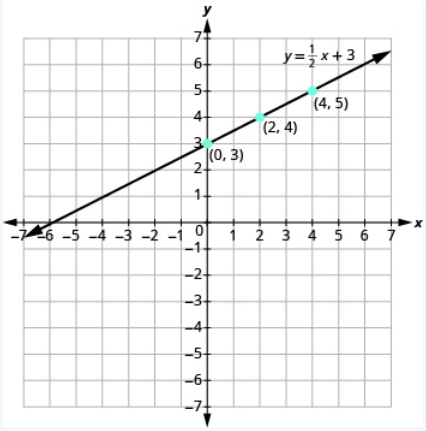
Find three points that are solutions to the equation. Since this equation has the fraction $\frac{1}{2}$ as a coefficient of x, we will choose values of x carefully. We will use zero as one choice and multiples of 2 for the other choices.

$x = 0$	$x = 2$	$x = 4$
$y = \frac{1}{2}x + 3$	$y = \frac{1}{2}x + 3$	$y = \frac{1}{2}x + 3$
$y = \frac{1}{2}(0) + 3$	$y = \frac{1}{2}(2) + 3$	$y = \frac{1}{2}(4) + 3$
$y = 3$	$y = 4$	$y = 5$
(0, 3)	(2, 4)	(4, 5)

The points are shown in the table.

$y = \frac{1}{2}x + 3$		
x	y	(x, y)
0	3	(0, 3)
2	4	(2, 4)
4	5	(4, 5)

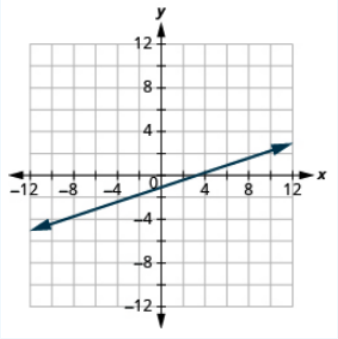
Plot the points, check that they line up, and draw the line as shown.



Exercise 8.5.4:

Graph the equation: $y = \frac{1}{3}x - 1$

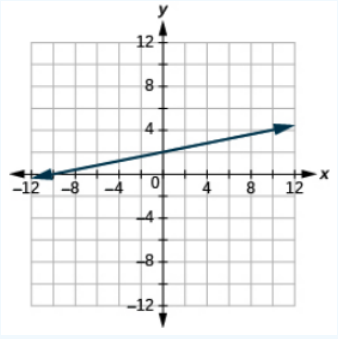
Answer



Exercise 8.5.5:

Graph the equation: $y = \frac{1}{4}x + 2$.

Answer



So far, all the equations we graphed had y given in terms of x. Now we'll graph an equation with x and y on the same side.

Example 8.5.4:

Graph the equation x + y = 5.

Solution

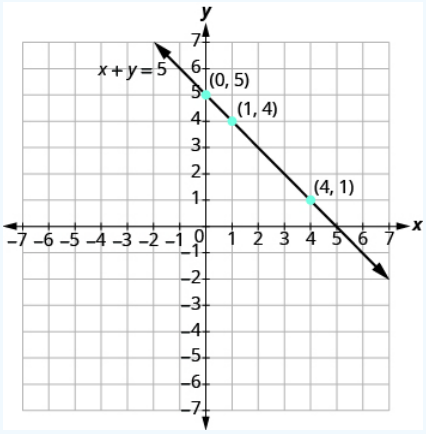
Find three points that are solutions to the equation. Remember, you can start with any value of x or y.

$x = 0$	$x = 1$	$x = 4$
$x + y = 5$	$x + y = 5$	$x + y = 5$
$0 + y = 5$	$1 + y = 5$	$4 + y = 5$
$y = 5$	$y = 4$	$y = 1$
(0, 5)	(1, 4)	(4, 1)

We list the points in a table.

x + y = 5		
x	y	(x, y)
0	5	(0, 5)
1	4	(1, 4)
4	1	(4, 1)

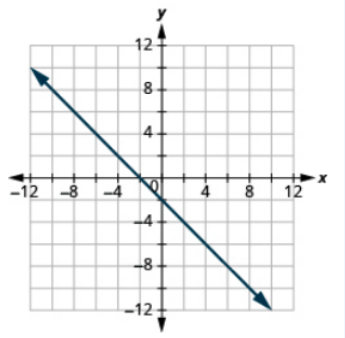
Then plot the points, check that they line up, and draw the line.



Exercise 8.5.6:

Graph the equation: x + y = −2.

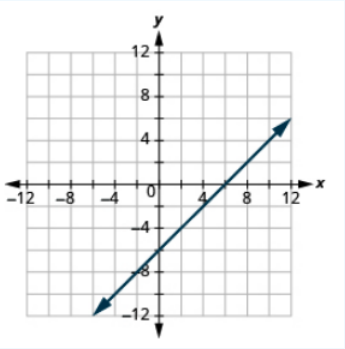
Answer



Exercise 8.5.7:

Graph the equation: x − y = 6.

Answer



In the previous example, the three points we found were easy to graph. But this is not always the case. Let's see what happens in the equation 2x + y = 3. If y is 0, what is the value of x?

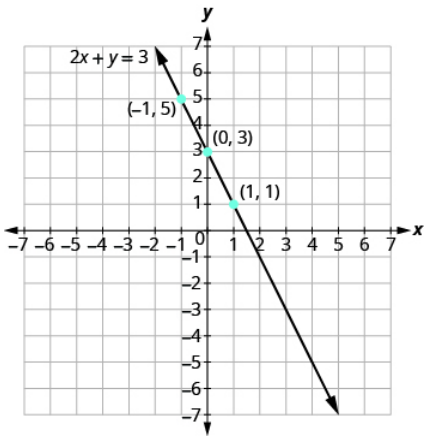
$$\begin{aligned} 2x+y &= 3 \\ 2x+0 &= 3 \\ 2x &= 3 \\ x &= \frac{3}{2} \end{aligned}$$

The solution is the point $\left(\frac{3}{2}, 0\right)$. This point has a fraction for the x -coordinate. While we could graph this point, it is hard to be precise graphing fractions. Remember in the example y = $\frac{1}{2}$x + 3, we carefully chose values for x so as not to graph fractions at all. If we solve the equation 2x + y = 3 for y, it will be easier to find three solutions to the equation.

$$\begin{aligned} 2x+y &= 3 \\ y &= -2x+3 \end{aligned}$$

Now we can choose values for x that will give coordinates that are integers. The solutions for x = 0, x = 1, and x = −1 are shown.

y = −2x + 3		
x	y	(x, y)
0	3	(0, 3)
1	1	(1, 1)
-1	5	(-1, 5)



Example 8.5.5:

Graph the equation 3x + y = −1.

Solution

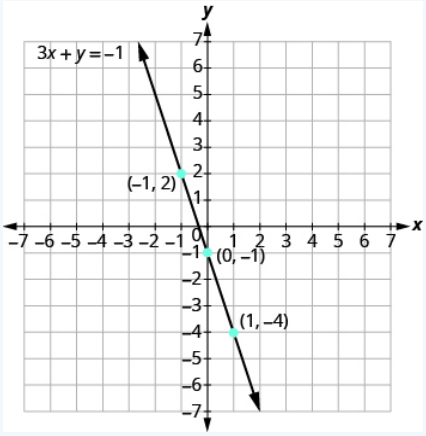
Find three points that are solutions to the equation.

First, solve the equation for y.

$$3x + y = -1$$
$$y = -3x - 1$$

We'll let x be 0, 1, and −1 to find three points. The ordered pairs are shown in the table. Plot the points, check that they line up, and draw the line.

y = −3x − 1		
x	**y**	**(x, y)**
0	-1	(0, -1)
1	-4	(1, -4)
-1	2	(-1, 2)

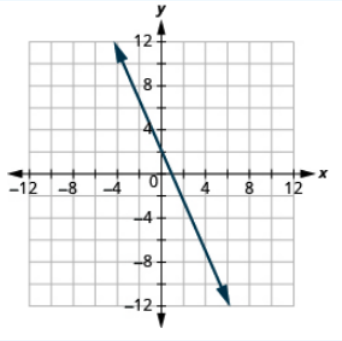


If you can choose any three points to graph a line, how will you know if your graph matches the one shown in the answers in the book? If the points where the graphs cross the x- and y -axes are the same, the graphs match.

Exercise 8.5.8:

Graph each equation: 2x + y = 2.

Answer



Exercise 8.5.9:

Graph each equation: 4x + y = −3.

8.6: Solve Geometry Applications- Volume and Surface Area (Part 2)

Find the Volume and Surface Area of Spheres

A **sphere** is the shape of a basketball, like a three-dimensional circle. Just like a circle, the size of a sphere is determined by its radius, which is the distance from the center of the sphere to any point on its surface. The formulas for the volume and surface area of a sphere are given below.

Showing where these formulas come from, like we did for a rectangular solid, is beyond the scope of this course. We will approximate π with 3.14.

Definition: Volume and Surface Area of a Sphere

For a sphere with radius r:

Example 8.6.5:

A sphere has a radius 6 inches. Find its (a) volume and (b) surface area.

Solution

Step 1 is the same for both (a) and (b), so we will show it just once.

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
(a)

Step 2. **Identify** what you are looking for.	the volume of the sphere	
Step 3. **Name**. Choose a variable to represent it.	let V = volume	
Step 4. **Translate**. Write the appropriate formula.	$V = \frac{4}{3}\pi r^3$	(9.6.12)
Step 5. **Solve**.	$V \approx \frac{4}{3}(3.14)6^3$ $V \approx 904.32\ cubic\ inches$	
Step 6. **Check**.	Double-check your math on a calculator.	
Step 7. **Answer** the question.	The volume is approximately 904.32 cubic inches.	

(b)

Step 2. **Identify** what you are looking for.	the surface area of the cube	
Step 3. **Name**. Choose a variable to represent it.	let S = surface area	
Step 4. **Translate**. Write the appropriate formula.	$S = 4\pi r^2$	(9.6.13)

Step 5. **Solve**.	$S \approx 4(3.14)6^2$ $S \approx 452.16\ sq.\ inches$
Step 6. **Check**.	Double-check your math on a calculator.
Step 7. **Answer** the question.	The surface area is approximately 452.16 square inches.

? Exercise 8.6.9:

Find the (a) volume and (b) surface area of a sphere with radius 3 centimeters.

Answer a

113.04 cu. cm

Answer b

113.04 sq. cm

? Exercise 8.6.10:

Find the (a) volume and (b) surface area of each sphere with a radius of 1 foot

Answer a

4.19 cu. ft

Answer b

12.56 sq. ft

✓ Example 8.6.6:

A globe of Earth is in the shape of a sphere with radius 14 centimeters. Find its (a) volume and (b) surface area. Round the answer to the nearest hundredth.

Step 1. **Read** the problem. Draw the figure and label it with the given information.	

(a)

Step 2. **Identify** what you are looking for.	the volume of the sphere
Step 3. **Name**. Choose a variable to represent it.	let V = volume
Step 4. **Translate**. Write the appropriate formula. Substitute. (Use 3.14 for π)	$V = \frac{4}{3}\pi r^3$ $V \approx \frac{4}{3}(3.14)14^3$
Step 5. **Solve**.	$V \approx 11,488.21$ $(9.6.14)$
Step 6. **Check**.	We leave it to you to check your calculations.

Step 7. **Answer** the question.	The volume is approximately 11,488.21 cubic inches.

(b)

Step 2. **Identify** what you are looking for.	the surface area of the sphere
Step 3. **Name**. Choose a variable to represent it.	let S = surface area
Step 4. **Translate**. Write the appropriate formula.	$S = 4\pi r^2$ $S \approx 4(3.14)14^2$
Step 5. **Solve**.	$S \approx 2461.76$ (9.6.15)
Step 6. **Check**.	We leave it to you to check your calculations.
Step 7. **Answer** the question.	The surface area is approximately 2461.76 square inches.

? Exercise 8.6.11:

A beach ball is in the shape of a sphere with radius of 9 inches. Find its (a) volume and (b) surface area.

Answer a

3052.08 cu. in

Answer b

1017.36 sq. in.

? Exercise 8.6.12:

A Roman statue depicts Atlas holding a globe with radius of 1.5 feet. Find the (a) volume and (b) surface area of the globe.

Answer a

14.13 cu. ft

Answer b

28.26 sq. ft

Find the Volume and Surface Area of a Cylinder

If you have ever seen a can of soda, you know what a cylinder looks like. A **cylinder** is a solid figure with two parallel circles of the same size at the top and bottom. The top and bottom of a cylinder are called the bases. The height h of a cylinder is the distance between the two bases. For all the cylinders we will work with here, the sides and the height, h, will be perpendicular to the bases.

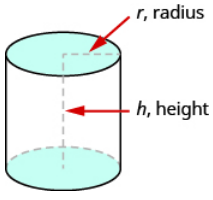

Figure 8.6.5 - A cylinder has two circular bases of equal size. The height is the distance between the bases.

Rectangular solids and cylinders are somewhat similar because they both have two bases and a height. The formula for the volume of a rectangular solid, V = Bh, can also be used to find the volume of a cylinder.

For the rectangular solid, the area of the base, B, is the area of the rectangular base, length × width. For a cylinder, the area of the base, B, is the area of its circular base, πr^2. Figure 8.6.6 compares how the formula V = Bh is used for rectangular solids and cylinders.

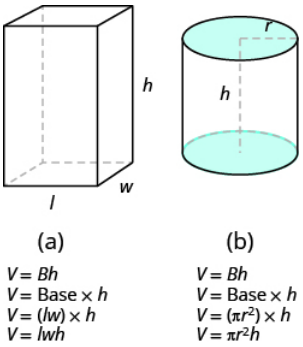

Figure 8.6.6 - Seeing how a cylinder is similar to a rectangular solid may make it easier to understand the formula for the volume of a cylinder.

To understand the formula for the surface area of a cylinder, think of a can of vegetables. It has three surfaces: the top, the bottom, and the piece that forms the sides of the can. If you carefully cut the label off the side of the can and unroll it, you will see that it is a rectangle. See Figure 8.6.7.

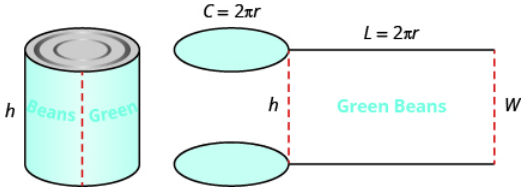

Figure 8.6.7 - By cutting and unrolling the label of a can of vegetables, we can see that the surface of a cylinder is a rectangle. The length of the rectangle is the circumference of the cylinder's base, and the width is the height of the cylinder.

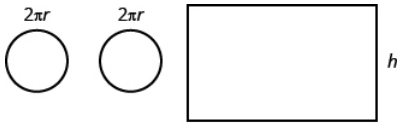
The distance around the edge of the can is the **circumference** of the cylinder's base it is also the length L of the rectangular label. The height of the cylinder is the width W of the rectangular label. So the area of the label can be represented as

$$A = L \cdot W$$
$$A = 2\pi r \cdot h$$

To find the total surface area of the cylinder, we add the areas of the two circles to the area of the rectangle.



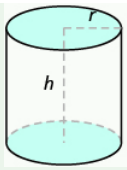
$$S = A_{\text{top circle}} + A_{\text{bottom circle}} + A_{\text{rectangle}}$$
$$S = \underbrace{\pi r^2 + \pi r^2} + 2\pi r \cdot h$$
$$S = 2 \cdot \pi r^2 + 2\pi rh$$
$$S = 2\pi r^2 + 2\pi rh$$

The surface area of a cylinder with radius r and height h, is

$$S = 2\pi r^2 + 2\pi rh \tag{9.6.16}$$

Definition: Volume and Surface Area of a Cylinder

For a cylinder with radius r and height h:



Volume: $V = \pi r^2 h$ or $V = Bh$
Surface Area: $S = 2\pi r^2 + 2\pi rh$

Example 8.6.7:

A cylinder has height 5 centimeters and radius 3 centimeters. Find the (a) volume and (b) surface area.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	
(a)

Step 2. **Identify** what you are looking for.	the volume of the cylinder	
Step 3. **Name**. Choose a variable to represent it.	let V = volume	
Step 4. **Translate**. Write the appropriate formula. Substitute. (Use 3.14 for π)	$V = \pi r^2 h$ $V \approx (3.14)3^2 \cdot 5$	
Step 5. **Solve**.	$V \approx 141.3$	$(9.6.17)$
Step 6. **Check**.	We leave it to you to check your calculations.	
Step 7. **Answer** the question.	The volume is approximately 141.3 cubic inches.	

(b)

Step 2. **Identify** what you are looking for.	the surface area of the cylinder	
Step 3. **Name**. Choose a variable to represent it.	let S = surface area	
Step 4. **Translate**. Write the appropriate formula.	$S = 2\pi r^2 + 2\pi rh$ $S \approx 2(3.14)3^2 + 2(3.14)(3)5$	
Step 5. **Solve**.	$S \approx 150.72$	$(9.6.18)$
Step 6. **Check**.	We leave it to you to check your calculations.	
Step 7. **Answer** the question.	The surface area is approximately 150.72 square inches.	

Exercise 8.6.13:

Find the (a) volume and (b) surface area of the cylinder with radius 4 cm and height 7 cm.

Answer a

351.68 cu. cm

Answer b

276.32 sq. ft

Exercise 8.6.14:

Find the (a) volume and (b) surface area of the cylinder with given radius 2 ft and height 8 ft.

Answer a

100.48 cu. ft

Answer b

125.6 sq. ft

Example 8.6.8:

Find the (a) volume and (b) surface area of a can of soda. The radius of the base is 4 centimeters and the height is 13 centimeters. Assume the can is shaped exactly like a cylinder.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	

(a)

Step 2. **Identify** what you are looking for.	the volume of the cylinder	
Step 3. **Name**. Choose a variable to represent it.	let V = volume	
Step 4. **Translate**. Write the appropriate formula. Substitute. (Use 3.14 for π)	$V = \pi r^2 h$ $V \approx (3.14)4^2 \cdot 13$	
Step 5. **Solve**.	$V \approx 653.12$	(9.6.19)
Step 6. **Check**.	We leave it to you to check.	
Step 7. **Answer** the question.	The volume is approximately 653.12 cubic centimeters.	

(b)

Step 2. **Identify** what you are looking for.	the surface area of the cylinder	
Step 3. **Name**. Choose a variable to represent it.	let S = surface area	
Step 4. **Translate**. Write the appropriate formula.	$S = 2\pi r^2 + 2\pi r h$ $S \approx 2(3.14)4^2 + 2(3.14)(4)13$	
Step 5. **Solve**.	$S \approx 427.04$	(9.6.20)

Step 6. **Check**.	We leave it to you to check your calculations.
Step 7. **Answer** the question.	The surface area is approximately 427.04 square centimeters.

? Exercise 8.6.15:

Find the (a) volume and (b) surface area of a can of paint with radius 8 centimeters and height 19 centimeters. Assume the can is shaped exactly like a cylinder.

Answer a

3,818.24 cu. cm

Answer b

1,356.48 sq. cm

? Exercise 8.6.16:

Find the (a) volume and (b) surface area of a cylindrical drum with radius 2.7 feet and height 4 feet. Assume the drum is shaped exactly like a cylinder.

Answer a

91.5624 cu. ft

Answer b

113.6052 sq. ft

Find the Volume of Cones

The first image that many of us have when we hear the word ‘cone’ is an ice cream cone. There are many other applications of cones (but most are not as tasty as ice cream cones). In this section, we will see how to find the volume of a cone.

In geometry, a **cone** is a solid figure with one circular base and a vertex. The height of a cone is the distance between its base and the vertex.The cones that we will look at in this section will always have the height perpendicular to the base. See Figure 8.6.8.

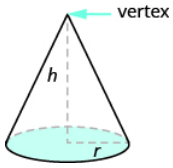


Figure 8.6.8 - The height of a cone is the distance between its base and the vertex.

Earlier in this section, we saw that the volume of a cylinder is $V = \pi r^2 h$. We can think of a cone as part of a cylinder. Figure 8.6.9 shows a cone placed inside a cylinder with the same height and same base. If we compare the volume of the cone and the cylinder, we can see that the volume of the cone is less than that of the cylinder.

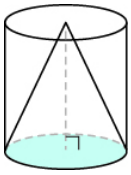

Figure 8.6.9 - The volume of a cone is less than the volume of a cylinder with the same base and height.

In fact, the volume of a cone is exactly one-third of the volume of a cylinder with the same base and height. The volume of a cone is

$$V = \frac{1}{3}Bh \tag{9.6.21}$$

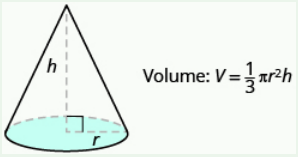
Since the base of a cone is a circle, we can substitute the formula of area of a circle, πr^2, for B to get the formula for volume of a cone.

$$V = \frac{1}{3}\pi r^2 h \tag{9.6.22}$$

In this book, we will only find the volume of a cone, and not its surface area.

Definition: Volume of a Cone

For a cone with radius r and height h .



Example 8.6.9:

Find the volume of a cone with height 6 inches and radius of its base 2 inches.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the volume of the cone
Step 3. **Name**. Choose a variable to represent it.	let V = volume
Step 4. **Translate**. Write the appropriate formula. Substitute. (Use 3.14 for π)	$V = \frac{1}{3}\pi r^2 h$ $V \approx \frac{1}{3}(3.14)(2)^2(6)$
Step 5. **Solve**.	$V \approx 25.12$ (9.6.23)
Step 6. **Check**.	We leave it to you to check your calculations.
Step 7. **Answer** the question.	The volume is approximately 25.12 cubic inches.

Exercise 8.6.17:

Find the volume of a cone with height 7 inches and radius 3 inches

Answer

65.94 cu. in.

Exercise 8.6.18:

Find the volume of a cone with height 9 centimeters and radius 5 centimeters

Answer

235.5 cu. cm

Example 8.6.10:

Marty's favorite gastro pub serves French fries in a paper wrap shaped like a cone. What is the volume of a conic wrap that is 8 inches tall and 5 inches in diameter? Round the answer to the nearest hundredth.

Solution

Step 1. **Read** the problem. Draw the figure and label it with the given information.	Step 2. **Identify** what you are looking for.	the volume of the cone
Step 3. **Name**. Choose a variable to represent it.	let V = volume
Step 4. **Translate**. Write the appropriate formula. Substitute. (Use 3.14 for π, and notice that we were given the distance across the circle, which is its diameter. The radius is 2.5 inches.)	$V = \frac{1}{3}\pi r^2 h$ $V \approx \frac{1}{3}(3.14)(2.5)^2(8)$
Step 5. **Solve**.	$V \approx 52.33$ $(9.6.24)$
Step 6. **Check**.	We leave it to you to check your calculations.
Step 7. **Answer** the question.	The volume of the wrap is approximately 52.33 cubic inches.

Exercise 8.6.19:

How many cubic inches of candy will fit in a cone-shaped piñata that is 18 inches long and 12 inches across its base? Round the answer to the nearest hundredth.

Answer

678.24 cu. in.

Exercise 8.6.20:

What is the volume of a cone-shaped party hat that is 10 inches tall and 7 inches across at the base? Round the answer to the nearest hundredth.

Answer

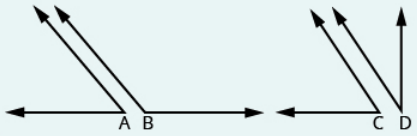
128.2 cu. in.

Summary of Geometry Formulas

The following charts summarize all of the formulas covered in this chapter.

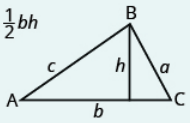
Supplementary and Complementary Angles

$m\angle A + m\angle B = 180°$ for supplementary angles A and B
$m\angle C + m\angle D = 90°$ for complementary angles C and D



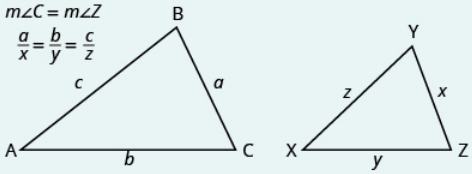
Triangle

For ΔABC, angle measures.
$m\angle A + m\angle B + m\angle C = 180°$
Perimeter. $P = a + b + c$
$A = \frac{1}{2}bh$



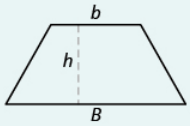
Similar Triangles

$m\angle A = m\angle X$
$m\angle B = m\angle Y$
$m\angle C = m\angle Z$
$\frac{a}{x} = \frac{b}{y} = \frac{c}{z}$



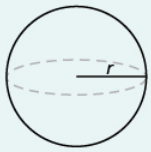
Trapezoid

Area. $A = \frac{1}{2}h(b + B)$



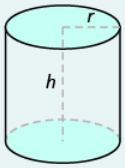
Sphere

Volume: $V = \frac{4}{3}\pi r^3$
Surface Area: $S = 4\pi r^2$



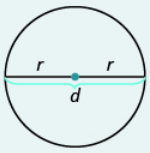
Cylinder

Volume: $V = \pi r^2 h$ or $V = Bh$
Surface Area: $S = 2\pi r^2 + 2\pi rh$

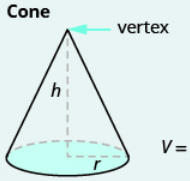


Circle

Circumference: $C = 2\pi r$ or $C = \pi d$
Area: $A = \pi r^2$



Cone



$V = \frac{1}{3}\pi r^2 h$

Volume of a Cone

Practice Makes Perfect

Find Volume and Surface Area of Rectangular Solids

In the following exercises, find (a) the volume and (b) the surface area of the rectangular solid with the given dimensions.

263. length 2 meters, width 1.5 meters, height 3 meters
264. length 5 feet, width 8 feet, height 2.5 feet
265. length 3.5 yards, width 2.1 yards, height 2.4 yards
266. length 8.8 centimeters, width 6.5 centimeters, height 4.2 centimeters

In the following exercises, solve.

267. **Moving van** A rectangular moving van has length 16 feet, width 8 feet, and height 8 feet. Find its (a) volume and (b) surface area.
268. **Gift box** A rectangular gift box has length 26 inches, width 16 inches, and height 4 inches. Find its (a) volume and (b) surface area.
269. **Carton** A rectangular carton has length 21.3 cm, width 24.2 cm, and height 6.5 cm. Find its (a) volume and (b) surface area.
270. **Shipping container** A rectangular shipping container has length 22.8 feet, width 8.5 feet, and height 8.2 feet. Find its (a) volume and (b) surface area.

In the following exercises, find (a) the volume and (b) the surface area of the cube with the given side length.

271. 5 centimeters
272. 6 inches
273. 10.4 feet
274. 12.5 meters

In the following exercises, solve.

275. **Science center** Each side of the cube at the Discovery Science Center in Santa Ana is 64 feet long. Find its (a) volume and (b) surface area.
276. **Museum** A cube-shaped museum has sides 45 meters long. Find its (a) volume and (b) surface area.
277. **Base of statue** The base of a statue is a cube with sides 2.8 meters long. Find its (a) volume and (b) surface area.
278. **Tissue box** A box of tissues is a cube with sides 4.5 inches long. Find its (a) volume and (b) surface area.

Find the Volume and Surface Area of Spheres

In the following exercises, find (a) the volume and (b) the surface area of the sphere with the given radius. Round answers to the nearest hundredth.

279. 3 centimeters
280. 9 inches
281. 7.5 feet
282. 2.1 yards

In the following exercises, solve. Round answers to the nearest hundredth.

283. **Exercise ball** An exercise ball has a radius of 15 inches. Find its (a) volume and (b) surface area.
284. **Balloon ride** The Great Park Balloon is a big orange sphere with a radius of 36 feet . Find its (a) volume and (b) surface area.
285. **Golf ball** A golf ball has a radius of 4.5 centimeters. Find its (a) volume and (b) surface area.
286. **Baseball** A baseball has a radius of 2.9 inches. Find its (a) volume and (b) surface area.

Find the Volume and Surface Area of a Cylinder

In the following exercises, find (a) the volume and (b) the surface area of the cylinder with the given radius and height. Round answers to the nearest hundredth.

287. radius 3 feet, height 9 feet
288. radius 5 centimeters, height 15 centimeters
289. radius 1.5 meters, height 4.2 meters
290. radius 1.3 yards, height 2.8 yards

In the following exercises, solve. Round answers to the nearest hundredth.

291. **Coffee can** A can of coffee has a radius of 5 cm and a height of 13 cm. Find its (a) volume and (b) surface area.
292. **Snack pack** A snack pack of cookies is shaped like a cylinder with radius 4 cm and height 3 cm. Find its (a) volume and (b) surface area.
293. **Barber shop pole** A cylindrical barber shop pole has a diameter of 6 inches and height of 24 inches. Find its (a) volume and (b) surface area.
294. **Architecture** A cylindrical column has a diameter of 8 feet and a height of 28 feet. Find its (a) volume and (b) surface area.

Find the Volume of Cones

In the following exercises, find the volume of the cone with the given dimensions. Round answers to the nearest hundredth.

295. height 9 feet and radius 2 feet
296. height 8 inches and radius 6 inches
297. height 12.4 centimeters and radius 5 cm
298. height 15.2 meters and radius 4 meters

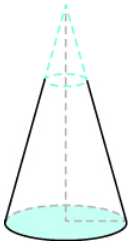
In the following exercises, solve. Round answers to the nearest hundredth.

299. **Teepee** What is the volume of a cone-shaped teepee tent that is 10 feet tall and 10 feet across at the base?

300. **Popcorn cup** What is the volume of a cone-shaped popcorn cup that is 8 inches tall and 6 inches across at the base?
301. **Silo** What is the volume of a cone-shaped silo that is 50 feet tall and 70 feet across at the base?
302. **Sand pile** What is the volume of a cone-shaped pile of sand that is 12 meters tall and 30 meters across at the base?

Everyday Math

303. **Street light post** The post of a street light is shaped like a truncated cone, as shown in the picture below. It is a large cone minus a smaller top cone. The large cone is 30 feet tall with base radius 1 foot. The smaller cone is 10 feet tall with base radius of 0.5 feet. To the nearest tenth, (a) find the volume of the large cone. (b) find the volume of the small cone. (c) find the volume of the post by subtracting the volume of the small cone from the volume of the large cone.



304. **Ice cream cones** A regular ice cream cone is 4 inches tall and has a diameter of 2.5 inches. A waffle cone is 7 inches tall and has a diameter of 3.25 inches. To the nearest hundredth, (a) find the volume of the regular ice cream cone. (b) find the volume of the waffle cone. (c) how much more ice cream fits in the waffle cone compared to the regular cone?

Writing Exercises

305. The formulas for the volume of a cylinder and a cone are similar. Explain how you can remember which formula goes with which shape.
306. Which has a larger volume, a cube of sides of 8 feet or a sphere with a diameter of 8 feet? Explain your reasoning.

Self Check

(a) After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
find volume and surface area of rectangular solids.			
find volume and surface area of spheres.			
find volume and surface area of cylinders.			
find volume of cones.			

(b) After reviewing this checklist, what will you do to become confident for all objectives?

8.7: Graphing Linear Equations (Part 2)

Graph Vertical and Horizontal Lines

Can we graph an equation with only one variable? Just x and no y, or just y without an x? How will we make a table of values to get the points to plot?

Let's consider the equation x = −3. The equation says that x is always equal to −3, so its value does not depend on y. No matter what y is, the value of x is always −3.

To make a table of solutions, we write −3 for all the x values. Then choose any values for y. Since x does not depend on y, you can chose any numbers you like. But to fit the size of our coordinate graph, we'll use 1, 2, and 3 for the y-coordinates as shown in the table.

x = -3		
x	**y**	**(x, y)**
-3	1	(-3, 1)
-3	2	(-3, 2)
-3	3	(-3, 3)

Then plot the points and connect them with a straight line. Notice in Figure 8.7.5 that the graph is a **vertical line**.

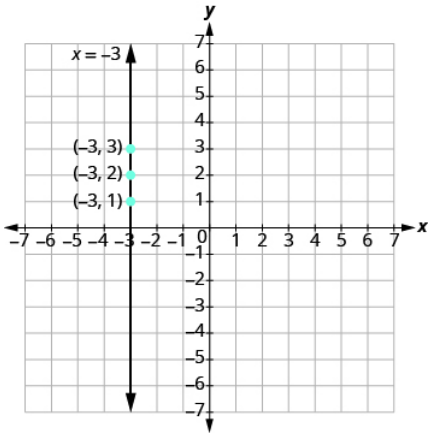

Figure 8.7.5

Definition: Vertical line

A vertical line is the graph of an equation that can be written in the form x = a. The line passes through the x -axis at (a, 0).

Example 8.7.6:

Graph the equation x = 2. What type of line does it form?

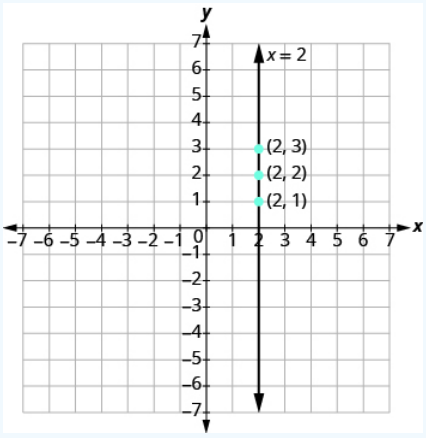
Solution

The equation has only variable, x, and x is always equal to 2. We make a table where x is always 2 and we put in any values for y.

x = -3		
x	**y**	**(x, y)**
2	1	(2, 1)

x = -3		
2	2	(2, 2)
2	3	(2, 3)

Plot the points and connect them as shown.

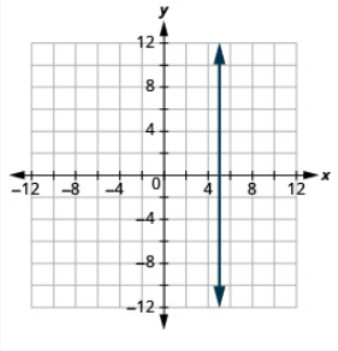


The graph is a vertical line passing through the x -axis at 2.

? Exercise 8.7.10:

Graph the equation: x = 5.

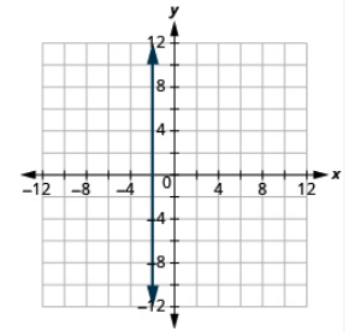
Answer



? Exercise 8.7.11:

Graph the equation: x = −2.

Answer



What if the equation has y but no x ? Let's graph the equation y = 4. This time the y -value is a constant, so in this equation y does not depend on x.

To make a table of solutions, write 4 for all the y values and then choose any values for x.

We'll use 0, 2, and 4 for the x -values.

x = -3		
x	**y**	**(x, y)**
0	4	(0, 4)
2	4	(2, 4)
4	4	(4, 4)

Plot the points and connect them, as shown in Figure 8.7.6. This graph is a horizontal line passing through the y-axis at 4.

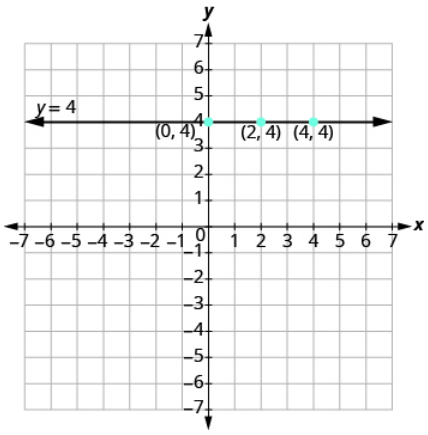


Figure 8.7.6

Definition: Horizontal Line

A horizontal line is the graph of an equation that can be written in the form y = b. The line passes through the y-axis at (0, b).

Example 8.7.7:

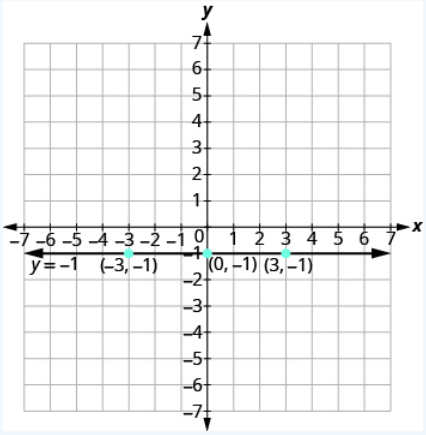
Graph the equation y = −1.

Solution

The equation y = −1 has only variable, y. The value of y is constant. All the ordered pairs in the table have the same y -coordinate, −1 . We choose 0, 3, and −3 as values for x.

x ≡ -3		
x	**y**	**(x, y)**
-3	-1	(-3, -1)
0	-1	(0, -1)
3	-1	(3, -1)

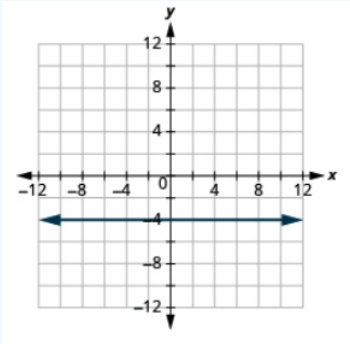
The graph is a horizontal line passing through the y -axis at −1 as shown.



? Exercise 8.7.12:

Graph the equation: y = −4.

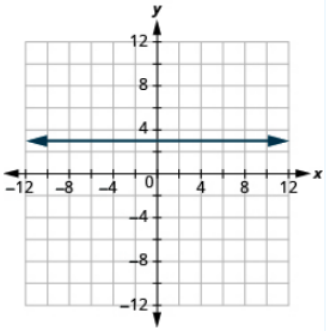
Answer



? Exercise 8.7.13:

Graph the equation: y = 3.

Answer



The equations for vertical and horizontal lines look very similar to equations like y = 4x. What is the difference between the equations y = 4x and y = 4?

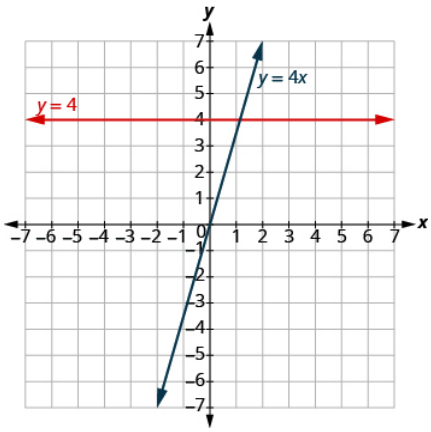
The equation y = 4x has both x and y. The value of y depends on the value of x. The y-coordinate changes according to the value of x.

The equation y = 4 has only one variable. The value of y is constant. The y-coordinate is always 4. It does not depend on the value of x.

y = 4x		
x	**y**	**(x, y)**
0	0	(0, 0)
1	4	(1, 4)
2	8	(2, 8)

$y = 4$		
x	**y**	**(x, y)**
0	4	(0, 4)
1	4	(1, 4)
2	4	(2, 4)

The graph shows both equations.



Notice that the equation y = 4x gives a slanted line whereas y = 4 gives a horizontal line.

Example 8.7.8:

Graph y = −3x and y = −3 in the same rectangular coordinate system.

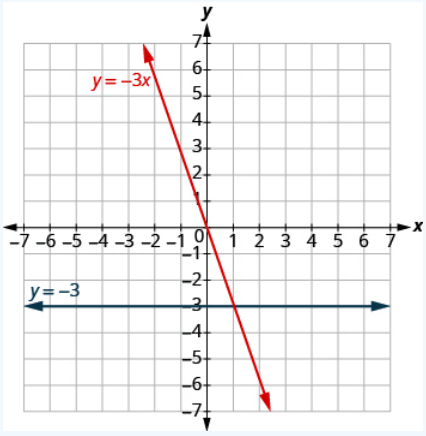
Solution

Find three solutions for each equation. Notice that the first equation has the variable x, while the second does not. Solutions for both equations are listed.

$y = -3x$		
x	**y**	**(x, y)**
0	0	(0, 0)
1	-3	(1, -3)
2	-6	(2, -6)

y = -3		
x	**y**	**(x, y)**
0	-3	(0, -3)
1	-3	(1, -3)
2	-3	(2, -3)

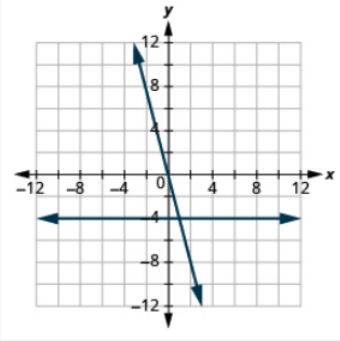
The graph shows both equations.



Exercise 8.7.14:

Graph the equations in the same rectangular coordinate system: y = −4x and y = −4.

Answer



Exercise 8.7.15:

Graph the equations in the same rectangular coordinate system: y = 3 and y = 3x.

Practice Makes Perfect

Recognize the Relation Between the Solutions of an Equation and its Graph

For each ordered pair, decide (a) is the ordered pair a solution to the equation? (b) is the point on the line?

39. y = x + 2
    1. (0, 2)
    2. (1, 2)
    3. (− 1, 1)
    4. (− 3, 1)
40. y = x − 4
    1. (0, − 4)
    2. (3, − 1)
    3. (2, 2)
    4. (1, − 5)
41. $y = \frac{1}{2}x - 3$

1. (0, − 3)
2. (2, − 2)
3. (− 2, − 4)
4. (4, 1)

42. $y = \frac{1}{3}x + 2$
    1. (0, 2)
    2. (3, 3)
    3. (− 3, 2)
    4. (− 6, 0)

Graph a Linear Equation by Plotting Points

In the following exercises, graph by plotting points.

43. $y = 3x - 1$
44. $y = 2x + 3$
45. $y = -2x + 2$
46. $y = -3x + 1$
47. $y = x + 2$
48. $y = x - 3$
49. $y = - x - 3$
50. $y = - x - 2$
51. $y = 2x$
52. $y = 3x$
53. $y = -4x$
54. $y = -2x$
55. $y = \frac{1}{2}x + 2$
56. $y = \frac{1}{3}x - 1$
57. $y = \frac{4}{3}x - 5$
58. $y = \frac{3}{2}x - 3$
59. $y = -\frac{2}{5}x + 1$
60. $y = -\frac{4}{5}x - 1$
61. $y = -\frac{3}{2}x + 2$
62. $y = -\frac{5}{3}x + 4$
63. $x + y = 6$
64. $x + y = 4$
65. $x + y = -3$
66. $x + y = -2$
67. $x - y = 2$
68. $x - y = 1$
69. $x - y = -1$
70. $x - y = -3$
71. $-x + y = 4$
72. $-x + y = 3$
73. $-x - y = 5$
74. $-x - y = 1$
75. $3x + y = 7$
76. $5x + y = 6$

77. $2x + y = -3$
78. $4x + y = -5$
79. $2x + 3y = 12$
80. $3x - 4y = 12$
81. $\frac{1}{3}x + y = 2$
82. $\frac{1}{2}x + y = 3$

Graph Vertical and Horizontal lines

In the following exercises, graph the vertical and horizontal lines.

83. $x = 4$
84. $x = 3$
85. $x = -2$
86. $x = -5$
87. $y = 3$
88. $y = 1$
89. $y = -5$
90. $y = -2$
91. $x = \frac{7}{3}$
92. $x = \frac{5}{4}$

In the following exercises, graph each pair of equations in the same rectangular coordinate system.

93. $y = -\frac{1}{2}x$ and $y = -\frac{1}{2}$
94. $y = -\frac{1}{3}x$ and $y = -\frac{1}{3}$
95. $y = 2x$ and $y = 2$
96. $y = 5x$ and $y = 5$

Mixed Practice

In the following exercises, graph each equation.

97. $y = 4x$
98. $y = 2x$
99. $y = -\frac{1}{2}x + 3$
100. $y = \frac{1}{4}x - 2$
101. $y = -x$
102. $y = x$
103. $x - y = 3$
104. $x + y = -5$
105. $4x + y = 2$
106. $2x + y = 6$
107. $y = -1$
108. $y = 5$
109. $2x + 6y = 12$
110. $5x + 2y = 10$
111. $x = 3$
112. $x = -4$

Everyday Math

113. **Motor home cost** The Robinsons rented a motor home for one week to go on vacation. It cost them $594 plus $0.32 per mile to rent the motor home, so the linear equation y = 594 + 0.32x gives the cost, y, for driving x miles. Calculate the rental cost for driving 400, 800, and 1,200 miles, and then graph the line.
114. **Weekly earning** At the art gallery where he works, Salvador gets paid $200 per week plus 15% of the sales he makes, so the equation y = 200 + 0.15x gives the amount y he earns for selling x dollars of artwork. Calculate the amount Salvador earns for selling $900, $1,600, and $2,000, and then graph the line.

Writing Exercises

115. Explain how you would choose three x-values to make a table to graph the line $y = \frac{1}{5}x - 2$.
116. What is the difference between the equations of a vertical and a horizontal line?

8.8: Use the Rectangular Coordinate System

Learning Objectives

By the end of this section, you will be able to:

- Plot points in a rectangular coordinate system
- Verify solutions to an equation in two variables
- Complete a table of solutions to a linear equation
- Find solutions to a linear equation in two variables

Note

Before you get started, take this readiness quiz.

1. Evaluate $x+3$ when $x=-1$.
   If you missed this problem, review Example 1.5.25.
2. Evaluate $2x-5y$ when $x=3$ and y=−2.
   If you missed this problem, review Example 1.5.28.
3. Solve for y: $40-4y=20$
   If you missed this problem, review Example 2.3.1.

Plot Points on a Rectangular Coordinate System

Just like maps use a grid system to identify locations, a grid system is used in algebra to show a relationship between two variables in a **rectangular coordinate system**. The rectangular coordinate system is also called the *xy*-plane or the 'coordinate plane'.

The horizontal number line is called the *x-axis*. The vertical number line is called the *y-axis*. The *x*-axis and the *y*-axis together form the rectangular coordinate system. These axes divide a plane into four regions, called **quadrants**. The quadrants are identified by Roman numerals, beginning on the upper right and proceeding counterclockwise. See Figure \(\PageIndex{1}\).

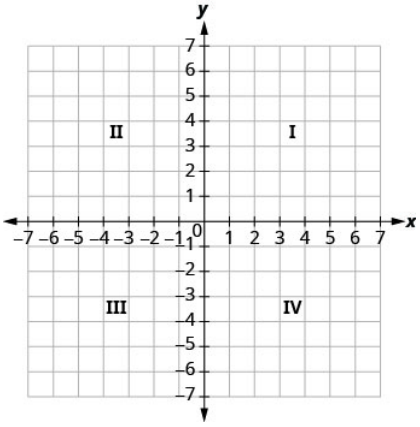

Figure 8.8.1: 'Quadrant' has the root 'quad,' which means 'four.'

In the **rectangular coordinate system**, every point is represented by an *ordered pair*. The first number in the ordered pair is the ***x*-coordinate** of the point, and the second number is the ***y*-coordinate** of the point.

ORDERED PAIR

An **ordered pair**, (x,y)(x,y), gives the coordinates of a point in a rectangular coordinate system.

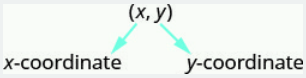

Figure 8.8.2

The first number is the *x*-coordinate.

The second number is the *y*-coordinate.

The phrase 'ordered pair' means the order is important. What is the ordered pair of the point where the axes cross? At that point both coordinates are zero, so its ordered pair is $(0, 0)$. The point $(0, 0)$ has a special name. It is called the **origin**.

THE ORIGIN

The point $(0, 0)$ is called the **origin**. It is the point where the *x*-axis and *y*-axis intersect.

We use the coordinates to locate a point on the *xy*-plane. Let's plot the point $(1, 3)$ as an example. First, locate 1 on the *x*-axis and lightly sketch a vertical line through $x = 1$. Then, locate 3 on the *y*-axis and sketch a horizontal line through $y = 3$. Now, find the point where these two lines meet — that is the point with coordinates $(1, 3)$.

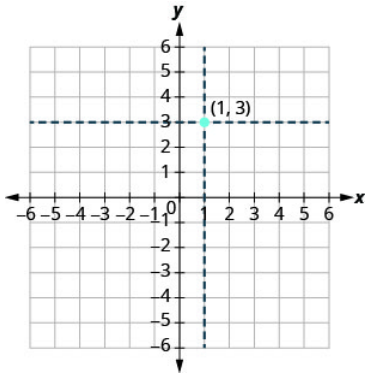

Figure 8.8.3

Notice that the vertical line through $x = 1$ and the horizontal line through $y = 3$ are not part of the graph. We just used them to help us locate the point $(1, 3)$.

Example 8.8.1

Plot each point in the rectangular coordinate system and identify the **quadrant** in which the point is located:

a. (−5,4)
b. (−3,−4)
c. (2,−3)
d. (−2,3)
e. $(3, \frac{5}{2})$

Solution

The first number of the coordinate pair is the *x*-coordinate, and the second number is the *y*-coordinate.

a. Since x=−5, the point is to the left of the *y*-axis. Also, since y=4, the point is above the *x*-axis. The point (−5,4) is in Quadrant II.
b. Since x=−3, the point is to the left of the *y*-axis. Also, since y=−4, the point is below the *x*-axis. The point (−3,−4) is in Quadrant III.
c. Since x=2, the point is to the right of the *y*-axis. Since y=−3, the point is below the *x*-axis. The point (2,−3) is in Quadrant IV.
d. Since x=−2, the point is to the left of the *y*-axis. Since y=3, the point is above the *x*-axis. The point (−2,3) is in Quadrant II.
e. Since x=3, the point is to the right of the *y*-axis. Since $y = \frac{5}{2}$, the point is above the *x*-axis. (It may be helpful to write $\frac{5}{2}$ as a mixed number or decimal.) The point $(3, \frac{5}{2})$ is in Quadrant I.

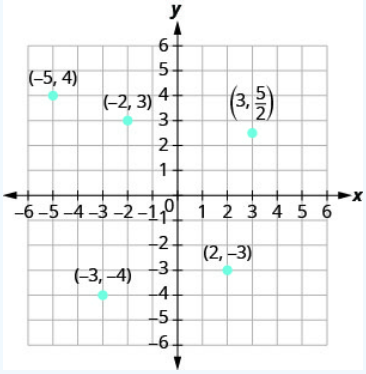

Figure 8.8.4

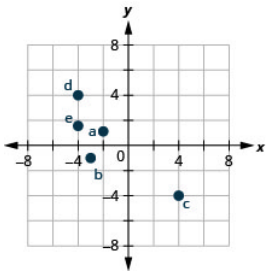
Try It 8.8.2

Plot each point in a rectangular coordinate system and identify the quadrant in which the point is located:

a. (−2,1)
b. (−3,−1)
c. (4,−4)
d. (−4,4)
e. $(-4, \frac{3}{2})$

Answer

The point a (-2,1) is in Quadrant II.
The point b (-3,-1) is in Quadrant III.
The point c (4,-4) is in Quadrant IV.
The point d (-4,4) is in Quadrant II.
The point e $(-4, \frac{3}{2})$ is in Quadrant II.



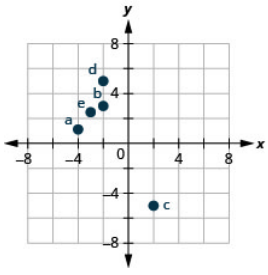
Try It 8.8.3

Plot each point in a rectangular coordinate system and identify the quadrant in which the point is located:

a. (−4,1)
b. (−2,3)
c. (2,−5)
d. (−2,5)
e. $(-3, \frac{5}{2})$

Answer

The point a (-4, 1) is in Quadrant II.
The point b (-2, 3) is in Quadrant II.
The point c (2, -5) is in Quadrant IV.
The point d (-2, 5) is in Quadrant II.
The point e $(-3, \frac{5}{2})$ is in Quadrant II.



How do the signs affect the location of the points? You may have noticed some patterns as you graphed the points in the previous example.

For the point in Figure 8.8.4 in Quadrant IV, what do you notice about the signs of the coordinates? What about the signs of the coordinates of points in the third quadrant? The second quadrant? The first quadrant?

Can you tell just by looking at the coordinates in which quadrant the point (−2,5) is located? In which quadrant is (2,−5) located?

QUADRANTS

We can summarize sign patterns of the quadrants in this way.

Quadrant I	Quadrant II	Quadrant III	Quadrant IV	
(x, y)	(x, y)	(x, y)	(x, y)	(8.8.1)
$(+, +)$	$(-, +)$	$(-, -)$	$(+, -)$	

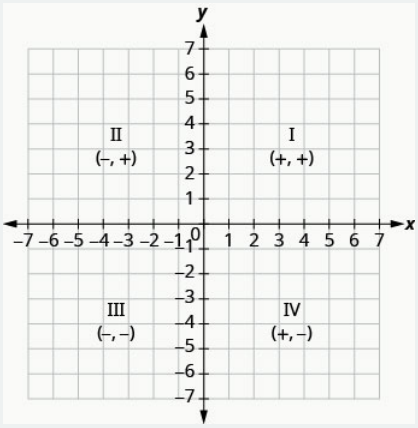


Figure 8.8.5

What if one coordinate is zero as shown in Figure 8.8.6? Where is the point (0,4) located? Where is the point (−2,0) located?

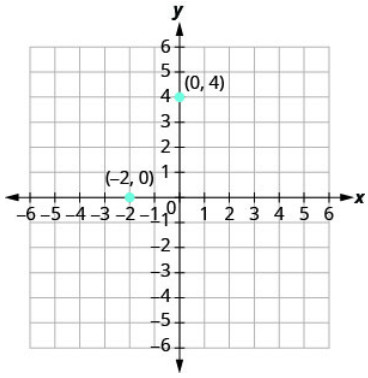

Figure 8.8.6

The point (0,4) is on the *y*-axis and the point (−2,0) is on the *x*-axis.

POINTS ON THE AXES

Points with a ***y*-coordinate** equal to 0 are on the *x*-axis, and have coordinates (a,0).

Points with an ***x*-coordinate** equal to 0 are on the *y*-axis, and have coordinates (0,b).

Example 8.8.4

Plot each point:

1. (0,5)
2. (4,0)
3. (−3,0)
4. (0,0)
5. (0,−1)

Solution

1. Since x=0, the point whose coordinates are (0,5) is on the *y*-axis.
2. Since y=0, the point whose coordinates are (4,0) is on the *x*-axis.
3. Since y=0, the point whose coordinates are (−3,0) is on the *x*-axis.
4. Since x=0 and y=0, the point whose coordinates are (0,0) is the origin.
5. Since x=0, the point whose coordinates are (0,−1) is on the *y*-axis.

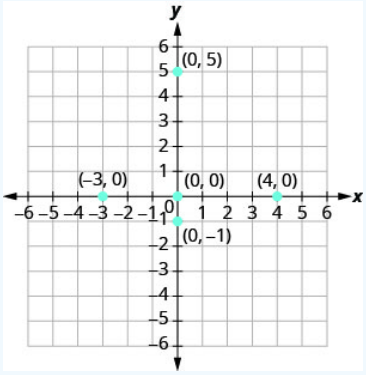

Figure 8.8.7

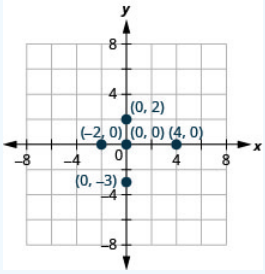
Try It 8.8.5

Plot each point:

1. (4,0)
2. (−2,0)
3. (0,0)
4. (0,2)
5. (0,−3).

Answer



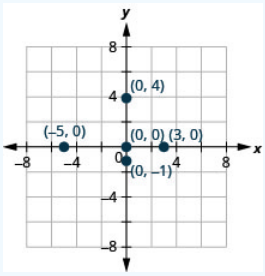
https://math.libretexts.org/@go/page/46277

Try It 8.8.6

Plot each point:

1. (−5,0)
2. (3,0)
3. (0,0)
4. (0,−1)
5. (0,4).

Answer



In algebra, being able to identify the coordinates of a point shown on a graph is just as important as being able to plot points. To identify the *x*-coordinate of a point on a graph, read the number on the *x*-axis directly above or below the point. To identify the *y*-coordinate of a point, read the number on the *y*-axis directly to the left or right of the point. Remember, when you write the **ordered pair** use the correct order, (x,y).

Example 8.8.7

Name the ordered pair of each point shown in the rectangular coordinate system.

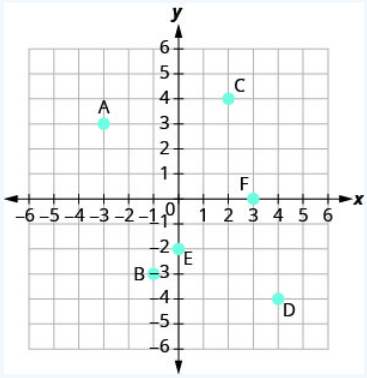


Figure 8.8.8

Solution

Point A is above −3 on the *x*-axis, so the *x*-coordinate of the point is −3.

The point is to the left of 3 on the *y*-axis, so the *y*-coordinate of the point is 3.

The coordinates of the point are (−3,3).

Point B is below −1 on the *x*-axis, so the *x*-coordinate of the point is −1.

The point is to the left of −3 on the *y*-axis, so the *y*-coordinate of the point is −3.

The coordinates of the point are (−1,−3).

Point C is above 2 on the *x*-axis, so the *x*-coordinate of the point is 2.

The point is to the right of 4 on the *y*-axis, so the *y*-coordinate of the point is 4.

The coordinates of the point are (2,4).

Point D is below 4 on the *x*-axis, so the *x*-coordinate of the point is 4.

The point is to the right of −4 on the *y*-axis, so the *y*-coordinate of the point is −4.

The coordinates of the point are (4,−4).

Point E is on the *y*-axis at y=−2. The coordinates of point E are (0,−2).

Point F is on the *x*-axis at x=3. The coordinates of point F are (3,0).

Try It 8.8.8

Name the ordered pair of each point shown in the rectangular coordinate system.

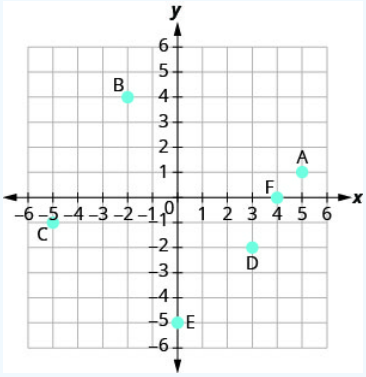

Figure 8.8.9

Answer

A: (5,1) B: (−2,4) C: (−5,−1) D: (3,−2) E: (0,−5) F: (4,0)

Try It 8.8.9

Name the ordered pair of each point shown in the rectangular coordinate system.

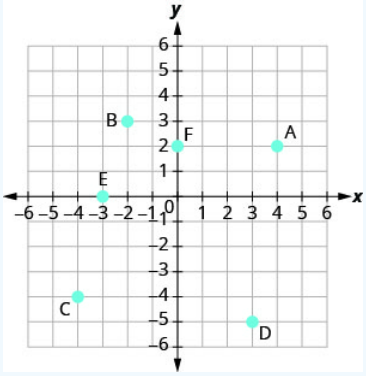

Figure 8.8.10

Answer

A: (4,2) B: (−2,3) C: (−4,−4) D: (3,−5) E: (−3,0) F: (0,2)

Verify Solutions to an Equation in Two Variables

Up to now, all the equations you have solved were equations with just one variable. In almost every case, when you solved the equation you got exactly one solution. The process of solving an equation ended with a statement like x=4. (Then, you checked the solution by substituting back into the equation.)

Here's an example of an equation in one variable, and its one solution.

$$\begin{aligned} 3x+5 &= 17 \\ 3x &= 12 \\ x &= 4 \end{aligned}$$

But equations can have more than one variable. Equations with two variables may be of the form Ax+By=C. Equations of this form are called **linear equations in two variables**.

LINEAR EQUATION

An equation of the form Ax+By=C, where A and B are not both zero, is called a **linear equation in two variables**.

Notice the word *line* in **linear**. Here is an example of a linear equation in two variables, x and y.

$$Ax + By = C$$
$$x + 4y = 8$$
$$A = 1,\ B = 4,\ C = 8$$

Figure 8.8.11

The equation y=−3x+5 is also a **linear equation**. But it does not appear to be in the form Ax+By=C. We can use the Addition Property of Equality and rewrite it in Ax+By=C form.

	y	$=$	$-3x+5$
Add to both sides.	$y+3x$	$=$	$-3x+5+3x$
Simplify.	$y+3x$	$=$	5
Use the Commutative Property to put it in $Ax+By=C$ form.	$3x+y$	$=$	5

By rewriting y=−3x+5 as 3x+y=5, we can easily see that it is a linear equation in two variables because it is of the form Ax+By=C. When an equation is in the form Ax+By=C, we say it is in *standard form*.

STANDARD FORM OF LINEAR EQUATION

A linear equation is in standard form when it is written Ax+By=C.

Most people prefer to have A, B, and C be integers and $A \geq 0$ when writing a linear equation in standard form, although it is not strictly necessary.

Linear equations have infinitely many solutions. For every number that is substituted for x there is a corresponding y value. This pair of values is a *solution* to the linear equation and is represented by the ordered pair (x,y). When we substitute these values of x and y into the equation, the result is a true statement, because the value on the left side is equal to the value on the right side.

Solution OF A LINEAR EQUATION IN TWO VARIABLES

An **ordered pair** (x,y) is a **solution** of the linear equation Ax+By=C, if the equation is a true statement when the *x*- and *y*-values of the ordered pair are substituted into the equation.

Example 8.8.10

Determine which ordered pairs are solutions to the equation x+4y=8.

(a) (0,2)

(b) (2,−4)

(c) (−4,3)

Solution

Substitute the *x*- and *y*-values from each ordered pair into the equation and determine if the result is a true statement.

https://math.libretexts.org/@go/page/46277

(a)	(b)	(c)
$(0, 2)$	$(2, -4)$	$(-4, 3)$
$x = 0, y = 2$	$x = 2, y = -4$	$x = -4, y = 3$
$x + 4y = 8$	$x + 4y = 8$	$x + 4y = 8$
$0 + 4 \cdot 2 \stackrel{?}{=} 8$	$2 + 4(-4) \stackrel{?}{=} 8$	$-4 + 4 \cdot 3 \stackrel{?}{=} 8$
$0 + 8 \stackrel{?}{=} 8$	$2 + (-16) \stackrel{?}{=} 8$	$-4 + 12 \stackrel{?}{=} 8$
$8 = 8$ ✓	$-14 \neq 8$	$8 = 8$ ✓
$(0, 2)$ is a solution.	$(2, -4)$ is not a solution.	$(-4, 3)$ is a solution.

Try It 8.8.11

Which of the following ordered pairs are solutions to 2x+3y=6?

1. (3,0)
2. (2,0)
3. (6,−2)

Answer

1, 3

Try It 8.8.12

Which of the following ordered pairs are solutions to the equation 4x−y=8?

1. (0,8)
2. (2,0)
3. (1,−4)

Answer

2, 3

Example 8.8.13

Which of the following ordered pairs are solutions to the equation y=5x−1?

(a) (0,−1)

(b) (1,4)

(c) (−2,−7)

Solution

Substitute the *x*- and *y*-values from each **ordered pair** into the equation and determine if it results in a true statement.

(a)	(b)	(c)
$(0, -1)$	$(1, 4)$	$(-2, -7)$
$x = 0, y = -1$	$x = 1, y = 4$	$x = -2, y = -7$
$y = 5x - 1$	$y = 5x - 1$	$y = 5x - 1$
$-1 \stackrel{?}{=} 5(0) - 1$	$4 \stackrel{?}{=} 5(1) - 1$	$-7 \stackrel{?}{=} 5(-2) - 1$
$-1 \stackrel{?}{=} 0 - 1$	$4 \stackrel{?}{=} 5 - 1$	$-7 \stackrel{?}{=} -10 - 1$
$-1 = -1$ ✓	$4 = 4$ ✓	$-7 \neq -11$
$(0, -1)$ is a solution.	$(1, 4)$ is a solution.	$(-2, -7)$ is not a solution.

Try It 8.8.14

Which of the following ordered pairs are solutions to the equation y=4x−3?

1. (0,3)
2. (1,1)
3. (−1,−1)

Answer

2

Try It 8.8.15

Which of the following ordered pairs are solutions to the equation y=−2x+6?

1. (0,6)
2. (1,4)
3. (−2,−2)

Answer

1, 2

Complete a Table of Solutions to a Linear Equation in Two Variables

In the examples above, we substituted the x- and y-values of a given ordered pair to determine whether or not it was a solution to a linear equation. But how do you find the ordered pairs if they are not given? It's easier than you might think—you can just pick a value for x and then solve the equation for y. Or, pick a value for y and then solve for x.

We'll start by looking at the solutions to the equation y = 5x−1 that we found in Example 8.8.13. We can summarize this information in a table of solutions, as shown in Table 8.8.1.

Table 8.8.1

y=5x−1		
x	**y**	**(x,y)**
0	−1	(0,−1)
1	4	(1,4)

To find a third solution, we'll let x=2 and solve for y.

	$y = 5x - 1$
Substitute $x = 2$.	$y = 5(2) - 1$
Multiply.	$y = 10 - 1$
Simplify.	$y = 9$

Figure 8.8.12

The ordered pair (2,9) is a solution to y=5x−1. We will add it to Table 8.8.2.

Table 8.8.2

y=5x−1		
x	**y**	**(x,y)**
0	−1	(0,−1)
1	4	(1,4)
2	9	(2,9)

We can find more solutions to the equation by substituting in any value of x or any value of y and solving the resulting equation to get another ordered pair that is a solution. There are infinitely many solutions of this equation.

Example 8.8.16

Complete the table to find three solutions to the equation $y=4x-2$.

Table 8.8.3

y=4x−2		
x	**y**	**(x,y)**
0		
−1		
2		

Solution

Substitute $x=0$, $x=-1$, and $x=2$ into $y=4x-2$.

$x=0$	$x=-1$	$x=2$
$y=4x-2$	$y=4x-2$	$y=4x-2$
$y=4\cdot 0-2$	$y=4(-1)-2$	$y=4\cdot 2-2$
$y=0-2$	$y=-4-2$	$y=8-2$
$y=-2$	$y=-6$	$y=6$
$(0,-2)$	$(-1,-6)$	$(2,6)$

The results are summarized in Table 8.8.4

Table 8.8.4

y=4x−2		
x	**y**	**(x,y)**
0	−2	(0,−2)
−1	−6	(−1,−6)
2	6	(2,6)

Try It 8.8.17

Complete the table to find three solutions to this equation: $y=3x-1$.

Table 8.8.5

y=3x−1		
x	**y**	**(x,y)**
0		
−1		
2		

Answer

Table 8.8.6

y=3x−1

x	y	(x,y)
0	-1	(0, -1)
−1	-4	(-1, -4)
2	5	(2, 5)

Try It 8.8.18

Complete the table to find three solutions to this equation: y=6x+1.

Table 8.8.7

y=6x+1		
x	**y**	**(x,y)**
-2		

Answer

Table 8.8.8

y=6x+1		
x	**y**	**(x,y)**
0	1	(0,1)
1	7	(1,7)
−2	−11	(−2,−11)

Example 8.8.19

Complete Table 8.8.9 to find three solutions to the equation 5x−4y=20.

Table 8.8.9

5x−4y=20		
x	**y**	**(x,y)**
	0	
	5	

Solution

Substitute the given value into the equation 5x−4y=20 and solve for the other variable. Then, fill in the values in the table.

$x = 0$	$y = 0$	$y = 5$
$5x - 4y = 20$	$5x - 4y = 20$	$5x - 4y = 20$
$5 \cdot 0 - 4y = 20$	$5x - 4 \cdot 0 = 20$	$5x - 4 \cdot 5 = 20$
$0 - 4y = 20$	$5x - 0 = 20$	$5x - 20 = 20$
$-4y = 20$	$5x = 20$	$5x = 40$
$y = -5$	$x = 4$	$x = 8$
$(0, -5)$	$(4, 0)$	$(8, 5)$

The results are summarized in Table 8.8.10

Table 8.8.10

5x−4y=20		
x	**y**	**(x,y)**
0	−5	(0,−5)
4	0	(4,0)
8	5	(8,5)

Try It 8.8.20

Complete the table to find three solutions to this equation: 2x−5y=20.

Table 8.8.11

2x−5y=20		
x	**y**	**(x,y)**
-5		

Answer

Table 8.8.12

2x−5y=20		
x	**y**	**(x,y)**
0	−4	(0,−4)
10	0	(10,0)
−5	−6	(−5,−6)

Try It 8.8.21

Complete the table to find three solutions to this equation: 3x−4y=12.

Table 8.8.13

3x−4y=12		
x	**y**	**(x,y)**

-4		

Answer

Table 8.8.14

3x−4y=12		
x	**y**	**(x,y)**
0	−3	(0,−3)
4	0	(4,0)
−4	−6	(−4,−6)

Find Solutions to a Linear Equation

To find a solution to a linear equation, you really can pick *any* number you want to substitute into the equation for x or y. But since you'll need to use that number to solve for the other variable it's a good idea to choose a number that's easy to work with.

When the equation is in *y*-form, with the *y* by itself on one side of the equation, it is usually easier to choose values of x and then solve for y.

Example 8.8.22

Find three solutions to the equation y=−3x+2.

Solution

We can substitute any value we want for x or any value for y. Since the equation is in *y*-form, it will be easier to substitute in values of x. Let's pick x=0, x=1, and x=−1.

	$x=0$	$x=1$	$x=-1$
	$y=-3x+2$	$y=-3x+2$	$y=-3x+2$
Substitute the value into the equation.	$y=-3\cdot 0+2$	$y=-3\cdot 1+2$	$y=-3(-1)+2$
Simplify.	$y=0+2$	$y=-3+2$	$y=3+2$
Simplify.	$y=2$	$y=-1$	$y=5$
Write the ordered pair.	(0, 2)	(1, -1)	(-1, 5)
Check.			
y=−3x+2	y=−3x+2	y=−3x+2	
$2\stackrel{?}{=}-3\cdot 0+2$	$-1\stackrel{?}{=}-3\cdot 1+2$	$5\stackrel{?}{=}-3(-1)+2$	
$2\stackrel{?}{=}0+2$	$-1\stackrel{?}{=}-3+2$	$5\stackrel{?}{=}-3+2$	
$2=2\checkmark$	$-1=-1\checkmark$	$5=5\checkmark$	

Table 8.8.15

So, (0,2), (1,−1) and (−1,5) are all solutions to y=−3x+2. We show them in Table 8.8.16

Table 8.8.16

y=−3x+2

x	y	(x,y)
0	2	(0,2)
1	−1	(1,−1)
−1	5	(−1,5)

Try It 8.8.23

Find three solutions to this equation: y=−2x+3.

Answer

Answers will vary. Answers might include (0,3), (1,1) and (−1,5).

Try It 8.8.24

Find three solutions to this equation: y=−4x+1.

Answer

Answers will vary. Answers might include (0,1), (1,−3) and (−1,5).

We have seen how using zero as one value of x makes finding the value of y easy. When an equation is in standard form, with both the x and y on the same side of the equation, it is usually easier to first find one solution when x=0 find a second solution when y=0, and then find a third solution.

Example 8.8.25

Find three solutions to the equation 3x+2y=6.

Solution

We can substitute any value we want for x or any value for y. Since the equation is in standard form, let's pick first x=0, then y=0, and then find a third point.

Table 8.8.17

$x=0$	$y=0$	$x=1$			
			$3x+2y=6$	$3x+2y=6$	$3x+2y=6$
Substitute the value into the equation.			$3(0)+2y=6$	$3x+2(0)=6$	$3(1)+2y=6$
Simplify.			$0+2y=6$	$3x+0=6$	$3+2y=6$
Solve.			$2y=6$	$3x=6$	$2y=3$
			$y=3$	$x=2$	$y=\frac{3}{2}$
Write the ordered pair.			(0, 3)	(2, 0)	$(1, \frac{3}{2})$
Check.					
3x+2y=6	3x+2y=6	3x+2y=6			
$3\cdot 0+2\cdot 3\stackrel{?}{=}6$	$3\cdot 2+2\cdot 0\stackrel{?}{=}6$	$3\cdot 1+2\cdot\frac{3}{2}\stackrel{?}{=}6$			
$0+6\stackrel{?}{=}6$	$6+0\stackrel{?}{=}6$	$3+3\stackrel{?}{=}6$			
$6=6$✓	$6=6$✓	$6=6$✓			

So (0,3), (2,0), and $(1, \frac{3}{2})$ are all solutions to the equation 3x+2y=6. We can list these three solutions in Table 8.8.18

Table 8.8.18

3x+2y=6		
x	**y**	**(x,y)**
0	3	(0,3)
2	0	(2,0)
1	$\frac{3}{2}$	$(1, \frac{3}{2})$

? Try It 8.8.26

Find three solutions to the equation 2x+3y=6.

Answer

Answers will vary. Answers might include (0,2), (3,0) and (6, −2).

? Try It 8.8.27

Find three solutions to the equation 4x+2y=8.

Answer

Answers will vary. Answers might include (0,4), (2,0) and (−1,6).

Key Concepts

- **Sign Patterns of the Quadrants**

Quadrant I	Quadrant II	Quadrant III	Quadrant IV
(x, y)	(x, y)	(x, y)	(x, y)
$(+, +)$	$(-, +)$	$(-, -)$	$(+, -)$

- **Points on the Axes**
  - On the *x*-axis, y=0. Points with a *y*-coordinate equal to 0 are on the *x*-axis, and have coordinates (a,0).
  - On the *y*-axis, x=0. Points with an *x*-coordinate equal to 0 are on the *y*-axis, and have coordinates (0,b).
- **Solution of a Linear Equation**
  - An ordered pair (x,y) is a solution of the linear equation Ax+By=C, if the equation is a true statement when the *x*- and *y*-values of the ordered pair are substituted into the equation.

Glossary

linear equation

A linear equation is of the form Ax+By=C, where A and B are not both zero, is called a linear equation in two variables.

ordered pair

An ordered pair (x,y) gives the coordinates of a point in a rectangular coordinate system.

origin

The point (0,0) is called the origin. It is the point where the *x*-axis and *y*-axis intersect.

quadrant

The *x*-axis and the *y*-axis divide a plane into four regions, called quadrants.

rectangular coordinate system

A grid system is used in algebra to show a relationship between two variables; also called the *xy*-plane or the ‘coordinate plane’.

***x*-coordinate**

The first number in an ordered pair (x,y).

***y*-coordinate**

The second number in an ordered pair (x,y).

8.8E: Exercises

Practice Makes Perfect

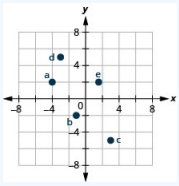
Plot Points in a Rectangular Coordinate System

In the following exercises, plot each point in a rectangular coordinate system and identify the quadrant in which the point is located.

Exercise 8.8E.1

1. $(-4,2)$
2. $(-1,-2)$
3. $(3,-5)$
4. $(-3,5)$
5. $\left(\frac{5}{3},2\right)$

Answer



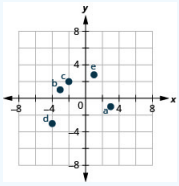
Exercise 8.8E.2

1. $(-2,-3)$
2. $(3,-3)$
3. $(-4,1)$
4. $(4,-1)$
5. $\left(\frac{3}{2},1\right)$

Exercise 8.8E.3

1. $(3,-1)$
2. $(-3,1)$
3. $(-2,2)$
4. $(-4,-3)$
5. $\left(1,\frac{14}{5}\right)$

Answer



Exercise 8.8E.4

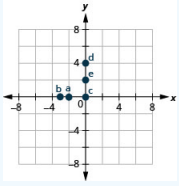
1. $(-1,1)$
2. $(-2,-1)$
3. $(2,1)$
4. $(1,-4)$
5. $\left(3,\frac{7}{2}\right)$

In the following exercises, plot each point in a rectangular coordinate system.

Exercise 8.8E.5

1. $(-2,0)$
2. $(-3,0)$
3. $(0,0)$
4. $(0,4)$
5. $(0,2)$

Answer



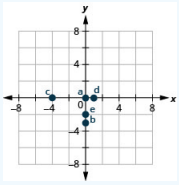
Exercise 8.8E.6

1. (0,1)
2. (0,−4)
3. (−1,0)
4. (0,0)
5. (5,0)

Exercise 8.8E.7

1. (0,0)
2. (0,−3)
3. (−4,0)
4. (1,0)
5. (0,−2)

Answer

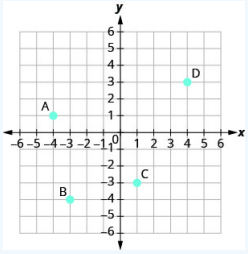


Exercise 8.8E.8

1. (−3,0)
2. (0,5)
3. (0,−2)
4. (2,0)
5. (0,0)

In the following exercises, name the ordered pair of each point shown in the rectangular coordinate system.

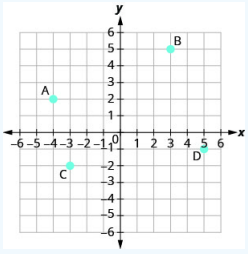
Exercise 8.8E.9



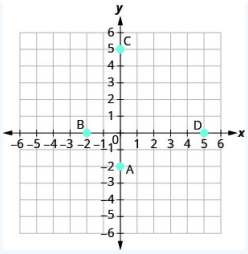
Answer

$A:(-4,1)\quad B:(-3,-4)\quad C:(1,-3)\quad D:(4,3)$

Exercise 8.8E.10



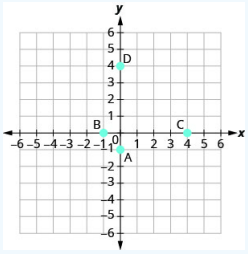
Exercise 8.8E.11



Answer

$A:(0,-2)\quad B:(-2,0)\quad C:(0,5)\quad D:(5,0)$

Exercise 8.8E.12



Verify Solutions to an Equation in Two Variables

In the following exercises, which ordered pairs are solutions to the given equations?

Exercise 8.8E.13

2x+y=6

1. (1,4)
2. (3,0)
3. (2,3)

Answer

1, 2

Exercise 8.8E.14

1. x+3y=9
2. (0,3)
3. (6,1)
4. (−3,−3)

Exercise 8.8E.15

4x−2y=8

1. (3,2)
2. (1,4)
3. (0,−4)

Answer

1, 3

Exercise 8.8E.16

3x−2y=12

1. (4,0)
2. (2,−3)
3. (1,6)

Exercise 8.8E.17

y=4x+3

1. (4,3)
2. (−1,−1)
3. $\left(\frac{1}{2},5\right)$

Answer

2, 3

Exercise 8.8E.18

y=2x−5

1. (0,−5)
2. (2,1)
3. $\left(\frac{1}{2}, -4\right)$

Exercise 8.8E.19

$y = \frac{1}{2}x - 1$

1. (2,0)
2. (−6,−4)
3. (−4,−1)

Answer

1, 2

Exercise 8.8E.20

$y = \frac{1}{3}x + 1$

1. (−3,0)
2. (9,4)
3. (−6,−1)

Complete a Table of Solutions to a Linear Equation

In the following exercises, complete the table to find solutions to each linear equation.

Exercise 8.8E.21

$y = 2x - 4$

x	y	(x,y)
0

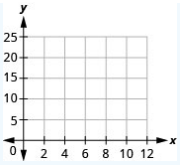
Everyday Math

Exercise 8.8E.49

Weight of a baby. Mackenzie recorded her baby's weight every two months. The baby's age, in months, and weight, in pounds, are listed in the table below, and shown as an ordered pair in the third column.

1. Plot the points on a coordinate plane.

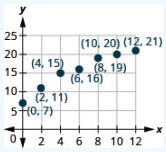


2. Why is only Quadrant I needed?

Age x	Weight y	(x,y)
0	7	(0, 7)
2	11	(2, 11)
4	15	(4, 15)
6	16	(6, 16)
8	19	(8, 19)
10	20	(10, 20)
12	21	(12, 21)

Answer

1.

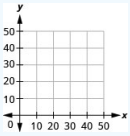


2. Age and weight are only positive.

Exercise 8.8E.50

Weight of a child. Latresha recorded her son's height and weight every year. His height, in inches, and weight, in pounds, are listed in the table below, and shown as an ordered pair in the third column.

1. Plot the points on a coordinate plane.



2. Why is only Quadrant I needed?

Height x	Weight y	(x,y)
28	22	(28, 22)
31	27	(31, 27)
33	33	(33, 33)
37	35	(37, 35)
40	41	(40, 41)
42	45	(42, 45)

Writing Exercises

Exercise 8.8E.51

Explain in words how you plot the point (4,−2) in a rectangular coordinate system?

Answer

Answers will vary.

Exercise 8.8E.52

How do you determine if an ordered pair is a solution to a given equation?

Exercise 8.8E.53

Is the point (−3,0) on the *x*-axis or *y*-axis? How do you know?

Answer

Answers will vary.

? Exercise $8.8E.54$

Is the point (0,8) on the *x*-axis or *y*-axis? How do you know?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
plot points in a rectangular coordinate system.			
identify points on a graph.			
verify solutions to an equation in two variables.			
complete a table of solutions to a linear equation.			
find solutions to a linear equation.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved the objectives in this section. Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific.

…with some help. This must be addressed quickly because topics you do not master become potholes in your road to success. In math every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no, I don't get it. This is a warning sign and you must not ignore it. You should get help right away or you will quickly be overwhelmed. See your instructor as soon as you can to discuss your situation. Together you can come up with a plan to get you the help you need.

8.9: Graphing with Intercepts (Part 1)

Learning Objectives

- Identify the intercepts on a graph
- Find the intercepts from an equation of a line
- Graph a line using the intercepts
- Choose the most convenient method to graph a line

be prepared!

Before you get started, take this readiness quiz.

1. Solve: $3x + 4y = -12$ for x when $y = 0$. If you missed this problem, review Example 9.11.6.
2. Is the point $(0, -5)$ on the x-axis or y-axis? If you missed this problem, review Example 11.1.5.
3. Which ordered pairs are solutions to the equation $2x - y = 6$? (a) (6, 0) (b) (0, −6) (c) (4, −2). If you missed this problem, review Example 11.2.8.

Identify the Intercepts on a Graph

Every linear equation has a unique line that represents all the solutions of the equation. When graphing a line by plotting points, each person who graphs the line can choose any three points, so two people graphing the line might use different sets of points.

At first glance, their two lines might appear different since they would have different points labeled. But if all the work was done correctly, the lines will be exactly the same line. One way to recognize that they are indeed the same line is to focus on where the line crosses the axes. Each of these points is called an **intercept of the line**.

Definition: Intercepts of a Line

Each of the points at which a line crosses the x-axis and the y-axis is called an intercept of the line.

Let's look at the graph of the lines shown in Figure 8.9.1.

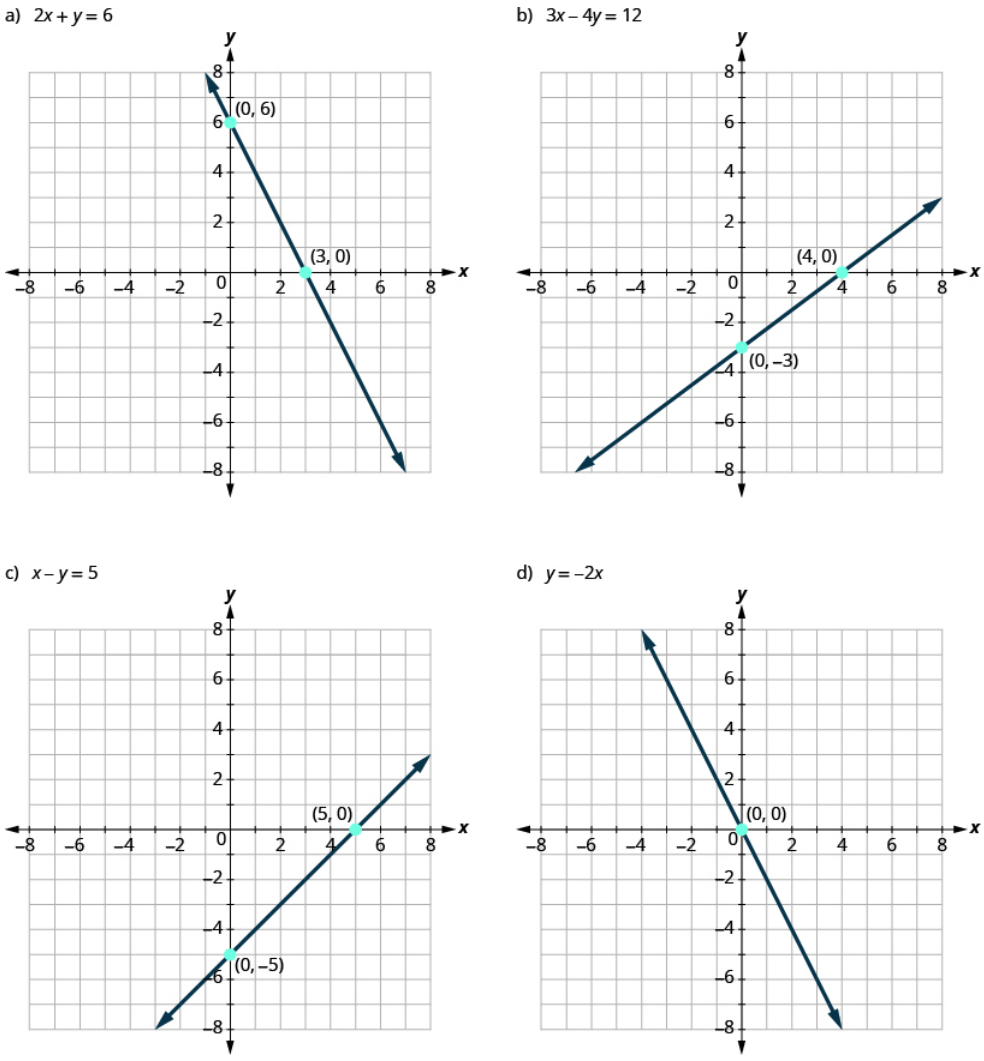

Figure 8.9.1

First, notice where each of these lines crosses the x- axis:

Table 8.9.1

Figure:	The line crosses the x-axis at:	Ordered pair of this point
Figure 8.9.1a	3	(3,0)
Figure 8.9.1b	4	(4,0)
Figure 8.9.1c	5	(5,0)
Figure 8.9.1d	0	(0,0)

Do you see a pattern?

For each row, the y-coordinate of the point where the line crosses the x-axis is zero. The point where the line crosses the x-axis has the form (a, 0); and is called the *x-intercept* of the line. The x-intercept occurs when y is zero.

Now, let's look at the points where these lines cross the y-axis.

Table 8.9.2

Figure:	The line crosses the x-axis at:	Ordered pair of this point
Figure 8.9.1a	6	(0, 6)

Figure:	The line crosses the x-axis at:	Ordered pair of this point
Figure 8.9.1*b*	-3	(0, -3)
Figure 8.9.1*c*	-5	(0, -5)
Figure 8.9.1*d*	0	(0, 0)

Definition: x-intercept and y-intercept of a line

The x-intercept is the point, (a, 0), where the graph crosses the x-axis.

The x-intercept occurs when y is zero.

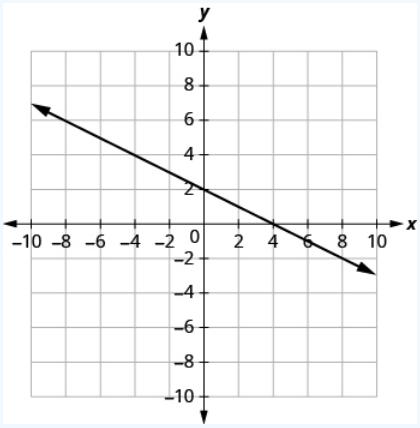
The y-intercept is the point, (0, b), where the graph crosses the y-axis.

The y-intercept occurs when x is zero.

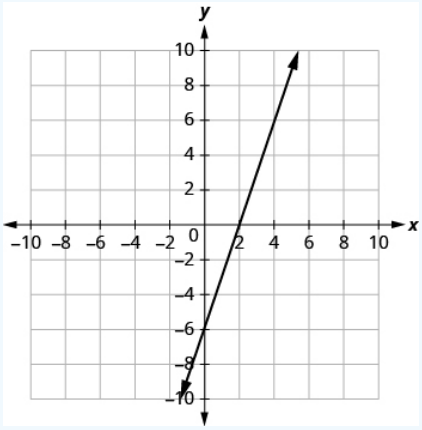
Example 8.9.1

Find the x- and y-intercepts of each line:

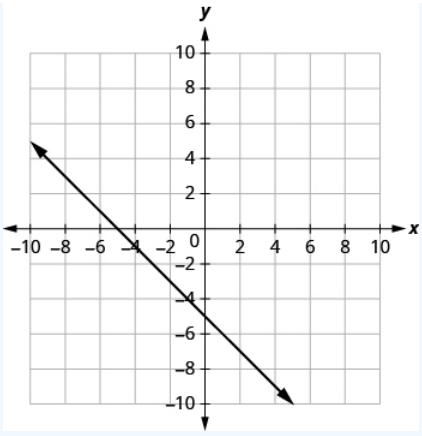
(a) x + 2y = 4



(b) 3x - y = 6



(c) x + y = -5



Solution

(a)

The graph crosses the x-axis at the point (4, 0).	The x-intercept is (4, 0).
The graph crosses the y-axis at the point (0, 2).	The x-intercept is (0, 2).

(b)

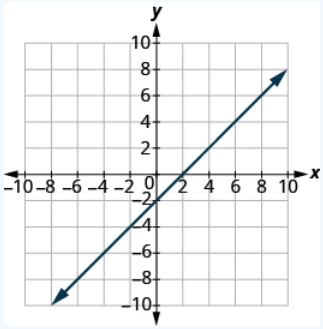
The graph crosses the x-axis at the point (2, 0).	The x-intercept is (2, 0).
The graph crosses the y-axis at the point (0, -6).	The x-intercept is (0, -6).

(c)

The graph crosses the x-axis at the point (-5, 0).	The x-intercept is (-5, 0).
The graph crosses the y-axis at the point (0, -5).	The x-intercept is (0, -5).

Exercise 8.9.1A

Find the x- and y-intercepts of the graph: x − y = 2.

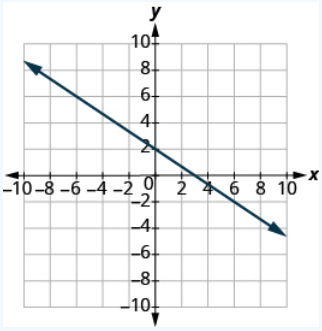


Answer

x-intercept (2,0); y-intercept (0,-2)

Exercise 8.9.1B

Find the x- and y-intercepts of the graph: 2x + 3y = 6.



Answer

x-intercept (3,0); y-intercept (0,2)

Find the Intercepts from an Equation of a Line

Recognizing that the x-intercept occurs when y is zero and that the y-intercept occurs when x is zero gives us a method to find the intercepts of a line from its equation. To find the x-intercept, let y = 0 and solve for x. To find the y-intercept, let x = 0 and solve for y.

Definition: Find the x and y from the Equation of a Line

Use the equation to find:

- the x-intercept of the line, let y = 0 and solve for x.
- the y-intercept of the line, let x = 0 and solve for y

Table 8.9.3

x	y
	0
0	

Example 8.9.2

Find the intercepts of 2x + y = 6

Solution

We'll fill in Figure 8.9.2.

2x + y = 6		
x	y	
	0	x-intercept
0		y-intercept

Figure 8.9.2

To find the x- intercept, let y = 0:

Substitute 0 for y.	$2x + 0 = 6$
Add.	2x = 6

Divide by 2.	x = 3

The x-intercept is (3, 0).

To find the y- intercept, let x = 0:

Substitute 0 for x.	$2 \cdot 0 + y = 6$
Multiply.	0 + y = 6
Add.	y = 6

The y-intercept is (0, 6).

2x + y = 6	
x	**y**
3	0
0	6

Figure 8.9.3

The intercepts are the points (3, 0) and (0, 6).

? Exercise 8.9.2A

Find the intercepts: 3x + y = 12.

Answer

x-intercept (4,0); y-intercept (0,12)

? Exercise 8.9.2B

Find the intercepts: x + 4y = 8.

Answer

x-intercept (8,0); y-intercept (0,2)

✓ Example 8.9.3

Find the intercepts of 4x−3y = 12.

Solution

To find the x-intercept, let y = 0.

Substitute 0 for y.	4x − 3 • 0 = 12
Multiply.	4x − 0 = 12
Subtract.	4x = 12
Divide by 4.	x = 3

The y-intercept is (0, −4). The intercepts are the points (−3, 0) and (0, −4).

4x - 3y = 12	
x	**y**
3	0
0	-4

? Exercise 8.9.3A

Find the intercepts of the line: 3x−4y = 12.

Answer

x-intercept (4,0); y-intercept (0,-3)

? Exercise 8.9.3B

Find the intercepts of the line: 2x−4y = 8.

Answer

x-intercept (4,0); y-intercept (0,-2)

Graph a Line Using the Intercepts

To graph a linear equation by plotting points, you can use the intercepts as two of your three points. Find the two intercepts, and then a third point to ensure accuracy, and draw the line. This method is often the quickest way to graph a line.

✔ Example 8.9.4

Graph −x + 2y = 6 using intercepts.

Solution

First, find the x-intercept. Let y = 0,

$$\begin{aligned} -x+2y &= 6 \\ -x+2(0) &= 6 \\ -x &= 6 \\ x &= -6 \end{aligned}$$

The x-intercept is (–6, 0).

Now find the y-intercept. Let x = 0.

$$\begin{aligned} -x+2y &= 6 \\ -0+2y &= 6 \\ 2y &= 6 \\ y &= 3 \end{aligned}$$

The y-intercept is (0, 3).

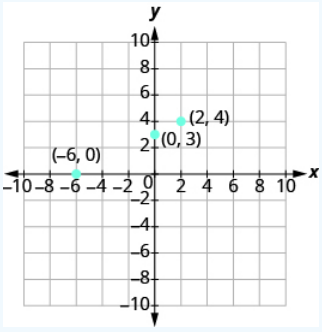
Find a third point. We'll use x = 2,

$$\begin{aligned} -x+2y &= 6 \\ -2+2y &= 6 \\ 2y &= 8 \\ y &= 4 \end{aligned}$$

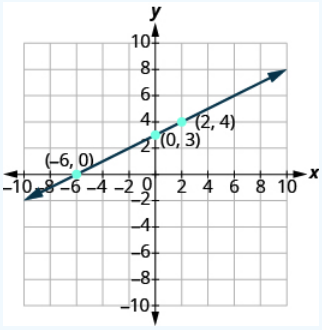
A third solution to the equation is (2, 4).

Summarize the three points in a table and then plot them on a graph.

-x + 2y = 6		
x	**y**	**(x,y)**
-6	0	(−6, 0)
0	3	(0, 3)
2	4	(2, 4)



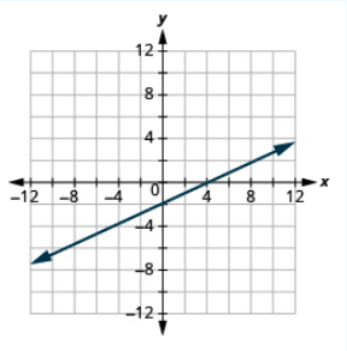
Do the points line up? Yes, so draw line through the points.



Exercise 8.9.4A

Graph the line using the intercepts: x−2y = 4.

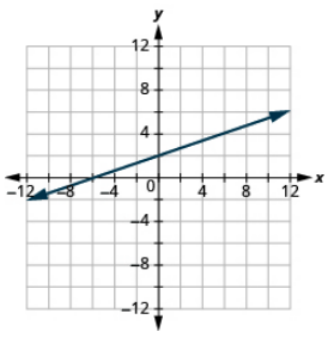
Answer



Exercise 8.9.4B

Graph the line using the intercepts: −x + 3y = 6.

Answer



HOW TO: GRAPH A LINE USING THE INTERCEPTS

Step 1. Find the x - and y-intercepts of the line.

- Let y = 0 and solve for x.
- Let x = 0 and solve for y.

Step 2. Find a third solution to the equation.

Step 3. Plot the three points and then check that they line up.

Step 4. Draw the line.

Example 8.9.5

Graph 4x−3y = 12 using intercepts.

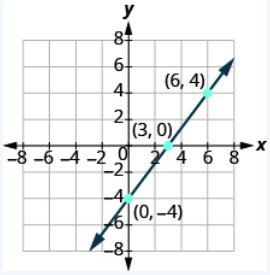
Solution

Find the intercepts and a third point.

$x-intercept,\ let\ y=0$	$y-intercept,\ let\ x=0$	$third\ point,\ let\ y=4$
$4x-3y=12$	$4x-3y=12$	$4x-3y=12$
$4x-3(0)=12$	$4(0)-3y=12$	$4x-12=12$
$4x=12$	$4x-3(4)=12$	$4x=24$
$x=3$	$-3y=12$	$x=6$
	$y=-4$	

We list the points and show the graph.

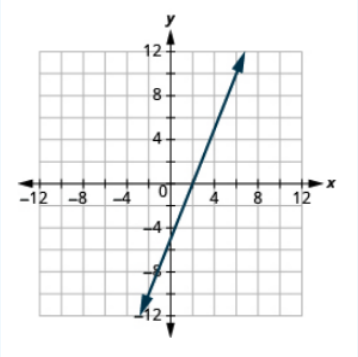
4x - 3y = 12		
x	**y**	**(x. y)**
3	0	(3, 0)
0	-4	(0, −4)
6	4	(6, 4)



Exercise $8.9.5A$

Graph the line using the intercepts: 5x−2y = 10.

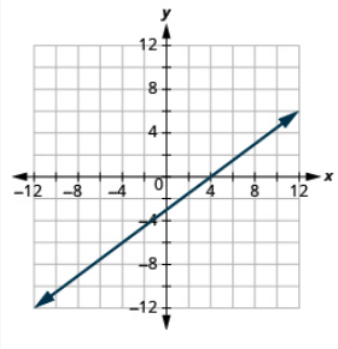
Answer



Exercise $8.9.5B$

Graph the line using the intercepts: 3x−4y = 12.

Answer



Example $8.9.6$

Graph $y = 5x$ using the intercepts.

Solution

$x-intercept;\ Let\ y=0.$	$y-intercept;\ Let\ x=0.$
$y=5x$ $0=5x$ $0=x$ $x=0$ $The\ x-intercept\ is\ (0,0).$	$y=5x$ $y=5(0)$ $y=0$ $The\ y-intercept\ is\ (0,0).$

This line has only one intercept! It is the point (0, 0).

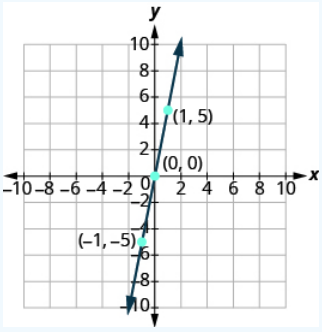
To ensure accuracy, we need to plot three points. Since the intercepts are the same point, we need two more points to graph the line. As always, we can choose any values for x, so we'll let x be 1 and −1.

$x=1$ $y=5x$ $y=5(1)$ $y=5$ $(1,-5)$	$x=-1$ $y=5x$ $y=5(-1)$ $y=-5$ $(-1,-5)$

Organize the points in a table.

y = 5x		
x	**y**	**(x, y)**
0	0	(0, 0)
1	5	(1, 5)
-1	-5	(−1, −5)

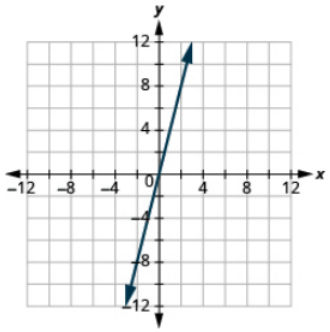
Plot the three points, check that they line up, and draw the line.



Exercise 8.9.6A

Graph using the intercepts: $y=3x$.

Answer



? Exercise $8.9.6B$

Graph using the intercepts: $y = -x$.

Answer

8.10: Graph Linear Equations in Two Variables

Learning Objectives

By the end of this section, you will be able to:

- Recognize the relationship between the solutions of an equation and its graph.
- Graph a linear equation by plotting points.
- Graph vertical and horizontal lines.

Note

Before you get started, take this readiness quiz.

1. Evaluate $3x+2$ when $x=-1$.
   If you missed this problem, review Exercise 1.5.34.
2. Solve $3x+2y=12$ for y in general.
   If you missed this problem, review Exercise 2.6.16.

Recognize the Relationship Between the Solutions of an Equation and its Graph

In the previous section, we found several solutions to the equation $3x+2y=6$. They are listed in Table 8.10.1. So, the ordered pairs (0,3), (2,0), and $(1, \frac{3}{2})$ are some solutions to the equation $3x+2y=6$. We can plot these solutions in the rectangular coordinate system as shown in Figure 8.10.1.

Table 8.10.1

3x+2y=6		
x	**y**	**(x,y)**
0	3	(0,3)
2	0	(2,0)
1	$\frac{3}{2}$	$(1, \frac{3}{2})$

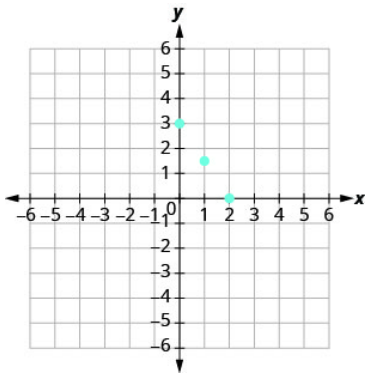

Figure 8.10.1

Notice how the points line up perfectly? We connect the points with a line to get the graph of the equation 3x+2y=6. See Figure 8.10.2 Notice the arrows on the ends of each side of the line. These arrows indicate the line continues.

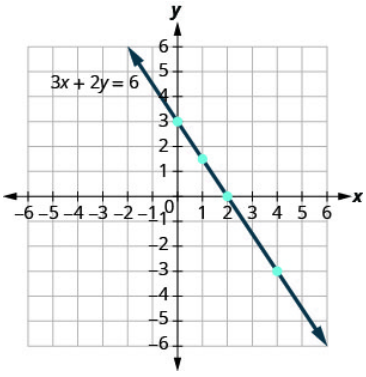

Figure 8.10.2

Every point on the line is a solution of the equation. Also, every solution of this equation is a point on this line. Points *not* on the line are not solutions.

Notice that the point whose coordinates are (−2,6) is on the line shown in Figure 8.10.3. If you substitute x=−2 and y=6 into the equation, you find that it is a solution to the equation.

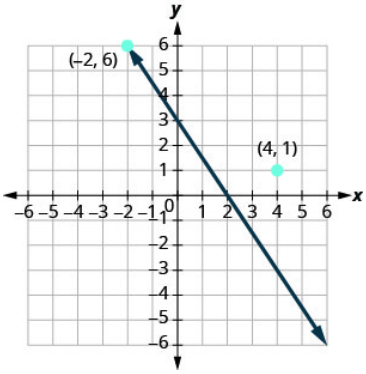

Figure 8.10.3

Test (–2, 6)

$$3x + 2y = 6$$

$$3(-2) + 2(6) = 6$$

$$-6 + 12 = 6$$

$$6 = 6 \checkmark$$

So the point (−2,6) is a solution to the equation $3x + 2y = 6$. (The phrase "the point whose coordinates are (−2,6)" is often shortened to "the point (−2,6).")

What about (4, 1) ?

$$3x + 2y = 6$$

$$3 \cdot 4 + 2 \cdot 1 = 6$$

$$12 + 2 \stackrel{?}{=} 6$$

$$14 \neq 6$$

Figure 8.10.3. This is an example of the saying, "A picture is worth a thousand words." The line shows you *all* the solutions to the equation. Every point on the line is a solution of the equation. And, every solution of this equation is on this line. This line is called the *graph* of the equation $3x + 2y = 6$.

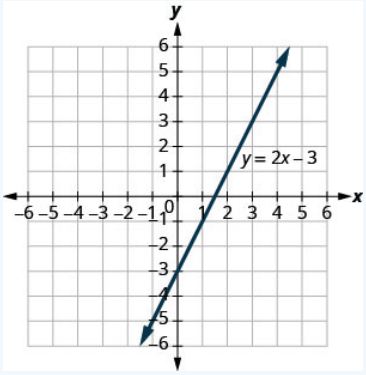
GRAPH OF A LINEAR EQUATION

The **graph of a linear equation** Ax+By=C is a line.

- Every point on the line is a solution of the equation.
- Every solution of this equation is a point on this line.

Example 8.10.1

The graph of y=2x−3 is shown.



For each ordered pair, decide:

1. Is the ordered pair a solution to the equation?
2. Is the point on the line?

A (0,−3) B (3,3) C (2,−3) D (−1,−5)

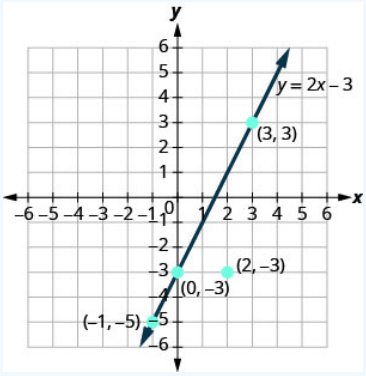
Solution

Substitute the *x*- and *y*- values into the equation to check if the ordered pair is a solution to the equation.

1.

A: (0, –3)	B: (3, 3)	C: (2, –3)	D: (–1, –5)
$y = 2x - 3$	$y = 2x - 3$	$y = 2x - 3$	$y = 2x - 3$
$-3 \stackrel{?}{=} 2(0) - 3$	$3 \stackrel{?}{=} 2(3) - 3$	$-3 \stackrel{?}{=} 2(2) - 3$	$-5 \stackrel{?}{=} 2(-1) - 3$
$-3 = -3$ ✓	$3 = 3$ ✓	$-3 \neq 1$	$-5 = -5$ ✓
(0, –3) is a solution.	(3, 3) is a solution.	(2, –3) is not a solution.	(–1, –5) is a solution.

2. Plot the points A (0,−3), B (3,3), C (2,−3), and D (−1,−5).



The points that are solutions to y=2x−3 are on the line, but the point that is not a solution is not on the line.

The points (0,−3), (3,3), and (−1,−5) are on the line y=2x−3, and the point (2,−3) is not on the line.

Try It 8.10.2

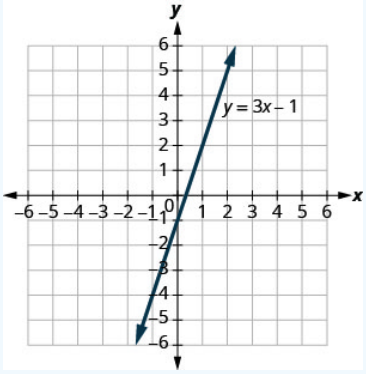
Use the graph of y=3x−1 to decide whether each ordered pair is:

- a solution to the equation.

https://math.libretexts.org/@go/page/46279

- on the line.

1. (0,−1)
2. (2,5)



Answer

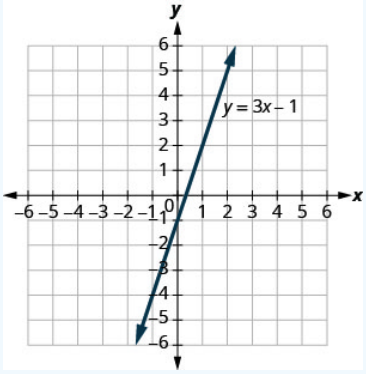
1. yes, yes
2. yes, yes

? Try It 8.10.3

Use graph of y=3x−1 to decide whether each ordered pair is:

- a solution to the equation
- on the line

1. (3,−1)
2. (−1,−4)



Answer

1. no, no
2. yes, yes

Graph a Linear Equation by Plotting Points

There are several methods that can be used to graph a linear equation. The method we used to graph 3x+2y=6 is called plotting points, or the Point–Plotting Method.

Example 8.10.4: How To Graph an Equation By Plotting Points

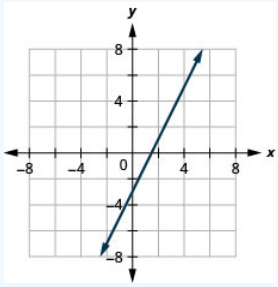
Graph the equation y=2x+1 by plotting points.

Solution

Step 1. Find three points whose coordinates are solutions to the equation.	You can choose any values for x or y. In this case, since y is isolated on the left side of the equation, it is easier to choose values for x.	$y = 2x + 1$ $x = 0$ $y = 2x + 1$ $y = 2 \cdot 0 + 1$ $y = 0 + 1$ $y = 1$ $x = 1$ $y = 2x + 1$ $y = 2 \cdot 1 + 1$ $y = 2 + 1$ $y = 3$ $x = -2$ $y = 2x + 1$ $y = 2(-2) + 1$ $y = -4 + 1$ $y = -3$
Organize the solutions in a table.	Put the three solutions in a table.	$y = 2x + 1$ x | y | (x, y) 0 | 1 | (0, 1) 1 | 3 | (1, 3) –2 | –3 | (–2, –3)
Step 2. Plot the points in a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work!	Plot: (0, 1), (1, 3), (–2, –3). Do the points line up? Yes, the points line up.	
Step 3. Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line.	This line is the graph of $y = 2x + 1$.	
Try It 8.10.5

Graph the equation by plotting points: y=2x−3.

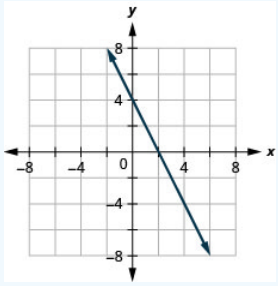
Answer



Try It 8.10.6

Graph the equation by plotting points: y=−2x+4.

Answer



The steps to take when graphing a linear equation by plotting points are summarized below.

GRAPH A LINEAR EQUATION BY PLOTTING POINTS

1. Find three points whose coordinates are solutions to the equation. Organize them in a table.
2. Plot the points in a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work.
3. Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line.

It is true that it only takes two points to determine a line, but it is a good habit to use three points. If you only plot two points and one of them is incorrect, you can still draw a line but it will not represent the solutions to the equation. It will be the wrong line.

If you use three points, and one is incorrect, the points will not line up. This tells you something is wrong and you need to check your work. Look at the difference between part (a) and part (b) in Figure 8.10.4

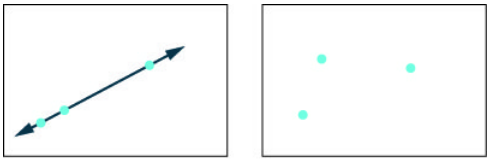


Figure 8.10.4

Let's do another example. This time, we'll show the last two steps all on one grid.

Example 8.10.7

Graph the equation y=−3x.

Solution

Find three points that are solutions to the equation. Here, again, it's easier to choose values for x. Do you see why?

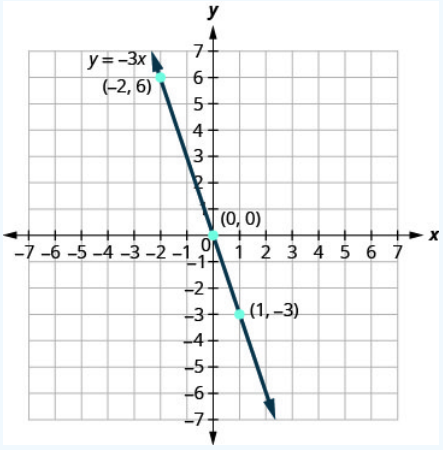
$x = 0$	$x = 1$	$x = -2$
$y = -3x$	$y = -3x$	$y = -3x$
$y = -3 \cdot 0$	$y = -3 \cdot 1$	$y = -3(-2)$
$y = 0$	$y = -3$	$y = 6$

We list the points in Table 8.10.2

Table 8.10.2

y=−3x		
x	**y**	**(x,y)**
0	0	(0,0)
1	−3	(1,−3)
−2	6	(−2,6)

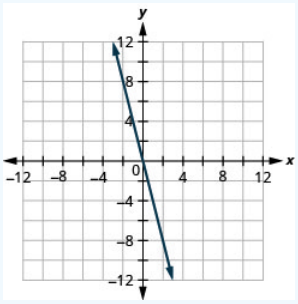
Plot the points, check that they line up, and draw the line.



Try It 8.10.8

Graph the equation by plotting points: y=−4x.

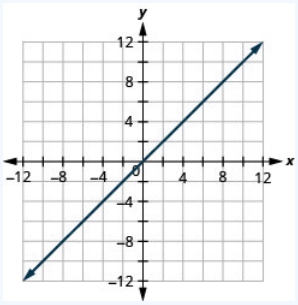
Answer



Try It 8.10.9

Graph the equation by plotting points: y=x.

Answer



When an equation includes a fraction as the coefficient of x, we can still substitute any numbers for x. But the math is easier if we make ‘good’ choices for the values of x. This way we will avoid fraction answers, which are hard to graph precisely.

Example 8.10.10

Graph the equation $y = \frac{1}{2}x + 3$.

Solution

Find three points that are solutions to the equation. Since this equation has the fraction $\frac{1}{2}$ as a coefficient of x, we will choose values of x carefully. We will use zero as one choice and multiples of 2 for the other choices. Why are multiples of 2 a good choice for values of x?

$x = 0$	$x = 2$	$x = 4$
$y = \frac{1}{2}x + 3$	$y = \frac{1}{2}x + 3$	$y = \frac{1}{2}x + 3$
$y = \frac{1}{2}(0) + 3$	$y = \frac{1}{2}(2) + 3$	$y = \frac{1}{2}(4) + 3$
$y = 0 + 3$	$y = 1 + 3$	$y = 2 + 3$
$y = 3$	$y = 4$	$y = 5$

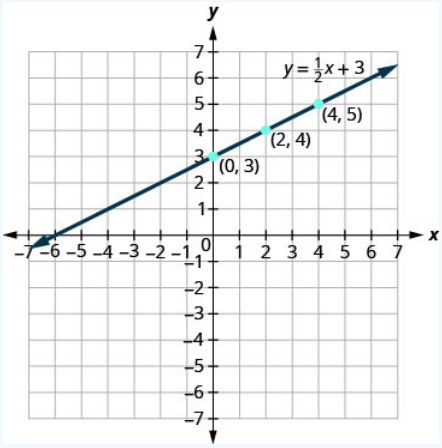
The points are shown in Table 8.10.3

Table 8.10.3

y=12x+3

x	y	(x,y)
0	3	(0,3)
2	4	(2,4)
4	5	(4,5)

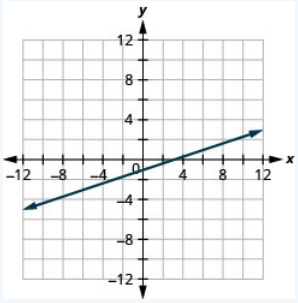
Plot the points, check that they line up, and draw the line.



Try It 8.10.11

Graph the equation $y = \frac{1}{3}x - 1$.

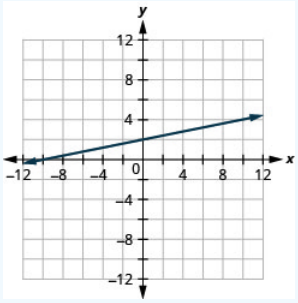
Answer



Try It 8.10.12

Graph the equation $y = \frac{1}{5}x + 2$.

Answer



So far, all the equations we graphed had y given in terms of x. Now we'll graph an equation with x and y on the same side. Let's see what happens in the equation 2x+y=3. If y=0 what is the value of x?

$$\begin{aligned} y &= 0 \\ 2x + y &= 3 \\ 2x + 0 &= 3 \\ 2x &= 3 \\ x &= \frac{3}{2} \\ \left(\frac{3}{2}, 0\right) \end{aligned}$$

This point has a fraction for the *x*- coordinate and, while we could graph this point, it is hard to be precise graphing fractions. Remember in the example y=12x+3, we carefully chose values for x so as not to graph fractions at all. If we solve the equation 2x+y=3 for y, it will be easier to find three solutions to the equation.

$$\begin{aligned} 2x + y &= 3 \\ y &= -2x + 3 \end{aligned}$$

The solutions for x=0, x=1, and x=−1 are shown in the Table 8.10.4 The graph is shown in Figure 8.10.5

Table 8.10.4

2x+y=3		
x	**y**	**(x,y)**
0	3	(0,3)
1	1	(1,1)
−1	5	(−1,5)

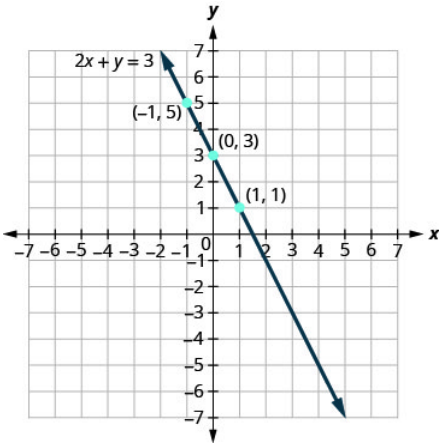


Figure 8.10.5

Can you locate the point $\left(\frac{3}{2}, 0\right)$ which we found by letting y=0, on the line?

Example 8.10.13

Graph the equation 3x+y=−1.

Solution

Find three points that are solutions to the equation. $3x + y = -1$

First solve the equation for y. $y = -3x - 1$

We'll let x be 0, 1, and −1 to find 3 points. The ordered pairs are shown in Table 8.10.5 Plot the points, check that they line up, and draw the line. See Figure 8.10.6

Table 8.10.5

3x+y=−1		
x	**y**	**(x,y)**
0	−1	(0,−1)
1	−4	(1,−4)
−1	2	(−1,2)

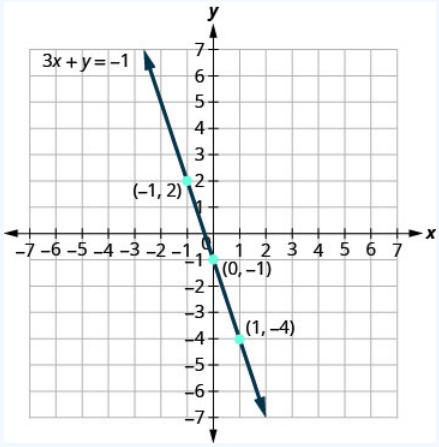

Figure 8.10.6

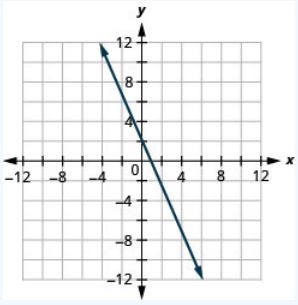
Try It 8.10.14

Graph the equation 2x+y=2.

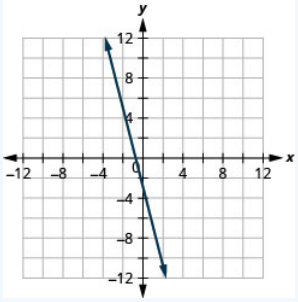
Answer



Try It 8.10.15

Graph the equation 4x+y=−3.

Answer



If you can choose any three points to graph a line, how will you know if your graph matches the one shown in the answers in the book? If the points where the graphs cross the *x*- and *y*-axis are the same, the graphs match!

The equation in Example 8.10.13was written in standard form, with both x and y on the same side. We solved that equation for y in just one step. But for other equations in standard form it is not that easy to solve for y, so we will leave them in standard form. We can still find a first point to plot by letting x=0 and solving for y. We can plot a second point by letting y=0 and then solving for x. Then we will plot a third point by using some other value for x or y.

Example 8.10.16

Graph the equation $2x-3y=6$.

Solution

Find three points that are solutions to the equation.	$2x-3y = 6$
	$2x-3y = 6$
First let $x=0$.	$2(0)-3y = 6$
Solve for y.	$-3y = 6$
	$y = -2$
Now let $y=0$.	$2x-3(0) = 6$
Solve for x.	$2x = 6$
	$x = 3$
We need a third point. Remember, we can choose any value for x or y. We'll let x = 6.	$2(6)-3y = 6$
	$12-3y = 6$
Solve for y.	$-3y = -6$
	$y = 2$

We list the ordered pairs in Table 8.10.6. Plot the points, check that they line up, and draw the line. See Figure 8.10.7.

Table 8.10.6

2x−3y=6		
x	**yT**	**(x,y)**
0	−2	(0,−2)
3	0	(3,0)
6	2	(6,2)

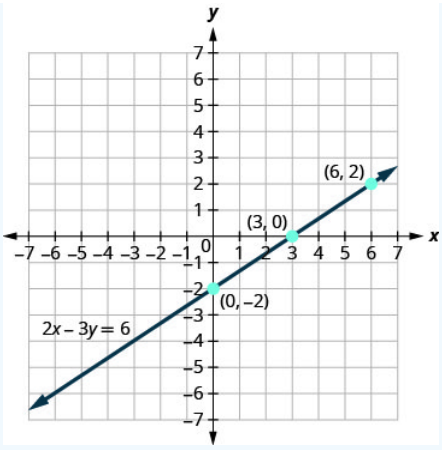


Figure 8.10.7

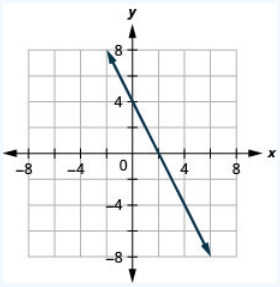
Try It 8.10.17

Graph the equation $4x + 2y = 8$.

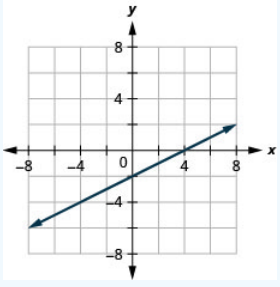
Answer



Try It 8.10.18

Graph the equation $2x - 4y = 8$.

Answer



Graph Vertical and Horizontal Lines

Can we graph an equation with only one variable? Just x and no y, or just y without an x? How will we make a table of values to get the points to plot?

Let's consider the equation x=−3. This equation has only one variable, x. The equation says that x is *always* equal to −3, so its value does not depend on y. No matter what y is, the value of x is always −3.

So to make a table of values, write −3 in for all the x values. Then choose any values for y. Since x does not depend on y, you can choose any numbers you like. But to fit the points on our coordinate graph, we'll use 1, 2, and 3 for the *y*-coordinates. See Table 8.10.7

Table 8.10.7

x=−3		
x	**y**	**(x,y)**
−3	1	(−3,1)
−3	2	(−3,2)
−3	3	(−3,3)

Plot the points from Table 8.10.7 and connect them with a straight line. Notice in Figure 8.10.8 that we have graphed a *vertical line*.

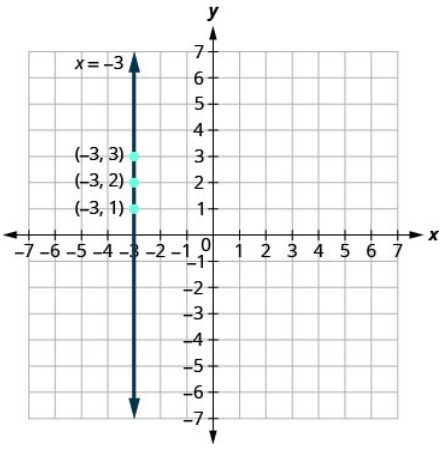


Figure 8.10.8

VERTICAL LINE

A **vertical line** is the graph of an equation of the form x=a.

The line passes through the *x*-axis at (a,0).

Example 8.10.19

Graph the equation x=2.

Solution

The equation has only one variable, x, and x is always equal to 2. We create Table 8.10.8 where x is always 2 and then put in any values for y. The graph is a vertical line passing through the *x*-axis at 2. See Figure 8.10.9

Table 8.10.8

x=2		
x	**y**	**(x,y)**
2	1	(2,1)
2	2	(2,2)
2	3	(2,3)

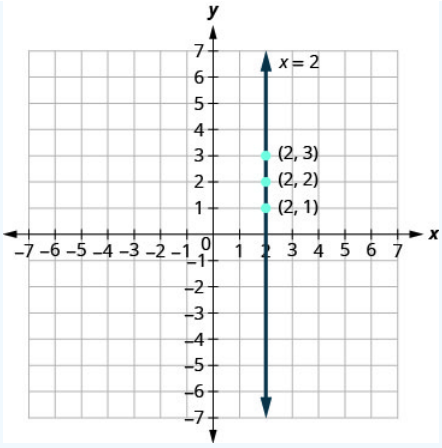

Figure 8.10.9

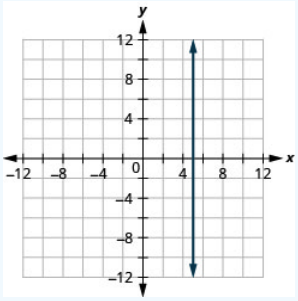
Try It 8.10.20

Graph the equation x=5.

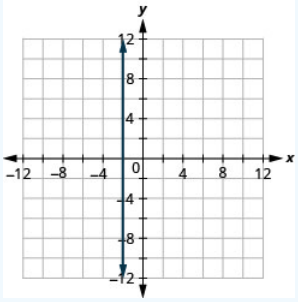
Answer



Try It 8.10.21

Graph the equation x=−2.

Answer



What if the equation has y but no x? Let's graph the equation y=4. This time the *y*- value is a constant, so in this equation, y does not depend on x. Fill in 4 for all the y's in Table 8.10.9 and then choose any values for x. We'll use 0, 2, and 4 for the *x*-coordinates.

Table 8.10.9

y=4		
x	**y**	**(x,y)**

0	4	(0,4)
2	4	(2,4)
4	4	(4,4)

The graph is a horizontal line passing through the *y*-axis at 4. See Figure 8.10.10

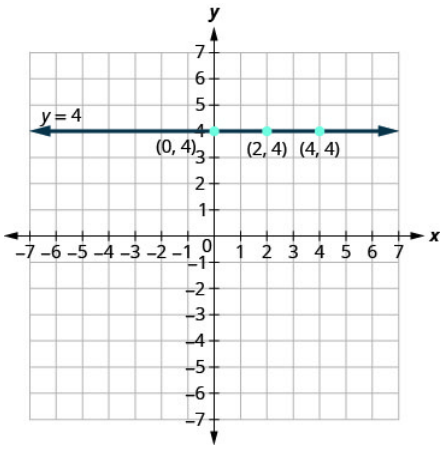


Figure 8.10.10

HORIZONTAL LINE

A **horizontal line** is the graph of an equation of the form y=b.

The line passes through the *y*-axis at (0,b).

Example 8.10.22

Graph the equation y=−1.

Solution

The equation y=−1 has only one variable, y. The value of y is constant. All the ordered pairs in Table 8.10.10have the same *y*-coordinate. The graph is a horizontal line passing through the *y*-axis at −1, as shown in Figure 8.10.11.

Table 8.10.10

y=−1		
x	**y**	**(x,y)**
	−1	(0,−1)
	−1	(3,−1)
−3	−1	(−3,−1)

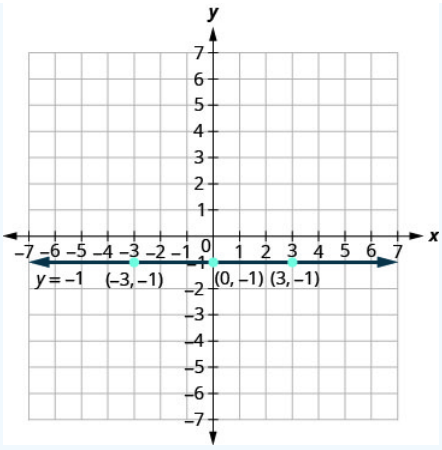

Figure 8.10.11

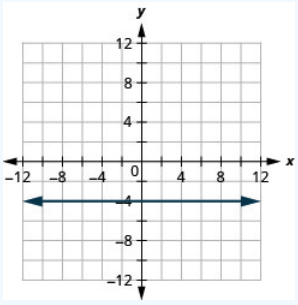
Try It 8.10.23

Graph the equation y=−4.

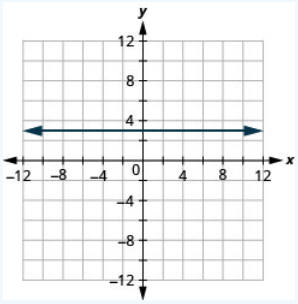
Answer



Try It 8.10.24

Graph the equation y=3.

Answer



The equations for vertical and horizontal lines look very similar to equations like y=4x. What is the difference between the equations y=4x and y=4?

The equation y=4x has both x and y. The value of y depends on the value of x. The *y*-coordinate changes according to the value of x. The equation y=4 has only one variable. The value of y is constant. The *y*-coordinate is always 4. It does not depend on the value of x. See Table 8.10.11.

Table 8.10.11

y=4x				y=4		
x	**y**	**(x,y)**		**x**	**y**	**(x,y)**
0	0	(0,0)		0	4	(0,4)
1	4	(1,4)		1	4	(1,4)
2	8	(2,8)		2	4	(2,4)

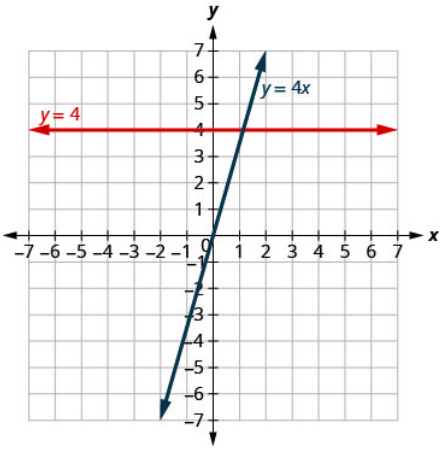


Figure 8.10.12

Notice, in Figure 8.10.12 the equation y=4x gives a slanted line, while y=4 gives a horizontal line.

Example 8.10.25

Graph y=−3x and y=−3 in the same rectangular coordinate system.

Solution

Notice that the first equation has the variable x, while the second does not. See Table 8.10.12 The two graphs are shown in Figure 8.10.13

Table 8.10.12

y=−3x				y=−3		
x	**y**	**(x,y)**		**x**	**y**	**(x,y)**
		(0,0)			−3	(0,−3)
	−3	(1,−3)			−3	(1,−3)
	−6	(2,−6)			−3	(2,−3)

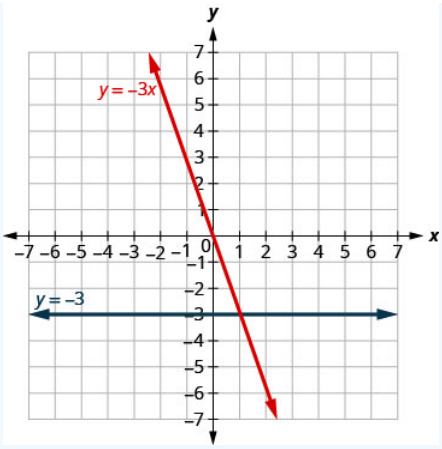

Figure 8.10.13

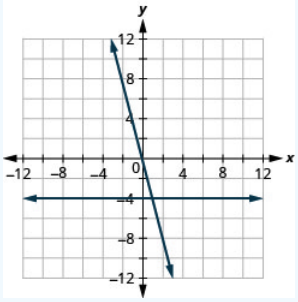
Try It 8.10.26

Graph y=−4x and y=−4 in the same rectangular coordinate system.

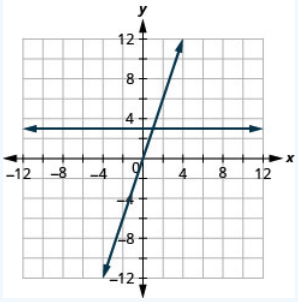
Answer



Try It 8.10.27

Graph y=3 and y=3x in the same rectangular coordinate system.

Answer



Key Concepts

- **Graph a Linear Equation by Plotting Points**
  1. Find three points whose coordinates are solutions to the equation. Organize them in a table.
  2. Plot the points in a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work!
  3. Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line.

Glossary

graph of a linear equation

The graph of a linear equation Ax+By=C is a straight line. Every point on the line is a solution of the equation. Every solution of this equation is a point on this line.

horizontal line

A horizontal line is the graph of an equation of the form y=b. The line passes through the *y*-axis at (0,b).

vertical line

A vertical line is the graph of an equation of the form x=a. The line passes through the *x*-axis at (a,0).

8.10E: Exercises

Practice Makes Perfect

Recognize the Relationship Between the Solutions of an Equation and its Graph

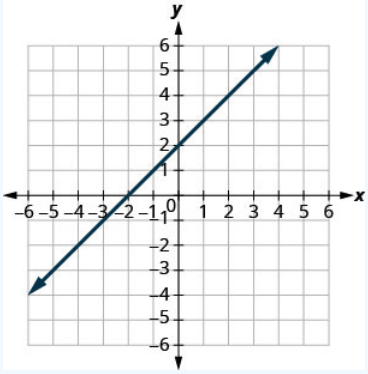
In the following exercises, for each ordered pair, decide:

1. Is the ordered pair a solution to the equation?
2. Is the point on the line?

Exercise 8.10.1

$y=x+2$

1. (0,2)
2. (1,2)
3. $(-1,1)$
4. $(-3,-1)$



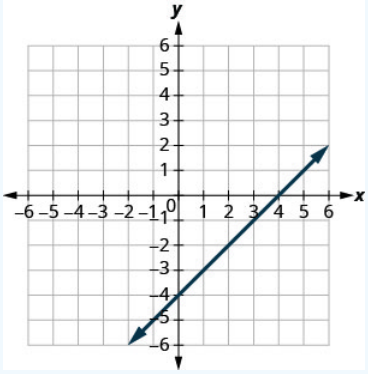
Answer

1. yes; no
2. no; no
3. yes; yes
4. yes; yes

Exercise 8.10.2

$y=x-4$

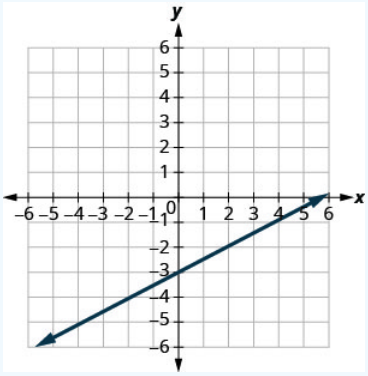
1. $(0,-4)$
2. $(3,-1)$
3. (2,2)
4. $(1,-5)$



Exercise 8.10.3

$y = \frac{1}{2}x - 3$

1. (0,−3)
2. (2,−2)
3. (−2,−4)
4. (4,1)



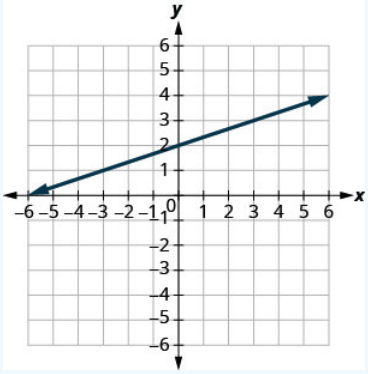
Answer

1. yes; yes
2. yes; yes
3. yes; yes
4. no; no

Exercise 8.10.4

$y = \frac{1}{3}x + 2$

1. (0,2)
2. (3,3)
3. (−3,2)
4. (−6,0)



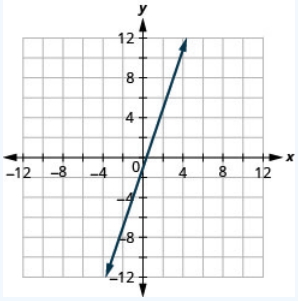
Graph a Linear Equation by Plotting Points

In the following exercises, graph by plotting points.

Exercise 8.10.5

$y = 3x - 1$

Answer



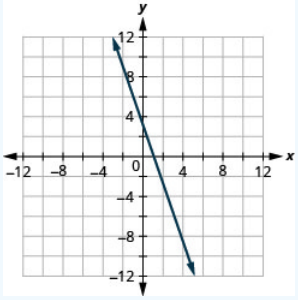
Exercise 8.10.6

$y = 2x + 3$

Exercise 8.10.7

$y = -2x + 2$

Answer



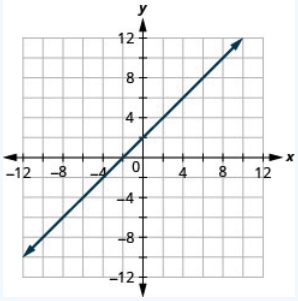
Exercise 8.10.8

$y = -3x + 1$

Exercise 8.10.9

$y = x + 2$

Answer



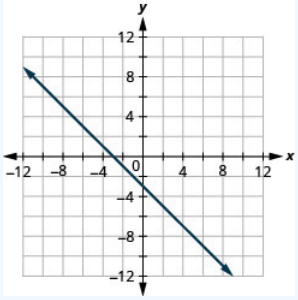
Exercise 8.10.10

$y = x - 3$

Exercise 8.10.11

$y = -x - 3$

Answer



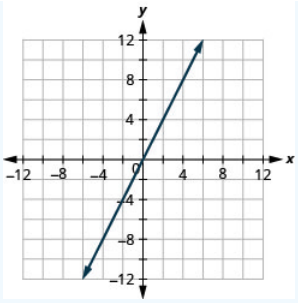
Exercise 8.10.12

$y = -x - 2$

Exercise 8.10.13

$y = 2x$

Answer



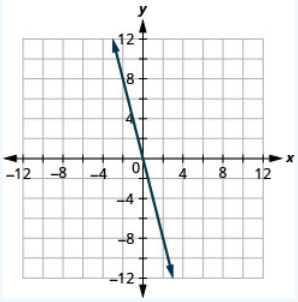
Exercise 8.10.14

$y = 3x$

Exercise 8.10.15

$y = -4x$

Answer



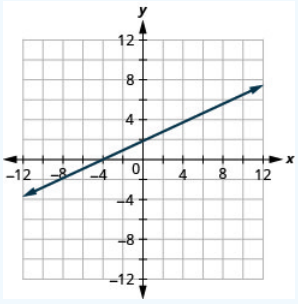
Exercise 8.10.16

$y = -2x$

Exercise 8.10.17

$y = \frac{1}{2}x + 2$

Answer



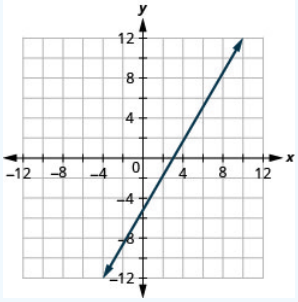
Exercise 8.10.18

$y = \frac{1}{3}x - 1$

Exercise 8.10.19

$y = \frac{4}{3}x - 5$

Answer



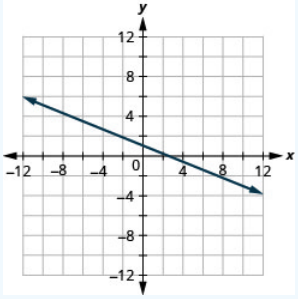
Exercise 8.10.20

$y = \frac{3}{2}x - 3$

Exercise 8.10.21

$y = -\frac{2}{5}x + 1$

Answer



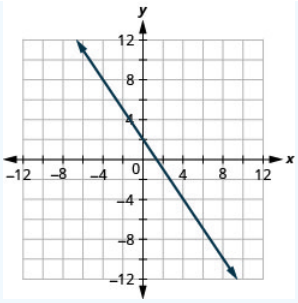
Exercise 8.10.22

$y = -\frac{4}{5}x - 1$

Exercise 8.10.23

$y = -\frac{3}{2}x + 2$

Answer



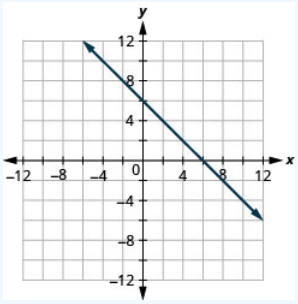
Exercise 8.10.24

$y = -\frac{5}{3}x + 4$

Exercise 8.10.25

$x + y = 6$

Answer



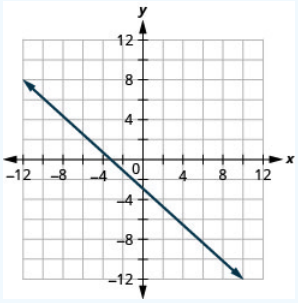
Exercise 8.10.26

$x + y = 4$

Exercise 8.10.27

$x + y = -3$

Answer



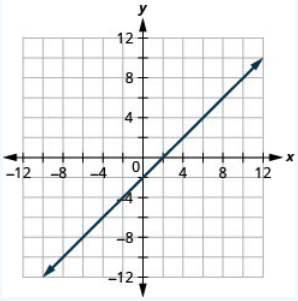
Exercise 8.10.28

$x + y = -2$

Exercise 8.10.29

$x - y = 2$

Answer



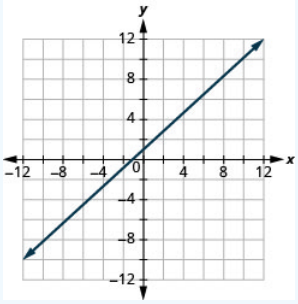
Exercise 8.10.30

$x - y = 1$

Exercise 8.10.31

$x - y = -1$

Answer



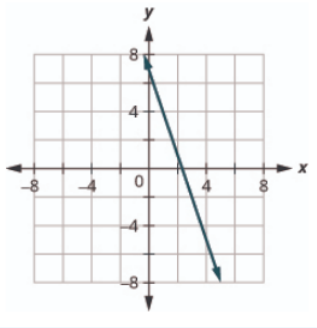
Exercise 8.10.32

$x - y = -3$

Exercise 8.10.33

$3x + y = 7$

Answer



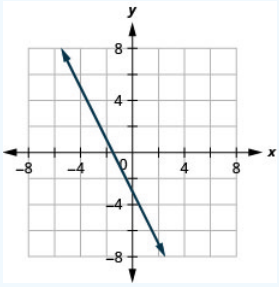
Exercise 8.10.34

$5x + y = 6$

Exercise 8.10.35

2x+y=−3

Answer



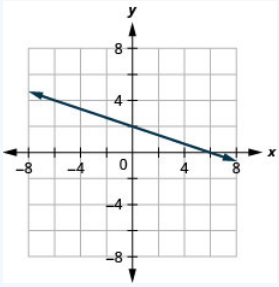
Exercise 8.10.36

$4x + y = -5$

Exercise 8.10.37

$\frac{1}{3}x + y = 2$

Answer



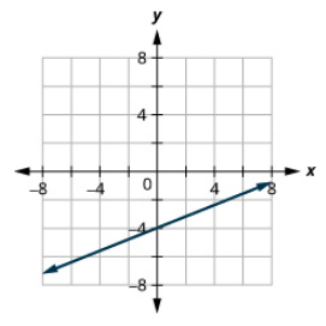
Exercise 8.10.38

$\frac{1}{2}x + y = 3$

Exercise 8.10.39

$\frac{2}{5}x - y = 4$

Answer



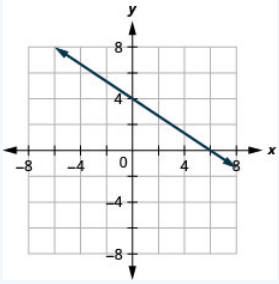
Exercise 8.10.40

$\frac{3}{4}x - y = 6$

Exercise 8.10.41

$2x + 3y = 12$

Answer



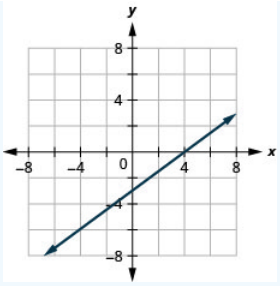
Exercise 8.10.42

4x+2y=12

Exercise 8.10.43

3x−4y=12

Answer



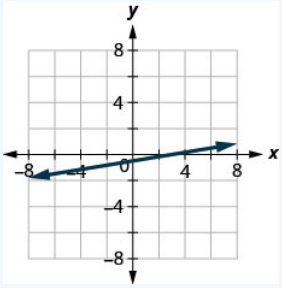
Exercise 8.10.44

$2x-5y=10$

Exercise 8.10.45

$x-6y=3$

Answer



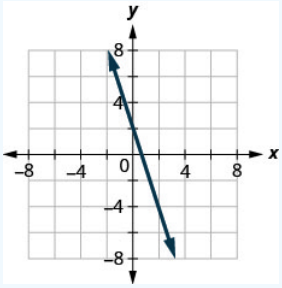
Exercise 8.10.46

$x-4y=2$

Exercise 8.10.47

$5x+2y=4$

Answer



Exercise 8.10.48

$3x+5y=5$

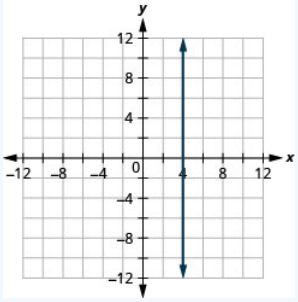
Graph Vertical and Horizontal Lines

In the following exercises, graph each equation.

Exercise 8.10.49

x=4

Answer



Exercise 8.10.50

x=3

Exercise 8.10.51

x=−2

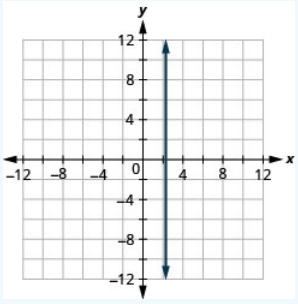
$x = \frac{7}{3}$

Answer



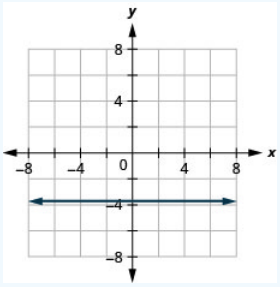
Exercise 8.10.58

$x = \frac{5}{4}$

Exercise 8.10.59

$y = -\frac{15}{4}$

Answer



Exercise 8.10.60

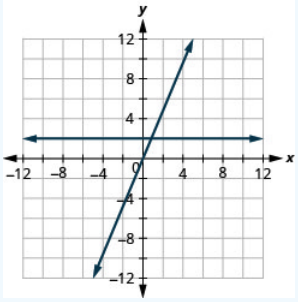
$y = -\frac{5}{3}$

In the following exercises, graph each pair of equations in the same rectangular coordinate system.

Exercise 8.10.61

y=2x and y=2

Answer



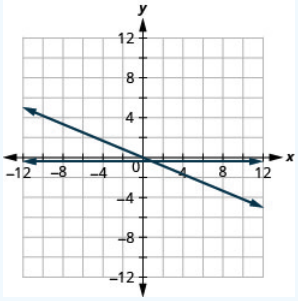
Exercise 8.10.62

y=5x and y=5

Exercise 8.10.63

$y = -\frac{1}{2}x$ and $y = -\frac{1}{2}$

Answer



Exercise 8.10.64

$y = -\frac{1}{3}x$ and $y = -\frac{1}{3}$

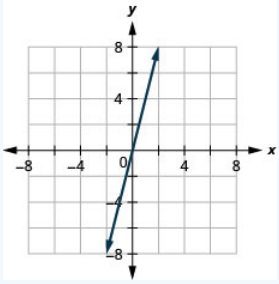
Mixed Practice

In the following exercises, graph each equation.

Exercise 8.10.65

y=4x

Answer



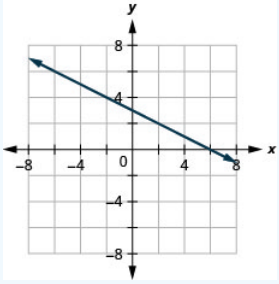
Exercise 8.10.66

y=2x

Exercise 8.10.67

$y = -\frac{1}{2}x + 3$

Answer



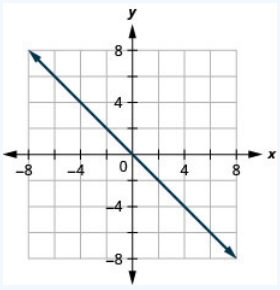
Exercise 8.10.68

$y = \frac{1}{4}x - 2$

Exercise 8.10.69

y=−x

Answer



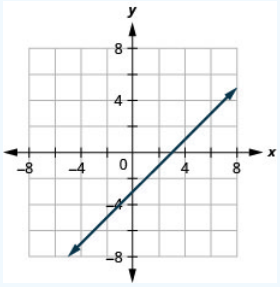
Exercise 8.10.70

y=x

Exercise 8.10.71

x−y=3

Answer



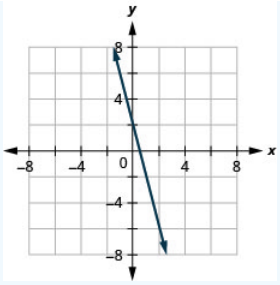
Exercise 8.10.72

x+y=−5

Exercise 8.10.73

4x+y=2

Answer



Exercise 8.10.74

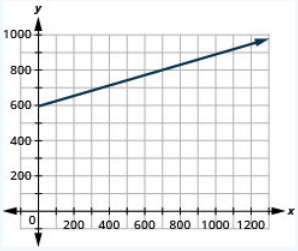
Everyday Math

Exercise 8.10.81

Motor home cost. The Robinsons rented a motor home for one week to go on vacation. It cost them $594 plus $0.32 per mile to rent the motor home, so the linear equation y=594+0.32x gives the cost, yy, for driving xx miles. Calculate the rental cost for driving 400, 800, and 1200 miles, and then graph the line.

Answer

$722, $850, $978



Exercise 8.10.82

Weekly earnings. At the art gallery where he works, Salvador gets paid $200 per week plus 15% of the sales he makes, so the equation y=200+0.15x gives the amount, yy, he earns for selling x dollars of artwork. Calculate the amount Salvador earns for selling $900, $1600, and $2000, and then graph the line.

Writing Exercises

Exercise 8.10.83

Explain how you would choose three x - values to make a table to graph the line $y = \frac{1}{5}x - 2$

Answer

Answers will vary.

Exercise 8.10.84

What is the difference between the equations of a vertical and a horizontal line?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
recognize the relation between the solutions of an equation and its graph.			
graph a linear equation by plotting points.			
graph vertical and horizontal lines.			

ⓑ After reviewing this checklist, what will you do to become confident for all goals?

8.11: Graphing with Intercepts (Part 2)

Choose the Most Convenient Method to Graph a Line

While we could graph any linear equation by plotting points, it may not always be the most convenient method. This table shows six of equations we've graphed in this chapter, and the methods we used to graph them.

	Equation	Method
#1	$y = 2x + 1$	Plotting points
#2	$y = \frac{1}{2}x + 3$	Plotting points
#3	$x = -7$	Vertical line
#4	$y = 4$	Horizontal line
#5	$2x + y = 6$	Intercepts
#6	$4x - 3y = 12$	Intercepts

What is it about the form of equation that can help us choose the most convenient method to graph its line?

Notice that in equations #1 and #2, y is isolated on one side of the equation, and its coefficient is 1. We found points by substituting values for x on the right side of the equation and then simplifying to get the corresponding y- values.

Equations #3 and #4 each have just one variable. Remember, in this kind of equation the value of that one variable is constant; it does not depend on the value of the other variable. Equations of this form have graphs that are vertical or horizontal lines.

In equations #5 and #6, both x and y are on the same side of the equation. These two equations are of the form $Ax + By = C$. We substituted $y = 0$ and $x = 0$ to find the x- and y- intercepts, and then found a third point by choosing a value for x or y.

This leads to the following strategy for choosing the most convenient method to graph a line.

HOW TO: CHOOSE THE MOST CONVENIENT METHOD TO GRAPH A LINE

Step 1. If the equation has only one variable. It is a vertical or horizontal line.

- $x = a$ is a vertical line passing through the x-axis at a.
- $y = b$ is a horizontal line passing through the y-axis at b.

Step 2. If y is isolated on one side of the equation. Graph by plotting points.

- Choose any three values for x and then solve for the corresponding y- values.

Step 3. If the equation is of the form $Ax + By = C$, find the intercepts.

- Find the x- and y- intercepts and then a third point.

Example 8.11.7:

Identify the most convenient method to graph each line: (a) $y = -3$ (b) $4x-6y = 12$ (c) $x = 2$ (d) $y = 2\ 5\ x-1$

Solution

(a) $y = -3$

This equation has only one variable, y. Its graph is a horizontal line crossing the y-axis at -3.

(b) $4x-6y = 12$

This equation is of the form $Ax + By = C$. Find the intercepts and one more point.

(c) $x = 2$

There is only one variable, x. The graph is a vertical line crossing the x-axis at 2.

(d) $y = \frac{2}{5}x - 1$

Since y is isolated on the left side of the equation, it will be easiest to graph this line by plotting three points.

Exercise 8.11.7A:

Identify the most convenient method to graph each line: (a) $3x + 2y = 12$ (b) $y = 4$ (c) $y = \frac{1}{5}x - 4$ (d) $x = -7$

Answer a

intercepts

Answer b

horizontal line

Answer c

plotting points

Answer d

vertical line

Exercise 8.11.7B:

Identify the most convenient method to graph each line: (a) $x = 6$ (b) $y = -\frac{3}{4}x + 1$ (c) $y = -8$ (d) $4x - 3y = -1$

Answer a

vertical line

Answer b

plotting points

Answer c

horizontal line

Answer d

intercepts

8.12: Graph with Intercepts

Learning Objectives

By the end of this section, you will be able to:

- Identify the x- and y- intercepts on a graph
- Find the x- and y- intercepts from an equation of a line
- Graph a line using the intercepts

Note

Before you get started, take this readiness quiz.

1. Solve: $3 \cdot 0 + 4y = -2$.
   If you missed this problem, review Exercise 2.2.13.

Identify the *x*- and *y*- Intercepts on a Graph

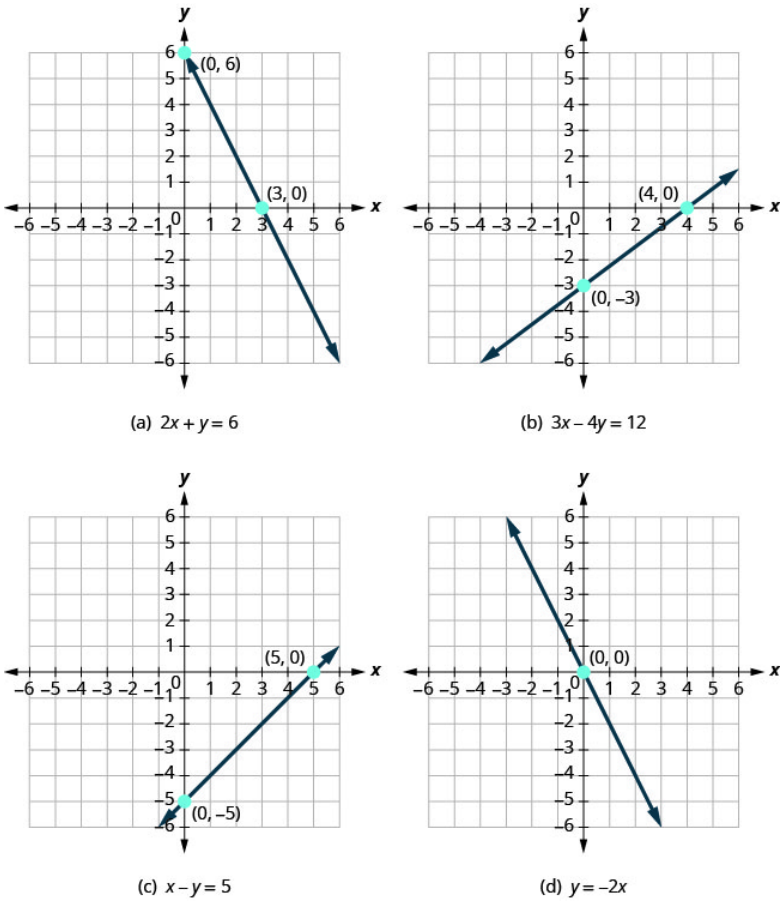
Every linear equation can be represented by a unique line that shows all the solutions of the equation. We have seen that when graphing a line by plotting points, you can use any three solutions to graph. This means that two people graphing the line might use different sets of three points.

At first glance, their two lines might not appear to be the same, since they would have different points labeled. But if all the work was done correctly, the lines should be exactly the same. One way to recognize that they are indeed the same line is to look at where the line crosses the *x*- axis and the *y*- axis. These points are called the *intercepts* of the line.

INTERCEPTS OF A LINE

The points where a line crosses the *x*- axis and the *y*- axis are called the **intercepts of a line**.

Let's look at the graphs of the lines in Figure 8.12.1.



(a) $2x + y = 6$ (b) $3x - 4y = 12$

(c) $x - y = 5$ (d) $y = -2x$

Figure 8.12.1: Examples of graphs crossing the x-negative axis.

First, notice where each of these lines crosses the x axis. See Figure 8.12.1.

Table 8.12.1

Figure	The line crosses the x-axis at:	Ordered pair of this point
Figure (a)	3	(3,0)
Figure (b)	4	(4,0)
Figure (c)	5	(5,0)
Figure (d)	0	(0,0)

Do you see a pattern?

For each row, the *y*- coordinate of the point where the line crosses the *x*- axis is zero. The point where the line crosses the *x*- axis has the form (a,0) and is called the ***x*- intercept of a line**. The *x*- intercept occurs when y is zero. Now, let's look at the points where these lines cross the *y*- axis. See Table 8.12.2

Table 8.12.2

Figure	The line crosses the x-axis at:	Ordered pair of this point
Figure (a)	6	(0,6)
Figure (b)	−3	(0,−3)
Figure (c)	−5	(0,5)
Figure (d)	0	(0,0)

What is the pattern here?

In each row, the *x*- coordinate of the point where the line crosses the *y*- axis is zero. The point where the line crosses the *y*- axis has the form (0,b) and is called the *y*- *intercept* of the line. The *y*- intercept occurs when x is zero.

X- INTERCEPT AND Y- INTERCEPT OF A LINE

The *x*- intercept is the point (a,0) where the line crosses the *x*- axis.

The *y*- intercept is the point (0,b) where the line crosses the *y*- axis.

	x	*y*
• The *x*-intercept occurs when *y* is zero.	*a*	0
• The *y*-intercept occurs when *x* is zero.	0	*b*

Figure 8.12.2

Example 8.12.1

Find the *x*- and *y*- intercepts on each graph.

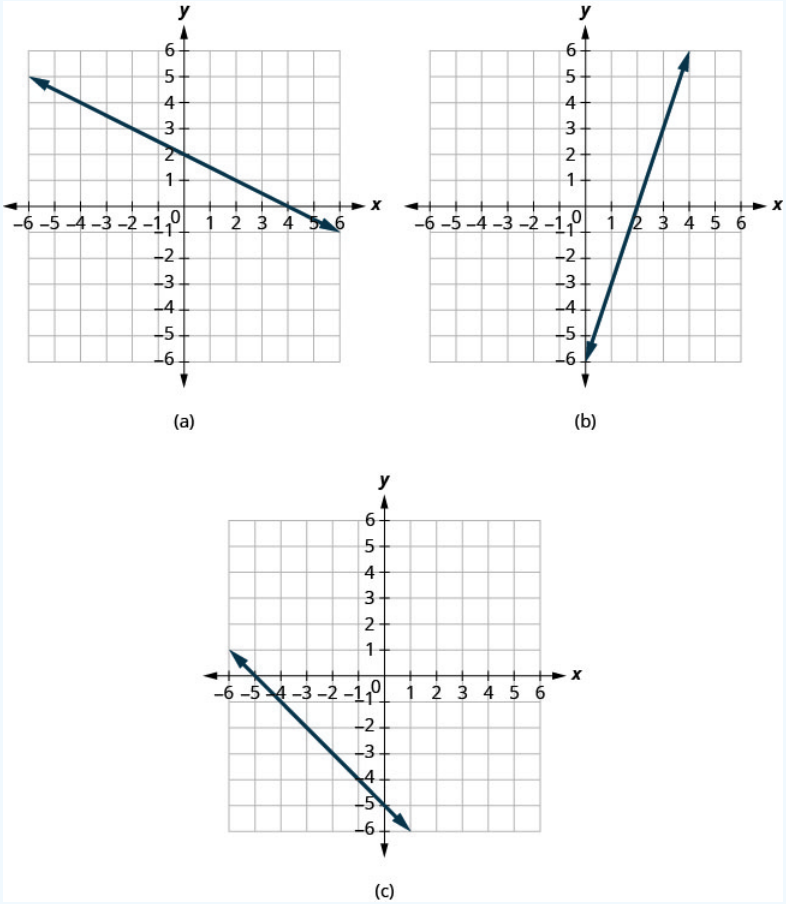


Figure 8.12.3

Solution

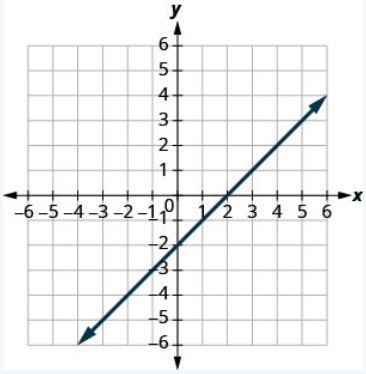
(a) The graph crosses the *x*- axis at the point (4,0). The *x*- intercept is (4,0).
The graph crosses the *y*- axis at the point (0,2). The *y*- intercept is (0,2).

(b) The graph crosses the x- axis at the point (2,0). The x- intercept is (2,0)
The graph crosses the y- axis at the point (0,−6). The y- intercept is (0,−6).

(c) The graph crosses the x- axis at the point (−5,0). The x- intercept is (−5,0).
The graph crosses the y- axis at the point (0,−5). The y- intercept is (0,−5).

Try It 8.12.2

Find the x- and y- intercepts on the graph.

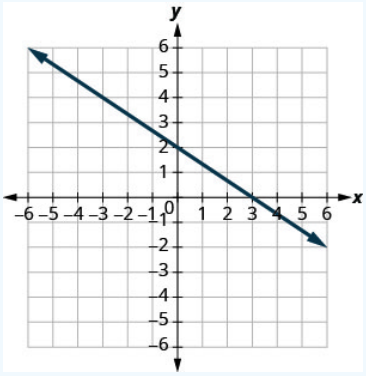


Answer

x- intercept: (2,0); y- intercept: (0,−2)

Try It 8.12.3

Find the x- and y- intercepts on the graph.



Answer

x- intercept: (3,0), y- intercept: (0,2)

Find the x- and y- Intercepts from an Equation of a Line

Recognizing that the ***x*- intercept** occurs when y is zero and that the y- intercept occurs when x is zero, gives us a method to find the intercepts of a line from its equation. To find the x- intercept, let y=0 and solve for x. To find the ***y*- intercept**, let x=0 and solve for y.

X- AND Y- INTERCEPTS FROM THE EQUATION OF A LINE

Use the equation of the line. To find:

- the *x*- intercept of the line, let y=0 and solve for x.
- the *y*- intercept of the line, let x=0 and solve for y.

Example 8.12.4

Find the intercepts of 2x+y=6.

Solution

We will let y=0 to find the *x*- intercept, and let x=0 to find the *y*- intercept. We will fill in the table, which reminds us of what we need to find.

$2x+y=6$	
x	y
	0
0	

x-intercept

y-intercept

To find the *x*- intercept, let y=0.

Table 8.12.3

	$2x+y=6$
Let $y = 0$.	$2x+0=6$
Simplify.	$2x=6$
	$x=3$
The *x*-intercept is	(3, 0)
To find the *y*-intercept, let $x = 0$.	
	$2x+y=6$
Let $x = 0$.	$2\cdot 0+y=6$
Simplify.	$0+y=6$
	$y=6$
The *y*-intercept is	(0, 6)

The intercepts are the points (3,0) and (0,6) as shown in Table 8.12.4

Table 8.12.4

2x+y=6	
x	**y**
3	0
0	6

Try It 8.12.5

Find the intercepts of 3x+y=12.

Answer

x- intercept: (4,0), *y*- intercept: (0,12)

Try It 8.12.6

Find the intercepts of x+4y=8.

Answer

x- intercept: (8,0), *y*- intercept: (0,2)

Example 8.12.7

Find the intercepts of 4x–3y=12.

Solution

To find the *x*-intercept, let $y = 0$.	
	$4x - 3y = 12$
Let $y = 0$.	$4x - 3 \cdot 0 = 12$
Simplify.	$4x - 0 = 12$
	$4x = 12$
	$x = 3$
The *x*-intercept is	(3, 0)
To find the *y*-intercept, let $x = 0$.	
	$4x - 3y = 12$
Let $x = 0$.	$4 \cdot 0 - 3y = 12$
Simplify.	$0 - 3y = 12$
	$-3y = 12$
	$y = -4$
The *y*-intercept is	(0, −4)

Table 8.12.5

The intercepts are the points (3, 0) and (0, −4) as shown in the following table.

Table 8.12.6

4x−3y=12	
x	**y**
3	0
0	−4

Find the intercepts of 3x–4y=12.

Answer

x- intercept: (4,0), *y*- intercept: (0,−3)

Try It 8.12.9

Find the intercepts of 2x–4y=8.

Answer

x- intercept: (4,0), *y*- intercept: (0,−2)

Graph a Line Using the Intercepts

To graph a linear equation by plotting points, you need to find three points whose coordinates are solutions to the equation. You can use the *x*- and *y*- intercepts as two of your three points. Find the intercepts, and then find a third point to ensure accuracy. Make sure the points line up—then draw the line. This method is often the quickest way to graph a line.

Example 8.12.10: How to Graph a Line Using Intercepts

Graph –x+2y=6 using the intercepts.

Solution

Step 1. Find the *x*- and *y*-intercepts of the line. Let $y = 0$ and solve for x. Let $x = 0$ and solve for y.	Find the *x*-intercept.	Let $y = 0$ $-x + 2y = 6$ $-x + 2(0) = 6$ $-x = 6$ $x = -6$ The *x*-intercept is (–6, 0).
	Find the *y*-intercept.	Let $x = 0$ $-x + 2y = 6$ $-0 + 2y = 6$ $2y = 6$ $y = 3$ The *y*-intercept is (0, 3).
Step 2. Find another solution to the equation.	We'll use $x = 2$.	Let $x = 2$ $-x + 2y = 6$ $-2 + 2y = 6$ $2y = 8$ $y = 4$ A third point is (2, 4).

Step 3. Plot the three points. Check that the points line up.	x | y | (x, y) -6 | 0 | $(-6, 0)$ 0 | 3 | $(0, 3)$ 2 | 4 | $(2, 4)$	Step 4. Draw the line.	See the graph.	
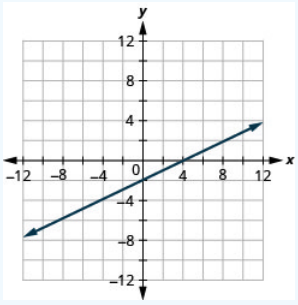
Try It 8.12.11

Graph x–2y=4 using the intercepts.

Answer

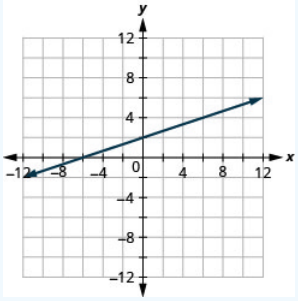


Try It 8.12.12

Graph –x+3y=6 using the intercepts.

Answer

https://math.libretexts.org/@go/page/46281



The steps to graph a linear equation using the intercepts are summarized below.

GRAPH A LINEAR EQUATION USING THE INTERCEPTS.

1. Find the *x*- and *y*- intercepts of the line.
   - Let y=0 and solve for x
   - Let x=0 and solve for y.
2. Find a third solution to the equation.
3. Plot the three points and check that they line up.
4. Draw the line.

Example 8.12.13

Graph 4x–3y=12 using the intercepts.

Solution

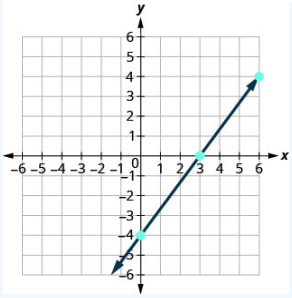
Find the intercepts and a third point.

x-intercept, let $y = 0$	*y*-intercept, let $x = 0$	third point, let $y = 4$
$4x - 3y = 12$	$4x - 3y = 12$	$4x - 3y = 12$
$4x - 3(0) = 12$	$4(0) - 3y = 12$	$4x - 3(4) = 12$
$4x = 12$	$-3y = 12$	$4x - 12 = 12$
$x = 3$	$y = -4$	$4x = 24$
		$x = 6$

We list the points in Table 8.12.7and show the graph below.

4x−3y=12		
x	**y**	**(x,y)**
3	0	(3,0)
0	−4	(0,−4)
6	4	(6,4)

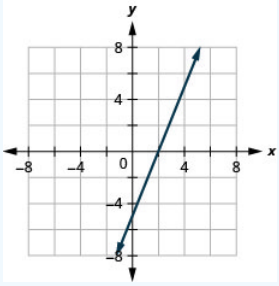
Table 8.12.7



Try It 8.12.14

Graph 5x–2y=10 using the intercepts.

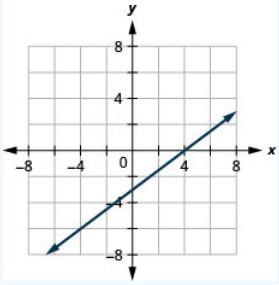
Answer



Try It 8.12.15

Graph 3x–4y=12 using the intercepts.

Answer



Example 8.12.16

Graph y=5x using the intercepts.

Solution

x-intercept	*y*-intercept
Let $y = 0$.	Let $x = 0$.
$y = 5x$	$y = 5x$
$0 = 5x$	$y = 5 \cdot 0$
$0 = x$	$y = 0$
(0, 0)	(0, 0)

This line has only one intercept. It is the point (0,0).

To ensure accuracy we need to plot three points. Since the x- and y- intercepts are the same point, we need *two* more points to graph the line.

Let $x = 1$.
$y = 5x$
$y = 5 \cdot 1$
$y = 5$

Let $x = -1$.
$y = 5x$
$y = 5(-1)$
$y = -5$

See Table 8.12.8

y=5x		
x	**y**	**(x,y)**
0	0	(0,0)
1	5	(1,5)
−1	−5	(−1,−5)

Table 8.12.8

Plot the three points, check that they line up, and draw the line.

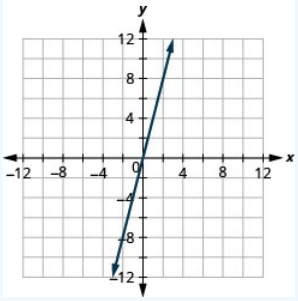
Graph y=4x using the intercepts.

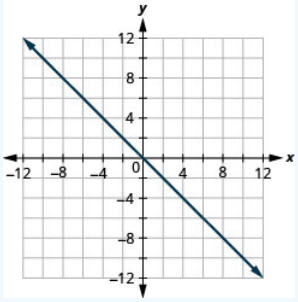
Answer



Try It 8.12.18

Graph y=−x the intercepts.

Answer



Key Concepts

- **Find the *x*- and *y*- Intercepts from the Equation of a Line**
  - Use the equation of the line to find the *x*- intercept of the line, let y=0 and solve for *x*.
  - Use the equation of the line to find the *y*- intercept of the line, let x=0 and solve for *y*.
- **Graph a Linear Equation using the Intercepts**
  1. Find the *x*- and *y*- intercepts of the line.
     Let y=0 and solve for *x*.
     Let x=0 and solve for *y*.
  2. Find a third solution to the equation.
  3. Plot the three points and then check that they line up.
  4. Draw the line.
- **Strategy for Choosing the Most Convenient Method to Graph a Line:**
  - Consider the form of the equation.
  - If it only has one variable, it is a vertical or horizontal line.
    x=a is a vertical line passing through the *x*- axis at a
    y=b is a horizontal line passing through the *y*- axis at b.
  - If *y* is isolated on one side of the equation, graph by plotting points.
  - Choose any three values for *x* and then solve for the corresponding *y*- values.
  - If the equation is of the form ax+by=c, find the intercepts. Find the *x*- and *y*- intercepts and then a third point.

Glossary

intercepts of a line

The points where a line crosses the *x*- axis and the *y*- axis are called the intercepts of the line.

***x*- intercept**

The point (a,0) where the line crosses the *x*- axis; the *x*- intercept occurs when y is zero.

***y*-intercept**

The point (0,b) where the line crosses the *y*- axis; the *y*- intercept occurs when x is zero.

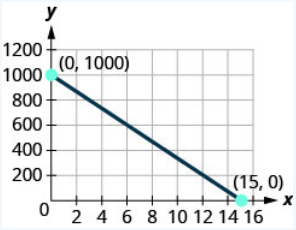
Everyday Math

Exercise 8.12E.67

Road trip. Damien is driving from Chicago to Denver, a distance of 1000 miles. The *x*- axis on the graph below shows the time in hours since Damien left Chicago. The *y*- axis represents the distance he has left to drive.



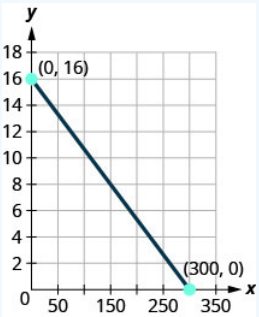
1. Find the *x*- and *y*- intercepts.
2. Explain what the *x*- and *y*- intercepts mean for Damien.

Answer

1. (0,1000),(15,0)
2. At (0,1000), he has been gone 0 hours and has 1000 miles left. At (15,0), he has been gone 15 hours and has 0 miles left to go.

Exercise 8.12E.68

Road trip. Ozzie filled up the gas tank of his truck and headed out on a road trip. The *x*- axis on the graph below shows the number of miles Ozzie drove since filling up. The *y*- axis represents the number of gallons of gas in the truck's gas tank.



1. Find the *x*- and *y*- intercepts.
2. Explain what the *x*- and *y*- intercepts mean for Ozzie.

Writing Exercises

Exercise 8.12E.69

How do you find the x -intercept of the graph of $3x - 2y = 6$?

Answer

Answers will vary.

Exercise 8.12E.70

Do you prefer to use the method of plotting points or the method using the intercepts to graph the equation 4x+y=−4? Why?

Exercise 8.12E.71

Do you prefer to use the method of plotting points or the method using the intercepts to graph the equation $y = \frac{2}{3}x - 2$? Why?

Answer

Answers will vary.

Exercise 8.12E.72

Do you prefer to use the method of plotting points or the method using the intercepts to graph the equation y=6? Why?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
identify the *x* and *y* intercepts on a graph.			
find the *x* and *y* intercepts from an equation of a line.			
graph a line using the intercepts.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

8.13: Understand Slope of a Line (Part 1)

Learning Objectives

- Use geoboards to model slope
- Find the slope of a line from its graph
- Find the slope of horizontal and vertical lines
- Use the slope formula to find the slope of a line between two points
- Graph a line given a point and the slope
- Solve slope applications

be prepared!

Before you get started, take this readiness quiz.

1. Simplify: $\frac{1-4}{8-2}$. If you missed this problem, review Example 4.6.12.
2. Divide: $\frac{0}{4}, \frac{4}{0}$. If you missed this problem, review Example 7.5.5.
3. Simplify: $\frac{15}{-3}, \frac{-15}{3}, \frac{-15}{-3}$. If you missed this problem, review Example 4.6.11.

As we've been graphing linear equations, we've seen that some lines slant up as they go from left to right and some lines slant down. Some lines are very steep and some lines are flatter. What determines whether a line slants up or down, and if its slant is steep or flat?

The steepness of the slant of a line is called the **slope of the line**. The concept of slope has many applications in the real world. The pitch of a roof and the grade of a highway or wheelchair ramp are just some examples in which you literally see slopes. And when you ride a bicycle, you feel the slope as you pump uphill or coast downhill.

Use Geoboards to Model Slope

In this section, we will explore the concepts of slope.

Using rubber bands on a geoboard gives a concrete way to model lines on a coordinate grid. By stretching a rubber band between two pegs on a geoboard, we can discover how to find the slope of a line. And when you ride a bicycle, you feel the slope as you pump uphill or coast downhill.

We'll start by stretching a rubber band between two pegs to make a line as shown in Figure 8.13.1.

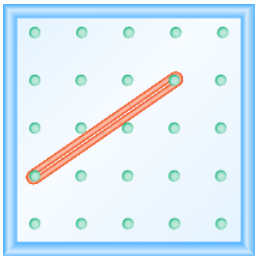

Figure 8.13.1

Does it look like a line?

Now we stretch one part of the rubber band straight up from the left peg and around a third peg to make the sides of a right triangle as shown in Figure 8.13.2. We carefully make a 90° angle around the third peg, so that one side is vertical and the other is horizontal.

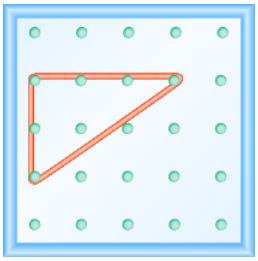

Figure 8.13.2

To find the slope of the line, we measure the distance along the vertical and horizontal legs of the triangle. The vertical distance is called the **rise** and the horizontal distance is called the **run**, as shown in Figure 8.13.3

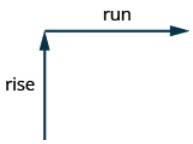

Figure 8.13.3

To help remember the terms, it may help to think of the images shown in Figure 8.13.4

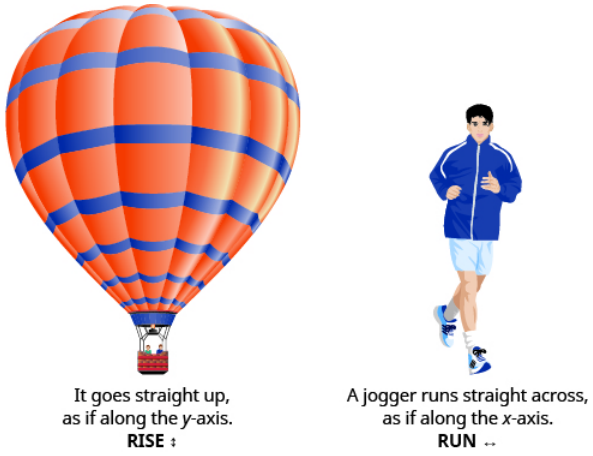

Figure 8.13.4

On our geoboard, the rise is 2 units because the rubber band goes up 2 spaces on the vertical leg. See Figure 8.13.5

What is the run? Be sure to count the spaces between the pegs rather than the pegs themselves! The rubber band goes across 3 spaces on the horizontal leg, so the run is 3 units.

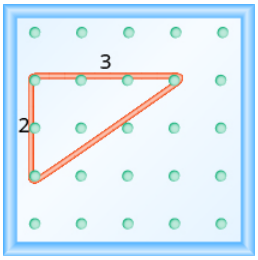

Figure 8.13.5

The slope of a line is the ratio of the rise to the run. So the slope of our line is $\frac{2}{3}$. In mathematics, the slope is always represented by the letter m.

Definition: Slope of a line

The slope of a line is m = $\frac{rise}{run}$.

The rise measures the vertical change and the run measures the horizontal change.

What is the slope of the line on the geoboard in Figure 8.13.5?

$$m = \frac{rise}{run}$$
$$m = \frac{2}{3}$$
$$The\ line\ has\ slope\ \frac{2}{3}.$$

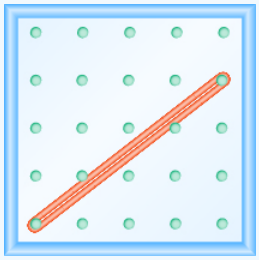
When we work with geoboards, it is a good idea to get in the habit of starting at a peg on the left and connecting to a peg to the right. Then we stretch the rubber band to form a right triangle.

If we start by going up the rise is positive, and if we stretch it down the rise is negative. We will count the run from left to right, just like you read this paragraph, so the run will be positive.

Since the slope formula has rise over run, it may be easier to always count out the rise first and then the run.

Example 8.13.1:

What is the slope of the line on the geoboard shown?

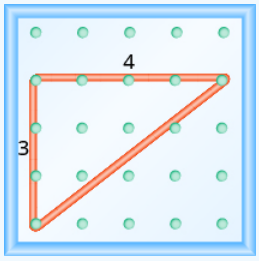


Solution

Use the definition of slope.

$$m = \frac{rise}{run} \tag{8.13.1}$$

Start at the left peg and make a right triangle by stretching the rubber band up and to the right to reach the second peg. Count the rise and the run as shown.



The rise is 3 units.

$$m = \frac{3}{run} \tag{8.13.2}$$

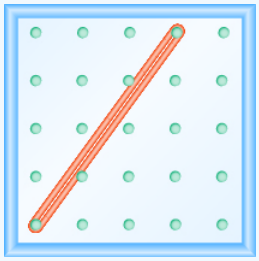
The run is 4 units.

$$m = \frac{3}{4} \tag{8.13.3}$$

The slope is $\frac{3}{4}$.

Exercise 8.13.1:

What is the slope of the line on the geoboard shown?

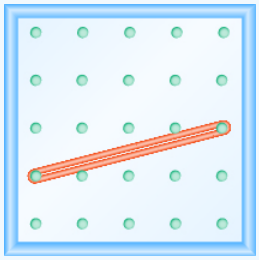


Answer

$\frac{4}{3}$

Exercise 8.13.2:

What is the slope of the line on the geoboard shown?

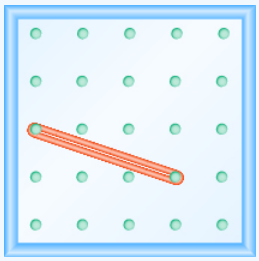


Answer

$\frac{1}{4}$

Example 8.13.2:

What is the slope of the line on the geoboard shown?

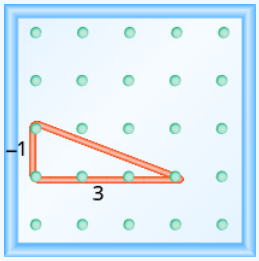


Solution

Use the definition of slope.

$$m = \frac{rise}{run} \tag{8.13.4}$$

Start at the left peg and make a right triangle by stretching the rubber band to the peg on the right. This time we need to stretch the rubber band down to make the vertical leg, so the rise is negative.



The rise is −1.

$$m = \frac{-1}{run} \tag{8.13.5}$$

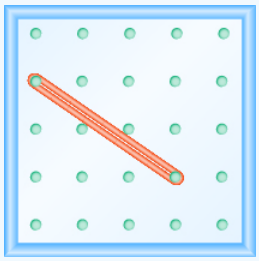
The run is 3.

$$m = \frac{-1}{3}$$
$$m = -\frac{1}{3}$$

The slope is $-\frac{1}{3}$.

? Exercise 8.13.3:

What is the slope of the line on the geoboard?

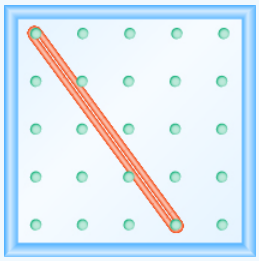


Answer

$-\frac{2}{3}$

? Exercise 8.13.4:

What is the slope of the line on the geoboard?



Answer

$-\frac{4}{3}$

Notice that in the first example, the slope is positive and in the second example the slope is negative. Do you notice any difference in the two lines shown in Figure 8.13.6

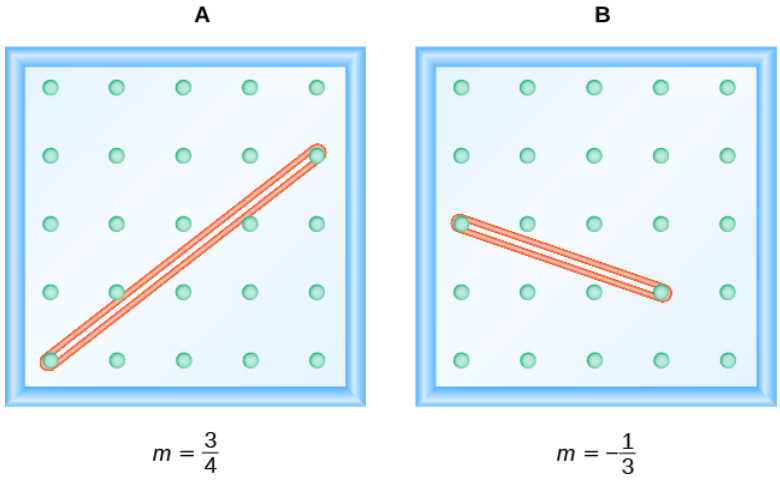


Figure 8.13.6

As you read from left to right, the line in Figure A, is going up; it has positive slope. The line Figure B is going down; it has negative slope.

Figure 8.13.7

Example 8.13.3:

Use a geoboard to model a line with slope $\frac{1}{2}$.

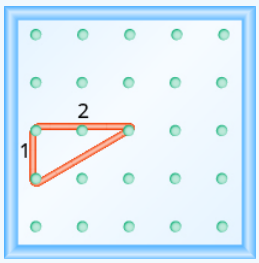
Solution

To model a line with a specific slope on a geoboard, we need to know the rise and the run.

Use the slope formula.	$m = \frac{rise}{run}$	(8.13.6)
Replace m with $\frac{1}{2}$.	$\frac{1}{2} = \frac{rise}{run}$	(8.13.7)

So, the rise is 1 unit and the run is 2 units.

Start at a peg in the lower left of the geoboard. Stretch the rubber band up 1 unit, and then right 2 units.

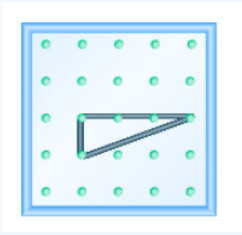


The hypotenuse of the right triangle formed by the rubber band represents a line with a slope of $\frac{1}{2}$.

Exercise 8.13.5:

Use a geoboard to model a line with the given slope: m = $\frac{1}{3}$.

Answer



Exercise 8.13.6:

Use a geoboard to model a line with the given slope: m = $\frac{3}{2}$.

Answer

Example 8.13.4:

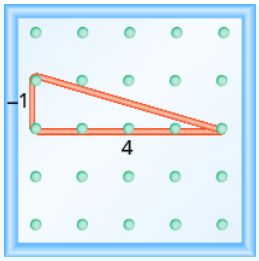
Use a geoboard to model a line with slope $\frac{-1}{4}$.

Solution

Use the slope formula.	$m = \frac{rise}{run}$	(8.13.8)
Replace m with $-\frac{1}{4}$.	$-\frac{1}{4} = \frac{rise}{run}$	(8.13.9)

So, the rise is −1 and the run is 4.

Since the rise is negative, we choose a starting peg on the upper left that will give us room to count down. We stretch the rubber band down 1 unit, then to the right 4 units.

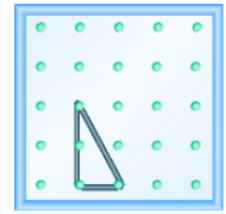


The hypotenuse of the right triangle formed by the rubber band represents a line whose slope is $-\frac{1}{4}$.

Exercise 8.13.7:

Use a geoboard to model a line with the given slope: m = $\frac{-3}{2}$.

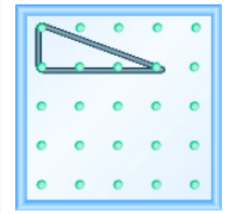
Answer



Exercise 8.13.8:

Use a geoboard to model a line with the given slope: m = $\frac{-1}{3}$.

Answer



Find the Slope of a Line from its Graph

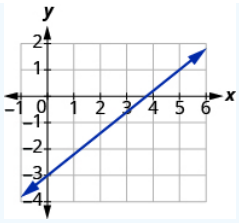
Now we'll look at some graphs on a coordinate grid to find their slopes. The method will be very similar to what we just modeled on our geoboards.

To find the slope, we must count out the rise and the run. But where do we start?

We locate any two points on the line. We try to choose points with coordinates that are integers to make our calculations easier. We then start with the point on the left and sketch a right triangle, so we can count the rise and run.

Example 8.13.5:

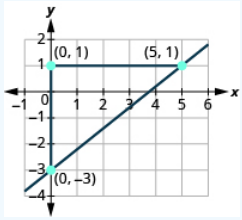
Find the slope of the line shown:



Solution

Locate two points on the graph, choosing points whose coordinates are integers. We will use (0, −3) and (5, 1).

Starting with the point on the left, (0, −3), sketch a right triangle, going from the first point to the second point, (5, 1).



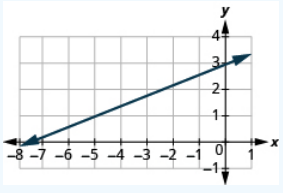
Count the rise on the vertical leg of the triangle.	The rise is 4 units.	
Count the run on the horizontal leg.	The run is 5 units.	
Use the slope formula.	$m = \frac{rise}{run}$	(8.13.10)
Substitute the values of the rise and run.	$m = \frac{4}{5}$	(8.13.11)

The slope of the line is $\frac{4}{5}$.

Notice that the slope is positive since the line slants upward from left to right.

? Exercise 8.13.9:

Find the slope of the line:

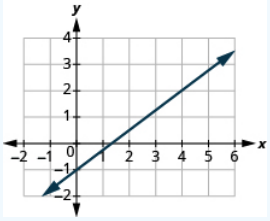


Answer

$\frac{2}{5}$

? Exercise 8.13.10:

Find the slope of the line:



Answer

$\frac{3}{4}$

HOW TO: FIND THE SLOPE FROM A GRAPH

Step 1. Locate two points on the line whose coordinates are integers.

Step 2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.

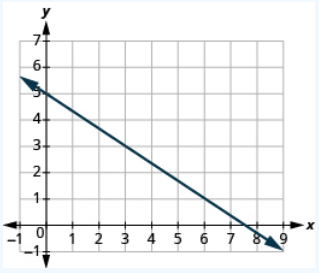
Step 3. Count the rise and the run on the legs of the triangle.

Step 4. Take the ratio of rise to run to find the slope.

$$m = \frac{rise}{run} \tag{8.13.12}$$

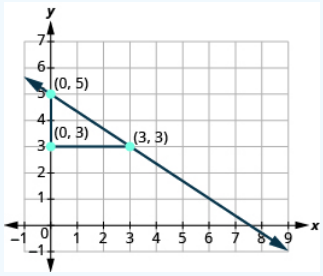
Example 8.13.6:

Find the slope of the line shown:



Solution

Locate two points on the graph. Look for points with coordinates that are integers. We can choose any points, but we will use (0, 5) and (3, 3). Starting with the point on the left, sketch a right triangle, going from the first point to the second point.



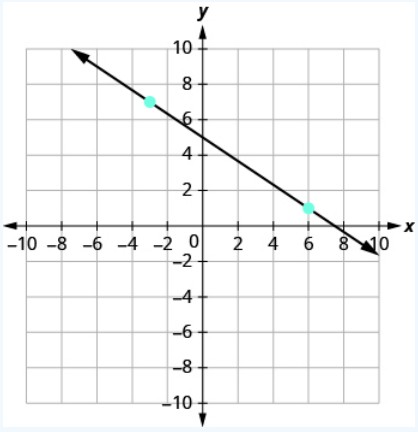
Count the rise – it is negative.	The rise is −2.
Count the run.	The run is 3.
Use the slope formula.	$m = \frac{rise}{run}$ (8.13.13)

Substitute the values of the rise and run.	$m = \frac{-2}{3}$	(8.13.14)
Simplify.	$m = -\frac{2}{3}$	(8.13.15)

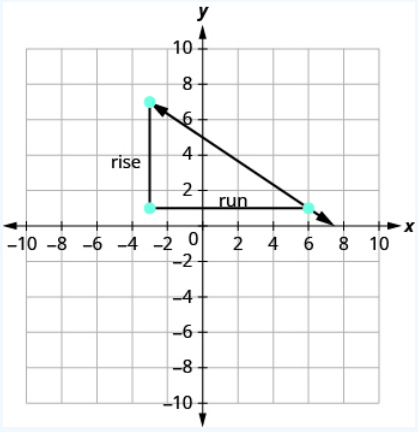
The slope of the line is $-\frac{2}{3}$.

Notice that the slope is negative since the line slants downward from left to right.

What if we had chosen different points? Let's find the slope of the line again, this time using different points. We will use the points (−3, 7) and (6, 1).



Starting at (−3, 7), sketch a right triangle to (6, 1).



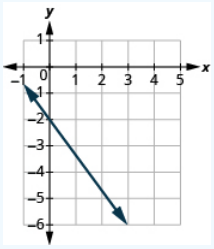
Count the rise.	The rise is −6.	
Count the run.	The run is 9.	
Use the slope formula.	$m = \frac{rise}{run}$	(8.13.16)
Substitute the values of the rise and run.	$m = \frac{-6}{9}$	(8.13.17)
Simplify the fraction.	$m = -\frac{2}{3}$	(8.13.18)

The slope of the line is $-\frac{2}{3}$.

It does not matter which points you use—the slope of the line is always the same. The slope of a line is constant!

Exercise 8.13.11:

Find the slope of the line:

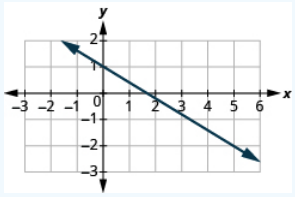


Answer

$-\frac{4}{3}$

Exercise 8.13.12:

Find the slope of the line:



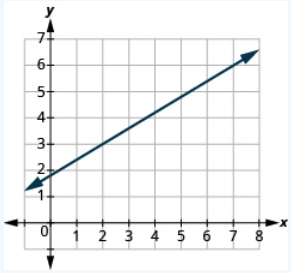
Answer

$-\frac{3}{5}$

The lines in the previous examples had y-intercepts with integer values, so it was convenient to use the y-intercept as one of the points we used to find the slope. In the next example, the y-intercept is a fraction. The calculations are easier if we use two points with integer coordinates.

Example 8.13.7:

Find the slope of the line shown:

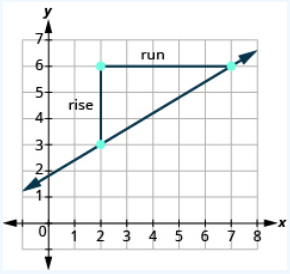


Solution

Locate two points on the graph whose coordinates are integers.	(2, 3) and (7, 6)

Which point is on the left?	(2, 3)

Starting at (2, 3), sketch a right angle to (7, 6) as shown below.

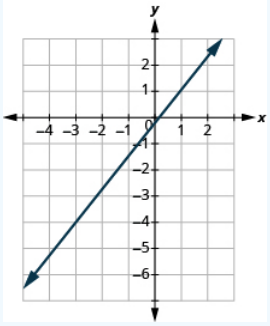


Count the rise.	The rise is 3.	
Count the run.	The run is 5.	
Use the slope formula.	$m = \frac{rise}{run}$	(8.13.19)
Substitute the values of the rise and run.	$m = \frac{3}{5}$	(8.13.20)

The slope of the line is $\frac{3}{5}$.

Exercise 8.13.13:

Find the slope of the line:

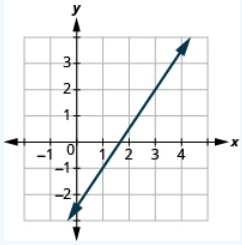


Answer

$\frac{5}{4}$

Exercise 8.13.14:

Find the slope of the line:



Answer

$\frac{3}{2}$

Find the Slope of Horizontal and Vertical Lines

Do you remember what was special about horizontal and vertical lines? Their equations had just one variable.

- horizontal line y = b; all the y -coordinates are the same.
- vertical line x = a; all the x -coordinates are the same.

So how do we find the slope of the horizontal line y = 4? One approach would be to graph the horizontal line, find two points on it, and count the rise and the run. Let's see what happens in Figure 8.13.8. We'll use the two points (0, 4) and (3, 4) to count the rise and run.

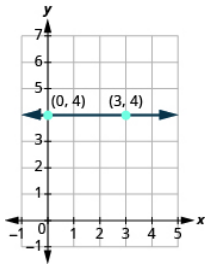


Figure 8.13.8

What is the rise?	The rise is 0.	
What is the run?	The run is 3.	
What is the slope?	$m = \frac{rise}{run}$	(11.4.21)
	$m = \frac{0}{3}$	(11.4.22)
	$m = 0$	(11.4.23)

The slope of the horizontal line y = 4 is 0.

All horizontal lines have slope 0. When the y-coordinates are the same, the rise is 0.

Definition: Slope of a Horizontal Line

The slope of a horizontal line, y = b, is 0.

Now we'll consider a vertical line, such as the line x = 3, shown in Figure 8.13.9. We'll use the two points (3, 0) and (3, 2) to count the rise and run.

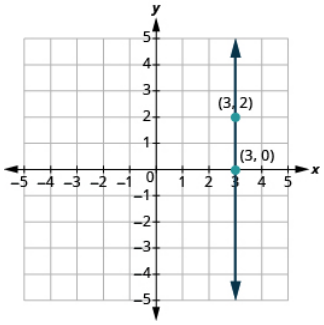

Figure 8.13.9

What is the rise?	The rise is 2.	
What is the run?	The run is 0.	
What is the slope?	$m = \frac{rise}{run}$	(11.4.24)
	$m = \frac{2}{0}$	(11.4.25)

But we can't divide by 0. Division by 0 is undefined. So we say that the slope of the vertical line x = 3 is undefined. The slope of all vertical lines is undefined, because the run is 0.

Definition: Slope of a Vertical Line

The slope of a vertical line, x = a, is undefined.

Example 8.13.8:

Find the slope of each line: (a) x = 8 (b) y = −5

Solution

(a) x = 8

This is a vertical line, so its slope is undefined.

(b) y = −5

This is a horizontal line, so its slope is 0.

Exercise 8.13.15:

Find the slope of the line: x = −4.

Answer

undefined

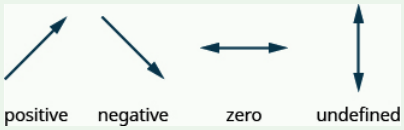
Exercise 8.13.16:

Find the slope of the line: y = 7.

Answer

0

Quick Guide to the Slopes of Lines



Use the Slope Formula to find the Slope of a Line between Two Points

Sometimes we need to find the slope of a line between two points and we might not have a graph to count out the rise and the run. We could plot the points on grid paper, then count out the rise and the run, but there is a way to find the slope without graphing.

Before we get to it, we need to introduce some new algebraic notation. We have seen that an ordered pair (x, y) gives the coordinates of a point. But when we work with slopes, we use two points. How can the same symbol (x, y) be used to represent two different points?

Mathematicians use subscripts to distinguish between the points. A subscript is a small number written to the right of, and a little lower than, a variable.

- (x_1, y_1) read x sub 1, y sub 1
- (x_2, y_2) read x sub 2, y sub 2

We will use (x_1, y_1) to identify the first point and (x_2, y_2) to identify the second point. If we had more than two points, we could use (x_3, y_3), (x_4, y_4), and so on.

To see how the rise and run relate to the coordinates of the two points, let's take another look at the slope of the line between the points (2, 3) and (7, 6) in Figure 8.13.10

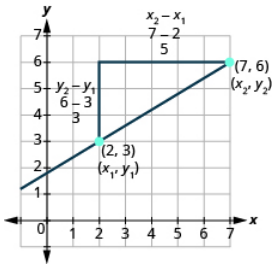


Figure 8.13.10

Since we have two points, we will use subscript notation.

$$\begin{array}{cc} x_1, y_1 & x_2, y_2 \\ (2, 3) & (7, 6) \end{array}$$

On the graph, we counted the rise of 3. The rise can also be found by subtracting the y-coordinates of the points.

$$\begin{array}{c} y_2 - y_1 \\ 6 - 3 \\ 3 \end{array}$$

We counted a run of 5. The run can also be found by subtracting the x-coordinates.

$$\begin{array}{c} x_2 - x_1 \\ 7 - 2 \\ 5 \end{array}$$

We know	$m = \frac{rise}{run}$	(11.4.26)

So	$m = \frac{3}{5}$	(11.4.27)
We rewrite the rise and run by putting in the coordinates.	$m = \frac{6-3}{7-2}$	(11.4.28)
But 6 is the y-coordinate of the second point, y_2 and 3 is the y-coordinate of the first point y_1. So we can rewrite the rise using subscript notation.	$m = \frac{y_2 - y_1}{7-2}$	(11.4.29)
Also 7 is the x-coordinate of the second point, x_2 and 2 is the x-coordinate of the first point x_2. So we rewrite the run using subscript notation.	$m = \frac{y_2 - y_1}{x_2 - x_1}$	(11.4.30)

We've shown that m = $\frac{y_2 - y_1}{x_2 - x_1}$ is really another version of m = $\frac{rise}{run}$. We can use this formula to find the slope of a line when we have two points on the line.

Definition: Slope Formula

The slope of the line between two points (x_1, y_1) and (x_2, y_2) is

$$m = \frac{y_2 - y_1}{x_2 - x_1} \tag{11.4.31}$$

Say the formula to yourself to help you remember it:

Slope is y of the second point minus y of the first point

over

x of the second point minus x of the first point.

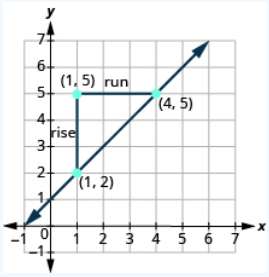
Example 8.13.9:

Find the slope of the line between the points (1, 2) and (4, 5).

Solution

We'll call (1, 2) point #1 and (4, 5) point #2.	$\begin{matrix} x_1, y_1 & x_2, y_2 \\ (1, 2) & (4, 5) \end{matrix}$	
Use the slope formula.	$m = \frac{y_2 - y_1}{x_2 - x_1}$	(11.4.32)
Substitute the values in the slope formula:		
y of the second point minus y of the first point	$m = \frac{5-2}{x_2 - x_1}$	(11.4.33)
x of the second point minus x of the first point	$m = \frac{5-2}{4-1}$	(11.4.34)
Simplify the numerator and the denominator.	$m = \frac{3}{3}$	(11.4.35)
	m = 1	

Let's confirm this by counting out the slope on the graph.



The rise is 3 and the run is 3, so

$$m = \frac{rise}{run}$$
$$m = \frac{3}{3}$$
$$m = 1$$

Exercise 8.13.17:

Find the slope of the line through the given points: (8, 5) and (6, 3).

Answer

1

Exercise 8.13.18:

Find the slope of the line through the given points: (1, 5) and (5, 9).

Answer

1

How do we know which point to call #1 and which to call #2? Let's find the slope again, this time switching the names of the points to see what happens. Since we will now be counting the run from right to left, it will be negative.

We'll call (4, 5) point #1 and (1, 2) point #2.	$\begin{matrix} x_1, y_1 & x_2, y_2 \\ (4, 5) & (1, 2) \end{matrix}$	
Use the slope formula.	$m = \frac{y_2 - y_1}{x_2 - x_1}$	(11.4.36)
Substitute the values in the slope formula:		
y of the second point minus y of the first point	$m = \frac{2 - 5}{x_2 - x_1}$	(11.4.37)
x of the second point minus x of the first point	$m = \frac{2 - 5}{1 - 4}$	(11.4.38)
Simplify the numerator and the denominator.	$m = \frac{-3}{-3}$	(11.4.39)
	m = 1	

The slope is the same no matter which order we use the points.

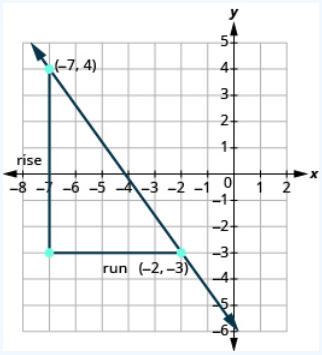
Example 8.13.10:

Find the slope of the line through the points (−2, −3) and (−7, 4).

Solution

We'll call (−2, −3) point #1 and (−7, 4) point #2.	$\begin{matrix} x_1, y_1 & x_2, y_2 \\ (-2,-3) & (-7,4) \end{matrix}$	
Use the slope formula.	$m = \frac{y_2 - y_1}{x_2 - x_1}$	(11.4.40)
Substitute the values.		
y of the second point minus y of the first point	$m = \frac{4-(-3)}{x_2 - x_1}$	(11.4.41)
x of the second point minus x of the first point	$m = \frac{4-(-3)}{-7-(-2)}$	(11.4.42)
Simplify.	$m = \frac{7}{-5}$	(11.4.43)
	$m = -\frac{7}{5}$	

Let's confirm this on the graph shown.



$$m = \frac{rise}{run}$$
$$m = \frac{-7}{5}$$
$$m = -\frac{7}{5}$$

Exercise 8.13.19:

Find the slope of the line through the pair of points: (−3, 4) and (2, −1).

Answer

-1

Exercise 8.13.20:

Find the slope of the line through the pair of points: (−2, 6) and (−3, −4).

Answer

10

8.14: Understand Slope of a Line (Part 2)

Graph a Line Given a Point and the Slope

In this chapter, we graphed lines by plotting points, by using intercepts, and by recognizing horizontal and vertical lines.

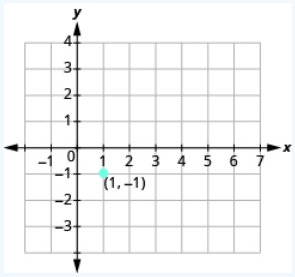
Another method we can use to graph lines is the point-slope method. Sometimes, we will be given one point and the slope of the line, instead of its equation. When this happens, we use the definition of slope to draw the graph of the line.

Example 8.14.11:

Graph the line passing through the point (1, −1) whose slope is m = $\frac{3}{4}$.

Solution

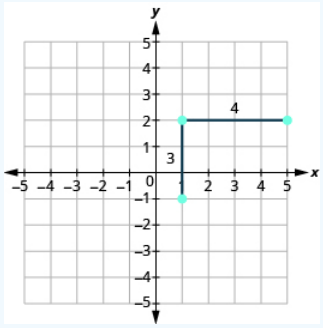
Plot the given point, (1, −1).



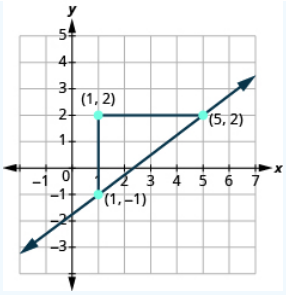
Use the slope formula m = $\frac{rise}{run}$ to identify the rise and the run.

$$m = \frac{3}{4}$$
$$\frac{rise}{run} = \frac{3}{4}$$
$$rise = 3$$
$$run = 4$$

Starting at the point we plotted, count out the rise and run to mark the second point. We count 3 units up and 4 units right.



Then we connect the points with a line and draw arrows at the ends to show it continues.



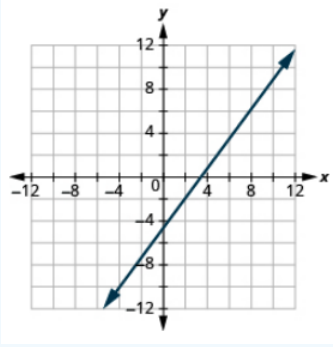
We can check our line by starting at any point and counting up 3 and to the right 4. We should get to another point on the line.

Exercise 8.14.21:

Graph the line passing through the point with the given slope:

$(2, -2)$, $m = \frac{4}{3}$

Answer

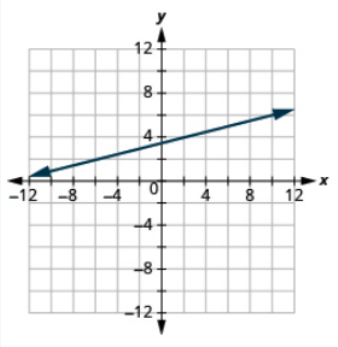


Exercise 8.14.22:

Graph the line passing through the point with the given slope:

$(-2, 3)$, $m = \frac{1}{4}$

Answer



HOW TO: GRAPH A LINE GIVEN A POINT AND A SLOPE

Step 1. Plot the given point.

Step 2. Use the slope formula to identify the rise and the run.

Step 3. Starting at the given point, count out the rise and run to mark the second point.

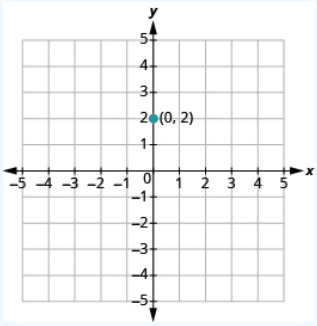
Step 4. Connect the points with a line.

Example 8.14.12:

Graph the line with y -intercept (0, 2) and slope m = $-\frac{2}{3}$.

Solution

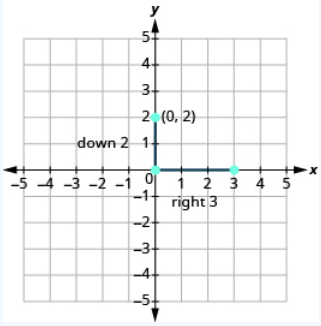
Plot the given point, the y -intercept (0, 2).



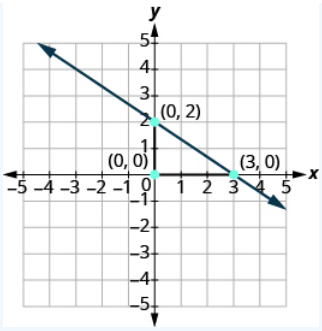
Use the slope formula m = rise run to identify the rise and the run.

$$m = -\frac{2}{3}$$
$$\frac{rise}{run} = \frac{-2}{3}$$
$$rise = -2$$
$$run = 3$$

Starting at (0, 2), count the rise and the run and mark the second point.



Connect the points with a line.

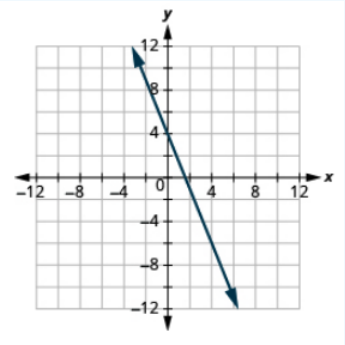


Exercise 8.14.23:

Graph the line with the given intercept and slope:

y-intercept 4, m = $-\frac{5}{2}$

Answer

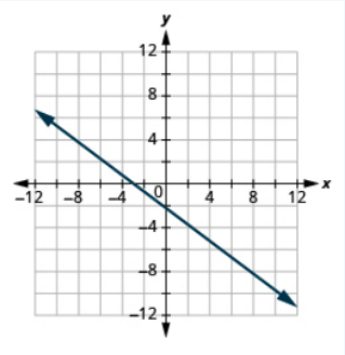


Exercise 8.14.24:

Graph the line with the given intercept and slope:

x-intercept −3, m = $-\frac{3}{4}$

Answer

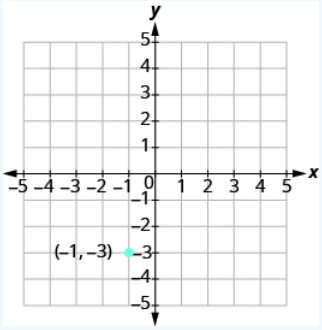


Example 8.14.13:

Graph the line passing through the point (−1, −3) whose slope is m = 4.

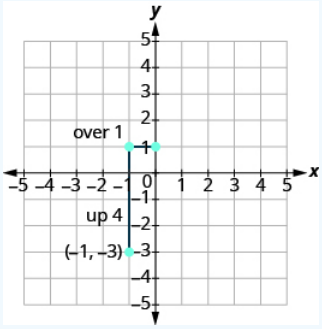
Solution

Plot the given point.

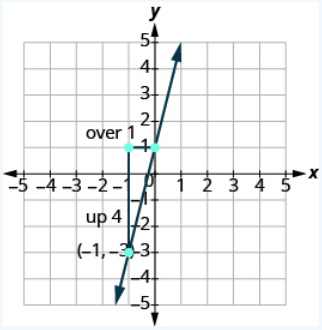


Identify the rise and the run.	$m = 4$	(11.4.44)
Write 4 as a fraction.	$\frac{rise}{run} = \frac{4}{1}$	(11.4.45)
	rise = 4, run = 1	

Count the rise and run.



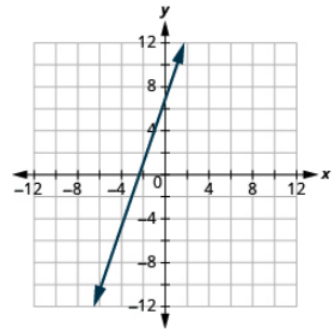
Mark the second point. Connect the two points with a line.



Exercise 8.14.25:

Graph the line with the given intercept and slope: (−2, 1), m = 3.

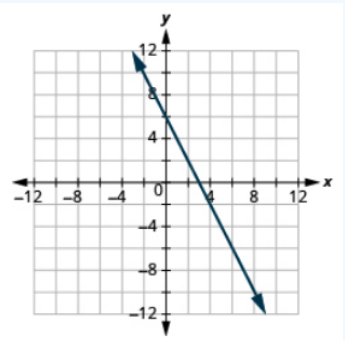
Answer



Exercise 8.14.26:

Graph the line with the given intercept and slope: (4, −2), m = −2.

Answer

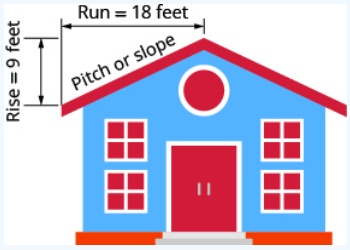


Solve Slope Applications

At the beginning of this section, we said there are many applications of slope in the real world. Let's look at a few now.

Example 8.14.14:

The pitch of a building's roof is the slope of the roof. Knowing the pitch is important in climates where there is heavy snowfall. If the roof is too flat, the weight of the snow may cause it to collapse. What is the slope of the roof shown?



Solution

Use the slope formula.	$m = \frac{rise}{run}$	(11.4.46)
Substitute the values for rise and run.	$m = \frac{9\ ft}{18\ ft}$	(11.4.47)

Simplify.	$m = \frac{1}{2}$	(11.4.48)
	The slope of the roof is $\frac{1}{2}$.	

? Exercise 8.14.27:

Find the slope given rise and run: A roof with a rise = 14 and run = 24.

Answer

$\frac{7}{12}$

? Exercise 8.14.28:

Find the slope given rise and run: A roof with a rise = 15 and run = 36.

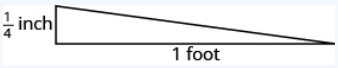
Answer

$\frac{5}{12}$

Have you ever thought about the sewage pipes going from your house to the street? Their slope is an important factor in how they take waste away from your house.

✓ Example 8.14.15:

Sewage pipes must slope down $\frac{1}{4}$ inch per foot in order to drain properly. What is the required slope?



Solution

Use the slope formula.	$m = \frac{rise}{run} = \frac{-\frac{1}{4}\ in.}{1\ ft}$	(11.4.49)
Convert 1 foot to 12 inches.	$m = \frac{-\frac{1}{4}\ in.}{12\ in}$	(11.4.50)
Simplify.	$m = -\frac{1}{48}$	(11.4.51)
	The slope of the pipe is $-\frac{1}{48}$.	

? Exercise 8.14.29:

Find the slope of the pipe: The pipe slopes down $\frac{1}{3}$ inch per foot.

Answer

$-\frac{1}{36}$

Exercise 8.14.30:

Find the slope of the pipe: The pipe slopes down $\frac{3}{4}$ inch per yard.

Answer

$-\frac{1}{48}$

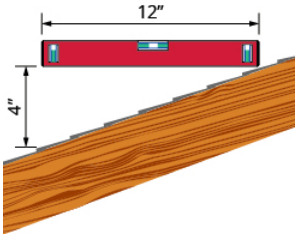
265. (1, 5); m = −3
266. (2, 3); m = −1

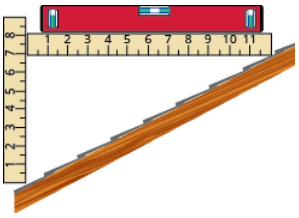
Solve Slope Applications

In the following exercises, solve these slope applications.

267. **Slope of a roof** A fairly easy way to determine the slope is to take a 12-inch level and set it on one end on the roof surface. Then take a tape measure or ruler, and measure from the other end of the level down to the roof surface. You can use these measurements to calculate the slope of the roof. What is the slope of the roof in this picture?



268. What is the slope of the roof shown?



269. **Road grade** A local road has a grade of 6%. The grade of a road is its slope expressed as a percent.
    a. Find the slope of the road as a fraction and then simplify the fraction.
    b. What rise and run would reflect this slope or grade?
270. **Highway grade** A local road rises 2 feet for every 50 feet of highway.
    a. What is the slope of the highway?
    b. The grade of a highway is its slope expressed as a percent. What is the grade of this highway?

Everyday Math

271. **Wheelchair ramp** The rules for wheelchair ramps require a maximum 1 inch rise for a 12 inch run.
    a. How long must the ramp be to accommodate a 24-inch rise to the door?
    b. Draw a model of this ramp.
272. **Wheelchair ramp** A 1-inch rise for a 16-inch run makes it easier for the wheelchair rider to ascend the ramp.
    a. How long must the ramp be to easily accommodate a 24-inch rise to the door?
    b. Draw a model of this ramp.

Writing Exercises

273. What does the sign of the slope tell you about a line?
274. How does the graph of a line with slope m = $\frac{1}{2}$ differ from the graph of a line with slope m = 2?
275. Why is the slope of a vertical line undefined?
276. Explain how you can graph a line given a point and its slope.

Self Check

8.E: Graphs (Exercises)

11.1 - Use the Rectangular Coordinate System

Plot Points in a Rectangular Coordinate System

In the following exercises, plot each point in a rectangular coordinate system.

277. (1, 3), (3, 1)
278. (2, 5), (5, 2)

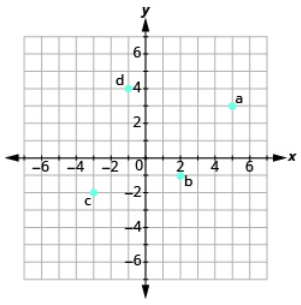
In the following exercises, plot each point in a rectangular coordinate system and identify the quadrant in which the point is located.

279. (a) $(-1, -5)$ (b) $(-3, 4)$ (c) $(2, -3)$ (d) $\left(1, \frac{5}{2}\right)$
280. (a) $(3, -2)$ (b) $(-4, -1)$ (c) $(-5, 4)$ (d) $\left(2, \frac{10}{3}\right)$

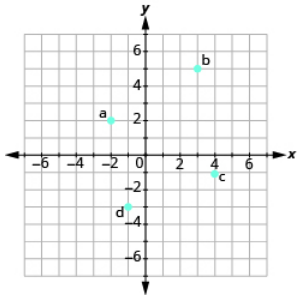
Identify Points on a Graph

In the following exercises, name the ordered pair of each point shown in the rectangular coordinate system.

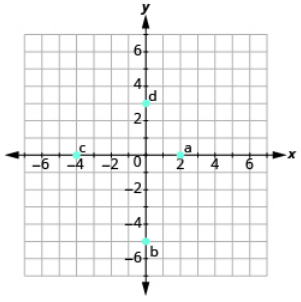
281.



282.



283.



284. 
Verify Solutions to an Equation in Two Variables

In the following exercises, find the ordered pairs that are solutions to the given equation.

285. $5x + y = 10$

a. (5, 1)
b. (2, 0)
c. (4, −10)

286. $y = 6x - 2$

a. (1, 4)
b. $\left(\frac{1}{3}, 0\right)$
c. (6, −2)

Complete a Table of Solutions to a Linear Equation in Two Variables

In the following exercises, complete the table to find solutions to each linear equation.

287. $y = 4x - 1$

x	y	(x, y)
0		
1		
-2		

288. $y = -\frac{1}{2}x + 3$

x	y	(x, y)
0		
1		
-2		

289. $x + 2y = 5$

x	y	(x, y)
	0	
1		
-1		

290. $3x - 2y = 6$

x	y	(x, y)
0		
	0	
-2		

Find Solutions to a Linear Equation in Two Variables

In the following exercises, find three solutions to each linear equation.

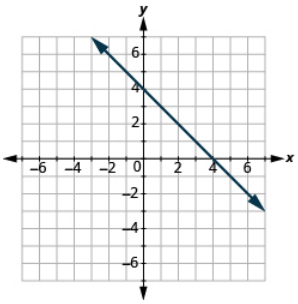
291. x + y = 3
292. x + y = −4
293. y = 3x + 1
294. y = − x − 1

11.2 - Graphing Linear Equations

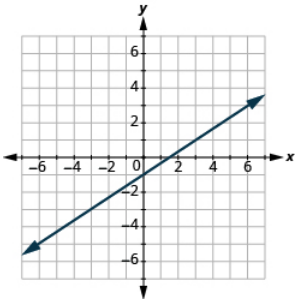
Recognize the Relation Between the Solutions of an Equation and its Graph

In the following exercises, for each ordered pair, decide (a) if the ordered pair is a solution to the equation. (b) if the point is on the line.

295. y = − x + 4
    a. (0, 4)
    b. (−1, 3)
    c. (2, 2)
    d. (−2, 6)



296. y = $\frac{2}{3}$x − 1
    a. (0, −1)
    b. (3, 1)
    c. (−3, −3)
    d. (6, 4)



Graph a Linear Equation by Plotting Points

In the following exercises, graph by plotting points.

297. $y = 4x - 3$
298. $y = -3x$
299. $2x + y = 7$

Graph Vertical and Horizontal lines

In the following exercises, graph the vertical or horizontal lines.

300. $y = -2$
301. $x = 3$

11.3 - Graphing with Intercepts

Identify the Intercepts on a Graph

In the following exercises, find the x- and y-intercepts.

302. 
303. 
Find the Intercepts from an Equation of a Line

In the following exercises, find the intercepts.

304. $x + y = 5$
305. $x - y = -1$
306. $y = \frac{3}{4}x - 12$
307. $y = 3x$

Graph a Line Using the Intercepts

In the following exercises, graph using the intercepts.

308. $-x + 3y = 3$
309. $x + y = -2$

Choose the Most Convenient Method to Graph a Line

In the following exercises, identify the most convenient method to graph each line.

310. $x = 5$
311. $y = -3$

312. $2x + y = 5$
313. $x - y = 2$
314. $y = \frac{1}{2}x + 2$
315. $y = \frac{3}{4}x - 1$

11.4 - Understand Slope of a Line

Use Geoboards to Model Slope

In the following exercises, find the slope modeled on each geoboard.

316. 317. 318. 319. 
In the following exercises, model each slope. Draw a picture to show your results.

320. $\frac{1}{3}$
321. $\frac{3}{2}$
322. $-\frac{2}{3}$

323. $-\frac{1}{2}$

Find the Slope of a Line from its Graph

In the following exercises, find the slope of each line shown.

324. 
325. 
326. 
327. 
Find the Slope of Horizontal and Vertical Lines

In the following exercises, find the slope of each line.

328. y = 2
329. x = 5
330. x = −3
331. y = −1

Use the Slope Formula to find the Slope of a Line between Two Points

In the following exercises, use the slope formula to find the slope of the line between each pair of points.

332. (2, 1), (4, 5)

333. (−1, −1), (0, −5)
334. (3, 5), (4, −1)
335. (−5, −2), (3, 2)

Graph a Line Given a Point and the Slope

In the following exercises, graph the line given a point and the slope.

336. (2, −2); m = $\frac{5}{2}$
337. (−3, 4); m = $-\frac{1}{3}$

Solve Slope Applications

In the following exercise, solve the slope application.

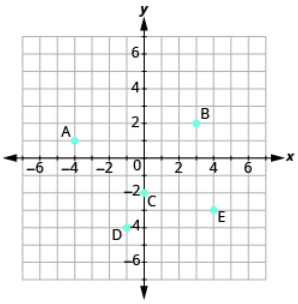
338. A roof has rise 10 feet and run 15 feet. What is its slope?

PRACTICE TEST

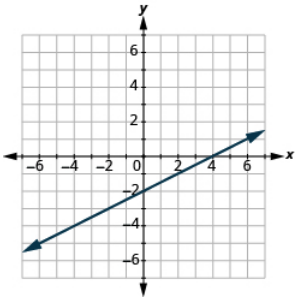
339. Plot and label these points:

a. (2, 5)
b. (−1, −3)
c. (−4, 0)
d. (3, −5)
e. (−2, 1)

340. Name the ordered pair for each point shown.



341. Find the x-intercept and y-intercept on the line shown.



342. Find the x-intercept and y-intercept of the equation 3x − y = 6.
343. Is (1, 3) a solution to the equation x + 4y = 12? How do you know?
344. Complete the table to find four solutions to the equation y = − x + 1.

x	y	(x, y)
0		
1		

x	y	(x, y)
3		
-2		

345. Complete the table to find three solutions to the equation 4x + y = 8.

x	y	(x, y)
0		
	0	
3		

In the following exercises, find three solutions to each equation and then graph each line.

346. y = −3x
347. 2x + 3y = −6

In the following exercises, find the slope of each line.

348. 
349. 
350. Use the slope formula to find the slope of the line between (0, −4) and (5, 2).
351. Find the slope of the line y = 2.
352. Graph the line passing through (1, 1) with slope m = $\frac{3}{2}$.
353. A bicycle route climbs 20 feet for 1,000 feet of horizontal distance. What is the slope of the route?

8.E: Review Exercises

Chapter 4 Review Exercises

Rectangular Coordinate System

Plot Points in a Rectangular Coordinate System

In the following exercises, plot each point in a rectangular coordinate system.

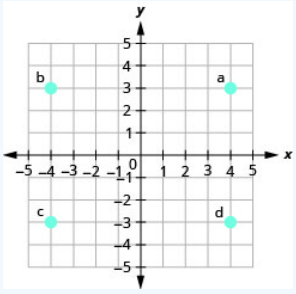
Exercise 8.E.1

1. $(-1,-5)$
2. $(-3,4)$
3. $(2,-3)$
4. $\left(1,\frac{5}{2}\right)$

Exercise 8.E.2

1. $(4,3)$
2. $(-4,3)$
3. $(-4,-3)$
4. $(4,-3)$

Answer



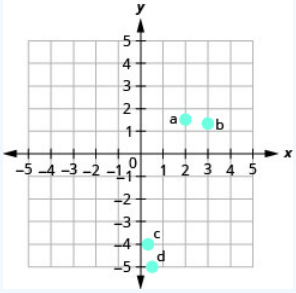
Exercise 8.E.3

1. $(-2,0)$
2. $(0,-4)$
3. $(0,5)$
4. $(3,0)$

Exercise 8.E.4

1. $\left(2,\frac{3}{2}\right)$
2. $\left(3,\frac{4}{3}\right)$
3. $\left(\frac{1}{3},-4\right)$
4. $\left(\frac{1}{2},-5\right)$

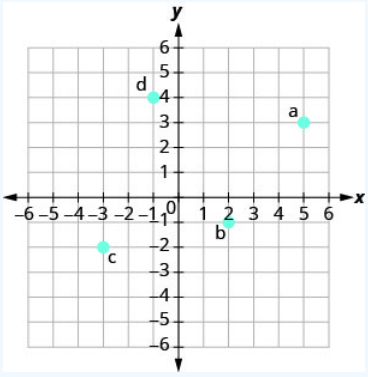
Answer



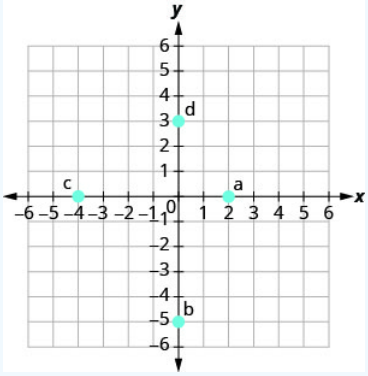
Identify Points on a Graph

In the following exercises, name the ordered pair of each point shown in the rectangular coordinate system.

Exercise 8.E.5



Exercise 8.E.6



Answer

a. (2,0)

b (0,−5)

c (−4.0)

d (0,3)

Verify Solutions to an Equation in Two Variables

In the following exercises, which ordered pairs are solutions to the given equations?

Exercise 8.E.7

$5x + y = 10$

1. (5,1)
2. (2,0)
3. (4,−10)

Exercise 8.E.8

$y = 6x - 2$

1. (1,4)
2. $\left(\frac{1}{3}, 0\right)$
3. (6,−2)

Answer

1, 2

Complete a Table of Solutions to a Linear Equation in Two Variables

In the following exercises, complete the table to find solutions to each linear equation.

Exercise 8.E.9

$y = 4x - 1$

x	y	(x,y)
0		
1		
-2		

Exercise 8.E.10

$y = -\frac{1}{2}x + 3$

x	y	(x,y)
0		
4		
-2		

Answer

x	y	(x,y)
0	3	(0,3)
4	1	(4, 1)
−2	4	(−2,4)

Exercise 8.E.11

$x + 2y = 5$

x	y	(x,y)
	0	
1		
-1		

Exercise 8.E.12

$3x + 2y = 6$

x	y	(x,y)
0		
	0	
-2		

Answer

x	y	(x,y)
0	−3	(0,−3)
2	0	(2,0)
−2	−6	(−2,−6)

Find Solutions to a Linear Equation in Two Variables

In the following exercises, find three solutions to each linear equation.

Exercise 8.E.13

$x + y = 3$

Exercise 8.E.14

$x + y = -4$

Answer

Answers will vary.

Exercise 8.E.15

$y = 3x + 1$

Exercise 8.E.16

$y = -x - 1$

Answer

Answers will vary.

Graphing Linear Equations

Recognize the Relation Between the Solutions of an Equation and its Graph

In the following exercises, for each ordered pair, decide:

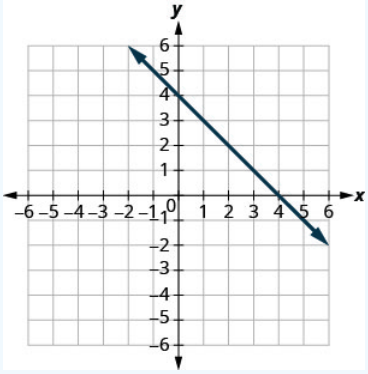
1. Is the ordered pair a solution to the equation?
2. Is the point on the line?

Exercise $8.E.17$

$y = -x + 4$

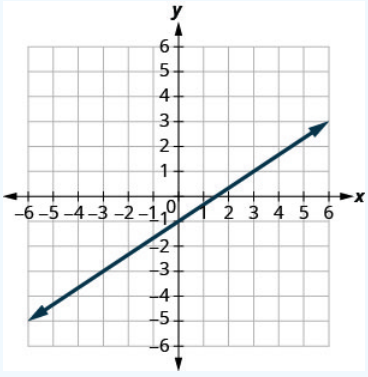
(0,4) (−1,3)

(2,2) (−2,6)



Exercise $8.E.18$

$y = \frac{2}{3}x - 1$
$(0, -1)(3, 1)$
$(-3, -3)(6, 4)$



Answer

1. yes; yes
2. yes; no

Graph a Linear Equation by Plotting Points

In the following exercises, graph by plotting points.

https://math.libretexts.org/@go/page/46291

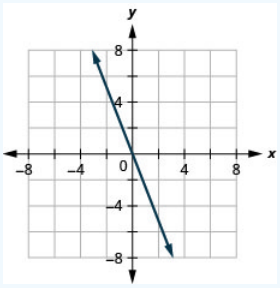
Exercise 8.E.19

$y = 4x - 3$

Exercise 8.E.20

$y = -3x$

Answer



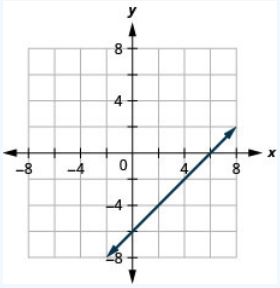
Exercise 8.E.21

$y = \frac{1}{2}x + 3$

Exercise 8.E.22

$x - y = 6$

Answer



Exercise 8.E.23

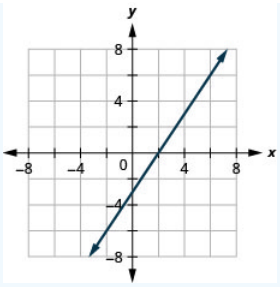
$2x + y = 7$

Exercise 8.E.24

$3x - 2y = 6$

Answer

https://math.libretexts.org/@go/page/46291



Graph Vertical and Horizontal lines

In the following exercises, graph each equation.

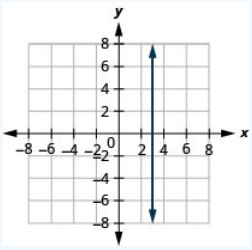
Exercise 8.E.25

$y = -2$

Exercise 8.E.26

$x = 3$

Answer



In the following exercises, graph each pair of equations in the same rectangular coordinate system.

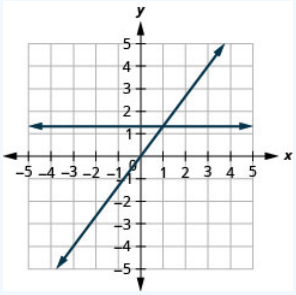
Exercise 8.E.27

$y = -2x$ and $y = -2$

Exercise 8.E.28

$y = \frac{4}{3}x$ and $y = \frac{4}{3}$

Answer

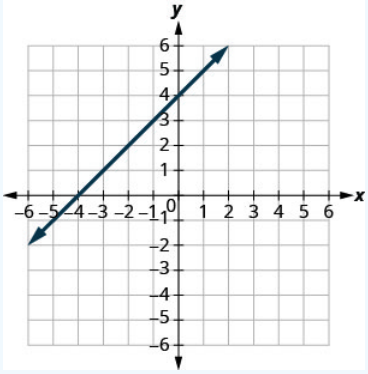


https://math.libretexts.org/@go/page/46291

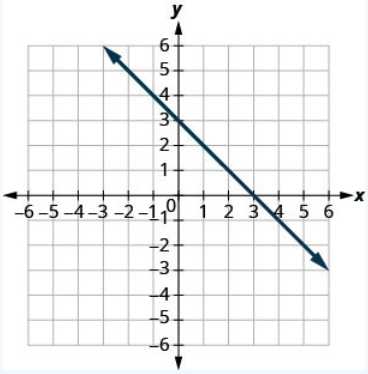
Identify the x- and y-Intercepts on a Graph

In the following exercises, find the x- and y-intercepts.

Exercise $8.E.29$



Exercise $8.E.30$



Answer

$(3, 0)$ and $(0, 3)$

Find the$x$- and y-Intercepts from an Equation of a Line

In the following exercises, find the intercepts of each equation.

Exercise $8.E.31$

$x + y = 5$

Exercise $8.E.32$

$x - y = -1$

Answer

$(-1, 0), (0, 1)$

Exercise 8.E.33

$x+2y=6$

Exercise 8.E.34

$2x+3y=12$

Answer

$(6,0),(0,4)$

Exercise 8.E.35

$y=\frac{3}{4}x-12$

Exercise 8.E.36

$y=3x$

Answer

$(0,0)$

Graph a Line Using the Intercepts

In the following exercises, graph using the intercepts.

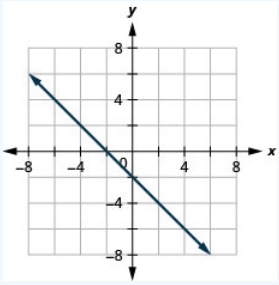
Exercise 8.E.37

$-x+3y=3$

Exercise 8.E.38

$x+y=-2$

Answer



Exercise 8.E.39

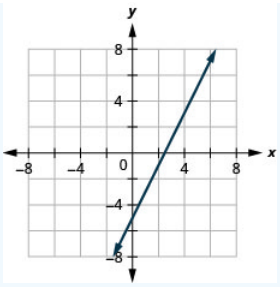
$x-y=4$

Exercise 8.E.40

$2x-y=5$

Answer

https://math.libretexts.org/@go/page/46291



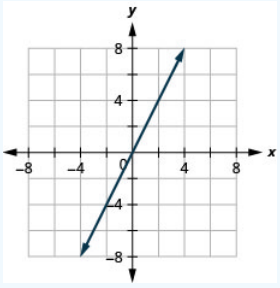
Exercise 8.E.41

$2x - 4y = 8$

Exercise 8.E.42

$y = 2x$

Answer

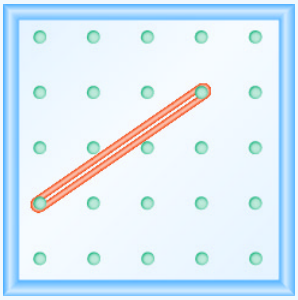


Slope of a Line

Use Geoboards to Model Slope

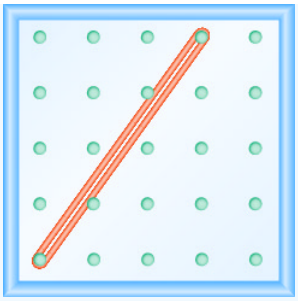
In the following exercises, find the slope modeled on each geoboard.

Exercise 8.E.43



Exercise 8.E.44

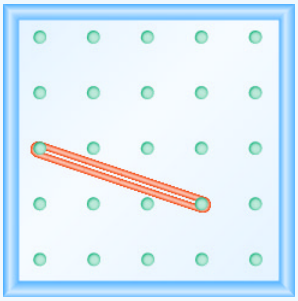
https://math.libretexts.org/@go/page/46291



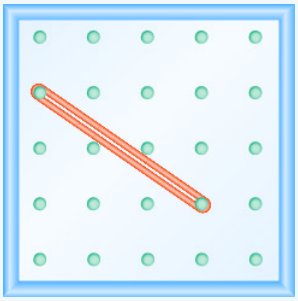
Answer

$\frac{4}{3}$

Exercise 8.E.45



Exercise 8.E.46



Answer

$-\frac{2}{3}$

Exercise 8.E.47

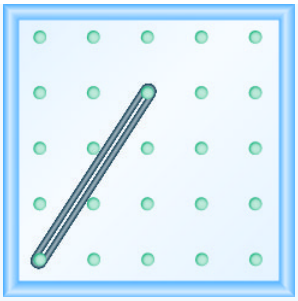
$\frac{1}{3}$

Exercise 8.E.48

$\frac{3}{2}$

Answer

https://math.libretexts.org/@go/page/46291



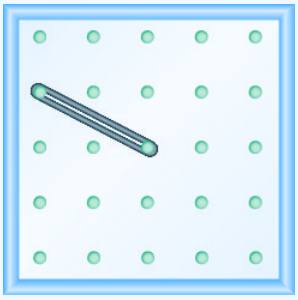
Exercise 8.E.49

$-\frac{2}{3}$

Exercise 8.E.50

$-\frac{1}{2}$

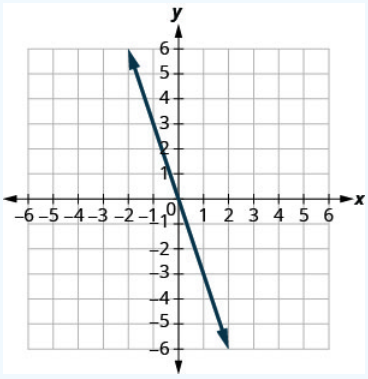
Answer



Use $m = \frac{\text{rise}}{\text{run}}$ to find the Slope of a Line from its Graph

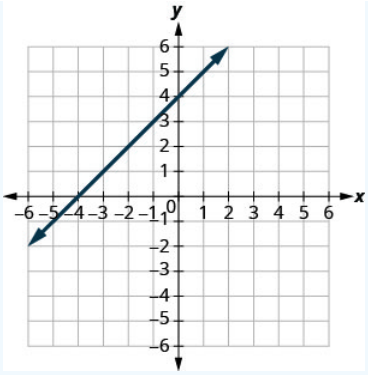
In the following exercises, find the slope of each line shown.

Exercise 8.E.51



Exercise 8.E.52

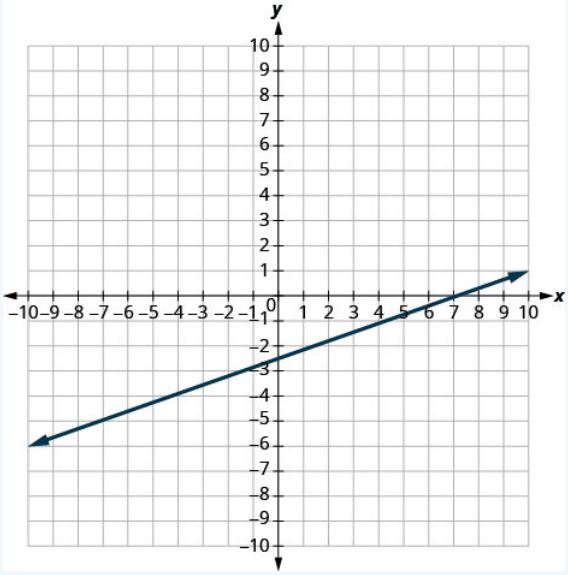
https://math.libretexts.org/@go/page/46291



Answer

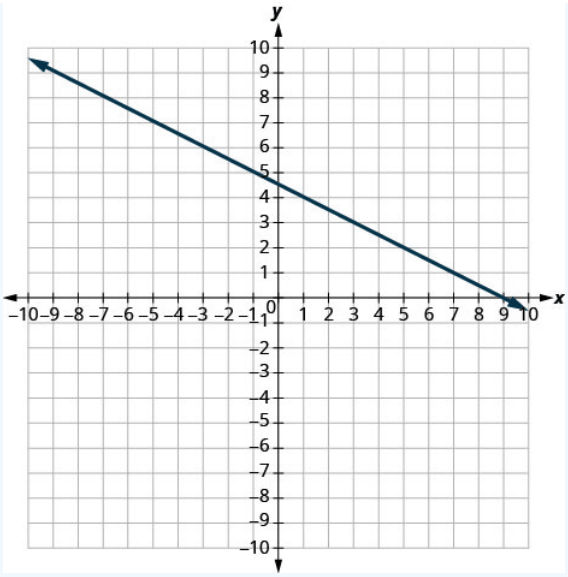
1

Exercise $8.E.53$



Exercise $8.E.54$

https://math.libretexts.org/@go/page/46291



Answer

$-\frac{1}{2}$

Find the Slope of Horizontal and Vertical Lines

In the following exercises, find the slope of each line.

Exercise 8.E.55

$y = 2$

Exercise 8.E.56

$x = 5$

Answer

undefined

Exercise 8.E.57

$x = -3$

Exercise 8.E.58

$y = -1$

Answer

0

Use the Slope Formula to find the Slope of a Line between Two Points

In the following exercises, use the slope formula to find the slope of the line between each pair of points.

Exercise 8.E.59

$(-1,-1),(0,5)$

Exercise 8.E.60

$(3,5),(4,-1)$

Answer

-6

Exercise 8.E.61

$(-5,-2),(3,2)$

Exercise 8.E.62

$(2,1),(4,6)$

Answer

$\frac{5}{2}$

Graph a Line Given a Point and the Slope

In the following exercises, graph each line with the given point and slope.

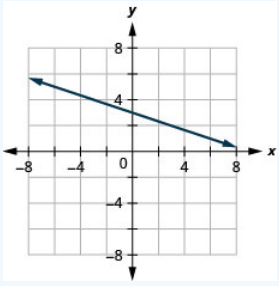
Exercise 8.E.63

$(2,-2);\quad m=\frac{5}{2}$

Exercise 8.E.64

$(-3,4);\quad m=-\frac{1}{3}$

Answer



Exercise 8.E.65

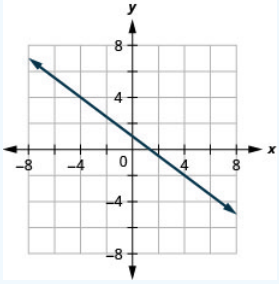
x -intercept $-4;\quad m=3$

https://math.libretexts.org/@go/page/46291

Exercise 8.E.66

y -intercept 1; $m = -\frac{3}{4}$

Answer

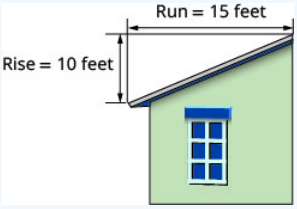


Solve Slope Applications

In the following exercises, solve these slope applications.

Exercise 8.E.67

The roof pictured below has a rise of 10 feet and a run of 15 feet. What is its slope?



Exercise 8.E.68

A mountain road rises 50 feet for a 500-foot run. What is its slope?

Answer

$\frac{1}{10}$

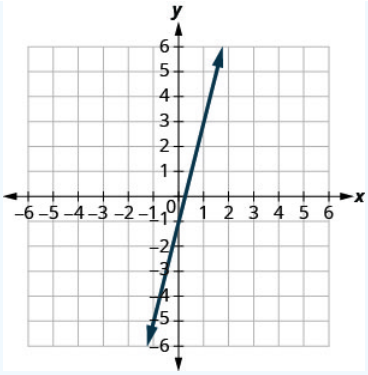
Intercept Form of an Equation of a Line

Recognize the Relation Between the Graph and the Slope–Intercept Form of an Equation of a Line

In the following exercises, use the graph to find the slope and y-intercept of each line. Compare the values to the equation $y = mx + b$.

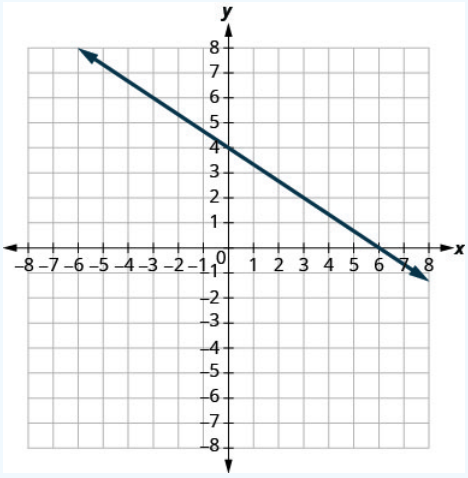
Exercise 8.E.69

https://math.libretexts.org/@go/page/46291



$y = 4x - 1$

Exercise 8.E.70



$y = -\frac{2}{3}x + 4$

Answer

slope $m = -\frac{2}{3}$ and y-intercept $(0, 4)$

Identify the Slope and y-Intercept from an Equation of a Line

In the following exercises, identify the slope and y-intercept of each line.

Exercise 8.E.71

$y = -4x + 9$

Exercise 8.E.72

$y = \frac{5}{3}x - 6$

Answer

$\frac{5}{3}; (0, -6)$

Exercise 8.E.73

$5x + y = 10$

Exercise 8.E.74

$4x - 5y = 8$

Answer

$\frac{4}{5}; \quad \left(0, -\frac{8}{5}\right)$

Graph a Line Using Its Slope and Intercept

In the following exercises, graph the line of each equation using its slope and y-intercept.

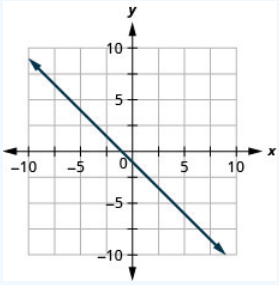
Exercise 8.E.75

$y = 2x + 3$

Exercise 8.E.76

$y = -x - 1$

Answer



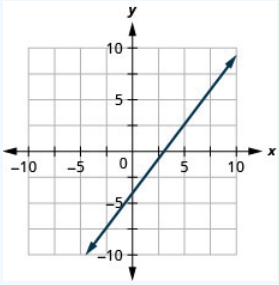
Exercise 8.E.77

$y = -\frac{2}{5}x + 3$

Exercise 8.E.78

$4x - 3y = 12$

Answer



https://math.libretexts.org/@go/page/46291

In the following exercises, determine the most convenient method to graph each line.

Exercise 8.E.79

$x = 5$

Exercise 8.E.80

$y = -3$

Answer

horizontal line

Exercise 8.E.81

$2x + y = 5$

Exercise 8.E.82

$x - y = 2$

Answer

intercepts

Exercise 8.E.83

$y = x + 2$

Exercise 8.E.84

$y = \frac{3}{4}x - 1$

Answer

plotting points

Graph and Interpret Applications of Slope–Intercept

Exercise 8.E.85

Katherine is a private chef. The equation $C = 6.5m + 42$ models the relation between her weekly cost, C, in dollars and the number of meals, m, that she serves.

1. Find Katherine's cost for a week when she serves no meals.
2. Find the cost for a week when she serves 14 meals.
3. Interpret the slope and C-intercept of the equation.
4. Graph the equation.

Exercise 8.E.86

Marjorie teaches piano. The equation $P = 35h - 250$ models the relation between her weekly profit, P, in dollars and the number of student lessons, s, that she teaches.

1. Find Marjorie's profit for a week when she teaches no student lessons.
2. Find the profit for a week when she teaches 20 student lessons.

3. Interpret the slope and P-intercept of the equation.
4. Graph the equation.

Answer

1. $-\$250$
2. $\$450$
3. The slope, 35, means that Marjorie's weekly profit, P, increases by $\$35$ for each additional student lesson she teaches. The P-intercept means that when the number of lessons is 0, Marjorie loses $\$250$
4. 
Use Slopes to Identify Parallel Lines

In the following exercises, use slopes and y-intercepts to determine if the lines are parallel.

? Exercise $8.E.87$

$4x-3y=-1; \quad y=\frac{4}{3}x-3$

? Exercise $8.E.88$

$2x-y=8; \quad x-2y=4$

Answer

not parallel

Use Slopes to Identify Perpendicular Lines

In the following exercises, use slopes and y-intercepts to determine if the lines are perpendicular.

? Exercise $8.E.89$

$y=5x-1; \quad 10x+2y=0$

? Exercise $8.E.90$

$3x-2y=5; \quad 2x+3y=6$

Answer

perpendicular

Find an Equation of the Line Given the Slope and *y*-Intercept

In the following exercises, find the equation of a line with given slope and y-intercept. Write the equation in slope–intercept form.

Exercise $8.E.91$

slope $\frac{1}{3}$ and y-intercept $(0, -6)$

Exercise $8.E.92$

slope -5 and y-intercept $(0, -3)$

Answer

$y = -5x - 3$

Exercise $8.E.93$

slope 0 and y-intercept $(0, 4)$

Exercise $8.E.94$

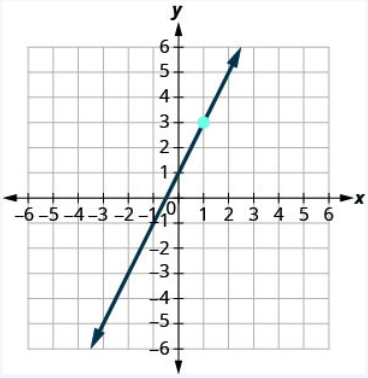
slope -2 and y-intercept $(0, 0)$

Answer

$y = -2x$

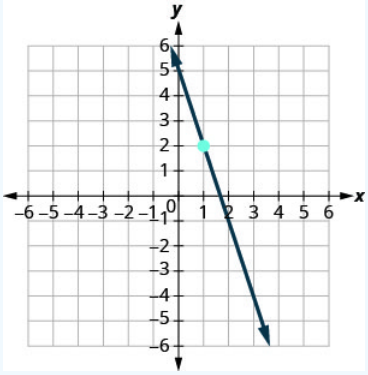
In the following exercises, find the equation of the line shown in each graph. Write the equation in slope–intercept form.

Exercise $8.E.95$



Exercise $8.E.96$

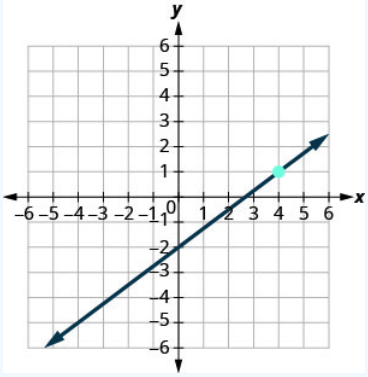
https://math.libretexts.org/@go/page/46291



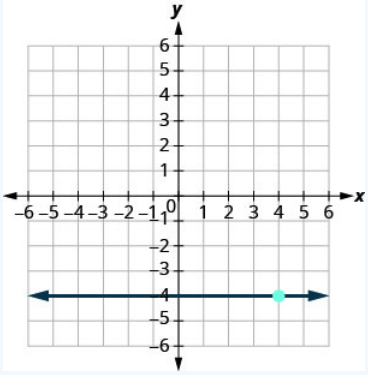
Answer

$y = -3x + 5$

Exercise 8.E.97



Exercise 8.E.98



Answer

$y = -4$

Find an Equation of the Line Given the Slope and a Point

In the following exercises, find the equation of a line with given slope and containing the given point. Write the equation in slope–intercept form.

Exercise 8.E.99

$m = -\frac{1}{4}$, point $(-8, 3)$

Exercise 8.E.100

$m = \frac{3}{5}$, point $(10, 6)$

Answer

$y = \frac{3}{5}x$

Exercise 8.E.101

Horizontal line containing $(-2, 7)$

Exercise 8.E.102

$m = -2$, point $(-1, -3)$

Answer

$y = -2x - 5$

Find an Equation of the Line Given Two Points

In the following exercises, find the equation of a line containing the given points. Write the equation in slope–intercept form.

Exercise 8.E.103

$(2, 10)$ and $(-2, -2)$

Exercise 8.E.104

$(7, 1)$ and $(5, 0)$

Answer

$y = \frac{1}{2}x - \frac{5}{2}$

Exercise 8.E.105

$(3, 8)$ and $(3, -4)$

Exercise 8.E.106

$(5, 2)$ and $(-1, 2)$

Answer

$y = 2$

Find an Equation of a Line Parallel to a Given Line

In the following exercises, find an equation of a line parallel to the given line and contains the given point. Write the equation in slope–intercept form.

Exercise 8.E.107

line $y = -3x + 6$, point $(1, -5)$

Exercise 8.E.108

line $2x + 5y = -10$, point $(10, 4)$

Answer

$y = -\frac{2}{5}x + 8$

Exercise 8.E.109

line $x = 4$, point $(-2, -1)$

Exercise 8.E.110

line $y = -5$, point $(-4, 3)$

Answer

$y = 3$

Find an Equation of a Line Perpendicular to a Given Line

In the following exercises, find an equation of a line perpendicular to the given line and contains the given point. Write the equation in slope–intercept form.

Exercise 8.E.111

line $y = -\frac{4}{5}x + 2$, point $(8, 9)$

Exercise 8.E.112

line $2x - 3y = 9$, point $(-4, 0)$

Answer

$y = -\frac{3}{2}x - 6$

Exercise 8.E.113

line $y = 3$, point $(-1, -3)$

Exercise 8.E.114

line $x = -5$ point $(2, 1)$

Answer

$y = 1$

Graph Linear Inequalities

Verify Solutions to an Inequality in Two Variables

In the following exercises, determine whether each ordered pair is a solution to the given inequality.

Exercise 8.E.115

Determine whether each ordered pair is a solution to the inequality $y < x - 3$:

1. $(0, 1)$
2. $(-2, -4)$
3. $(5, 2)$
4. $(3, -1)$
5. $(-1, -5)$

Exercise 8.E.116

Determine whether each ordered pair is a solution to the inequality $x + y > 4$:

1. $(6, 1)$
2. $(-3, 6)$
3. $(3, 2)$
4. $(-5, 10)$
5. $(0, 0)$

Answer

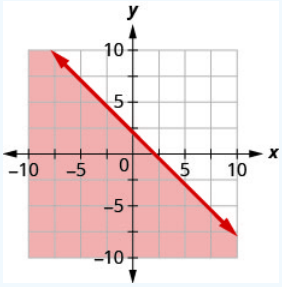
1. yes
2. no
3. yes
4. yes
5. no

Recognize the Relation Between the Solutions of an Inequality and its Graph

In the following exercises, write the inequality shown by the shaded region.

Exercise 8.E.117

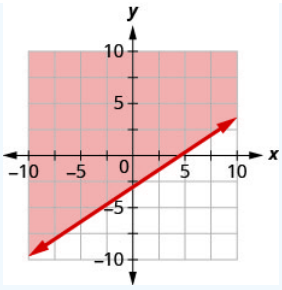
Write the inequality shown by the graph with the boundary line $y = -x + 2$.



Exercise 8.E.118

Write the inequality shown by the graph with the boundary line $y = \frac{2}{3}x - 3$

https://math.libretexts.org/@go/page/46291

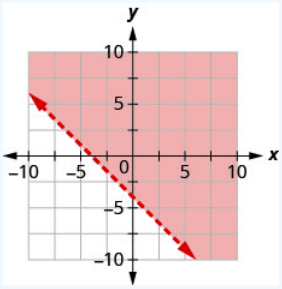


Answer

$y > \frac{2}{3}x - 3$

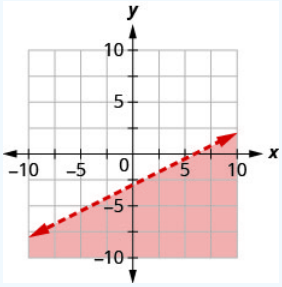
Exercise 8.E.119

Write the inequality shown by the shaded region in the graph with the boundary line $x + y = -4$.



Exercise 8.E.120

Write the inequality shown by the shaded region in the graph with the boundary line $x - 2y = 6$.



Answer

$x - 2y \geq 6$

Graph Linear Inequalities

In the following exercises, graph each linear inequality.

Exercise 8.E.121

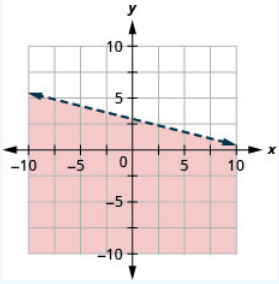
Graph the linear inequality $y > \frac{2}{5}x - 4$

https://math.libretexts.org/@go/page/46291

Exercise 8.E.122

Graph the linear inequality $y \leq -\frac{1}{4}x + 3$

Answer



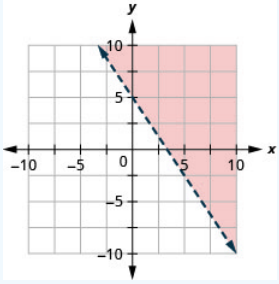
Exercise 8.E.123

Graph the linear inequality $x - y \leq 5$

Exercise 8.E.124

Graph the linear inequality $3x + 2y > 10$

Answer



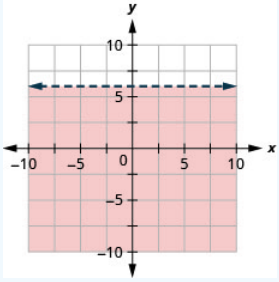
Exercise 8.E.125

Graph the linear inequality $y \leq -3x$

Exercise 8.E.126

Graph the linear inequality $y < 6$

Answer



https://math.libretexts.org/@go/page/46291

Practice Test

Exercise $8.E.1$

Plot each point in a rectangular coordinate system.

1. $(2, 5)$
2. $(-1, -3)$
3. $(0, 2)$
4. $\left(-4, \frac{3}{2}\right)$
5. $(5, 0)$

Exercise $8.E.2$

Which of the given ordered pairs are solutions to the equation $3x - y = 6$?

1. $(3, 3)$
2. $(2, 0)$
3. $(4, -6)$

Answer

1. yes
2. yes
3. no

Exercise $8.E.3$

Find three solutions to the linear equation $y = -2x - 4$

Exercise $8.E.4$

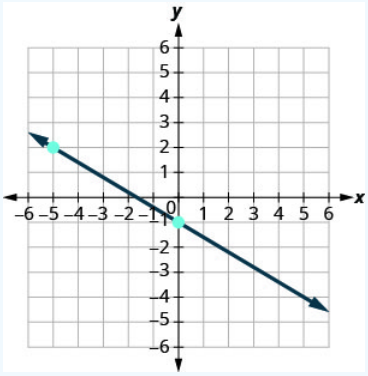
Find the x- and y-intercepts of the equation $4x - 3y = 12$

Answer

$(3, 0), (0, -4)$

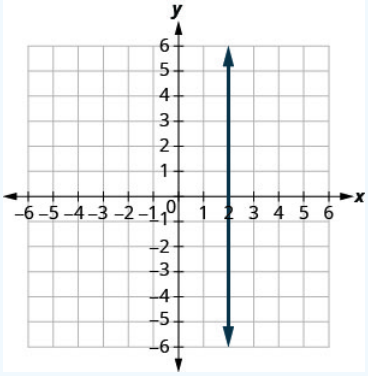
Find the slope of each line shown.

Exercise $8.E.5$



https://math.libretexts.org/@go/page/46291

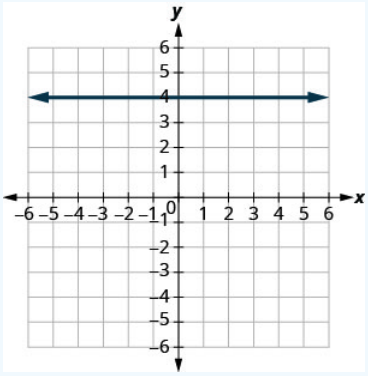
Exercise 8.E.6



Answer

undefined

Exercise 8.E.7



Exercise 8.E.8

Find the slope of the line between the points $(5, 2)$ and $(-1, -4)$

Answer

1

Exercise 8.E.9

Graph the line with slope $\frac{1}{2}$ containing the point $(-3, -4)$

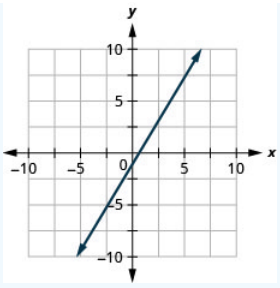
Graph the line for each of the following equations.

Exercise 8.E.10

$y = \frac{5}{3}x - 1$

Answer

https://math.libretexts.org/@go/page/46291



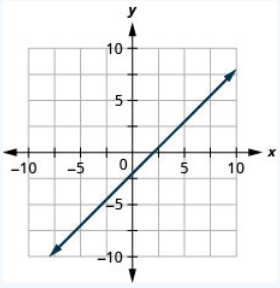
Exercise 8.E.11

$y = -x$

Exercise 8.E.12

$x - y = 2$

Answer



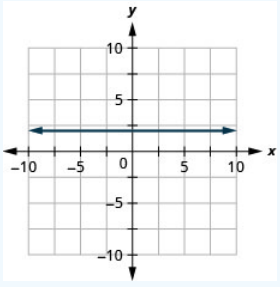
Exercise 8.E.13

$4x + 2y = -8$

Exercise 8.E.14

$y = 2$

Answer



Exercise 8.E.15

$x = -3$

Find the equation of each line. Write the equation in slope–intercept form.

https://math.libretexts.org/@go/page/46291

Exercise 8.E.16

slope $-\frac{3}{4}$ and y-intercept $(0, -2)$

Answer

$y = -\frac{3}{4}x - 2$

Exercise 8.E.17

$m = 2$, point $(-3, -1)$

Exercise 8.E.18

containing $(10, 1)$ and $(6, -1)$

Answer

$y = \frac{1}{2}x - 4$

Exercise 8.E.19

parallel to the line $y = -\frac{2}{3}x - 1$, containing the point $(-3, 8)$

Exercise 8.E.20

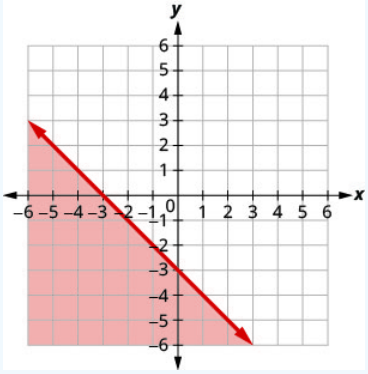
perpendicular to the line $y = \frac{5}{4}x + 2$, containing the point $(-10, 3)$

Answer

$y = -\frac{4}{5}x - 5$

Exercise 8.E.21

Write the inequality shown by the graph with the boundary line $y = -x - 3$.



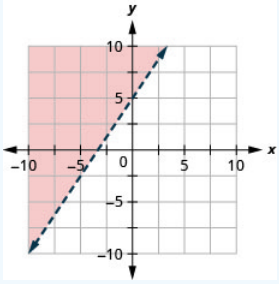
Graph each linear inequality.

https://math.libretexts.org/@go/page/46291

Exercise $8.E.22$

$y > \frac{3}{2}x + 5$

Answer



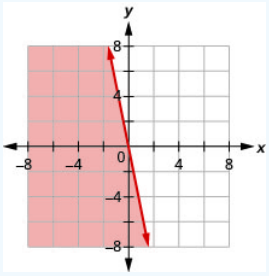
Exercise $8.E.23$

$x - y \geq -4$

Exercise $8.E.24$

$y \leq -5x$

Answer



Exercise $8.E.1$

$y < 3$

8.S: Graphs (Summary)

KEY TERMS

horizontal line	The graph of an equation that can be written in the form y = b whose line passes through the y-axis at (0, b).
intercepts of a line	Each of the points at which a line crosses the x-axis and the y-axis is called an intercept of the line.
linear equation	An equation of the form Ax + By = C, where A and B are not both zero, is called a linear equation in two variables
ordered pair	An ordered pair (x, y) gives the coordinates of a point in a rectangular coordinate system. The first number is the x-coordinate. The second number is the y-coordinate.
origin	The point (0, 0) is called the origin. It is the point where the point where the x-axis and y-axis intersect.
quadrants	The four areas of a rectangular coordinate system that has been divided by the x-axis and y-axis.
slope of a line	The slope of a line is m = $\frac{rise}{run}$. The rise measures the vertical change and the run measures the horizontal change.
solution to a linear equation in two variables	An ordered pair (x, y) is a solution to the linear equation Ax + By = C, if the equation is a true statement when the x- and y-values of the ordered pair are substituted into the equation.
vertical line	A vertical line is the graph of an equation that can be written in the form x = a. The line passes through the x-axis at (a, 0).
x-axis	The horizontal axis in a rectangular coordinate system.
y-axis	The vertical axis on a rectangular coordinate system.

Key Concepts

11.1 Use the Rectangular Coordinate System

- **Sign Patterns of the Quadrants**

Quadrant I	Quadrant II	Quadrant III	Quadrant IV
(x,y)	(x,y)	(x,y)	(x,y)
(+,+)	(−,+)	(−,−)	(+,−)

- **Coordinates of Zero**
  - Points with a y-coordinate equal to 0 are on the x-axis, and have coordinates (a, 0).
  - Points with a x-coordinate equal to 0 are on the y-axis, and have coordinates (0, b).
  - The point (0, 0) is called the origin. It is the point where the x-axis and y-axis intersect.

11.2 Graphing Linear Equations

- **Graph a linear equation by plotting points**.
  1. Find three points whose coordinates are solutions to the equation. Organize them in a table.
  2. Plot the points on a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work.
  3. Draw the line through the points. Extend the line to fill the grid and put arrows on both ends of the line.
- **Graph of a Linear Equation**: The graph of a linear equation ax + by = c is a straight line.

- Every point on the line is a solution of the equation.
- Every solution of this equation is a point on this line.

11.3 Graphing with Intercepts

- **Intercepts**
  - The x-intercept is the point, (a, 0), where the graph crosses the x-axis. The x-intercept occurs when y is zero.
  - The y-intercept is the point, (0, b), where the graph crosses the y-axis. The y-intercept occurs when x is zero.
  - The x-intercept occurs when y is zero.
  - The y-intercept occurs when x is zero.
- **Find the x and y intercepts from the equation of a line**
  - To find the x-intercept of the line, let y = 0 and solve for x.
  - To find the y-intercept of the line, let x = 0 and solve for y.

x	y
	0
0	

- **Graph a line using the intercepts**
  1. Find the x- and y-intercepts of the line.
     - Let y = 0 and solve for x.
     - Let x = 0 and solve for y.
  2. Find a third solution to the equation.
  3. Plot the three points and then check that they line up.
  4. Draw the line.
- **Choose the most convenient method to graph a line**
  1. Determine if the equation has only one variable. Then it is a vertical or horizontal line.
     - x = a is a vertical line passing through the x-axis at a.
     - y = b is a horizontal line passing through the y-axis at b.
  2. Determine if y is isolated on one side of the equation. The graph by plotting points. Choose any three values for x and then solve for the corresponding y-values.
  3. Determine if the equation is of the form Ax + By = C, find the intercepts. Find the x- and y-intercepts and then a third point.

11.4 Understand Slope of a Line

- **Find the slope from a graph**
  1. Locate two points on the line whose coordinates are integers.
  2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.
  3. Count the rise and the run on the legs of the triangle.
  4. Take the ratio of rise to run to find the slope, m = $\frac{rise}{run}$.
- **Slope of a Horizontal Line**
  - The slope of a horizontal line, y = b, is 0.
- **Slope of a Vertical Line**
  - The slope of a vertical line, x = a, is undefined.
- **Slope Formula**
  - The slope of the line between two points (x_1, y_1) and (x_2, y_2) is m = $\frac{y_2 - y_1}{x_2 - x_1}$.
- **Graph a line given a point and a slope.**
  1. Plot the given point.
  2. Use the slope formula to identify the rise and the run.

3. Starting at the given point, count out the rise and run to mark the second point.
4. Connect the points with a line.

9.1: Solve Equations Using the Subtraction and Addition Properties of Equality

Learning Objectives

By the end of this section, you will be able to:

- Verify a solution of an equation
- Solve equations using the Subtraction and Addition Properties of Equality
- Solve equations that require simplification
- Translate to an equation and solve
- Translate and solve applications

Quiz

Before you get started, take this readiness quiz.

1. Evaluate $x+4$ when $x=-3$.
   If you missed this problem, review Exercise 1.5.25.
2. Evaluate $15-y$ when $y=-5$.
   If you missed this problem, review Exercise 1.5.31.
3. Simplify $4(4n+1)-15n$.
   If you missed this problem, review Exercise 1.10.49.
4. Translate into algebra "5 is less than x."
   If you missed this problem, review Exercise 1.3.43.

Verify a Solution of an Equation

Solving an equation is like discovering the answer to a puzzle. The purpose in solving an equation is to find the value or values of the variable that make each side of the equation the same – so that we end up with a true statement. Any value of the variable that makes the equation true is called a solution to the equation. It is the answer to the puzzle!

Definition: Solution of an Equation

A **solution of an equation** is a value of a variable that makes a true statement when substituted into the equation.

TO DETERMINE WHETHER A NUMBER IS A Solution TO AN EQUATION

1. Substitute the number in for the variable in the equation.
2. Simplify the expressions on both sides of the equation.
3. Determine whether the resulting equation is true (the left side is equal to the right side)
   - If it is true, the number is a solution.
   - If it is not true, the number is not a solution.

Example 9.1.1

Determine whether $x=\frac{3}{2}$ is a solution of $4x-2=2x+1$.

Solution

Since a solution to an equation is a value of the variable that makes the equation true, begin by substituting the value of the solution for the variable.

	$4x-2=2x+1$
Substitute $\frac{3}{2}$ for x.	$4\left(\frac{3}{2}\right)-2\stackrel{?}{=}2\left(\frac{3}{2}\right)+1$
Multiply.	$6-2\stackrel{?}{=}3+1$
Subtract.	$4=4\checkmark$

Since $x=\frac{3}{2}$ results in a true equation (4 is in fact equal to 4), $\frac{3}{2}$ is a solution to the equation $4x-2=2x+1$.

Try It 9.1.2

Is $y = \frac{4}{3}$ a solution of $9y + 2 = 6y + 3$?

Answer

no

Try It 9.1.3

Is $y = \frac{7}{5}$ a solution of $5y + 3 = 10y - 4$?

Answer

yes

Solve Equations Using the Subtraction and Addition Properties of Equality

We are going to use a model to clarify the process of solving an equation. An envelope represents the variable – since its contents are unknown – and each counter represents one. We will set out one envelope and some counters on our workspace, as shown in Figure 9.1.1. Both sides of the workspace have the same number of counters, but some counters are "hidden" in the envelope. Can you tell how many counters are in the envelope?

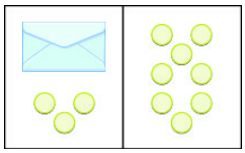

Figure 9.1.1: The illustration shows a model of an equation with one variable. On the left side of the workspace is an unknown (envelope) and three counters, while on the right side of the workspace are eight counters.

What are you thinking? What steps are you taking in your mind to figure out how many counters are in the envelope?

Perhaps you are thinking: "I need to remove the 3 counters at the bottom left to get the envelope by itself. The 3 counters on the left can be matched with 3 on the right and so I can take them away from both sides. That leaves five on the right—so there must be 5 counters in the envelope." See Figure 9.1.2 for an illustration of this process.

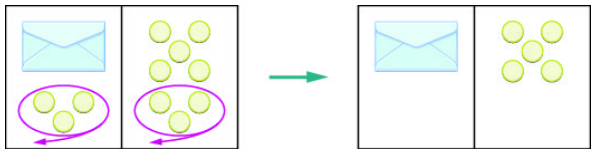

Figure 9.1.2: The illustration shows a model for solving an equation with one variable. On both sides of the workspace remove three counters, leaving only the unknown (envelope) and five counters on the right side. The unknown is equal to five counters.

What algebraic equation would match this situation? In Figure 9.1.3 each side of the workspace represents an expression and the center line takes the place of the equal sign. We will call the contents of the envelope x.

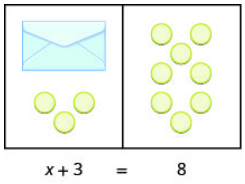

Figure 9.1.3: The illustration shows a model for the equation $x + 3 = 8$.

Let's write algebraically the steps we took to discover how many counters were in the envelope:

Table 9.1.1

	$x + 3 = 8$
First, we took away three from each side.	$x + 3 - 3 = 8 - 3$
Then we were left with five.	$x = 5$

Check:

Five in the envelope plus three more does equal eight!

$$5+3=8$$

Our model has given us an idea of what we need to do to solve one kind of equation. The goal is to isolate the variable by itself on one side of the equation. To solve equations such as these mathematically, we use the **Subtraction Property of Equality**.

SUBTRACTION PROPERTY OF EQUALITY

For any numbers a, b, and c,

$$\begin{aligned} &\text{If} \quad a=b \\ &\text{then} \quad a-c=b-c \end{aligned}$$

When you subtract the same quantity from both sides of an equation, you still have equality.

Note

Doing the Manipulative Mathematics activity "Subtraction Property of Equality" will help you develop a better understanding of how to solve equations by using the **Subtraction Property of Equality**.

Let's see how to use this property to solve an equation. Remember, the goal is to isolate the variable on one side of the equation. And we check our solutions by substituting the value into the equation to make sure we have a true statement.

Example 9.1.4

Solve: $y+37=-13$.

Solution

To get y by itself, we will undo the addition of 37 by using the Subtraction Property of Equality.

	$y+37=-13$
Subtract 37 from each side to 'undo' the addition.	$y+37=-13$ $-37 \quad -37$
Simplify.	$y=-50$

Check:	$y+37=-13$
Substitute $y=-50$	$-50+37=-13$
	$-13 \stackrel{?}{=} -13$ ✓

Since y=−50 makes y+37=−13 a true statement, we have the solution to this equation.

Try It 9.1.5

Solve: $x+19=-27$.

Answer

$x=-46$

Try It 9.1.6

Solve: $x+16=-34$.

Answer

$x=-50$

What happens when an equation has a number subtracted from the variable, as in the equation $x-5=8$? We use another property of equations to solve equations where a number is subtracted from the variable. We want to isolate the variable, so to 'undo' the subtraction we will add the number to both sides. We use the **Addition Property of Equality**.

ADDITION PROPERTY OF EQUALITY

For any numbers a, b, and c,

$$\begin{aligned} &\text{If} \quad a=b \\ &\text{then} \quad a+c=b+c \end{aligned}$$

When you add the same quantity from both sides of an equation, you still have equality.

In Exercise 9.1.4, 37 was added to the y and so we subtracted 37 to 'undo' the addition. In Exercise 9.1.7, we will need to 'undo' subtraction by using the **Addition Property of Equality**.

Example 9.1.7

Solve: $a-28=-37$.

Solution

	$a-28=-37$
Add 28 to each side to 'undo' the subtraction.	$a-28+28=-37+28$
Simplify.	$a=-9$
Check:	$a-28=-37$
Substitute $a=-9$	$-9-28=-37$
	$-37\stackrel{?}{=}-37$ ✓
	The solution to $a-28=-37$ is $a=-9$.

Try It 9.1.8

Solve: $n-61=-75$.

Answer

$n=-14$

Try It 9.1.9

Solve: $p-41=-73$.

Answer

$p=-32$

Example 9.1.10

Solve: $x-\frac{5}{8}=\frac{3}{4}$

Solution

	$x-\frac{5}{8}=\frac{3}{4}$
Use the Addition Property of Equality.	$x-\frac{5}{8}+\frac{5}{8}=\frac{3}{4}+\frac{5}{8}$
Find the LCD to add the fractions on the right.	$x=\frac{6}{8}+\frac{5}{8}$
Simplify.	$x=\frac{11}{8}$

Check:	$x-\frac{5}{8}=\frac{3}{4}$	
Substitute $x=\frac{11}{8}$	$\frac{11}{8}-\frac{5}{8}\stackrel{?}{=}\frac{3}{4}$	
Subtract.	$\frac{6}{8}\stackrel{?}{=}\frac{3}{4}$	
Simplify.	$\frac{3}{4}=\frac{3}{4}\checkmark$	
		The solution to $x-\frac{5}{8}=\frac{3}{4}$ is $x=\frac{11}{8}$.

Try It 9.1.11

Solve: $p-\frac{2}{3}=\frac{5}{6}$.

Answer

$p=\frac{9}{6}p=\frac{3}{2}$

Try It 9.1.12

Solve: $q-\frac{1}{2}=\frac{5}{6}$.

Answer

$q=\frac{4}{3}$

The next example will be an equation with decimals.

Example 9.1.13

Solve: $n-0.63=-4.2$.

Solution

		$n-0.63=-4.2$
Use the Addition Property of Equality.		$n-0.63+0.63=-4.2+0.63$
Add.		$n=-3.57$
Check:	$n=-3.57$	
Let $n=-3.57$.	$-3.57-0.63\stackrel{?}{=}-4.2$	
	$-4.2=-4.2\checkmark$	

Try It 9.1.14

Solve: $b-0.47=-2.1$.

Answer

$b=-1.63$

Try It 9.1.15

Solve: $c-0.93=-4.6$.

Answer

$c=-3.67$

Solve Equations That Require Simplification

In the previous examples, we were able to isolate the variable with just one operation. Most of the equations we encounter in algebra will take more steps to solve. Usually, we will need to simplify one or both sides of an equation before using the Subtraction or Addition Properties of Equality.

You should always simplify as much as possible before you try to isolate the variable. Remember that to simplify an expression means to do all the operations in the expression. Simplify one side of the equation at a time. Note that **simplification** is different from the process used to solve an equation in which we apply an operation to both sides.

Example 9.1.16: How to Solve Equations That Require Simplification

Solve: $9x-5-8x-6=7$.

Solution

Step 1. Simplify the expressions on each side as much as possible.	Rearrange the terms, using the Commutative Property of Addition. Combine like terms. Notice that each side is now simplified as much as possible.	$9x-5-8x-6=7$ $9x-8x-5-6=7$ $x-11=7$
Step 2. Isolate the variable.	Now isolate x. Undo subtraction by adding 11 to both sides.	$x-11+11=7+11$
Step 3. Simplify the expressions on both sides of the equation.		$x=18$
Step 4. Check the solution.		**Check:** Substitute $x=18$. $9x-5-8x-6=7$ $9(18)-5-8(18)-6\stackrel{?}{=}7$ $162-5-144-6\stackrel{?}{=}7$ $157-144-6\stackrel{?}{=}7$ $13-6\stackrel{?}{=}7$ $7=7$ ✓ The solution to $9x-5-8x-6=7$ is $x=18$.

Try It 9.1.17

Solve: $8y-4-7y-7=4$.

Answer

$y=15$

Try It 9.1.18

Solve: $6z+5-5z-4=3$.

Answer

$z=2$

Example 9.1.19

Solve: $5(n-4)-4n=-8$.

Solution

We simplify both sides of the equation as much as possible before we try to isolate the variable.

	$5(n-4)-4n=-8$
Distribute on the left.	$5n-20-4n=-8$
Use the Commutative Property to rearrange terms.	$5n-4n-20=-8$
Combine like terms.	$n-20=-8$
Each side is as simplified as possible. Next, isolate n.	
Undo subtraction by using the Addition Property of Equality.	$n-20+20=-8+20$
Add.	$n=12$
Check. Substitute $n=12$. $5(n-4)-4n=-8$ $5(12-4)-4(12)\stackrel{?}{=}-8z$ $5(8)-48\stackrel{?}{=}-8$ $40-48\stackrel{?}{=}-8$ $-8=-8\checkmark$	
	The solution to $5(n-4)-4n=-8$ is $n=12$.

Try It 9.1.20

Solve: $5(p-3)-4p=-10$.

Answer

$p=5$

Try It 9.1.21

Solve: $4(q+2)-3q=-8$.

Answer

$q=-16$

Example 9.1.22

Solve: $3(2y-1)-5y=2(y+1)-2(y+3)$.

Solution

We simplify both sides of the equation before we isolate the variable.

	$3(2y-1)-5y=2(y+1)-2(y+3)$
Distribute on both sides.	$6y-3-5y=2y+2-2y-6$
Use the Commutative Property of Addition.	$6y-5y-3=2y-2y+2-6$
Combine like terms.	$y-3=-4$
Each side is as simplified as possible. Next, isolate y.	
Undo subtraction by using the Addition Property of Equality.	$y-3+3=-4+3$

Add.	$y = -1$
Check. Let y=−1. $3(2y-1)-5y=2(y+1)-2(y+3)$ $3(2(-1)-1)-5(-1) \stackrel{?}{=} 2(-1+1)-2(-1+3)$ $3(-2-1)+5 \stackrel{?}{=} 2(0)-2(2)$ $3(-3)+5 \stackrel{?}{=} -4$ $-9+5 \stackrel{?}{=} -4$ $-4=-4$ ✓	
	The solution to $3(2y-1)-5y=2(y+1)-2(y+3)3(2y-1)-5y=2(y+1)-2(y+$ is $y=-1$.

Try It 9.1.23

Solve: $4(2h-3)-7h=6(h-2)-6(h-1)$.

Answer

$h=6$

Try It 9.1.24

Solve: $2(5x+2)-9x=3(x-2)-3(x-4)$.

Answer

$x=2$

Translate to an Equation and Solve

To solve applications algebraically, we will begin by translating from English sentences into equations. Our first step is to look for the word (or words) that would translate to the **equals sign**. Here are some of the words that are commonly used.

Equals =

- is
- is equal to
- is the same as
- the result is
- gives
- was
- will be

The steps we use to translate a sentence into an equation are listed below.

TRANSLATE AN ENGLISH SENTENCE TO AN ALGEBRAIC EQUATION

1. Locate the “equals” word(s). Translate to an equals sign (=).
2. Translate the words to the left of the “equals” word(s) into an algebraic expression.
3. Translate the words to the right of the “equals” word(s) into an algebraic expression.

Example 9.1.25

Translate and solve: Eleven more than x is equal to 54.

Solution

Translate.	Eleven more than x is equal to 54 $x+11 = 54$
Subtract 11 from both sides.	$x+11-11 = 54-11$
Simplify.	$x = 43$
Check: Is 54 eleven more than 43? $43+11 = 54\checkmark$	

Try It 9.1.26

Translate and solve: Ten more than x is equal to 41.

Answer

$x+10=41; \quad x=31$

Try It 9.1.27

Translate and solve: Twelve less than x is equal to 51.

Answer

$y-12=51; \quad y=63$

Example 9.1.28

Translate and solve: The difference of $12t$ and $11t$ is -14.

Solution

Translate.	The difference of $12t$ and $11t$ is -14 $12t-11t = -14$
Simplify.	$t = -14$
Check: $12(-14)-11(-14) \stackrel{?}{=} -14$ $-168+154 \stackrel{?}{=} -14$ $-14 = -14\checkmark$	

Try It 9.1.29

Translate and solve: The difference of $4x$ and $3x$ is 14.

Answer

$4x-3x=14; \quad x=14$

Try It 9.1.30

Translate and solve: The difference of $7a$ and $6a$ is -8.

Answer

$7a-6a=-8; \quad a=-8$

Translate and Solve Applications

Most of the time a question that requires an algebraic solution comes out of a real life question. To begin with that question is asked in English (or the language of the person asking) and not in math symbols. Because of this, it is an important skill to be able to translate an everyday situation into algebraic language.

We will start by restating the problem in just one sentence, assign a variable, and then translate the sentence into an equation to solve. When assigning a variable, choose a letter that reminds you of what you are looking for. For example, you might use q for the number of quarters if you were solving a problem about coins.

Example 9.1.31: How to Solve Translate and Solve Applications

The MacIntyre family recycled newspapers for two months. The two months of newspapers weighed a total of 57 pounds. The second month, the newspapers weighed 28 pounds. How much did the newspapers weigh the first month?

Solution

Step 1. Read the problem. Make sure all the words and ideas are understood.	The problem is about the weight of newspapers.	
Step 2. Identify what we are asked to find.	What are we asked to find?	"How much did the newspapers weigh the 2nd month?"
Step 3. Name what we are looking for. Choose a variable to represent that quantity.	Choose a variable.	Let w = weight of the newspapers the 1st month
Step 4. Translate into an equation. It may be helpful to restate the problem in one sentence with the important information.	Restate the problem. We know the weight of the newspapers the second month is 28 pounds. Translate into an equation, using the variable w.	Weight of newspapers the 1st month plus the weight of the newspapers the 2nd month equals 57 pounds. Weight from 1st month plus 28 equals 57. $w + 28 = 57$
Step 5. Solve the equation using good algebra techniques.	Solve.	$w + 28 - 28 = 57 - 28$ $w = 29$
Step 6. Check the answer in the problem and make sure it makes sense.	Does 1st month's weight plus 2nd month's weight equal 57 pounds?	**Check:** Does 1st month's weight plus 2nd month's weight equal 57 pounds? $29 + 28 \stackrel{?}{=} 57$ $57 = 57$ ✓
Step 7. Answer the question with a complete sentence.	Write a sentence to answer "How much did the newspapers weigh the 2nd month?"	The 2nd month the newspapers weighed 29 pounds.

Try It 9.1.32

Translate into an algebraic equation and solve:

The Pappas family has two cats, Zeus and Athena. Together, they weigh 23 pounds. Zeus weighs 16 pounds. How much does Athena weigh?

Answer

7 pounds

Try It 9.1.33

Translate into an algebraic equation and solve:

Sam and Henry are roommates. Together, they have 68 books. Sam has 26 books. How many books does Henry have?

Answer

42 books

SOLVE AN APPLICATION.

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
4. **Translate** into an equation. It may be helpful to restate the problem in one sentence with the important information.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

Example 9.1.34

Randell paid $28,675 for his new car. This was $875 less than the sticker price. What was the sticker price of the car?

Solution

Step 1. Read the problem.	
Step 2. Identify what we are looking for.	"What was the sticker price of the car?"
Step 3. Name what we are looking for. Choose a variable to represent that quantity.	Let s = the sticker price of the car.
Step 4. Translate into an equation. Restate the problem in one sentence.	$28675 is $875 less than the sticker price
	$28675 is $875 less than s
	$28675 = s - 875$
Step 5. Solve the equation.	$28675 + 875 = s - 875 + 875$
	$29550 = s$
Step 6. Check the answer. Is $875 less than $29550 equal to $28675? $29550 - 875 \stackrel{?}{=} 28675$ $28675 = 28675$✓	
Step 7. Answer the question with a complete sentence.	The sticker price of the car was $29550.

Try It 9.1.35

Translate into an algebraic equation and solve:

Eddie paid $19875 for his new car. This was $1025 less than the sticker price. What was the sticker price of the car?

Answer

$20900

Try It 9.1.36

Translate into an algebraic equation and solve:

The admission price for the movies during the day is $7.75. This is $3.25 less the price at night. How much does the movie cost at night?

Answer

$11.00

Key Concepts

- **To Determine Whether a Number is a Solution to an Equation**
  1. **Substitute the number in for the variable in the equation.**
  2. **Simplify the expressions on both sides of the equation.**
  3. **Determine whether the resulting statement is true.**
     - If it is true, the number is a solution.
     - If it is not true, the number is not a solution.
- **Addition Property of Equality**
  - For any numbers a, b and c, if $a = b$, then $a + c = b + c$.
- **Subtraction Property of Equality**
  - For any numbers a, b and c, if $a = b$, then $a - c = b - c$.
- **To Translate a Sentence to an Equation**
  1. Locate the “equals” word(s). Translate to an equal sign (=).
  2. Translate the words to the left of the “equals” word(s) into an algebraic expression.
  3. Translate the words to the right of the “equals” word(s) into an algebraic expression.
- **To Solve an Application**
  1. Read the problem. Make sure all the words and ideas are understood.
  2. Identify what we are looking for.
  3. Name what we are looking for. Choose a variable to represent that quantity.
  4. Translate into an equation. It may be helpful to restate the problem in one sentence with the important information.
  5. Solve the equation using good algebra techniques.
  6. Check the answer in the problem and make sure it makes sense.
  7. Answer the question with a complete sentence.

Glossary

solution of an equation

A solution of an equation is a value of a variable that makes a true statement when substituted into the equation.

9.1E: Exercises

Practice Makes Perfect

Verify a Solution of an Equation

In the following exercises, determine whether the given value is a solution to the equation.

Exercise 9.1E.1

Is $y = \frac{5}{3}$ a solution of
$6y + 10 = 12y$?

Answer

Yes

Exercise 9.1E.2

Is $x = \frac{9}{4}$ a solution of
$4x + 9 = 8x$?

Exercise 9.1E.3

Is $u = -\frac{1}{2}$ a solution of
$8u - 1 = 6u$?

Answer

No

Exercise 9.1E.4

Is $v = -\frac{1}{3}$ a solution of
$9v - 2 = 3v$?

Solve Equations using the Subtraction and Addition Properties of Equality

In the following exercises, solve each equation using the Subtraction and Addition Properties of Equality.

Exercise 9.1E.5

$x + 24 = 35$

Answer

x = 11

Exercise 9.1E.6

$x + 17 = 22$

Exercise 9.1E.7

$y + 45 = -66$

Answer

y = -111

Exercise 9.1E.8

$y + 39 = -83$

Exercise 9.1E.9

$b + \frac{1}{4} = \frac{3}{4}$

Answer

$b = \frac{1}{2}$

Exercise 9.1E.10

$a + \frac{2}{5} = \frac{4}{5}$

Exercise 9.1E.11

$p + 2.4 = -9.3$

Answer

p = -11.7

Exercise 9.1E.12

$m + 7.9 = 11.6$

Exercise 9.1E.13

$a - 45 = 76$

Answer

a = 121

Exercise 9.1E.14

$a - 30 = 57$

Exercise 9.1E.15

$m - 18 = -200$

Answer

m = -182

Exercise 9.1E.16

$m - 12 = -12$

Exercise 9.1E.17

$x - \frac{1}{3} = 2$

Answer

$x = \frac{7}{3}$

Exercise 9.1E.18

$x - \frac{1}{5} = 4$

Exercise 9.1E.19

$y - 3.8 = 10$

Answer

y = 10.8

Exercise 9.1E.20

$y - 7.2 = 5$

Exercise 9.1E.21

$x - 165 = -420$

Answer

$x = -255$

Exercise 9.1E.22

$z - 101 = -314$

Exercise 9.1E.23

$z + 0.52 = -8.5$

Answer

$z = -9.02$

Exercise 9.1E.24

$x + 0.93 = -4.1$

Exercise 9.1E.25

$q + \frac{3}{4} = \frac{1}{2}$

Answer

$q = -\frac{1}{4}$

Exercise 9.1E.26

$p+\frac{1}{3}=\frac{5}{6}$

Exercise 9.1E.27

$p-\frac{2}{5}=\frac{2}{3}$

Answer

$p=\frac{16}{15}$

Exercise 9.1E.28

$y-\frac{3}{4}=\frac{3}{5}$

Solve Equations that Require Simplification

In the following exercises, solve each equation.

Exercise 9.1E.29

$c+31-10=46$

Answer

c = 25

Exercise 9.1E.30

$m+16-28=5$

Exercise 9.1E.31

$9x+5-8x+14=20$

Answer

x = 1

Exercise 9.1E.32

$6x+8-5x+16=32$

Exercise 9.1E.33

$-6x-11+7x-5=-16$

Answer

x = 0

Exercise 9.1E.34

$-8n-17+9n-4=-41$

Exercise 9.1E.35

$5(y-6)-4y=-6$

Answer

$y=24$

Exercise 9.1E.36

$9(y-2)-8y=-16$

Exercise 9.1E.37

$8(u+1.5)-7u=4.9$

Answer

$u=-7.1$

Exercise 9.1E.38

$5(w+2.2)-4w=9.3$

Exercise 9.1E.39

$6a-5(a-2)+9=-11$

Answer

$a=-30$

Exercise 9.1E.40

$8c-7(c-3)+4=-16$

Exercise 9.1E.41

$6(y-2)-5y=4(y+3)-4(y-1)$

Answer

y =28

Exercise 9.1E.42

$9(x-1)-8x=-3(x+5)+3(x-5)$

Exercise 9.1E.43

$3(5n-1)-14n+9=10(n-4)-6n-4(n+1)$

Answer

n = -50

Exercise 9.1E.44

$2(8m+3)-15m-4=9(m+6)-2(m-1)-7m$

Exercise 9.1E.45

$-(j+2)+2j-1=5$

Answer

j = 8

Exercise 9.1E.46

$-(k+7)+2k+8=7$

Exercise 9.1E.47

$-\left(\frac{1}{4}a-\frac{3}{4}\right)+\frac{5}{4}a=-2$

Answer

$a=-\frac{11}{4}$

Exercise 9.1E.48

$-\left(\frac{2}{3}d-\frac{1}{3}\right)+\frac{5}{3}d=-4$

Exercise 9.1E.49

$8(4x+5)-5(6x)-x$
$=53-6(x+1)+3(2x+2)$

Answer

x=13

Exercise 9.1E.50

$6(9y-1)-10(5y)-3y$
$=22-4(2y-12)+8(y-6)$

Translate to an Equation and Solve

In the following exercises, translate to an equation and then solve it.

Exercise 9.1E.51

Nine more than x is equal to 52.

Answer

$x+9=52; x=43$

Exercise 9.1E.52

The sum of x and -15 is 23.

Exercise 9.1E.53

Ten less than m is -14.

Answer

$m-10=-14; m=-4$

Exercise 9.1E.54

Three less than y is -19.

Exercise 9.1E.55

The sum of y and -30 is 40.

Answer

$y+(-30)=40; y=70$

Exercise 9.1E.56

Twelve more than p is equal to 67.

Exercise 9.1E.57

The difference of $9x$ and $8x$ is 107.

Answer

$9x-8x=107; 107$

Exercise 9.1E.58

The difference of $5c$ and $4c$ is 602.

Exercise 9.1E.59

The difference of $5c$ and $4c$ is 602

Answer

$n-\frac{1}{6}=\frac{1}{2}; \frac{2}{3}$

Exercise 9.1E.60

The difference of f and $\frac{1}{3}$ is $\frac{1}{12}$.

Exercise 9.1E.61

The sum of $-4n$ and $5n$ is -82

Answer

$-4n+5n=-82;-82$

Exercise 9.1E.62

The sum of $-9m$ and $10m$ is -95

Translate and Solve Applications

In the following exercises, translate into an equation and solve.

Exercise 9.1E.63

Distance Avril rode her bike a total of 18 miles, from home to the library and then to the beach. The distance from Avril's house to the library is 7 miles. What is the distance from the library to the beach?

Answer

11 miles

Exercise 9.1E.64

Reading Jeff read a total of 54 pages in his History and Sociology textbooks. He read 41 pages in his History textbook. How many pages did he read in his Sociology textbook?

Exercise 9.1E.65

Age Eva's daughter is 15 years younger than her son. Eva's son is 22 years old. How old is her daughter?

Answer

7 years old

Exercise 9.1E.66

Age Pablo's father is 3 years older than his mother. Pablo's mother is 42 years old. How old is his father?

Exercise 9.1E.67

Groceries For a family birthday dinner, Celeste bought a turkey that weighed 5 pounds less than the one she bought for Thanksgiving. The birthday turkey weighed 16 pounds. How much did the Thanksgiving turkey weigh?

Answer

21 pounds

Exercise 9.1E.68

Weight Allie weighs 8 pounds less than her twin sister Lorrie. Allie weighs 124 pounds. How much does Lorrie weigh?

Exercise 9.1E.69

Health Connor's temperature was 0.7 degrees higher this morning than it had been last night. His temperature this morning was 101.2 degrees. What was his temperature last night?

Answer

100.5 degrees

Exercise 9.1E.70

Health The nurse reported that Tricia's daughter had gained 4.2 pounds since her last checkup and now weighs 31.6 pounds. How much did Tricia's daughter weigh at her last checkup?

Exercise 9.1E.71

Salary Ron's paycheck this week was $17.43 less than his paycheck last week. His paycheck this week was $103.76. How much was Ron's paycheck last week?

Answer

$121.19

Exercise 9.1E.72

Textbooks Melissa's math book cost $22.85 less than her art book cost. Her math book cost $93.75. How much did her art book cost?

Everyday Math

Exercise 9.1E.73

Construction Miguel wants to drill a hole for a $\frac{5}{8}$ inch screw. The hole should be $\frac{1}{12}$ inch smaller than the screw. Let d equal the size of the hole he should drill. Solve the equation $d = \frac{5}{8} - \frac{1}{12}$ to see what size the hole should be.

Answer

$d = \frac{13}{24}$ inch

Exercise 9.1E.74

Baking Kelsey needs $\frac{2}{3}$ cup of sugar for the cookie recipe she wants to make. She only has $\frac{3}{8}$ cup of sugar and will borrow the rest from her ner neighbor. Let s equal the amount of sugar she will borrow. Solve the equation $\frac{3}{8} + s = \frac{2}{3}$ to find the amount of sugar she should ask to borrow.

Writing Exercises

Exercise 9.1E.75

Is -8 a solution to the equation $3x = 16 - 5x$? How do you know?

Answer

No. Justifications will vary.

? Exercise $9.1E.76$

What is the first step in your solution to the equation $10x + 2 = 4x + 26$?

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
verify a solution of an equation.			
solve equations using the subtraction and addition properties of equality.			
solve equations that require simplification.			
translate to an equation and solve.			
translate and solve applications.			

ⓑ If most of your checks were:

…confidently. Congratulations! You have achieved your goals in this section! Reflect on the study skills you used so that you can continue to use them. What did you do to become confident of your ability to do these things? Be specific!

…with some help. This must be addressed quickly as topics you do not master become potholes in your road to success. Math is sequential - every topic builds upon previous work. It is important to make sure you have a strong foundation before you move on. Who can you ask for help? Your fellow classmates and instructor are good resources. Is there a place on campus where math tutors are available? Can your study skills be improved?

…no - I don't get it! This is critical and you must not ignore it. You need to get help immediately or you will quickly be overwhelmed. See your instructor as soon as possible to discuss your situation. Together you can come up with a plan to get you the help you need.

This page titled 9.1E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **2.1E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

9.2: Solve Equations using the Division and Multiplication Properties of Equality

Learning Objectives

By the end of this section, you will be able to:

- Solve equations using the Division and Multiplication Properties of Equality
- Solve equations that require simplification
- Translate to an equation and solve
- Translate and solve applications

Note

Before you get started, take this readiness quiz.

1. Simplify: $-7\left(\frac{1}{-7}\right)$.
   If you missed this problem, review Exercise 1.6.13.
2. Evaluate $9x+2$ when $x=-3$.
   If you missed this problem, review Exercise 1.5.34.

Solve Equations Using the Division and Multiplication Properties of Equality

You may have noticed that all of the equations we have solved so far have been of the form $x+a=b$ or $x-a=b$. We were able to isolate the variable by adding or subtracting the constant term on the side of the equation with the variable. Now we will see how to solve equations that have a variable multiplied by a constant and so will require division to isolate the variable.

Let's look at our puzzle again with the envelopes and counters in Figure 9.2.1.

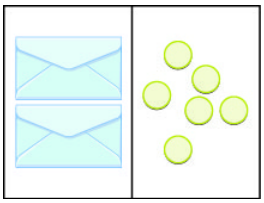

Figure 9.2.1: The illustration shows a model of an equation with one variable multiplied by a constant. On the left side of the workspace are two instances of the unknown (envelope), while on the right side of the workspace are six counters.

In the illustration there are two identical envelopes that contain the same number of counters. Remember, the left side of the workspace must equal the right side, but the counters on the left side are "hidden" in the envelopes. So how many counters are in each envelope?

How do we determine the number? We have to separate the counters on the right side into two groups of the same size to correspond with the two envelopes on the left side. The 6 counters divided into 2 equal groups gives 3 counters in each group (since $6\div 2=3$).

What equation models the situation shown in Figure 9.2.2? There are two envelopes, and each contains xx counters. Together, the two envelopes must contain a total of 6 counters.

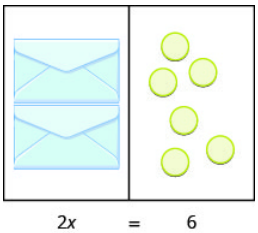

Figure 9.2.2: The illustration shows a model of the equation $2x=6$.

$2x=6$

If we divide both sides of the equation by 2, as we did with the envelopes and counters,	$\frac{2x}{2}=\frac{6}{2}$
we get:	$x=3$

We found that each envelope contains 3 counters. Does this check? We know $2 \cdot 3 = 6$, so it works! Three counters in each of two envelopes does equal six!

This example leads to the **Division Property of Equality**.

THE DIVISION PROPERTY OF EQUALITY

For any numbers a, b, and c, and $c \neq 0$,

$$\begin{array}{rcl} \text{If} & a & = & b \\ \text{then} & \frac{a}{c} & = & \frac{b}{c} \end{array} \qquad (9.2.1)$$

When you divide both sides of an equation by any non-zero number, you still have equality.

Note

Doing the Manipulative Mathematics activity "**Division Property of Equality**" will help you develop a better understanding of how to solve equations by using the Division Property of Equality.

The goal in solving an equation is to 'undo' the operation on the variable. In the next example, the variable is multiplied by 5, so we will divide both sides by 5 to 'undo' the multiplication.

Example 9.2.1

Solve: $5x = -27$.

Solution

To isolate x, "undo" the multiplication by 5.		$5x=-27$
Divide to 'undo' the multiplication.		$\frac{5x}{5}=\frac{-27}{5}$
Simplify.		$x=-\frac{27}{5}$
Check:	$5x=-27$	
Substitute $-\frac{27}{5}$ for x.	$5\left(-\frac{27}{5}\right)\stackrel{?}{=}-27$	
	$-27=-27$ ✓	
		Since this is a true statement, $x=-\frac{27}{5}$ is the solution to $5x=-27$.

Try It 9.2.2

Solve: $3y = -41$.

Answer

$y=-\frac{41}{3}$

Try It 9.2.3

Solve: $4z = -55$.

Answer

$y = -\frac{55}{4}$

Consider the equation $\frac{x}{4} = 3$. We want to know what number divided by 4 gives 3. So to "undo" the division, we will need to multiply by 4. The **Multiplication Property of Equality** will allow us to do this. This property says that if we start with two equal quantities and multiply both by the same number, the results are equal.

THE MULTIPLICATION PROPERTY OF EQUALITY

For any numbers *a*, *b*, and *c*,

$$\begin{array}{lllll} \text{If} & a & = & b \\ \text{then} & ac & = & bc \end{array} \qquad (9.2.2)$$

If you multiply both sides of an equation by the same number, you still have equality.

Example 9.2.4

Solve: $\frac{y}{-7} = -14$

Solution

Here y is divided by −7. We must multiply by −7 to isolate y.

	$\frac{y}{-7} = -14$
Multiply both sides by −7.	$-7\left(\frac{y}{-7}\right) = -7(-14)$
Multiply.	$\frac{-7y}{7} = 98$
Simplify.	$y = 98$
Check: $\frac{y}{-7} = -14$	
Substitute y=98.	$\frac{98}{-7} \stackrel{?}{=} -14$
Divide.	$-14 = -14$ ✓

Try It 9.2.5

Solve: $\frac{a}{-7} = -42$

Answer

$a = 294$

Try It 9.2.6

Solve: $\frac{b}{-6} = -24$

Answer

$b = 144$

Example 9.2.7

Solve: $-n = 9$

Solution

	$-n = 9$
Remember −n is equivalent to −1n.	$-1n = 9$
Divide both sides by −1.	$\frac{-1n}{-1} = \frac{9}{-1}$
Divide.	$n = -9$

Notice that there are two other ways to solve −n=9. We can also solve this equation by multiplying both sides by −1 and also by taking the opposite of both sides.

Check:	$-n = 9$	
Substitute n=−9.	$-(-9) \stackrel{?}{=} 9$	
Simplify.	$9 = 9$ ✓	

Try It 9.2.8

Solve: $-k = 8$.

Answer

$k = -8$

Try It 9.2.9

Solve: $-g = 3$.

Answer

$g = -3$

Example 9.2.10

Solve: $\frac{3}{4}x = 12$

Solution

Since the product of a number and its reciprocal is 1, our strategy will be to isolate x by multiplying by the reciprocal of $\frac{3}{4}$.

	$\frac{3}{4}x = 12$
Multiply by the reciprocal of $\frac{3}{4}$.	$\frac{4}{3} \cdot \frac{3}{4}x = \frac{4}{3} \cdot 12$
Reciprocals multiply to 1.	$1x = \frac{4}{3} \cdot \frac{12}{1}$
Multiply.	$x = 16$

Notice that we could have divided both sides of the equation $\frac{3}{4}x = 12$ by $\frac{3}{4}$ to isolate x. While this would work, most people would find multiplying by the reciprocal easier.

Check:	$\frac{3}{4}x = 12$	

Substitute $x = 16$.	$\frac{3}{4} \cdot 16 \stackrel{?}{=} 12$	
	$12 = 12$ ✓	

Try It 9.2.11

Solve: $\frac{2}{5}n = 14$.

Answer

$n = 35$

Try It 9.2.12

Solve: $\frac{5}{6}y = 15$.

Answer

$y = 18$

In the next example, all the variable terms are on the right side of the equation. As always, our goal in solving the equation is to isolate the variable.

Example 9.2.13

Solve: $\frac{8}{15} = -\frac{4}{5}x$

Solution

	$\frac{8}{15} = -\frac{4}{5}x$
Multiply by the reciprocal of $-\frac{4}{5}$.	$\left(-\frac{5}{4}\right)\left(\frac{8}{15}\right) = \left(-\frac{5}{4}\right)\left(-\frac{4}{5}x\right)$
Reciprocals multiply to 1.	$-\frac{\cancel{5} \cdot \cancel{4} \cdot 2}{\cancel{4} \cdot 3 \cdot \cancel{5}} = 1x$
Multiply.	$-\frac{2}{3} = x$

Check:	$\frac{8}{15} = -\frac{4}{5}x$
Let $x = -\frac{2}{3}$.	$\frac{8}{15} = -\frac{4}{5}\left(-\frac{2}{3}\right)$
	$\frac{8}{15} = \frac{8}{15}$ ✓

Try It 9.2.14

Solve: $\frac{9}{25} = -\frac{4}{5}z$

Answer

$z = -\frac{9}{5}$

Try It 9.2.15

$\frac{5}{6} = -\frac{8}{3}r$

Answer

$r = -\frac{5}{16}$

Solve Equations That Require Simplification

Many equations start out more complicated than the ones we have been working with.

With these more complicated equations the first step is to simplify both sides of the equation as much as possible. This usually involves combining like terms or using the distributive property.

Example 9.2.16

Solve: $14 - 23 = 12y - 4y - 5y$.

Solution

Begin by simplifying each side of the equation.

	$14 - 23 \stackrel{?}{=} -36 + 12 + 15$
Simplify each side.	$-9 = -9$ ✓
Divide both sides by 3 to isolate y.	$14 - 23 = 12y - 4y - 5y$
Divide.	$-9 = 3y$
Check:	$14 - 23 = 12y - 4y - 5y$
Substitute $y = -3$.	$14 - 23 \stackrel{?}{=} 12(-3) - 4(-3) - 5(-3)$
	$14 - 23 \stackrel{?}{=} -36 + 12 + 15$
	$-9 = -9$ ✓

Try It 9.2.17

Solve: $18 - 27 = 15c - 9c - 3c$.

Answer

$c = -3$

Try It 9.2.18

Solve: $18 - 22 = 12x - x - 4x$.

Answer

$x = -\frac{4}{7}$

Example 9.2.19

Solve: $-4(a - 3) - 7 = 25$.

Solution

Here we will simplify each side of the equation by using the distributive property first.

	$-4(a-3)-7=25$
Distribute.	$-4a+12-7=25$
Simplify.	$-4a+5=25$
Simplify.	$-4a=20$
Divide both sides by -4 to isolate a.	$\frac{-4a}{-4}=\frac{20}{-4}$
Divide.	$a=-5$

Check:	$-4(a-3)-7=25$
Substitute $a=-5$	$-4(-5-3)-7\stackrel{?}{=}25$
	$-4(-8)-7\stackrel{?}{=}25$
	$32-7\stackrel{?}{=}25$
	$25=25$ ✓

Try It 9.2.20

Solve: $-4(q-2)-8=24$.

Answer

$q=-6$

Try It 9.2.21

Solve: $-6(r-2)-12=30$.

Answer

$r=-5$

Now we have covered all four properties of equality—subtraction, addition, division, and multiplication. We'll list them all together here for easy reference.

PROPERTIES OF EQUALITY

When you add, subtract, multiply, or divide the same quantity from both sides of an equation, you still have equality.

$$\begin{array}{ll} \textbf{Subtraction Property of Equality} & \textbf{Addition Property of Equality} \\ \text{For any real numbers a, b, and c,} & \text{For any real numbers a, b, and c,} \\ \text{if } a=b, & \text{if } a=b, \\ \text{then } a-c=b-c & \text{then } a+c=b+c \\ \textbf{Divition Property of Equality} & \textbf{Multiplication Property of Equality} \\ \text{For any real numbers a, b, and c,} & \text{For any real numbers a, b, and c,} \\ \text{if } a=b, & \text{if } a=b, \\ \text{then } a-c=b-c & \text{then } a+c=b+c \end{array} \tag{9.2.3}$$

When you add, subtract, multiply, or divide the same quantity from both sides of an equation, you still have equality.

Translate to an Equation and Solve

In the next few examples, we will translate sentences into equations and then solve the equations. You might want to review the translation table in the previous chapter.

Example 9.2.22

Translate and solve: The number 143 is the product of −11 and *y*.

Solution

Translate.	The number 143 is the product of −11 and y. $143 = -11y$
Divide by −11.	$\frac{143}{-11} = \frac{-11y}{-11}$
Simplify.	$-13 = y$
Check: $143 = -11y$ $143 \stackrel{?}{=} -11(-13)$ (9.2.4) $143 = 143\checkmark$	

Try It 9.2.23

Translate and solve: The number 132 is the product of *−12* and *y*.

Answer

132=−12y;y=−11

Try It 9.2.24

Translate and solve: The number 117 is the product of *−13* and *z*.

Answer

117=−13z;z=−9

Example 9.2.25

Translate and solve: *n* divided by 8 is −32.

Solution

Begin by translating the sentence into an equation. Translate.		*n* divided by 8 is −32. $\frac{n}{8} = -32$
Multiple both sides by 8.		$8 \cdot \frac{n}{8} = 8(-32)$
Simplify.		$n = -256$
Check:	Is nn divided by 8 equal to −32?	
Let $n = -256$.	Is −256 divided by 88 equal to −32?	
Translate.	$\frac{-256}{8} \stackrel{?}{=} -32$	

Simplify.	$-32 = -32$✓

Try It 9.2.26

Translate and solve: nn divided by 7 is equal to −21.

Answer

$\frac{n}{7} = -21; n = -147$

Try It 9.2.27

Translate and solve: n divided by 8 is equal to −56.

Answer

$\frac{n}{8} = -56; n = -448$

Example 9.2.28

Translate and solve: The quotient of yy and −4 is 68.

Solution

Begin by translating the sentence into an equation.

Translate.	The quotient of y and -4 is 68. $\frac{y}{-4} = 68$
Multiply both sides by -4.	$-4\left(\frac{y}{-4}\right) = -4(68)$
Simplify.	$y = -272$
Check:	Is the quotient of y and −4 equal to 68?
Let y=−272.	Is the quotient of −272 and −4 equal to 68?
Translate.	$\frac{-272}{-4} \stackrel{?}{=} 68$
Simplify.	$68 = 68$✓

Try It 9.2.29

Translate and solve: The quotient of q and −8 is 72.

Answer

$\frac{q}{-8} = 72; q = -576$

Try It 9.2.30

Translate and solve: The quotient of p and −9 is 81.

Answer

$\frac{p}{-9} = 81; p = -729$

Example 9.2.31

Translate and solve: Three-fourths of p is 18.

Solution

Begin by translating the sentence into an equation. Remember, “of” translates into multiplication.

Translate.	Three-fourths of p is 18. $\frac{3}{4}p = 18$
Multiply both sides by $\frac{4}{3}$.	$\frac{4}{3} \cdot \frac{3}{4}p = \frac{4}{3} \cdot 18$
Simplify.	$p = 24$
Check:	Is three-fourths of p equal to 18?
Let p = 24.	Is three-fourths of 24 equal to 18?
Translate.	$\frac{3}{4} \cdot 24 \stackrel{?}{=} 18$
Simplify.	$18 = 18$✓

Try It 9.2.32

Translate and solve: Two-fifths of f is 16.

Answer

$\frac{2}{5}f = 16; f = 40$

Try It 9.2.33

Translate and solve: Three-fourths of f is 21.

Answer

$\frac{3}{4}f = 21; f = 28$

Example 9.2.34

Translate and solve: The sum of three-eighths and x is one-half.

Solution

Begin by translating the sentence into an equation.

Translate.	The sum of three – eighths and x is $\frac{1}{2}$ $\frac{3}{8} + x = \frac{1}{2}$
Subtract $\frac{3}{8}$ from each side.	$\frac{3}{8} - \frac{3}{8} + x = \frac{1}{2} - \frac{3}{8}$
Simplify and rewrite fractions with common denominators.	$x = \frac{4}{8} - \frac{3}{8}$
Simplify.	$x = \frac{1}{8}$

Check:	Is the sum of three-eighths and x equal to one-half?
Let $x = \frac{1}{8}$.	Is the sum of three-eighths and one-eighth equal to one-half?
Translate.	$\frac{3}{8} + \frac{1}{8} \stackrel{?}{=} \frac{1}{2}$
Simplify.	$\frac{4}{8} \stackrel{?}{=} \frac{1}{2}$
Simplify.	$\frac{1}{2} = \frac{1}{2}$ ✓

Try It 9.2.35

Translate and solve: The sum of five-eighths and *x* is one-fourth.

Answer

$\frac{5}{8} + x = \frac{1}{4}; x = -\frac{3}{8}$

Try It 9.2.36

Translate and solve: The sum of three-fourths and *x* is five-sixths.

Answer

$\frac{3}{4} + x = \frac{5}{6}; x = \frac{1}{12}$

Translate and Solve Applications

To solve applications using the Division and Multiplication Properties of Equality, we will follow the same steps we used in the last section. We will restate the problem in just one sentence, assign a variable, and then translate the sentence into an equation to solve.

Example 9.2.37

Denae bought 6 pounds of grapes for $10.74. What was the cost of one pound of grapes?

Solution

What are you asked to find?	The cost of 1 pound of grapes	
Assign a variable.	Let c = the cost of one pound.	
Write a sentence that gives the information to find it.	The cost of 6 pounds is $10.74	
Translate into an equation.	$6c = 10.74$	
Solve.	$\frac{6c}{c} = \frac{10.74}{6}$ $c = 1.79$	(9.2.5)
	The grapes cost $1.79 per pound.	
Check: If one pound costs $1.79, *do* 6 pounds cost $10.74?		
$6(1.79) \stackrel{?}{=} 10.74$ $10.74 = 10.74$✓		

? Try It 9.2.38

Translate and solve:

Arianna bought a 24-pack of water bottles for $9.36. What was the cost of one water bottle?

Answer

$0.39

? Try It 9.2.39

Translate and solve:

At JB's Bowling Alley, 6 people can play on one lane for $34.98. What is the cost for each person?

Answer

$5.83

✓ Example 9.2.40

Andreas bought a used car for $12,000. Because the car was 4-years old, its price was $\frac{3}{4}$ of the original price, when the car was new. What was the original price of the car?

Solution

What are you asked to find?	The original price of the car
Assign a variable.	Let p = the original price.
Write a sentence that gives the information to find it.	\$12000 is $\frac{3}{4}$ of the original price.
Translate into an equation.	$12000 = \frac{3}{4}p$
Solve.	$\frac{3}{4}(12000) = \frac{4}{3} \cdot \frac{3}{4}p$ $16000 = p$
	The original cost of the car was \$16000.

(9.2.6)

Check: Is $\frac{3}{4}$ of \$16000 equal to \$12000

$\frac{3}{4} \cdot 16000 \stackrel{?}{=} 12000$
$12000 = 12000$✓

? Try It 9.2.41

Translate and solve:

The annual property tax on the Mehta's house is \$1,800, calculated as $\frac{15}{1000}$ of the assessed value of the house. What is the assessed value of the Mehta's house?

Answer

\$120000

? Try It 9.2.42

Translate and solve:

Stella planted 14 flats of flowers in $\frac{2}{3}$ of her garden. How many flats of flowers would she need to fill the whole garden?

Answer

21 flats

Key Concepts

- **The Division Property of Equality**—For any numbers a, b, and c, and $c \neq 0$, if $a = b$, then $\frac{a}{c} = \frac{b}{c}$.
  When you divide both sides of an equation by any non-zero number, you still have equality.
- **The Multiplication Property of Equality**—For any numbers a, b, and c, if $a = b$, then $ac = bc$.
  If you multiply both sides of an equation by the same number, you still have equality.

9.2E: Exercises

Practice Makes Perfect

Solve Equations Using the Division and Multiplication Properties of Equality

In the following exercises, solve each equation using the Division and Multiplication Properties of Equality and check the solution.

Exercise 9.2E.1

$8x = 56$

Answer

$x = 7$

Exercise 9.2E.2

$7p = 63$

Exercise 9.2E.3

$-5c = 55$

Answer

$c = -11$

Exercise 9.2E.4

$-9x = -27$

Exercise 9.2E.5

$-809 = 15y$

Answer

$y = -\frac{809}{15}$

Exercise 9.2E.6

$-731 = 19y$

Exercise 9.2E.7

$-37p = -541$

Answer

$p = -\frac{541}{37}$

Exercise 9.2E.8

$-19m = -586$

Exercise 9.2E.9

$0.25z = 3.25$

Answer

z= 13

Exercise 9.2E.10

$0.75a = 11.25$

Exercise 9.2E.11

$-13x = 0$

Answer

$x = 0$

Exercise 9.2E.12

$24x = 0$

Exercise 9.2E.13

$\frac{x}{4} = 35$

Answer

$x = 140$

Exercise 9.2E.14

$\frac{z}{2} = 54$

Exercise 9.2E.15

$-20 = \frac{q}{-5}$

Answer

$q = 100$

Exercise 9.2E.16

$\frac{c}{-3} = -12$

Exercise 9.2E.17

$\frac{y}{9} = -16$

Answer

$y = -144$

Exercise 9.2E.18

$\frac{q}{6} = -38$

Exercise 9.2E.19

$\frac{m}{-12} = 45$

Answer

$m = -540$

Exercise 9.2E.20

$-24 = \frac{p}{-20}$

Exercise 9.2E.21

$-y = 6$

Answer

$y = -6$

Exercise 9.2E.22

$-u = 15$

Exercise 9.2E.23

$-v = -72$

Answer

$v = 72$

Exercise 9.2E.24

$-x = -39$

Exercise 9.2E.25

$\frac{2}{3}y = 48$

Answer

$y = 72$

Exercise 9.2E.26

$\frac{3}{5}r = 75$

Exercise 9.2E.27

$-\frac{5}{8}w = 40$

Answer

$w = -64$

Exercise 9.2E.28

$24 = -\frac{3}{4}x$

Exercise 9.2E.29

$-\frac{2}{5} = \frac{1}{10}a$

Answer

$a = -4$

Exercise 9.2E.30

$-\frac{1}{3}q = -\frac{5}{6}$

Exercise 9.2E.31

$-\frac{7}{10}x = -\frac{14}{3}$

Answer

$x = \frac{20}{3}$

Exercise 9.2E.32

$\frac{3}{8}y = -\frac{1}{4}$

Exercise 9.2E.33

$\frac{7}{12} = -\frac{3}{4}p$

Answer

$p = -\frac{7}{9}$

Exercise 9.2E.34

$\frac{11}{18} = -\frac{5}{6}q$

Exercise 9.2E.35

$-\frac{5}{18} = -\frac{10}{9}u$

Answer

$u = \frac{1}{4}$

Exercise 9.2E.36

$-\frac{7}{20}=-\frac{7}{4}v$

Solve Equations That Require Simplification

In the following exercises, solve each equation requiring simplification.

Exercise 9.2E.37

$100-16=4p-10p-p$

Answer

$p=-12$

Exercise 9.2E.38

$-18-7=5t-9t-6t$

Exercise 9.2E.39

$\frac{7}{8}n-\frac{3}{4}n=9+2$

Answer

$n=88$

Exercise 9.2E.40

$\frac{5}{12}q+\frac{1}{2}q=25-3$

Exercise 9.2E.41

$0.25d+0.10d=6-0.75$

Answer

d=15

Exercise 9.2E.42

$0.05p-0.01p=2+0.24$

Exercise 9.2E.43

$-10(q-4)-57=93$

Answer

$q=-11$

Exercise 9.2E.44

$-12(d-5)-29=43$

Exercise 9.2E.45

$-10(x+4)-19=85$

Answer

$x=-\frac{72}{5}$

Exercise 9.2E.46

$-15(z+9)-11=75$

Mixed Practice

In the following exercises, solve each equation.

Exercise 9.2E.47

$\frac{9}{10}x=90$

Answer

$x=100$

Exercise 9.2E.48

$\frac{5}{12}y=60$

Exercise 9.2E.49

$y+46=55$

Answer

$y=9$

Exercise 9.2E.50

$x+33=41$

Exercise 9.2E.51

$\frac{w}{-2}=99$

Answer

$w=-198$

Exercise 9.2E.52

$\frac{s}{-3}=-60$

Exercise 9.2E.53

$27 = 6a$

Answer

$a = \frac{9}{2}$

Exercise 9.2E.54

$-a = 7$

Exercise 9.2E.55

$-x = 2$

Answer

$x = -2$

Exercise 9.2E.56

$z - 16 = -59$

Exercise 9.2E.57

$m - 41 = -14$

Answer

$m = 27$

Exercise 9.2E.58

$0.04r = 52.60$

Exercise 9.2E.59

$63.90 = 0.03p$

Answer

$p = 2130$

Exercise 9.2E.60

$-15x = -120$

Exercise 9.2E.61

$84 = -12z$

Answer

$y = -7$

Exercise 9.2E.62

$19.36 = x - 0.2x$

Exercise 9.2E.63

$c - 0.3c = 35.70$

Answer

$c = 51$

Exercise 9.2E.64

$-y = -9$

Exercise 9.2E.65

$-x = -8$

Answer

$x = 8$

Translate to an Equation and Solve

In the following exercises, translate to an equation and then solve.

Exercise 9.2E.66

187 is the product of -17 and m

Exercise 9.2E.67

133 is the product of -19 and n

Answer

$133 = -19n; n = -7$

Exercise 9.2E.68

-184 is the product of 23 and p

Exercise 9.2E.69

-152 is the product of 8 and q

Answer

$-152 = 8q; q = -19$

Exercise 9.2E.70

u divided by 7 is equal to -49

Exercise 9.2E.71

r divided by 12 is equal to -48

Answer

$\frac{r}{12} = -48; r = -576$

Exercise 9.2E.72

h divided by -13 is equal to -65

Exercise 9.2E.73

j divided by -20 is equal to -80

Answer

$\frac{j}{-20} = -80; j = 1,600$

Exercise 9.2E.74

The quotient c and -19 is 38.

Exercise 9.2E.75

The quotient of b and -6 is 18

Answer

$\frac{b}{-6} = 18; b = -108$

Exercise 9.2E.76

The quotient of h and 26 is -52

Exercise 9.2E.77

The quotient k and 22 is -66

Answer

$\frac{k}{22} = -66; k = -1,452$

Exercise 9.2E.78

Five-sixths of y is 15

Exercise 9.2E.79

Three-tenths of x is 15

Answer

$\frac{3}{10}x = 15; x = 50$

Exercise 9.2E.80

Four-thirds of w is 36

Exercise 9.2E.81

Five-halves of v is 50

Answer

$\frac{5}{2}v = 50; v = 20$

Exercise 9.2E.82

The sum of nine-tenths and g is two-thirds.

Exercise 9.2E.83

The sum of two-fifths and f is one-half.

Answer

$\frac{2}{5} + f = \frac{1}{2}; f = \frac{1}{10}$

Exercise 9.2E.84

The difference of p and one-sixth is two-thirds.

Exercise 9.2E.85

The difference of q and one-eighth is three-fourths.

Answer

$q - \frac{1}{8} = \frac{3}{4}; q = \frac{7}{8}$

Translate and Solve Applications

In the following exercises, translate into an equation and solve.

Exercise 9.2E.86

Kindergarten Connie's kindergarten class has 24 children. She wants them to get into 4 equal groups. How many children will she put in each group?

Exercise 9.2E.87

Balloons Ramona bought 18 balloons for a party. She wants to make 3 equal bunches. How many balloons did she use in each bunch?

Answer

6 balloons

Exercise 9.2E.88

Tickets Mollie paid $36.25 for 5 movie tickets. What was the price of each ticket?

Exercise 9.2E.89

Shopping Serena paid $12.96 for a pack of 12 pairs of sport socks. What was the price of pair of sport socks?

Answer

$1.08

Exercise 9.2E.90

Sewing Nancy used 14 yards of fabric to make flags for one-third of the drill team. How much fabric, would Nancy need to make flags for the whole team?

Exercise 9.2E.91

MPG John's SUV gets 18 miles per gallon (mpg). This is half as many mpg as his wife's hybrid car. How many miles per gallon does the hybrid car get?

Answer

36 mpg

Exercise 9.2E.92

Height Aiden is 27 inches tall. He is $\frac{3}{8}$ as tall as his father. How tall is his father?

Exercise 9.2E.92

Real estate Bea earned $\$11,700$ commission for selling a house, calculated as $\frac{6}{100}$ of the selling price. What was the selling price of the house?

Answer

$195,000

Everyday Math

Exercise 9.2E.93

Commissions Every week Perry gets paid $\$150$ plus 12% of his total sales amount. Solve the equation $840 = 150 + 0.12(a - 1250)$ for a to find the total amount Perry must sell in order to be paid $\$840$ one week.

Exercise 9.2E.94

Stamps Travis bought $9.45 worth of 49-cent stamps and 21-cent stamps. The number of 21-cent stamps was 5 less than the number of 49-cent stamps. Solve the equation 0.49s+0.21(s−5)=9.45 for s, to find the number of 49-cent stamps Travis bought.

Answer

15 49-cent stamps

Writing Exercises

Exercise $9.2E.95$

Frida started to solve the equation −3x=36 by adding 3 to both sides. Explain why Frida's method will not solve the equation.

Exercise $9.2E.96$

Emiliano thinks $x = 40$ is the solution to the equation $\frac{1}{2}x = 80$. Explain why he is wrong.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve equations using the Division and Multiplication Properties of equality.			
solve equations that require simplification.			
translate to an equation and solve.			
translate and solve applications.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 9.2E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **2.2E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

9.3: Solve Equations with Variables and Constants on Both Sides

Learning Objectives

By the end of this section, you will be able to:

- Solve an equation with constants on both sides
- Solve an equation with variables on both sides
- Solve an equation with variables and constants on both sides

Note

Before you get started, take this readiness quiz.

1. Simplify: 4y−9+9.
   If you missed this problem, review Exercise 1.10.20.

Solve Equations with Constants on Both Sides

In all the equations we have solved so far, all the variable terms were on only one side of the equation with the constants on the other side. This does not happen all the time—so now we will learn to solve equations in which the variable terms, or constant terms, or both are on both sides of the equation.

Our strategy will involve choosing one side of the equation to be the "variable side", and the other side of the equation to be the "constant side." Then, we will use the Subtraction and Addition Properties of Equality to get all the variable terms together on one side of the equation and the constant terms together on the other side.

By doing this, we will transform the equation that began with variables and constants on both sides into the form $ax = b$. We already know how to solve equations of this form by using the Division or Multiplication Properties of Equality.

Example 9.3.1

Solve: $7x + 8 = -13$.

Solution

In this equation, the variable is found only on the left side. It makes sense to call the left side the "variable" side. Therefore, the right side will be the "constant" side. We will write the labels above the equation to help us remember what goes where.

$$\overset{\text{variable}}{7x} + 8 = \overset{\text{constant}}{-13}$$

Since the left side is the "xx", or variable side, the 8 is out of place. We must "undo" adding 8 by subtracting 8, and to keep the equality we must subtract 8 from both sides.

	$\overset{\text{variable}}{7x} + 8 = \overset{\text{constant}}{-13}$
Use the Subtraction Property of Equality.	$7x + 8 - 8 = -13 - 8$
Simplify.	$7x = -21$
Now all the variables are on the left and the constant on the right. The equation looks like those you learned to solve earlier.	
Use the Division Property of Equality.	$\frac{7x}{7} = \frac{-21}{7}$
Simplify.	$x = -3$
Check:	$7x + 8 = -13$
Let x=−3.	$7(-3) + 8 \stackrel{?}{=} -13$

	$-21+8\stackrel{?}{=}-13$ $-13=-13\checkmark$	

Try It 9.3.2

Solve: $3x+4=-8$.

Answer

$x=-4$

Try It 9.3.3

Solve: $5a+3=-37$.

Answer

$a=-8$

Example 9.3.4

Solve: $8y-9=31$.

Solution

Notice, the variable is only on the left side of the equation, so we will call this side the "variable" side, and the right side will be the "constant" side. Since the left side is the "variable" side, the 9 is out of place. It is subtracted from the 8y, so to "undo" subtraction, add 9 to both sides. Remember, whatever you do to the left, you must do to the right.

	variable constant $8y-9=31$
Add 9 to both sides.	$8y-9=31$ $+9\quad+9$
Simplify.	$8y=40$
	The variable is now on one side and the constants on the other. We continue from here as we did earlier.
Divide both sides by 8.	$\frac{8y}{8}=\frac{40}{8}$
Simplify.	$y=5$
Check:	$8y-9=31$
Let y=5.	$8\cdot5-9\stackrel{?}{=}31$
	$40-9\stackrel{?}{=}31$
	$31=31\checkmark$

Try It 9.3.5

Solve: $5y-9=16$.

Answer

$y = 5$

Try It 9.3.6

Solve: $3m - 8 = 19$.

Answer

$m = 9$

Solve Equations with Variables and Constants on Both Sides

The next example will be the first to have variables and constants on both sides of the equation. It may take several steps to solve this equation, so we need a clear and organized strategy.

Example 9.3.7

Solve: $9x = 8x - 6$.

Solution

Here the variable is on both sides, but the constants only appear on the right side, so let's make the right side the "constant" side. Then the left side will be the "variable" side.

	$9x = 8x - 6$
We don't want any x's on the right, so subtract the 8x from both sides.	$9x - 8x = 8x - 8x - 6$
Simplify.	$x = -6$
We succeeded in getting the variables on one side and the constants on the other, and have obtained the solution.	
Check:	$9x = 8x - 6$
Let x=−6.	$9(-6) \stackrel{?}{=} 8(-6) - 6$
	$-54 \stackrel{?}{=} -48 - 6$
	$-54 = -54$ ✓

Try It 9.3.8

Solve: $6n = 5n - 10$.

Answer

$n = -10$

Try It 9.3.9

Solve: $-6c = -7c - 1$

Answer

$c = -1$

Example 9.3.10

Solve: $5y - 9 = 8y$

Solution

The only constant is on the left and the y's are on both sides. Let's leave the constant on the left and get the variables to the right.

	$\overset{\text{constant}}{5y} - 9 = \overset{\text{variable}}{8y}$
Subtract 5y from both sides.	$5y - 5y - 9 = 8y - 5y$
Simplify.	$-9 = 3y$
We have the y's on the right and the constants on the left. Divide both sides by 3.	$\frac{-9}{3} = \frac{3y}{3}$
Simplify.	$-3 = y$
Check:	$5y - 9 = 8y$
Let $y = -3$.	$5(-3) - 9 \stackrel{?}{=} 8(-3)$
	$-15 - 9 \stackrel{?}{=} -24$
	$-24 = -24$ ✓

Try It 9.3.11

Solve: $3p - 14 = 5p$.

Answer

$p = -7$

Try It 9.3.12

Solve: $8m + 9 = 5m$

Answer

$m = -3$

Example 9.3.13

Solve: $12x = -x + 26$

Solution

The only constant is on the right, so let the left side be the "variable" side.

	$\overset{\text{variable}}{12x} = \overset{\text{constant}}{-x + 26}$
Remove the $-x$ from the right side by adding x to both sides.	$12x + x = -x + x + 26$
Simplify.	$13x = 26$
All the x's are on the left and the constants are on the right. Divide both sides by 13.	$\frac{13x}{13} = \frac{26}{13}$

Simplify.	$x = 2$

Try It 9.3.14

Solve: $12j = -4j + 32$

Answer

$j = 2$

Try It 9.3.15

Solve: $8h = -4h + 12$

Answer

$h = 1$

Solve Equations with Variables and Constants on Both Sides

The next example will be the first to have variables and constants on both sides of the equation. It may take several steps to solve this equation, so we need a clear and organized strategy.

Example 9.3.16: How to Solve Equations with Variables and Constants on Both Sides

Solve: $7x + 5 = 6x + 2$

Solution

Step 1. Choose which side will be the "variable" side—the other side will be the "constant" side.	The variable terms are $7x$ and $6x$. Since 7 is greater than 6, we will make the left side the "x" side. The right side will be the "constant" side.	variable constant $7x + 5 = 6x + 2$
Step 2. Collect the variable terms to the "variable" side of the equation, using the addition or subtraction property of equality.	With the right side as the "constant" side, the $6x$ is out of place, so subtract $6x$ from both sides. Combine like terms. Now, the variable is only on the left side!	$7x - 6x + 5 = 6x - 6x + 2$ $x + 5 = 2$
Step 3. Collect all the constants to the other side of the equation, using the addition or subtraction property of equality.	The right side is the "constant" side, so the 5 is out of place. Subtract 5 from both sides. Simplify.	$x + 5 - 5 = 2 - 5$ $x = -3$

Step 4. Make the coefficient of the variable equal 1, using the multiplication or division property of equality.	The coefficient of x is one. The equation is solved.	
Step 5. Check.	Let $x = -3$ Simplify. Add.	**Check:** $7x + 6 = 6x + 2$ $(-3) + 5 = 6(-3) + 2$ $-21 + 5 = -18 + 2$ $-16 = -16$ ✓

? Try It 9.3.17

Solve: $12x + 8 = 6x + 2$.

Answer

$x = -1$

? Try It 9.3.18

Solve: $9y + 4 = 7y + 12$.

Answer

$y = 4$

We'll list the steps below so you can easily refer to them. But we'll call this the 'Beginning Strategy' because we'll be adding some steps later in this chapter.

BEGINNING STRATEGY FOR SOLVING EQUATIONS WITH VARIABLES AND CONSTANTS ON BOTH SIDES OF THE EQUATION.

1. Choose which side will be the "variable" side—the other side will be the "constant" side.
2. Collect the variable terms to the "variable" side of the equation, using the Addition or Subtraction Property of Equality.
3. Collect all the constants to the other side of the equation, using the Addition or Subtraction Property of Equality.
4. Make the coefficient of the variable equal 1, using the Multiplication or Division Property of Equality.
5. Check the solution by substituting it into the original equation.

In Step 1, a helpful approach is to make the "variable" side the side that has the variable with the larger coefficient. This usually makes the arithmetic easier.

✓ Example 9.3.19

Solve: $8n - 4 = -2n + 6$.

Solution

In the first step, choose the variable side by comparing the coefficients of the variables on each side.

Since $8 > -2$, make the left side the "variable" side.	variable constant $8n - 4 = -2n + 6$
We don't want variable terms on the right side—add 2n to both sides to leave only constants on the right.	$8n + 2n - 4 = -2n + 2n + 6$
Combine like terms.	$10n - 4 = 6$

We don't want any constants on the left side, so add 4 to both sides.	$10n-4+4=6+4$
Simplify.	$10n=10$
The variable term is on the left and the constant term is on the right. To get the coefficient of nn to be one, divide both sides by 10.	$\frac{10n}{10}=\frac{10}{10}$
Simplify.	$n=1$
Check:	$8n-4=-2n+6$
Let n=1.	$8\cdot 1-4\stackrel{?}{=}-2\cdot 1+6$
	$8-4\stackrel{?}{=}-2+6$
	$4=4\checkmark$

Try It 9.3.20

Solve: $8q-5=-4q+7$

Answer

$q=1$

Try It 9.3.21

Solve: $7n-3=n+3$

Answer

$n=1$

Example 9.3.22

Solve: $7a-3=13a+7$

Solution

In the first step, choose the variable side by comparing the coefficients of the variables on each side.

Since 13>7, make the right side the "variable" side and the left side the "constant" side.

	constant variable $7a-3=13a+7$
Subtract 7a from both sides to remove the variable term from the left.	$7a-7a-3=13a-7a+7$
Combine like terms.	$-3=6a+7$
Subtract 7 from both sides to remove the constant from the right.	$-3-7=6a+7-7$
Simplify.	$-10=6a$
Divide both sides by 6 to make 1 the coefficient of a.	$\frac{-10}{6}=\frac{6a}{6}$
Simplify.	$-\frac{5}{3}=a$
Check:	$7a-3=13a+7$
Let $a=-\frac{5}{3}$.	$7\left(-\frac{5}{3}\right)-3\stackrel{?}{=}13\left(-\frac{5}{3}\right)+7$

	$-\frac{35}{3}-\frac{9}{3}\stackrel{?}{=}-\frac{65}{3}+\frac{21}{3}$	
	$-\frac{54}{3}=-\frac{54}{3}\checkmark$	

Try It 9.3.23

Solve: $2a-2=6a+18$

Answer

$a=-5$

Try It 9.3.24

Solve: $4k-1=7k+17$

Answer

$k=-6$

In the last example, we could have made the left side the "variable" side, but it would have led to a negative coefficient on the variable term. (Try it!) While we could work with the negative, there is less chance of errors when working with positives. The strategy outlined above helps avoid the negatives!

To solve an equation with fractions, we just follow the steps of our strategy to get the solution!

Example 9.3.25

Solve: $\frac{4}{5}x+6=\frac{1}{4}x-2$

Solution

Since $\frac{5}{4}>\frac{1}{4}$, make the left side the "variable" side and the right side the "constant" side.

	variable constant $\frac{5}{4}x+6=\frac{1}{4}x-2$
Subtract $\frac{1}{4}x$ from both sides.	$\frac{5}{4}x-\frac{1}{4}x+6=\frac{1}{4}x-\frac{1}{4}x-2$
Combine like terms.	$x+6=-2$
Subtract 6 from both sides.	$x+6-6=-2-6$
Simplify.	$x=-8$
Check: Let $x=-8$	$\frac{5}{4}x+6 = \frac{1}{4}x-2$ $\frac{5}{4}(-8)+6 \stackrel{?}{=} \frac{1}{4}(-8)-2$ $-10+6 \stackrel{?}{=} -2-2$ $-4 = -4\checkmark$

Try It 9.3.26

Solve: $\frac{7}{8}x-12=-\frac{1}{8}x-2$

Answer

$x = 10$

Try It 9.3.27

Solve: $\frac{7}{6}x + 11 = \frac{1}{6}y + 8$

Answer

$y = -3$

We will use the same strategy to find the solution for an equation with decimals.

Example 9.3.28

Solve: $7.8x + 4 = 5.4x - 8$.

Solution

Since $7.8 > 5.4$, make the left side the "variable" side and the right side the "constant" side.

	variable side constant side $7.8x + 4 = 5.4x - 8$
Subtract 5.4x from both sides.	$7.8x - 5.4x + 4 = 5.4x - 5.4x - 8$
Combine like terms.	$2.4x + 4 = -8$
Subtract 4 from both sides.	$2.4x + 4 - 4 = -8 - 4$
Simplify.	$2.4x = -12$
Use the Division Property of Equality.	$\frac{2.4x}{2.4} = \frac{-12}{2.4}$
Simplify.	$x = -5$
Check:	$7.8x + 4 = 5.4x - 5$
Let $x = -5$	$7.8(-5) + 4 = 5.4(-5) - 8$
	$-39 + 4 \stackrel{?}{=} -27 - 8$
	$-35 = -35$ ✓

Try It 9.3.29

Solve: $2.8x + 12 = -1.4x - 9$

Answer

$x = -5$

Try It 9.3.30

Solve: $3.6y + 8 = 1.2y - 4$

Answer

$y = -5$

Key Concepts

- **Beginning Strategy for Solving an Equation with Variables and Constants on Both Sides of the Equation**
  1. Choose which side will be the “variable” side—the other side will be the “constant” side.
  2. Collect the variable terms to the “variable” side of the equation, using the Addition or Subtraction Property of Equality.
  3. Collect all the constants to the other side of the equation, using the Addition or Subtraction Property of Equality.
  4. Make the coefficient of the variable equal 1, using the Multiplication or Division Property of Equality.
  5. Check the solution by substituting it into the original equation.

9.3E: Exercises

Practice Makes Perfect

Solve Equations with Constants on Both Sides

In the following exercises, solve the following equations with constants on both sides.

Exercise 9.3E.1

$9x - 3 = 60$

Exercise 9.3E.2

$12x - 8 = 64$

Answer

$x = 6$

Exercise 9.3E.3

$14w + 5 = 117$

Exercise 9.3E.4

$15y + 7 = 97$

Answer

$y = 6$

Exercise 9.3E.5

$2a + 8 = -28$

Exercise 9.3E.6

$3m + 9 = -15$

Answer

$m = -8$

Exercise 9.3E.7

$-62 = 8n - 6$

Exercise 9.3E.8

$-77 = 9b - 5$

Answer

$b = -8$

Exercise 9.3E.9

$35 = -13y + 9$

Exercise 9.3E.10

$60 = -21x - 24$

Answer

$x = -4$

Exercise 9.3E.11

$-12p - 9 = 9$

Exercise 9.3E.12

$-14q - 2 = 16$

Answer

$q = -\frac{9}{7}$

Solve Equations with Variables on Both Sides

In the following exercises, solve the following equations with variables on both sides.

Exercise 9.3E.13

$19z = 18z - 7$

Exercise 9.3E.14

$21k = 20k - 11$

Answer

$k = -11$

Exercise 9.3E.15

$9x + 36 = 15x$

Exercise 9.3E.16

$8x + 27 = 11x$

Answer

$x = 9$

Exercise 9.3E.17

$c = -3c - 20$

Exercise 9.3E.18

$b = -4b - 15$

Answer

$b = -3$

Exercise 9.3E.19

$9q = 44 - 2q$

Exercise 9.3E.20

$5z = 39 - 8z$

Answer

$z = 3$

Exercise 9.3E.21

$6y + \frac{1}{2} = 5y$

Exercise 9.3E.22

$4x + \frac{3}{4} = 3x$

Answer

$x = -\frac{3}{4}$

Exercise 9.3E.23

$-18a - 8 = -22a$

Exercise 9.3E.24

$-11r - 8 = -7r$

Answer

$r = -2$

Solve Equations with Variables and Constants on Both Sides

In the following exercises, solve the following equations with variables and constants on both sides.

Exercise 9.3E.25

$8x - 15 = 7x + 3$

Exercise 9.3E.26

$6x - 17 = 5x + 2$

Answer

$x = 19$

Exercise 9.3E.27

$26 + 13d = 14d + 11$

Exercise 9.3E.28

$21 + 18f = 19f + 14$

Answer

$f = 7$

Exercise 9.3E.29

$2p - 1 = 4p - 33$

Exercise 9.3E.30

$12q - 5 = 9q - 20$

Answer

$q = -5$

Exercise 9.3E.31

$4a + 5 = -a - 40$

Exercise 9.3E.32

$8c + 7 = -3c - 37$

Answer

$c = -4$

Exercise 9.3E.33

$5y - 30 = -5y + 30$

Exercise 9.3E.34

$7x - 17 = -8x + 13$

Answer

$x = 2$

Exercise 9.3E.35

$7s + 12 = 5 + 4s$

Exercise 9.3E.36

$9p+14=6+4p$

Answer

$p=-\frac{8}{5}$

Exercise 9.3E.37

$2z-6=23-z$

Exercise 9.3E.38

$3y-4=12-y$

Answer

$y=4$

Exercise 9.3E.39

$\frac{5}{3}c-3=\frac{2}{3}c-16$

Exercise 9.3E.40

$\frac{7}{4}m-7=\frac{3}{4}m-13$

Answer

$m=-6$

Exercise 9.3E.41

$8-\frac{2}{5}q=\frac{3}{5}q+6$

Exercise 9.3E.42

$11-\frac{1}{5}a=\frac{4}{5}a+4$

Answer

$a=7$

Exercise 9.3E.43

$\frac{4}{3}n+9=\frac{1}{3}n-9$

Exercise 9.3E.44

$\frac{5}{4}a+15=\frac{3}{4}a-5$

Answer

$a=-40$

Exercise 9.3E.45

$\frac{1}{4}y+7=\frac{3}{4}y-3$

Exercise 9.3E.46

$\frac{3}{5}p+2=\frac{4}{5}p-1$

Answer

$p=15$

Exercise 9.3E.47

$14n+8.25=9n+19.60$

Exercise 9.3E.48

$13z+6.45=8z+23.75$

Answer

$z=3.46$

Exercise 9.3E.49

$2.4w-100=0.8w+28$

Exercise 9.3E.50

$2.7w-80=1.2w+10$

Answer

$w=60$

Exercise 9.3E.51

$5.6r+13.1=3.5r+57.2$

Exercise 9.3E.52

$6.6x-18.9=3.4x+54.7$

Answer

$x=23$

Everyday Math

Exercise 9.3E.53

Concert tickets At a school concert the total value of tickets sold was $1506. Student tickets sold for $6 and adult tickets sold for $9. The number of adult tickets sold was 5 less than 3 times the number of student tickets. Find the number of student tickets sold, *s*, by solving the equation 6s+27s−45=1506. Add exercises text here.

Exercise $9.3E.54$

Making a fence Jovani has 150 feet of fencing to make a rectangular garden in his backyard. He wants the length to be 15 feet more than the width. Find the width, w, by solving the equation $150 = 2w + 30 + 2w$.

Answer

30 feet

Writing Exercises

Exercise $9.3E.55$

Solve the equation $\frac{6}{5}y - 8 = \frac{1}{5}y + 7$ explaining all the steps of your solution as in the examples in this section.

Exercise $9.3E.56$

Solve the equation $10x + 14 = -2x + 38$ explaining all the steps of your solution as in this section.

Answer

$x = 2$ Justifications will vary.

Exercise $9.3E.57$

When solving an equation with variables on both sides, why is it usually better to choose the side with the larger coefficient of x to be the "variable" side?

Exercise $9.3E.58$

Is $x = -2$ a solution to the equation $5 - 2x = -4x + 1$? How do you know?

Answer

Yes. Justifications will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve an equation with constants on both sides.			
solve an equation with variables on both sides.			
solve an equation with variables and constants on both sides.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

9.4: Use a General Strategy to Solve Linear Equations

Learning Objectives

By the end of this section, you will be able to:

- Solve equations using a general strategy
- Classify equations

Note

Before you get started, take this readiness quiz.

1. Simplify: $-(a-4)$.
   If you missed this problem, review Exercise 1.10.46
2. Multiply: $\frac{3}{2}(12x+20)$
   If you missed this problem, review Exercise 1.10.34.
3. Simplify: $5-2(n+1)$
   If you missed this problem, review Exercise 1.10.49.
4. Multiply: $3(7y+9)$
   If you missed this problem, review Exercise 1.10.34.
5. Multiply: $(2.5)(6.4)$
   If you missed this problem, review Exercise 1.8.19.

Solve Equations Using the General Strategy

Until now we have dealt with solving one specific form of a linear equation. It is time now to lay out one overall strategy that can be used to solve any linear equation. Some equations we solve will not require all these steps to solve, but many will.

Beginning by simplifying each side of the equation makes the remaining steps easier.

Example 9.4.1: How to Solve Linear Equations Using the General Strategy

Solve: $-6(x+3)=24$.

Solution

Step 1. Simplify each side of the equation as much as possible.	Use the Distributive Property. Notice that each side of the equation is simplified as much as possible.	$-6(x+3)=24$ $-6x-18=24$
Step 2. Collect all variable terms on one side of the equation.	Nothing to do – all x's are on the left side.	
Step 3. Collect constant terms on the other side of the equation.	To get constants only on the right, add 18 to each side. Simplify.	$-6x-18+18=24+18$ $-6x=42$

Step 4. Make the coefficient of the variable term to equal to 1.	Divide each side by –6.	$\frac{-6x}{-6} = \frac{42}{-6}$
	Simplify.	$x = -7$
Step 5. Check the solution.	Let $x = -7$	**Check:** $-6(x + 3) = 24$
	Simplify.	$-6(-7 + 3) \stackrel{?}{=} 24$
	Multiply.	$-6(-4) \stackrel{?}{=} 24$
		$24 = 24$ ✓

Try It 9.4.2

Solve: $5(x+3) = 35$

Answer

$x = 4$

Try It 9.4.3

Solve: $6(y-4) = -18$

Answer

$y = 1$

GENERAL STRATEGY FOR SOLVING LINEAR EQUATIONS.

1. **Simplify each side of the equation as much as possible.**
   Use the Distributive Property to remove any parentheses.
   Combine like terms.
2. **Collect all the variable terms on one side of the equation.**
   Use the Addition or Subtraction Property of Equality.
3. **Collect all the constant terms on the other side of the equation.**
   Use the Addition or Subtraction Property of Equality.
4. **Make the coefficient of the variable term to equal to 1.**
   Use the Multiplication or Division Property of Equality.
   State the solution to the equation.
5. **Check the solution.** Substitute the solution into the original equation to make sure the result is a true statement.

Example 9.4.4

Solve: $-(y+9) = 8$

Solution

	$-(y + 9) = 8$
Simplify each side of the equation as much as possible by distributing.	$-y - 9 = 8$
The only y term is on the left side, so all variable terms are on the left side of the equation.	
Add 9 to both sides to get all constant terms on the right side of the equation.	$-y - 9 + 9 = 8 + 9$
Simplify.	$-y = 17$

Rewrite $-y$ as $-1y$.		$-1y = 17$
Make the coefficient of the variable term to equal to 1 by dividing both sides by -1.		$\frac{-1y}{-1} = \frac{17}{-1}$
Simplify.		$y = -17$
Check:	$-(y+9) = 8$	
Let y=−17.	$-(-17+9) \stackrel{?}{=} 8$	
	$-(-8) \stackrel{?}{=} 8$	
	$8 = 8$ ✓	

Try It 9.4.5

Solve: $-(y+8) = -2$

Answer

$y = -6$

Try It 9.4.6

Solve: $-(z+4) = -12$

Answer

$z = 8$

Example 9.4.7

Solve: $5(a-3)+5 = -10$

Solution

		$5(a-3)+5 = -10$
Simplify each side of the equation as much as possible.		
Distribute.		$5a-15+5 = -10$
Combine like terms.		$5a-10 = -10$
The only a term is on the left side, so all variable terms are on one side of the equation.		
Add 10 to both sides to get all constant terms on the other side of the equation.		$5a-10+10 = -10+10$
Simplify.		$5a = 0$
Make the coefficient of the variable term to equal to 11 by dividing both sides by 55.		$\frac{5a}{5} = \frac{0}{5}$
Simplify.		$a = 0$
Check:	$5(a-3)+5 = -10$	
Let a=0.	$5(0-3)+5 \stackrel{?}{=} -10$	
	$5(-3)+5 \stackrel{?}{=} -10$	
	$-15+5 \stackrel{?}{=} -10$	

	$-10 = -10$ ✓

Try It 9.4.8

Solve: $2(m-4)+3=-1$

Answer

$m=2$

Try It 9.4.9

Solve: $7(n-3)-8=-15$

Answer

$n=2$

Example 9.4.10

Solve: $\frac{2}{3}(6m-3)=8-m$

Solution

	$\frac{2}{3}(6m-3)=8-m$
Distribute.	$4m-2=8-m$
Add m to get the variables only to the left.	$4m+m-2=8-m+m$
Simplify.	$5m-2=8$
Add 2 to get constants only on the right.	$5m-2+2=8+2$
Simplify.	$5m=10$
Divide by 5.	$\frac{5m}{5}=\frac{10}{5}$
Simplify.	$m=2$
Check:	$\frac{2}{3}(6m-3)=8-m$
Let m=2.	$\frac{2}{3}(6\cdot 2-3)\stackrel{?}{=}8-2$
	$\frac{2}{3}(12-3)\stackrel{?}{=}6$
	$\frac{2}{3}(9)\stackrel{?}{=}6$
	$6=6$ ✓

Try It 9.4.11

Solve: $\frac{1}{3}(6u+3)=7-u$

Answer

$u=2$

Try It 9.4.12

Solve: $\frac{2}{3}(9x-12)=8+2x$

Answer

$x=4$

Example 9.4.13

Solve: $8-2(3y+5)=0$

Solution

	$8-2(3y+5)=0$
Simplify—use the Distributive Property.	$8-6y-10=0$
Combine like terms.	$-6y-2=0$
Add 2 to both sides to collect constants on the right.	$-6y-2+2=0+2$
Simplify.	$-6y=2$
Divide both sides by -6−6.	$\frac{-6y}{-6}=\frac{2}{-6}$
Simplify.	$y=-\frac{1}{3}$
Check: Let y=−13. $8-2(3y+5)=0$ $8-2\left[3\left(-\frac{1}{3}\right)+5\right]=0$ $8-2(-1+5)\stackrel{?}{=}0$ $8-2(4)\stackrel{?}{=}0$ $8-8\stackrel{?}{=}0$ $0=0$ ✓	

Try It 9.4.14

Solve: $12-3(4j+3)=-17$

Answer

$j=\frac{5}{3}$

Try It 9.4.15

Solve: $-6-8(k-2)=-10$

Answer

$k=\frac{5}{2}$

Example 9.4.16

Solve: $4(x-1)-2=5(2x+3)+6$

Solution

	$4(x-1)-2=5(2x+3)+6$
Distribute.	$4x-4-2=10x+15+6$
Combine like terms.	$4x-6=10x+21$
Subtract 4x to get the variables only on the right side since $10>4$.	$4x-4x-6=10x-4x+21$
Simplify.	$-6=6x+21$
Subtract 21 to get the constants on left.	$-6-21=6x+21-21$
Simplify.	$-27=6x$
Divide by 6.	$\frac{-27}{6}=\frac{6x}{6}$
Simplify.	$-\frac{9}{2}=x$
Check:	$4(x-1)-2=5(2x+3)+6$
Let $x=-\frac{9}{2}$.	$4\left(-\frac{9}{2}-1\right)-2\stackrel{?}{=}5\left[2\left(-\frac{9}{2}\right)+3\right]+6$
	$4\left(-\frac{11}{2}\right)-2\stackrel{?}{=}5(-9+3)+6$
	$-22-2\stackrel{?}{=}5(-6)+6$
	$-24\stackrel{?}{=}-30+6$
	$-24=-24$ ✓

Try It 9.4.17

Solve: $6(p-3)-7=5(4p+3)-12$

Answer

$p=-2$

Try It 9.4.18

Solve: $8(q+1)-5=3(2q-4)-1$

Answer

$q=-8$

Example 9.4.19

Solve: $10[3-8(2s-5)]=15(40-5s)$

Solution

	$10[3-8(2s-5)]=15(40-5s)$

https://math.libretexts.org/@go/page/46253

Simplify from the innermost parentheses first.	$10[3-16s+40]=15(40-5s)$
Combine like terms in the brackets.	$10[43-16s]=15(40-5s)$
Distribute.	$430-160s=600-75s$
Add 160s to get the s's to the right.	$430-160s+160s=600-75s+160s$
Simplify.	$430=600+85s$
Subtract 600 to get the constants to the left.	$430-600=600+85s-600$
Simplify.	$-170=85s$
Divide.	$\frac{-170}{85}=\frac{85s}{85}$
Simplify.	$-2=s$

Check:	$10[3-8(2s-5)]=15(40-5s)$
Substitute s=−2.	$10[3-8(2(-2)-5)] \stackrel{?}{=} 15(40-5(-2))$
	$10[3-8(-4-5)] \stackrel{?}{=} 15(40+10)$
	$10[3-8(-9)] \stackrel{?}{=} 15(50)$
	$10[3+72] \stackrel{?}{=} 750$
	$10[75] \stackrel{?}{=} 750$
	$750=750$ ✓

Try It 9.4.20

Solve: $6[4-2(7y-1)]=8(13-8y)$.

Answer

$y=-\frac{17}{5}$

Try It 9.4.21

Solve: $12[1-5(4z-1)]=3(24+11z)$.

Answer

$z=0$

Example 9.4.22

Solve: $0.36(100n+5)=0.6(30n+15)$.

Solution

	$0.36(100n+5)=0.6(30n+15)$
Distribute.	$36n+1.8=18n+9$
Subtract 18n to get the variables to the left.	$36n-18n+1.8=18n-18n+9$
Simplify.	$18n+1.8=9$

Subtract 1.8 to get the constants to the right.		$18n + 1.8 - 1.8 = 9 - 1.8$
Simplify.		$18n = 7.2$
Divide.		$\frac{18n}{18} = \frac{7.2}{18}$
Simplify.		$n = 0.4$
Check:	$0.36(100n + 5) = 0.6(30n + 15)$	
Let n=0.4.	$0.36(100(0.4) + 5) \stackrel{?}{=} 0.6(30(0.4) + 15)$	
	$0.36(40 + 5) \stackrel{?}{=} 0.6(12 + 15)$	
	$0.36(45) \stackrel{?}{=} 0.6(27)$	
	$16.2 = 16.2$ ✓	

? Try It 9.4.23

Solve: $0.55(100n+8) = 0.6(85n+14)$.

Answer

$n = 1$

? Try It 9.4.24

Solve: $0.15(40m-120) = 0.5(60m+12)$.

Answer

$m = -1$

Classify Equations

Consider the equation we solved at the start of the last section, 7x+8=−13. The solution we found was x=−3. This means the equation 7x+8=−13 is true when we replace the variable, *x*, with the value −3. We showed this when we checked the solution x=−3 and evaluated 7x+8=−13 for x=−3.

$$7(-3) + 8 \stackrel{?}{=} -13$$
$$-21 + 8 \stackrel{?}{=} -13$$
$$-13 = -13 \checkmark$$

If we evaluate 7x+8 for a different value of *x*, the left side will not be −13.

The equation 7x+8=−13 is true when we replace the variable, *x*, with the value −3, but not true when we replace *x* with any other value. Whether or not the equation 7x+8=−13 is true depends on the value of the variable. Equations like this are called conditional equations.

All the equations we have solved so far are conditional equations.

CONDITIONAL EQUATION

An equation that is true for one or more values of the variable and false for all other values of the variable is a **conditional equation**.

Now let's consider the equation 2y+6=2(y+3). Do you recognize that the left side and the right side are equivalent? Let's see what happens when we solve for *y*.

	$2y+6=2(y+3)$
Distribute.	$2y+6=2y+6$
Subtract 2y to get the y's to one side.	$2y-2y+6=2y-2y+6$
Simplify—the y's are gone!	$6=6$

But 6=6 is true.

This means that the equation 2y+6=2(y+3) is true for any value of *y*. We say the solution to the equation is all of the real numbers. An equation that is true for any value of the variable like this is called an **identity**.

IDENTITY

An equation that is true for any value of the variable is called an **identity**.

The solution of an identity is all real numbers.

What happens when we solve the equation 5z=5z−1?

	$5z=5z-1$
Subtract 5z to get the constant alone on the right.	$5z-5z=5z-5z-1$
Simplify—the z's are gone!	$0\neq -1$

But $0 \neq -1$.

Solving the equation 5z=5z−1 led to the false statement 0=−1. The equation 5z=5z−1 will not be true for any value of z. It has no solution. An equation that has no solution, or that is false for all values of the variable, is called a **contradiction**.

CONTRADICTION

An equation that is false for all values of the variable is called a **contradiction**.

A contradiction has no solution.

Example 9.4.25

Classify the equation as a conditional equation, an identity, or a contradiction. Then state the solution.

$6(2n-1)+3=2n-8+5(2n+1)$

Solution

$6(2n-1)+3=2n-8+5(2n+1)$	
Distribute.	$12n-6+3=2n-8+10n+5$
Combine like terms.	$12n-3=12n-3$
Subtract 12n to get the nn's to one side.	$12n-12n-3=12n-12n-3$
Simplify.	$-3=-3$
This is a true statement.	The equation is an identity. The solution is all real numbers.

Try It 9.4.26

Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$4+9(3x-7)=-42x-13+23(3x-2)$

Answer

identity; all real numbers

Try It 9.4.27

Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$8(1-3x)+15(2x+7)=2(x+50)+4(x+3)+1$

Answer

identity; all real numbers

Example 9.4.28

Classify as a conditional equation, an identity, or a contradiction. Then state the solution.

$10+4(p-5)=0$

Solution

	$10+4(p-5)=0$
Distribute.	$10+4p-20=0$
Combine like terms.	$4p-10=0$
Add 10 to both sides.	$4p-10+10=0+10$
Simplify.	$4p=10$
Divide.	$\frac{4p}{4}=\frac{10}{4}$
Simplify.	$p=\frac{5}{2}$
The equation is true when $p=frac52$.	This is a conditional equation. The solution is $p=frac52$.

Try It 9.4.29

Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution: $11(q+3)-5=19$

Answer

conditional equation; \(q = \frac{9}{11}\

Try It 9.4.30

Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution: $6+14(k-8)=95$

Answer

conditional equation; $k = \frac{193}{14}$

Example 9.4.31

Classify the equation as a conditional equation, an identity, or a contradiction. Then state the solution.

$5m + 3(9 + 3m) = 2(7m - 11)$

Solution

	$5m + 3(9 + 3m) = 2(7m - 11)$
Distribute.	$5m + 27 + 9m = 14m - 22$
Combine like terms.	$14m + 27 = 14m - 22$
Subtract 14m from both sides.	$14m + 27 - 14m = 14m - 22 - 14m$
Simplify.	$27 \neq -22$
But $27 \neq -22$.	The equation is a contradiction. It has no solution.

Try It 9.4.32

Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$12c + 5(5 + 3c) = 3(9c - 4)$

Answer

contradiction; no solution

Try It 9.4.33

Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$4(7d + 18) = 13(3d - 2) - 11d$

Answer

contradiction; no solution

Type of equation	What happens when you solve it?	Solution
Conditional Equation	True for one or more values of the variables and false for all other values	One or more values
Identity	**True** for any value of the variable	All real numbers
Contradiction	**False** for all values of the variable	No solution

Key Concepts

- **General Strategy for Solving Linear Equations**
  1. Simplify each side of the equation as much as possible.
     Use the Distributive Property to remove any parentheses.
     Combine like terms.

2. Collect all the variable terms on one side of the equation.
   Use the Addition or Subtraction Property of Equality.
3. Collect all the constant terms on the other side of the equation.
   Use the Addition or Subtraction Property of Equality.
4. Make the coefficient of the variable term to equal to 1.
   Use the Multiplication or Division Property of Equality.
   State the solution to the equation.
5. Check the solution.
   Substitute the solution into the original equation.

9.4E: Exercises

Practice Makes Perfect

Solve Equations Using the General Strategy for Solving Linear Equations

In the following exercises, solve each linear equation.

Exercise 9.4E.1

$15(y-9)=-60$

Exercise 9.4E.2

$21(y-5)=-42$

Answer

$y=3$

Exercise 9.4E.3

$-9(2n+1)=36$

Exercise 9.4E.4

$-16(3n+4)=32$

Answer

$n=-2$

Exercise 9.4E.5

$8(22+11r)=0$

Exercise 9.4E.6

$5(8+6p)=0$

Answer

$p=-\frac{4}{3}$

Exercise 9.4E.7

$-(w-12)=30$

Exercise 9.4E.8

$-(t-19)=28$

Answer

$t=-9$

Exercise 9.4E.9

$9(6a+8)+9=81$

Exercise 9.4E.10

$8(9b-4)-12=100$

Answer

$b=2$

Exercise 9.4E.11

$32+3(z+4)=41$

Exercise 9.4E.12

$21+2(m-4)=25$

Answer

$m=6$

Exercise 9.4E.13

$51+5(4-q)=56$

Exercise 9.4E.14

$-6+6(5-k)=15$

Answer

$k=\frac{3}{2}$

Exercise 9.4E.15

$2(9s-6)-62=16$

Exercise 9.4E.16

$8(6t-5)-35=-27$

Answer

$t=1$

Exercise 9.4E.17

$3(10-2x)+54=0$

Exercise 9.4E.18

$-2(11-7x)+54=4$

Answer

$x=-2$

Exercise 9.4E.19

$\frac{2}{3}(9c-3)=22$

Exercise 9.4E.20

$\frac{3}{5}(10x-5)=27$

Answer

$x=5$

Exercise 9.4E.21

$\frac{1}{5}(15c+10)=c+7$

Exercise 9.4E.22

$\frac{1}{4}(20d+12)=d+7$

Answer

$d=1$

Exercise 9.4E.23

$18-(9r+7)=-16$

Exercise 9.4E.24

$15-(3r+8)=28$

Answer

$r=-7$

Exercise 9.4E.25

$5-(n-1)=19$

Exercise 9.4E.26

$-3-(m-1)=13$

Answer

$m=-15$

Exercise 9.4E.27

$11-4(y-8)=43$

Exercise 9.4E.28

$18-2(y-3)=32$

Answer

$y=-4$

Exercise 9.4E.29

$24-8(3v+6)=0$

Exercise 9.4E.30

$35-5(2w+8)=-10$

Answer

$w=\frac{1}{2}$

Exercise 9.4E.31

$4(a-12)=3(a+5)$

Exercise 9.4E.32

$-2(a-6)=4(a-3)$

Answer

$a=4$

Exercise 9.4E.33

$2(5-u)=-3(2u+6)$

Exercise 9.4E.34

$5(8-r)=-2(2r-16)$

Answer

$r=8$

Exercise 9.4E.35

$3(4n-1)-2=8n+3$

Exercise 9.4E.36

$9(2m-3)-8=4m+7$

Answer

$m=3$

Exercise 9.4E.37

$12+2(5-3y)=-9(y-1)-2$

Exercise 9.4E.38

$-15+4(2-5y)=-7(y-4)+4$

Answer

$y=-3$

Exercise 9.4E.39

$8(x-4)-7x=14$

Exercise 9.4E.40

$5(x-4)-4x=14$

Answer

$x=34$

Exercise 9.4E.41

$5+6(3s-5)=-3+2(8s-1)$

Exercise 9.4E.42

$-12+8(x-5)=-4+3(5x-2)$

Answer

$x=-6$

Exercise 9.4E.43

$4(u-1)-8=6(3u-2)-7$

Exercise 9.4E.44

$7(2n-5)=8(4n-1)-9$

Answer

$n=-1$

Exercise 9.4E.45

$4(p-4)-(p+7)=5(p-3)$

Exercise 9.4E.46

$3(a-2)-(a+6)=4(a-1)$

Answer

$a=-4$

Exercise 9.4E.47

$-(9y+5)-(3y-7)$
$=16-(4y-2)$

Exercise 9.4E.48

$-(7m+4)-(2m-5)$
$=14-(5m-3)$

Answer

$m=-4$

Exercise 9.4E.49

$4[5-8(4c-3)]$
$=12(1-13c)-8$

Exercise 9.4E.50

$5[9-2(6d-1)]$
$=11(4-10d)-139$

Answer

$d=-3$

Exercise 9.4E.51

$3[-9+8(4h-3)]$
$=2(5-12h)-19$

Exercise 9.4E.52

$3[-14+2(15k-6)]$
$=8(3-5k)-24$

Answer

$k=\frac{3}{5}$

Exercise 9.4E.53

$5[2(m+4)+8(m-7)]$
$=2[3(5+m)-(21-3m)]$

Exercise 9.4E.54

$10[5(n+1)+4(n-1)]$
$=11[7(5+n)-(25-3n)]$

Answer

$n=-5$

Exercise 9.4E.55

$5(1.2u-4.8)=-12$

Exercise 9.4E.56

$4(2.5v-0.6)=7.6$

Answer

$v=1$

Exercise 9.4E.57

$0.25(q-6)=0.1(q+18)$

Exercise 9.4E.58

$0.2(p-6)=0.4(p+14)$

Answer

$p=-34$

Exercise 9.4E.59

$0.2(30n+50)=28$

Exercise 9.4E.60

$0.5(16m+34)=-15$

Answer

$m=-4$

Classify Equations

In the following exercises, classify each equation as a conditional equation, an identity, or a contradiction and then state the solution.

Exercise 9.4E.61

$23z+19=3(5z-9)+8z+46$

Exercise 9.4E.62

$15y+32=2(10y-7)-5y+46$

Answer

identity; all real numbers

Exercise 9.4E.63

$5(b-9)+4(3b+9)=6(4b-5)-7b+21$

Exercise 9.4E.64

$9(a-4)+3(2a+5)=7(3a-4)-6a+7$

Answer

identity; all real numbers

Exercise 9.4E.65

$18(5j-1)+29=47$

Exercise 9.4E.66

$24(3d-4)+100=52$

Answer

conditional equation; $d=\frac{2}{3}$

Exercise 9.4E.67

$22(3m-4)=8(2m+9)$

Exercise 9.4E.68

$30(2n-1)=5(10n+8)$

Answer

conditional equation; $n=7$

Exercise 9.4E.69

$7v+42=11(3v+8)-2(13v-1)$

Exercise 9.4E.70

$18u-51=9(4u+5)-6(3u-10)$

Answer

contradiction; no solution

Exercise 9.4E.71

$3(6q-9)+7(q+4)=5(6q+8)-5(q+1)$

Exercise 9.4E.72

$5(p+4)+8(2p-1)=9(3p-5)-6(p-2)$

Answer

contradiction; no solution

Exercise 9.4E.73

$12(6h-1)=8(8h+5)-4$

Exercise 9.4E.74

$9(4k-7)=11(3k+1)+4$

Answer

conditional equation; $k=26$

Exercise 9.4E.75

$45(3y-2)=9(15y-6)$

Exercise 9.4E.76

$60(2x-1)=15(8x+5)$

Answer

contradiction; no solution

Exercise 9.4E.77

$16(6n+15)=48(2n+5)$

Exercise 9.4E.78

$36(4m+5)=12(12m+15)$

Answer

identity; all real numbers

Exercise 9.4E.79

$9(14d+9)+4d=13(10d+6)+3$

Exercise 9.4E.80

$11(8c+5)-8c=2(40c+25)+5$

Answer

identity; all real numbers

Everyday Math

Exercise 9.4E.81

Fencing Micah has 44 feet of fencing to make a dog run in his yard. He wants the length to be 2.5 feet more than the width. Find the length, L, by solving the equation 2L+2(L−2.5)=44.

Exercise 9.4E.82

Coins Rhonda has $\$1.90$ in nickels and dimes. The number of dimes is one less than twice the number of nickels. Find the number of nickels, n, by solving the equation $0.05n+0.10(2n-1)=1.90$.

Answer

8 nickels

Writing Exercises

Exercise 9.4E.83

Using your own words, list the steps in the general strategy for solving linear equations.

Exercise 9.4E.84

Explain why you should simplify both sides of an equation as much as possible before collecting the variable terms to one side and the constant terms to the other side.

Answer

Answers will vary.

Exercise 9.4E.85

What is the first step you take when solving the equation $3-7(y-4)=38$? Why is this your first step?

Exercise 9.4E.86

Solve the equation $\frac{1}{4}(8x+20)=3x-4$ explaining all the steps of your solution as in the examples in this section.

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objective of this section.

I can...	Confidently	With some help	No-I don't get it!
solve equations using the general strategy for solving linear equations.			
classify equations.			

ⓑ On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

Glossary

conditional equation

An equation that is true for one or more values of the variable and false for all other values of the variable is a conditional equation.

contradiction

An equation that is false for all values of the variable is called a contradiction. A contradiction has no solution.

identity

An equation that is true for any value of the variable is called an identity. The solution of an identity is all real numbers.

9.5: Solve Equations with Fractions or Decimals

Learning Objectives

By the end of this section, you will be able to:

- Solve equations with fraction coefficients
- Solve equations with decimal coefficients

Note

Before you get started, take this readiness quiz.

1. Multiply: $8 \cdot 38$.
   If you missed this problem, review Exercise 1.6.16.
2. Find the LCD of $\frac{5}{6}$ and $\frac{1}{4}$.
   If you missed this problem, review Exercise 1.7.16.
3. Multiply 4.78 by 100.
   If you missed this problem, review Exercise 1.8.22.

Solve Equations with Fraction Coefficients

Let's use the general strategy for solving linear equations introduced earlier to solve the equation, $\frac{1}{8}x + \frac{1}{2} = \frac{1}{4}$.

Table 9.5.1

	$\frac{1}{8}x+\frac{1}{2}=\frac{1}{4}$
To isolate the x term, subtract $\frac{1}{2}$ from both sides.	$\frac{1}{8}x+\frac{1}{2}-\frac{1}{2}=\frac{1}{4}-\frac{1}{2}$
Simplify the left side.	$\frac{1}{8}x=\frac{1}{4}-\frac{1}{2}$
Change the constants to equivalent fractions with the LCD.	$\frac{1}{8}x=\frac{1}{4}-\frac{2}{4}$
Subtract.	$\frac{1}{8}x=-\frac{1}{4}$
Multiply both sides by the reciprocal of $\frac{1}{8}$.	$\frac{8}{1}\cdot\frac{1}{8}x=\frac{8}{1}\left(-\frac{1}{4}\right)$
Simplify.	$x=-2$

This method worked fine, but many students do not feel very confident when they see all those fractions. So, we are going to show an alternate method to solve equations with fractions. This alternate method eliminates the fractions.

We will apply the Multiplication Property of Equality and multiply both sides of an equation by the least common denominator of all the fractions in the equation. The result of this operation will be a new equation, equivalent to the first, but without fractions. This process is called "clearing" the equation of fractions.

Let's solve a similar equation, but this time use the method that eliminates the fractions.

Example 9.5.1: How to Solve Equations with Fraction Coefficients

Solve: $\frac{1}{6}y - \frac{1}{3} = \frac{5}{6}$

Solution

Step 1. Find the least common denominator of *all* the fractions in the equation.	What is the LCD of $\frac{1}{6}$, $\frac{1}{3}$, and $\frac{5}{6}$?	$\frac{1}{6}y-\frac{1}{3}=\frac{5}{6}$ LCD $=6$
Step 2. Multiply both sides of the equation by that LCD. This clears the fractions.	Multiply both sides of the equation by the LCD 6. Use the Distributive Property. Simplify – and notice, no more fractions!	$6\left(\frac{1}{6}y-\frac{1}{3}\right)=6\left(\frac{5}{6}\right)$ $6\cdot\frac{1}{6}y-6\cdot\frac{1}{3}=6\cdot\frac{5}{6}$ $y-2=5$
Step 3. Solve using the General Strategy for Solving Linear Equations.	To isolate the "y" term, add 2. Simplify.	$y-2+2=5+2$ $y=7$

Try It 9.5.2

Solve: $\frac{1}{4}x+\frac{1}{2}=\frac{5}{8}$

Answer

$x=\frac{1}{2}$

Try It 9.5.3

Solve: $\frac{1}{8}x+\frac{1}{2}=\frac{1}{4}$

Answer

$x=-2$

Notice in Exercise 9.5.1, once we cleared the equation of fractions, the equation was like those we solved earlier in this chapter. We changed the problem to one we already knew how to solve! We then used the General Strategy for Solving Linear Equations.

STRATEGY TO SOLVE EQUATIONS WITH FRACTION COEFFICIENTS.

1. Find the least common denominator of *all* the fractions in the equation.
2. Multiply both sides of the equation by that LCD. This clears the fractions.
3. Solve using the General Strategy for Solving Linear Equations.

Example 9.5.4

Solve: $6=\frac{1}{2}v+\frac{2}{5}v-\frac{3}{4}v$

Solution

We want to clear the fractions by multiplying both sides of the equation by the LCD of all the fractions in the equation.

Find the LCD of all fractions in the equation.	$6=\frac{1}{2}v+\frac{2}{5}v-\frac{3}{4}v$
The LCD is 20.	
Multiply both sides of the equation by 20.	$20(6)=20\cdot\left(\frac{1}{2}v+\frac{2}{5}v-\frac{3}{4}v\right)$
Distribute.	$20(6)=20\cdot\frac{1}{2}v+20\cdot\frac{2}{5}v-20\cdot\frac{3}{4}v$

Simplify—notice, no more fractions!		$120 = 10v + 8v - 15v$
Combine like terms.		$120 = 3v$
Divide by 3.		$\frac{120}{3} = \frac{3v}{3}$
Simplify.		$40 = v$
Check:	$6 = \frac{1}{2}v + \frac{2}{5}v - \frac{3}{4}v$	
Let v=40.	$6 \stackrel{?}{=} \frac{1}{2}(40) + \frac{2}{5}(40) - \frac{3}{4}(40)$	
	$6 \stackrel{?}{=} 20 + 16 - 30$	
	$6 = 6$ ✓	

Try It 9.5.5

Solve: $7 = \frac{1}{2}x + \frac{3}{4}x - \frac{2}{3}x$

Answer

$x = 12$

Try It 9.5.6

Solve: $-1 = \frac{1}{2}u + \frac{1}{4}u - \frac{2}{3}u$

Answer

$u = -12$

In the next example, we again have variables on both sides of the equation.

Example 9.5.7

Solve: $a + \frac{3}{4} = \frac{3}{8}a - \frac{1}{2}$

Solution

	$a + \frac{3}{4} = \frac{3}{8}a - \frac{1}{2}$
Find the LCD of all fractions in the equation. The LCD is 8.	
Multiply both sides by the LCD.	$8\left(a + \frac{3}{4}\right) = 8\left(\frac{3}{8}a - \frac{1}{2}\right)$
Distribute.	$8 \cdot a + 8 \cdot \frac{3}{4} = 8 \cdot \frac{3}{8}a - 8 \cdot \frac{1}{2}$
Simplify—no more fractions.	$8a + 6 = 3a - 4$
Subtract 3a3a from both sides.	$8a - 3a + 6 = 3a - 3a - 4$
Simplify.	$5a + 6 = -4$
Subtract 6 from both sides.	$5a + 6 - 6 = -4 - 6$
Simplify.	$5a = -10$

Divide by 5.	$\frac{5a}{5}=\frac{-10}{5}$
Simplify.	$a=-2$
Check:	$a+\frac{3}{4}=\frac{3}{8}a-\frac{1}{2}$
Let a=−2.	$-2+\frac{3}{4}\stackrel{?}{=}\frac{3}{8}(-2)-\frac{1}{2}$
	$-\frac{8}{4}+\frac{3}{4}\stackrel{?}{=}-\frac{16}{8}-\frac{4}{8}$
	$-\frac{5}{4}=-\frac{10}{8}$
	$-\frac{5}{4}=-\frac{5}{4}\checkmark$

Try It 9.5.8

Solve: $x+\frac{1}{3}=\frac{1}{6}x-\frac{1}{2}$

Answer

$x=-1$

Try It 9.5.9

Solve: $c+\frac{3}{4}=\frac{1}{2}c-\frac{1}{4}$

Answer

$c=-2$

In the next example, we start by using the Distributive Property. This step clears the fractions right away.

Example 9.5.10

Solve: $-5=\frac{1}{4}(8x+4)$

Solution

	$-5=\frac{1}{4}(8x+4)$
Distribute.	$-5=\frac{1}{4}\cdot 8x+\frac{1}{4}\cdot 4$
Simplify. Now there are no fractions.	$-5=2x+1$
Subtract 1 from both sides.	$-5-1=2x+1-1$
Simplify.	$-6=2x$
Divide by 2.	$\frac{-6}{2}=\frac{2x}{2}$
Simplify.	$-3=x$
Check:	$-5=\frac{1}{4}(8x+4)$
Let x=−3.	$-5\stackrel{?}{=}\frac{1}{2}(4(-3)+2)$

	$-5 \stackrel{?}{=} \frac{1}{2}(-12+2)$	
	$-5 \stackrel{?}{=} \frac{1}{2}(-10)$	
	$-5 = -5$ ✓	

Try It 9.5.11

Solve: $-11 = \frac{1}{2}(6p+2)$

Answer

$p = -4$

Try It 9.5.12

Solve: $8 = \frac{1}{3}(9q+6)$

Answer

$q = 2$

In the next example, even after distributing, we still have fractions to clear.

Example 9.5.13

Solve: $\frac{1}{2}(y-5) = \frac{1}{4}(y-1)$

Solution

	$\frac{1}{2}(y-5) = \frac{1}{4}(y-1)$
Distribute.	$\frac{1}{2} \cdot y - \frac{1}{2} \cdot 5 = \frac{1}{4} \cdot y - \frac{1}{4} \cdot 1$
Simplify.	$\frac{1}{2}y - \frac{5}{2} = \frac{1}{4}y - \frac{1}{4}$
Multiply by the LCD, 4.	$4\left(\frac{1}{2}y - \frac{5}{2}\right) = 4\left(\frac{1}{4}y - \frac{1}{4}\right)$
Distribute.	$4 \cdot \frac{1}{2}y - 4 \cdot \frac{5}{2} = 4 \cdot \frac{1}{4}y - 4 \cdot \frac{1}{4}$
Simplify.	$2y - 10 = y - 1$
Collect the variables to the left.	$2y - y - 10 = y - y - 1$
Simplify.	$y - 10 = -1$
Collect the constants to the right.	$y - 10 + 10 = -1 + 10$
Simplify.	$y = 9$
Check:	$\frac{1}{2}(y-5) = \frac{1}{4}(y-1)$
Let y=9.	$\frac{1}{2}(9-5) \stackrel{?}{=} \frac{1}{4}(9-1)$
Finish the check on your own.	

Try It 9.5.14

Solve: $\frac{1}{5}(n+3)=\frac{1}{4}(n+2)$

Answer

$n=2$

Try It 9.5.15

Solve: $\frac{1}{2}(m-3)=\frac{1}{4}(m-7)$

Answer

$m=-1$

Example 9.5.16

Solve: $\frac{5x-3}{4}=\frac{x}{2}$

Solution

	$\frac{5x-3}{4}=\frac{x}{2}$
Multiply by the LCD, 4.	$4\left(\frac{5x-3}{4}\right)=4\left(\frac{x}{2}\right)$
Simplify.	$5x-3=2x$
Collect the variables to the right.	$5x-5x-3=2x-5x$
Simplify.	$-3=-3x$
Divide.	$\frac{-3}{-3}=\frac{-3x}{-3}$
Simplify.	$1=x$
Check:	$\frac{5x-3}{4}=\frac{x}{2}$
Let x=1.	$\frac{5(1)-3}{4}\stackrel{?}{=}\frac{1}{2}$
	$\frac{2}{4}\stackrel{?}{=}\frac{1}{2}$
	$\frac{1}{2}=\frac{1}{2}$ ✓

Try It 9.5.17

Solve: $\frac{4y-7}{3}=\frac{y}{6}$

Answer

$y=2$

Try It 9.5.18

Solve: $\frac{-2z-5}{4}=\frac{z}{8}$

Answer

$z = -2$

Example 9.5.19

Solve: $\frac{a}{6} + 2 = \frac{a}{4} + 3$

Solution

	$\frac{a}{6} + 2 = \frac{a}{4} + 3$
Multiply by the LCD, 12.	$12\left(\frac{a}{6} + 2\right) = 12\left(\frac{a}{4} + 3\right)$
Distribute.	$12 \cdot \frac{a}{6} + 12 \cdot 2 = 12 \cdot \frac{a}{4} + 12 \cdot 3$
Simplify.	$2a + 24 = 3a + 36$
Collect the variables to the right.	$2a - 2a + 24 = 3a - 2a + 36$
Simplify.	$24 = a + 36$
Collect the constants to the left.	$24 - 36 = a + 36 - 36$
Simplify.	$a = -12$
Check:	$\frac{a}{6} + 2 = \frac{a}{4} + 3$
Let a=−12.	$\frac{-12}{6} + 2 \stackrel{?}{=} \frac{-12}{4} + 3$
	$-2 + 2 \stackrel{?}{=} -3 + 3$
	$0 = 0$ ✓

Try It 9.5.20

Solve: $\frac{b}{10} + 2 = \frac{b}{4} + 5$

Answer

$b = -20$

Try It 9.5.21

Solve: $\frac{c}{6} + 3 = \frac{c}{3} + 4$

Answer

$c = -6$

Example 9.5.22

Solve: $\frac{4q+3}{2} + 6 = \frac{3q+5}{4}$

Solution

	$\frac{4q+3}{2} + 6 = \frac{3q+5}{4}$
Multiply by the LCD, 4.	$4\left(\frac{4q+3}{2} + 6\right) = 4\left(\frac{3q+5}{4}\right)$

Distribute.	$4\left(\frac{4q+3}{2}\right)+4\cdot 6=4\cdot\left(\frac{3q+5}{4}\right)$
Simplify.	$2(4q+3)+24=3q+5$ $8q+6+24=3q+5$ $8q+30=3q+5$
Collect the variables to the left.	$8q-3q+30=3q-3q+5$
Simplify.	$5q+30=5$
Collect the constants to the right.	$5q+30-30=5-30$
Simplify.	$5q=-25$
Divide by 5.	$\frac{5q}{5}=\frac{-25}{5}$
Simplify.	$q=-5$
Check:	$\frac{4q+3}{2}+6=\frac{3q+5}{4}$
Let q=−5.	$\frac{4(-5)+3}{2}+6\stackrel{?}{=}\frac{3(-5)+5}{4}$
Finish the check on your own.	

Try It 9.5.23

Solve: $\frac{3r+5}{6}+1=\frac{4r+3}{3}$

Answer

$r=1$

Try It 9.5.24

Solve: $\frac{2s+3}{2}+1=\frac{3s+2}{4}$

Answer

$s=-8$

Solve Equations with Decimal Coefficients

Some equations have decimals in them. This kind of equation will occur when we solve problems dealing with money or percentages. But decimals can also be expressed as fractions. For example, $0.3=\frac{3}{10}$ and $0.17=\frac{17}{100}$. So, with an equation with decimals, we can use the same method we used to clear fractions—multiply both sides of the equation by the least common denominator.

Example 9.5.25

Solve: $0.06x+0.02=0.25x-1.5$

Solution

Look at the decimals and think of the equivalent fractions.

$0.06=\frac{6}{100}\quad 0.02=\frac{2}{100}\quad 0.25=\frac{25}{100}\quad 1.5=1\frac{5}{10}$

Notice, the LCD is 100.

By multiplying by the LCD, we will clear the decimals from the equation.

	$0.06x + 0.02 = 0.25x - 1.5$
Multiply both side by 100.	$100(0.06x + 0.02) = 100(0.25x - 1.5)$
Distribute.	$100(0.06x) + 100(0.02) = 100(0.25x) - 100(1.5)$
Multiply, and now we have no more decimals.	$6x + 2 = 25x - 150$
Collect the variables to the right.	$6x - 6x + 2 = 25x - 6x - 150$
Simplify.	$2 = 19x - 150$
Collect the variables to the right.	$2 + 150 = 19x - 150 + 150$
Simplify.	$152 = 19x$
Divide by 19.	$\frac{152}{19} = \frac{19x}{19}$
Simplify.	$8 = x$
Check: Let x=8 $0.06(8) + 0.02 \stackrel{?}{=} 0.25(8) - 1.5$ $0.48 + 0.02 \stackrel{?}{=} 2.00 - 1.5$ $0.50 = 0.50$ ✓	

Try It 9.5.26

Solve: $0.14h + 0.12 = 0.35h - 2.4$

Answer

$h = 12$

Try It 9.5.27

Solve: $0.65k - 0.1 = 0.4k - 0.35$

Answer

$k = -1$

The next example uses an equation that is typical of the money applications in the next chapter. Notice that we distribute the decimal before we clear all the decimals.

Example 9.5.28

Solve: $0.25x + 0.05(x + 3) = 2.85$

Solution

	$0.25x + 0.05(x + 3) = 2.85$
Distribute first.	$0.25x + 0.05x + 0.15 = 2.85$
Combine like terms.	$0.30x + 0.15 = 2.85$
To clear decimals, multiply by 100.	$100(0.30x + 0.15) = 100(2.85)$
Distribute.	$30x + 15 = 285$
Subtract 15 from both sides.	$30x + 15 - 15 = 285 - 15$

Simplify.	$30x = 270$
Divide by 30.	$\frac{30x}{30} = \frac{270}{30}$
Simplify.	$x = 9$
Check it yourself by substituting x=9 into the original equation.	

Try It 9.5.29

Solve: $0.25n + 0.05(n + 5) = 2.95$

Answer

$n = 9$

Try It 9.5.30

Solve: $0.10d + 0.05(d - 5) = 2.15$

Answer

$d = 16$

Key Concepts

- **Strategy to Solve an Equation with Fraction Coefficients**
  1. Find the least common denominator of all the fractions in the equation.
  2. Multiply both sides of the equation by that LCD. This clears the fractions.
  3. Solve using the General Strategy for Solving Linear Equations.

9.5E: Exercises

Practice Makes Perfect

Solve Equations with Fraction Coefficients

In the following exercises, solve each equation with fraction coefficients.

Exercise 9.5E.1

$\frac{1}{4}x - \frac{1}{2} = -\frac{3}{4}$

Exercise 9.5E.2

$\frac{3}{4}x - \frac{1}{2} = \frac{1}{4}$

Answer

x=1

Exercise 9.5E.3

$\frac{5}{6}y - \frac{2}{3} = -\frac{3}{2}$

Exercise 9.5E.4

$\frac{5}{6}y - \frac{1}{3} = -\frac{7}{6}$

Answer

$y = -1$

Exercise 9.5E.5

$\frac{1}{2}a + \frac{3}{8} = \frac{3}{4}$

Exercise 9.5E.6

$\frac{5}{8}b + \frac{1}{2} = -\frac{3}{4}$

Answer

$b = -2$

Exercise 9.5E.7

$2 = \frac{1}{3}x - \frac{1}{2}x + \frac{2}{3}x$

Exercise 9.5E.8

$2 = \frac{3}{5}x - \frac{1}{3}x + \frac{2}{5}x$

Answer

$x = 3$

Exercise 9.5E.9

$\frac{1}{4}m - \frac{4}{5}m + \frac{1}{2}m = -1$

Exercise 9.5E.10

$\frac{5}{6}n - \frac{1}{4}n - \frac{1}{2}n = -2$

Answer

$n = -24$

Exercise 9.5E.11

$x + \frac{1}{2} = \frac{2}{3}x - \frac{1}{2}$

Exercise 9.5E.12

$x + \frac{3}{4} = \frac{1}{2}x - \frac{5}{4}$

Answer

$x = -4$

Exercise 9.5E.13

$\frac{1}{3}w + \frac{5}{4} = w - \frac{1}{4}$

Exercise 9.5E.14

$\frac{3}{2}z + \frac{1}{3} = z - \frac{2}{3}$

Answer

$z = -2$

Exercise 9.5E.15

$\frac{1}{2}x - \frac{1}{4} = \frac{1}{12}x + \frac{1}{6}$

Exercise 9.5E.16

$\frac{1}{2}a - \frac{1}{4} = \frac{1}{6}a + \frac{1}{12}$

Answer

$a = 1$

Exercise 9.5E.17

$\frac{1}{3}b + \frac{1}{5} = \frac{2}{5}b - \frac{3}{5}$

Exercise 9.5E.18

$\frac{1}{3}x+\frac{2}{5}=\frac{1}{5}x-\frac{2}{5}$

Answer

$x=-6$

Exercise 9.5E.19

$1=\frac{1}{6}(12x-6)$

Exercise 9.5E.20

$1=\frac{1}{5}(15x-10)$

Answer

$x=1$

Exercise 9.5E.21

$\frac{1}{4}(p-7)=\frac{1}{3}(p+5)$

Exercise 9.5E.22

$\frac{1}{5}(q+3)=\frac{1}{2}(q-3)$

Answer

$q=7$

Exercise 9.5E.23

$\frac{1}{2}(x+4)=\frac{3}{4}$

Exercise 9.5E.24

$\frac{1}{3}(x+5)=\frac{5}{6}$

Answer

$x=-\frac{5}{2}$

Exercise 9.5E.25

$\frac{5q-8}{5}=\frac{2q}{10}$

Exercise 9.5E.26

$\frac{4m+2}{6}=\frac{m}{3}$

Answer

$m=-1$

Exercise 9.5E.27

$\frac{4n+8}{4} = \frac{n}{3}$

Exercise 9.5E.28

$\frac{3p+6}{3} = \frac{p}{2}$

Answer

$p = -4$

Exercise 9.5E.29

$\frac{u}{3} - 4 = \frac{u}{2} - 3$

Exercise 9.5E.30

$\frac{v}{10} + 1 = \frac{v}{4} - 2$

Answer

$v = 20$

Exercise 9.5E.31

$\frac{c}{15} + 1 = \frac{c}{10} - 1$

Exercise 9.5E.32

$\frac{d}{6} + 3 = \frac{d}{8} + 2$

Answer

$d = -24$

Exercise 9.5E.33

$\frac{3x+4}{2} + 1 = \frac{5x+10}{8}$

Exercise 9.5E.34

$\frac{10y-2}{3} + 3 = \frac{10y+1}{9}$

Answer

$y = -1$

Exercise 9.5E.35

$\frac{7u-1}{4} - 1 = \frac{4u+8}{5}$

Exercise 9.5E.36

$\frac{3v-6}{2}+5=\frac{11v-4}{5}$

Answer

$v=4$

Solve Equations with Decimal Coefficients

In the following exercises, solve each equation with decimal coefficients.

Exercise 9.5E.37

$0.6y+3=9$

Exercise 9.5E.38

$0.4y-4=2$

Answer

$y=15$

Exercise 9.5E.39

$3.6j-2=5.2$

Exercise 9.5E.40

$2.1k+3=7.2$

Answer

$k=2$

Exercise 9.5E.41

$0.4x+0.6=0.5x-1.2$

Exercise 9.5E.42

$0.7x+0.4=0.6x+2.4$

Answer

$x=20$

Exercise 9.5E.43

$0.23x+1.47=0.37x-1.05$

Exercise 9.5E.44

$0.48x+1.56=0.58x-0.64$

Answer

$x = 22$

Exercise 9.5E.45

$0.9x - 1.25 = 0.75x + 1.75$

Exercise 9.5E.46

$1.2x - 0.91 = 0.8x + 2.29$

Answer

$x = 8$

Exercise 9.5E.47

$0.05n + 0.10(n + 8) = 2.15$

Exercise 9.5E.48

$0.05n + 0.10(n + 7) = 3.55$

Answer

$n = 19$

Exercise 9.5E.49

$0.10d + 0.25(d + 5) = 4.05$

Exercise 9.5E.50

$0.10d + 0.25(d + 7) = 5.25$

Answer

$d = 10$

Exercise 9.5E.51

$0.05(q - 5) + 0.25q = 3.05$

Exercise 9.5E.52

$0.05(q - 8) + 0.25q = 4.10$

Answer

$q = 15$

Everyday Math

Exercise 9.5E.53

Coins Taylor has $200 in dimes and pennies. The number of pennies is 2 more than the number of dimes. Solve the equation $0.10d+0.01(d+2)=2$ for d, the number of dimes.

Exercise 9.5E.54

Stamps Paula bought $22.82 worth of 49-cent stamps and 21-cent stamps. The number of 21-cent stamps was 8 less than the number of 49-cent stamps. Solve the equation $0.49s+0.21(s-8)=22.82$ for s, to find the number of 49-cent stamps Paula bought.

Answer

$s=35$

Writing Exercises

Exercise 9.5E.55

Explain how you find the least common denominator of $\frac{3}{8}$, $\frac{1}{6}$, and $\frac{2}{3}$

Exercise 9.5E.56

If an equation has several fractions, how does multiplying both sides by the LCD make it easier to solve?

Answer

Answers will vary.

Exercise 9.5E.57

If an equation has fractions only on one side, why do you have to multiply both sides of the equation by the LCD?

Exercise 9.5E.58

In the equation $0.35x+2.1=3.85$ what is the LCD? How do you know?

Answer

100. Justifications will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
solve equations with fraction coefficients.			
solve equations with decimal coefficients.			

ⓑ Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

This page titled 9.5E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

- **2.5E: Exercises** by OpenStax has no license indicated. Original source: https://openstax.org/details/books/elementary-algebra-2e.

9.6: Solve a Formula for a Specific Variable

Learning Objectives

By the end of this section, you will be able to:

- Use the Distance, Rate, and Time formula
- Solve a formula for a specific variable

Quiz

Before you get started, take this readiness quiz.

1. Solve: $15t = 120$.
   If you missed this problem, review Exercise 2.2.1.
2. Solve: $6x + 24 = 96$.
   If you missed this problem, review Exercise 2.3.1.

Use the Distance, Rate, and Time Formula

One formula you will use often in algebra and in everyday life is the formula for distance traveled by an object moving at a constant rate. Rate is an equivalent word for "speed." The basic idea of rate may already familiar to you. Do you know what distance you travel if you drive at a steady rate of 60 miles per hour for 2 hours? (This might happen if you use your car's cruise control while driving on the highway.) If you said 120 miles, you already know how to use this formula!

DISTANCE, RATE, AND TIME

For an object moving at a uniform (constant) rate, the distance traveled, the elapsed time, and the rate are related by the formula:

$$d = rt \quad \text{where} \quad \begin{aligned} d &= \text{distance} \\ r &= \text{rate} \\ t &= \text{time} \end{aligned} \tag{9.6.1}$$

We will use the Strategy for Solving Applications that we used earlier in this chapter. When our problem requires a formula, we change Step 4. In place of writing a sentence, we write the appropriate formula. We write the revised steps here for reference.

SOLVE AN APPLICATION (WITH A FORMULA).

1. **Read** the problem. Make sure all the words and ideas are understood.
2. **Identify** what we are looking for.
3. **Name** what we are looking for. Choose a variable to represent that quantity.
4. **Translate** into an equation. Write the appropriate formula for the situation. Substitute in the given information.
5. **Solve** the equation using good algebra techniques.
6. **Check** the answer in the problem and make sure it makes sense.
7. **Answer** the question with a complete sentence.

You may want to create a mini-chart to summarize the information in the problem. See the chart in this first example.

Example 9.6.1

Jamal rides his bike at a uniform rate of 12 miles per hour for $3\frac{1}{2}$ hours. What distance has he traveled?

Solution

Step 1. Read the problem.	

Step 2. Identify what you are looking for.	distance traveled
Step 3. Name. Choose a variable to represent it.	Let d = distance.
Step 4. Translate: Write the appropriate formula.	$d = rt$
	$d = ?$ $r = 12$ mph $t = 3\frac{1}{2}$ hours
Substitute in the given information.	$d = 12 \cdot 3\frac{1}{2}$
Step 5. Solve the equation.	$d = 42$ miles
Step 6. Check	
Does 42 miles make sense?	
Jamal rides:	
12 miles in 1 hour, 24 miles in 2 hours, 36 miles in 3 hours, 42 miles in $3\frac{1}{2}$ hours is reasonable 48 miles in 4 hours.	
Step 7. Answer the question with a complete sentence.	Jamal rode 42 miles.

Try It 9.6.2

Lindsay drove for $5\frac{1}{2}$ hours at 60 miles per hour. How much distance did she travel?

Answer

330 miles

Try It 9.6.3

Trinh walked for $2\frac{1}{3}$ hours at 3 miles per hour. How far did she walk?

Answer

7 miles

Example 9.6.4

Rey is planning to drive from his house in San Diego to visit his grandmother in Sacramento, a distance of 520 miles. If he can drive at a steady rate of 65 miles per hour, how many hours will the trip take?

Solution

Step 1. Read the problem.	
Step 2. Identify what you are looking for.	How many hours (time)
Step 3. Name. Choose a variable to represent it.	Let t = time.
	$d = 520$ miles $r = 65$ mph $t = ?$ hours

Step 4. Translate. Write the appropriate formula.	$d = rt$
Substitute in the given information.	$520 = 65t$
Step 5. Solve the equation.	$t = 8$
Step 6. Check. Substitute the numbers into the formula and make sure the result is a true statement.	
$d = rt$ $520 \stackrel{?}{=} 65 \cdot 8$ $520 = 520 \checkmark$	
Step 7. Answer the question with a complete sentence. Rey's trip will take 8 hours.	

Try It 9.6.5

Lee wants to drive from Phoenix to his brother's apartment in San Francisco, a distance of 770 miles. If he drives at a steady rate of 70 miles per hour, how many hours will the trip take?

Answer

11 hours

Try It 9.6.6

Yesenia is 168 miles from Chicago. If she needs to be in Chicago in 3 hours, at what rate does she need to drive?

Answer

56 mph

Solve a Formula for a Specific Variable

You are probably familiar with some geometry formulas. A formula is a mathematical description of the relationship between variables. Formulas are also used in the sciences, such as chemistry, physics, and biology. In medicine they are used for calculations for dispensing medicine or determining body mass index. Spreadsheet programs rely on formulas to make calculations. It is important to be familiar with formulas and be able to manipulate them easily.

In Exercise 9.6.1 and Exercise 9.6.4, we used the formula $d = rt$. This formula gives the value of d, distance, when you substitute in the values of r and t, the rate and time. But in Exercise 9.6.4, we had to find the value of t. We substituted in values of d and r and then used algebra to solve for tt. If you had to do this often, you might wonder why there is not a formula that gives the value of t when you substitute in the values of d and r. We can make a formula like this by solving the formula $d = rt$ for t.

To solve a formula for a specific variable means to isolate that variable on one side of the equals sign with a coefficient of 1. All other variables and constants are on the other side of the equals sign. To see how to solve a formula for a specific variable, we will start with the distance, rate and time formula.

Example 9.6.7

Solve the formula d=rt for t:

1. when d=520 and r=65
2. in general

Solution

We will write the solutions side-by-side to demonstrate that solving a formula in general uses the same steps as when we have numbers to substitute.

1. when d=520 and r=65		2. in general	
Write the formula.	$d = rt$	Write the formula.	$d = rt$
Substitute.	$520 = 65t$		
Divide, to isolate t.	$\frac{520}{65} = \frac{65t}{65}$	Divide, to isolate tt.	$\frac{d}{r} = \frac{rt}{t}$
Simplify.	$8 = t$	Simplify.	$\frac{d}{r} = t$

We say the formula $t = \frac{d}{r}$ is solved for t.

Try It 9.6.8

Solve the formula $d = rt$ for r:

1. when d=180 and t=4
2. in general

Answer

1. $r = 45$
2. $r = \frac{d}{t}$

Try It 9.6.9

Solve the formula $d = rt$ for r:

1. when d=780 and t=12
2. in general

Answer

1. $r = 65$
2. \(r = \frac{d}{rt}\)

Example 9.6.10

Solve the formula $A = \frac{1}{2}bh$ for h:

1. when $A = 90$ and $b = 15$
2. in general

Solution

1. when $A = 90$ and $b = 15$		2. in general	
Write the formula.	$A = \frac{1}{2}bh$	Write the formula.	$A = \frac{1}{2}bh$
Substitute.	$90 = \frac{1}{2} \cdot 15 \cdot h$		
Clear the fractions.	$2 \cdot 90 = 2 \cdot \frac{1}{2}15h$	Clear the fractions.	$2 \cdot A = 2 \cdot \frac{1}{2}bh$
Simplify.	$180 = 15h$	Simplify.	$2A = bh$
Solve for h.	$12 = h$	Solve for hh.	$\frac{2A}{b} = h$

We can now find the height of a triangle, if we know the area and the base, by using the formula $h = \frac{2A}{b}$

Try It 9.6.11

Solve the formula $A = \frac{1}{2}bh$ for h:

1. when $A = 170$ and $b = 17$
2. in general

Answer

1. $h = 20$
2. $h = \frac{2A}{b}$

Try It 9.6.12

Solve the formula $A = \frac{1}{2}bh$ for h:

1. when $A = 62$ and $h = 31$
2. in general

Answer

1. $b = 4$
2. $b = \frac{2A}{h}$

The formula $I = Prt$ is used to calculate simple interest, *I*, for a principal, *P*, invested at rate, *r*, for *t* years.

Example 9.6.13

Solve the formula I=Prt to find the principal, P:

1. when I=$5,600, r=4% ,t=7years
2. in general

Solution

1. I=$5,600, r=4% ,t=7years		2. in general	
Write the formula.	$I = Prt$	Write the formula.	$I = Prt$
Substitute.	$5600 = P(0.04)(7)$		
Simplify.	$5600 = P(0.28)$	Simplify.	$I = P(rt)$
Divide, to isolate *P*.	$\frac{5600}{0.28} = \frac{P(0.28)}{0.28}$	Divide, to isolate *P*.	$\frac{I}{rt} = \frac{P(rt)}{rt}$
Simplify.	$20,000 = P$	Simplify.	$\frac{I}{rt} = P$
The principal is	$20,000		$P = \frac{I}{rt}$

Try It 9.6.14

Solve the formula I=Prt to find the principal, P:

1. when I=$2160, r=6% ,t=3 years
2. in general

Answer

1. $12000
2. $P = \frac{1}{rt}$

Try It 9.6.15

Solve the formula I=Prt to find the principal, P:

1. when I=$5400, r= 12% ,t=5 years
2. in general

Answer

1. $9000
2. $P = \frac{1}{rt}$

Later in this class, and in future algebra classes, you'll encounter equations that relate two variables, usually *x* and *y*. You might be given an equation that is solved for *y* and need to solve it for *x*, or vice versa. In the following example, we're given an equation with both *x* and *y* on the same side and we'll solve it for *y*.

Example 9.6.16

Solve the formula 3x+2y=18 for *y*:

1. when x=4
2. in general

Solution

1. when x=4		2. in general	
	$3x + 2y = 18$		$3x + 2y = 18$
Substitute.	$3(4) + 2y = 18$		
Subtract to isolate the y-term.	$12 - 12 + 2y = 18 - 12$	Subtract to isolate the y-term.	$3x - 3x + 2y = 18 - 3x$
Divide.	$\frac{2y}{2} = \frac{6}{2}$	Divide.	$\frac{2y}{2} = \frac{18}{2} - \frac{3x}{2}$
Simplify.	$y = 3$	Simplify.	$y = -\frac{3x}{2} + 9$

Try It 9.6.17

Solve the formula 3x+4y=10 for *y*:

1. when $x = \frac{14}{3}$
2. in general

Answer

1. $y = -1$
2. $y = \frac{10-3x}{4}$

Try It 9.6.18

Solve the formula 5x+2y=18 for *y*:

1. when $x = 4$

2. in general

Answer

1. $y = -1$
2. $y = \frac{18-5x}{2}$

In Exercise $9.6.7$ through Exercise $9.6.18$ we used the numbers in part 1 as a guide to solving in general in part 2. Now we will solve a formula in general without using numbers as a guide.

Example 9.6.19

Solve the formula P=a+b+c for a.

Solution

We will isolate aa on one side of the equation.	$P = a + b + c$
Both b and c are added to a, so we subtract them from both sides of the equation.	$P - b - c = a + b + c - b - c$
Simplify.	$P - b - c = a$ $a = P - b - c$

Try It 9.6.20

Solve the formula P=a+b+c for *b*.

Answer

b=P−a−c

Try It 9.6.21

Solve the formula P=a+b+c for *c*.

Answer

c=P−a−b

Example 9.6.22

Solve the formula 6x+5y=13 for *y*.

Solution

	$6x + 5y = 13$
Subtract 6x from both sides to isolate the term with y.	$6x - 6x + 5y = 13 - 6x$
Simplify.	$5y = 13 - 6x$
Divide by 5 to make the coefficient 1.	$\frac{5y}{5} = \frac{13-6x}{5}$
Simplify.	$y = \frac{13-6x}{5}$

The fraction is simplified. We cannot divide 13−6x by 5.

? Try It 9.6.23

Solve the formula 4x+7y=9 for *y*.

Answer

$y = \frac{9-4x}{7}$

? Try It 9.6.24

Solve the formula 5x+8y=1 for *y*.

Answer

$y = \frac{1-5x}{8}$

Key Concepts

- **To Solve an Application (with a formula)**
  1. **Read** the problem. Make sure all the words and ideas are understood.
  2. **Identify** what we are looking for.
  3. **Name** what we are looking for. Choose a variable to represent that quantity.
  4. **Translate** into an equation. Write the appropriate formula for the situation. Substitute in the given information.
  5. **Solve** the equation using good algebra techniques.
  6. **Check** the answer in the problem and make sure it makes sense.
  7. **Answer** the question with a complete sentence.
- **Distance, Rate and Time**
  For an object moving at a uniform (constant) rate, the distance traveled, the elapsed time, and the rate are related by the formula: d=rt where *d* = distance, *r* = rate, *t* = time.
- **To solve a formula for a specific variable** means to get that variable by itself with a coefficient of 1 on one side of the equation and all other variables and constants on the other side.

- **2.6: Solve a Formula for a Specific Variable** by OpenStax is licensed CC BY 4.0. Original source: https://openstax.org/details/books/elementary-algebra-2e.

9.6E: Exercises

Practice Makes Perfect

Use the Distance, Rate, and Time Formula

In the following exercises, solve.

Exercise 9.6E.1

Steve drove for $8\frac{1}{2}$ hours at 72 miles per hour. How much distance did he travel?

Exercise 9.6E.2

Socorro drove for $4\frac{5}{6}$ hours at 60 miles per hour. How much distance did she travel?

Answer

290 miles

Exercise 9.6E.3

Yuki walked for $1\frac{3}{4}$ hours at 4 miles per hour. How far did she walk?

Exercise 9.6E.4

Francie rode her bike for $2\frac{1}{2}$ hours at 12 miles per hour. How far did she ride?

Answer

30 miles

Exercise 9.6E.5

Connor wants to drive from Tucson to the Grand Canyon, a distance of 338 miles. If he drives at a steady rate of 52 miles per hour, how many hours will the trip take?

Exercise 9.6E.6

Megan is taking the bus from New York City to Montreal. The distance is 380 miles and the bus travels at a steady rate of 76 miles per hour. How long will the bus ride be?

Answer

5 hours

Exercise 9.6E.7

Aurelia is driving from Miami to Orlando at a rate of 65 miles per hour. The distance is 235 miles. To the nearest tenth of an hour, how long will the trip take?

Exercise 9.6E.8

Kareem wants to ride his bike from St. Louis to Champaign, Illinois. The distance is 180 miles. If he rides at a steady rate of 16 miles per hour, how many hours will the trip take?

Answer

11.25 hours

Exercise 9.6E.9

Javier is driving to Bangor, 240 miles away. If he needs to be in Bangor in 4 hours, at what rate does he need to drive?

Exercise 9.6E.10

Alejandra is driving to Cincinnati, 450 miles away. If she wants to be there in 6 hours, at what rate does she need to drive?

Answer

75 mph

Exercise 9.6E.11

Aisha took the train from Spokane to Seattle. The distance is 280 miles and the trip took 3.5 hours. What was the speed of the train?

Exercise 9.6E.12

Philip got a ride with a friend from Denver to Las Vegas, a distance of 750 miles. If the trip took 10 hours, how fast was the friend driving?

Answer

75 mph

Solve a Formula for a Specific Variable

In the following exercises, use the formula $d = rt$.

Exercise 9.6E.13

Solve for t

1. when $d = 350$ and $r = 70$
2. in general

Exercise 9.6E.14

Solve for t

1. when $d = 240$ and $r = 60$
2. in general

Answer

1. $t = 4$
2. $t = \frac{d}{r}$

Exercise 9.6E.15

Solve for t

1. when $d = 510$ and $r = 60$

2. in general

Exercise 9.6E.16

Solve for t

1. when $d = 175$ and $r = 50$
2. in general

Answer

1. $t = 3.5$
2. $t = \frac{d}{r}$

Exercise 9.6E.17

Solve for r

1. when $d = 204$ and $t = 3$
2. in general

Exercise 9.6E.18

Solve for r

1. when $d = 420$ and $t = 6$
2. in general

Answer

1. $r = 70$
2. $r = \frac{d}{t}$

Exercise 9.6E.19

Solve for r

1. when $d = 160$ and $t = 2.5$
2. in general

Exercise 9.6E.20

Solve for r

1. when $d = 180$ and $t = 4.5$
2. in general

Answer

1. $r = 40$
2. $r = \frac{d}{t}$

In the following exercises, use the formula $A = \frac{1}{2}bh$

Exercise 9.6E.21

Solve for b

1. when $A = 126$ and $h = 18$
2. in general

Exercise 9.6E.22

Solve for h

1. when $A = 176$ and $b = 22$
2. in general

Answer

1. $h = 16$
2. $h = \frac{2A}{b}$

Exercise 9.6E.23

Solve for h

1. when $A = 375$ and $b = 25$
2. in general

Exercise 9.6E.24

Solve for b

1. when $A = 65$ and $h = 13$
2. in general

Answer

1. $b = 10$
2. $b = \frac{2A}{h}$

In the following exercises, use the formula $I = Prt$.

Exercise 9.6E.25

Solve for the principal, P for

1. $I = \$5,480$, $r = 4\%$, $t = 7$ years
2. in general

Exercise 9.6E.26

Solve for the principal, P for

1. $I = \$3,950$, $r = 6\%$, $t = 5$ years
2. in general

Answer

1. $P = \$13,166.67$
2. $P = \frac{I}{rt}$

Exercise 9.6E.27

Solve for the time, t for

1. $I = \$2,376$, $P = \$9,000$, $r = 4.4\%$
2. in general

Exercise 9.6E.28

Solve for the time, t for

1. $I = \$624$, $P = \$6,000$, $r = 5.2\%$
2. in general

Answer

1. $t = 2$ years
2. $t = \frac{I}{Pr}$

In the following exercises, solve.

Exercise 9.6E.29

Solve the formula $2x + 3y = 12$ for y

1. when $x = 3$
2. in general

Exercise 9.6E.30

Solve the formula $5x + 2y = 10$ for y

1. when $x = 4$
2. in general

Answer

1. $y = -5$
2. $y = \frac{10-5x}{2}$

Exercise 9.6E.31

Solve the formula $3x - y = 7$ for y

1. when $x = -2$
2. in general

Exercise 9.6E.32

Solve the formula $4x + y = 5$ for y

1. when $x = -3$
2. in general

Answer

1. $y = 17$
2. $y = 5 - 4x$

Exercise 9.6E.33

Solve $a+b=90$ for b.

Exercise 9.6E.34

Solve $a+b=90$ for a

Answer

$a=90-b$

Exercise 9.6E.35

Solve $180=a+b+c$ for a

Exercise 9.6E.36

Solve $180=a+b+c$ for c

Answer

$c=180-a-b$

Exercise 9.6E.37

Solve the formula $8x+y=15$ for y

Exercise 9.6E.38

Solve the formula $9x+y=13$ for y

Answer

$y=13-9x$

Exercise 9.6E.39

Solve the formula $-4x+y=-6$ for y

Exercise 9.6E.40

Solve the formula $-5x+y=-1$ for y

Answer

$y=-1+5x$

Exercise 9.6E.41

Solve the formula $4x+3y=7$ for y

Exercise 9.6E.42

Solve the formula $3x+2y=11$ for y

Answer

$y=\frac{11-3x}{2}$

Exercise 9.6E.43

Solve the formula $x-y=-4$ for y

Exercise 9.6E.44

Solve the formula $x-y=-3$ for y

Answer

$y=3+x$

Exercise 9.6E.45

Solve the formula $P=2L+2W$ for L

Exercise 9.6E.46

Solve the formula $P=2L+2W$ for W

Answer

$W=\frac{P-2L}{2}$

Exercise 9.6E.47

Solve the formula $C=\pi d$ for d

Exercise 9.6E.48

Solve the formula $C=\pi d$ for π

Answer

$\pi=\frac{C}{d}$

Exercise 9.6E.49

Solve the formula $V=LWH$ for L

Exercise 9.6E.50

Solve the formula $V=LWH$ for H

Answer

$H=\frac{V}{LW}$

Everyday Math

Exercise 9.6E.51

Converting temperature While on a tour in Greece, Tatyana saw that the temperature was 40° Celsius. Solve for F in the formula $C = \frac{5}{9}(F - 32)$ to find the Fahrenheit temperature.

Exercise 9.6E.52

Converting temperature Yon was visiting the United States and he saw that the temperature in Seattle one day was 50ºFahrenheit. Solve for C in the formula $F = \frac{9}{5}C + 32$ to find the Celsius temperature.

Answer

10°C

Writing Exercises

Exercise 9.6E.53

Solve the equation $2x + 3y = 6$ for y

1. when $x = -3$
2. in general
3. Which solution is easier for you, 1 or 2? Why?

Exercise 9.6E.54

Solve the equation $5x - 2y = 10$ for x

1. when $y = 10$
2. in general
3. Which solution is easier for you, 1 or 2? Why?

Answer

Answers will vary.

Self Check

ⓐ After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

I can...	Confidently	With some help	No-I don't get it!
use the distance, rate, and time formula.			
solve a formula for a specific variable.			

ⓑ What does this checklist tell you about your mastery of this section? What steps will you take to improve?

This page titled 9.6E: Exercises is shared under a not declared license and was authored, remixed, and/or curated by OpenStax.

9.7: Solve Linear Inequalities

Learning Objectives

By the end of this section, you will be able to:

- Graph inequalities on the number line
- Solve inequalities using the Subtraction and Addition Properties of inequality
- Solve inequalities using the Division and Multiplication Properties of inequality
- Solve inequalities that require simplification
- Translate to an inequality and solve

Note

Before you get started, take this readiness quiz.

1. Translate from algebra to English: $15 > x$.
   If you missed this problem, review Exercise 1.3.1.
2. Solve: $n - 9 = -42$.
   If you missed this problem, review Exercise 2.1.7.
3. Solve: $-5p = -23$.
   If you missed this problem, review Exercise 2.2.1.
4. Solve: $3a - 12 = 7a - 20$.
   If you missed this problem, review Exercise 2.3.22.

Graph Inequalities on the Number Line

Do you remember what it means for a number to be a solution to an equation? A solution of an equation is a value of a variable that makes a true statement when substituted into the equation.

What about the solution of an inequality? What number would make the inequality $x > 3$ true? Are you thinking, 'x could be 4'? That's correct, but x could be 5 too, or 20, or even 3.001. Any number greater than 3 is a solution to the inequality $x > 3$.

We show the solutions to the inequality $x > 3$ on the number line by shading in all the numbers to the right of 3, to show that all numbers greater than 3 are solutions. Because the number 3 itself is not a solution, we put an open parenthesis at 3. The graph of $x > 3$ is shown in Figure 9.7.1. Please note that the following convention is used: light blue arrows point in the positive direction and dark blue arrows point in the negative direction.

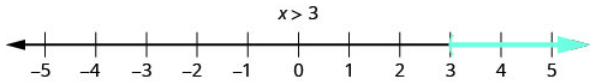

Figure 9.7.1: The inequality $x > 3$ is graphed on this number line.

The graph of the inequality $x \geq 3$ is very much like the graph of $x > 3$, but now we need to show that 3 is a solution, too. We do that by putting a bracket at $x = 3$, as shown in Figure 9.7.2.

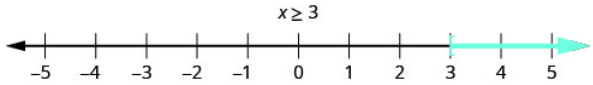

Figure 9.7.2: The inequality $x \geq 3$ is graphed on this number line.

Notice that the open parentheses symbol, (, shows that the endpoint of the inequality is not included. The open bracket symbol, [, shows that the endpoint is included.

Exercise 9.7.1

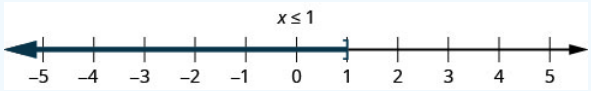
Graph on the number line:

1. $x \leq 1$
2. $x < 5$

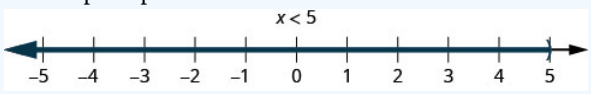
3. $x > -1$

Answer

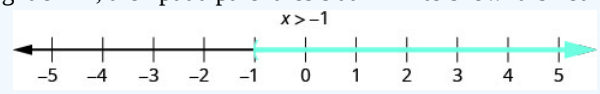
1. $x \leq 1$ This means all numbers less than or equal to 1. We shade in all the numbers on the number line to the left of 1 and put a bracket at x=1 to show that it is included.



2. $x < 5$ This means all numbers less than 5, but not including 5. We shade in all the numbers on the number line to the left of 5 and put a parenthesis at x=5 to show it is not included.



3. $x > -1$ This means all numbers greater than −1, but not including −1. We shade in all the numbers on the number line to the right of −1, then put a parenthesis at x=−1 to show it is not included.



Exercise 9.7.2

Graph on the number line:

1. $x \leq -1$
2. $x > 2$
3. $x < 3$

Answer

1. 
2. 
3. 
Exercise 9.7.3

Graph on the number line:

1. $x > -2$
2. $x < -3$
3. $x \geq -1$

Answer

1. 
2. 
3. 
We can also represent inequalities using *interval notation.* As we saw above, the inequality $x > 3$ means all numbers greater than 3. There is no upper end to the solution to this inequality. In **interval notation**, we express $x > 3$ as $(3, \infty)$. The symbol ∞ is read as 'infinity'. It is not an actual number. Figure $9.7.3$ shows both the number line and the interval notation.

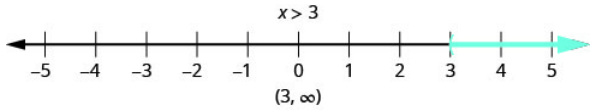


Figure 9.7.3: The inequality $x > 3$ is graphed on this number line and written in interval notation.

The inequality $x \leq 1$ means all numbers less than or equal to 1. There is no lower end to those numbers. We write $x \leq 1$ in interval notation as $(-\infty, 1]$. The symbol $-\infty$ is read as 'negative infinity'. Figure 9.7.4 shows both the number line and interval notation.

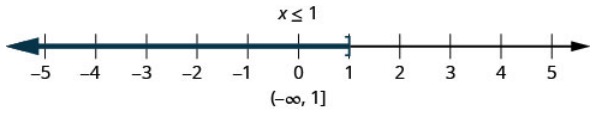

Figure 9.7.4: The inequality $x \leq 1$ is graphed on this number line and written in interval notation.

INEQUALITIES, NUMBER LINES, AND INTERVAL NOTATION

Did you notice how the parenthesis or bracket in the interval notation matches the symbol at the endpoint of the arrow? These relationships are shown in Figure 9.7.5.

Figure 9.7.5: The notation for inequalities on a number line and in interval notation use similar symbols to express the endpoints of intervals.

Exercise 9.7.4

Graph on the number line and write in interval notation.

1. $x \geq -3$
2. $x < 2.5$
3. $x \leq \frac{3}{5}$

Answer

1.

	$x \geq -3$
Shade to the right of −3, and put a bracket at −3.	
Write in interval notation.	[–3, ∞)

2.

	$x < 2.5$
Shade to the left of 2.5, and put a parenthesis at 2.5.	
Write in interval notation.	(–∞, 2.5)

3.

	$x \leq -\frac{3}{5}$

Shade to the left of $-\frac{3}{5}$, and put a bracket at $-\frac{3}{5}$.	
Write in interval notation.	$\left(-\infty, -\frac{3}{5}\right]$

Exercise 9.7.5

Graph on the number line and write in interval notation:

1. $x > 2$
2. $x \leq -1.5$
3. $x \geq \frac{3}{4}$

Answer

1. 
2. 
3. 
Exercise 9.7.6

Graph on the number line and write in interval notation:

1. $x \leq -4$
2. $x \geq 0.5$
3. $x < -\frac{2}{3}$

Answer

1. 
2. 
3. 
Solve Inequalities using the Subtraction and Addition Properties of Inequality

The Subtraction and Addition Properties of Equality state that if two quantities are equal, when we add or subtract the same amount from both quantities, the results will be equal.

PROPERTIES OF EQUALITY

Subtraction Property of Equality	**Addition Property of Equality**
For any numbers $a, b,$ and c,	For any numbers $a, b,$ and c
if $a = b$,	if $a = b$
then $a - c = b - c$.	then $a + c = b + c$

(9.7.1)

Similar properties hold true for inequalities.

Table 9.7.1

For example, we know that −4 is less than 2.	$-4 < 2$
If we subtract 5 from both quantities, is the left side still less than the right side?	$-4-5 \stackrel{?}{<} 2-5$
We get −9 on the left and −3 on the right.	$-9 \stackrel{?}{<} -3$
And we know −9 is less than −3.	$-9 < -3$
	The inequality sign stayed the same.

Similarly we could show that the inequality also stays the same for addition.

This leads us to the Subtraction and Addition Properties of Inequality.

PROPERTIES OF INEQUALITY

Subtraction Property of Inequality	**Addition Property of Inequality**
For any numbers $a, b,$ and c,	For any numbers $a, b,$ and c
if $a < b$	if $a < b$
then $a - c < b - c$.	then $a + c < b + c$
if $a > b$	if $a > b$
then $a - c > b - c$.	then $a + c > b + c$

(9.7.2)

We use these properties to solve inequalities, taking the same steps we used to solve equations. Solving the inequality $x + 5 > 9$, the steps would look like this:

$$\begin{array}{lrcl} & x+5 & > & 9 \\ \text{Subtract 5 from both sides to isolate } x. & x+5-5 & > & 9-5 \\ & x & > & 4 \end{array} \tag{9.7.3}$$

Any number greater than 4 is a solution to this inequality.

Exercise 9.7.7

Solve the inequality $n - \frac{1}{2} \leq \frac{5}{8}$, graph the solution on the number line, and write the solution in interval notation.

Answer

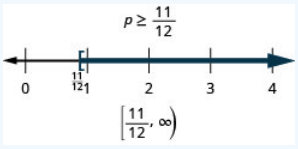
	$n - \frac{1}{2} \leq \frac{5}{8}$
Add $\frac{1}{2}$ to both sides of the inequality.	$n - \frac{1}{2} + \frac{1}{2} \leq \frac{5}{8} + \frac{1}{2}$
Simplify.	$n \leq \frac{9}{8}$
Graph the solution on the number line.	
Write the solution in interval notation.	

Exercise 9.7.8

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$p - \frac{3}{4} \geq \frac{1}{6}$

Answer



Exercise 9.7.9

Solve the inequality, graph the solution on the number line, and write the solution in interval notation.

$r - \frac{1}{3} \leq \frac{7}{12}$

Answer
